

Appendix A

This appendix includes the comments received in the Draft Environmental Impact Statement and response to those comments.

Federal Agencies

Preserving America's Heritage

January 27, 2009

Mr. Leslie T. Rogers
Regional Administrator
Federal Transit Administration Region IX
201 Mission St., Suite 1650
San Francisco, CA 94105-1839

*RE: Honolulu High-Capacity Transit Corridor Project
Honolulu, Hawaii*

Dear Mr. Rogers:

Consulting parties have recently contacted the Advisory Council on Historic Preservation (ACHP) with concerns about the effects of the referenced undertaking on historic properties, particularly visual effects that may result to the Pearl Harbor National Historic Landmark (NHL). The extent and complexity of the planned undertaking calls for the Federal Transit Administration (FTA) to provide appropriate guidance and oversight to its applicant, the City and County of Honolulu Department of Transportation Services (City) to ensure that consulting parties and other stakeholders are involved in consultation in keeping with the spirit and intent of the Section 106 implementing regulations, "Protection of Historic Properties" (36 CFR Part 800).

We would like to confirm our understanding that the FTA has not yet circulated a finding of effect for this undertaking as the City is presently conducting additional study and analysis of effects to historic properties in response to comments received from consulting parties during the recent circulation of a Draft Environmental Impact Statement (DEIS) for the project. Should the FTA conclude, following the results of this additional analysis and consultation with the Hawaii SHPO and other consulting parties, that the undertaking will adversely affect historic properties, or that the development of a Programmatic Agreement is necessary, the agency must notify the ACHP and provide the documentation detailed at 36 CFR § 800.11(e). The Hawaii State Historic Preservation Office (SHPO) has raised concerns about the proposed development of two Section 106 agreement documents should adverse effects result from the proposed undertaking. It is unclear to us how the FTA has proceeded to this point without ongoing consultation with all consulting parties. Further, we wish to clarify that, per the provisions of §800.6 of our regulations, a Section 106 agreement document should address all the adverse effects that may result from an undertaking. It therefore is inconsistent per 36 CFR Part 800 for the FTA to develop two agreement documents for this single undertaking.

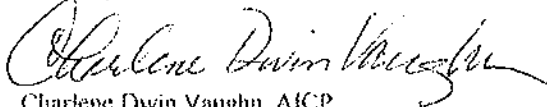

ADVISORY COUNCIL ON HISTORIC PRESERVATION

1100 Pennsylvania Avenue NW, Suite 803 • Washington, DC 20004
Phone: 202-606-8503 • Fax: 202-606-8647 • achp@achp.gov • www.achp.gov

We request an update on the status of the Section 106 consultation for the Honolulu High-Capacity Transit Corridor as well as information about how the FTA is providing oversight to the City regarding the coordination of the historic preservation review and consultation with all consulting parties, including Native Hawaiian organizations. This information will help us respond to inquiries from consulting parties and members of the public who express concerns about the FTA's Section 106 coordination. We will also be able to better advise the FTA regarding interpretation of the regulations and procedural requirements.

We look forward to your response and to assisting the FTA with its responsibilities under the National Historic Preservation Act. If you have any questions, please contact Blythe Semmer by telephone at (202) 606-8552 or by e-mail at bsemmer@achp.gov.

Sincerely,

Charlene Dwin Vaughn, AICP

Dear Ms. Vaughn:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

At the time of issuance of the Draft EIS, the FTA had not submitted an Effects Determination Report. The Proposed Effects Determinations included in the Draft EIS were not formally submitted to the State Historic Preservation Division (SHPD) and, consequently, FTA had not received SHPD concurrence. The Draft EIS provided an opportunity for agencies and the public to review and comment on the preliminary determinations. The SHPD and other consulting parties provided substantive comments that have been considered and are reflected in the Honolulu High-Capacity Transit Corridor Project Historic Resources Effects Report (RTD 2009d) and summarized in Section 4.16, Archaeological, Cultural, and Historic Resources, in the Final EIS.

Based on concerns raised by Section 106 consulting parties, preliminary effects determinations as shown in the Historic Resources Technical Report (August 2008) and in the

Ms. Charlene Dwin Vaughn
Page 2

Draft EIS (November 2008) were reevaluated and documented in a Historic Effects Report (April 2009). This report is available at the Department of Transportation Services, Rapid Transit Division office, at libraries, and on the project website (www.honolulutransit.org).

The Historic Effects Report showed that the Project will adversely affect a number of historic properties not discussed in the review conducted for the Draft EIS.

Both direct and indirect effects to historic properties were reconsidered in this report. Following consultation, SHPD concurred with the adverse effect findings and identified 11 additional resources as adversely affected. In July 2009, the FTA accepted the SHPD's opinion of effect on the additional resources. These determinations of effect are documented in Section 4.16 of the Final EIS.

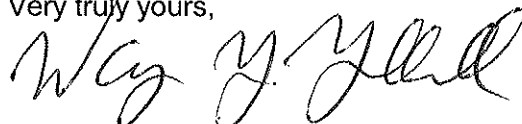

The Programmatic Agreement (PA) related to the finding of adverse effect is included in the Final EIS as Appendix H, Section 106 of the National Historic Preservation Act Programmatic Agreement. As you know, ACHP participated in the development of the programmatic agreement during the Section 106 consultation process.

The FTA, ACHP and SHPD will execute a single programmatic agreement (PA) that includes both specific effects and mitigations to historic properties and a second part that is programmatic and addresses the level of exploration for sub-surface archaeological resources during the final design process and the treatment of any resources found.

FTA has provided direction as to the preparation of the PA and finding of effects. All Section 106 documentation has been circulated to all consulting parties. Historic properties were identified in the Historic Resources Technical Report (RTD 2008); preliminary assessments of effect to these properties were also included in that document. As described, concerns from consulting parties regarding these initial effect assessments led to their reconsideration. Preliminary effect assessments as documented in the Historic Resources Technical Report (RTD 2008) were thus superseded by the findings documented in the Historic Effects Report (RTD 2009). Section 106 consultation with consulting parties, including correspondence, circulation of documentation, meetings, and site visits, is documented in both reports.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Mr. Wayne Y. Yoshioka, Director
Department of Transportation Services
City and County of Honolulu
650 South King Street, 3rd Floor
Honolulu, Hawaii 96813

Thank you for providing the NRCS the opportunity to review the Honolulu High-Capacity Transit Corridor Project, Draft Environmental Impact Statement/Section 4(f) Evaluation. Previously, the NRCS has worked with the City and County of Honolulu and Ms. Amy Zaref, Project Manager from Parsons Brinckerhoff, on this project to provide the Important Farmland information. We assisted in completing a Farmland Impact Conversion Rating Form (AD-1006) for this project. This form is required on projects that convert farmlands into non-farmland uses and have federal dollars attached to the project. See the website link below for more information on the Farmland Protection and Preservation Act (FPPA), and a copy of the AD-1006 form, with instructions.

Another area of potential concern are the impacts on wetlands. The NRCS Soil Survey of Oahu, Hawaii identifies areas of hydric soils. Hydric soils are potential areas of wetlands. If wetlands do exist, any proposed impacts to these wetlands would need to demonstrate compliance with the "Clean Water Act", and may need an Army Corps of Engineers 404 permit. The NRCS Soil Survey Maps are not provided with this report due to the extent of the project area. If you have any questions concerning hydric soils or obtaining NRCS Soil Survey information please contact us at the number provided below.

The NRCS Soil Survey is a general planning tool and does not eliminate the need for an onsite investigation. If you have any questions concerning the soils or interpretations for this project please contact, Tony Rolfes, Assistant State Soil Scientist, by phone (808) 541-2600 Ext. 129, or email, Tony.Rolfes@hi.usda.gov.

Dear Mr. Yamamoto:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Coordination regarding the Farmland Protection Policy Act has been ongoing between the City and NRCS. This coordination includes two submittals of the Form NRCS-CPA-106 with a request for NRCS to complete the corridor assessment scoring portion of the form. Only one corridor was evaluated in the Form NRCS-CPA-106 as only one alignment through farmlands were evaluated in the Draft and Final EISs. As defined in 7 CFR 658.4(c)(2), "Sites receiving a total score of less than 160 need not be given further consideration for protection and no additional sites need to be evaluated." The Project was given a Farmland Conversion Impact Rating Score of 120. On April 24, 2009, this final form was sent to you. Therefore, no further action is necessary for the Project regarding its compliance with the Farmland Protection Policy Act.

The two proposed alignments in the Draft EIS for the rapid transit route extend over 20 miles across southern Oahu. All of the crossings of named streams along this route were evaluated to determine whether the water bodies were navigable waters, waters of the U.S., or not waters of the U.S. Field investigations for waters of the U.S. were conducted along the project's alignment from December 2007 through January 2008 and from January 2009 through July 2009. Thirty-one sites were studied that were either streams or areas where there was the potential for wetlands. The results of this study are documented in the Wetland and Waters of U.S. Study (RTD2009b).

The methods used to evaluate potential wetlands along the project alignment followed the Wetlands Delineation Manual (USACE 2987). The NRCS Soil Survey of Oahu, Hawaii was one of the sources of information used to determine the presence of hydric soils.

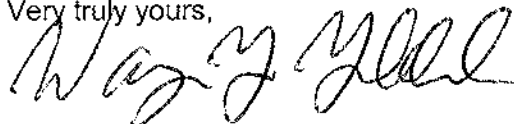

In addition, maps of wetland sites were also examined. There are three information sources for wetland sites:

- The USFWS 1970 wetlands map, which catalogues known wetlands and open water surfaces from aerial surveys. Many open water bodies (such as those on the Ewa Plain near the rapid transit route) were previous irrigation impoundments that have long been removed.*
- The Geographic Approach to Planning (GAP) maps, which only covers bird habitats in the Pearl Harbor area.*
- The Hawaii Wetlands Joint Venture, which provides a point location (not an area) as a wetland identifier.*

DTS has coordinated with the USACE throughout this study and will continue coordination as part of the Section 404 permitting process. The results of the analysis demonstrate that the project will not impact wetlands. Sections 4.14.2 and 4.14.3 in this Final EIS document this effort.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Mr. Wayne Y. Yoshioka
Department of Transportation Services
City and County of Honolulu
650 South King Street, 3rd Floor
Honolulu, HI 96813

Dear Mr. Matley and Mr. Yoshioka:

This letter transmits our comments on the **Honolulu High-Capacity Transit Corridor Project (Project) Draft Environmental Impact Statement (DEIS)**, dated November 2008. The document was jointly prepared by the U.S. Department of Transportation, Federal Transit Administration (FTA) and the City and County of Honolulu, Department of Transportation Services (DTS) to evaluate the environmental consequences of the proposed 23-mile rapid transit project located between Kapolei and University of Hawaii Mānoa on the Island of Oahu, Hawaii. Our comments are provided pursuant to the U.S. Army Corps of Engineers (Corps) regulatory authorities promulgated under Section 404 of the Clean Water Act (CWA) of 1972 and Section 10 of the Rivers and Harbors Act (RHA) of 1899. Our feedback is also guided by the Project's *Draft Coordination Plan* that was developed for this project pursuant to Section 6002 of the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFTEA-LU) and our independent statutory responsibilities under the National Environmental Policy Act (NEPA) of 1969.

As a way of background, our role as an official cooperating agency is to ensure appropriate consideration of the aquatic ecosystem throughout the environmental review process. In doing so, we expect the Final EIS to be substantively sufficient for purposes of our agency's adoption in accordance with the Council on Environmental Quality's (CEQ) NEPA implementing regulations. Furthermore, our early involvement in the Project is intended to assist FTA and DTS in complying with all applicable federal laws that fall under our regulatory jurisdiction. Towards this end, my office has submitted comments on the Project in letters dated February 13, 2006¹; April 10, 2007²; May 8, 2007³ and September 16, 2008⁴. Our most recent review of the

¹ Letter from George P. Young, U.S. Army Corps of Engineers to Kenneth Hamayasu, DTS, regarding scoping and EIS Preparation Notice

RECEIVED
09 FEB 11 3:01
DIRECTOR'S OFFICE
REGISTRATION SERVICE
TRANSPORTATION

public DEIS encompassed all pertinent documents provided to our agency, including, but not limited to:

- DEIS, Chapters 1 through 8 (FTA and DTS, November 2008);
- Appendix A of the DEIS: Conceptual Alignment Plans and Profiles (DTS, September 2008);
- Appendix C of the DEIS: Construction Approach (DTS, November 2008);
- Water Resources Technical Report (DTS, August 2008);
- Alternatives Analysis Report (DTS, November 2006); and
- Draft Coordination Plan (FTA and DTS, March 2007)

Based on our review, we found that a number of our agency's previous comments and concerns relating to the identification/delineation of waters of the United States, project impact assessment, the 404(b)(1) alternatives analysis, and proposed compensatory mitigation were not adequately addressed or incorporated into the DEIS. In the absence of this key information, we are unable to provide meaningful comments on the subject draft NEPA document as it relates to our statutory responsibilities. Moreover, these data and assessment deficiencies could adversely affect the timeliness and streamlining of our Department of the Army (DA) permit decision. Therefore, as a cooperating agency, we suggest the following comments be vetted and resolved, as appropriate, by the Federal lead and cooperating agencies prior to the next formal step in the NEPA process.

Aquatic Resources Data Gaps

According to the President's CBQ, an EIS must rigorously explore and objectively evaluate a reasonable range of alternatives, including the proposed action. One of the cornerstones of the NEPA process is the disclosure of the environmental consequences of the proposed action and its alternatives. An analytical evaluation of project impacts is necessary in order for a reviewer to sharply compare and contrast alternatives. While there is no mandate for a particular outcome or that the lead agency achieves particular substantive environmental results, a rigorous evaluation of alternatives is required to inform decision-makers of the likely environmental consequences, both detrimental and beneficial, of the alternatives. The preface of the Project's DEIS acknowledges the purpose of the document is to "...provide...[a] full and open analysis of costs, benefits, and environmental impacts of alternatives considered...", yet based on our review of the document, we do not concur that some of these basic NEPA tenets have been adequately fulfilled.

Irrespective of the NEPA precept of a concise environmental document, at the project-specific DEIS stage we require greater specificity and disclosure of quantitative data regarding the aquatic environment. We note neither the Water Resources Technical Report (WRTR) nor Chapter 4 of the DEIS (*Environmental Analysis, Consequences and Mitigation*) contains

² Letter from George P. Young, U.S. Army Corps of Engineers to Kenneth Namayasu, DTS, regarding NEPA scoping comments in response to FTA's NOI

³ Letter from LTC Charles H. Klinge, U.S. Army Corps of Engineers to Leslie T. Rogers, FTA, regarding cooperating agency status and SAFETEA-LU coordination plan

⁴ Letter from George P. Young, U.S. Army Corps of Engineers to Wayne Yoshioka, DTS, regarding comments on

information on: 1) the geographic boundaries of waters of the U.S., including wetlands; 2) quantitative data documenting the areal extent of direct and indirect impacts for each of the proposed build alternatives (e.g., footprint of disturbance); and 3) specific documentation of how the Project will avoid and minimize impacts to aquatic resources to the maximum extent practicable. In previous correspondence, the Corps requested the DEIS include these standard analytical and procedural requirements in order to document our geographic scope of jurisdiction and to characterize the functional losses to the aquatic ecosystem, if any, as a result of project implementation. Both aspects are fundamental to our regulatory program and DA permit decisions.

Notwithstanding the aforementioned data omissions, we offer the following specific comments on the presence/absence of aquatic resources, the analysis of impacts on the aquatic environment and proposed mitigation.

- Table 4-1 in the WRTR identifies 18 streams/waterways that occur within the study area, whereas Table 4-25 in the DEIS depicts 17 streams; the Ala Wai Canal is excluded in the latter. A third matrix, entitled "Streams in the Study Corridor" was distributed for discussion purposes during our December 2008 agency coordination meeting. This table lists 20 streams occurring in the study area that could be affected by the Project. The Corps recommends any discrepancies with the various tables be reconciled and a clear, comprehensive accounting of the existing aquatic resources within the study area be presented.
- Page 4-130 of the DEIS indicates "...wetland areas are listed in Table 4-28..." However, the aquatic resources called out in Table 4-28 do not appear to be classified or delineated based on the Corps' 1987 Wetlands Delineation Manual (manual) and other current Corps policy. For example, nine of these water resources listed in Table 4-28 are described as concrete channels or concrete culverts, which generally are not known to support hydric soils (unless they maintain a natural channel invert), and therefore would not be considered wetlands. The Corps suggests this table be reviewed and modified, as appropriate, to categorize or otherwise identify water resources that constitute a "wetland" based on the Corps methodology.
- We noted inconsistencies with respect to the conclusions made in the DEIS regarding environmental consequences. For instance, page 4-135 of the DEIS states that mitigation is not required because no impacts to wetlands are expected, although page 4-159, Section 4.17.7 (*Natural Resources*), indicates "...[C]onstruction activities could affect wildlife, vegetation, wetlands and streams near the Project." [Emphasis added]. The Corps recommends clarification on the conclusions of the water resources impact analysis. We also suggest a reference or citation be provided in the DEIS that directs the reader to the actual field data and detailed analysis that substantiate the findings.
- While Section 4.13.3 of the DEIS (page 4-131) asserts: "...the project would not adversely affect water resources...", page S-1 of the WRTR states: "Piers to support the guideway may have to be located in some streams." Similar statements on page 6-1 of the WRTR and page 4-132 of the DEIS indicate: "[A]ny piers in streams would be

placed to line up with existing bridge structures when feasible...[a]reas where elevated structures would cross navigable waterways have been identified and consultation with the Coast Guard is underway to address effects” We infer from these statements that there would be direct impacts to [potential] waters of the U.S., likely requiring review and authorization under Section 404 of the CWA and/or Section 10 of the RHA. The Corps suggests this section of the DEIS be clarified.

- Subsequent to the release of the DEIS, the Corps was informed that there may be construction methodologies that could result in direct impacts to waters of the U.S., such as the use of coffer dams (pers. comm., Amy Zaref et al., December 16, 2008). Therefore, we recommend the Final EIS identify all project features and construction methodologies that may affect waters of the U.S. FTA and DTS should provide an explicit accounting of what waterways and wetlands will be impacted, including an estimate of the footprint of disturbance (e.g., acres) and the type of impact (e.g., direct, indirect, permanent, temporary, and so forth). In order to accomplish this, a formal JD must be undertaken by a qualified consultant and verified by the Corps. Information contained in the JD, in conjunction with detailed engineering plans, should then be used to substantiate the presence/absence of jurisdictional waters of the U.S. and whether impacts would result from implementation of the proposed build alternatives.
- Section 4.13.1 of the DEIS (*Regulatory Context*) indicates the Corps regulates activities in jurisdictional waters pursuant to Section 10 of the RHA and Section 103 of the Marine Protection, Research and Sanctuaries Act of 1972, however, omits the fact we also regulate activities that involve the discharge of dredged or fill material in jurisdictional waters of the U.S. under Section 404 of the CWA. Although a separate subheading entitled “*Wetlands*” (page 4-128) correctly explains the Corps regulates wetlands under Section 404 of the CWA, it does not explicitly acknowledge that we regulate activities that discharge fill material into other types of waters of the U.S., such as non-wetland tributaries. Therefore, the text of the DEIS should be modified to clarify the scope of our jurisdiction under Section 404 of the CWA. Unless FTA and DTS intend to transport dredged or fill material for ocean disposal, the Corps does not anticipate our authorities under Section 103 of the MPRSA will be relevant to this Project.
- Page 4-134 of the DEIS indicates verbatim: “...[A] letter has been sent to the Army Corps of Engineers asking for their jurisdictional determination concurring that the Project will not have a direct impact on wetlands.” We are concerned with the accuracy of this statement, as the Corps has not received a letter from the Project proponent or its designated agent requesting our jurisdictional determination (JD). Further, we have not received a draft JD report prepared in accordance with the 1987 Wetlands Delineation Manual, 33 C.F.R. § 328.3(d) and 33 C.F.R. § 328(e) to review and approve. For this reason, we request this statement be stricken from the DEIS or substantially modified to accurately portray the status of coordination with our office on the Project’s JD.

Based on recent coordination with your consultant team, we understand the aforementioned data gaps are under development and that site-specific information will be forthcoming. It is not clear, however, how this yet-to-be obtained information will be incorporated into the DEIS and

considered by the public and agency decision-makers prior to the final determination of a federally preferred alternative. Again, due to the absence of a geographic ID, we are unable to determine the extent, intensity and permanence of impacts to the aquatic ecosystem. At this time, we are also precluded from weighing in on the adequacy of a 404(b)(1) alternatives analysis, appropriate mitigation, and the possible identification of the least environmentally damaging practicable alternative (LEDPA).

Alternatives Analysis

The purpose of the Project is to: "...[p]rovide high capacity rapid transit in the highly congested east-west transportation corridor, between Kapolei in the west and University of Hawaii, Mānoa in the east, as specified in the *Oahu Regional Transportation Plan 2030*" (page 1-19). A number of alternatives were initially examined, but rejected as part of the Alternative Analysis process conducted by DTS in 2006. The Alternative Analysis Report evaluated four alternatives, including the No Build, Transportation System Management, Express Buses Operating in Managed Lanes, and Fixed Guideway Transit System. The latter was selected by the City Council as the locally preferred alternative. According to the DEIS, the NEPA scoping process confirmed that there were no other available alternatives that would satisfy the project purpose at less cost, with greater effectiveness or less environmental or community impact.

The 404(b)(1) Guidelines⁵ impose substantive requirements on the applicant with respect to the alternatives analysis and the sequenced search for the LEDPA. These guidelines are heavily weighted towards preventing environmental degradation of waters of the U.S. The regulation specifically requires that no discharge of dredged or fill material shall be permitted if there is a practicable⁶ alternative to the proposed discharge which would have less adverse impact on the aquatic ecosystem, so long as the alternative does not have other significant adverse environmental consequences [40 C.F.R. § 230.10(a)]. Section 4.13.1 of the DEIS (*Background and Methodology*) appropriately acknowledges the applicant must conduct a 404(b)(1) alternatives analysis, however, we were unable to locate this analysis within the DEIS, its appendices or technical studies. Presuming this analysis has not yet been prepared, there is no reference in the DEIS as to when it might be performed.

Generally, if the NEPA alternatives analysis is adequately robust with respect to the aquatic ecosystem impacts such that it demonstrates that the proposed activity is the LEDPA, then it can duly serve to fulfill the 404(b)(1) alternatives analysis requirement. Otherwise, a separate alternatives analysis must be conducted to provide greater specificity and/or a modified range of alternatives in order to satisfy the substantive criteria of the Guidelines (i.e., the identification of the LEDPA). It is germane to note that if it is otherwise a practicable alternative, an area not presently owned by the applicant which could be reasonably obtained, utilized, expanded or managed in order to fulfill the basic purpose of the proposed project may be considered under the Guidelines. NEPA has similar language in which it requires that even if an alternative is not

the administrative draft BIS

⁵ U.S. Environmental Protection Agency, 404(b)(1) Guidelines, 40 C.F.R. § 230 (45 FR 85336 – 85357, dated December 24, 1980)

⁶ "Practicable" is defined in regulation as being available and capable of being done after taking into consideration cost, existing technology and logistics in light of the overall project purpose.

within the lead agency's jurisdiction it should be rigorously analyzed in the EIS if it is reasonable and achieves the project purpose [40 C.F.R. 1506.2(d)]. Despite some alternatives being outside the control or legal jurisdiction of the lead agency, their inclusion in the EIS helps to provide a sharper contrast among alternatives and informs the public as well as decision-makers of the environmental consequences (beneficial or detrimental) of alternative actions.

For the Honolulu High-Capacity Transit Corridor project, the range of alternatives includes the No Action alternative plus one build alternative with two alignment variations. The alignments considered in the DEIS are: 1) the Honolulu International Airport variation, 2) the Salt Lake Boulevard variation, and 3) implementation of both the Airport and Salt Lake Boulevard variations. Aside from the area between Aloha Stadium and Kalihi where the alignment varies, the alternatives traverse the same footprint for the majority of the 19-mile length. In fact, the DEIS states: "...the guideway would follow the same alignment for all Build Alternatives through most of the study corridor, except between Aloha Stadium and Kalihi." (pages S-4, 2-9). In consideration of the requirements of the 404(b)(1) Guidelines, the Corps recommends FTA and DTS carefully examine and clearly document the environmental differences between the build alternatives/alignments and provide documentation that there is no other practicable alternative—other than the locally preferred alternative—that would have less adverse impact on the aquatic ecosystem.

Cumulative Effects

According to the DEIS, the proposed transportation corridor is approximately 23 miles in length, of which a detailed environmental evaluation was conducted for a core 19 miles located between East Kapolei and Ala Moana Center. Future transit extensions to West Kapolei and UH Mānoa and Waikiki may occur, but are only considered in the DEIS in the context of cumulative effects. We agree this is an appropriate approach for potential future Project extensions that currently have not been approved, designed or funded. The NEPA requires that the lead agency take a hard look at alternatives and the resultant environmental consequences to enable informed agency decisions. Environmental consequences may be beneficial or adverse, but in all cases, the direct, indirect and cumulative impacts must be assessed and disclosed within the NEPA document. We found the Project's cumulative impact analysis for waters of the U.S. to lack sufficient analytical detail and robustness for purposes of public disclosure and agency decision-making. A meaningful cumulative impact assessment includes an evaluation of the historic and current conditions of the environmental resource of interest, a thorough accounting of past, present and reasonably foreseeable future projects and how such projects affect a given environmental resource when assessed in the aggregate.

The cumulative impacts to waters of the U.S. must be considered in the context of the pre-established geographic boundaries for the wetlands/waters cumulative effects analysis. The impacts that would result from the Project's build alternatives must be evaluated in comparison to the quantity and quality of aquatic resources occurring within the geographic study area and in consideration of other stressors or impacts resulting from past, present and reasonably foreseeable projects. That is, it may be that the resulting impacts from the Honolulu High-Capacity Transit Corridor project alternatives are, individually, deemed minimal when compared to the overall Project footprint of disturbance, but when the project impacts are compared to the

already diminished extent and health of wetlands existing within the study area, such impacts could be considerably more substantial. The discussion of the water resources cumulative effects offered in Section 4.18.3 (page 4-174) is inadequate to enable a fair and objective evaluation of cumulative impacts. Therefore, the Corps recommends the text be expanded to better address the suggestions outlined above.

Compensatory Mitigation

For projects evaluated under Section 404 of the CWA, no discharge of dredged or fill material into waters of the U.S. can be approved that does not meet the requirements of the 404(b)(1) Guidelines. Guidance for implementing the 404(b)(1) Guidelines is provided through the joint Corps-EPA 1990 Mitigation Memorandum of Agreement (MOA) and the new Compensatory Mitigation Rule⁷, which supersedes certain provisions of the 1990 MOA. Among other things, the MOA states that compensatory mitigation may not be used as a method to reduce environmental impacts in the evaluation of the alternatives for the purposes of requirements under 40 C.F.R. Section 230.10(a).

The Corps anticipates providing feedback on the draft 404(b)(1) alternatives analysis as the environmental process moves forward. In general, however, the following sequence of determinations will be used in evaluating the Project:

- A determination that potential impacts have been avoided to the maximum extent practicable;
- A determination that remaining unavoidable impacts will be mitigated to the extent appropriate and practicable by requiring measures to minimize impacts through project modifications and permit conditions; and
- A determination that appropriate and practicable compensatory mitigation has been provided for unavoidable adverse impacts.

The DEIS should document an explicit and transparent link between project impacts and proposed mitigation. Under the new Compensatory Mitigation Rule, greater flexibility exists for permittee-responsible mitigation through on-site and off-site mitigation. The same holds true for out-of-kind mitigation. In general, however, implementation of compensatory mitigation should occur on-site unless it is demonstrated there is no practicable opportunity for on-site mitigation or if off-site mitigation provides greater ecological benefits. Compensatory mitigation should also occur within the same watershed of impact whenever possible. If compensatory mitigation is recommended to occur outside the watershed of impact, a sound ecological rationale must be presented as to why it is the most practicable choice.

In our previous comment letters, we cautioned DTS about deferring specific mitigation planning to the permitting stage of this project. In our view, it is important that discussions with

⁷ Final Rule, Compensatory Mitigation for Losses of Aquatic Resources (Corps and EPA, April 10, 2008; 73 FR 19594 - 19705).

key regulatory and resource agencies related to compensatory mitigation begin at this phase of the NEPA process and continue throughout the permit process. Also, it is noteworthy to point out that the new Compensatory Mitigation Rule requires our Public Notice (PN) for the preferred alternative contain a statement explaining how impacts associated with the proposed action are to be avoided, minimized and compensated for and that a final mitigation plan be approved by our district engineer prior to issuance of an individual permit. Therefore, it is important that at the time of issuance of our PN the mitigation proposal is specific enough for the public to offer meaningful comments on its appropriateness and effectiveness.

Should your augmented impact analysis for aquatic resources determine there are unavoidable adverse impacts to waters of the U.S., we expect a draft compensatory mitigation plan to be prepared in accordance with Honolulu District's Mitigation and Monitoring Guidelines and the Final Compensatory Mitigation Rule. At a minimum, this plan should include the following: 1) a direct correlation between project impacts and proposed mitigation to offset the loss in functional value; 2) the specific functions and values expected to be gained through the proposed establishment, restoration, enhancement and preservation efforts; 3) a schedule for implementation; and 4) an evaluation and monitoring plan.

In addition, it may be prudent to consider implementation of certain components of the compensatory mitigation plan in advance of the impacts occurring, which may then reduce the temporal losses associated with project construction.

NEPA Procedural Requirements

As a cooperating agency with both special expertise and jurisdiction by law, we intend to adopt FTA's Final EIS for compliance with the Corps' independent NEPA responsibilities for our federal action (i.e., DA permit decision). In doing so, we will be required to issue a Notice of Intent in the Federal Register and prepare our own Record of Decision (ROD). The Corps' ROD will constitute our agency's decision document and will be relied upon for the final DA permit decision. As part of agency's decision-making, the Corps will need written evidence from FTA that compliance with Section 7 of the Endangered Species Act and Section 106 of the National Historic Preservation Act has been achieved. Similarly, prior to a DA permit decision, the Corps must have evidence that the Project has obtained Section 401 of the CWA certification (or waiver thereof) and Section 307(c) of the Coastal Zone Management Act consistency (or exemption).

Public Interest Review

Lastly, our project evaluation process requires we balance the project purpose against the public interest. The public benefits and detriments of all factors relevant to this transportation project will be carefully reviewed and considered. Relevant factors may include, but are not limited to, conservation, economics, aesthetics, wetlands, cultural values, fish and wildlife values, water quality, and any other factors judged important to the needs and welfare of the people. The following general criteria will be considered in evaluating the Honolulu High-Capacity Transit Corridor project application:

- The relevant extent of public and private needs
- Where unresolved conflicts of resource use exist, the practicability of using reasonable alternative locations and methods to accomplish project purposes; and
- The extent and permanence of the beneficial and/or detrimental effects the proposed project may have on public and private uses to which the area is suited.

No DA permit can be granted if the project is found to be contrary to the public interest. We anticipate working with FTA, DTS, other key agencies and interested parties in the documentation of our public interest review.

We appreciate the opportunity to comment on the Project's DEIS. Our goal is to ensure the environmental review process is appropriately comprehensive, technically sound and transparent to enable meaningful public participation and informed agency decision-making. We look forward to continuing our dialogue with your respective offices as well as your consultant team. If you have any questions or concerns, please contact Ms. Susan A. Meyer of my staff at (808) 438-2137 or by electronic mail at susan.a.meyer@usace.army.mil. Please refer to the Corps File No. POH-2007-127 in any future correspondence or communications related to this project.

Sincerely,

George P. Young, P.E.

Mr. George P. Young, Chief
Regulatory Branch
Department of the Army
U.S. Army Engineer District
Fort Shafter, Hawaii 96858-5440

Dear Mr. Young:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Aquatic Resources

Coordination with Federal, State, and Local agencies with water resource expertise and responsibilities has been ongoing to provide input and guidance on the resources, design, and construction of the Project. Coordination will continue as appropriate with regulatory agencies throughout final design and construction. Since publication of the Draft EIS, several meetings have been held with the USACE December 9, 2008, January 15, February 25, May 13, July 3, and August 10, 2009. DTS appreciates the time the USACE has taken to review the Project materials required to fill the aquatic resource data gaps.

Sections 4.14 and 4.18.10 of this Final EIS have been revised to include the deficiencies and clarify the discrepancies identified by the USACE in the Draft EIS. These revisions occurred in the following water resource areas:

- Regulatory authority of the USACE.
- Identification and delineation of waters of the U.S.
- Project impact assessment for waters of the U.S. (permanent and temporary).
- The 404(b)(1) alternatives analysis.
- Mitigation to waters of the U.S.

USACE guidance permits the use of a preliminary jurisdictional determination (JD) approach to satisfy NEPA requirements. The "preliminary JD" approach is being followed for this Project. Under this approach, areas that are potentially waters of the U.S. are considered to be waters of the U.S. For the purposes of this document, all waters (including intermittent and ephemeral streams) are considered waters of the U.S. if they fit the definitions of tidal, wetland, RPW, or non-RPW waters, unless otherwise stated. The Wetland and Waters of the U.S. Study (RTD 2009b) provides additional information on areas being covered under preliminary JDs which is also documented in Section 4.14 of the Final EIS. The Final EIS also includes an evaluation of impacts to waters of the U.S. (See Section 4.14.4 in this Final EIS).

On September 15, 2009, the Army Corps of Engineers stated in a letter that its substantive concerns relating to Section 404 of the Clean Waters Act had been addressed and that the scope and intensity of impacts to jurisdictional waters of the United States are now relatively minor due to the extent of avoidance and minimization of impacts on the aquatic environment resulting from project site selection and design. This letter is in Appendix F of this Final EIS. There will be impacts to waters of the U.S. by the Project. Transit guideway support columns will be placed in Waiawa, Moanalua, and Nuuanu Streams. In addition, the Project will be widening the existing Dillingham Boulevard Bridge at Kapalama Stream which will require extension of the existing piers and abutments. The total permanent impacts from structural elements of the Project is 0.02 acres. An existing stormwater outfall in Waiawa Springs will be extended at the Pearl Highlands Station to reduce ponding (total impact is 0.06 acres). For all work in waters of the U.S., the City will apply for USACE Section 404 nationwide permits for impacts to waters under the jurisdiction of the Corps where impacts could not be avoided.

Permanent mitigation features are proposed at Waiawa Stream, within the Pearl Highlands Station, see Figure 4-62 in the Final EIS. This approximately 17-acre site provides sufficient space for mitigation since only approximately 5 acres will be required for the station, leaving the remainder of the site available for mitigation. Regulations suggest, but do not require, mitigation within the same watershed. Impacts from the Project amount to several small impacts in different watersheds. Individually these would be difficult to mitigate separately (i.e., keep within the same watershed as the impact) to achieve lasting compensation. Impacted watersheds could be more broadly defined on the basis of the nearby receiving waterbody for the impacted estuary; these are Pearl and Honolulu Harbors and Ke'ehi Lagoon. Of the three,

Pearl Harbor has the greatest potential for benefit from a mitigation effort directed at improving function within a contributing stream system. This is because it is the largest of the estuarine environments (i.e., of a type closer to the environments impacted) and is the most enclosed. As a result, it is more sensitive to land impacts than Ke'ehi Lagoon or Honolulu Harbor. The proposal is to consolidate mitigation to a single site (Site 12) Figure 4-62 and Figure 4-67 in the Final EIS, on Waiawa Stream. Waiawa Stream was selected over an estuary location because of the availability of land that is part of the Project where enhancement of the stream and potential establishment of a riverine wetland are possible with a high degree of long-term success. The mitigation area would become part of the Project. Although the Project will have minimal effect on the stream, Figure 4-62 in the Final EIS, it will have a considerable effect on the riparian area at that location. Waiawa Springs (Site 13) Figure 4-62 and Figure 4-67 in the Final EIS, is under the jurisdiction of the USACE. The impact area of constructing a culvert to direct the stormwater outfall and spring flow away from under the Pearl Highlands Station is greater (0.06 acre) than all the permanent impacts from the guideway (0.02 acre). Mitigation in this location can also be used to improve the existing outfall, improve water quality, and enhance the natural setting of the station.

As discussed in Section 4.18, during construction of the linear transportation features of the Project, it is anticipated that there will also be a temporary effect of up to 0.13 acre of waters of the U.S.

A "functional assessment" was also performed for each location where the Project is adjacent to or crosses waters of the U.S., as identified in the Wetland and Waters of the U.S. Study (RTD 2009b). Given this level of impact to water resources within Honolulu's urban core, the intent of the functional assessment was to analyze impacts of the aquatic ecosystem to develop mitigation concepts for those waters of the U.S. where impacts could not be avoided and only after impacts were minimized to the extent feasible.

Alternatives Analysis

Additional discussion regarding the consideration of aquatic resources that is documented in previous studies is now more clearly summarized in Chapter 2, Alternatives Considered, in this Final EIS and Section 4.14.4, includes an analysis of alternatives to meet the requirements of the Clean Water Act 404(b)(1) Analysis. As noted by the USACE, the City has avoided and minimized impacts to waters of the U.S. which has resulted in relatively minor impacts to jurisdictional waters of the U.S.

Cumulative Effects

Section 4.19.3 Cumulative Effects, in this Final EIS has been refined to add detail regarding past actions as well as to elaborate upon how past actions have affected water resources and how water resources will be effected cumulatively by the aggregate of both the Project and reasonably foreseeable future projects.

Mr. George P. Young
Page 4

NEPA Procedural Requirements

The required documentation of compliance with the Section 7 of the Endangered Species Act and Section 106 of the National Historic Preservation Act are in this Final EIS Sections 4.13 and 4.16. Prior to the USACE's permit decision, DTS understands the need to meet the requirements for Sections 401 and 404 of the CWA and Section 307(c) of the Coastal Zone Management Act.

Agency Coordination

The City will continue to work with the USACE to ensure that the USACE receives all of the necessary documentation to satisfy its public interest review criteria.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

DEC 23 2008

Mr. Wayne Y. Yoshioka, Director
Department of Transportation Services
City and County of Honolulu
650 South King Street, 3rd Floor
Honolulu, Hawaii 96813

Dear Mr. Yoshioka,

As a cooperating agency for the Honolulu High Capacity Transit Corridor project, we appreciate the opportunity to review both the Administrative Draft Environmental Impact Statement (DEIS) dated 1 August 2008 and the November 2008 public copy. Per our letter to Mr. Leslie Rogers at the Federal Transit Administration dated 28 September 2007, the Coast Guard had identified every impacted waterway but was still determining each waterway's navigability.

This review, as well as associated impacts to navigation resulting from the project, has been completed. Table 4-25 of the DEIS identifies 17 streams within the study corridor. During our review, however, we considered not only the currently planned route (including alternatives), but also all future planned extensions. Doing so added Makakilo Gulch near the proposed Fort Barretts Road Station and Ala Wai Canal near the proposed Convention Center Station. Additionally, we added Kalauzo Springs Stream, Aolele Street Ditch and Kahauiki Stream, which are all within the study corridor but not included on table 4-25.

Enclosure (1) details the results of our analysis. Out of the 22 streams reviewed, eight are considered navigable and subject to Coast Guard jurisdiction. However, at the elevated guideway's proposed location over each of these eight streams, no vessels other than canoes, rowboats, rafts and small motorboats would be able to transit the waterway. Therefore, pursuant to 33 CFR 115.70, the Coast Guard grants advance approval to the location and plans for the guideway over the eight streams. The clearances provided as part of the elevated guideway system are considered adequate for meeting the reasonable needs of navigation, and, in fact, are greater than those of the bridges already in place over these streams. Accordingly, Coast Guard bridge permits will not be required for the project. Pursuant to 33 CFR 118.40, the project is also exempted from providing bridge lighting on the guideways over each navigable stream.

This authorization is valid for a period of two years to commence construction. With respect to completion of the guideway over each affected navigable stream, the Coast Guard accepts the project timeline as proposed in figure 2-45 of the DEIS. Should you not adhere to this time frame, you must resubmit documents for Coast Guard review to ensure that conditions have not changed that would preclude the project from meeting the criteria for advance approval. This determination does not relieve you of your responsibility to obtain appropriate permits from any other federal, state or local agency having jurisdiction in this matter.

Because identification of a waterway as an Advance Approval Waterway is not a major federal action for purposes of the NEPA, and is in fact a categorical exclusion, the Coast Guard requests to alter its affiliation with this project from a cooperating agency to a participating agency.

If you have any questions or concerns, please do not hesitate to contact my representative in this matter, LT Doug Jannusch, at (808) 535-3412 or Douglas.A.Jannusch@uscg.mil.

U.S. Department of Homeland Security
300 Ala Moana Boulevard, Room 9-216
Honolulu, Hawaii 96850-4982

Dear Captain Marhoffer:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Table 4-25 from the Draft EIS was updated and appears as Table 4-26 in the Final EIS. It reflects all the streams within the corridor along with the Coast Guard's navigability determinations.

The assessment regarding elevation and clearance under the guideway is correct.

DTS appreciates the Coast Guards' efforts on the Project and understand the requirement to resubmit documents for Coast Guard review if the proposed timeframe for construction changes.

W.R. Marhoffer, Captain
Page 2

In response to your comment, the status for the Coast Guard has been changed to "participating" in Section 8.2.2, Government and Other Agency Coordination, of this Final EIS.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Wayne Y. Yoshioka, Director
Department of Transportation Services
City and County of Honolulu
650 South King Street, 3rd Floor
Honolulu, Hawaii 96813

Dear Mr. Yoshioka:

This is in response to your request for comments on the Honolulu High-Capacity Transit Corridor Project Draft Environmental Impact Statement/Section 4(f) Evaluation.

Please review the current effective Flood Insurance Rate Maps (FIRMs) for the City and County of Honolulu (Community Number 150001), Map revised June 2, 2005. Please note that the City and County of Honolulu, Hawaii are participants in the National Flood Insurance Program (NFIP). The minimum, basic NFIP floodplain management building requirements are described in Vol. 44 Code of Federal Regulations (44 CFR), Sections 59 through 65.

A summary of these NFIP floodplain management building requirements are as follows:

- All buildings constructed within a riverine floodplain, (i.e., Flood Zones A, AO, AH, AE, and AI through A30 as delineated on the FIRM), must be elevated so that the lowest floor is at or above the Base Flood Elevation level in accordance with the effective Flood Insurance Rate Map.
- If the area of construction is located within a Regulatory Floodway as delineated on the FIRM, any *development* must not increase base flood elevation levels. The term *development* means any man-made change to improved or unimproved real estate, including but not limited to buildings, other structures, mining, dredging, filling, grading, paving, excavation or drilling operations, and storage of equipment or materials. A hydrologic and hydraulic analysis must be performed *prior* to the start of development, and must demonstrate that the development would not cause any rise in base flood levels. No rise is permitted within regulatory floodways.

Wayne Y. Yoshioka, Director

Page 2

December 12, 2008

- All buildings constructed within a coastal high hazard area, (any of the "V" Flood Zones as delineated on the FIRM), must be elevated on pilings and columns, so that the lowest horizontal structural member, (excluding the pilings and columns), is elevated to or above the base flood elevation level. In addition, the posts and pilings foundation and the structure attached thereto, is anchored to resist flotation, collapse and lateral movement due to the effects of wind and water loads acting simultaneously on all building components.
- Upon completion of any development that changes existing Special Flood Hazard Areas, the NFIP directs all participating communities to submit the appropriate hydrologic and hydraulic data to FEMA for a FIRM revision. In accordance with 44 CFR, Section 65.3, as soon as practicable, but not later than six months after such data becomes available, a community shall notify FEMA of the changes by submitting technical data for a flood map revision. To obtain copies of FEMA's Flood Map Revision Application Packages, please refer to the FEMA website at <http://www.fema.gov/business/nfip/forms.shtm>.

Please Note:

Many NFIP participating communities have adopted floodplain management building requirements which are more restrictive than the minimum federal standards described in 44 CFR. Please contact the local community's floodplain manager for more information on local floodplain management building requirements. The Honolulu floodplain manager can be reached by calling Mario Siu Li, at (808) 768-8098.

If you have any questions or concerns, please do not hesitate to call Cynthia McKenzie of the Mitigation staff at (510) 627-7190.

Sincerely,

Gregor Blackburn, CFM, Branch Chief
Floodplain Management and Insurance Branch

Dear Mr. Blackburn:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The current Flood Insurance Rate Maps for the City and County of Honolulu have been reviewed with the hydrological and hydraulic studies for this Project. The flood zones and their associated water bodies within the study corridor are presented in Section 4.14.2, Affected Environment [Water], and Table 4-29, Streams Having FEMA Mapped Flood Zones, in this Final EIS.

Structures associated with the Project will be elevated so that the lowest floor is at or above Base Flood Elevation levels in accordance with the effective Flood Insurance Rate Map.

Mr. Gregor Blackburn
Page 2

More detailed hydrological and hydraulic studies are ongoing. Should these studies show any potential rise, the design will be changed so that when the Project is constructed there will be no rise in the base floodplain elevations as required by FEMA.

The Project meets the requirements for construction within a coastal high hazard area, including elevation of lowest horizontal structural member, resistance to water loads, and resistance to wind loads.

DTS will comply with FEMA's requirements for a FIRM revision if it is necessary, in accordance with 44 CFR, Section 65.3.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Dear Mr. Lentz:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

Thank you for your interest in the project. The National Park Service has been notified of applicable consultation meetings.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

IN REPLY REFER TO:

A3615 (PWR-PA)

JAN 06 2009

Leslie Rogers
Regional Administrator
U. S. Department of Transportation
Federal Transit Administration
201 Mission Street
Suite 1650
San Francisco, CA 94105-1839

Dear Mr. Rogers:

Thank you for your recent letter notifying the Department of the Interior, National Park Service (NPS) of the City and County of Honolulu's Department of Transportation Services (DTS) consultation for a proposed 20-mile elevated guideway transit system on Oahu and your invitation to participate in this consultation per 36 C.F.R. § 800.10(c). The National Park Service accepts the invitation and looks forward to working with you and your staff.

Your letter also seeks our determination about prospects for a de minimus finding for the impact of the Honolulu High-Capacity Transit Corridor Project on the Pearl Harbor National Historical Landmark District (NHL). The NPS supports the concept of a transit system with a primary or alternate route that includes a station with convenient access to the USS Arizona Memorial (included with the recently designated WWII Valor in the Pacific National Monument) and will participate in the planning process as applicable. However, the proposed de minimus finding seems premature and the NPS cannot, at this time, concur with a de minimus finding due to the reasons described below. NPS will participate in the ongoing consultation process and will provide our determination once an assessment of effect for the Pearl Harbor NHL District, the Bowfin NHL, and the Valor in the Pacific National Monument have been completed and once we have conferred with the State Historic Preservation Office. The NPS also will provide formal comments on the Draft Environmental Impact Statement (DEIS) by the February 6 deadline.

Proposed Transit System Construction within the Pearl Harbor NHL. The boundary of the NHL proceeds along the Pearl Harbor side of Kamehameha Highway from Aloha Stadium to the opposite side of Radford Drive. Three station entrances (stops) to the transit system are proposed within that distance: Aloha Stadium Station, Arizona Memorial Station, and Pearl Harbor Naval Base Station. The DEIS only discusses impacts associated with the Pearl Harbor Naval Base Station (Table 4-32, Historic Properties within Project's Area of Potential Effect). The DEIS should analyze the potential impacts of the other two proposed station entrances within the Pearl Harbor National Historic Landmark before a de minimus

TAKE PRIDE
IN AMERICA 

finding can be considered. For example, there would be a major impact at the proposed USS Arizona Memorial Station proposed to be located on an existing NPS parking lot. There is currently not enough parking at the site, so losing this parking space would have a major effect on NPS operations and visitation.

Visual Impact. A 30-40 foot tall elevated guideway transit system along Kamehameha Highway could cause significant negative impacts to the Pearl Harbor NHL view shed. The NPS recommends that a view shed analysis be completed for the proposed route before a de minimus finding can be considered.

Potential Impacts to Soundscape. The DEIS is not clear about the existing acoustic environment and what impacts to the soundscape of the Pearl Harbor NHL the proposed guideway rail system would generate. A soundscape analysis should be completed to determine impacts to the Pearl Harbor and USS Bowfin NHL's and the USS Arizona Memorial before a de minimus finding can be considered.

Potential Vibration Effects. The DEIS states that vibration levels should not exceed 65 VdB, which is below the 72 VdB allowed by the FTA around residential buildings. Analysis should be included for potential vibration effects on historic structures before a de minimus finding can be considered. WWII Valor in the Pacific National Monument. The DEIS does not analyze the potential impact to the newly designated monument.

At this time, the NPS does not concur with a de minimus finding in regards to impacts of the Honolulu High-Capacity Transit Corridor Project on the Pearl Harbor NHL. The National Park Service looks forward to working with the conferees to develop the measures necessary to eliminate or mitigate adverse effects of the proposed transit project on the significant historic resources of the Pearl Harbor NHL District, the USS Bowfin NHL, and the WWII Valor in the Pacific National Monument.

Sincerely,

Patricia A. Neubauer

Dear Mr. Jarvis:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Based on concerns raised by Section 106 consulting parties, including the National Park Service, preliminary effect determinations described in the Honolulu High-Capacity Transit Corridor Historic Resources Technical Report (RTD 2008o) and the Draft EIS were reconsidered. An effects evaluation for all eligible resources was completed and the results are documented in the Honolulu High-Capacity Transit Corridor Historic Effects Report (RTD 2009d). This report was provided to the National Park Service for consultation under Section 106 of the National Historic Preservation Act (as amended). The State Historic Preservation Division (SHPD) has concurred with the 22 adverse effect determinations and recommended that an additional 11 resources were adversely affected. FTA accepted these

additional adverse effect determinations. The determinations of effect and the SHPD's concurrence are presented in Section 4.16 in this Final EIS.

The U.S. Naval Base Pearl Harbor National Historic Landmark (NHL) district and the CINCPACFLT Headquarters were determined to be in the Area of Potential Effects (APE) and identified as such in the Honolulu High-Capacity Transit Corridor Historic Resources Technical Report (RTD 2008o). Potential Project impacts to the Pearl Harbor NHL and historic properties associated with it and the CINCPACFLT Headquarters were reevaluated and addressed in the Honolulu High-Capacity Transit Corridor Historic Effects Report (RTD 2009d). This portion of the report is preceded by a special section explaining the methodology used to evaluate these resources. Although the Historic Effects Report concluded that there was no adverse effect to these NHLs, the SHPD did not concur and FTA agreed to accept the SHPD's recommendation. Ossipoff's Aloha Chapel was also determined to be adversely affected by the Project. The NHLs USS Arizona, USS Utah, and USS Bowfin are not within the APE and, therefore, are not part of the Historic Effects Report.

The City refined the Project design to avoid and minimize impacts to the NHL and, therefore, there are no direct impacts from the Project and there is no need for the NPS to concur on de minimis impacts within the NHL. Chapter 5 of the Final EIS includes the Section 4(f) evaluation.

Impacts resulting from the Arizona Memorial Station were not reevaluated in the Historic Effects Report since this station was part of the Airport & Salt Lake Alternative in the Draft EIS. This station is not part of the Project as defined in this Final EIS and, therefore, will not cause any effects to resources.

Based on the National Park Service's comment, additional viewshed analysis was conducted for the Project. Section 4.8, Visual and Aesthetic Conditions, in this Final EIS includes this viewshed analysis with two visual simulations that demonstrate that the Project would have a low visual effect on the Pearl Harbor National Historic Landmark and the portion of the World War II Valor in the Pacific National Monument that is contained within Pearl Harbor's boundaries.

Based on the National Park Service's comment, additional noise analysis was completed to determine the impacts of the Project on the Pearl Harbor National Historic Landmark acoustic environment. After consultation with the National Park Service regarding sampling locations, noise measurements and analyses were completed at three additional locations. Using FTA guidelines, no noise impacts were found (see Section 4.10.3 for figure identifying the noise measurement locations and results (Aloha Stadium to Kalihi), in the Final EIS). Vibration effects from the Project were determined using the detailed vibration assessment information and procedures contained in the FTA's Transit Noise and Vibration Impact Assessment (FTA 2006a). FTA reference data on ground transmission of vibration energy were used to estimate vibration levels. Based on this analysis, there is no long-term vibration impact to historic resources. Vibration impacts and mitigation are discussed in Section 4.18.5 of the Final EIS and in the Programmatic Agreement for the Project (Appendix H of the Final EIS).

Mr. Jonathan B. Jarvis
Page 3

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is fluid and cursive, with the first name "Wayne" being the most prominent.

Dear Mr. Yoshida:

Thank you for your letter and Draft Environmental Impact Statement (EIS) to review regarding the City and County of Honolulu's Department of Transportation Services (DTS) proposed Honolulu High-Capacity Transit Corridor Project.

The National Park Service (NPS) supports the concept of a transit system with a primary or alternate route that includes a station with convenient access to Valor in the Pacific National Monument (formerly known as the USS Arizona Memorial) but has some significant concerns and comments. Please see the enclosure for a complete list of NPS comments. The National Park Service looks forward to working with the U. S. Department of Transportation on this important project. If you have any questions please contact Frank Hays at 808-541-2693 extension 723 or email him at Frank_Hays@nps.gov.

Sincerely,

Jonathan B. Jarvis

AGENCY: National Park Service (NPS)

PROJECT: Honolulu High-Capacity Transit Corridor
 REVIEWERS: Doug Lentz, Paul DePrey, Frank Hays, Elaine Jackson-Retondo, Melia Lane-Kamahele, Alan Schmitter

No.	Page	Topic	Comment
1.	5-6 thru 5-9	Table 5-2, Historic Properties	Consideration/analysis of the impact to the newly established World War II Valor in the Pacific National Monument (NM), Pearl Harbor (NHL), USS Arizona Memorial (NHL), and USS Bowfin (NHL) is absent throughout this DEIS. Analysis of these resources needs to be incorporated. These resources should also be identified on a map that shows their boundaries and proximity to the elevated transit system.
2.	S-8	Archaeological, Cultural, and Historic Resources, paragraph 5 and 6.	It states that up to 61 historic resources for the project could be affected (moved/damaged/destroyed). "Appropriate mitigation measures are discussed in the following Construction Effects section." Mitigation measures are not discussed in the Construction Effects section.
3.	S-9	Cost and Financial Analysis	The Pearl Harbor Historic Sites (USS Bowfin Submarine Museum and Park, Pacific Aviation Museum, Battleship Missouri Memorial, and World War II Valor in the Pacific National Monument, formally USS Arizona Memorial) receive over 1.5 million visitors a year, one of the most visited destinations in the Pacific. All visitors access the Pearl Harbor Historic Sites through World War II Valor in the Pacific National Monument. The National Park Service (NPS) supports either an alternative that includes the Airport Alternative with a stop in reasonable proximity to the NM or a public transportation option that transports visitors from the Salt Lake Alternative (Salt Lake Station) to the NM.
4.	2-19	Airport Alternative	This alternative states "Stations would be constructed at Aloha Stadium, Pearl Harbor Naval Base, Honolulu International Airport, and Lagoon Drive." However, all maps that pertain to this area, and other locations in the DEIS, identify a station at the NM, formally USS Arizona Memorial . See comment 3.

5.	3-29	Figure 3-10	If both the Salt Lake and Airport alternatives are implemented consider consolidating the two Aloha Stadium stations.
6.	3-44	3.4.5. Mitigation of Long-term Transportation Effects Traffic	The NPS is concerned about commuter parking at the NM station. There is currently not enough parking for visitors to the NM. Please include the Pearl Harbor Historic Sites (Pacific Aviation Museum, USS Bowfin Submarine Museum and Park, Battleship Missouri Memorial, and World War II Valor in the Pacific National Monument) in discussions about the NM station location.
7.	3-45 3-48	3.5 Construction-related Effects on Transportation Table 3-26 3.5.7 Mitigation of Construction-related Effects	There is only one road from King Kamehameha Highway that accesses the Pearl Harbor Historic Sites, Arizona Memorial Place. The DEIS does not address this cross street in the narrative or on table 3-26. The Maintenance of Traffic Plan needs to plan for the traffic issues at this intersection prior to construction. The Pearl Harbor Historic Sites are a destination for over 4,000 visitors a day. Please work with the Pearl Harbor Historic Sites to plan for vehicular access for employees and visitors.
8.	4-31	Figure 4-11 Community Resources and Facilities within One-half Mile, Aloha Stadium to Kalihi	Identify World War II Valor in the Pacific National Monument, formally USS Arizona Memorial, and USS Bowfin Submarine Museum and Park as parks or recreation facilities within one-half mile of the transit system.
9.	4-36	Table 4-7 (property acquisition)	The Pearl Harbor Historic Sites are not listed in the table of community facilities and services that will be affected.

4-36	and Airport Alternative	<p>The DEIS proposes a station at World War II Valor in the Pacific National Monument, formally USS Arizona Memorial. The NPS has concerns with a station at this proposed location. Please include the Pearl Harbor Historic Sites (Pacific Aviation Museum, USS Bowfin Submarine Museum and Park, Battleship Missouri Memorial, and World War II Valor in the Pacific National Monument) in discussions about the NM station location.</p>
10	4-37 Parklands and Recreation Facilities	<p>The DEIS does not acknowledge, or address the effects of, acquisition of property at the NM but it does show the footprint of a station on the commercial parking lot. There will be a major effect on World War II Valor in the Pacific National Monument if a station is located on half of the commercial bus parking lot. This will need further discussion and involvement with the NPS.</p>
11	4-40 4-41 Affected Environment Neighborhoods Aiea	<p>This section looks at neighborhoods adjacent to the project and the anticipated effects. The Pearl Harbor Historic Sites attract over 1.5 million visitors to Pearl Harbor every year and are located in the Aiea neighborhood but are not considered in the DEIS.</p>
12	4-59 Visually Sensitive Resources Kalihi to Ala Moana Center Landscape Unit	<p>The DEIS identifies "Pearl Harbor (East Loch)" in the wrong section. Pearl Harbor is located in the two prior sections, Aloha Stadium to Kalihi and Fort Weaver Road to Aloha Stadium.</p>
13	4-65 to 84 Viewpoints	<p>The before and after pictures are extremely helpful. A before and after viewshed analysis from the USS Arizona Memorial, the USS Bowfin and from other Ford Island sites looking toward the proposed railway (mauka) should be completed. Consult with NPS and US Navy historians to identify and take actions to preserve or mitigate impacts to historic viewsheds.</p>

14	4-100	4.9.3 Environmental Consequences and Mitigation	Include the noise model that was used to project noise levels. It should include the noise level 100 yards away from the raised rail line. No noise projections or estimates were done between Aloha Stadium and Hickam Air Force Base and need to be. Noise projections range up to 75 dBA. That is too loud for quiet contemplation or interpretive talks.
15	4-108	4.10.2 Electric and Magnetic Fields	The maintenance facility at the NM is within the 200 feet of the transit rail line and has not been evaluated for electric and magnetic concerns.
16	4-125	4.12.3 Environmental Consequences and Mitigation	All night lighting should be down lighting to reduce light pollution of night skies and to protect an endangered bird species.
17	4-142	4.15.1 Section 106	The NPS should be on this list to review.
18	4-168	4.18.2 Indirect Effects Airport Alternative	In the DEIS the Arizona Memorial Station and Aloha Stadium Station were left out of this section, both of which are within the Pearl Harbor NHL. Therefore, there are three stations within the NHL and the cumulative impact of that should be evaluated.
19	4-169	4.18.3 Cumulative Effects	See comment 18.
20	5-2,3	De Minimis Impacts	At this time, the NPS does not concur with a <i>de minimis</i> finding in regards to impacts of the project on the Pearl Harbor, USS Arizona Memorial, and USS Bowfin NHLs.
21	5-4	Table 5-1 Publicly Owned Parks and Rec. Areas Adjacent to Project Alignment	The World War II Valor in the Pacific National Monument, formerly USS Arizona Memorial, is publicly owned and adjacent and should be included here.
22	5-5	5.4 Direct Use of Section 4(f) Properties 5.4.1 Park and Rec. Resources	Please include the Pearl Harbor Historic Sites (Pacific Aviation Museum, USS Bowfin Submarine Museum and Park, Battleship Missouri Memorial, and World War II Valor in the Pacific National Monument, formally USS Arizona Memorial) in discussions about the NM station location.
23	5-34	5.5.2 Parks and Rec. Resources	The NM should fall into Section 4(f) consideration.

Mr. Jonathan B. Jarvis
National Park Service, Pacific West Region
U.S. Department of the Interior
1111 Jackson Street, Suite 700
Oakland, California 94607-4807

Dear Mr. Jarvis:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

NPS Comment 1

Potential Project impacts to the CINCPACFLT Headquarters and Pearl Harbor National Historic Landmark and historic properties associated with it were evaluated and addressed in the Historic Effects Report: Honolulu High-Capacity Transit Corridor Project (RTD 2009d). This report contains information, including mapping, detailing the methodology used to evaluate these resources. Although the Project team determined that there were no adverse effects to the NHL, the State Historic Preservation Division (SHPD) did not concur with these evaluations. FTA agreed to accept these adverse effect determinations. Final determinations of effect are documented in this Final EIS, Section 4.16. A figure illustrating the location of these resources

has been added to the Final EIS Section 4.16. Effects to the World War II Valor in the Pacific National Monument were also considered, although this resource type is not specifically provided for under Section 106. Please note that the USS Arizona Memorial and the USS Bowfin are not within the Area of Potential Effects for this project. Section 4.5 of the Final EIS identifies community resources and facilities within one-half mile of the Project. This figure has been revised in this Final EIS to include World War II Valor in the Pacific National Monument.

NPS Comment 2

The discussion of construction effects on Archaeological, Cultural, and Historic Resources is included in Section 4.18.11, Archaeological, Cultural, and Historic Resources, in this Final EIS, and includes discussion of mitigation measures, including sampling, monitoring, and where appropriate, preservation of such resources. The Programmatic Agreement (Appendix H of the Final EIS) identifies measures will be employed to mitigate potential impacts to archaeological resources and all work will follow applicable state laws. The effects to historic resources were re-evaluated after the publication of the Draft EIS. The effect determinations are presented in Section 4.16.3 of the Final EIS. Thirty-three historic resources will be adversely affected by the Project. Any potential construction impacts to historic properties will be mitigated using measures outlined in previous construction sections related to noise, vibration, air quality, and water quality.

NPS Comment 3

The National Park Service's support for an alternative that is in reasonable proximity to the National Monument (NM) is noted. The Preferred Alternative as presented in the Final EIS includes a station at Aloha Stadium. Visitors can walk or transfer to a bus to visit the NM.

NPS Comment 4

As indicated in Figure 2-7 of the Draft EIS, the Arizona Memorial Station would have been constructed only for the Airport & Salt Lake Alternative. The City has identified the Airport Alternative as the preferred alternative.

NPS Comment 5

As indicated in Figure 2-7 of the Draft EIS, each alternative would have had a different station location or combination of station locations in the vicinity of Aloha Stadium. The City has selected the Airport Alternative as the preferred alternative. This alternative includes one station at Kamehameha Highway at Salt Lake Boulevard.

NPS Comment 6

There is no longer a station planned near the Arizona Memorial. The closest station will be almost a half-mile away at Aloha Stadium. Parking would be provided for commuters at Aloha Stadium Station, and therefore, it is not expected that commuters would park at the Arizona Memorial to use the Project.

NPS Comment 7

Table 3-27 in this Final EIS presents information on lane closures during construction of the fixed guideway system. Under the Airport Alternative, one lane will be closed in the Koko Head-bound direction on Kamehameha Highway from Salt Lake Boulevard to Center Drive. Arizona Memorial Place is within this segment. This is expected to have temporary traffic impacts on Kamehameha Highway during construction.

NPS Comment 7

As discussed in Section 3.5.7, *Mitigation of Construction-related Effects*, in this Final EIS a Maintenance of Traffic (MOT) Plan will be developed by the contractor prior to construction, and will describe road closures and delays. Maintaining traffic flow and access are the primary objectives of these plans. As stated in this Final EIS, "During final design...detailed Work Zone Traffic Control plans, including detour plans, would be formulated in cooperation with the City, HDOT, and other affected jurisdictions." Coordination with the Pearl Harbor Historic Sites will occur and access to the Memorial will be maintained throughout the construction period to minimize disruption.

As stated in Section 8.7, *Continuing Public Involvement through Construction*, in this Final EIS, several public involvement strategies will be utilized to inform businesses and the general public (and, in this case, the NPS and Memorial staff) about construction activities, including roadway detours and temporary arrangements to accommodate construction activities. These strategies include: a public involvement plan developed prior to construction to inform business owners of the construction schedule and activities, public information campaigns to inform people that businesses and other visitor destinations are open during construction and to encourage their continued patronage, and public information regarding construction activities and ongoing activities provided in print and on television and radio.

NPS Comment 8

Section 4.5 of the Final EIS identifies community resources and facilities within one-half mile of the Project. This figure has been revised in this Final EIS to include World War II Valor in the Pacific National Monument.

NPS Comment 9

The Project will not acquire land from the Pearl Harbor Sites and therefore, it is not listed in Section 4.5.3 as a community facility that will be affected by the Project. As indicated in Figure 2-7 of the Draft EIS, the Arizona Memorial Station would have been constructed only for the Airport & Salt Lake Alternative. The City has selected the Airport Alternative as the preferred alternative.

NPS Comment 10

The preferred alternative for the project is the Airport Alternative only, which extends from East Kapolei to Ala Moana Center. The Arizona Memorial Station referred to would only be constructed if the combined Airport and Salt Lake Alternative were selected. The Airport

Alternative, the Salt Lake Alternative and the Airport & Salt Lake Alternative were carried forward in the Draft EIS, and none was identified as the preferred alternative at that time. The City has since identified the Airport Alternative as the preferred alternative. This selection was based on consideration of the benefits of each alternative, public input on the Draft EIS, and City Council Resolution 80-261 identifying the Airport Alternative. Therefore, the Arizona Memorial Station will not be constructed, and no land acquisition would occur within the commercial bus parking lot of Aloha Stadium.

NPS Comment 11

Section 4.5, Community Services and Facilities of the Final EIS, including parklands and recreational facilities, has been revised to include the Pearl Harbor Historic Sites are adjacent to the Project and acknowledges the 1.5 million visitors a year.

NPS Comment 12

The reference to "Pearl Harbor (East Loch) in the discussion of the Kalihi to Ala Moana Center Landscape Unit, has been deleted in this Final EIS.

NPS Comment 13

After consultation with NPS, two additional visual simulations were prepared and views from the NM were analyzed. The viewshed analysis of the World War II Valor in the Pacific National Monument at Pearl Harbor has been prepared and added to Section 4.8 in this Final EIS. The viewshed analysis in the Final EIS includes two additional viewpoints: visual simulation from the Arizona Memorial looking mauka and visual simulation from the World War II Valor in the Pacific National Monument Visitor Center parking lot looking mauka. The analysis showed that the Project would not affect the NHL's visual integrity and will hardly be visible on mauka views from the Harbor. The Project elements will be dominant visual elements along the mauka edge of the NHL Visitor Center parking lot."

NPS Comment 14

As stated in Section 4.10.1 of the Final EIS, noise measurements were taken at 46 noise sensitive location along the study corridor. Eight of the noise measurements were taken at sites near the Arizona Memorial and Pearl Harbor Naval Base in response to comments on the Draft EIS.

Noise analysis was completed at the Arizona Memorial Remembrance Circle, parking lot, and boat dock. The results are included in Section 4.10.3 of the Final EIS and in the Noise Technical Report Addendum. There will be no noise impact at these locations as a result of the Project.

The project design includes an integrated noise-blocking parapet wall at the edge of the guideway structure that extends three feet above the top of the rail. The parapet wall will substantially reduce ground-level noise.

NPS Comment 15

The Honolulu High-Capacity Transit Corridor Electric and Magnetic Fields Technical Report (RTD 2008h) indicates: "3.1 Field Survey of Potentially Affected Facilities Sensitive land uses that may be affected by changes to the Earth's geomagnetic field from operation of the Project could include research, manufacturing, medical, and possibly military facilities that use tools that depend on the stability of the Earth's field. These tools can include, but may not be limited to, electron microscopes, nuclear magnetic resonance spectrometers, and magnetic resonance imaging (MRI) equipment used for medical diagnostic purposes.

Verification of land uses in the study area was necessary because the City and County of Honolulu (City) does not have a designated land use map in its General Plan. Therefore, the following steps were taken to establish existing conditions:

- 1. Prior to conducting field verification, the following land uses were mapped according to readily available data: high-voltage power lines, medical and diagnostic facilities, institutional and research facilities, and military operations.*
- 2. The maintenance facility at the National Monument to which you refer to does not meet "the tools that depend on the stability of the Earth's field" methodology and will not be effected.*

NPS Comment 16

In Section 4.8.3 of this Final EIS, the following design criteria will be implemented in Final Design as mitigation measures to minimize lighting effects:

- The quality of the lighting design will greatly influence the appearance and attractiveness of stations and will play an important role in enabling the public's acceptance of the system and the stations.*
- Glare from transit station lights or reflective surfaces will be reduced to an absolute minimum such that it does not affect the vision of motorists.*
- Light spill will be prevented from the stations onto roadways and areas adjacent to stations and station sites.*
- Brightness and glare will be reduced to an absolute minimum by:*
 - Locating light sources to avoid direct reflection or by selecting anti-reflective finishes.*
 - Minimizing or eliminating undesirable reflections in glazed and polished surfaces, glass, walls and other similar elements.*
 - Minimizing or eliminating light spillage onto adjacent properties and eliminating night sky pollution. This will be done using full cut-off luminaries (fixture and lamp design) and low-reflective surfaces.*

- *Light sources in parking structures will not be visible from outside the structure, particularly those on the upper decks.*

NPS Comment 17

The National Park Service has been added to the list of agencies and groups in Section 4.16.1, Background and Methodology, in this Final EIS that have participated as consulting parties as part of the Section 106 process.

NPS Comment 18

The Airport Alternative has been identified as the preferred alternative, and therefore, the Arizona Memorial Station is no longer being considered. The environmental effects related to the Aloha Stadium Station are discussed in Section 4.19.2, Indirect Effects, in this Final EIS. These two stations differ from the other project stations. Both are fairly remote from other developments and not likely to have any indirect transit-oriented development (TOD) effects. The primary land use near the Aloha Stadium is the Stadium and Pearl Harbor Navy facilities, neither of which is likely to be redeveloped before 2030.

NPS Comment 19

The cumulative impact analysis as presented in Section 4.19.3 of the Final EIS has been expanded since the Draft EIS and discusses the cumulative effects of the Project and describes the past, present, and reasonably foreseeable actions in the study corridor. The environmental effects related to the Aloha Stadium Station are discussed in this section as part of the overall Project analysis.

NPS Comment 20

FTA has accepted SHPD's recommendation that the Project will have an adverse effect to the Pearl Harbor NHL. In addition, there will be no direct use of land by the Project in U.S. Naval Base Pearl Harbor HNL, USS Arizona Memorial, and USS Bowfin National Historic Landmarks. Therefore, a de minimis approach is no longer applicable.

NPS Comment 21

The World War II Valor in the Pacific National Monument, identified as the United States Naval Base Pearl Harbor NHL, has been added to Table 5-2, Historic Resources Evaluated for Section 4(f) Use, in this Final EIS.

NPS Comment 22

Section 5.5.2, Historic Sites, in this Final EIS has been revised to identify that there will be no use of the Pacific Aviation Museum, USS Bowfin Submarine Museum and Park, Battleship Missouri Memorial, and USS Arizona Memorial.

Mr. Jonathan B. Jarvis
Page 7

NPS Comment 23

The National Monument has been added Section 5.5.2, Historic Sites, in this Final EIS.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

RECEIVED

CERTIFIED MAIL NO. 7003 1680 0000 7269 2083

Mr. Wayne Yoshioka, Director
Department of Transportation Services
City and County of Honolulu
650 South King Street, 3rd Floor
Honolulu, HI 96813

Dear Mr. Yoshioka:

We recently received a copy of your Historic Resources Technical Report for the Honolulu High-Capacity Transit Corridor Project. We are concerned that the City and County of Honolulu (CCH) has conducted assessments of Navy properties and evaluated said properties for National Register eligibility without Navy input. Accordingly, several of the eligibility determinations listed in the Transit Corridor report conflict with determinations upon which Navy previously received State Historic Preservation Office (SHPO) concurrence. These include both sites and structures on Navy owned property at the former Naval Air Station Barbers Point. We maintain that Navy's National Register for Historic Places (NRHP) eligibility determinations remain valid and that CCH may not revise these determinations on Navy's behalf.

Navy consulted with the SHPO during development of the 1999 Barbers Point Base Realignment and Closure (BRAC) Environmental Impact Statement (EIS) and during the 2002 Ford Island Master Development (FIMD) Programmatic EIS. Through these processes, Navy received concurrence on all Barbers Point NRHP eligibility determinations as documented in these EISs. Surveys conducted during the 1990s including our 1997 Phase I Cultural Resources Survey and Inventory Summary, cultural resource surveys leading up to the 1997 survey, and the Navy's 1999 Cultural Resources Management Plan formed the foundation for these consultations.

As we recently conveyed 499 acres at Barbers Point pursuant to congressional mandate, we are especially interested in the following structures on the 499 acres:

- Quonset huts 1144, 1149, 1150, 1152, 1153, 1562, and 1570
- Facilities 5, 77, 128, 476, 477, and 484

With respect to the Quonset huts, Navy determined these Quonset Huts as "not eligible" for listing on the NRHP. Navy operates under a nationwide Programmatic Memorandum of Agreement (PMOA) for World War

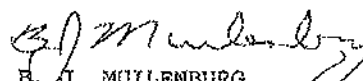

5750
Ser N4/ 00113
12 NOV 2008

II Temporary Buildings. The Advisory Council for Historic Preservation (ACHP) and the National Council of State Historic Preservation Officers (NCSHPO) established conditions and stipulations under which the temporary building demolition program would be carried out for the Department of Defense. The Navy, SHPO, ACHP, National Trust for Historic Preservation, Historic Hawaii Foundation, and the Oahu Council of Hawaiian Civic Clubs subsequently signed a 2003 Programmatic Agreement Regarding Navy Undertakings in Hawaii which recognizes the World War II Temporary Buildings PMOA and addresses treatment of these Quonset huts. Specifically, the parties to the 2003 PA will be notified of any adverse action to be taken with respect to these structures, and the Navy agrees to engage in discussions to explore preservation options for these structures.

Navy surveys determined facilities 5, 77, 128, 476, and 477 as "not eligible" for NRHP listing. Navy also considers facility 484 as "not eligible" for NRHP listing because of its association with facility 128 (radio transmitter facility). Navy is unaware of any new information that has surfaced since we received SHPO concurrence on our site evaluations. Only Building 77, which was constructed in 1958, has become 50 years old since our surveys were conducted. Despite its age, Building 77 was originally included in our 1997 survey as part of the Cold War Building Inventory (Appendix B.II in Tuggle and Tomanari-Tuggle 1997 Part I) and was determined ineligible for listing on the NRHP.

We request that you revise your report to reflect Navy's eligibility determinations for the above-listed structures. We plan to review your Historic Resources Technical Report in more detail with respect to all Navy property at the former NAS Barbers Point, and we look forward to receiving your reply related to the 499 acres. We also intend to send separate correspondence on the proposed corridor alternatives as they relate to Navy property and operations. Please contact Mr. John Muraoka, (808) 473-4137 extension 239, if you require additional information related to historic resources.

Sincerely,

E. J. MUILENBURG

Pearl Harbor, Hawaii 96860-5101

Dear Commander Muilenburg:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The Navy's eligibility determinations remain valid. The properties in question, including the 499 acres at Barbers Point, are outside the boundaries of the Project covered in the Draft EIS, and the FTA makes no eligibility determinations for them. No eligibility determinations for the properties in question were submitted the State Historic Preservation Division (SHPD) for concurrence, and SHPD's concurrence letter does not discuss these properties. Section 106 consultation letters are presented in Appendix G, Record of Public and Stakeholder Correspondence and Coordination, of this Final EIS.

Section 106 consultation did not include eligibility determinations for the properties in question. Neither the eligibility determinations in the Honolulu High-Capacity Transit Corridor Project Historic Resources Technical Report (RTD 2008o) nor the Historic Effects Report

Commander B.J. Muilenburg
Page 2

(April 2009) include the properties in question. These reports are available from the Department of Transportation Services and on the project website (www.honolulutransit.org).

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

SUBJ: NAVY HONOLULU HIGH-CAPACITY TRANSIT CORRIDOR PROJECT
PARTICIPATING AGENCY PROJECT UPDATE

Dear Mr. Yoshioka:

Thank you for the opportunity to participate in the review process for this endeavor, and for the project updates, draft Environmental Impact Statement, and preliminary discussions of inter-agency agreement provided by your staff to the Navy on November 14 and 18, 2008.

In a separate letter dated November 12, 2008, the Navy raised concerns that the Historic Resources Technical Report for the Honolulu High-Capacity Transit Corridor (HHCTC) Project evaluated Navy property for National Register eligibility without Navy input. This letter provides additional information in response to your letter dated August 18, 2008 requesting Navy's written comments on the project.

The Salt Lake Alignment poses fewer concerns but also offers fewer benefits to the Navy compared to the Airport Alignment. The Navy previously indicated support for the Airport Alignment due to benefits for the Pearl Harbor Navy workforce, family housing areas and historic visitor destinations at Halawa Landing. In either case, careful collaboration to ensure a satisfactory outcome for all parties is needed. Navy's concerns relate to security, noise and traffic impacts (both during and after construction), appearance and the need for adequate transportation spokes between the closest HHCTC station and major Pearl Harbor area work centers, including Pearl Harbor Naval Shipyard which is the largest industrial employer in Hawaii. The enclosed document discusses these concerns in greater detail.

As mandated by the 2005 Base Realignment and Closure legislation, Hickam Air Force Base and Naval Station Pearl Harbor will join to form Joint Base Pearl Harbor Hickam in 2010. As Navy is the lead service for the Joint Base, for planning purposes the issues discussed in the enclosure can be expected to apply to Hickam AFB and related housing areas.

Should you have any questions, please contact my Public Works Officer, CDR Lore Aguayo, at 471-2647 or email maria.aguayo@navy.mil

Warm regards,

R. W. KITCHENS
Captain, U. S. Navy
Commanding Officer
Naval Station Pearl Harbor

Enclosure:

- (1) U. S. Navy Initial Comments for the Honolulu High-Capacity Transit Corridor Project, dtd 24 NOV 08

November 24, 2008

U.S. NAVY INITIAL COMMENTS FOR THE HONOLULU HIGH-CAPACITY
TRANSIT CORRIDOR PROJECT

1. Impacts to Security and Operations

This issue was discussed in the security meeting of July 16, 2008 attended by both U.S. Navy and DTS key players. The Navy cites potential security issues regarding the Airport Alternative as it runs adjacent to Navy property. The location of the Pearl Harbor Station (#32) raises security concerns due to its proximity to the Makalapa Entry Control Point and other high occupancy or critical Navy facilities such as barracks, medical facilities and administration buildings. The location, elevation and design of all stations should incorporate measures to protect Navy property and prevent increased visibility of and access to Navy assets and operations. The Navy is also concerned about potential increases in traffic along Kamehameha Highway at the Pearl Harbor Station and congestion around drop-off zones for this station. Security concerns along the Salt Lake Alternative are noted below under Item 3. Impacts to Navy Housing.

2. Navy Real Property Encroachments

City use of Navy land requires issuance of appropriate real estate documents prior to use of the property. Please provide information on all Navy lands required by the City for the transit project to this office for Navy review. A formal request must be submitted to Navy Region Hawaii for such use at least nine months in advance to enable the processing of the request. Based on the information provided thus far, impacts to Navy property were noted at the locations listed below. In addition, it is our understanding that the project may also encroach upon Navy property along other parts of the transit route outside of the Pearl Harbor main base area.

Salt Lake Alternative

- a. #20, near Lawehana Street
- b. #21, near Radford Drive
- c. #22, near Peltier Avenue

Airport Alternative

- a. Aloha Stadium Station
- b. Arizona Memorial Station
- c. Pearl Harbor Station
- d. Ohana Nui Area

3. Impacts to Navy Housing

Navy housing is currently managed and controlled by Ohana Military Communities, LLC. Any necessary adjustments to property boundaries or real property encroachments

DIRECTOR'S OFFICE
TRANSITATION SERVICES

0801023 P12:21

RECEIVED

Enclosure (1)

should be addressed through formal agreements between City and County and the Navy as discussed above.

In addition, the Navy is concerned about possible visual impacts of an elevated-track system, increases in ambient noise levels in adjacent housing areas, and traffic congestion generated by transit stations. In particular, the Navy is concerned about the location of the Ala Lilikoi Station, the potential increase in vehicular traffic on Camp Catlin Drive and the impacts to surrounding housing areas and pedestrian safety. Camp Catlin Drive traverses through three residential areas. When fully developed, Camp Catlin will have 318 homes, Doris Miller Park will have 214 homes and Halsey Terrace will have 477 homes. Although Camp Catlin Drive is primarily a residential secondary street servicing local traffic needs, construction of a light rail station at the north end of Camp Catlin/Arizona Road will likely result in Camp Catlin Drive becoming a primary thoroughfare.

Camp Catlin Drive is a federally-owned road that is an integral part of a security plan negotiated between Ohana Military Communities, LLC and the Department of the Navy. Substantial increases in traffic on Camp Catlin Drive may adversely impact implementation of the security plan and jeopardize the security of the housing residents. Camp Catlin Drive is also a major pedestrian route used by students in the housing area to walk to Aliamanu Elementary and Intermediate Schools. Current vehicular traffic is heavy enough to warrant the provision of a security guard to assist pedestrians across the street. The Navy requests that the City implement appropriate mitigation measures for affected streets and surrounding areas and consider accepting fee title to this roadway.

R.W. Kitchens, Commanding Officer
Department of the Navy
Pearl Harbor Naval Station
850 Ticonderoga Street, Suite 100
Pearl Harbor, Hawaii 96860-5102

Dear Commander Kitchens:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

1. Security and Operations

DTS is coordinating with the Navy regarding base security concerns. Section 2.5.4 of the Final EIS provides an overview of Safety and Security features of the Project. Specific security concerns have been addressed with the Navy through inter-governmental coordination. Project threat assessment staff have met with Navy staff to evaluate issues of concern and provide appropriate security mitigation through project design.

As mentioned in Final EIS section 3.4.3, traffic volumes along major roadways will decrease with the Project, compared to the No Build alternative. For example, the traffic model found decreases in traffic of 11 percent at the Kaluaao screenline and the Salt Lake screenline, in the Koko Head direction. At the Pearl Harbor Naval Base Station, increased activity could occur due to transfers between buses and trains, passengers being dropped off or picked up,

and pedestrians crossing the street to reach the station or nearby destinations such as the Navy Base. The traffic analysis found no significant effect from the Project at this location.

2. Navy Real Property

DTS continues to coordinate with the Navy regarding project right-of-way requirements and its impacts. The Navy has been provided a map of areas required for the Project. Coordination with the Navy for use of Navy lands is ongoing. Current information regarding station design and right-of-way needs was presented to the Navy on June 12, 2009.

Your preference for the Airport Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been identified as the Preferred Alternative as described above. Compared to the other alternatives discussed in the Draft EIS, the Airport Alternative will carry more passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly lower impacts to the natural and built environment. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative.

The Alternatives Analysis phase, which preceded the EIS process, is documented in Chapter 2 of the Final EIS. It evaluated a range of modal and general alignment alternatives, in terms of their costs, benefits, and impacts. The scoping process for the Alternatives Analysis involved a presentation of the viable alternatives to the public and interested public agencies and officials to receive comments on the Purpose and Need, alternatives, and scope of the analysis. Scoping for the EIS followed the FTA process that provides for a culling of alternatives studied in the EIS through an Alternatives Analysis. The scoping process initiated for the Alternatives Analysis included a variety of highway, bus and fixed guideway options for consideration. During the later scoping effort for the EIS, the public was requested to propose alternatives that would satisfy the purpose and need at less cost or with greater effectiveness, less environmental or community impact and to propose alternatives that were not previously studied and eliminated for good cause. The only alternative that emerged that met these criteria was a fixed-guideway alternative following several alternative alignments. All reasonable alternatives that emerged from these processes were ultimately evaluated in the Draft and Final EISs.

Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts, and mitigation commitments.

3. Impacts to Navy Housing

DTS has coordinated with the Navy regarding project right-of-way requirements. As shown in Figure 4-25 of the Final EIS, the Project will be visible to some residential areas.

Commander R.W. Kitchens
Page 3

In response to concerns expressed by the Department of the Navy, the Final EIS, Section 4.10.3, contains additional noise analysis of Navy housing areas. As shown on Figure 4-55, the noise monitoring was conducted at Belto Place, Makalapa Guest House, Makalapa Drive, Community Center, and MWR Youth Field for the Final EIS. Moderate noise impacts were predicted to occur at Makalapa Guest House and Belto Place; however, wheel skirts on transit vehicles will be included as noise mitigation in project design. As a result, with mitigation, the Project will cause no noise impacts in this area.

With the selection of the Airport Alternative, there would not be an Ala Liliroi Station; therefore, substantial traffic effects on Camp Catlin Drive are not expected.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Enclosure

PEARL HARBOR HI 96860-5102

11011
Ser NO0/028
05 FEB 2009

CERTIFIED MAIL NO. 7007 3020 0002 3044 3834

Mr. Wayne Yoshioka, Director
Department of Transportation Service
City and County of Honolulu
650 South King Street, 3rd Floor
Honolulu, HI 96813

Dear Mr. Yoshioka:

Thank you for the opportunity to provide comments on the Draft Environmental Impact Statement (DEIS) for the Honolulu High-Capacity Transit Corridor Project. These comments supplement initial comments provided in our December 17th 2008 letter.

Navy's status should be changed from Participating Agency to Cooperating Agency based on our jurisdiction by law and our special expertise related to the use of Navy lands both within and outside the Pearl Harbor area and along the proposed corridor alignments. As stated in our December 17th letter, Hickam Air Force Base (AFB) and Naval Station Pearl Harbor will join to form Joint Base Pearl Harbor - Hickam in 2010. As such, issues discussed in this letter and accompanying enclosures can be expected to apply to Hickam AFB and related housing areas.

In addition to concerns raised in our December 17th letter, Navy requires a complete understanding of Navy and Air Force properties needed for the corridor alignment. Although the DEIS discusses reduction of Navy road widths and land acquisition at Nimitz Field, Richardson Field, Navy-Marine Corps Golf Course, and Makalapa Branch Medical Clinic, we have not been provided a detailed listing of the full scope of Navy and Air Force properties along the entire corridor alignment. Request the City and County of Honolulu (CCH) provide Navy a letter listing all Navy and Air Force properties required, including detailed drawings and property lines, for all alternatives considered. This will allow Navy to fully understand the scope and breadth of impacts and to provide guidance related to those properties.

Associated general concerns and specific DEIS comments, along with a site location map of Halawa Landing, are provided as enclosures (1) and (2) to this letter. As a result of the many issues associated with the transit corridor proposal and potential impacts to Navy and Air Force properties, Navy has assembled a team of subject matter experts to address areas such as real estate, security, family

11011
Ser N00/028
05 FEB 2009

housing, utilities, fuels, hazardous waste and cultural resources. This will assist in the coordination required between Navy and the City in our role as a Cooperating Agency.

We look forward to continued dialogue throughout this process. Should you have any questions, please contact my Public Works Officer, CDR Lore Aguayo, at (808) 471-2647 or e-mail maria.aguayo@navy.mil.

Sincerely,

R. W. KITCHENS

U.S. NAVY ADDITIONAL COMMENTS ON THE HONOLULU HIGH-CAPACITY TRANSIT
CORRIDOR PROJECT DRAFT ENVIRONMENTAL IMPACT STATEMENT (DEIS)

(These comments supplement Navy comments of December 17th 2008)

General Comments / Concerns:

1) Navy and Air Force land acquisition. Appendix B of the DEIS reflects a number of Navy-owned lands in the Pearl Harbor area that are identified as being required for the Honolulu High-Capacity Transit Corridor Project. A determination must be made by the Navy as to whether those identified lands can be made available for City and County (CCH) use from a security, operational and legal standpoint. This will require that CCH submit an official letter identifying each parcel (Navy and Air Force) and requesting Navy's comments on the acquisition of those parcels for the Corridor Project. If property can be made available, fee conveyance to CCH would likely be in the best interests of the Navy for liability and administrative reasons. Certain properties may not be available as they have security or operational issues or are encumbered under existing long term agreements to other parties. As noted in our December 17th letter, the process for land acquisition from the Navy requires at least nine months.

Recommend that the DEIS include a discussion that reflects that the acquisition of Federal lands differs from the acquisition of privately owned lands.

2) Impacts to Navy utilities. Identification and any necessary relocation of Navy utilities including high-voltage power lines and underground utility lines will require extremely close coordination with the Navy. We are particularly concerned about water, sewage, and high-voltage electrical lines. No Navy sewer lines run along either alignment (Salt Lake and Airport routes), but several lines run perpendicular to these routes, including a major 18" line from Camp Smith that crosses Salt Lake Boulevard in the auxiliary Stadium (triangle) Parking area. The airport alignment contains several sewer crossings, including one area where an 18" sewer parallels Kamehameha Hwy near the Federal Fire Department area. Water lines run along both Salt Lake Boulevard and along Kamehameha Highway near the Post Office. High voltage lines run parallel to Moanalua Terrace. Of note, abandoned Navy fuel lines exist along the proposed corridor route. Navy cannot guarantee lines are completely empty because of potential water intrusion into these lines over time. Navy will not be responsible for any potential releases from these lines during the course of construction.

3) Impacts to Navy roadways and traffic patterns adjacent to Navy property. Wear-and-tear on Navy roadways from increased traffic to-and-from transit corridor stations and park-and-ride

Enclosure (1)

facilities will result from implementation of any of the build alternatives. Further, Navy believes that traffic pattern impacts will likely result from construction of the Park and Ride facilities and transfer stations. For example, although the Draft EIS states that no effects will be realized at the intersections surrounding the Aloha Stadium Park and Ride, Navy believes that residents entering and exiting Ford Island to and from Kamehameha Highway will, in fact, realize impacts from the additional 600 spaces planned at the Aloha Stadium Park and Ride directly across from the Admiral Clarey bridge (access to Ford Island). We request further mitigation discussions with the City for: (1) roadway maintenance related to those roadways affected by this proposal; (2) traffic congestion near Park and Ride facilities and transfer stations.

4) Noise impacts to Navy housing areas: Although Section 4.9 of the Draft EIS does not specify noise impacts to Navy housing areas, Navy would like to discuss CCH's plans for further mitigation of noise impacts to Navy housing areas, both during construction and during rail operation. Navy recognizes that the Draft EIS discusses implementation of noise-blocking parapet walls and wheel skirts; however, Navy remains concerned about the cumulative noise impacts to Navy housing areas adjacent to Kamehameha Highway, Nimitz Highway, and Salt Lake Boulevard. Navy encourages maximum use of sound absorptive materials in the track area to reduce noise impacts to ambient levels.

5) Construction impacts. All construction adjacent to Navy and Air Force properties and housing areas requires close coordination with the Navy, to include laydown and equipment yards, road closures, utility outages, etc. Navy requests that CCH minimize construction impacts to personnel transiting to and from Pearl Harbor-Hickam and to those living in military housing areas.

6) Impacts to Navy permits. Close coordination is required with Navy related to any impacts from the proposed build alternatives to existing Navy permits, particularly utilities (water and sewer) and drainage permits. Navy is concerned about quality and quantity of drainage and Navy permit effects resulting from corridor construction and from the corridor itself.

7) Security concerns including proximity to Pearl Harbor Naval Station fenceline and housing / parking impacts. The Draft EIS does not specify the transit corridor height and lateral distance from the Pearl Harbor Naval Station fenceline for the Airport and Airport/Salt Lake build alternatives. Further, unauthorized parking and increased vehicular and foot traffic will likely increase around transit corridor stations for the various build alternatives, including the Aloha Stadium Station and Park and Ride, the Arizona Station, the Pearl Harbor Station, and the Ala Liliko'i Station. We request further mitigation discussions with

the City to discuss: (1) appropriate platform height and stand-off distances from the Pearl Harbor Naval Station fence line to ensure adequate Station security; and (2) CCH plans for security and prevention of unauthorized parking in Navy family housing areas and areas adjacent to Pearl Harbor Naval Station, including Halawa landing (Arizona Memorial and museums, Richardson Center Complex, Rainbow Bay Marina, Dry Boat storage, and Oahu Concepts).

8) Integration of public transportation with transit corridor stations. The Draft EIS does not elaborate on the integration of other public transportation systems with the transit corridor. Depending on the time of day, the corridor will run every three, six, or ten minutes. Navy is specifically interested in how other forms of public transportation will integrate with the transit corridor schedules and ultimately transport riders to and from their originating or final destinations, including: (1) Navy and Air Force employment concentration areas (e.g., Pearl Harbor Naval Shipyard); (2) Navy and Air Force housing areas; and (3) Military shopping areas. Further, Navy is interested in discussion of impacts resulting from changes to the public transportation system as it integrates with the transit corridor.

9) Hazardous waste and materials and Installation Restoration (IR) sites. Information contained in DEIS Section 4.11, Hazardous Waste and Materials, requires revision for accuracy as it relates to Navy properties. Specific comments are provided below. Additionally, several IR sites exist along the proposed transit alignment. Navy requires a detailed review of the proposed alignment for 1) subsurface oil monitoring wells, and 2) an underground storage tank (UST) site at the golf course. The DEIS does not contain enough information to determine the potential impacts to Navy property for the western portion of the transit line. Specific information for restoration areas around the Pearl Harbor main complex is provided in the "Specific Comments" section below.

10) Potential Impacts to Navy fuel distribution system. Based on information contained in the DEIS, it appears that the transit line construction may impact the Navy's fuel distribution system as it will be adjacent to a major Navy fuel storage and distribution system. Close coordination with the Fleet Industrial Supply Center (FISC) will be required.

11) Impacts to Archaeological, Cultural, and Historic Properties. Any specific undertakings affecting Navy eligible historic properties require consultation with the Navy. Specific requirements are provided below.

Specific Comments:

1) Section 4.5 Neighborhoods: 4.5.3, p. 4-45, Aliamanu-Salt Lake description states, "Except for certain areas, Navy allows the general public to drive through these areas, and many motorists travel to and from Kamehameha Highway and the H-1 Freeway." This statement is misleading as these roadways and the roadways through the Navy housing areas near the airport are not specifically intended as main roadways for the general public. Navy currently retains the ability to close these Navy roads under certain security postures. Navy is concerned about increased roadway maintenance related to implementation of any of the proposed alternatives in the DEIS. Navy would like to further discuss with CCH appropriate mitigation measures for direct and indirect effects to certain Navy roadways resulting from implementation of any of the build alternatives.

2) Section 4.11 Hazardous Waste and Materials:

a) 4.11.1, 2d paragraph. Requires slight revision. Hazardous Waste (HW) is primarily regulated by Department of Health (DOH) Solid and Hazardous Waste (SHW) Branch, Hawaii Administrative Rules (HAR) 11-260 series. The HEER Hazard Evaluation & Emergency Response (HEER) group is a mirror of the Comprehensive Environmental Response Compensation & Liability Act (CERCLA) and is responsible for release response of HS Hazardous Substance (HS)/petroleum and cleanup of sites associated with past releases of HS/petroleum. There is a distinction of HW regulation under Resource Conservation and Recovery Act (RCRA), which is the responsibility of the SHW Branch and not the HEER group.

b) 4.11.2, Military Uses, 1st paragraph, 2d sentence. The National Priority List (NPL) site is erroneously referred to as Pearl Harbor Naval Station. The correct NPL site designation is Pearl Harbor Naval Complex.

c) 4.11.2, Military Uses, 1st bullet. Requires clarification. Navy still retains portions of property at the former Naval Air Station Barbers Point (NAS BP). The Navy retained portion of the NAS BP is under Navy jurisdiction and not Hawaii Community Development Authority (HCDA) jurisdiction as noted in the DEIS.

d) 4.11.2, Military Uses, 2 bullet. Refer to the NPL designation comment, Pearl Harbor Naval Station. The NPL is also identified as the former Navy Drum site and active Navy base. The former Ewa Drum facility is not a Navy base and has been closed under the State Contingency Plan (SCP). DOH provided Navy a concurrence letter on the closure of the former Ewa Drum facility. The Installation Restoration (IR)

site of the former Ewa Drum facility is referred to as "Fleet Industrial & Supply Center (FISC) 27 Ewa Junction Motor Gasoline (MOGAS) Spill."

e) 4.11.2, Military Uses, Ranked "1" bullet. Refer to the NPL designation comment, Pearl Harbor Naval Station. Please provide rationale for including this information, as the proposed transit corridor is outside of the borders of the Pearl Harbor Naval Complex. The road systems within the transit corridors are controlled by the State of Hawaii and CCH.

f) 4.11.2, Military Uses, page 4-112, last paragraph, last sentence. The draft EIS needs to clearly state the former Ewa Drum site has been closed under the SCP.

g) 4.11.3, Environmental Consequences, Common to All Build Alternatives, 2d column, 1st paragraph, 3d bullet. Please clarify the connection between fluorescent light tubes and vehicle components. Vehicles use lithium, halogen, and/or incandescent bulbs.

h) Additional IR Site information:

i) Subsurface Oil: The identified proposed transit line runs adjacent to an existing subsurface oil plume. Estimated limits of the plume nearest Kamehameha Highway area of tank 54 are within 200 feet of Kamehameha Highway. Navy also operates monitoring wells just inside of the fence line along the highway.

ii) Near the Halawa Landing area: The nearest IR site to the proposed rail route would be the Inactive Petroleum Pipeline at Halawa Landing. The area of known petroleum contamination is approximately 400 ft west of Kamehameha Highway (located in the parking lot area approximately 200 ft east of the Bowfin Museum). The approximate site location is shown on the attached map titled CTO61.

iii) Near the area of the golf course: Northern alignment of the Airport Viaduct route is near several former IR sites (mainly transformer sites) and a current IR site: UST NS-29. UST NS29 is at the corner of Building A-19.

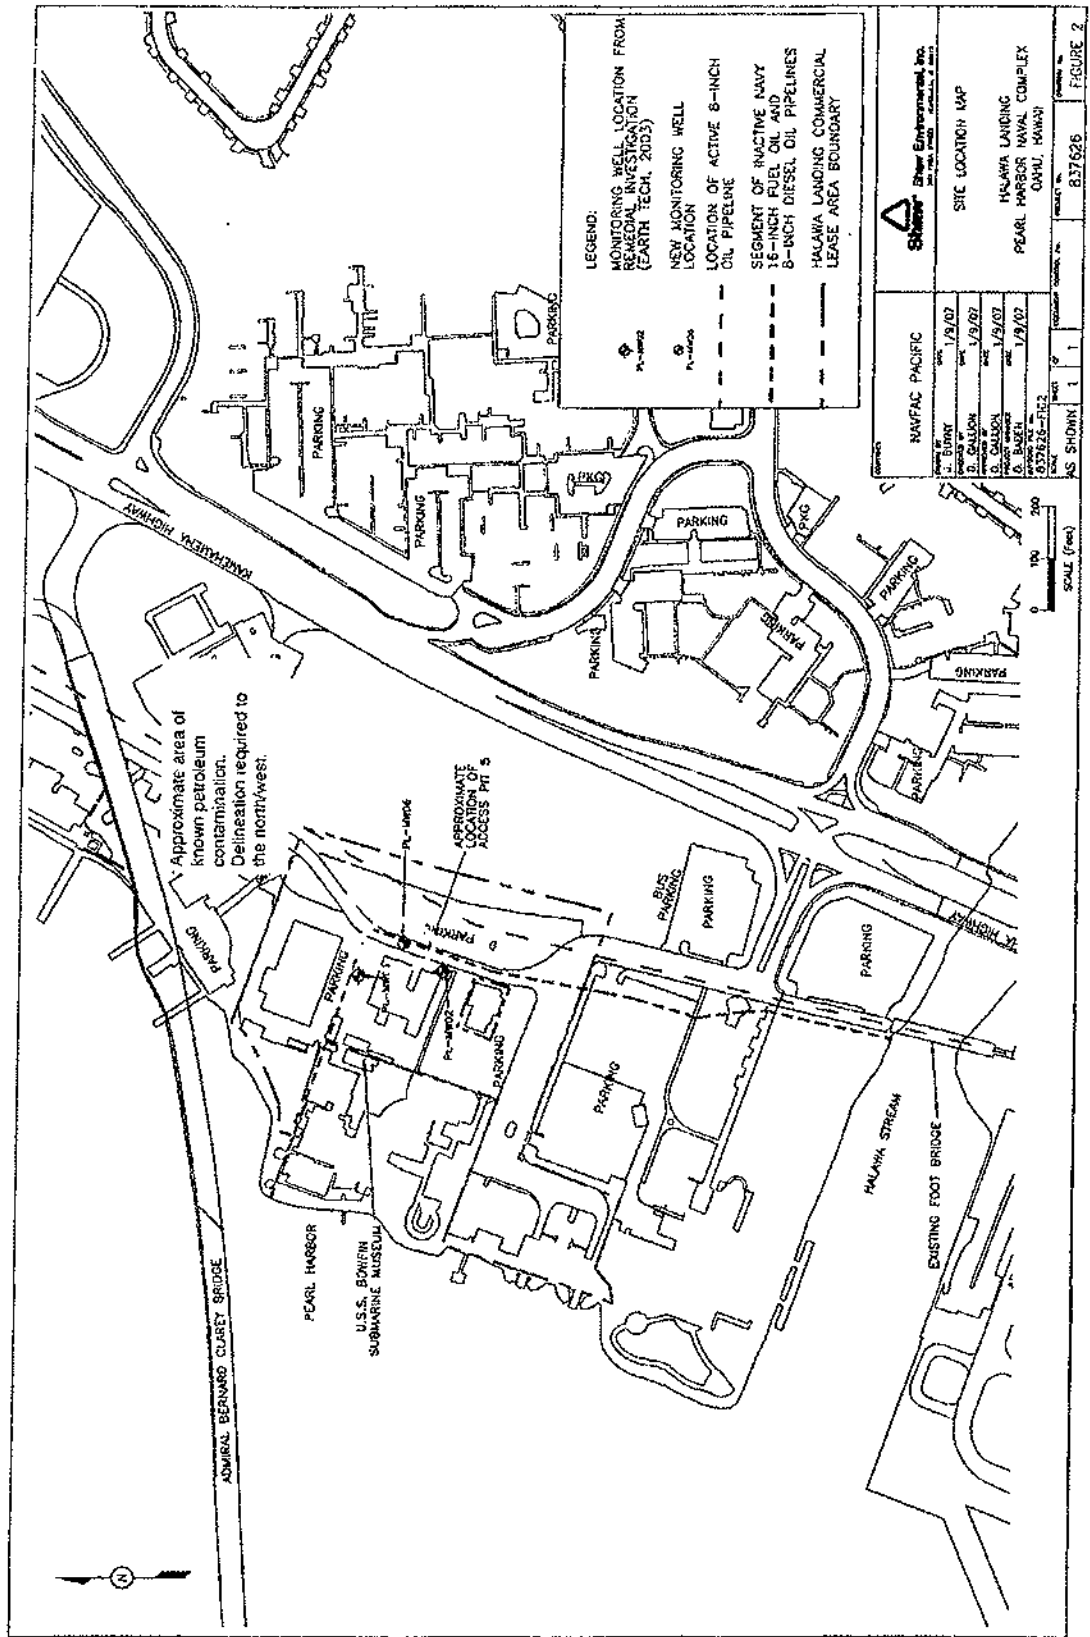

3) Section 4.15 Archaeological, Cultural, and Historic Resources: Any identification of or undertakings affecting a Navy eligible historic facility requires consultation with the Navy. Specific requirements include:

a) CCH will need to consult the Navy during the execution of the specific undertakings affecting Navy properties containing eligible historic assets. This includes Navy review and

coordination during the planning and design phases of each undertaking.

b) The Navy as a Federal Agency retains authority for the identification of eligible historic properties on Navy land. As such, CCH should consult with Navy during identification of potentially eligible Navy historic properties along and adjacent to the proposed transit corridor.

c) CCH will need to consult with Navy regarding the assessment of the Area of Potential Effect on historic properties for all undertakings, inclusive of all other requirements under the National Historic Preservation Act of 1966, and as amended.

Dear Commander Kitchens:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Cover Letter

The Navy has been provided a map of areas required for the Project. Property for the Pearl Harbor Station will be needed in the vicinity of the Little Makalapa Housing Area, and a small portion of Hickam Air Force Base property will be needed in the vicinity of Nimitz Field for the guideway. DTS has coordinated with the Navy throughout the development of the Project.

General Comments/Concerns:

1) Navy and Air Force land: *As described above, the Navy has been provided a map of areas required for the Project. Coordination with the Navy for use of Navy lands is ongoing. The most recent information regarding station design and right-of-way needs was presented to the Navy on June 12, 2009.*

2) Navy utilities: As presented in Section 4.18.2 of this Final EIS, "Design criteria will govern all new utility construction outside of buildings, as well as the support, maintenance, relocation, and restoration of utilities encountered or affected by project construction." In addition, coordination will occur with property owners on factors including, but not limited to, underground utility service connections, access or driveway reconstruction, utility disruption, water service, grounding work, demolition, landscape protection, landscape restoration, fencing, mail delivery, and garbage collection. This will include notifying and working with the Navy regarding non-State roadways and roadway rights-of-way on Navy property.

3) Navy roadways and traffic patterns adjacent to Navy property: There will be no substantial additional wear and tear on Navy roadways as a result of commuter traffic to fixed guideway stations or park-and-ride lots. Any wear and tear resulting from construction will be repaired by the contractor upon completion of construction.

As shown in Table 5-40 in Addendum 02 to the Honolulu High-Capacity Transit Corridor Project Transportation Technical Report (DTS 2009i), the analysis of the effect of the park-and-ride trips to the Aloha Stadium Station was conducted at nine intersections adjacent to the proposed station. The access to and from Ford Island to the proposed park-and-ride station would be via the intersections of Kamehameha Highway at Salt Lake Boulevard (makai bound) and Kamehameha Highway at Ford Island Boulevard at Admiral Clarey Bridge/Salt Lake Boulevard (mauka bound). The analysis indicated that neither of these two intersections near the Aloha Stadium Station park-and-ride will experience an increase in delay compared to No Build Alternative.

4) Noise impacts to Navy housing areas: Additional noise measurement sites have been added between Aloha Stadium and Hickam Air Force base based on Navy concerns. The Project noise levels in this area have been added to Section 4.10 of the Final EIS. As discussed in this section, the noise monitoring was conducted at Belto Place, Makalapa Guest House, Makalapa Drive, Community Center, and MWR Youth Field for the Final EIS. Moderate noise impacts will occur at Makalapa Guest House and Belto Place. However, the Project will include an integrated parapet wall at the edge of the guideway structure that extends three feet above the top of rail. The parapet wall will substantially reduce ground-level noise. Wheel skirts will increase the benefit from the parapet wall at locations above the elevation of the track. As a result, the Project will cause no noise impacts in this area. Once the Project is operating, noise levels will be remeasured to confirm that there are no noise impacts from the Project.

5) Construction impacts: As the Project proceeds to construction in the vicinity of Navy and Air Force facilities, the DTS will coordinate construction timing. The selected construction contractor will be required to keep the Navy and other neighbors informed of upcoming activities.

6) Impacts to Navy permits: As detailed in Section 4.14 of the Final EIS, the fixed guideway will not generate water pollution nor will it add to impervious surface. In the vicinity of Pearl Harbor, it will run above a currently paved area. DTS will continue to work with the Navy so that the Project will not impair Navy permit conditions.

7) Security concerns including proximity to Pearl Harbor Naval Station fence line and housing/parking impacts: DTS is coordinating with the Navy regarding base security concerns. Section 2.5.4 of the Final EIS provides an overview of Safety and Security features of the Project. Specific security concerns have been addressed with the Navy through inter-governmental coordination beginning with the April 17, 2009 meeting. Appendix B, Preliminary Alignment Plans and Profiles, of this Final EIS includes the location and height of the system and stations.

The park-and-ride lot at Aloha Stadium will be located closer to a station than any of the listed areas above; therefore, users are likely to use the authorized parking at that location. Nonetheless, DTS has committed in the Final EIS to work with local property owners around stations to develop measures to limit the effects of potential spillover parking. As stated in Section 3.4.7 of the Final EIS, the approach to mitigating the effects of spillover parking will be unique to each station area. The City will conduct surveys to determine the extent of spillover parking demand near stations and implement one or more mitigation strategies as needed. Strategies include, but are not limited to, parking restrictions, parking regulations, permit parking, and/or shared parking arrangements. The specific mitigation strategies and the schedule for implementation will be determined as stations are opened. Parking surveys will be conducted prior to starting construction of a station, and again within six months after opening of the station.

Increased pedestrian traffic near Aloha Stadium station will primarily consist of residents accessing nearby residential communities and people walking to/from the stadium during events. In addition, some Arizona Memorial visitors will likely walk from the Aloha Stadium station along Kamehameha Highway (about a 10-minute walk) to reach the memorial. The primary users of the Pearl Harbor Navy Base station will be Base workers and some nearby residents or visitors. After getting off at the station, most pedestrians will walk directly to the Base.

8) Integration of public transportation with transit corridor stations: Chapter 3 in the Final EIS states: "The bus network will also be restructured to provide access from surrounding communities to the fixed guideway with more frequent bus service. Bus routes serving guideway stations will typically be shorter and will operate in less congested residential communities. These operations will help maintain service reliability compared to operations of longer-distance routes."

The restructured bus network serving the stations includes connections to the major employment centers on Oahu, including Pearl Harbor Naval Base and Hickam Air Force Base. These locations are currently served by TheBus routes and are frequently delayed due to traffic conditions outside of the military facilities. With the Project, these two employment areas will be served with all-day shuttles connected to the guideway. The Pearl Harbor shuttle (Route 312) is planned to provide 8-minute service in the peak hour with 30-minute mid-day frequency directly serving Pearl Harbor from the Aloha Stadium Station and Transit Center. The Hickam Air Force Base shuttle (Route 313) is planned to provide 15-minute service in the peak hour with 30-minute mid-day service. Future transit routes and frequencies are shown in a table and series of maps in Appendix D, Bus Transit Routes, of the Final EIS.

Other planned service improvements include:

1. *Reconfigured Route 314 will provide service to the entire island.*
2. *Reconfigured Route 312 will operate via Aloha Stadium Station to EB Kamehameha, right on Arizona to serve Pearl Harbor via Halawa Gate. The route will continue left on Neches, right on North Road, left on Kuahua, right on Jarvis, right on Northampton to Simms, right on Vincennes serving the Fleet and Industrial Supply Center. The route will continue along its current alignment and would enter/exit Pearl Harbor via Halawa Gate.*
3. *The Fleet and Industrial Supply Center will be served as described above.*
4. *Kuahua Avenue will be served as described above.*
5. *Although South Avenue will not be directly served under this plan, many of the buildings along South Avenue are served by Route 312 operating along Central Avenue.*
6. *New Route 315 will provide peak period weekday service to the office buildings in Makalapa Crater. The route will operate via Aloha Stadium to EB Kamehameha, left on Halawa Drive to Luapele Drive with a turnaround. Route 315 is approximately 1.35 miles roundtrip from Aloha Stadium Station and will offer 4:00 a.m. and 4:00 p.m. peak period trips.*

Shuttle service frequencies will be adjusted based upon passenger demand experience as the guideway is developed. Guideway connections for military residential and shopping areas have been designed based upon the same travel demand and access information as other areas on Oahu.

All of the transit centers (Aloha Stadium, Pearl Highlands, West Loch, and University of Hawaii at West Oahu) serving the guideway are being planned with space for bus shuttles not operated by the City, including the military's bus service, to pick up and drop off passengers.

The Final EIS includes information about changes to the public transit system to accommodate the fixed guideway operations in Appendix D.

9) Hazardous waste and materials and Installation Restoration (IR) sites: The Project will not affect the golf course site. No Navy property between Elliot Street and Moanalua Stream will be affected. This is shown in Appendix C, Preliminary Right-of-Way Plans, of the Final EIS. The individual issues in this comment are addressed to the "Specific Comments" section below. No impact to Navy hazardous materials/waste facilities are anticipated.

10) Navy fuel distribution system: DTS is coordinating with the Navy to ensure that the Navy fuel distribution system will not be affected by the Project.

11) Archaeological, Cultural, and Historic Properties: DTS has consulted with the Navy on the Programmatic Agreement for the Project.

Specific Comments:

1) Section 4.5 Neighborhoods: The section discussing Aliamanu-Salt Lake Boulevard has been removed from the Final EIS. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with FTA's NEPA regulations that state that the Final EIS should focus on the Preferred Alternative (23 CFR § 771.125 (a)(1)). As stated previously, DTS does not anticipate substantial increased traffic by persons not affiliated with the Navy on Navy streets as a result of the Project.

2) Section 4.11 Hazardous Waste and Materials

a) In response to your comment, the second paragraph of Section 4.11.1 of the Draft EIS has been modified in Section 4.12.1 of this Final EIS to read "Hazardous waste in the City is primarily regulated by the Solid and Hazardous Waste Branch of the HDOH. The Solid and Hazardous Waste Branch is responsible for overseeing the Office of Solid Waste Management, the Underground Storage Tank Program, and the Hazardous Waste Program. The HDOH Office of Hazard Evaluation and Emergency Response is responsible for implementing the Hawaii Environmental Response Law (HRS 128D), the State Contingency Plan (HAR 11-451), and the Hawaii Emergency Planning and Community Right-to-Know Act (HRS 128E)."

b) In response to your comment, the name of the National Priority List site has been changed to read Pearl Harbor Naval Complex in Section 4.12.2 of this Final EIS.

c) In response to your comment, the bullet has been changed in Section 4.12.2 of the Final EIS to read "Former Naval Air Station Barbers Point—portions of which are still under the jurisdiction of the Navy, while other portions are now under the Hawaii Community Development Agency's jurisdiction."

d) In response to your comment, the bullet has been changed to read "Pearl Harbor Naval Complex—an active Navy base on the National Priority List (Superfund); the complex formerly included in the Navy Drum site." Because this site has a history of being referred to as the "Navy Drum" site, we will continue to use this term instead of the official IR name. The closure of the site is discussed in Section 4.12.2 of the Final EIS.

e) The Pearl Harbor Naval Station was given a "1" rank not because of its current use and condition but based on past petroleum and chemical releases. We understand that many of those releases have been appropriately addressed. The 1 ranking indicates further assessment is warranted prior to construction of the Project.

f) *In response to your comment, the last sentence has been modified to read "The U.S. Department of Health & Human Services and Hawaii DOH reviewed the study, concur with the findings, and consider the case closed."*

g) *The interior passenger area of the transit vehicles will use fluorescent light bulbs. Fluorescent light bulbs would also likely be used in station areas and other Project areas.*

h i - iii) *The information provided is noted. This has been reviewed during planning and design efforts to address potential contaminated soil and groundwater in these areas.*

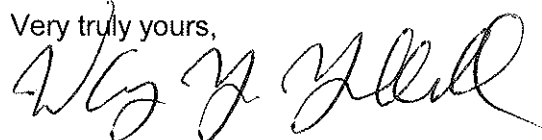

3) Section 4.15 Archaeological, Cultural, and Historic Resources

a) *The Navy has been included as a Section 106 consulting party. All Section 106 documentation has been transmitted to the Navy for review and comment. The Honolulu High-Capacity Transit Corridor Project Historic Effects Report (DTS 2009d) was provided to the Navy on April 17, 2009.*

b-c) *The Navy was consulted in the effects determination for historic properties.*

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Re: Honolulu Rail Transit System (Honolulu High -
Capacity Transit Corridor Project, 2008/PIM-1);
Security Risk for Federal Court Building

Dear Mr. Rogers:

The undersigned Judges, being all of the United States Judges of the District of Hawaii, write to strongly voice our opposition to the proposed route of the Honolulu Rail Transit System on Halekauwila Street immediately adjacent to the Federal Court Building. The proposed Halekauwila Street route, or any route similarly close to the Federal Courthouse, raises unacceptable severe security concerns - exposing our Courthouse to potential terrorists' gunfire and/or bombing such as occurred in Oklahoma City and within trains in Madrid, or to a lone attack by an individual holding a grudge against a particular Judge. We understand that you have reviewed the initial draft Environmental Impact Statement submitted by the City and County of Honolulu. We believe there are suitable alternative routes other than Halekauwila Street.

On October 16th of this year we met with the Chief of the Rapid Transit Division of the Dept. of Transportation Services of the City and County of Honolulu, Mr. Kenneth Toru Hamayasu, to express our concern of the high security risk to which the Federal

08 NOV 21 3 56
DTS
RAPID TRANSIT

Courthouse would be exposed should the rail transit system run on Halekauwila Street. He informed us that he did not feel there are any viable alternatives to Halekauwila Street and that any change would be highly unlikely and would require Honolulu City Council approval.^{1/} We disagree that there are no reasonable alternatives.

We believe that Queen Street, King Street, Beretania Street, and possibly other streets could be utilized instead. We recognize, as does Mr. Hamayasu, that any route (including Halekauwila Street) presents problems.

We understand from our discussion with Mr. Hamayasu that the guideway structure will be 45 feet above street level and will pass within a mere 45 feet of the Federal Courthouse building. Our Court building is 4 stories high, so the guideway structure will be at the same level as the windows of three Judges' chambers. The guideway structure will be 25 feet wide, providing 2 sets of tracks for trains proceeding in either direction. There will be approximately 50 trains, with a train passing by our Courthouse during rush hours every 3 minutes in each direction. As noted in the draft Environmental Impact Statement, Halekauwila Street is an unusually narrow street. Moreover, currently there is no public transport system along this street.

Subsequent to our meeting with Mr. Hamayasu, we met with the City's security committee. The security committee presented us with its security analysis entitled "Honolulu Rail Transit Project Potential Threats to Federal Court Building from Transit Viaduct", a copy of which is enclosed. The City's security committee acknowledged that this security analysis was prepared only after our earlier meeting with Mr. Hamayasu, and that previously no consideration had been given to the Federal Courthouse's unique security concerns. It was also noted that neither the U.S. Marshal nor any other federal court security representative was previously consulted or even contacted regarding a proposed transit line running along Halekauwila Street adjacent to the Federal Courthouse. The City's security committee also acknowledged that none of the security specialists who participated in preparing its analysis was familiar with security standards for Federal Courthouses.

^{1/} You may be aware that the City Council is considering initially re-routing the rail transit system to run by the Honolulu Airport rather than the Salt Lake community.

The City's security analysis concludes that "the possibility of an assault from the viaduct to the Courthouse is deemed to be most improbable for many reasons"; yet the analysis fails to effectively address our concerns. As an example, our primary concern is detonation of explosives placed inside a train triggered by a cell phone operated by terrorists from a far distance (similar to what occurred in the Madrid attacks). This could be accomplished in a number of ways; such as, several people carrying sufficient explosives boarding a train several stops before the Federal Courthouse and exiting one or two stops before the Courthouse after leaving the explosives on board, or simply by several suicide bombers. Further, the security enhancements suggested by the City's analysis would afford little, if any, protection from a major bomb blast within a passing train.

After the Oklahoma City bombing and the terrorists attacks of September 11, certain security issues affecting the Federal Courthouse were recognized, and concrete berms and planters were placed along Halekauwila Street to impede trucks with bombs from destroying our Court building as happened in Oklahoma City and Lebanon. A cable secured fence was constructed around the lawn area on the northwest side of the Courthouse, and security patrols were implemented.

We are still at war with terrorists who want to destroy us - and will be for years to come. Federal buildings have been prime targets.

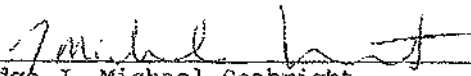

Now the proposed rail transit system on Halekauwila Street would expose the Federal Courthouse to a much greater risk, similar to the train bombings which occurred in Madrid. We urge that you consider this security risk thoroughly, and we request that you require the transit system to utilize a street other than Halekauwila Street.

Please do not hesitate to contact us should you have any questions concerning the above.

Very truly yours,

Chief Judge Helen Gillmor

Judge Susan Oki Mollway

Judge J. Michael Seabright

Judge Samuel P. King

Federal Transit Administration

HONOLULU RAIL TRANSIT PROJECT

Potential Threats to Federal Court Building from Transit Viaduct

The construction of a transit viaduct in close proximity to the court house has been evaluated by security specialists for potential security vulnerabilities. As a result of this evaluation, the possibility of an assault from the viaduct to the court house is deemed to be most improbable for many reasons, including: lack of access to viaduct, easy detection of trespassers, lack of sufficient time to plan an attack, lack of time to carry out an attack, lack of a plausible escape route by a perpetrator, challenge of coordination between train schedules and target availability, and alternatives for accomplishing such an assault which would have significantly less risk of failure.

The evaluation team included a PB Force Protection Specialist with extensive DOD experience, a PB Senior Security Specialist who was a former DHS/TSA executive for Mass Transit and a PB Senior Safety and Security Specialist who was the former DOT/FTA Director of Safety and Security. All of these specialists have conducted numerous vulnerability assessments for transit systems, and maintain high security clearances and liaisons with their prior agencies for current threats, threat trends and security best practices.

Part of the evaluation process was examining similar systems the team is familiar with: the Miami Dade People Mover, Detroit People Mover and Seattle Monorail all travel within close proximity of buildings and in some cases within 50 feet. The Detroit People Mover is adjacent to the federal court house. There have never been any threats or incidents from the People Mover.

The evaluation team contacted the intelligence community regarding this possible threat. Factors considered that would dissuade this type of an assault are: lack the ability of "dry runs", challenged by timing of the target versus train schedules, possibility of being detected (during planning and execution of the attack) and the lack of a good escape method. The team also checked for new or existing current threats that would affect this situation; none were identified.

Significant challenges for anyone attempting an assault from the viaduct include an intrusion detection system protecting entrances to the track area, complemented with CCTVs specifically pointed from platform ends to track area. Trespassers will be detected and a response generated, making it very difficult for a sniper to carry out surveillance or an attack successfully.

Security standards for federal buildings are published by the US General Services Administration. After 9/11, the standards were categorized listed as sensitive security information (SSI) and are no longer available without a specific need to know. The US Protective Services and the US Marshals have access to this information. Judges need to confer with them for any guidance in this matter.

HONOLULU RAIL TRANSIT PROJECT

A requirement in the System Safety Management Plan (SSMP) is the development of a Security Plan for the construction phase of the project. The construction contractor will be required to develop the plan and address security issues such as this one. There are a variety of measures that can be implemented, including security fencing to restrict access to the guideway, lighting to aid in detection, intrusion detection systems, and security patrols.

Though the evaluation team found this threat to be most improbable, the following security enhancements for the courthouse can be taken:

- Obscure the direct line of view from the viaduct. Installing a screening wall along the viaduct in the areas of access where there is a direct line of view to the courthouse will reduce opportunities for surveillance of the building and access to areas where a direct fire event could be launched.
- Window glass film/frame anchoring. Attaching a clear or tinted composite film over the window's glass to resist a direct fire or blast overpressure; also, it keeps the glass panel together as a single unit, thus reducing flying glass shards (Kobar Towers). However, window frames require anchoring to the building structure and a horizontal catch bar should be installed on the inside of the window to 'catch' the glass panel if the frame fails, thus, preventing the glass panel from becoming a missile hazard.
- Relocate the Judges Chambers. Relocating the judges' chambers to an area of the building that has limited or no direct line of view and limited entry, multi-level access controls. Remove any public, external, or internal identification, signs, boards, menu's, entrances, etc that list directions or locations to Chambers.
- Tint Chamber windows. Prevent the public from seeing into the Chambers to determine if they are occupied by applying a reflective film over the windows. This may also provide environmental conditioning savings to the building and prevent ultra-violet damage to office property.

The Honorable Helen Gillmor, Chief Judge
U.S. District Court
District of Hawaii
300 Ala Moana Boulevard, C-400
Honolulu, Hawaii 96850-0400

Dear Judge Gillmor:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The City has received documents from the U. S. General Services Administration (GSA) related to the security needs of the Federal Building. Representatives from the Project's Safety and Security Department have met with GSA and Court staff to address security concerns on October 16 and November 10, 2008, and on February 3 and March 31, 2009, and will continue to work with GSA staff on security concerns. The Project has been working with property management staff from the GSA. We will commit to meet all applicable setback requirements in addition to other security measures as discussed directly with the GSA to safeguard the Department of Justice and other federal staff. A safety and security plan is being developed for the Project, which will take into account the unique security concerns of the Federal Building.

Queen Street, King Street, and Beretania Street were previously evaluated during the Alternatives Analysis process for either an elevated or underground alignment and determined to be inferior to Halekauwila Street based on a number of considerations. An alignment that

avoided Halekauwila Street was evaluated at two stages of the Alternatives Analysis process. This alignment had significant visual impacts, impacts on historic properties, evidence of burials within the vicinity of Queen Street near Kawaiahao Church, impacts on street traffic patterns, and severe engineering constraints, and was not brought forward into the Draft EIS for these reasons. As stated in the Alternatives Screening Memo (Chapter 6), an alignment along Queen Street, rather than Halekauwila Street, had been proposed for screening. Following initial scoping of the alternatives and further engineering analysis, however, it was determined that the Queen Street alignment might not prove to be feasible. As noted in the Alternatives Screening Memo (Page 6-3), "The elevated alignment [along Queen Street] would have to pass very near high-rise buildings in some locations. Locating stations within the physical constraints of this alignment is a particular challenge." Both the Queen Street and the Halekauwila Street alignments were advanced to the Alternatives Analysis. While the Halekauwila Street alignment was acknowledged to have the potential for visual impacts on the Aloha Tower, this impact was evaluated in the context of the fact that the Queen Street alignment would have the same impact to Aloha Tower and would have impacts on a number of historical resources. The Queen Street alignment would have significant visual impacts. As noted in the Alternatives Analysis (Pages 6-4 to 6-5), "The Queen Street alignment would have somewhat greater negative visual impact because the narrow available right-of-way would require a stacked alignment in the Downtown area and because it would cross between Hale Auhau and the rest of the Hawaii Capital Historic District. The Nimitz Highway/Halekauwila Street/Kapiolani Boulevard alignment would be the best alignment option within Section V." The Capital Historic District is not affected by the Halekauwila alignment. As a result, the Queen Street alignment did not advance from the Alternatives Analysis to the Draft EIS.

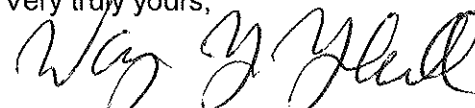

An elevated system on either Beretania Street or King Street would run in front of either the State Capitol or Iolani Palace and would require removal of traffic lanes. The Ala Moana Boulevard to Pohukaina Street alignment was eliminated during the project screening process partially because the alignment would cross a substantial portion of the Federal Building property.

As indicated above, representatives from the Project's Safety and Security Department will continue to work with GSA staff on security concerns and will ensure that the project design meets the applicable Courthouse security requirements.

The Court's concern with explosive attacks is noted. DTS is working with the GSA to determine security requirements and ensure that the project design meets the requirements.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The City has received documents from the U. S. General Services Administration (GSA) related to the security needs of the Federal Building. Representatives from the Project's Safety and Security Department have met with GSA and Court staff to address security concerns on October 16 and November 10, 2008, and on February 3 and March 31, 2009, and will continue to work with GSA staff on security concerns. The Project has been working with property management staff from the GSA. We will commit to meet all applicable setback requirements in addition to other security measures as discussed directly with the GSA to safeguard the Department of Justice and other federal staff. A safety and security plan is being developed for the Project, which will take into account the unique security concerns of the Federal Building.

Queen Street, King Street, and Beretania Street were previously evaluated during the Alternatives Analysis process for either an elevated or underground alignment and determined to be inferior to Halekauwila Street based on a number of considerations. An alignment that avoided Halekauwila Street was evaluated at two stages of the Alternatives Analysis process. This alignment had significant visual impacts, impacts on historic properties, evidence of burials within the vicinity of Queen Street near Kawaiahao Church, impacts on street traffic patterns, and severe engineering constraints, and was not

brought forward into the Draft EIS for these reasons. As stated in the Alternatives Screening Memo (Chapter 6), an alignment along Queen Street, rather than Halekauwila Street, had been proposed for screening. Following initial scoping of the alternatives and further engineering analysis, however, it was determined that the Queen Street alignment might not prove to be feasible. As noted in the Alternatives Screening Memo (Page 6-3), "The elevated alignment [along Queen Street] would have to pass very near high-rise buildings in some locations. Locating stations within the physical constraints of this alignment is a particular challenge." Both the Queen Street and the Halekauwila Street alignments were advanced to the Alternatives Analysis. While the Halekauwila Street alignment was acknowledged to have the potential for visual impacts on the Aloha Tower, this impact was evaluated in the context of the fact that the Queen Street alignment would have the same impact to Aloha Tower and would have impacts on a number of historical resources. The Queen Street alignment would have significant visual impacts. As noted in the Alternatives Analysis (Pages 6-4 to 6-5), "The Queen Street alignment would have somewhat greater negative visual impact because the narrow available right-of-way would require a stacked alignment in the Downtown area and because it would cross between Hale Auhau and the rest of the Hawaii Capital Historic District. The Nimitz Highway/Halekauwila Street/Kapiolani Boulevard alignment would be the best alignment option within Section V." The Capital Historic District is not affected by the Halekauwila alignment. As a result, the Queen Street alignment did not advance from the Alternatives Analysis to the Draft EIS.

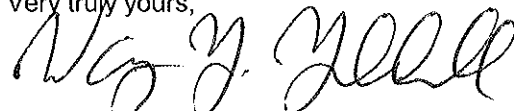

An elevated system on either Beretania Street or King Street would run in front of either the State Capitol or Iolani Palace and would require removal of traffic lanes. The Ala Moana Boulevard to Pohukaina Street alignment was eliminated during the project screening process partially because the alignment would cross a substantial portion of the Federal Building property.

As indicated above, representatives from the Project's Safety and Security Department will continue to work with GSA staff on security concerns and will ensure that the project design meets the applicable Courthouse security requirements.

The Court's concern with explosive attacks is noted. DTS is working with the GSA to determine security requirements and ensure that the project design meets the requirements.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Honolulu, Hawaii 96850-0400

Dear Judge Kobayashi:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The City has received documents from the U. S. General Services Administration (GSA) related to the security needs of the Federal Building. Representatives from the Project's Safety and Security Department have met with GSA and Court staff to address security concerns on October 16 and November 10, 2008, and on February 3 and March 31, 2009, and will continue to work with GSA staff on security concerns. The Project has been working with property management staff from the GSA. We will commit to meet all applicable setback requirements in addition to other security measures as discussed directly with the GSA to safeguard the Department of Justice and other federal staff. A safety and security plan is being developed for the Project, which will take into account the unique security concerns of the Federal Building.

Queen Street, King Street, and Beretania Street were previously evaluated during the Alternatives Analysis process for either an elevated or underground alignment and determined to be inferior to Halekauwila Street based on a number of considerations. An alignment that avoided Halekauwila Street was evaluated at two stages of the Alternatives Analysis process. This alignment had significant visual impacts, impacts on historic properties, evidence of burials within the vicinity of Queen Street near Kawaiahao Church, impacts on street traffic patterns, and severe engineering constraints, and was not

brought forward into the Draft EIS for these reasons. As stated in the Alternatives Screening Memo (Chapter 6), an alignment along Queen Street, rather than Halekauwila Street, had been proposed for screening. Following initial scoping of the alternatives and further engineering analysis, however, it was determined that the Queen Street alignment might not prove to be feasible. As noted in the Alternatives Screening Memo (Page 6-3), "The elevated alignment [along Queen Street] would have to pass very near high-rise buildings in some locations. Locating stations within the physical constraints of this alignment is a particular challenge." Both the Queen Street and the Halekauwila Street alignments were advanced to the Alternatives Analysis. While the Halekauwila Street alignment was acknowledged to have the potential for visual impacts on the Aloha Tower, this impact was evaluated in the context of the fact that the Queen Street alignment would have the same impact to Aloha Tower and would have impacts on a number of historical resources. The Queen Street alignment would have significant visual impacts. As noted in the Alternatives Analysis (Pages 6-4 to 6-5), "The Queen Street alignment would have somewhat greater negative visual impact because the narrow available right-of-way would require a stacked alignment in the Downtown area and because it would cross between Hale Auhau and the rest of the Hawaii Capital Historic District. The Nimitz Highway/Halekauwila Street/Kapiolani Boulevard alignment would be the best alignment option within Section V." The Capital Historic District is not affected by the Halekauwila alignment. As a result, the Queen Street alignment did not advance from the Alternatives Analysis to the Draft EIS.

An elevated system on either Beretania Street or King Street would run in front of either the State Capitol or Iolani Palace and would require removal of traffic lanes. The Ala Moana Boulevard to Pohukaina Street alignment was eliminated during the project screening process partially because the alignment would cross a substantial portion of the Federal Building property.

As indicated above, representatives from the Project's Safety and Security Department will continue to work with GSA staff on security concerns and will ensure that the project design meets the applicable Courthouse security requirements.

The Court's concern with explosive attacks is noted. DTS is working with the GSA to determine security requirements and ensure that the project design meets the requirements.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Honolulu City Council
530 S. King Street, Room 202
Honolulu, HI 96913

Re: Honolulu Rail Transit System (Honolulu High
Capacity Transit Corridor Project, 2008/PIM-1);
Security Risk for Federal Court Building

Dear Councilman Apo:

I write on behalf of the Judges of the United States District Court to strongly voice our opposition to the proposed route of the Honolulu Rail Transit System on Halekauwila Street immediately adjacent to the Federal Court Building. The proposed Halekauwila Street route, or any route similarly close to the Federal Courthouse, raises unacceptable severe security concerns - exposing our Courthouse to potential terrorists' gunfire and/or bombing such as occurred in Oklahoma City and within trains in Madrid, or to a lone attack by an individual holding a grudge against a particular Judge. We believe there are suitable alternative routes other than Halekauwila Street (such as Queen Street, which we understand from Mr. Kenneth Toru Hamayasu, Chief of the Rapid Transit Division of the Department of Transportation Services of the City and County of Honolulu, was the City's initial choice for this route).

We previously expressed our deep concern over this matter by letter dated November 28, 2008, to Mr. Leslie T. Rogers, Regional Administrator of the Federal Transit Administration. We reiterated our position by letter dated December 9, 2008, addressed to The Honorable Nestor Garcia, Chairman of the City Council Transportation and Public Works

Committee. Copies of both of these letters were sent to Mr. Hamayasu.

We received a response dated December 24, 2008 from Mr. Wayne Y. Yoshioka, Director of the Department of Transportation Services of the City and County of Honolulu, informing us that any changes to the rail transit system route on Halekauwila Street would require City Council action. Accordingly, we are now addressing our concerns directly to the City Council.

We understand from an article in the Honolulu Advertiser on January 3, 2009, that the City intends to pursue an "aggressive schedule," including such steps as promptly issuing requests for proposals on design/build contracts for the project's first phase, and revising a final Environmental Impact Statement for Federal approval. An article in the Honolulu Advertiser on January 11, 2009, reports that a risk management feasibility study contract will be awarded next month, and that the City has introduced Bill 63 to allow the City administration to seek construction proposals without Council approval. We urge the City Council to consider relocating the rail transit system route to avoid Halekauwila Street before making any costly commitments as to this route prior to the final review by the Federal Transit Administration.

On October 16 of last year we met with Mr. Hamayasu to express our concern about the high security risk to which the Federal Courthouse would be exposed should the rail transit system run on Halekauwila Street. He informed us that he did not feel there are any viable alternatives to Halekauwila Street, and that any change would be highly unlikely and would require Honolulu City Council approval. We disagree that there are no reasonable alternatives. We believe that Queen Street, King Street, Beretania Street, and possibly other streets could be utilized instead. We recognize, as does Mr. Hamayasu, that any route (including Halekauwila Street) presents problems.

We understand from our discussion with Mr. Hamayasu that the guideway structure will be 45 feet above street level and will pass within a mere 45 feet of the Federal Courthouse building. Our Court building is 4 stories high, so the guideway structure will be at the same level as the windows of three Judges' chambers. The guideway structure will be 25 feet wide, providing 2 sets of tracks for trains proceeding in either direction. There will be approximately 50 trains, with a train passing by our Courthouse during rush hours every 3 minutes in

each direction. As noted in the draft Environmental Impact Statement, Halekauwila Street is an unusually narrow street. Moreover, currently there is no public transport system along this street.

Subsequent to our meeting with Mr. Hamayasu, we met with the City's security committee. The security committee presented us with its security analysis entitled "Honolulu Rail Transit Project Potential Threats to Federal Court Building from Transit Viaduct". The City's security committee acknowledged that this security analysis was prepared only after our earlier meeting with Mr. Hamayasu, and that previously no consideration had been given to the Federal Courthouse's unique security concerns. It was also noted that neither the U.S. Marshal nor any other federal court security representative was previously consulted or even contacted regarding a proposed transit line running along Halekauwila Street adjacent to the Federal Courthouse. Nor was the owner of the Federal Building and Courthouse given any notice of the proposed Halekauwila Street route. We enclose a copy of letter dated December 15, 2008, from Michael D. Larson, Property Manager, U.S. General Services Administrator, Public Building Service, PJKK Federal Building, 300 Ala Moana Boulevard, expressing concerns over the Halekauwila Street route and the lack of any notice. The City's security committee also acknowledged that none of the security specialists who participated in preparing its analysis was familiar with security standards for Federal Courthouses.

The City's security analysis concludes that "the possibility of an assault from the viaduct to the Courthouse is deemed to be most improbable for many reasons;" yet the analysis fails to effectively address our concerns. As an example, our primary concern is detonation of explosives placed inside a train triggered by a cell phone operated by terrorists from a far distance (similar to what occurred in the Madrid attacks). This could be accomplished in a number of ways; such as, several people carrying sufficient explosives boarding a train several stops before the Federal Courthouse and exiting one or two stops before the Courthouse after leaving the explosives on board, or simply by several suicide bombers. Further, the security enhancements suggested by the City's analysis would afford little, if any, protection from a major bomb blast within a passing train.

After the Oklahoma City bombing and the terrorists attacks of September 11, certain security issues affecting the Federal Courthouse were recognized, and concrete berms and

planters were placed along Halekauwila Street to impede trucks with bombs intent on destroying our Court building as happened in Oklahoma City and Lebanon. A cable secured fence was constructed around the lawn area on the northwest side of the Courthouse, and security patrols were implemented.

We are still at war with terrorists who want to destroy us - and will be for years to come. Federal buildings have been prime targets.

The proposed rail transit system on Halekauwila Street would expose the Federal Courthouse to a much greater risk, similar to the train bombings which occurred in Madrid. We urge that you consider this security risk thoroughly, and we request that the City re-route the transit system to utilize a street other than Halekauwila Street.

Please do not hesitate to contact us should you have any questions concerning the above. Our judges would be pleased to meet with you and show you the close proximity of the proposed guideway structure to our chambers.

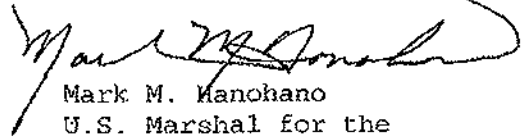

Very truly yours,

Chief Judge Helen Gillmor

As the U.S. Marshal for the District of Hawaii, I concur with the above assessment of the Judges of this District that the proposed route of the Honolulu Rail Transit System on Halekauwila Street presents a severe security risk to the Federal Court building, and I join in opposing this route.

Dated: January 23, 2009.

Very truly yours,

Mark M. Manohano

Dear Judge Gillmor:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Since the publication of the Draft EIS, DTS has coordinated directly with the U. S. General Services Administration (GSA) on safety and security concerns at the Federal Courthouse building. GSA has provided documents allowing a more comprehensive determination of security needs. The Project's Safety and Security experts will continue to work with GSA staff on security concerns. Project staff have been working with property management staff from the GSA. We will commit to meet all applicable setback requirements in addition to other security measures as discussed directly with the GSA to safeguard the Department of Justice and other federal staff. DTS met with representatives of the Court and GSA on October 16 and November 10, 2008, and on February 3 and March 31, 2009. A threat and vulnerability assessment was developed for the Federal Building, including the Federal Courthouse. The assessment was provided to GSA.

An alignment that avoided Halekauwila Street was evaluated at two stages of the Alternatives Analysis process. A Queen Street alignment had significant visual impacts, impacts on historic properties, evidence of burials within the vicinity of Queen Street near Kawaiahao Church, impacts on street traffic

patterns, and severe engineering constraints, and was not brought forward into the Draft EIS for these reasons. As stated in the Alternatives Screening Memo (Chapter 6), an alignment along Queen Street, rather than Halekauwila Street, had been proposed for screening. Following initial scoping of the alternatives and further engineering analysis, however, it was determined that the Queen Street alignment might not prove to be feasible. As noted in the Alternatives Screening Memo (Page 6-3), "The elevated alignment [along Queen Street] would have to pass very near high-rise buildings in some locations. Locating stations within the physical constraints of this alignment is a particular challenge." Both the Queen Street and the Halekauwila Street alignments were advanced to the Alternatives Analysis. While the Halekauwila Street alignment was acknowledged to have the potential for visual impacts on the Aloha Tower, this impact was evaluated in the context of the fact that the Queen Street alignment would have the same impact to Aloha Tower and would have impacts on a number of historical resources. The Queen Street alignment would have significant visual impacts. As noted in the Alternatives Analysis (Pages 6-4 to 6-5), "The Queen Street alignment would have somewhat greater negative visual impact because the narrow available right-of-way would require a stacked alignment in the Downtown area and because it would cross between Hale Auhau and the rest of the Hawaii Capital Historic District. The Nimitz Highway/Halekauwila Street/Kapiolani Boulevard alignment would be the best alignment option within Section V." The Capital Historic District is not affected by the Halekauwila alignment. As a result, the Queen Street alignment did not advance from the Alternatives Analysis to the Draft EIS.

The City Council received the letter provided by the Courts. It was forwarded to the Department of Transportation Services, Rapid Transit Division, for response in the Final EIS.

Queen Street, King Street, and Beretania Street were previously evaluated during the Alternatives Analysis process for either an elevated or underground alignment and determined to be inferior to Halekauwila Street based on a number of considerations. The effects from a Queen Street alignment are discussed previously in this letter. In addition, Queen Street is narrower than Halekauwila Street. An elevated system on either Beretania Street or King Street would run in front of either the State Capitol or Iolani Palace and would require removal of traffic lanes.

As stated above, DTS is coordinating with the GSA so the Project complies with applicable Courthouse security requirements.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Honolulu, Hawaii 96850-0400

Dear Mr. Hanohano:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Since the publication of the Draft EIS, DTS has coordinated directly with the U. S. General Services Administration (GSA) on safety and security concerns at the Federal Courthouse building. GSA has provided documents allowing a more comprehensive determination of security needs. The Project's Safety and Security experts will continue to work with GSA staff on security concerns. Project staff have been working with property management staff from the GSA. We will commit to meet all applicable setback requirements in addition to other security measures as discussed directly with the GSA to safeguard the Department of Justice and other federal staff. DTS met with representatives of the Court and GSA on October 16 and November 10, 2008, and on February 3 and March 31, 2009. A threat and vulnerability assessment was developed for the Federal Building, including the Federal Courthouse. The assessment was provided to GSA.

An alignment that avoided Halekauwila Street was evaluated at two stages of the Alternatives Analysis process. A Queen Street alignment had significant visual impacts, impacts on historic properties, evidence of burials within the vicinity of Queen Street near Kawaiahao Church, impacts on street traffic patterns, and severe engineering constraints, and was not brought forward into the Draft EIS for these reasons. As stated in the Alternatives Screening Memo (Chapter 6), an alignment along Queen Street, rather than Halekauwila Street, had been proposed for screening. Following initial

Mr. Mark M. Hanohano
Page 2

scoping of the alternatives and further engineering analysis, however, it was determined that the Queen Street alignment might not prove to be feasible. As noted in the Alternatives Screening Memo (Page 6-3), "The elevated alignment [along Queen Street] would have to pass very near high-rise buildings in some locations. Locating stations within the physical constraints of this alignment is a particular challenge." Both the Queen Street and the Halekauwila Street alignments were advanced to the Alternatives Analysis. While the Halekauwila Street alignment was acknowledged to have the potential for visual impacts on the Aloha Tower, this impact was evaluated in the context of the fact that the Queen Street alignment would have the same impact to Aloha Tower and would have impacts on a number of historical resources. The Queen Street alignment would have significant visual impacts. As noted in the Alternatives Analysis (Pages 6-4 to 6-5), "The Queen Street alignment would have somewhat greater negative visual impact because the narrow available right-of-way would require a stacked alignment in the Downtown area and because it would cross between Hale Auhau and the rest of the Hawaii Capital Historic District. The Nimitz Highway/Halekauwila Street/Kapiolani Boulevard alignment would be the best alignment option within Section V." The Capital Historic District is not affected by the Halekauwila alignment. As a result, the Queen Street alignment did not advance from the Alternatives Analysis to the Draft EIS.

The City Council received the letter provided by the Courts. It was forwarded to DTS Rapid Transit Division, for response in the Final EIS.

Queen Street, King Street, and Beretania Street were previously evaluated during the Alternatives Analysis process for either an elevated or underground alignment and determined to be inferior to Halekauwila Street based on a number of considerations. The effects from a Queen Street alignment are discussed previously in this letter. In addition, Queen Street is narrower than Halekauwila Street. An elevated system on either Beretania Street or King Street would run in front of either the State Capitol or Iolani Palace and would require removal of traffic lanes.

As stated above, DTS is coordinating with the GSA so the Project complies with applicable Courthouse security requirements.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

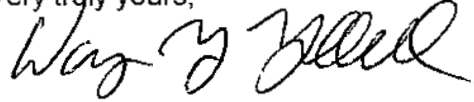

WAYNE Y. YOSHIOKA
Director

Enclosure

Mr. Mark M. Hanohano

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY

REGION IX

75 Hawthorne Street
San Francisco, CA 94105-3901

February 12, 2009

Mr. Ted Matley
U.S. Department of Transportation
Federal Transit Administration
201 Mission Street, Suite 1650
San Francisco, California 94105

Subject: Draft Environmental Impact Statement for the Proposed Honolulu High-Capacity Transit Corridor Project, Oahu, Hawaii (CEQ #20080469)

Dear Mr. Matley:

The Environmental Protection Agency (EPA) has reviewed the above-referenced document pursuant to the National Environmental Policy Act (NEPA), Council on Environmental Quality (CEQ) regulations (40 CFR Parts 1500-1508), and Section 309 of the Clean Air Act. Our detailed comments are enclosed.

While EPA supports the goal of providing transportation choices to the communities of Oahu, we have some concerns related to wetlands, water quality, environmental justice, and noise impacts. EPA has rated this document EC-2, *Environmental Concerns, Insufficient Information*. Please see the attached *Rating Factors* for a description of our rating system.

We are particularly concerned that the Draft Environmental Impact Statement (DEIS) does not contain any quantitative information about the location, acreage, and potential impacts to aquatic resources, hydrology, and waters of the United States in the project area. Impacts to waters of the United States will be subject to Clean Water Act (CWA) Section 404 (b)(1) Guidelines (40 CFR 230). If it is determined that an Individual Permit is required, only the Least Environmentally Damaging Practicable Alternative (LEDPA) can be permitted pursuant to the 404 (b)(1) Guidelines. In addition, without any data regarding potential impacts to hydrologic flows and potential downstream impacts, it is difficult to determine whether significant impacts may occur and what mitigation commitments are needed. EPA recommends that a meeting be scheduled with our wetlands staff and staff of the U.S. Army Corps of Engineers Regulatory Branch to discuss CWA requirements and potential project impacts to hydrology in the area.

Printed on Recycled Paper

We are also concerned that required consultation processes, such as 1) Section 106 consultation for potential impacts to historic and archaeological resources, 2) the water quality assessment associated with the sole source aquifer, and 3) the determination of consistency with the Hawaii Coastal Zone Management Program, have not been completed. These processes should be completed prior to publication of the Final Environmental Impact Statement (FEIS) in order to determine whether or not significant impacts will result. The FEIS should document the specific consultation processes, any additional impacts identified through this coordination, and all resulting mitigation commitments.

Finally, while we believe that most of the alternatives eliminated prior to the DEIS are documented sufficiently, we have remaining questions about why light rail or bus rapid transit in an exclusive right-of-way were not considered as reasonable alternatives in the DEIS. Additional information should be included in the FEIS explaining why these technologies were not considered to be reasonable alternatives and were therefore not reviewed in the DEIS.

We appreciate the opportunity to review this DEIS and look forward to future coordination on the project. When the FEIS is released for public review, please send two copies to the address above (mail code: CED-2). If you have any questions, please contact Connell Dunning, Transportation Team Leader, at 415-947-4161, or Carolyn Mulvihill, the lead reviewer for this project, at 415-947-3554 or mulvihill.carolyn@epa.gov.

Sincerely,

KMG

Kathleen M. Goforth, Manager
Environmental Review Office (CED-2)

Enclosures:
Summary of EPA Rating Definitions
EPA's Detailed Comments

Susan Meyer, U.S. Army Corps of Engineers

Alternatives Analysis

EPA recognizes that a significant amount of analysis of alternatives has taken place and has been documented prior to the Draft Environmental Impact Statement (DEIS). While we believe that most of the alternatives eliminated prior to the DEIS are documented sufficiently, we have remaining questions about why light rail or bus rapid transit in an exclusive right-of-way were not considered as reasonable alternatives in the DEIS. The Final Environmental Impact Statement (FEIS) should identify the specific rationale behind the elimination of these technologies from consideration.

Recommendation:

- Include additional information in the FEIS explaining why light rail or bus rapid transit in an exclusive right-of-way were not considered to be reasonable alternatives and were therefore not reviewed in the DEIS. If these technologies may have resulted in fewer environmental impacts, further justification is warranted to substantiate why those less damaging alternatives were not carried through for consideration.

It is also our understanding that modifications to the alignment described in the DEIS are being considered in order to avoid federal facilities in the current project area. These changes and the impacts associated with them should be described in the FEIS, along with the reasons for considered modifications. If significant variations from the analyzed alternatives are proposed, the Federal Transit Administration (FTA) and the Department of Transportation Services (DTS) should consider preparing a Supplemental DEIS for public review. EPA is available to discuss with FTA and DTS the appropriate level of environmental documentation needed should new information be incorporated into the document.

Recommendation:

- Include information in the FEIS about any changes to the proposed alignment and impacts associated with those changes. Consult EPA regarding the appropriate level of documentation.

We understand that the project will eventually include extensions of the proposed project on both ends of the initial segment. However, the extensions to the project were not analyzed in this DEIS. It is critical that selection of the alternative for the initial segment not preclude a reasonable range of alternatives for those future extensions. *Given that the proposed project is an elevated structure, there are few remaining alternative sites where the subsequent extension projects can "link" to the project.* The extensions should be viewed as reasonably foreseeable future actions and, as such, should be analyzed thoroughly in the cumulative impact analysis. Specifically, what additional

resources of concern will be affected should the proposed action be carried forward and should the proposed extensions be built?

Recommendation:

- Ensure that selection of the alternative for the initial segment will not preclude a reasonable range of alternatives for future extensions. Include an analysis of potential impacts, and mitigation for those impacts, that would occur should the extensions to the project be built. Identify all reasonably foreseeable future actions associated with the placement of the proposed project as well as the impacts to resources from those future actions. Provide any mitigation for these identified cumulative effects.

Wetlands and Waters

In our January 6, 2006 and April 13, 2007 scoping comments, EPA stated that the DEIS should disclose the approximate area of waters of the United States that occur within the study area of the proposed project, including permanent and intermittent streams and wetlands. The Clean Water Act (CWA) Section 404(b)(1) Guidelines at 40 CFR Part 230.10(a) state that "... no discharge of dredged or fill material shall be permitted if there is a practicable alternative to the proposed discharge which would have less adverse impact on the aquatic ecosystem, so long as the alternative does not have other significant adverse environmental consequences." While the DEIS states that "no direct impacts to wetlands are expected" (page 4-134), EPA believes that it is likely that the project will have both direct and indirect impacts to waters of the United States. FTA and DTS will have to demonstrate that potential impacts to waters of the United States have been avoided and minimized to the maximum extent practicable prior to obtaining a CWA Section 404 permit (40 CFR 230.10(a) and 230.10(d)). Our scoping comments further recommended that the following information be included in the DEIS, and we reiterate that this information should be included in the FEIS.

We also recommend that DTS meet with EPA wetlands staff and staff of the U.S. Army Corps of Engineers to discuss Section 404(b)(1) requirements. Please contact Wendy Wiltse of EPA's Honolulu office at 808-541-2752 to arrange a meeting.

Recommendations:

- Work with EPA and the Corps to acquire a jurisdictional delineation of waters of the United States and impacts to those waters in the project area.
- Demonstrate that all potential impacts to waters of the United States have been avoided and minimized. If these resources cannot be avoided, clearly demonstrate how cost, logistical, or technological constraints preclude avoidance and minimization of impacts.
- Quantify the benefits from measures and modifications designed to avoid and minimize impacts to water resources; for example, number of stream crossings avoided, acres of waters of the United States avoided, etc.

- Identify all protected resources with special designations and all special aquatic sites¹ and waters within state, local, and federal protected lands. Additional steps should be taken to avoid and minimize impacts to these areas.
- Identify and commit to mitigation for any unavoidable impacts. Include a timeframe for implementation of mitigation commitments along with the responsible party.

Water Quality

The DEIS states that a Water Quality Impact Assessment is underway, as required in areas that depend upon a sole source aquifer for drinking water. The results of this assessment should be included in the FEIS.

The DEIS also states that the project's consistency with the objectives and policies of the Hawaii Coastal Zone Management Program will be reviewed by the Department of Business, Economic Development & Tourism (DBEDT) Office of Planning. This review should be completed and documented in the FEIS.

While we support DTS's plan to implement permanent best management practices (BMPs) to manage stormwater runoff, we do not believe that there is sufficient information in the DEIS to document that the project will have no adverse impacts on water quality due to increased pollutants in stormwater. Additional information is needed in the FEIS to support the conclusion that there will be no adverse impacts to water quality. Where the proposed project will widen existing roads, the current stormwater detention basins and structures should be evaluated to determine if they will continue to be effective. We also recommend the use of green infrastructure as part of stormwater management. Detailed information about green infrastructure approaches is available at <http://cfpub.epa.gov/npdes/greeninfrastructure/technology.cfm>.

The FEIS should also include a discussion of other impacts the project may have on local hydrology, such as sediment transport, groundwater recharge, and flood attenuation, and how these impacts would be minimized or mitigated.

Recommendations:

- Include the results of the sole source aquifer water quality assessment in the FEIS and confirm that no significant impacts will result. Identify specific mitigation measures for any potential impacts.
- Include a discussion of the DBEDT Office of Planning review of the project's consistency with the Coastal Zone Management Program and confirm that the project is consistent with the program.

¹ Special aquatic sites are defined at 40 CFR 230.40 – 230.45 and include wetlands, mud flats, vegetated shallows, coral reefs, and riffle and pool complexes.

- Consider including green infrastructure in the permanent BMPs for stormwater management and document the BMPs in the FEIS.
- Identify the project's impacts on local hydrology, such as sediment transport, groundwater recharge, and flood attenuation in the FEIS rather than waiting to analyze these impacts at a future date. Include specific mitigation commitments in the FEIS and identify how these mitigation actions will reduce impacts to surface hydrology. Include an analysis of potential hydrological impacts due to the reasonably foreseeable future extensions of the proposed project.

Noise Impacts

The DEIS, including the visual impact simulations, indicate that residents in a number of areas may experience significant noise impacts due to the proximity of the project to homes. EPA encourages DTS to consider noise abatement measures not specified in the DEIS, such as noise insulation of receptor sites.

EPA also recommends that particular attention be given to potential noise impacts and mitigation in the vicinity of Pearl Harbor and the USS Arizona Memorial.

Recommendations:

- Consider additional noise abatement measures, such as noise insulation of receptor sites, for residences and other sensitive receptors that would experience noise impacts. Provide quantitative information in the FEIS on the decrease in noise impacts from additional mitigation strategies.
- Provide additional noise mitigation in the vicinity of Pearl Harbor and the USS Arizona Memorial, if necessary to preserve the contemplative nature of the site.

Environmental Justice

EPA previously provided feedback on the environmental justice (EJ) analysis methodology proposed for this project, which was based on the Oahu Metropolitan Planning Organization's method for determining EJ areas. While we believe that the DEIS appropriately identifies EJ areas, we have concerns about the proposed relocation of residents of the Banana Patch community, which is identified in the DEIS as an EJ area of concern. We encourage DTS to choose an alternative alignment that would avoid relocation of this community. If no reasonable avoidance alternative exists, EPA recommends that extensive efforts be made to communicate and consult with the community in planning and implementing the project, and that all past and future consultation activities with this community be documented in the FEIS.

In addition, EPA recommends that additional assistance be provided to any other residents of environmental justice communities who will be relocated.

Recommendations:

- Identify an alternative alignment that would avoid the Banana Patch community and alter the proposed action to accommodate this modification.
- Document the content and outcomes of the community meeting held with the Banana Patch community, as well as any other past or planned communication with the community, in the FEIS.
- Identify and commit to specific mitigation measures to minimize the impacts of relocation on low-income and minority populations.
- Conduct interviews with all potential displacees who have special needs to ensure that issues are fully identified and a plan for assistance is prepared. Based on the results from these interviews, identify and commit to additional measures to minimize the impacts of relocation, such as providing translation services, transportation to visit potential replacement housing, and/or additional relocation specialists to work with these communities.

Section 106 Consultation

The DEIS states that Section 106 consultation is ongoing. The consultation process should be completed prior to release of the FEIS and the process and required mitigation should be documented. This is critical to the determination of whether the project will have significant impacts on historical resources.

Recommendation:

- Complete the Section 106 process and document all related mitigation commitments in the FEIS. Confirm in the FEIS that the Section 106 consultation process included analysis of potential impacts from the reasonably foreseeable future action of the proposed extension of the project. Identify what, if any, additional impacts to historical properties may occur with future extensions of the project.

Invasive Species

EPA's January 6, 2006 and April 13, 2007 scoping comments included recommendations for minimizing the spread of invasive species. The islands of Hawaii are particularly vulnerable to invasive species, and construction associated with the project has the potential to aid in the establishment of invasive plants along any newly disturbed corridors. We reiterate our recommendations below and request that they be addressed in the FEIS.

Recommendations:

- In accordance with Executive Order 13112, identify proposed methods to minimize the spread of invasive species and utilize native plant and tree species where revegetation is planned.

- Coordinate invasive species management with local agencies and organizations, such as the Oahu Invasive Species Committee: a voluntary partnership organized to prevent new invasive species infestations on the island of Oahu, to eradicate incipient invasive species, and to stop established invasive species from spreading on Oahu (<http://www.hear.org/oisc/>).
- Coordinate measures to reduce the potential for the spread of invasive species with other ongoing planning efforts. Additional resources related to Federal and State programs to address invasive species can be found at: <http://www.invasivespeciesinfo.gov/>

Visual Impacts

The DEIS indicates that there may be significant visual impacts resulting from the project. Context sensitive design can be used to mitigate these impacts.

Recommendation:

- Utilize context sensitive design, including neighborhood-based design guidelines and community input, as much as possible to mitigate the project's visual impacts.

Climate Change

Research on global climate change indicates that many coastal areas may be impacted in the future by sea level rise. The IPCC projects that global sea level will rise between 7 and 23 inches by the end of the century (2090–2099) relative to the base period (1980–1999). According to the IPCC, the average rate of sea level rise during the 21st century is very likely to exceed the 1961–2003 average rate. Storm surge levels are also expected to increase due to projected sea level rise. Combined with non-tropical storms, rising sea level extends the zone of impact from storm surge and waves farther inland, and will likely result in increasingly greater coastal erosion and damage.²

Recommendation:

- Include a discussion in the FEIS of the potential impacts of climate change on the proposed project and identify adaptive management strategies to protect the project area from those impacts.

² IPCC, 2007b: Summary for Policymakers. In: *Climate Change 2007: Impacts, Adaptation and Vulnerability. Dear Ms. Goforth:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Alternatives Analysis

The Transportation System Management Alternative that was evaluated in the Alternatives Analysis included aspects of bus rapid transit. As summarized in Chapter 2 of the Draft EIS, while the alternative had merit for cost-effectiveness, its overall system benefit would be very low. Light rail technology was not eliminated; however, at-grade light-rail would not meet Project speed and reliability requirements. Additional clarification has been included in Chapter 2 in this Final EIS regarding the Alternatives Analysis. These alternatives were not advanced for further environmental analysis since they did not meet the purpose and need.

The Alternatives Screening Memorandum (DTS 2006a) recognized the visually sensitive areas in Kakaako and Downtown Honolulu, including the Chinatown, Hawaii Capital, and Thomas Square/Academy of Arts Special Design Districts. To minimize impacts on historic resources, visual aesthetics, and surface traffic, the screening process considered 15 combinations of tunnel, at-grade, or elevated alignments between Iwilei and Ward Avenue. Five different alignments through Downtown Honolulu were advanced for further analysis in the Alternatives Analysis, including an at-grade portion along Hotel Street, a tunnel under King Street, and elevated guideways along Nimitz Highway and Queen Street.

The Alternatives Analysis Report (DTS 2006b) evaluated the alignment alternatives based on transportation and overall benefits, environmental and social impacts, and cost considerations. The report found that an at-grade alignment along Hotel Street would require the acquisition of more parcels and affect more potential burial sites than any of the other alternatives considered. The alignment with at-grade operation Downtown and a tunnel through the Capital Historic District, in addition to the environmental effects such as impacts to cultural resources, reduction of street capacity, and property acquisition requirements of the at-grade and tunnel sections, would cost an additional \$300 million.

The Project's purpose is "to provide high-capacity rapid transit" in the congested east-west travel corridor (see Section 1.7 of the Final EIS). The need for the Project includes improving corridor mobility and reliability. The at-grade alignment would not meet the Project's Purpose and Need because it could not satisfy the mobility and reliability objectives of the Project (see bullets below). Some of the technical considerations associated with an at-grade versus elevated alignment through Downtown Honolulu include the following:

- **System Capacity, Speed, and Reliability:** *The short, 200-foot (or less) blocks in Downtown Honolulu would permanently limit the system to two-car trains to prevent stopped trains from blocking vehicular traffic on cross-streets. Under ideal operational circumstances, the capacity of an at-grade system could reach 4,000 passengers per hour per direction, assuming optimistic five minute headways. Based on travel forecasts, the Project should support approximately 8,000 passengers in the peak hour by 2030. Moreover, the Project can be readily expanded to carry over 25,000 in each direction by reducing the interval between trains (headway) to 90 seconds during the peak period. To reach a comparable system capacity, speed, and reliability, an at-grade alignment would require a fenced, segregated right-of-way that would eliminate all obstacles to the train's passage, such as vehicular, pedestrian, or bicycle crossings. Even with transit signal priority, the at-grade speeds would be slower and less reliable than an elevated guideway. An at-grade system would travel at slower speeds due to the shorter blocks, tight and short radius curves in places within the constrained and congested Downtown street network, the need to obey traffic regulations (e.g., traffic signals), and potential conflicts with other at-grade activity, including cars, bicyclists, and pedestrians. These effects mean longer travel times and far less reliability than a fully grade-separated system. None of these factors affect an elevated rail system. The elevated rail can travel at its own speed any time of the*

day regardless of weather, traffic or the need to let cross traffic proceed at intersections.

- **Mixed-Traffic Conflicts:** *The planned three-minute headways on the guideway will prevent effective coordination of traffic signals in the delicately balanced signal network in Downtown Honolulu. A three minute cycle of traffic lights would affect traffic flow and capacity of cross-streets. Furthermore, there would be no option to increase the capacity of the rail system by reducing the headway to 90 seconds, which would only exacerbate the signalization problem. An at-grade system would require removal of two or more existing traffic lanes on affected streets. This effect is significant and would exacerbate congestion. Congestion would not be isolated to the streets that cross the at-grade alignment but, instead would spread throughout Downtown. The Final EIS shows that the Project's impact on traffic will be isolated and minimal with elevated rail, and in fact will reduce system-wide traffic delay by 18 percent compared to the No Build Alternative (Table 3-14 in the Final EIS). The elevated guideway will require no removal of existing travel lanes, while providing a reliable travel alternative. When traffic slows, or even stops due to congestion or incidents, the elevated rail transit will continue to operate without delay or interruption.*

An at-grade light rail system with continuous tracks in-street, would create major impediments to turning movements, many of which would have to be closed to eliminate a crash hazard. Even where turning movements are designed to be accommodated, at-grade systems experience potential collision problems. In addition, mixing at-grade fixed guideway vehicles with cars, bicyclists, and pedestrians presents a much higher potential for conflicts compared to grade-separated conditions. Where pedestrians and automobiles cross the tracks in the street network, particularly in areas of high activity (e.g., station areas or intersections), there is a risk of collisions involving trains that does not exist with an elevated system. There is evidence of crashes between trains and cars and trains and pedestrians on other at-grade systems throughout the country. This potential would be high in the Chinatown and Downtown neighborhoods, where the number of pedestrians is high and the aging population presents a particular risk.

- **Construction Impacts:** *Constructing an at-grade rail system could have more effects than an elevated system in a number of ways. The wider and continuous footprint of an at-grade rail system compared to an elevated rail system (which touches the ground only at discrete column foundations, power substations and station accessways) increases the potential of utility conflicts and discovery of sensitive cultural resources. In addition, the extra roadway lanes taken away for the system would result in increased congestion or require that additional businesses or homes be taken to widen the roadway through Downtown. Additionally, the duration of short-term construction impacts to the community and environment with an at-grade system would be greater than with an elevated system. Because of differing construction techniques, more lanes would need to be continuously closed for at-grade construction and the closures would last*

longer than with elevated construction. This would result in a greater disruption to business and residential access.

Because it is not feasible for an at-grade system through Downtown to move passengers rapidly and reliably without significant detrimental effects on other transportation system elements (e.g., the highway and pedestrian systems, safety, reliability, etc.), an at-grade system would have a negative system-wide impact that would reduce ridership throughout the system. The at-grade system would not meet the Project's Purpose and Need and, therefore, does not require additional analysis.

For the Kapolei future extension, the alignment may continue in the North-South Road median. The extension could either follow the alignment discussed in the Draft EIS, or diverge from North-South Road at any point. The alignment decision would be made as part of a separate environmental evaluation if an extension is proposed and funded for implementation. Impacts will be analyzed at that time, and appropriate mitigation measures will be developed. At the Koko Head end of the Project, the Project has been designed to allow for an extension to climb over the Ala Moana Center parking garage that is immediately beyond the end of the Project. The alignment would follow Kona Street and is anticipated to cross to Kapiolani Boulevard at a point prior to Mahukona Street. The alignment decision would be made as part of a separate environmental evaluation if an extension is proposed for implementation and receives future funding. Impacts will be analyzed at that time, and appropriate mitigation measures will be developed.

Construction of the Project will not preclude future development of the planned extensions. The planned extensions will be evaluated through a separate NEPA and HRS 343 environmental review process. The Indirect Effects, 4.19.2 and Cumulative Effects analysis in Section 4.19.3 Cumulative Effects, in this Final EIS has been expanded since the Draft EIS to include a more comprehensive list of the planned and foreseeable development and includes evaluation of the planned extensions. No mitigation for the impacts of the extensions would be provided by the Project. Additional analysis will be undertaken before action is taken on the proposed extensions.

Wetlands and Waters

Coordination with Federal, State, and Local agencies with water resource expertise and responsibilities has been ongoing to provide input and guidance on the resources, design, and construction of the Project. Coordination will continue as appropriate with regulatory agencies throughout final design and construction. Since publication of the Draft EIS, several meetings have been held. On December 9, 2008, the USACE, HDOH, Hawaii's CZM Program, Hawaii Commission on Water Resource Management, and EPA met with project staff to clarify water resource requirements for the Project. As materials were completed to support this section for the Final EIS, follow-up meetings with the EPA were held on March 10, 2009, and July 10, 2009. Meetings were held with the USACE on January 15, February 25, May 13, July 3, and August 10, 2009. Additional coordination between technical staff and the USACE has occurred. Input from these agencies has directed the analysis included in this Final EIS.

USACE guidance permits the use of a preliminary jurisdictional determination (JD) approach to satisfy NEPA requirements. The "preliminary JD" approach is being followed for this Project. Under this approach, areas that are potentially waters of the U.S. are considered to be waters of the U.S. For the purposes of this document, all waters (including intermittent and ephemeral streams) are considered waters of the U.S. if they fit the definitions of tidal, wetland, RPW, or non-RPW waters, unless otherwise stated. The Wetland and Waters of the U.S. Study (RTD 2009b) provides additional information on areas being covered under preliminary JDs which is also documented in Section 4.14 of the Final EIS. The Final EIS also includes an evaluation of impacts to waters of the U.S. to meet the requirement of the Clean Water Act Section 404(b)(1) analysis (See Section 4.14.4 in this Final EIS).

On September 15, 2009, the Army Corps of Engineers stated that its substantive concerns relating to Section 404 of the Clean Waters Act had been addressed and that the scope and intensity of impacts to jurisdictional waters of the United States are now relatively minor due to the extent of avoidance and minimization of impacts on the aquatic environment resulting from project site selection and design. There will be impacts to waters of the U.S. by the Project. Transit guideway support columns will be placed in Waiawa, Moanalua, and Nuuanu Streams. In addition, the Project will be widening the existing Dillingham Boulevard Bridge at Kapalama Stream which will require extension of the existing piers and abutments. The total permanent impacts from structural elements of the Project is 0.02 acres. An existing stormwater outfall in Waiawa Springs will be extended at the Pearl Highlands Station to reduce ponding (total impact is 0.06 acres). For all work in waters of the U.S., the City will apply for USACE Section 404 nationwide permits for impacts to waters under the jurisdiction of the Corps where impacts could not be avoided. As discussed in Section 4.18, during construction of the linear transportation features of the Project, it is anticipated that there will also be a temporary effect of up to 0.13 acre of waters of the U.S.

A "functional assessment" was also performed for each location where the Project is adjacent to or crosses waters of the U.S., as identified in the Wetland and Waters of the U.S. Study (RTD 2009b). Given this level of impact to water resources within Honolulu's urban core, the intent of the functional assessment was to analyze impacts of the aquatic ecosystem to develop mitigation concepts for those waters of the U.S. where impacts could not be avoided and only after impacts were minimized to the extent feasible.

Water resource mitigation is being proposed to compensate for the 0.06 acre of permanent encroachment into waters of the U.S. from the linear transportation features of the Project and 0.06 acre of impact from other Project elements (culvert improvement at Waiawa Springs). The Project will temporarily impact 0.13 acre in waters of the U.S. during construction. The mitigation measures presented here satisfy the requirements established by 33 CFR 325 and 332, and 40 CFR 230 (Subpart J: Compensatory Mitigation for Losses of Aquatic Resources). These mitigation measures are presented only after measures to fully avoid the water feature have not been possible and only after all measures have been taken to minimize encroachment.

Permanent mitigation features are proposed at Waiawa Stream, within the Pearl Highlands Station. Mitigation proposed for the Waiawa Stream mitigation site may include the following:

- *Enhancement of the stream to restore and/or improve ecological and aquatic function.*
- *Establishment of water quality basins or wetlands.*
- *Enhancement of floodway capacity conveyance to achieve zero rise in flood zone by removal of fill and an increase in stream area.*
- *Relocation of Waiawa Stream to its original location.*
- *Extension of existing culvert to Waiawa Stream to correct existing ponding situation.*
- *Ecological restoration with native Hawaiian plantings and use of non-invasive species.*

Construction phase mitigation measures are discussed in Section 4.18. Mitigation details will be developed during the permitting phase. The City will obtain Section 404 nationwide permits for the Project prior to construction and will comply with the conditions of the Section 404 permit.

Water Quality

Results of the sole source aquifer water quality assessment are included in Section 4.14, Water, in this Final EIS. A Water Quality Impact Assessment for the Project was received by EPA, and they agreed that contamination of the Southern Oahu Basal Aquifer would not occur, based on the construction methods that would be employed and the presence of an upward hydraulic gradient in the study corridor.

DTS is coordinating with Hawaii DBEDT Office of Planning to certify compliance with the Hawaii Coastal Zone Management Program. There is no requirement to have the certification completed before the Final EIS is published. FTA and the Hawaii CZM Program have concurred with DTS's approach.

The discussion of permanent Best Management Practices (BMPs) has been refined in Section 4.14.3, Environmental Consequences and Mitigation [Water], in this Final EIS. Permanent BMPs addressing stormwater runoff and water quality for the park-and-ride lots and the maintenance and storage facility will be prepared during design. The permanent storm water BMPs will be designed, installed, and maintained in accordance with the criteria and guidelines described in the respective authority having jurisdiction's storm water management plan. Types and sizes of permanent storm water BMPs will depend upon the runoff quality and water quality requirements of each receiving water body.

There are minimal hydrological impacts associated with an elevated guideway. The Project creates little new impervious surface, and therefore, there is negligible new stormwater. Groundwater recharge for the water table or caprock aquifer will not be affected as most of the

runoff will be returned to the groundwater system close to where it originates by the permanent BMPs. Permanent BMPs would include vegetated swales, retention ponds, and sediment removal structures and are discussed in Section 4.13.3, Environmental Consequences and Mitigation [Ecosystems], in this Final EIS. Groundwater recharge for the Southern Oahu Basal Aquifer is mostly unaffected since the Project generally overlies the caprock as discussed in the Honolulu High-Capacity Transit Corridor Water Resources Technical Report (RTD 2008k). No increases in sediment transport should occur during the operation of the Project. Mitigation during construction for sediment transport impacts will be detailed in the required NPDES Construction Stormwater permit and will include silt fences, stabilized entrances, covered stockpiles and other standard methods to control stormwater runoff at construction sites.

Since the Project is linear, it traverses several flood zones. As required by floodplain regulations, there will be no rise in the base flood elevations in the flood zones. The hydrological impacts for the future extensions would be studied in separate environmental evaluations should those projects become funded in the future.

Noise Impacts

As stated in Section 4.10.3 of the Final EIS, the Project will cause no severe noise impacts. Moderate impacts will occur at upper floors of a few high-rise buildings (as shown in Table 4-18 in the Final EIS). With the recommended mitigation in place (sound absorbing material and wheel skirts), the noise analysis indicates that the new noise generated by the Project will be lower than the existing noise levels in most places.

The project design includes an integrated noise-blocking parapet wall at the edge of the guideway structure that extends three feet above the top of the rail. The parapet wall will substantially reduce ground-level noise.

Wheel skirts will increase the benefit from the parapet wall at locations above the elevation of the track. The use of sound-absorptive materials below the tracks in the areas that will experience moderate noise impacts will reduce the Project noise levels from the upper floors to below the impact level. Once the Project is operating, noise levels will be re-measured to confirm that there are no noise impacts from the Project.

Additional noise analyses were performed in the area of Pearl Harbor and the USS Arizona Memorial for the Final EIS. Three additional noise sensitive receptor sites were modeled for noise impacts from the Project. As a result of this analysis, it was determined that there are no noise impacts at these receptors. The results of the noise analysis are presented in Section 4.10.3, Figure 4-55 in this Final EIS.

Environmental Justice

There is no reasonable alternative to avoid impact to the Banana Patch community. An avoidance alternative was evaluated in the Draft EIS to avoid the Solmirin House, which at that time was thought to be a historic property eligible for the NRHP. Since the release of the Draft EIS, the SHPD determined that this property is not eligible. Based on the analysis in Chapter 5 (Section 4(f)) of the Draft EIS, there is no feasible alternative.

DTS has been coordinating with residents of the Banana Patch community since October 2008. Every household has been visited by DTS staff, Right-of-Way staff, and Engineering staff to discuss the Project, special needs, and relocation assistance.

A meeting was held at the Alpha Omega Christian Fellowship Church specifically for this community. Invitations were sent to each Banana Patch community household. At this meeting, a brief presentation was given on the Project and public testimony was recorded by a court reporter. A complete transcript is included in Appendix A in this Final EIS. The transcript of the community meeting held March 2009 is presented in Appendix A, Comments Received on the Draft EIS and Responses, in this Final EIS.

The Project will not result in disproportionately high and adverse impacts within OahuMPO EJ Areas. Therefore, no specific mitigation measures to reduce impacts are warranted. The mitigation measures related to acquisitions, displacements, and relocations are presented in Section 4.4.3, Environmental Consequences and Mitigation, in this Final EIS. The City's right-of-way managers will be working with individual property owners to provide relocation services to all affected business and residential property owners and tenants without discrimination; persons, businesses, or organizations that are displaced as part of the Project would be treated fairly and equitably. The Final EIS provides mitigation measures for property acquisition in accordance with the requirements of the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act and the USDOT's implementing regulations of 49 CFR Part 24.

Section 4.7.4 in this Final EIS presents a summary of all of the public outreach activities that have been performed. During the public outreach effort for the Project, particular attention has been paid to identifying and reaching low-income and minority populations that are traditionally underserved and underrepresented in the public involvement process. An update to the community outreach activities that have occurred since the publishing of the Draft EIS, including for the Banana Patch community, is also presented in this section of this Final EIS.

Section 106 Consultation

Potential Project impacts to historic resources listed in or eligible for listing in the National Register of Historic Places were evaluated and addressed in the Historic Effects Report: Honolulu High-Capacity Transit Corridor Project (April 2009). This report contains information detailing the methodology used to evaluate these resources. The status of the final determinations of effect is documented in this Final EIS, Section 4.16. As part of these effects determinations, direct, indirect, and cumulative effects were analyzed. To mitigate these adverse effects, a Programmatic Agreement was developed and is included in Appendix H. Impacts from any future extensions will be assessed when the Section 106 process is completed for that work.

Consultation with Section 106 consulting parties will continue for the duration of the Project to accommodate post-Record of Decision discoveries. This consultation will consist primarily of interagency meetings and contacts with individuals and groups. Additional coordination regarding archaeological sampling, surveying, and construction techniques will be

ongoing after the Record of Decision is issued and throughout construction. The stipulations of this consultation are described in the Project's Programmatic Agreement.

Invasive Species

The Project specifications will ensure any construction equipment or material imported to Oahu from the mainland, neighbor islands, or foreign countries, be free of dirt, vegetative matter, and animals. Construction equipment from other parts of the island or other counties will have to be washed before being brought to the Project site. On-site workers will be trained to recognize common invasive species growing in the construction area. Criteria for cleaning, inspection, and treatment of plants that are at risk of harboring pests is part of the Landscape Architecture Design Criteria. Species that can be harmful invaders or contribute to existing problems will not be used for Project plantings. The design criteria includes the American Society of Landscape Architects' Invasive Species List shall serve as a "do not plant" list.

DTS has met with the Oahu Invasive Species Council for this Project. The Oahu Invasive Species Council has provided the Project with specific construction procedures that are presented in Section 4.18.9, in this Final EIS and will be incorporated into construction contract documents.

Hawaii DOT is developing construction standard specifications for Invasive Species Management (Hawaii Chapter of the ASLA Maintenance Specifications Section 665). Once adopted by Hawaii DOT as a standard specification, this Project will comply with it through incorporation into the construction contract documents.

Visual Impacts

The assessment of visual effect due to the Project as described in Section 4.8.3 of the Final EIS considers changes to the visual landscape and viewer responses to those changes. This includes the existing development along the Project alignment. Within the Project corridor the environment changes from rural at the Wai'anae end of the corridor to dense high-rise development at the Koko Head end.

As part of the design process, the City has developed design principles, which are identified in the Honolulu High-Capacity Transit Corridor Project Compendium of Design Criteria (RTD 2009m) that will be implemented in final design to minimize visual effects of the Project. For example, guideway materials and surface textures will be selected in accordance with generally accepted architectural principles to achieve effective integration between the guideway and its surrounding environment. Landscape and streetscape improvements will mitigate potential visual impacts, primarily for street-level views.

Other measures to address visual impacts of the Project are being developed through the station design and planning process. The initial station area plans and design guidelines were first developed with coordination between DTS and the Department of Planning and Permitting (DPP). The next level of transit station design focuses on integrating individual neighborhood characteristics of the communities served by the stations.

The following mitigation framework will be included in the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

- *Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
- *Coordinate the project design with City TOD planning and DPP.*
- *Consult with the communities surrounding each station for input on station design elements.*
- *Consider specific sites for landscaping and trees during the final design phase when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will serve to mitigate potential visual impacts.*

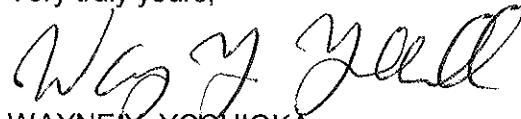

Section 4.8.3 of the Final EIS, Design Principles and Mitigation includes information related to the mitigation framework described above. Specifically architecture and landscape design criteria include guidelines regarding site design, materials and finishes, and lighting, which apply to stations, station areas, and the guideway.

Climate Change

The minimum elevation for any Project feature is five feet above sea level; therefore, a rise of up to two feet would not directly affect any Project feature. Any evaluation of indirect effects, such as changes in ridership as a result of residents moving from low-lying areas, would be speculative based on available information.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Dear Mr. Akana:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

The City is coordinating with HDOT Airport Operations and the FAA Honolulu office to ensure the design of the Project is consistent with flight operation requirements for runways 22L/4R and 22R/4L. With the design modifications that were made in coordination with HDOT Airports and the FAA and are included in the Final EIS, the Lagoon Drive Station location and guideway are compliant with the Runway Protection Zone requirements. The City will continue to coordinate with HDOT and FAA to ensure the Project is consistent with the Airport Master Plan and flight operation requirements.

Mr. Moses Akana
Page 2

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Dear Mr. Neely:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Since the publication of the Draft EIS, DTS has coordinated directly with GSA on safety and security concerns at the Federal Courthouse building. GSA has provided documents allowing a more comprehensive determination of security needs. The Project's Safety and Security experts will continue to work with GSA staff on security concerns. Project staff have been working with property management staff from the GSA. We will commit to meet all applicable setback requirements in addition to other security measures as discussed directly with the GSA to safeguard the Department of Justice and other federal staff. We are confident that we can adequately address your concerns without moving the proposed alignment. Section 2.5.4, Safety and Security Measures, of this Final EIS contains additional details on security measures being incorporated into the project.

Mr. Jeff Neely
Page 2

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

City and County of Honolulu
650 S King Street, 3rd Floor
Honolulu, Hawaii 96813

Dear Mr. Yoshioka:

The purpose of this letter is to express our concerns over the proposed Honolulu High Capacity Transit Corridor Project

The United States General Services Administration is the record owner of the Prince Jonah Kuhio Kalaniana'ole Federal Building and Courthouse located at 300 Ala Moana Boulevard ("PJKK Building"). We have never received any notice from the City and County of Honolulu Department of Transportation Services Rapid Transit Division (DOT) about this project. As such, we were surprised to learn that the proposed project entails the construction and operation of an elevated transit system along a narrow street directly abutting the PJKK Building on Halekawiila Street. As a federal agency and property owner significantly impacted by the proposed project, DOT is required to invite us to participate in the scoping process which appears to have occurred in late Dec 2005 and January 2006. Nor have we received any of the multiple notices of intent issued for this project and the draft Environmental Impact Statement. See List of Draft EIS recipients attached to the Draft EIS.

We hope that this project has not proceeded so far that any possibility of our providing meaningful comment at this time has been eliminated. Our obvious concerns include noise, vibration, security and apparent site easement. We are hereby requesting an immediate meeting with DOT in order that we may be briefed as to the proposed project and its particular impact upon the PJKK Building. We would caution DOT not to proceed on the basis that that any property necessary for this project (including air rights) along Halekawiila can be obtained through the eminent domain process since this process is not available against the United States.

We trust that DOT will immediately correct its notice procedures and now include us on the mailing list for this project and provide all documents prepared and invitations of public meetings for the proposed project to the United States of America. Please note that all information should be sent to the PJKK Building as follows:

Dear Mr. Larson:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

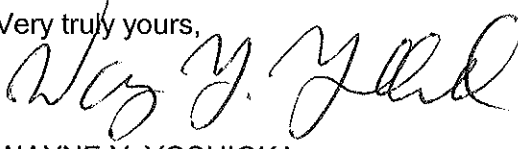

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The General Services Administration (GSA) did not receive a scoping notice for the March and April 2007 NEPA scoping period, nor an invitation to be a participating agency because, at that time, the need for use of federal land at the Prince Jonah Kuhio Kalaniana'ole (PJKK) Federal Building had not been identified. Nor was any other required permit or approval from the GSA identified. The GSA will receive all relevant notices and documents regarding the Project in the future. The DTS met with the GSA and Court staff to determine courthouse security requirements and address security concerns on October 16 and November 10, 2008, and on February 3 and March 31, 2009. In addition, DTS staff will continue to work with the GSA to address safety and security concerns associated with location of the alignment near the PJKK Federal Building. DTS will commit to meet all applicable setback requirements in addition to other security measures as discussed directly with the GSA to safeguard the Department of Justice and other federal staff.

An alignment that avoided Halekauwila Street was evaluated at two stages of the Alternatives Analysis process. This alignment had significant visual impacts, impacts on historic properties, evidence of burials within the vicinity of Queen Street near Kawaiahao Church, impacts on street traffic patterns, and severe engineering constraints, and was not brought forward into the Draft EIS for these reasons. As stated in the Alternatives Screening Memo (Chapter 6), an alignment along Queen Street, rather than Halekauwila Street, had been proposed for screening. Following initial scoping of the alternatives and further engineering analysis, however, it was determined that the Queen Street alignment might not prove to be feasible. As noted in the Alternatives Screening Memo (page 6-3), "The elevated alignment [along Queen Street] would have to pass very near high-rise buildings in some locations. Locating stations within the physical constraints of this alignment is a particular challenge." Both the Queen Street and the Halekauwila Street alignments were advanced to the Alternatives Analysis. While the Halekauwila Street alignment was acknowledged to have the potential for visual impacts on the Aloha Tower, this impact was evaluated in the context of the fact that the Queen Street alignment would have the same impact to Aloha Tower and would have impacts on a number of historical resources. The Queen Street alignment would have significant visual impacts. As noted in the Alternatives Analysis (pages 6-4 to 6-5), "The Queen Street alignment would have somewhat greater negative visual impact because the narrow available right-of-way would require a stacked alignment in the Downtown area and because it would cross between Hale Auhau and the rest of the Hawaii Capital Historic District. The Nimitz Highway/Halekauwila Street/Kapiolani Boulevard alignment would be the best alignment option within Section V." The Capital Historic District is not affected by the Halekauwila alignment. As a result, the Queen Street alignment did not advance from the Alternatives Analysis to the Draft EIS.

Section 4.10.3 of the Final EIS discusses noise and vibration impacts. This analysis concludes that there will not be any moderate or significant noise and vibration impacts on the PJKK Federal Building as a result of the Project. The Project will include an integrated parapet wall at the edge of the guideway structure that extends three feet above the top of rail. The parapet wall will substantially reduce ground-level noise. Wheel skirts will increase the benefit from the parapet wall at locations above the elevation of the track. Once the Project is operating, noise levels will be re-measured to confirm that there are no noise impacts from the Project.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

FEB 6 9 49 AM '09
RECEIVED
GENERAL SERVICES ADMINISTRATION
HAWAII FIELD OFFICE

Dear Mr. Yoshioka:

The purpose of this letter is to bring to your attention the following issues for the Draft Environmental Impact Statement for the Honolulu High-Capacity Transit Corridor Project (the Project) proposed by the Department of Transportation, City and County of Honolulu (DOT). The United States General Services Administration is the owner and property manager of the Prince Jonah Kuhio Kalaniana'ole Federal Building and Courthouse located at 300 Ala Moana Boulevard ("PJKK Building"). The PJKK Building houses approximately 2,000 federal employees from tenants such as the United States District Courts, Marshals Service, Federal Bureau of Investigation, Secret Service, Drug Enforcement Agency, Coast Guard, Department of Homeland Security, Internal Revenue Service, and Social Security Administration. Further, the PJKK has approximately 500 to 700 public visitors per day.

We understand that DOT is proposing an elevated light rail transportation system which will travel on Halekauwila Street, including a portion of the site of the PJKK Federal Building. On December 15, we wrote to DOT to advise them that GSA, an affected property owner, had not received an invitation to participate in the scoping process. Nor have we received any of the multiple notices of intent issued for this project and the draft Environmental Impact Statement. (A copy of our December 15 letter is attached).

DOT's January 22 response was silent on the absence of required notice. DOT only expressed that GSA should have commented during the alternatives screening held in 2006 without explaining how GSA could have participated since we were never notified of the alternatives screening. The result of this screening process was that DOT decided to place the route on Halekauwila Street requiring the loss of a portion of the site. DOT stated that any changes to the route at this stage would need city council approval thereby implying that opportunity for meaningful comment has been foreclosed which is in direct contravention of the National Environmental Policy Act (NEPA).

DOT's excuse for failure to notify GSA was that there was opportunity to comment on proposed routes prior to the issuance of the Draft EIS. However, the fact that there was a screening process prior to the issuance of the Draft EIS does not relieve the DOT of its legal obligation to notify interested parties of the EIS process.

Further, as stated above, GSA was never notified of the screening process. Also, the fact that the alternatives screenings process was a public process does not meet the notice requirements of NEPA.

The fact that the proposed project is public knowledge provides only information from the government to the citizens and does not allow information to flow from the citizens to the government. *Natural Resources Defense Council v. Morton*, 388 F.Supp. 829 (D.D.C. 1974).

Since GSA is a property owner whose property is proposed for acquisition, GSA is an "interested party" under NEPA. See *Colony Federal Savings and Loan Association*, 482 F.Supp. 296 (W.D. PA 1980). DOT is legally required to notify interested parties of the proposed project. By failing to do so, DOT has precluded GSA from raising environmental issues prior to its selection of Halekauwila as part of the preferred alternative.

We believe that there are important issues critical to DOT's ability to make an informed decision about the Halekauwila Street portion of the route. GSA would have been able to provide DOT information about the possible significant adverse impact of the proposed project. We are very concerned that the presence of an elevated rail transit system in close proximity to the PJKK will create security problems.

In our February 3, 2009 meeting with Faith Miyamoto, Chief of Transportation Planning, and City consultants we discussed some of these security concerns. After the bombing of the federal building in Oklahoma, all federal buildings were classified according to necessary security level. Minimum security standards were established for each security level. Due to high volume public contact and the presence of the US District courts and other agencies, the PJKK Federal Building has been classified at a security level necessitating stringent security requirements. As a result, the PJKK building must be setback to the maximum extent possible from any potential point of explosion. Introduction of the light rail along the Halekauwila Street and/or reducing our current setback will adversely impact the security of the occupants of the PJKK Federal Building and may limit the agencies that can occupy this building.

During this meeting, we also shared other possible impacts and asked for additional information. We were informed that an Ala Moana route had been the preferred alternative for rapid transit in the past, but was ruled out during the current DEIS process primarily because of prior opposition from the federal community. Frankly, we are perplexed that "federal concerns" were cited as the primary reason that the Ala Moana alternative was abandoned, yet we were not consulted during the process of selecting Halekauwila Street as the preferred local alternative. It should have been obvious to DOT that GSA and the federal community would have similar issues on either side of the PJKK Building; and in fact, our concerns are more serious regarding the Halekauwila Street alternative given its more limited set-back.

During our meeting we also discussed serious concerns about the shortfalls in the development and analysis of the City's in-house security evaluation titled, "Potential Threats to Federal Court Building from Transit Viaduct (copy attached). This security evaluation was prepared last year and was not shared with GSA. In fact, we only learned of the existence of this report by second hand sources on February 2, 2009, the day before our meeting. However, we do appreciate DOT's willingness to provide considerable background information regarding the subject report. First, it was confirmed during our meeting that the report was prepared by the City's in-house security staff without any consultation with GSA as the PJKK Building's owner or any federal executive agency tenants such as FBI, DHS, DEA and Secret Service. Second, it was confirmed that the PJKK Building had been inadvertently overlooked as a building with a high risk security rating, and would have otherwise been considered for a compressive and participatory security study similar to those conducted at Pearl

Harbor Navy Yard, Hickam Air Force Base, and Fort Shafter. We were told that DOT acknowledges that a comprehensive security evaluation is in order. Subsequent to our meeting, we received a telephone call from DOT's security consultant, Peter Loverso of Parsons Brinckerhoff, who has requested a kick-off meeting with GSA regarding a security evaluation scheduled for March 31, 2009.

It appears that it is not too late for route changes from a cost standpoint, as evidenced by a recent change approved by the City Council from a routing along Salt Lake Blvd. to an alternative route closer to the Honolulu International Airport. Further, we were informed during the meeting that the alternatives to Halekauwila (Ala Moana and Queen Street) are still considered to be feasible routes from environmental impact, constructability and cost standpoints.

In *Oregon Environmental Council v. Kunzman*, 817 F.2d 484 (9th Cir. 1987), the 9th Circuit held that the form, content and preparation of an EIS should foster both informed decision-making and informed public participation. Certainly, a security evaluation which accurately assesses the true security risks of the Project on PJKK will provide DOT with the ability to make an informed decision about the proposed route on Halekauwila Street in accordance with NEPA.

In conclusion, we look forward to working with the City DOT and its consultants during the process of a comprehensive and participatory security evaluation of the Halekauwila Street route relative to the PJKK Building. However, there should be no foregone conclusion that mitigation of our security concerns should stop short of a possible route change.

Sincerely,

Michael D. Larson
Property Manager

Wayne Yoshioka, Director
Department of Transportation
City and County of Honolulu
650 S. King Street, 3rd Floor
Honolulu, Hawaii 96813

Dear Mr. Yoshioka:

The purpose of this letter is to express our concerns over the proposed Honolulu High Capacity Transit Corridor Project.

The United States General Services Administration is the record owner of the Prince Jonah Kuhio Kalanianaʻole Federal Building and Courthouse located at 300 Ala Moana Boulevard ("PJKK Building"). We have never received any notice from the City and County of Honolulu Department of Transportation Services Rapid Transit Division (DOT) about this project. As such, we were surprised to learn that the proposed project entails the construction and operation of an elevated transit system along a narrow street directly abutting the PJKK Building on Halekawila Street. As a federal agency and property owner significantly impacted by the proposed project, DOT is required to invite us to participate in the scoping process which appears to have occurred in late Dec 2005 and January 2006. Nor have we received any of the multiple notices of intent issued for this project and the draft Environmental Impact Statement. See List of Draft EIS recipients attached to the Draft EIS.

We hope that this project has not proceeded so far that any possibility of our providing meaningful comment at this time has been eliminated. Our obvious concerns include noise, vibration, security and apparent site easement. We are hereby requesting an immediate meeting with DOT in order that we may be briefed as to the proposed project and its particular impact upon the PJKK Building. We would caution DOT not to proceed on the basis that that any property necessary for this project (including air rights) along Halekawila can be obtained through the eminent domain process since this process is not available against the United States.

We trust that DOT will immediately correct its notice procedures and now include us on the mailing list for this project and provide all documents prepared and invitations of public meetings for the proposed project to the United States of America. Please note that all information should be sent to the PJKK Building as follows:

Michael D. Larson, Property Manager

HONOLULU RAIL TRANSIT PROJECT

Potential Threats to Federal Court Building from Transit Viaduct

The construction of a transit viaduct in close proximity to the court house has been evaluated by security specialists for potential security vulnerabilities. As a result of this evaluation, the possibility of an assault from the viaduct to the court house is deemed to be most improbable for many reasons, including: lack of access to viaduct, easy detection of trespassers, lack of sufficient time to plan an attack, lack of time to carry out an attack, lack of a plausible escape route by a perpetrator, challenge of coordination between train schedules and target availability, and alternatives for accomplishing such an assault which would have significantly less risk of failure.

The evaluation team included a PB Force Protection Specialist with extensive DOD experience, a PB Senior Security Specialist who was a former DHS/TSA executive for Mass Transit and a PB Senior Safety and Security Specialist who was the former DOT/FTA Director of Safety and Security. All of these specialists have conducted numerous vulnerability assessments for transit systems, and maintain high security clearances and liaisons with their prior agencies for current threats, threat trends and security best practices.

Part of the evaluation process was examining similar systems the team is familiar with: the Miami Dade People Mover, Detroit People Mover and Seattle Monorail all travel within close proximity of buildings and in some cases within 50 feet. The Detroit People Mover is adjacent to the federal court house. There have never been any threats or incidents from the People Mover.

The evaluation team contacted the intelligence community regarding this possible threat. Factors considered that would dissuade this type of an assault are: lack the ability of "dry runs", challenged by timing of the target versus train schedules, possibility of being detected (during planning and execution of the attack) and the lack of a good escape method. The team also checked for new or existing current threats that would affect this situation; none were identified.

Significant challenges for anyone attempting an assault from the viaduct include an intrusion detection system protecting entrances to the track area, complemented with CCTVs specifically pointed from platform ends to track area. Trespassers will be detected and a response generated, making it very difficult for a sniper to carry out surveillance or an attack successfully.

Security standards for federal buildings are published by the US General Services Administration. After 9/11, the standards were categorized listed as sensitive security information (SSI) and are no longer available without a specific need to know. The US Protective Services and the US Marshals have access to this information. Judges need to confer with them for any guidance in this matter.

HONOLULU RAIL TRANSIT PROJECT

A requirement in the System Safety Management Plan (SSMP) is the development of a Security Plan for the construction phase of the project. The construction contractor will be required to develop the plan and address security issues such as this one. There are a variety of measures that can be implemented, including security fencing to restrict access to the guideway, lighting to aid in detection, intrusion detection systems, and security patrols.

Though the evaluation team found this threat to be most improbable, the following security enhancements for the courthouse can be taken:

- Obscure the direct line of view from the viaduct. Installing a screening wall along the viaduct in the areas of access where there is a direct line of view to the courthouse will reduce opportunities for surveillance of the building and access to areas where a direct fire event could be launched.
- Window glass film/frame anchoring. Attaching a clear or tinted composite film over the window's glass to resist a direct fire or blast overpressure; also, it keeps the glass panel together as a single unit, thus reducing flying glass shards (Kobar Towers). However, window frames require anchoring to the building structure and a horizontal catch bar should be installed on the inside of the window to 'catch' the glass panel if the frame fails, thus, preventing the glass panel from becoming a missile hazard.
- Relocate the Judges Chambers. Relocating the judges' chambers to an area of the building that has limited or no direct line of view and limited entry, multi-level access controls. Remove any public, external, or internal identification, signs, boards, menu's, entrances, etc that list directions or locations to Chambers.
- Tint Chamber windows. Prevent the public from seeing into the Chambers to determine if they are occupied by applying a reflective film over the windows. This may also provide environmental conditioning savings to the building and prevent ultra-violet damage to office property.

Dear Mr. Larson:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your December 15, 2008 letter is addressed in an individual response letter to the General Service Administration (GSA) that is included in Appendix A to the Final EIS.

The GSA did not receive a scoping notice for the March and April 2007 NEPA scoping period, nor an invitation to be a participating agency because, at that time, the need for use of federal land at the PJKK Federal Building had not been identified. Nor was any other required permit or approval from the GSA identified.

Since the publication of the Draft EIS, DTS has coordinated directly with GSA on safety and security concerns at the Federal Courthouse building. GSA has provided documents allowing a more comprehensive determination of security needs. The Project's Safety and Security experts will continue to work with GSA staff on security concerns. Project staff has been working with property management staff from the GSA. We will commit to meet all applicable setback requirements in addition to other security measures as discussed directly with the GSA to safeguard the Department of Justice and other federal staff. We are confident that we can adequately address your concerns without moving the proposed alignment. Section 2.5.4, Safety and Security Measures, of this Final EIS contains additional details on security measures being incorporated into the project.

An alignment that avoided Halekauwila Street was evaluated at two stages of the Alternatives Analysis process. A Queen Street alignment had significant visual impacts, impacts on historic properties, evidence of burials within the vicinity of Queen Street near Kawaiahao Church, impacts on street traffic patterns, and severe engineering constraints, and was not brought forward into the Draft EIS for these reasons. As stated in the Alternatives Screening Memo (Chapter 6), an alignment along Queen Street, rather than Halekauwila Street, had been proposed for screening. Following initial scoping of the alternatives and further engineering analysis, however, it was determined that the Queen Street alignment might not prove to be feasible. As noted in the Alternatives Screening Memo (Page 6-3), "The elevated alignment [along Queen Street] would have to pass very near high-rise buildings in some locations. Locating stations within the physical constraints of this alignment is a particular challenge." Both the Queen Street and the Halekauwila Street alignments were advanced to the Alternatives Analysis. While the Halekauwila Street alignment was acknowledged to have the potential for visual impacts on the Aloha Tower, this impact was evaluated in the context of the fact that the Queen Street alignment would have the same impact to Aloha Tower and would have impacts on a number of historical resources. The Queen Street alignment would have significant visual impacts. As noted in the Alternatives Analysis (Pages 6-4 to 6-5), "The Queen Street alignment would have somewhat greater negative visual impact because the narrow available right-of-way would require a stacked alignment in the Downtown area and because it would cross between Hale Auhau and the rest of the Hawaii Capital Historic District. The Nimitz Highway/Halekauwila Street/Kapiolani Boulevard alignment would be the best alignment option within Section V." The Capital Historic District is not affected by the Halekauwila alignment. As a result, the Queen Street alignment did not advance from the Alternatives Analysis to the Draft EIS.

Queen Street, King Street, and Beretania Street were previously evaluated during the Alternatives Analysis process for either an elevated or underground alignment and determined to be inferior to Halekauwila Street based on a number of considerations. The effects from a Queen Street alignment are discussed previously in this letter. In addition, Queen Street is narrower than Halekauwila Street. An elevated system on either Beretania Street or King Street would run in front of either the State Capitol or Iolani Palace and would require removal of traffic lanes. The Ala Moana Boulevard to Pohukaina Street alignment was eliminated during the project screening process partially because the alignment would cross a substantial portion of the Federal Building property. The Halekauwila Street alignment is entirely within the City's street right-of-way as it passes in front of the Federal Building. The only encroachment from the Halekauwila Street alignment is to the open area Ewa of the Federal Building.

Ms. Michael D. Larson

Comments on Rail Draft Environmental Impact Statement

Dear Wayne,

We are writing to express our support for allowing bicycles and luggage on the Honolulu rail system. Making provision for bicycles and luggage on rail cars will increase ridership of the new system.

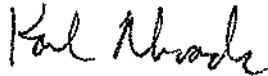

The draft EIS indicates (page 3-35) that accommodation for bicycles on rail cars is being contemplated during off-peak hours. We believe allowing bicycles on rail cars only during off-peak hours would be a mistake. As you know, integrating the various modes of transportation is essential to maximizing the benefits of rail. Prohibiting bicycles during rush hour would discourage the use of bicycles as a commuting vehicle. Some commuters may not wish to leave their bicycles at a station due to fears of theft. Others may need the bicycle to complete their commute once off the train. Either way, in a climate where bicycles can be ridden year-round, we should encourage their use not put up barriers to it.

With regard to luggage, whether the airport route or the Salt Lake route is ultimately chosen, we strongly support allowing luggage on the train including suitcases, backpacks, duffel bags and any other hand-carried containers. While there are important advantages to riding the train, there are disadvantages as well. One disadvantage is that a rider can only bring on what he/she can carry. Putting any further limit on luggage discourages ridership.

Some may argue that allowing suitcases poses a security risk, but a suitcase carried to the checkpoint of an airport poses just as great a threat. It could also be argued that a person weighted down with luggage will impede other passengers. While this is true to an extent, it is outweighed by the fact that every person who rides the train will alleviate traffic congestion.

Mahalo for considering our comments.

Dear Representative Lee:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 Identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Regarding your questions about bicycle accommodations on trains, bicycles will be allowed on trains, as regulated by a bicycle policy that has yet to be developed. In addition, the luggage policy for the system is not final, but the concept of the policy will be to allow luggage that does not interfere with the safety or comfort of other passengers. No change to the policy on TheBus is proposed at this time.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka", is written over the typed name.

SECTION'S OFFICE
OF THE
DEPARTMENT OF
TRANSPORTATION SERVICES

Dear Messrs. Matley and Yoshioka:

Subject: Honolulu High Capacity Transit Corridor Project
City and County of Honolulu Draft EIS 4(f) Evaluation (November 2008)

Thank you for the opportunity to provide comments on the City's high-capacity transit corridor project. We represent the Ala Moana-Sheridan, central Kaka'ako and McCully communities whose residents and small businesses are located within a 7-block radius of the Honolulu High-Capacity Transit Corridor project route between Halekiauila to Kona Street.

With respect to the central Kaka'ako and Ala Moana-Sheridan neighborhoods most directly impacted by the HHCTCP route, we have the following concerns regarding displacement of existing businesses and older residents, as well as further congestion of heavily-trafficked thoroughfares:

Transit Impacts upon Central Kaka'ako business district

In 2006, the Kaka'ako mauka portion of Kaka'ako included 1,479 businesses with 16,931 employees (representing 3.7% of Honolulu's non-agriculture workers), and generating \$2.02 billion in annual sales.

Of this amount, central Kaka'ako businesses in 2007 employed about 1,971 people and generated estimated sales of \$259 million dollars (source: *Final Report and Quarterly Report No. 4 for Contract entitled "Transit Oriented Community-based Development Project", Honolulu City Council, March 2008*).

1. Central Kaka'ako transit right-of-way acquisitions: The City's HHCTCP DEIS identifies nine private properties for acquisition in their entirety, with an

Mr. Ted Matley
Mr. Wayne Yoshioka
February 5, 2009
Page 2

estimated 20 small businesses that generate at least \$14.4 million in annual income being directly displaced. An additional 28 properties (with roughly 30 small businesses) are proposed for partial acquisition (*source: HHCTCP DEIS, Appendix B, November 2008*), with various properties subject to loss of on-street parking, business visibility and aesthetics due to transit columns. Central Kaka'ako service businesses are especially vulnerable to transit displacement because they are subject to multiple layers of regulation – rapidly-escalating property taxes imposed by the City & County of Honolulu, combined with zoning/property assessments designed for larger landholdings imposed by the Hawaii Community Development Authority. The nature of small businesses also means that their needs and unique requirements cannot readily be addressed by a one-size-fits-all approach.

Of the remaining 54 partial acquisitions and 15 full acquisitions of house numbers (portions within a single TMK parcel) identified by the HHCTCP DEIS for the central Kaka'ako route, a large number of home owners and residents in the area will be displaced as a result of the current alignment.

2. Mitigation measures for businesses and residents displaced or impacted by transit route alignments in central Kaka'ako: Section 4-42 of the DEIS, covering impacts of the HHCTCP route upon neighborhoods, glosses over the likely impacts in the Ala Moana-Kaka'ako region through this observation:

"[t]he transition between...[Downtown] and Ala Moana Center would require acquisitions and displacements...Because Kaka'ako has been designated a redevelopment area, changes in land uses to transit-oriented development is likely, which may result in a change in character along the alignment, especially near stations (emphasis added)."

With a total of 82 partial acquisitions and 24 full acquisitions in this area alone, the HHCTCP discussion of mitigation measures and ways to address the needs of those being displaced is woefully inadequate.

We believe the following questions, which are not addressed in the HHCTCP DEIS document, must be addressed by the City & County of Honolulu for heavily-impacted neighborhoods like Ala Moana-Kaka'ako:

- What steps has the City & County of Honolulu taken in notifying property owners, residents and businesses of their likely displacement (through full and partial property acquisitions), and what assistance has been offered to property owners, residents and businesses to compensate for their losses?
- What kinds of displacement assistance and/or relocation assistance, financial aid or tax relief will property owners, residents and businesses be provided in order to address business disruption/termination? What is

Mr. Ted Matley
Mr. Wayne Yoshioka
February 5, 2009
Page 3

the City & County of Honolulu's timeline for notifying affected property owners, residents and businesses and offering assistance with relocation, financial aid or tax relief?

- What steps will the City & County of Honolulu take to help maintain service businesses in central Kaka'ako, especially where those businesses' strategic location near major employment centers (Downtown, Civic Center, Makiki, Ala Moana and Waikiki) equals over \$250 million in annual sales?

For example, central Kaka'ako houses over 25% of Honolulu's auto repair, mechanical repair/auto body and repainting businesses, as well as a substantial number of businesses providing wholesale and direct service support to Waikiki, Ala Moana hotels, restaurants and retail outlets. Where will residents, employees in urban Honolulu and Ala Moana/Waikiki businesses have to go to obtain these services?

- What actions will the City & County of Honolulu take to address displacement of property owners and residents on fixed incomes or with limited means? What programs will the City & County of Honolulu provide to assist senior citizens and elderly property owners with relocation financing, alternative housing and transit assistance as development of TODs "of a different character" emerge in their neighborhoods?

Transit Impacts upon the Ala Moana/Sheridan community

In its cursory observation of the impacts that the proposed transit route will have upon the Ala Moana/Kaka'ako area cited in Section 4-42 of the DEIS, the HHCTCP DEIS fails to incorporate recommendations from community planning and traffic studies conducted over the past decade for this area.

For example, the City & County of Honolulu's Ala Moana-Sheridan Draft Community Plan (*Department of Planning and Permitting, 2006*) and Transit Oriented Community-based Development Project, Phase I Report (*Honolulu City Council, March 2008*) have characterized this area as one with a rapidly-growing percentage of elderly residents - 65-and older residents comprise 20% of today's population, and the number is increasing.

Recognizing the high percentage of elderly residents in the Ala Moana and Kaka'ako area, the Ala Moana-Sheridan Draft Community Plan recommended a series of changes to improve pedestrian safety in the Kapiolani corridor (e.g., Kapiolani/Keeaumoku, Kapiolani/Atkinson Drive, Atkinson/Ala Moana Boulevard).

It also identified the Kapiolani/Keeaumoku intersection as one of the most dangerous intersections in Honolulu. It sought to reduce the level of through-traffic through Sheridan streets by proposing that Piikoi Street and Pensacola

Mr. Ted Matley
Mr. Wayne Yoshioka
February 5, 2009
Page 4

Street be changed from one-way streets to two-way streets that utilized a landscaped median to provide a means for pedestrians and bicyclists to safely cross these two multi-lane streets.

We believe that the following should also be addressed as part of the HHCTCP DEIS mitigation measures for the Ala Moana/Kaka'ako community:

- What steps will the City & County of Honolulu take to address the existing level of high traffic volume along the Kapiolani corridor and use transit station locations and services along its mass transit route to provide a safer transit travel alternative for elderly residents?
- What steps will the City & County of Honolulu take to reduce pedestrian safety hazards in the Kapiolani/Keeaumoku intersection, especially with respect to the elevated transit station planned for the Ala Moana Center at Nordstrom's?
- What design alternatives is the City & County of Honolulu evaluating to make it safe and easy for elderly, immigrant and very young transit-riders and pedestrians to navigate between the elevated transit station and street-level buses departing/arriving at Ala Moana Center?
- What alternatives has the City & County of Honolulu considered in identifying the best solutions for separating pedestrian traffic from vehicular traffic in the Kapiolani corridor? For example, has the City & County of Honolulu considered construction of a pedestrian overpass between the Ala Moana Center transit station at Nordstrom's and mauka side of Kapiolani Boulevard?
- What steps has the City & County of Honolulu taken to evaluate pedestrian-friendly alternatives for mauka-makaa traffic in the Kapiolani corridor (e.g., Kalakaua, Atkinson, Keeaumoku, Piikoi, Pensacola, Ward), such as modifying the one-way directions for Piikoi/Pensacola Streets into two-way streets?
- What alternatives has the City & County of Honolulu considered in identifying the best means of enhancing the use of NBC Exhibition Hall and Arena and its existing parking facilities with close proximity to a mass transit station?

We strongly endorse the benefits that can accrue to our neighborhoods as a result of transit development; and seek to work proactively with our city and federal partners. Although the draft EIS has not addressed some of these issues in sufficient detail to provide appropriate mitigation, we are confident these issues can be dealt with in the months ahead as we complete our review of the Final EIS.

Mr. Ted Matley
Mr. Wayne Yoshioka
February 5, 2009

The Honorable Carol Fukunaga
The Senate
Hawaii State Capitol, Room 216
Honolulu, Hawaii 96813

Dear Senator Fukunaga:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Central Kakaako Business District

Regarding your comments on the Central Kakaako District, DTS has considered the complexities and interdependencies of the Kakaako district. Overall the Project is expected to strengthen the district's function as an employment center. The Project also could bring in new customers for businesses and services because of the increased mobility and access the new transit mode will provide to a wider region.

According to Appendix C of the Final EIS, there will be 28 partial acquisitions and 6 full acquisitions, resulting in 18 business displacements between Bishop Street and Ala Moana Center. Of these displacements, 11 will occur along the alignment between South Street and

Kamakee Street. In addition, 12 of the 28 partial acquisitions will occur between South Street and Kamakee Street, but these acquisitions are not expected to displace any businesses. There are not any residential displacements in this area of the corridor.

Acquisitions, displacements, and relocations will be addressed on a case-by-case basis as discussed in Section 4.4 of the Final EIS, and property that will be directly affected by the Project will be purchased at market rates. As stated in Section 4.4.3 of the Final EIS, "... compensation will be provided to affected property owners, businesses, or residents in compliance with all applicable Federal and State laws and will follow the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act (49 CFR 24)." Specific mitigation measures are listed in Section 4.4 of the Final EIS.

Your bulleted points are addressed separately below.

- Owners of properties where an acquisition is required have all been individually contacted to discuss right-of-way options. Those from whom property is to be acquired will be treated according to the requirements of the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act. It provides for purchase at fair market value and includes relocation assistance to those affected. The Act requires that those in need of relocation be placed in comparable quarters for living or for business. It should be noted that because of the design of the system, it impacts fewer properties compared to other projects of this size and requires full acquisition of only 33 properties throughout the entire alignment, as indicated in Section 4.4 of the Final EIS.*
- As stated in Section 4.4.3 of the Final EIS, "... compensation will be provided to affected property owners, businesses, or residents in compliance with all applicable Federal and State laws and will follow the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act (49 CFR 24)." As stated previously, owners of properties where an acquisition is required have all been individually contacted to discuss right-of-way options.*
- DTS has considered the complexities and interdependencies of the Kakaako district. Overall the Project is expected to strengthen the district's function as an employment center. The Project also could bring in new customers for businesses and services because of the increased mobility and access the new transit mode will provide to a wider region. It is beyond the scope of this EIS to predict where displaced businesses will choose to relocate.*
- Section 4.18 of the Final EIS discusses the temporary and limited construction effects of the Project. Coordination will occur with all businesses and residents adjacent to the study corridor who may be affected by construction regarding business and home-life activities that need to be maintained during construction. Details are available in Section 4.18.1 of the Final EIS, which includes proposed mitigation.*

As stated in Section 4.4.3 of the Final EIS, "... compensation will be provided to affected property owners, businesses, or residents in compliance with all applicable Federal and State laws and will follow the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act (49 CFR 24)."

Ala Moana/Sheridan Community

To address your comments on the Ala Moana/Sheridan communities, the analysis conducted for the Draft and Final EISs considered the committed transportation projects that are identified in the Oahu Regional Transportation Plan (OahuMPO 2007). Congestion-relief projects are described in Table 2-3 of the Final EIS. Projects not related to the transit project are not addressed in the Draft and Final EISs.

Your bulleted points are addressed separately below.

- The Project provides a safe, reliable high-speed transit system that will reduce traffic volume and delay in the study corridor compared with the No Build Alternative in 2030. Near stations, however, there could be additional traffic caused by vehicles (buses, cars, taxis, etc.) trying to access the stations. Traffic analysis conducted for the EIS found that the Project will not affect Kapiolani Boulevard, and therefore the Project does not propose any changes to Kapiolani Boulevard. DTS is working with appropriate State and City agencies to prioritize improvements to pedestrian and bicycle facilities and to encourage construction of safe and convenient connections to the rail stations.*
- All transit stations will be fully accessible and comply with the Americans with Disabilities Act (ADA) and other relevant regulations. Stations are being designed to allow safe and convenient access to adjacent areas. There are no proposed changes to Kapiolani Boulevard or the intersection of Kapiolani Boulevard and Keeaumoku Street as part of the Project. However, as discussed above, DTS is working with appropriate State and City agencies to prioritize improvements to pedestrian and bicycle facilities near rail stations.*
- Facilities at all guideway stations will be designed in a manner that accommodates persons with disabilities consistent with ADA requirements. Each station will have escalators and elevators to allow access between platforms and the street. The majority of transit passengers will be familiar with the process of entering and using the system. However, by using identical or similar station access as well as concourse and platform configurations, all passengers, regular users, newcomers, tourists, the elderly, and persons with disabilities will find the system user-friendly and inviting.*
- Pedestrians will use the existing network of sidewalks in the Kapiolani corridor. A pedestrian overpass at this location is not proposed as part of the Project, but the Project does not preclude future projects such as this by others.*
- Pedestrian planning along those roadways is outside the focus of the Project.*

- *Use of the Neal Blaisdell Center for station area parking is not being considered as part of the Project. However, as stated in Section 3.4.7 of the Final EIS, the approach to mitigating the effects of spillover parking will be unique to each station area. The City will conduct surveys to determine the extent of spillover parking near stations and implement one or more mitigation strategies as needed. Strategies to be considered include, but are not limited to, parking restrictions (where parking causes safety or congestion problems) and shared parking arrangements (at locations where parking is available but dedicated to another purpose, such as retail centers, office uses, or places of worship). Implemented strategies will be monitored, and necessary adjustments will be made as needed.*

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE J. YOSHIOKA
Director

Dear Representative Brower:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Central Kakaako Business District

Regarding your comments on the Central Kakaako District, DTS has considered the complexities and interdependencies of the Kakaako district. Overall the Project is expected to strengthen the district's function as an employment center. The Project also could bring in new customers for businesses and services because of the increased mobility and access the new transit mode will provide to a wider region.

According to Appendix C of the Final EIS, there will be 28 partial acquisitions and 6 full acquisitions, resulting in 18 business displacements between Bishop Street and Ala Moana Center. Of these displacements, 11 will occur along the alignment between South Street and

Kamakee Street. In addition, 12 of the 28 partial acquisitions will occur between South Street and Kamakee Street, but these acquisitions are not expected to displace any businesses. There are not any residential displacements in this area of the corridor.

Acquisitions, displacements, and relocations will be addressed on a case-by-case basis as discussed in Section 4.4 of the Final EIS, and property that will be directly affected by the Project will be purchased at market rates. As stated in Section 4.4.3 of the Final EIS, "... compensation will be provided to affected property owners, businesses, or residents in compliance with all applicable Federal and State laws and will follow the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act (49 CFR 24)." Specific mitigation measures are listed in Section 4.4 of the Final EIS.

Your bulleted points are addressed separately below.

- Owners of properties where an acquisition is required have all been individually contacted to discuss right-of-way options. Those from whom property is to be acquired will be treated according to the requirements of the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act. It provides for purchase at fair market value and includes relocation assistance to those affected. The Act requires that those in need of relocation be placed in comparable quarters for living or for business. It should be noted that because of the design of the system, it impacts fewer properties compared to other projects of this size and requires full acquisition of only 33 properties throughout the entire alignment, as indicated in Section 4.4 of the Final EIS.*
- As stated in Section 4.4.3 of the Final EIS, "... compensation will be provided to affected property owners, businesses, or residents in compliance with all applicable Federal and State laws and will follow the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act (49 CFR 24)." As stated previously, owners of properties where an acquisition is required have all been individually contacted to discuss right-of-way options.*
- DTS has considered the complexities and interdependencies of the Kakaako district. Overall the Project is expected to strengthen the district's function as an employment center. The Project also could bring in new customers for businesses and services because of the increased mobility and access the new transit mode will provide to a wider region. It is beyond the scope of this EIS to predict where displaced businesses will choose to relocate.*
- Section 4.18 of the Final EIS discusses the temporary and limited construction effects of the Project. Coordination will occur with all businesses and residents adjacent to the study corridor who may be affected by construction regarding business and home-life activities that need to be maintained during construction. Details are available in Section 4.18.1 of the Final EIS, which includes proposed mitigation.*

As stated in Section 4.4.3 of the Final EIS, "... compensation will be provided to affected property owners, businesses, or residents in compliance with all applicable Federal and State laws and will follow the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act (49 CFR 24)."

Ala Moana/Sheridan Community

To address your comments on the Ala Moana/Sheridan communities, the analysis conducted for the Draft and Final EISs considered the committed transportation projects that are identified in the Oahu Regional Transportation Plan (OahuMPO 2007). Congestion-relief projects are described in Table 2-3 of the Final EIS. Projects not related to the transit project are not addressed in the Draft and Final EISs.

Your bulleted points are addressed separately below.

- The Project provides a safe, reliable high-speed transit system that will reduce traffic volume and delay in the study corridor compared with the No Build Alternative in 2030. Near stations, however, there could be additional traffic caused by vehicles (buses, cars, taxis, etc.) trying to access the stations. Traffic analysis conducted for the EIS found that the Project will not affect Kapiolani Boulevard, and therefore the Project does not propose any changes to Kapiolani Boulevard. DTS is working with appropriate State and City agencies to prioritize improvements to pedestrian and bicycle facilities and to encourage construction of safe and convenient connections to the rail stations.*
- All transit stations will be fully accessible and comply with the Americans with Disabilities Act (ADA) and other relevant regulations. Stations are being designed to allow safe and convenient access to adjacent areas. There are no proposed changes to Kapiolani Boulevard or the intersection of Kapiolani Boulevard and Keeaumoku Street as part of the Project. However, as discussed above, DTS is working with appropriate State and City agencies to prioritize improvements to pedestrian and bicycle facilities near rail stations.*
- Facilities at all guideway stations will be designed in a manner that accommodates persons with disabilities consistent with ADA requirements. Each station will have escalators and elevators to allow access between platforms and the street. The majority of transit passengers will be familiar with the process of entering and using the system. However, by using identical or similar station access as well as concourse and platform configurations, all passengers, regular users, newcomers, tourists, the elderly, and persons with disabilities will find the system user-friendly and inviting.*
- Pedestrians will use the existing network of sidewalks in the Kapiolani corridor. A pedestrian overpass at this location is not proposed as part of the Project, but the Project does not preclude future projects such as this by others.*
- Pedestrian planning along those roadways is outside the focus of the Project.*

- *Use of the Neal Blaisdell Center for station area parking is not being considered as part of the Project. However, as stated in Section 3.4.7 of the Final EIS, the approach to mitigating the effects of spillover parking will be unique to each station area. The City will conduct surveys to determine the extent of spillover parking near stations and implement one or more mitigation strategies as needed. Strategies to be considered include, but are not limited to, parking restrictions (where parking causes safety or congestion problems) and shared parking arrangements (at locations where parking is available but dedicated to another purpose, such as retail centers, office uses, or places of worship). Implemented strategies will be monitored, and necessary adjustments will be made as needed.*

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

The Honorable Wayne Yoshioka
City Department of Transportation Services
650 South King Street, 3rd Floor
Honolulu, Hawaii 96813

Dear Director Yoshioka:

The Kamehameha Highway Improvements Project Task Force is a group of elected officials, business leaders, and community groups that have a common goal to make traffic, safety and aesthetic improvements to the highway while still maintaining a sense of culture and place. The project focuses on the highway from Waihona Street (Sam's Club in Pearl City) to Center Drive (Pearl Harbor Naval Base).

This group began formally meeting since February 2005 after the State Legislature appropriated an initial \$1.2 million for this effort. Since our initial meeting, we have continued to meet quarterly to discuss our plans for the corridor and identify short-, mid- and long-term projects that will improve and enhance this stretch of the highway.

At our December 10, 2008 meeting, a presentation was made on the Honolulu High-Capacity Transit Corridor Project. We learned that the rail project would utilize the median of Kamehameha Highway through the Aiea-Pearl City area.

While we continue to support the City's effort to provide reliable and effective mass transportation options to meet our City's growing needs, we are wary of becoming merely a corridor for travel for non-residents of Aiea-Pearl City. For example, we are quite concerned about the impacts that a visually-intrusive viaduct may have on our plans to improve the aesthetics of the area, our sense of community pride, and our community's cohesiveness.

At the December 10 meeting, the Task Force reached a consensus on several issues that we would like you, Mayor Mufi Hannemann, your Transit Team, and the City Council to carefully consider when evaluating the mass transit options. The issues the Task Force would like you to consider are:

- We request that remaining overhead utility lines on both the mauka and makai sides of the corridor (such as the mammoth 138 KV lines) be incorporated into the transit viaduct structure. The removal of these massive overhead power lines would help mitigate the further visual degradation that would result from the transit viaduct. Using the transit viaduct to carry all overhead utility lines may provide some aesthetic mitigation at a cost far cheaper than undergrounding the overhead utilities.
- Placement of the transit viaduct down the median of Kamehameha

Highway through our community should be accompanied by meaningful beautification improvements at grade within the median. A cohesive median beautification program would help mitigate the visual intrusion of the viaduct while fostering community pride and cohesiveness.

Attached please find a list of the Kamehameha Highway Improvements Task Force membership. Those members who were present at the December 10, 2008 Task Force meeting are noted. Thank you for considering this input.

With warmest aloha,

Representative K. Mark Takai
Co-Chair, Kamehameha Hwy Improvements Task Force

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Visual effects along the Kamehameha Highway are discussed under the "Fort Weaver Road to Aloha Stadium Landscape Unit" and the "Aloha Stadium to Kalihi Landscape Unit" in Section 4.8.3 of the Final EIS. The Project will be set in an urban context where visual change is expected and differences in scales of structures are typical. Noticeable changes to views will occur where the Project elements will be near existing views or in the foreground of these views. Viewpoints not located near the alignment or stations will generally be less affected by changes in the visual environment because they will take in a longer, more expansive landscape. Medians will be landscaped where appropriate to soften the effect of the guideway and create an attractive environment along the alignment.

The assessment of visual effect due to the Project as described in Section 4.8.3 of the Final EIS considers changes to the visual landscape and viewer responses to those changes. This includes the existing development along the Project alignment. Within the Project corridor

the environment changes from rural at the Wai'anae end of the corridor to dense high-rise development at the Koko Head end.

As part of the design process, the City has developed design principles, which are identified in the Honolulu High-Capacity Transit Corridor Project Compendium of Design Criteria (RTD 2009m) that will be implemented in final design to minimize visual effects of the Project. For example, guideway materials and surface textures will be selected in accordance with generally accepted architectural principles to achieve effective integration between the guideway and its surrounding environment. Landscape and streetscape improvements will mitigate potential visual impacts, primarily for street-level views.

Other measures to address visual impacts of the Project are being developed through the station design and planning process. The initial station area plans and design guidelines were first developed with coordination between DTS and the Department of Planning and Permitting (DPP). The next level of transit station design focuses on integrating individual neighborhood characteristics of the communities served by the stations. The following mitigation framework will be included in the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

- Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
- Coordinate the project design with City TOD planning and DPP.*
- Consult with the communities surrounding each station for input on station design elements.*
- Consider specific sites for landscaping and trees during the final design phase when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will serve to mitigate potential visual impacts.*

Section 4.8.3 of the Final EIS, Design Principles and Mitigation includes information related to the mitigation framework described above. Specifically architecture and landscape design criteria include guidelines regarding site design, materials and finishes, and lighting, which apply to stations, station areas, and the guideway.

It should also be noted that the Project will provide users, including tourists, with expansive views from several portions of the corridor by elevating riders above highway traffic, street trees, and low structures adjacent to the alignment. In Section 4.8.3 of the Final EIS, Environmental Consequences and Mitigation under the heading Design Principles and Mitigation, specific Environmental, Architecture and Landscape Design Criteria are listed that will help minimize visual effects of the Project.

To address your first concern, current plans do not include incorporating utility lines into the transit structure. In addition, to address your second concern, current plans show the Project placed in the median of Kamehameha Highway.

Representative K. Mark Takai
Page 3

As stated in the discussion of mitigation in Section 4.8 of the Final EIS, DTS has developed specifications and Design Criteria to address the City's requirements for the Project. Landscaping and streetscape improvements will mitigate potential visual impacts. Existing trees will be retained where practical and some new vegetation will be provided. DTS will continue to consult with communities surrounding each station for input on station design elements.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is fluid and cursive, with the first name "Way" and last name "Yoshioka" clearly distinguishable.

RE: HNL High-Capacity Corridor Project Draft Environmental Impact Statement/Section 4(f) Evaluation

Dear Director Yoshioka,

Thank you for the copy of the draft Environmental Impact Statement on the Honolulu High-Capacity Transit Corridor Project. Upon review I would like to offer the following comment:

As an outer-island legislator, myself and residents from neighboring counties are forced to pay the GET while visiting Oahu. If the City is using the GET tax to fund this project it would only be fair to include a route to the airport so that our outer-island residents can also enjoy the benefits of a transportation system that they helped fund.

Thank you for the opportunity to comment on this project. If you need further information, please contact me at 808-586-6270, or by email at reptokioka@capitol.hawaii.gov.

Sincerely,

James Kunane Tokioka

Dear Representative Tokioka:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the

Dear Mr. Yoshioka:

Subject: Honolulu High-Capacity Transit Corridor Project
Draft Environmental Impact Statement (DEIS) / Section 4(f) Evaluation

Thank you for your letters of November 12 and November 25, 2008. The Department of Accounting and General Services remains prepared to work with the Department of Transportation Services but questions the *de minimus* determination you made with regard to the Aloha Stadium (Table 5-1, Pages 5-4, 5-10). Your project, including the park-and-ride, will take approximately 6.2 acres of our Aloha Stadium site. This diminishes our use of the site as a recreation facility, particularly the loss of parking during events. The new offsite park-and-ride parking connected to the Aloha Stadium by this project may not compensate for our on-site parking loss. As a reminder, comments in our September 8, 2008 letter still apply, especially Items 1 thru 5. (See attachment or Pages 95-96 of Appendix D of this DEIS).

If you have any questions, please call me at 586-0400 or have your staff call Mr. Bruce Bennett of the Public Works Division at 586-0491.

Sincerely,

Handwritten signature of Russ K. Saito in cursive.

Honolulu, Hawaii 96810

Dear Mr. Saito:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

DTS has met with the Aloha Stadium Manager and the Department of Accounting and General Services since the selection of the Airport Alignment as the preferred alternative. DTS reviewed the impacts of the Project, and the Department of Accounting and General Services has been consulted regarding a de minimis determination.

Potential project impacts to listed and eligible historic properties were evaluated and addressed in the Honolulu High-Capacity Transit Corridor Project Historic Effects Report (RTD 2009). This report contains information detailing the methodology used to evaluate these resources. The State Historic Preservation Division (SHPD) has concurred with the majority of effect determinations and the Project team agreed to accept additional adverse effect

determinations based on the SHPD's analysis. Final determinations of effect are presented in this Final EIS, Section 4.16.

The Project follows Kamehameha Highway on the Airport alignment and does not affect Aloha Stadium parking as substantially as the Salt Lake alignment, considered in the Draft EIS. Only three parking spaces in the main parking lot will be affected by the Airport Alternative, where columns need to be placed to support the guideway. The Project will pave and stripe the existing gravel overflow lot to accommodate a park-and-ride facility to be used by commuters on weekdays and available for use by Stadium attendees at any time. Improved access provided by the fixed guideway station and bus transit center will reduce parking demand. Thus, a multi-level parking structure at Aloha Stadium is not necessary to mitigate Project impacts. Coordination with the Aloha Stadium Manager and the Department of Accounting and General Services to minimize the permanent loss of parking has occurred and will continue during final design.

The City has identified the Airport Alternative as the Preferred Alternative. This selection was based on consideration of the benefits of each alternative, public input on the Draft EIS, and City Council Resolution 08-261 identifying the Airport Alternative. The selection is described in Chapter 2 in this Final EIS.

As indicated in Section 3.5.7, in this Final EIS, a Maintenance of Traffic (MOT) Plan and Transit Mitigation Program will identify measures to mitigate temporary construction related effects on transportation. The MOT Plan will address effects on streets and highways, businesses and residences, and pedestrians and bicyclists for each construction phase. Construction activity at Aloha Stadium will be focused primarily on the overflow parking lot area, for construction of the station, bus transit center and resurfacing of the parking lot. There will also be temporary construction activity in the main parking lot, adjacent to Kamehameha Highway as columns are erected to support the guideway. Construction will not directly affect Stadium activities, and access to the Stadium will be available during construction.

There will be no direct connection from the fixed guideway station to the Stadium or primary Stadium parking lot. Stadium patrons will cross Salt Lake Boulevard at-grade using the existing crosswalk to reach the station entrance. Stations entrances will be securable from the station. DTS has coordinated with the Aloha Stadium Manager and Department of Accounting and General Services with regard to station features. Safety and security are discussed in this Final EIS.

As stated in Section 4.10.3 of the Final EIS, the Project will cause no severe noise impacts. Moderate impacts will occur at upper floors of a few high-rise buildings (as shown in Table 4-18 in the Final EIS). With the recommended mitigation in place (sound absorbing material and wheel skirts), the noise analysis indicates that the new noise generated by the Project will be lower than the existing noise levels in most places.

The project design includes an integrated noise-blocking parapet wall at the edge of the guideway structure that extends three feet above the top of the rail. The parapet wall will substantially reduce ground-level noise. Wheel skirts will increase the benefit from the parapet wall at locations above the elevation of the track. The use of sound-absorptive materials below

the tracks in the areas that will experience moderate noise impacts will reduce the Project noise levels from the upper floors to below the impact level. Once the Project is operating, noise levels will be re-measured to confirm that there are no noise impacts from the Project.

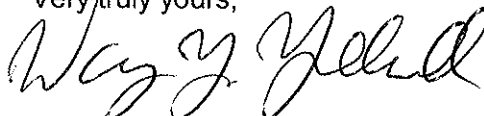

Noise during construction is discussed in Section 4.18.5, Noise and Vibration [Construction Phase Effects] in this Final EIS.

Future traffic conditions in the Aloha Stadium area were analyzed in the Draft EIS, both with and without the Project. Analysis revealed that the Project would not have an effect on future traffic conditions in that location. Therefore, no major changes to traffic patterns are proposed.

The proposed traction power substation, shown on Figure 2-10, Fixed Guideway Transit Alternative Features, Aloha Stadium to Kalihi, in the Final EIS, is on a parcel (TMK 1-5-8:9) owned by the City and County of Honolulu. The proposed traction power substation will not impact the Liliha Civic Center property.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Mr. Wayne Y. Yoshioka, Director
Department of Transportation Services
City & County of Honolulu
650 South King Street, 3rd Floor
Honolulu HI 96813

Dear Mr. Yoshioka:

Subject: Draft Environmental Impact Statement/Section 4(f) Evaluation and Supplemental Information

The Department of Agriculture has reviewed the subject draft environmental impact statement (DEIS) and offers the following comments that are limited to the East Kapolei – Pearl City Highlands segment.

The Honolulu High-Capacity Transit Corridor Project (Project) right-of-way and proposed maintenance facility will use approximately 88 acres of "Prime" and "Other Important" agricultural land, of which approximately 70 acres are actively cultivated (Chapter 4, pages 4-19, -20). The DEIS states that pursuant to the Ewa Development Plan, the larger agricultural area situated on both sides of the Project right-of-way is to be eventually developed into urban uses (see Figure 4-3, Chapter 4, page 4-15). The entire Ewa plain makai of the H-1 Freeway, including the Project, adjacent planned urban development and the existing agricultural activities is within the City's Urban Growth Boundary.

The Project site has many of the attributes that would likely qualify it as candidate Important Agricultural Lands, pursuant to Chapter 205, Hawaii Revised Statutes. The loss of these highly productive agricultural lands and any relocation of the affected farming operations northward make it critical that the agricultural lands, north of the H-1 Freeway and along Kunia Road, designated as "Agricultural Land Preservation" in the Ewa Development Plan and Central Oahu Sustainable Communities Plan remain in agriculture.

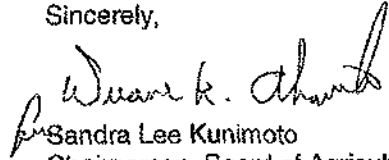

The DEIS states that the project will displace less than one-tenth of one percent of the 70,000 acres of agricultural land in cultivation on Oahu. Obviously the impact on agricultural lands in central Oahu is much greater. We recommend that the DEIS

Mr. Wayne Yoshioka
February 3, 2009
Page 2

include information on the scale of the agricultural activities affected within the vicinity of the Project. For instance, the DEIS for the Hoopili development through which the Project right-of-way passes through, identified four farming operations that are leased or licensed to occupy agricultural lands in the vicinity of the Project – Aloun Farms (1,000 acres of which 301 were planted), Fat Law's Farm (100 acres of which 80 were planted), Sugarland Farms (197 acres of which 64 were planted), and Syngenta Seeds (200 acres of which 59 were planted). These four farms had \$6 million in farmgate revenues, or 4.4% of Oahu revenue from sales of all crops (2006 Statistics of Hawaii Agriculture, page 81), or 14.3% of the farmgate value of vegetables and melons produced on Oahu (ibid., page 80). The farms employed 77 people represents about 3.9% of all the farm workers on Oahu (ibid., page 156).

Furthermore, we recommend that the affected farm operations be made aware and kept informed of the phasing of development, and that they be allowed transit of farm personnel and equipment for fields to be affected by the Project right-of-way so as to maximize their productive use of the leased/licensed lands for as long as possible.

Sincerely,

Sandra Lee Kunimoto

Dear Ms. Kunimoto:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

In Section 4.2.3, Environmental Consequences and Mitigation, of the Final EIS, agricultural lands currently in cultivation as well as agricultural lands designated by the U.S. Department of Agriculture (USDA), the Natural Resources Conservation Service (NRCS), or the State of Hawaii as prime, unique, or of statewide importance, are noted. Some of the designated lands are not currently in active cultivation. The 2002 Census of Agriculture reported that there are more than 70,000 acres of agricultural land in cultivation on Oahu. The use of agricultural land by the Project represents less than one-tenth of one percent of available agricultural land on Oahu.

As further described in Section 4.2.3, approximately 80 acres of prime farmland and 8 acres of statewide-important farmlands will be acquired by the Project, of which 70 acres are actively cultivated. About half of the agricultural property that could be used for the Project is located at the Hoopili maintenance and storage facility option. The site is currently used for agricultural purposes by Aloun Farms, which is leased from a private developer, and is proposed for development in the future as a mixed use development as discussed in Section 4.19.3 of the Final EIS. Total potential effects to agricultural lands is presented in the Final EIS; however, the preferred alternative

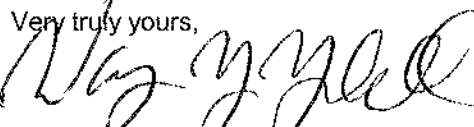

for the maintenance and storage facility is the former Navy fuel storage and delivery facility near Leeward Community College. If the Project can acquire this site, only about 47 agricultural acres of land designated prime or of statewide importance will be used for the Project.

The Adopted Ewa Development Plan (DPP 2000) outlines the use of some areas for dense development while preserving other areas for agriculture. While this area is designated for agriculture use by County zoning, it is outside of the Agricultural and Preservation Area identified in the Ewa Development Plan as illustrated in on Figure 4-2 of the Final EIS. Designation of lands for "Agricultural Land Preservation" is the responsibility of the City's Department of Planning and Permitting (DPP).

As provided in Section 4.19.2, Indirect Effects, in this Final EIS: It is not expected that the Project would lead to an increase in the overall level of growth allowed or expected in the study corridor. Rather, it will influence the distribution rate, density, and intensity of development in the study corridor. It would also support transit-oriented development (TOD) making it more likely that growth would be focused into patterns that would increase the number of viable travel options available to corridor residents and employees, including transit, walking, and bicycling. As an additional benefit, compact TOD would reduce the cost of providing utilities, facilities, and services to new residential and commercial developments.

Operating farms that are affected by the transit project will be given information so they can plan their productive use of the leased lands. There will be a public information program to keep the public (including businesses) informed of construction areas and plans. This program will involve information dissemination and education through the various techniques discussed in Section 8.7, Continuing Public Involvement through Construction, in this Final EIS. Further, as stated in Section 3.5.7, Mitigation of Construction-related Effects, in this Final EIS, the Maintenance of Traffic (MOT) Plan will be developed by the contractor for each phase of construction, and coordinated with and subject to approval by Hawaii Department of Transportation and the City. The Project is committed to such a plan; however, the MOT Plan cannot be developed until final design for the Project is completed to account for all facets of the design. As discussed in Section 4.4 Acquisitions, Displacements, and Relocations, relocation services will be provided to all affected business and residential property owners and tenants without discrimination; and persons, businesses, or organizations that are displaced as a result of the Project will be treated fairly and equitably.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

DIRECTOR'S OFFICE
DEPARTMENT OF TRANSPORTATION SERVICES

Dear Mr. Yoshioka:

Subject: Honolulu High Capacity Transit Corridor Project
Draft Environmental Impact Statement (EIS)

Thank you for sending the State Department of Business, Economic Development & Tourism (DBEDT) a copy of the subject document for review. Following are the recommendations of my department by division.

Research and Economic Analysis Division

DBEDT's Research and Economic Analysis Division, the departmental lead for economic research, methodology, data collection and tracking, has the following recommendations.

1. Page 4-154, Employment: The description on indirect and induced jobs is not clear. We recommend the following wording: "Indirect employment is the jobs created in the supporting industries such as building suppliers, wholesale and retail trade, and transportation, as a result of the rail construction. Induced employment results from the increase in spending by the employees of the construction and other supporting industries from income derived from the rail construction."
2. Table 4-33: The employment impacts are over estimated for the following reasons:
 - A) Total costs were used in estimating the jobs impact, which is equivalent to the assumption that all funds are coming from out of state. Most of the funding comes from the 0.5% County Surcharge Tax. Oahu residents will reduce their consumption on other goods and services due to the increase in the total tax rate. The job loss due to the reduction in resident spending should be taken into account.

- B) The assumption that all funds will be spent on construction is not accurate. A portion of the funds will be used for importing equipment and conducting other studies like the one under review. When calculating the employment impact, it is better to itemize the spending by sector rather than assume that it will all be spent on one industry - construction.

Strategic Industry Division

The Strategic Industries Division of DBEDT, the departmental lead on energy, science and technology issues, has the following recommendations.

1. Page 4-108: With respect to the amount of power the system is projected to consume, the report states, "The Project would consume approximately 1 to 2 percent of the total projected electricity generated in 2030." This is open to some interpretation. What is the actual amount of power the rail will need to operate, and will that demand coincide with the utility's peak electrical demand? Will the City and County develop any type of renewable energy or energy storage projects to meet the requirements for the system? The report goes on to state, "Integration of photo-voltaic cells into stations and other project features could reduce net project electricity demand." How much PV are they estimating they will install, and what percentage of station or system energy requirements will be met by these additions? What other alternatives are they considering as primary or backup power for the system? The bottom line is that more specific details should be provided.
2. In addition, we would like to call your attention to the following considerations:
 - A) **State energy conservation goals.** Project buildings, activities, and site grounds should be designed and/or retrofit with energy saving considerations. The mandate for such consideration is found in Chapter 344, HRS ("State Environmental Policy") and Chapter 226 ("Hawaii State Planning Act"). In particular, we would like to call to your attention HRS 226 18(c) (4) which includes a State objective of promoting all cost-effective energy conservation through adoption of energy-efficient practices and technologies.
 - B) **Energy and resource efficiency.** We encourage a leadership commitment to implement innovative and resource efficient operations and management, and to design and construct related buildings to meet and receive certification for U.S. Green Building Council's Leadership in Energy and Environmental Design (LEED), among others. We also

Mr. Wayne Y. Yoshioka
February 3, 2009
Page 3

encourage planning for or installing energy reduction, energy savings,
or energy producing efforts and technologies to lessen electrical
consumption or to increase efficiencies in using electrical energy.

Thank you for allowing us to provide these recommendations and we look forward to
receiving a copy an updated Final EIS.

Sincerely,

A handwritten signature in black ink, appearing to read 'Theodore E. Liu', written over a large, stylized, handwritten letter 'L'.

Dear Mr. Liu:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Research and Economic Development Division

The recommended definitions regarding indirect employment and induced employment in Section 4.18.1 of the Draft EIS have been integrated into this Final EIS, Section 4.19.1, Background and Methodology [Indirect and Cumulative Effects].

The employment figures presented in Table 4-33 of the Draft EIS were based upon total capital costs associated with the Project. The construction employment analysis did not consider the proposed capital funding sources as presented in

Section 6.2.2 of the Draft EIS to calculate the net employment increase. The net increase in employment will be that portion of the capital cost that is paid by funding sources outside of the State (sometimes referred to as "new money"). Since about one-fifth of the total funding source comes from FTA New Starts funding, the net increase in construction employment from "new money" is about one-fifth of the total presented in Table 4-33.

Note that the employment effects shown in Table 4-35, Employment Effects, in this Final EIS are slightly different from those shown in the Draft EIS. The Draft EIS was based on the 2008 State of Hawaii multiplier rate for heavy civil construction, while the Final EIS used the updated 2009 multipliers.

DTS's analysis indicates that the 0.5 percent surcharge is small enough that it is unlikely to have significant impacts on consumers' discretionary spending habits.

The amount of project capital costs related to additional engineering (final design) and construction management are a very small percentage of the overall budget for project capital costs. While the employment multipliers may be different for engineering and construction management than for heavy civil construction, the differences are not that great to change the overall analysis of employment impacts associated with the Project.

Strategic Industries Division

As discussed in Section 4.10.3 of the Draft EIS, the elevated guideway transit system will require about 1,224 million BTUs per day; this corresponds to about 358 megawatt hours per day. Given that the trains will be running 20 hours per day, this means that the demand load of the transit system on HECO's grid will be 17.9 megawatts. HECO and the independent power producers on Oahu have a firm generating capacity of 1,727 megawatts. Note that projected energy demand shown in Table 4-21, 2030 Summary of Average Daily Transportation Energy Demand in this Final EIS are slightly higher than those reported in the Draft EIS. Since release of the Draft EIS the energy demand was updated based on new vehicle miles traveled data.

HECO and the independent power producers generate about 11 percent of their generating capacity through renewable energy sources. HECO is currently requesting proposals for additional non-firm renewable-energy generating capacity up to 100 megawatts to be in service between 2010 and 2014.

Because of the large current and voltage demands for the propulsion systems for the trains, the transit system cannot directly use alternative energy sources to power the transit system but has to receive power from HECO's grid.

Within the Architecture Design Criteria for the stations, the station design goals includes the following, "Reduce energy consumption and consider the generation of a portion of each station's and support facility's energy requirements through incorporation of new generation integrated photovoltaic technology in canopy structures and roofs." At

this time the station designs, along with their electrical needs that can be met with photovoltaic technology, have not been advanced to provide additional specificity. However, renewable sources, including photovoltaic will be incorporated where feasible.

Sustainability Design Criteria have been prepared to be included in the Project contract documents. The Sustainability Design Criteria reference the City and County of Honolulu Ordinance 06-06 – Green Building Standards for City Facilities. HRS 226 18(c) (4) will be added to the applicable codes and standards of the Sustainability Design Criteria. The Sustainability Design Criteria commit the Project to the following LEED Certification: "Project buildings over 5,000 square feet in area shall be designed to achieve a LEED Silver certification level as defined by the U.S. Green Building Council (USGBC) LEED Green Building Rating System for New Construction and Major Renovation." This will apply to the maintenance and storage facility.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

December 24, 2008

Mr. Wayne Y. Yoshioka, Director
Department of Transportation Services
City and County of Honolulu
650 S. King Street, 3rd Floor
Honolulu, Hawaii 96813

Dear Mr. Yoshioka:

**Subject: Honolulu High-Capacity Transit Corridor Project
Draft Environmental Impact Statement (EIS)**

Thank you for sending the Office of Planning the Draft EIS for the above referenced project. The action triggering the environmental review is the requested use of federal and State funds and land to implement the project.

The project's purpose is to provide high-capacity rapid transit in the highly congested east-west transportation corridor between Kapolei and the University of Hawaii at Manoa, as specified in the Oahu Regional Transportation Plan 2030 (Oahu Metropolitan Planning Organization 2007).

The Office of Planning recommends that the Final EIS sufficiently cover areas of State concern. The Final EIS should consider the impacts of the proposed project and appropriate mitigation measures covering the following issues:

1. **Agricultural Lands** – Preservation of important agricultural lands is a priority for the State and counties. The Draft EIS has a discussion of the issue in Section 4.1.3 but concludes that the effect would not be significant. These lands are currently in agricultural use and represent a significant percentage of prime agricultural lands on Oahu. Please discuss how the loss of these lands can be justified, how other lands of equal importance on Oahu can be protected, and the impact to the specific farm operations and whether they will be able to relocate.
2. **Cultural/Historic Resources** – The Department of Land and Natural Resources, State Historic Preservation Division (SHPD) reviewed the technical reports prepared for the project and did not have any questions or comments regarding the

Mr. Wayne Y. Yoshioka
Page 2
December 24, 2008

methodology used to determine National Register eligibility. SHPD has reviewed the preliminary determination of effects presented in the Draft EIS but has not completed concurrence on determination of adverse effects. SHPD has raised concerns regarding indirect effects to several resources and the magnitude of the effects to the Chinatown Historic District. The Final EIS should include an inventory survey of cultural and historic sites, with monitoring and preservation plans approved by SHPD.

3. **Coastal Zone Management (CZM)** – The proposed project site is entirely within the State Coastal Zone Management Area. The State oversees protection of natural, cultural, and economic resources within the coastal zone. The project as proposed appears to generally conform to the State CZM objectives and policies.

The Office of Planning looks forward to receiving an updated Final EIS with the potential impacts and mitigation measures for the above issues clarified and addressed. If you have any questions, please call Scott Derrickson, AICP, in the Land Use Division at 587-2805.

Sincerely,

Abbey Seth Mayer

Dear Mr. Mayer:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Agricultural Land

In Section 4.2.3, Environmental Consequences and Mitigation, of the Final EIS, agricultural lands currently in cultivation agricultural lands designated by the U.S. Department of Agriculture (USDA), the Natural Resources Conservation Service (NRCS), or the State of Hawaii as prime, unique, or of statewide importance, are noted. Some of the designated lands are not currently in active cultivation. The 2002 Census of Agriculture reported that there are more than

70,000 acres of agricultural land in cultivation on Oahu. The use of agricultural land by the Project represents less than one-tenth of one percent of available agricultural land on Oahu.

As described in Section 4.2.3, Environmental Consequences and Mitigation, in this Final EIS, approximately 80 acres of prime farmland and 8 acres of statewide-important farmlands will be acquired by the Project, of which 70 acres are actively cultivated. About half of the agricultural property that could be used for the Project is located at the Hoopili maintenance and storage facility option. The site is currently used for agricultural purposes by Aloun Farms, which is leased from a private developer, and is proposed for development in the future as a mixed use planned development as discussed in Section 4.19.3, Cumulative Effects, of this Final EIS.

The Adopted Ewa Development Plan (DPP 2000) outlines the use of some areas for dense development while preserving other areas for agriculture. While this area is designated for agriculture use by County zoning, it is outside of the Agricultural and Preservation Area identified in the Ewa Development Plan as discussed in Section 4.19.3, Cumulative Effects, of this Final EIS.

Total potential effects to agricultural lands is presented in the Final EIS; however, the preferred alternative for the maintenance and storage facility is the former Navy fuel storage and delivery facility near Leeward Community College. If the Project can acquire this site, only about 47 acres of agricultural land designated prime or of statewide importance will be used for the Project.

As provided in Section 4.19.2, Indirect Effects, in this Final EIS: It is not expected that the Project would lead to an increase in the overall level of growth allowed or expected in the study corridor. Rather, it will influence the distribution rate, density, and intensity of development in the study corridor. It would also support transit-oriented development (TOD) making it more likely that growth would be focused into patterns that would increase the number of viable travel options available to corridor residents and employees, including transit, walking, and bicycling. As an additional benefit, compact TOD would reduce the cost of providing utilities, facilities, and services to new residential and commercial developments.

Cultural/Historic Resources

Section 4.16, Archaeological, Cultural, and Historic Resources, in this Final EIS contains a complete inventory of historic resources and analysis of impacts to such resources. The eligible or listed historic resources (individual or districts) contained in the Area of Potential Effects are listed in Section 4.16.3 of the Final EIS. State Historic Preservation Division (SHPD) effect determinations as provided in correspondence dated May 21, 2009, and July 22, 2009, were accepted by the FTA. Coordination and consultation with the SHPD and other Section 106 consulting parties has continued since release of the Draft EIS. The status of the final effects determinations and a summary of the consultation process and mitigation are presented in this Final EIS. Mitigation of adverse impacts to historic resources is included in the Programmatic Agreement (Appendix H).

Mr. Abbey Seth Mayer
Page 3

Coastal Zone Management (CZM)

Table 4-40 in this Final EIS, identifies the permits, approvals, and agreements for this Project including the need for a Coastal Zone Management Program consistency determination. The application approval will be submitted to DEBDT following the submittal of FTA New Starts of FFGA application.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

February 10, 2008

Mr. Wayne Y. Yoshioka, Director
Department of Transportation Services
City and County of Honolulu
650 South King Street, 3rd Floor
Honolulu, Hawaii 96813

Dear Mr. Yoshioka:

Draft Environmental Impact Statement
Honolulu High-Capacity Transit Corridor Project, Oahu, Hawaii

Thank you for the opportunity to comment on this important and historic development. After careful review of the documents provided for this project, we wish to propose the following recommendations:

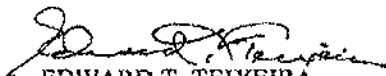

- Relating to Hazardous Materials sites, we feel that the right of way acquisition and site remediation for displaced hazardous materials operations are not fully addressed. If it has not already been done, the Department of Health should be consulted to review this area.
- Mitigation and flood plain management to control storm water quality and quantity may need to be more adequately addressed. If not already done, the Department of Land and Natural Resources should be consulted to review this area.
- When planning the location of transit stops, it is crucial for the safety of passengers that the stops and surrounding development be built outside tsunami evacuation zones. During a destructive tsunami, the structure supporting the transit system could become part of the debris field and cause extensive damage, including the loss of the system.
- In order to alert passengers of approaching tsunamis or other hazards, we recommend that both audible and visual warning displays be included in each transit station. The warning displays should be able to provide emergency information to passengers, including hearing impaired and visually impaired personnel. This warning system should aid in instructing passengers where and how to evacuate should the need arise.

Mr. Wayne Y. Yoshioka
February 10, 2009
Page 2

- Due to Homeland Security consideration and for critical infrastructure protection, we recommend that the transit stations and support columns for the transit system be built with blast barriers designed to prevent automobiles from approaching too closely. Items such as cement planters, etc, could be incorporated into the design and could provide a level of deterrence from attack.
- According to the draft EIS, freeway traffic lanes will be taken away, some temporarily for construction and some permanently. Questions that arise include where will these lane closures occur and what are their durations? Are there plans for traffic rerouting? Evacuation plans will be affected and first responders will need clear access to all neighborhoods. What plans have the City made or are planning to make in the future to mitigate the effects of any loss of lanes?
- What effect will a hurricane have on the new rail system? Are trains expected to operate? By way of comparison, the train system in Houston was shut down for ten days due to Hurricane Ike. What plans are in place to replace transportation lost for rail users once the system is deactivated due to damage?
- Two existing sirens in Waipahu and two in the Honolulu International Airport area are directly in the path of the proposed rail system. These four sirens will have to be relocated due to the construction. We will gladly work with the contractor to find suitable locations for all four sirens.

If you have any questions, please contact Mr. Richard Stercho, State Civil Defense Hazard Mitigation Planner, at (808) 733-4300, ext. 583.

Sincerely,

EDWARD T. TEIXEIRA
Vice Director of Civil Defense

Mr. Edward T. Teixeira
Vice Director of Civil Defense
Department of Defense
State of Hawaii
3949 Diamond Head Road
Honolulu, Hawaii 96816-4495

Dear Mr. Teixeira:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The Project has and will continue to work with the Hawaii Department of Health to address hazardous materials/waste issues along the Project corridor as construction of the system approaches. Table 4-22 in the Final EIS identifies specific sites of concern relative to contamination. As discussed in Section 4.12.3 of the Final EIS, a Phase I Environmental Site Assessment will be performed by the City prior to right-of-way acquisitions for parcels identified as having a risk of contamination.

The State Department of Land and Natural Resources provided comments on the Draft EIS regarding mitigation and floodplain management with respect to stormwater management

and best management practices (BMP). BMPs will be implemented during construction pursuant to the NPDES Construction Stormwater permit. Permanent BMPs are being designed for the park-and-ride facilities and the vehicle maintenance and storage facility to maintain on-site infiltration and prevent polluted runoff from entering streams and near shore waters.

As stated in the introduction section of Chapter 4 in the Final EIS: "The Project will be designed to meet seismic and other design standards related to natural hazards, such as wind forces from tropical storms. The project alignment is outside the tsunami evacuation zones." Stations will be equipped with both audible and visual message systems. Civil defense alerts can be transmitted over this system to inform transit users of tsunamis or other hazards. The transit operating agency will work with Hawaii Department of Defense to develop clear messages and protocols for civil defense alerts prior to commencement of transit operations.

The system will be designed to comply with design requirements for elevated transportation facilities. Columns in roadway medians will have setbacks from the curb face and be designed to withstand an automobile collision. In addition, a safety and security plan will be developed and implemented.

Table 3-21 in the Final EIS presents information regarding column placement effects on streets and highways. The effects listed in this table are permanent. As seen, the Project would not result in any travel lanes being taken away. Some lane widths would be reduced to accommodate column placement; however, this will not affect roadway capacity. As shown in Table 3-23, six intersections will be affected by project-related traffic during the a.m. and p.m. peak hours. Planned mitigation measures to address traffic effects at these intersections are discussed in Section 3.4.7 of the Final EIS. As such, there will not be any permanent impacts on roadway capacity or emergency evacuations.

Table 3-27 in the Final EIS presents information on potential peak-period lane closures during construction. These closures will be temporary in nature. Prior to construction, a Maintenance of Traffic (MOT) Plan will be prepared and will identify the duration of lane closures and plans for traffic rerouting. The contractor will develop the MOT Plan with approval from the City DTS and Hawaii Department of Transportation. Any temporary closures to support construction will be coordinated with emergency service providers and will address emergency evacuation routes.

As discussed in the Geology, Soils, Farmlands, and Natural Hazards Technical Report (RTD 2008), the guideway and other structures will be designed and constructed to withstand wind forces from tropical storms. Some piers and stations will be located within floodplains, but no increased hazards are anticipated because the guideway and stations will be elevated. The aforementioned technical report is available on the Project website (www.honolulustransit.org). Since trains and rail stations will be electrically powered, the system's infrastructure is being designed to handle service disruptions. For example, trains will draw power from many points along the route, so an outage in a few areas should not disrupt service. If electrical power is lost systemwide, then train brakes are designed to stop the rail cars even without power, lights will stay on in trains and stations, and backup batteries will provide lighting for several hours. The train operations center will communicate with passengers via the public address system and intercom and provide guidance during any power disruptions.

Mr. Edward T. Teixeira
Page 3

If power is restored within a short time, service will resume. With a prolonged outage, the operations center will direct passengers to exit the trains and walk along a lighted emergency walkway on the guideway to the nearest station. For those unable to exit rail cars, help will be provided by emergency responders and transit staff. Passengers will be met at the train station by a coordinated response from emergency responders and City transportation workers. TheBus will be available as an alternate transit system to the Project. Capacity will be added with buses to the extent possible depending on the resources available.

DTS will work with the Office of Civil Defense to ensure any sirens affected by construction are relocated in suitable locations.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Enclosure

STATE OF HAWAII
DEPARTMENT OF EDUCATION
P.O. BOX 2360
HONOLULU, HAWAII 96804

OFFICE OF SCHOOL FACILITIES AND SUPPORT SERVICES

February 2, 2009

Mr. Wayne Y. Yoshioka, Director
Department of Transportation Services
City and County of Honolulu
650 South King Street, 3rd Floor
Honolulu, Hawaii 96813

Dear Mr. Yoshioka:

SUBJECT: Draft Environmental Impact Statement for the Honolulu Transit Corridor Project

The Department of Education (DOE) has reviewed the Draft Environmental Impact Statement (DEIS) for the Transit Corridor Project (Project). The DEIS is comprehensive in identifying all DOE schools adjacent to the Project, however there should be certain consistencies in identification throughout the DEIS. Pearl City Elementary School is adjacent to the alignment but isn't identified as a school on all maps. Aliamanu Elementary and Aliamanu Middle are two distinct schools.

The DEIS has no information on future public school sites which are in proximity to the Project. Maps should include the sites of the elementary school on the University of Hawaii – West Oahu land, and the elementary and middle schools within the Department of Hawaiian Home Lands East Kapolei project. The DEIS also does not identify the Pohukaina block in Kakaako (adjacent to the Mother Waldron Park) as a potential school site with its own impacts.

In the maps of planned extension routes for the Project, there is no identification of the existing Barbers Point Elementary or Lunalilo Elementary.

The largest amount of land that would be given up for the Project is the estimated .16 acres at Waipahu High School, if the maintenance and storage facility is located at the former Navy Drum property. In addition to the removal, relocation and replacement of school facilities in the school area identified for acquisition, the DOE would want to see plans for landscaping since the strip of land remains a part of the face of the campus. The DOE also wants to be sure there are adequate security measures taken to prevent public access from school property.

The need for landscaping and maintenance of the landscaping also applies to Radford High School, Aliamanu Middle and Aliamanu Elementary, where the project proposes to cross along their "front yard."

AN AFFIRMATIVE ACTION AND EQUAL OPPORTUNITY EMPLOYER

Mr. Wayne Y. Yoshioka

Page 2

February 2, 2009

The discussion of transit oriented development, which goes hand-in-hand with the development of the transit system, does not acknowledge that increased residential density in urban areas such as Waipahu could generate demand for additional public service space such as parks and school sites that cannot be met in areas already so urbanized.

The DEIS discussion on noise impacts claims there are 18 to 23 residential buildings, parks and schools that will experience adverse noise effects. The DOE would like to know which DOE schools are in that count. We would also like to know which future schools might experience adverse effects, such as a future school on the Pohukaina block of Kakaako.

The Board of Education (BOE) has a policy for when air conditioning or other noise control measures must be provided. During construction, or during the transit system's operations, if transit generated noise levels exceed the BOE standard of 55 dBA; the project will need to provide mitigation. If the mitigation includes air conditioning, it must also include electrical upgrades to support the air conditioning as well as provide ongoing maintenance.

The DEIS acknowledges schools adjacent to the project will be affected by a variety of construction issues. The DOE notes the DEIS statements that efforts will be made to mitigate these effects. The DOE seeks assurance that school principals will be consulted about construction schedules and all construction impacts when work is planned near the affected schools.

The DOE appreciates the opportunity to review the DEIS. If you have any questions, please call Heidi Meeker of the Facilities Development Branch at 377-8301.

Sincerely yours,

Duane Y. Kashiwai
Public Works Administrator

Mr. Duane Y. Kashiwai, Public Works Administrator
Office of School Facilities & Support Services
Department of Education
State of Hawaii
P.O. Box 2360
Honolulu, Hawaii 96804

Dear Mr. Kashiwai:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Mahalo for clarifying the location and names of schools along the fixed guideway alignments. Pearl City Elementary School has been added to figures in Section 4.5 of the Final EIS, which illustrate community facilities. Aliamanu Elementary and Aliamanu Middle Schools are along the Salt Lake Boulevard Alignment. The Airport Alternative from East Kapolei to Ala Moana Center has been identified as the Preferred Alternative. The identification of the Airport Alternative as the Preferred Alternative was made by the City to comply with FTA's NEPA regulations that state that the Final EIS should focus on the Preferred Alternative [23 CFR 771.125 (a)(1)]. Accordingly, maps in the Final EIS do not show effects along the Salt Lake Boulevard alignment.

The Draft and Final EISs only identify existing schools adjacent to the Project. Schools that will be constructed in the future are discussed generally in Section 4.19.3 under Community Facilities and Public Services.

The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the Cumulative Effects sections of Chapters 3 and 4 of the Final EIS. However, the future extensions are not part of this Project; thus, they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative effects analysis) because they are not part of the proposed action to be taken by the City and FTA. If the extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time. Thus, the impacts on schools associated with the extensions are not evaluated in the Final EIS.

Landscaping is incorporated into the Project's contract documents through design criteria for landscape architecture. The proposed maintenance and storage facility will be fenced and protected from public intrusion through school property. The landscaping plans for the maintenance and storage facility will be shared with the Department of Education once they are developed.

Regarding security, the maintenance and storage facility will be fenced and lighted. Safety personnel will patrol the site.

Radford High, Aliamanu Elementary, and Aliamanu Middle Schools are along the Salt Lake Boulevard Alignment and are not included in the Final EIS.

The indirect effects of transit-oriented development (TOD) are addressed in Section 4.19.2 of the Final EIS. This section states that if development occurs around stations, it is anticipated that City infrastructure will be improved in these areas. As an additional benefit, TOD will reduce the cost of providing utilities, facilities, and services to new residential and commercial developments.

No significant noise impacts to schools or public parks are predicted as analyzed in the Draft and Final EISs. Text has been added in Section 4.10.3 of the Final EIS stating that "No noise impacts will occur for schools, public parks...as a result of the Project."

Please see the response to the comment above regarding analysis of future schools. There are no noise impacts predicted for any schools along the Project; noise levels due to operation of the trains is not expected to be above 55 dBA Leq(h) for the classrooms during the operation of the system. The project design includes an integrated noise-blocking parapet wall at the edge of the guideway structure that extends three feet above the top of the rail. The parapet wall will substantially reduce ground-level noise. Moderate impacts will occur at upper floors of a few high-rise buildings (as shown in Table 4-18 in the Final EIS). With the

Mr. Duane Y. Kashiwai
Page 3

recommended mitigation in place (sound absorbing material and wheel skirts), the noise analysis indicates that the new noise generated by the Project will be lower than the existing noise levels in most places. Wheel skirts will increase the benefit from the parapet wall at locations above the elevation of the track. The use of sound-absorptive materials below the tracks in the areas that will experience moderate noise impacts will reduce the Project noise levels from the upper floors to below the impact level. Once the Project is operating, noise levels will be remeasured to confirm that there are no noise impacts from the Project.

From Section 4.18.2 Communities and Neighborhoods [Construction Phase Effects]: During development of the Construction Safety and Security Plans, measures will be identified to minimize effects on communities and their resources that address specific consequences anticipated at each location within the various communities as well as ensure the safety of the public and the environment. Schools adjacent to the project alignment may be affected by a variety of construction issues, such as noise, vibration, air quality, and visual intrusion, depending on the school's distance from the Project. In instances where schools experience a disruption in access, the effects will be mitigated as necessary and appropriate using applicable practices similar to those outlined in Business Access in Section 4.18.1 Land Use and Economics Activity. Temporary barrier walls or fences will be placed around any school, parkland, or recreational resource to clearly delimit a construction area to avoid public exposure to any possible construction hazards.

Mitigation measures for construction near schools will be finalized during the design and construction phase, when more information on the types of construction activities is determined. Coordination will continue throughout the process and advance notification of construction will be supplied when construction is planned for locations near Department of Education facilities.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Other Submission Method :
Submission Date : 12/18/2008
Submission Content/Notes : The first phase of construction should serve the Downtown-Mapunapuna area, not the Kapolei-Waipahu area. The idea is that there will be more riders who use the rail if the destination is the downtown area, and it should provide immediate traffic relief in the Salt Lake, H-1 Middle and Kalihi areas. Each of these areas are severely impacted by current traffic volume because each of them have major highway and freeway interchanges with no room to expand. As someone whos worked as a courier in that area on a daily basis I can tell you first hand that these places are the ones that back everyone else up. These areas also have a high volume of industrial traffic which will benefit greatly from less vehicles in that vicinity which in turn may curb their fuel usage, and help keep costs associated with transportation of their goods at a reasonable rate.

Honolulu, Hawaii 96813

Dear Mr. Kimura:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As described in Section 2.5.10 of the Final EIS and further in Section 8.6.9., to support phased opening of the system, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. The first phase of the Project must be connected to the maintenance and storage facility because, in addition to maintenance of equipment and ongoing operations, the maintenance and storage facility houses the main control center for the entire Project, and the required testing and operation of the system could not be completed without access to it. No location has been identified closer to Downtown, with sufficient available space to construct a maintenance and storage facility. Therefore,

construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- *Reduce the time that each area will experience traffic and community disturbances.*
- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*
- *Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- *Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Honolulu, Hawaii 96813

Dear Mr. Yoshioka:

Subject: Comments on the Draft Environmental Impact Statement (DEIS) for the
Honolulu High-Capacity Transit Corridor (HHCTC) Project

Mahalo for the opportunity to provide comments on the subject DEIS and for extending the public review period on this important project.

As stated in the DEIS, the Department of Hawaiian Home Lands (DHHL) has several new development projects in East Kapolei that would be impacted by the proposed HHCTC project. We have reviewed the document and provide the following comments.

Over the past few years DHHL has expedited the number of homestead awards to qualified native Hawaiians and have focused on ensuring that new and existing homesteads are livable and complete communities. DHHL seeks to enhance the quality of life for all its beneficiaries and to ensure that they not only have adequate shelter, but their homes are energy efficient, well served by schools, internet ready, transit ready, and pedestrian oriented. Our goal is to provide live, work, play and educational opportunities within our communities.

Kapolei/Ewa is the fastest growing region in the State of Hawai'i. There are several public and private investments driving the growth of this secondary urban center on O'ahu. Major road and utility infrastructure projects, a University of Hawai'i West O'ahu campus (UHWO), major residential clusters, and nodes of commercial development are amongst the investments being supported as the region continues to develop.

DHHL's Kapolei lands are in the middle of this prospering secondary urban center. The investments in infrastructure, employment, education, recreation, housing and commercial projects have contributed to a holistic community. These developments are leading to the actualization of Kapolei as O'ahu's Secondary Urban Center, and not just a bedroom suburb of Honolulu. Since many of DHHL's lands elsewhere in the State are located in rural or remote areas, there are few places better for DHHL to have a greater impact on meeting the needs of its beneficiaries than in Kapolei.

DHHL's East Kapolei 1 and 2 projects represent DHHL's ideal master plan community development efforts. DHHL's primary goal is to provide thriving communities where people can:

- Live (proposed single-family and multi-family residences within East Kapolei 1 and 2),
- Work (Ka Makana Ali'i regional shopping complex),
- Play (the proposed Kroc Center),
- Learn (UHWO campus, and proposed elementary and middle school sites in DHHL East Kapolei 2), and
- Shop (Ka Makana Ali'i regional shopping complex).

Additionally, DHHL has lands within Kalaeloa that would probably be best suited for industrial or industrial mixed-use development, with the potential for providing more work opportunities for its beneficiaries residing in Ewa and Waianae.

Approximately 2,650 new housing units are planned for DHHL East Kapolei 1 and 2 projects along with the headquarters for DHHL, open parks, and a preschool. Also planned for DHHL's East Kapolei 1 and 2 projects are public and community services including the Kroc Center, a new fire station site, spaces for Hawaiian organizations and a Hawaiian Homestead Heritage Center. Some of the housing will be developed by the State of Hawaii's Housing Finance and Development Corporation (HHFDC). Thus, the proposed developments on DHHL East Kapolei 1 and 2 projects will not only benefit DHHL's beneficiaries but all residents as well.

The DHHL East Kapolei 1 and 2 parcels are further surrounded and supported by other work, live, play and learn opportunities. The UHWO campus will be located immediately mauka of the East Kapolei 1 parcel providing learning opportunities (including a State Department of Education elementary school site). Recreational opportunities will be provided at proposed park sites and at the Kroc Center, which is situated within walking distance of most of the residential units in DHHL East Kapolei 2. A 1.5 million square foot regional mall is planned in the commercial parcel of DHHL East Kapolei 1 ("Ka Makana Ali'i regional shopping complex").

When finished, the UHWO campus is expected to have roughly 743,000 gross square feet of building space with room for expansion that could accommodate 7,600 students and 1,000 faculty and staff. DHHL supports the plans of the University of Hawai'i - West O'ahu campus to locate in East Kapolei. The proposed campus also attracts housing and commercial developments and provides opportunities to create communities where one can live, work, play, and learn.

Additionally, Kapolei's tremendous growth creates a critical mass that will attract new employment opportunities, as well as transit ridership. The UHWO campus, Kroc Center, and the planned Ka Makana Ali'i regional shopping complex on DHHL land, and other commercial and retail projects will provide future employment so that Kapolei/Ewa residents will not be forced to commute to Honolulu and Waikiki. For this reason, DHHL is supportive of the proposed phasing of the HHCTC project to start construction between Kapolei and Waipahu.

Our detailed comments on the DEIS follow:

On page 2-24, the key components of each transit are described in a "sidebar." We note that there is no mention of public restrooms (even automated public toilets) or what form of security will be provided (including security cameras). We would think that both types of facilities are necessary for old, young and otherwise. The impacts of including or not including such facilities should be directly addressed in the Final EIS (FEIS).

Vehicle Maintenance and Storage Facility - On page 2-38 of the DEIS, it is noted that one potential location for the required Vehicle Maintenance and Storage Facility would be located on a 43-acre site makai of Farrington Highway between Waipahu High School and Leeward Community College. While we concur that this site would allow for an efficient transit "system operation because it is more centrally located and vehicles could enter and exit the fixed guideway in either direction...", the loss of 43 acres of centrally located land will have a significant negative impact to DHHL's goals of providing either housing and/or economic benefits to its beneficiaries. This site is centrally located to H-1 and H-2 and would be ideal for warehousing operations for larger retailers. Located between two educational facilities, this site is also ideal for families with school-aged children or for adults interested in changing careers or life-long learning.

We believe that if the City and County of Honolulu would be willing to exchange Varona Village for the proposed Vehicle Maintenance and Storage Facility near Leeward Community College, this would help to mitigate the impacts of losing the

Mr. Wayne Y. Yoshioka
February 6, 2009
Page 4

latter site. The Hawaiian Homes Commission Act requires that land exchanges be of equal value.

On Figure 2-14 (page 2-25), the location of the "Proposed Park-and-Ride Lot" for the East Kapolei Station is shown but what is not shown is how commuters will access the parking lot. We would, of course, be concerned about late commuters speeding through the DHHL East Kapolei 1 project to access the "Proposed Park-and-Ride Lot" for the East Kapolei Station, endangering our beneficiaries and their children commuting to a proposed DOE elementary school in the UH West O'ahu site.

On page 3-53, in the "sidebar" entitled "Summary of Findings: Transportation Conditions and Effects," we note that under the category of "Effects of the Build Alternatives," there is no mention of the traffic impacts from cars generated from the "Proposed Park-and-Ride Lots" on streets immediately surrounding such facilities.

Table 4-1, Page 4-5, "Acquisitions, Displacements, and Relocations (Section 4.3)" - The land under the selected Vehicle Maintenance and Storage Facility site would eliminate either landowner's opportunities for development of their respective sites. This should be included in Table 4-1 or elsewhere in the FEIS.

Page 4-28, Figure 4-9 - While Figure 4-3 indicates the "Future Campus of UH West O'ahu" and the "Future Salvation Army Kroc Center," Figure 4-9 does not show these important community resources and facilities, even though they are currently not in operation (but will be by the time the transit stations are built). Figure 4-9 should be revised accordingly.

Page 4-171, Table 4-36 - There is no mention of DHHL's East Kapolei 1 (between UH West O'ahu, North-South Road, Kapolei Parkway and Kapolei Golf Course) and East Kapolei 2 (between Hoopili, North-South Road and Ewa Villages) projects. Table 4-36 should be revised accordingly.

With the electorate voted in favor of proceeding with the HHCTC project this past November, DHHL wishes to express its support for the HHCTC Project, but wants to ensure that the project is done "right." We believe that the HHCTC project will increase its beneficiaries' accessibility to jobs, schools, shopping and recreational opportunities, without having to own a second car.

DHHL wants to be on record that it supports the extension of the HHCTC west towards the City of Kapolei as long as there is a transit station (identified as Kapolei Parkway Station on Figure 2-5 of the DEIS) located at DHHL's Ka Makana Ali'i regional shopping complex.

Mr. Wayne Y. Yoshioka

Mr. Micah Kane, Chairman
Department of Hawaiian Home Lands
State of Hawaii
P.O. Box 1879
Honolulu, Hawaii 96805

Dear Chairman:

**Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement**

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal:

Each station will have a secured public restroom. Patrons will ask the station attendant for access to the restroom. As discussed in Sections 2.5.4 and 4.6.3, in this Final EIS, a Safety and Security Management Plan (SSMP) will be developed and implemented for the Project. Security will be provided in all stations and on all trains; and the City will coordinate with the Honolulu Police Department regarding security for the Project.

Further, as described in Section 2.5.4, Safety and Security Measures, in this Final EIS, the Project includes security measures to protect public services and facilities. Additional mitigation measures will include:

- *Design and architectural details to enhance safety.*
- *Use of closed-circuit television cameras and lighting included as a specific design measure.*
- *Security patrols of transit property and vehicles, ongoing train safety awareness education, and ongoing public security awareness education.*
- *Security cameras will be included throughout the system.*

As described in Section 2.5.10, Project Phasing, of the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified near the Downtown area with sufficient available space to construct a maintenance and storage facility. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- *Reduce the time that each area will experience traffic and community disturbances.*
- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*
- *Match the rate of construction to what can be maintained with local workforce and resources.*
- *Balance expenditure of funds to minimize borrowing.*

The portion of the corridor Ewa of Pearl Highlands is less developed than the areas Koko Head. Right-of-way can be obtained more quickly; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted Koko Head from Pearl Highlands to Aloha Stadium, then Kalihi, and finally to Ala Moana Center. As described in Section 4.19.3 Cumulative Effects, current land use plans anticipate extensive development of the Ewa plain irrespective of whether or not the project is built. Thus, the project may have the effect of intensifying land use in the areas near the planned stations; however, the overall development plan will not be substantially altered by the Project. The State of Hawaii prepared an Environmental Assessment (EA) of the effects of two major transportation projects, the North-South Road and Kapolei Parkway) in the Ewa area. The evaluated growth-inducing and cumulative impacts of the projects under the Hawaii Environmental Policy Act, see EA § 3.15.4.

The Ewa Development Plan (DPP 2000) strives to designate some areas for dense development while preserving other areas for agriculture.

Access to park-and-ride lots associated with the future extension projects would be designed as part of the project development process for each extension.

Mr. Micah Kane, Chairman
Page 3

The traffic impact of park-and-ride lots is discussed in Section 3.4.3, Effects on Streets and Highways, in this Final EIS. Traffic impacts are projected at six intersections near the East Kapolei, UH West Oahu, Pearl Highlands, and Ala Moana Station areas. Section 3.4.7 presents measures to mitigate these impacts. Traffic conditions with the planned mitigation are identified in Table 3-23, Effects on Traffic near Park-and-Ride Facilities and Bus Transit Centers—Existing Conditions, No Build Alternative, and the Project (without and with mitigation).

The acquisition of land for a maintenance and storage facility is addressed in Section 4.17, Maintenance and Storage Facility, in this Final EIS. Section 4.4, Acquisitions, Displacements, and Relocations, in this Final EIS, describes the process for land acquisitions associated with the Project, including land for the maintenance and storage facility.

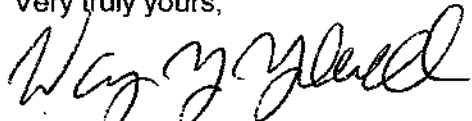

Figures 4-9 through 4-12, Community Resources and Facilities within One-half Mile, in this Final EIS, depicts existing facilities.

The East Kapolei 1 Development is included in the development assumptions.

Department of Hawaiian Home Lands' support of the Project and support of the West Kapolei Extension with a Kapolei Parkway Station is noted.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Issuance of the Record of Decision under NEPA and acceptance of the Final EIS by the Governor of the State of Hawaii are the next anticipated actions and will conclude the environmental review process for this Project.

Very truly yours,

WAYNE Y. YOSHIOKA

RECEIVED
9 FEB 5 PM 2:35
CHIEF OF OFFICE
DEPT. OF
TRANSPORTATION SERVICES

Mr. Wayne Y. Yoshioka, Director
Department of Transportation Services
City and County of Honolulu
650 South King Street, 3rd Floor
Honolulu, Hawaii 96813

Dear Mr. Yoshioka:

SUBJECT: Draft Environmental Impact Statement (EIS) for Honolulu High-Capacity Transit Corridor Project (HHCTCP)
Honolulu and Ewa Districts, Oahu, Hawaii

Thank you for allowing us to review and comment on the subject application. The document was routed to the various branches, offices and groups of the Department. We have the following Wastewater Branch, Clean Water Branch, Hazard Evaluation and Emergency Response Office, Indoor and Radiological Health Branch, Built Environmental Working Group and General comments.

Wastewater Branch

The document identifies the current and future need to address mobility and travel reliability issues to support transportation and land use planning policies, and improve transportation equity in the corridor between Kapolei and the University of Hawaii at Manoa on the Island of Oahu.

The subject project is located in the Critical Wastewater Disposal Area (CWDA) where no new cesspools will be allowed.

Information provided to our office showed that the HHCTCP's Maintenance and Storage Facility may generate domestic and non-domestic wastewaters. We have no objections to the draft EIS provided all wastewaters generated by the facility shall be connected to the available public sewer system.

Clean Water Branch

The Department of Health (DOH), Clean Water Branch (CWB), has reviewed the subject DEIS. The CWB staff also attended December 16, 2006 Honolulu High-Capacity Transit Corridor Project Water Resources Agency Coordination Meeting held at the Transit Office. Please note that our review and comments are based on the limited technical information provided in the DEIS and additional information and knowledge obtained during the agency coordination meeting and its compliance with Hawaii Administrative Rules (HAR), Chapters 11-54 and 11-55. The City and County of Honolulu (CCH), Department of Transportation Services (DTS), may be responsible for fulfilling additional requirements related to our program. We recommend that CCH-DTS and its consultant also read our standard comments on our website at <http://www.hawaii.gov/health/environmental/env-planning/landuse/CWB-standardcomment.pdf>.

1. Any project and its potential impacts to State waters must meet the following criteria:
 - a. Antidegradation policy (HAR, Section 11-54-1.1), which requires that the existing uses and the level of water quality necessary to protect the existing uses of the receiving State water be maintained and protected.
 - b. Designated uses (HAR, Section 11-54-3), as determined by the classification of the receiving State waters.
 - c. Water quality criteria (HAR, Sections 11-54-4 through 11-54-8).
2. An application for an individual Section 401 Water Quality Certification (WQC) authorized under Clean Water Act (CWA), Section 401; Hawaii Revised Statutes (HRS), Section 342D-53; and HAR, Chapter 11-54 is required for the subject project. Table 4-37 (Page 4-176 of DEIS) has identified that a Department of the Army (DA) CWA, Section 404 permit is anticipated. As discussed in Item No. 4.13.1 (page 4-128 of DEIS), the requirement of a DA Section 404 permit triggers the need for DOH's CWA, Section 401 WQC.

We were further informed at the meeting that a standard (individual) DA CWA, Section 404 permit is required for the placement of drilled shafts/piers in at least four (4) streams.

In addition, the construction of any drainage outfall and associated shore protection structures may also require the DA CWA, Section 404 permit and DOH Section 401 WQC coverage if the work is to be conducted below the high water mark.

Section 401 WQC Application and Guidelines may be picked up at our office or downloaded from our website at:
<http://www.hawaii.gov/health/environmental/water/cleanwater/forms/wqc-index.htm>

3. The CCH-DTS is required to obtain a National Pollutant Discharge Elimination System (NPDES) permit for discharges of wastewater, including storm water runoff, into State surface waters authorized under CWA, Section 402; HRS, Chapter 342D; and HAR, Chapter 11-55. An NPDES permit is required for effluent discharges from the following activities and/or facilities:
 - a. Storm water associated with industrial activities, as defined in Title 40, Code of Federal Regulations, Sections 122.26(b)(14)(i) through 122.26(b)(14)(ix) and 122.26(b)(14)(xi).
 - b. Storm water associated with construction activities, including clearing, grading, and excavation, that result in the disturbance of equal to or greater than one (1) acre of total land area. The total land area includes a contiguous area where multiple separate and distinct construction activities may be taking place at different times on different schedules under a larger common plan of development or sale. **An NPDES permit is required before the start of the construction activities.**
 - c. Treated effluent from leaking underground storage tank remedial activities.
 - d. Hydrotesting water.
 - e. Construction site dewatering effluent.
 - f. Vehicles wash area(s).
 - g. Small Municipal Separate Storm Sewer System.

For certain types of discharges into Class A or Class 2 State waters, CCH-DTS may apply for NPDES general permit coverage by submitting a Notice of Intent (NOI) form. The CCH-DTS must submit a separate NOI form for each type of discharge at least 30 days prior to the start of the discharge activity, except when applying for coverage for discharges of storm water associated with construction activity. For this type of discharge, the NOI must be submitted 30 days before to the start of construction activities. The NOI forms may be picked up at our office or downloaded from our website at:
<http://www.hawaii.gov/health/environmental/water/cleanwater/forms/geni-index.html>

4. The CCH-DTS must also submit a copy of the NOI or NPDES permit application to the State Department of Land and Natural Resources, State Historic Preservation Division (SHPD), or demonstrate to the satisfaction of the CWB that SHPD has or is in the process of evaluating your project. CCH-DTS should submit a copy of their request for review by SHPD or SHPD's determination letter for the project along with CCH's NOI or NPDES permit application, as applicable.
5. The adequacy of the statement (Page No. 4-134 of DEIS) "[M]ost of the guideway, stations, and transit facilities are planned within roadway corridors and in non-wetland area. Therefore, no direct impacts to wetlands are expected for any of the Build Alternatives" and the statement (Page No. 4-135) that "[B]ecause no impact to wetlands are expected, no mitigation is expected to be required," needs to be re-evaluated. (Emphasis added)
 - a. The DEIS needs to discuss in details whether wetlands exist within the project construction and operation limits. There was no discussion on potential impacts to wetlands in the Water Resources Technical Report. Limited discussion regarding wetlands' presence is located in Item No. 4 of the "Natural resources Technical Report" and Page Nos. 4-128 and 4-130 of the DEIS. The potential indirect impact to the "spring-fed" wetland system in Kalauao adjacent to a segment of the project (and is currently used by the Sumida Watercress Farm) is identified in the DEIS.
 - b. Page No. 4-21 of the August 15, 2008 "Natural Resources Technical Report" indicated that Field investigation of wetlands along the proposed alignment was conducted in December 2007 and January 2008. But, there is no indication of whether a wetlands delineation was performed. Wetlands delineation and wetlands function shall be properly identified and mitigation measures proposed if adverse impacts to wetlands are "unavoidable." We acknowledge that Page No. 4-128 of the DEIS did indicate that "[I]f mitigation is required for fill placed in the wetlands, the project must comply with *Compensatory Mitigation for Losses of Aquatic Resources Final Rules*." However, under this situation, the CWB prefers to have the on-site compensatory mitigation measures that will address wetlands function replacement and acreage loss.
6. For water pollution control purposes, DEIS and associated technical reports should also include an assessment of potential adverse impacts to the quality of receiving State waters resulting from the construction site(s) storm water discharges (either directly or indirectly) into and construction activities within the State waters including perennial streams, intermittent streams, gulches, ditches, nature drainage ways, etc.

7. Prior to DOH's establishment of Total Daily Maximum Loads (TMDL) for CWA, Subsection 303(d) listed water bodies, discussion is needed on what types of Best Management Practices (BMPs) measures will be implemented during the project construction and operations period to ensure that there will be "no net increase of loadings of pollutants of concerns" for each of the listed streams, estuaries and embayments.

We note that Page No. 4-1 of the "Water Resources Technical Report," identified that many of the streams within the construction corridor are listed by the DOH as impaired water bodies under CWA, Subsection 303(d). Item No. 2.1.3 (Page No. 2-4) of the same report also indicated that "during the design phase of each section of the project area, a Permanent BMPs Technical Manual will be produced."

8. An Applicable Monitoring and Assessment Plan (AMAP) shall be properly established and implemented to adequately monitor and assess potential project construction related Short-term impacts and operations related long-term impacts.

An AMAP shall be properly designed and implemented to ensure the adequacy of the implemented BMPs measures and to demonstrate that the project construction and operations related activities do not cause applicable water quality criteria to be violated in the receiving State waters.

An AMAP should be developed using the Data Quality Objectives (DQO) planning process and include Quality Assurance (QA) and Quality Control (QC) methods to be used. The purpose and goal of the DQO process can be found at <http://www.hanford.gov/dqo>.

9. The CCH-DTS shall be informed that all discharges related to the project construction or operation activities, whether or not NPDES permit coverage and/or Section 401 WQC are required, must comply with the applicable State's Water Quality Standards. Noncompliance with water quality requirements contained in HAR, Chapter 11-54, and/or permitting requirements, specified in HAR, Chapter 11-55, may be subject to penalties of \$25,000 per day per violation.

If you have any questions, please visit our website at <http://www.hawaii.gov/health/environmental/water/cleanwater/index.html>, or contact Mr. Ed Chen of the Engineering Section, CWB, at 586-4309.

Hazard Evaluation and Emergency Response Office (HEER)

The route of the fixed guide-way rail system goes through agricultural and industrial areas where soil contamination may be encountered during excavations for the system's construction. It is appropriate to conduct Phase I investigations of those properties with the potential for chemical contamination, and Phase II studies when necessary. This includes businesses associated with

Mr. Yoshioka
Page 6
2/3/2009

automotive repair (oil and solvents), dry cleaning (chlorinated solvents), petroleum and petroleum products refining and storage (gasoline, diesel and other products), pesticide mixing and storage facilities (metals, dioxins, chlorinated pesticides/herbicides), etc.

A major component of potential contamination is the array of pipelines in the Iwilei District. There are also extensive areas of known contamination along Dillingham Boulevard and the rest of the Honolulu Harbor area. Great care should be taken when excavating along this route. Coordination with the HEER Office is imperative. The appropriate contact for the Iwilei District is Anna Fernandez. She can be reached through the HEER Office at 586-4249.

In summary, the City and its contractors should be in direct contact with the HEER Office to locate properties along the route already in the HEER Database. All Phase I reports, sampling plans, and Phase II reports should be reviewed by the HEER Office. Please call Richard Palmer at 586-0957 if you have any questions regarding the comments.

Indoor and Radiological Health Branch

Project activities shall comply with the Administrative Rules of the Department of Health, Chapter 11-46, Community Noise Control

Should there be any questions, please contact Russell S. Takata, Environmental Health Program Manager, Indoor and Radiological Health Branch, at 586-4701.

Built Environmental Working Group

The Hawaii Department of Health Built Environment Working Group (BEWG) is comprised of 20 representatives from 12 divisions within the Department holding as its overarching goal cross-programmatic collaboration. By implementing this approach, we intend to improve the health and safety of Hawaii residents through the promotion of healthy community design policies and practices.

Based on our review of the Honolulu High Capacity Transit Corridor EIS Review, the following are a listing of our recommendations and comments:

Recommendations:

Transit User Benefits Section: Recommendation is to include the health benefits of utilizing transit. (Summarized by Katie M. Heinrich, Ph.D.)

- Over time, physical activity levels have declined due to increased reliance on time-saving devices, and reduced physical demands of work, housework, and travel. This has created an energy imbalance (consuming more calories than are expended) resulting in higher obesity rates.¹ Rail transit has the potential for increasing physical activity, since most

trips begin and end with walking.²⁻³ As compared to people who do not use public transit, those using rail walk an additional 10.5 more minutes per day,⁴ with 1/3 of American transit users walking the recommended 30 minutes per day.² Even small increases in physical activity, such as a brisk walk of 15-20 minutes, help expend up to 100 calories per day, potentially attenuating weight gain for 90% of the population.⁴ By construction, light rail stops involve greater distance than bus stop, inviting more walking, and one round-trip rail commute involves an average of 4 walking trips each day.⁵ Rail use can also result in public health cost savings (e.g., \$12.6 million over 9 years for 9100 residents in Charlotte, NC;¹ or \$4800-\$6600 per person each year nationally⁴), development rights around rail stations and rights of way, increased land values, lower rates of injury and death, reductions in vehicular accident costs, reductions in air pollution, increased access to care, stress reductions, and reduced traffic congestion.^{1,2,4} It is imperative that the design of areas around and to rail stations is a collaborative effort between health, housing, transportation, and environmental advocates in order to create an attractive built environment that supports walking to destinations for everyday activities.^{3,5}

Chapter 2, Page 2-20 states that it is "envisioned" that bicycles will be allowed on trains. Recommendation would be to plan for bikes to be allowed on trains as well as in the design of the transit stations. Light rail vehicles can be equipped with interior bike racks as achieved in other states. Visit http://www.vta.org/services/bikes.html#bikes_on_buses for additional information.

Chapter 3, Page 3-35 explains that each guideway vehicle would be designed to accommodate bicycles in "off peak hours". It is recommended that guideway vehicles be designed to accommodate bicycles at all times. The MOST important time to accommodate bicycles would be during peak hours.

It also states that several stations would be located at existing or planned bicycle facilities. Recommendation would be for all stations to have bike facilities. Bike stations that are installed

Mr. Yoshioka
Page 8
2/3/2009

at transit stops provide transit users a safe, and secure location to store bikes. It can also provide opportunities for bike share and rentals, bike repair and encourages users who may travel longer distances to utilize transit knowing their bikes could be stored at the station. Visit <http://www.bikestation.org/>.

As mentioned on pages 3-43 to 3-44, allowing bikes on trains, as currently envisioned, would create a demand for bicycle lanes or routes near stations. Recommendation would be to plan for access and connections for bicycles to and from transit stations preferably as marked bike lanes or routes.

The discussion of existing bicycle and pedestrian facilities (3.2.5) does not mention that the bicycle facilities are also "sometimes narrow or not continuous" as they do mention for the pedestrian facilities. Please include this language in reference to bicyclists as well.

Chapter 4, page 4-93 states that "new vegetation" will be provided whenever trees must be displaced. Recommend that such vegetation should include the planting of new trees whenever feasible and as appropriate.

On visual impacts (Chapter 4), recommend providing visual simulations of the rail system between Halekauwila St. and Ala Moana Center. The height of the rail system is the issue. The Halekauwila St. intersection simulation looks like it runs 20 feet above grade, but does the height increase once it reaches Ala Moana Center? Also, any visual shots to show the project's effects on existing mountain-to-ocean view corridors, like Piikoi St. and Ward Ave, would be welcome.

Comments:

We appreciate the City Department of Transportation Services' willingness to coordinate with the City Department of Planning and Permitting TOD initiative, and that they will ask communities for input on station design elements. We recommend that:

- Each community along the proposed route have a sense of ownership of their neighborhood station
- Public outreach should continue throughout the design and construction phases, especially with regard to environmental justice areas

If the Airport route is chosen over the Salt Lake and combination options, recommend the DEIS provide more discussion on its connectivity with feeder bus routes.

- Based on Chapters 3 and 7, the Airport route appears to have higher ridership, need for fewer parcel acquisitions, fewer acres converted to transportation usage, and would be built on level, less hilly terrain.

Mr. Yoshioka
Page 9
2/3/2009

- The Airport route seems to be slightly less cost-effective than the Salt Lake option. However, the small difference appears to be made up by increased ridership.

Linkages between the train stops and local resources should be made apparent (e.g., schools, shopping, parks). Recommend these linkages be provided through visual simulation or GIS mapping.

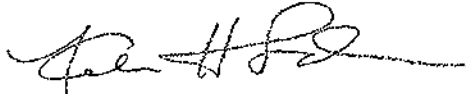

Please call Heidi Smith at 586-4495 if have any questing regarding these recommendations and comments

General

We strongly recommend that you review all of the Standard Comments on our website: www.hawaii.gov/health/environmental/env-planning/landuse/landuse.html. Any comments specifically applicable to this project be adhered to.

If there are any questions about these comments please contact Jiakai Liu with the Environmental Planning Office at 586-4346.

Sincerely,

KELVIN H. SUNADA, MANAGER
Environmental Planning Office

Department of Health
State of Hawaii
P.O. Box 3378
Honolulu, Hawaii 96801-3378

Dear Mr. Sunada:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Wastewater from the maintenance and storage facility is discussed in Section 4.17.2, in this Final EIS. Domestic and non-domestic wastewaters (but not including stormwater runoff) would be connected to the existing City and County of Honolulu public sewer system.

As discussed in 4.14.3 of the Final EIS, pollution prevention BMPs, such as regular inspection and cleaning of the drainage system, will need to be a part of the stormwater management plan that will be developed during Final Design. Stormwater runoff from the developed area of the site will be collected through an on-site drainage system consisting of catch basins, swales, and underground perforated pipe systems to direct runoff to a stormwater detention basin located on-site.

As discussed in Section 4.14.1, Background and Methodology [Water], in this Final EIS, the Project will comply with the anti-degradation policy, applicable designated uses, and water quality criteria. The water quality and waters permits required for the Project are noted in Table 4-40, List of Anticipated Permits, and discussed in Sections 4.14 and 4.21, in this Final EIS and include CWA Section 401 water quality certification, CWA Section 404 permit for impacts to jurisdictional waters of the U.S. and National Pollutant Discharge Elimination System permits.

The Project is designed to minimize the number of streams that will require work in waters of the U.S. under the jurisdiction of the USACE. On September 15, 2009, the Army Corps of Engineers stated that its substantive concerns relating to Section 404 of the Clean Waters Act had been addressed and that the scope and intensity of impacts to jurisdictional waters of the United States are now relatively minor due to the extent of avoidance and minimization of impacts on the aquatic environment resulting from project site selection and design. There will be impacts to waters of the U.S. by the Project. Transit guideway support columns will be placed in Waiawa, Moanalua, and Nuuanu Streams. In addition, the Project will be widening the existing Dillingham Boulevard Bridge at Kapalama Stream which will require extension of the existing piers and abutments. The total permanent impacts from structural elements of the Project is 0.02 acres. An existing stormwater outfall in Waiawa Springs will be extended at the Pearl Highlands Station to reduce ponding (total impact is 0.06 acres). For all work in waters of the U.S., the City will apply for USACE Section 404 nationwide permits for impacts to waters under the jurisdiction of the Corps where impacts could not be avoided. See Section 4.14.3 for details.

Section 4.18.10 identifies the types of temporary construction phase impacts from the Project on water resources. Section 4.18.10 also identifies the specific stormwater best management practices (BMPs) that will be employed by the construction contractor to protect the quality of State waters.

In addition, the discussion of permanent BMPs has been revised in Section 4.14.3, in this Final EIS. Permanent BMPs addressing stormwater runoff and water quality for the park-and-ride lots and the maintenance and storage facility will be prepared during design. The permanent storm water BMPs will be designed, installed, and maintained in accordance with the criteria and guidelines described in the State's Storm Water Permanent Best Management Practices Manual. Types and sizes of permanent storm water BMPs will depend upon the runoff quality and water quality requirements of each receiving water body.

Further, when the Project applies for the CWA Section 401 Water Quality Certification, an Applicable Monitoring and Assessment Plan will be established.

The information provided on water quality is noted. The Project will comply with applicable State Water Quality Standards and permitting requirements. As stated in Section 4.21 Anticipated Permits, Approvals, and Agreements and Table 4-40 that summarizes permits, certificates, and/or approvals anticipated to be required for implementation of the Project.

Potential subsurface impacts at sites of concern identified in Section 4.12, Hazardous Waste and Materials, and listed in Table 4-22 in this Final EIS, have been analyzed.

Construction in these areas is planned to begin in the next few years and construction in these areas will be conducted in phases over time. Figure 2-42 in this Final EIS shows the anticipated Project Schedule. As construction approaches, the Project will coordinate with the Hazard Evaluation and Emergency Response Office (HEER) regarding these areas. In addition, contractors will be required to prepare plans, as outlined in Section 4.18.7, in this Final EIS, to address the potential of contaminated subsurface material.

The Project has coordinated with the HEER and will continue to do so. HEER will be given the opportunity to review the Phase I Environmental Site Assessment and other studies through ongoing coordination with the Project.

The information provided regarding the health benefits of transit is noted.

Bicycles will be allowed on transit vehicles as regulated by a bicycle policy that will be developed. In addition, the Project is coordinating with City and State agencies to encourage development of enhanced bicycle facilities near stations, but the actual construction of such facilities is beyond the scope of the Project.

Section 2.5.5, Pedestrian and Bicycle Access, in this Final EIS, provides information about pedestrian and bicycle access to stations. Stations will be designed to encourage and accommodate pedestrian and bicycle access.

The suggested language, "Bicycle facilities are often narrow and not continuous", has been added to Section 3.3.5, Existing Bicycle and Pedestrian Network Conditions and Performance, in this Final EIS.

Section 4.13.3, Environmental Consequences and Mitigation, of the Draft EIS states that, "effects to trees would be mitigated by transplanting existing trees or planting new ones." Section 4.15, Street Trees, in this Final EIS presents additional information on the Project's affect on street trees, and provides specific environmental commitments regarding street trees.

Visual simulations between Halekauwila Street and Ala Moana Center are shown on Figures 4-13 through 4-20 of the Draft EIS. The guideway height at the Halekauwila Street intersection is about 45 feet, and it is about 80 feet at the Ala Moana Center Station. Additional simulations at Ward and Piikoi Streets are provided in Section 4.8.3, Environmental Consequences and Mitigation [Visual and Aesthetic Conditions], in this Final EIS.

The City and County of Honolulu is conducting workshops with communities that will have rail stations. The purpose of the workshops is to engage the public about rail stations and give opportunities for residents to contribute ideas about the appearance of the station in their area. Ideas generated at the workshops will be incorporated into the station planning and design process. For more information and to get involved in this process, please visit the Project website at www.honolulustransit.org.

Public outreach, including environmental justice areas, will continue throughout the Project development process.

Mr. Kelvin H. Sunada
Page 4

Information about feeder bus routes for the preferred alternative (Airport Alternative) is located in Appendix D, Bus Transit Routes, of this Final EIS.

The Airport Alternative would have higher ridership than the Salt Lake Alternative. As a result, this alternative will also be more effective in reducing vehicle miles traveled and vehicle hours traveled. The selection process for the Airport Alternative as the preferred alternative is described in Section 2.4, Preferred Alternative Identification Process, in this Final EIS. As stated in Chapter 7, Evaluation of the Project, in this Final EIS, there are other benefits associated with the Airport Alternative, including less land conversion and fewer property acquisitions and displacements.

The City is familiar with of the standard comments for environmental impact statements developed by the Environmental Planning Office and will comply with those applicable to the Project.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Subject: DEIS Comments

Aloha Stephanie:

Attached are the initial comments from OEQC, can you please give me call after you have reviewed them?
My numbers are 586-4185 and 265-1796.

Thanks so much! Aloha- Kathy

1. Relationship of the Proposed Action to Land Use Plans, Policies and Controls for the affected area.

Please expound on the paragraph on page 4-164. In accordance with Section 11-200-17(h), Hawai'i Administrative Rules, please discuss if there are any conflicts or inconsistencies in the proposed project. If so, please discuss the reasons that you plan to proceed notwithstanding the absence of full reconciliation.

In Section 4.17.10 on page 4-164, pursuant to Section 11-200-17(j), Hawai'i Administrative Rules, please discuss the extent to which the proposed project would foreclose future options and the extent to which the proposed project would narrow the range of beneficial uses of the environment or pose long-term risks to health and safety.

2. Status of Necessary Approvals

Table 4-37 on page 4-176 presents the list of necessary approvals. Pursuant to Section 11-200-17(h), Hawai'i Administrative Rules, please also indicate the status of each approval.

3. Resources -- Irreversible and Irretrievable Commitments

In Section 4.19 on page 4-175, pursuant to Section 11-200-17(k), Hawai'i Administrative Rules, please expound on the existing text by considering "resources" only as "energy, construction materials, and labor." The rule notes that "resources" also means natural and cultural resources committed to loss or destruction by the action.

4. Recommendation -- Summary Table of Probable Unavoidable Adverse Environmental Effects

Section 11-200-17(l), Hawai'i Administrative Rules states in pertinent part that "[t]he draft EIS shall address all probable adverse environmental effects which cannot be avoided. It would be helpful if the EIS included a table summarizing these unavoidable probable adverse environmental effects

5. Mitigation of Hazardous Materials or Wastes, Potential Toxic Tort Liability Issues

Pursuant to Section 11-200-17(m), Hawai'i Administrative Rules, with respect to mitigation for impacts from hazardous materials and/or wastes, Section 4.11, on page 4-113, notes that the City would perform partial or complete Phase I Site Assessments in accordance with American Society for Testing and Materials protocol E1527-05. Please discuss what measures the City would take with respect to remediation and/or removal of the offending hazardous materials or wastes contamination prior to property acquisition.

6. Mitigation in General

With respect to mitigation measures in general, please discuss measures to reduce significant, unavoidable, adverse impacts to insignificant levels and the basis for considering these levels acceptable. Also, where a particular mitigation measure has been chosen from among several alternative mitigation measures, please discuss each alternative measure and disclose the reasons for choosing a particular one. Please discuss the timing of each step in any mitigation process. Please disclose what performance bonds (if any) may be posted, as well as provisions proposed to assure that the mitigation measures will be taken.

7. Summary of Unresolved Issues with Discussion

Pursuant to Section 11-200-17(p), Hawai'i Administrative Rules, please include in a separate and distinct section in the EIS that summarizes unresolved issues and contains either a discussion of how such issues will be resolved prior to commencement of the action, or what overriding reasons there are for proceeding without resolving the problems.

Honolulu, Hawaii 96813

Dear Ms. Kealoha:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Relationship of the Proposed Action to Land Use Plans, Policies and Controls for the affected area

The statement in Section 4.1.3 of the Draft EIS, "The Build Alternatives would be consistent with adopted State and Local government transportation and land use policies." has been clarified in this Final EIS in Section 4.18.12, as follows, "The Project is consistent with the land use and transportation elements of plans, policies, and controls within the study corridor. The Project does not exclude future options, narrow the range of beneficial uses of the environment, or pose long-term risks to health and safety."

Status of Necessary Approvals

Section 4.21 in this Final EIS has an updated list of List of Anticipated Permits, Table 4-40. The status of the permits is included in this table.

Resources – Irreversible and Irretrievable Commitments

In this Final EIS, Section 4.20, Irreversible and Irretrievable Commitments of Resources, has been revised to include, “and impact natural and cultural resources.”

Probable adverse environmental effects that cannot be avoided are included in Table 4-1, Summary of Direct Environmental Effects and Mitigation Measures to Avoid, Minimize, or Reduce Impacts, in this Final EIS for each of the environmental resources evaluated.

Mitigation of Hazardous Materials or Wastes, Potential Toxic Tort Liability Issues

As discussed in Section 4.12.3, Environmental Consequences and Mitigation [Hazardous Materials and Waste] of this Final EIS, either a partial or complete Phase I Environmental Site Assessment (ESA) will be performed by the City prior to acquiring portions of these properties. This effort will minimize the chance that the City will acquire a degraded piece of real estate or that workers will be exposed to contaminants during construction.

Specific pre-construction activities regarding contaminated media are discussed in Section 4.18.7 of this Final EIS. The nature of any future study would vary by area or site and would depend on the level of concern in each area.

Mitigation in General

Mitigation measures are presented in Chapter 4 and are summarized in Table 4-1 in this Final EIS. The mitigation measures in this Final EIS were developed based upon the potential impacts of the Project. Mitigation measures will be incorporated during design and construction of the Project. In the time between the Draft EIS and this Final EIS, there have been subsequent design efforts. The design team will continue to coordinate with the environmental team to further reduce impacts whenever possible.

Construction phasing is presented in Section 2.5.10, Project Phasing, in this Final EIS. The construction contractor is responsible for obtaining the necessary performance bonds.

Summary of Unresolved Issues with Discussion

A summary of unresolved issues is presented in Section 7.8 in this Final EIS.

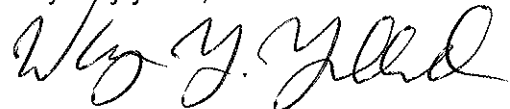

Chapter 8 of the Draft EIS presents DTS' coordination with agencies, non-governmental groups, and the public throughout the planning process for the Project. For this Final EIS, comments and responses made on the Draft EIS are in Appendix A, Comments Received on the Draft EIS and Responses. The Final EIS was revised to incorporate changes where required in

Ms. Katherine Kealoha
Page 3

response to comments received. A summary of changes between the Draft EIS and Final EIS is provided at the beginning of each chapter.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is fluid and cursive, with the first name "Wayne" and last name "Yoshioka" clearly distinguishable.

Subject: Honolulu High Capacity Transit Corridor Project (City and County of Honolulu)
Draft Environmental Impact Statement/Section 4(f) Evaluation

Dear Mr. Yoshioka:

Thank you for the opportunity to review the above-referenced submittal received November 2008, regarding improved transportation equity in the corridor between Kapolei and the University of Hawai'i at Manoa on the island of Oahu. After review by the Department of Land and Natural Resources (DLNR), division comments have been compiled. The following is representative of the State Historic Preservation Division, the Commission on Water Resource Management and Division of Aquatic Resources, the Division of Engineering, Land Management, the Division of Forestry and Wildlife, and State Parks.

I. Historic Preservation

The State Historic Preservation Division (SHPD) disagrees with the Federal Transit Administration (FTA) that this project will have "no adverse effect" on known and potentially unknown historic properties, potential burial sites, cultural landscapes and traditional cultural properties. The FTA's determination has the potential to eradicate over 80 potentially eligible known sites and overlooks impacts existing viewplanes in Ewa, Chinatown and to individual properties. Additionally, the SHPD has concerns about the treatment of potential burials and archaeological sites, including cultural layers that may be found during the archaeological inventory phase. To date the State Historic Preservation Officer has not concurred the FTA's determination.

A. Architecture: The Architecture Branch provides documents on the draft Historic Resources Technical Report on September 26, 2008 (2008.3762/0809AL44). On December 17, 2008, the SHPD Architecture Branch participated in a workshop

regarding effect determinations for the proposed Transit Corridor project as part of ongoing Section 106 consultation under the National Historic Preservation Act alongside representatives from Parsons Brinckerhoff (PB), the City and County of Honolulu's Department of Transportation Services, Historic Hawai'i Foundation, and the National Trust for Historic Preservation. A total of 83 architectural resources within the area of potential effect have been determined eligible for nomination to the National Register of Historic Places. PB staff presented a finding of adverse effect for a total of seven properties: Solminin House; Afuso House; Higa Fourplex; Teixeira House; Kamani Trees (Dillingham Blvd.); Dillingham Transportation Building; and the Boulevard Saimin property. A finding of no historic properties affected or no adverse effect was presented for the remaining 76 properties located along the corridor.

SHPD Architecture Branch has expressed concern over these preliminary determinations on a number of points. First, a finding of no historic properties affected implies that no historic properties are present in the area of potential effect or that the undertaking will have no effect as defined in 36 CFR Part 800.16(i). However, it appears that FTA has only affected the project's direct effects and has not taken into account the indirect effects of the project on historic resources. For example, the raised guideway may impede customary viewplanes, changes to the scale and character of the setting, or transit based development around stations may have long-term impacts to the historic resource.

SHPD believes that visual effect must be given greater consideration where it concerns impacts to integrity of setting, feeling, and association. For example, the indirect effects of guideway crossings on Nu'uuanu Stream Bridge and Hono'uli'uli Stream Bridge. Other resources that deserve additional consideration for indirect impacts per 36 CFR Part 800.5(a)(2)(v), include the 'Aiea (Honolulu Plantation) Cemetery, Tong Fat Wood Tenement Buildings, Aloha Tower, OR & L Depot, Mother Waldron Park, Walker Park, Irwin Park, and the Aloha Chapel. SHPD suggested that simulations be developed to analyze the character of visual and atmospheric effects and parcel takings to this and other individual resources. Adverse effects are not confined to direct impacts to a parcel and can include cumulative and far-reaching impacts to historic resources as provoked by the Project, including proposed transit based development around transit stations.

The above should also be duly re-considered in regards to constructive use determinations under Section 4(f) of the Department of Transportation Act. Per 23 CFR Part 774.15(a), as published in the Federal Register Vol. 73, No. 49 (March 12, 2008): "A constructive use occurs when the transportation project does not incorporate land from a Section 4(f) property, but the project's proximity impacts are so severe that the protected activities, features, or attributes that qualify the property for protection under Section 4(f) are substantially impaired." Impairments include noise level increase, obstruction or elimination of primary views, restriction of

access, vibration impacts, etc. Table 5-2 cites *de minimis* findings for direct use determination under Section 4(f) for the six Quonset hut grouping along Dillingham Boulevard, Chinatown historic district (see below), Hawaiian Electric, Radford High School, and Pearl Harbor National Historic Landmark (see below). These determinations are still pending.

Regarding the Chinatown historic district, listed on the National Register of Historic Places on January 17, 1973, SHPD expressed specific concerns. The district nomination records the following description:

"The boundaries of the district, as established by the Hawai'i Historic Places Review Board, are as follows: a 50 ft. line on the ' *ewa* (north) side of Nu'uauu Stream, the *mauka* (east) side of Beretania Street, a line 50 ft. from the building line on the Diamond Head (south) side of Nu'uauu Avenue, and 50 ft. *makai* (west) of the longest pier stretching into Honolulu Harbor. The major reason for its early development and continuous history as a commercial area was due to the close proximity to Honolulu Harbor."

Under statement of significance, the nomination reads:

"Throughout the whole of its 180 years as a trading center in the Pacific, Honolulu has always been closely identified with its harbor--the principal channel of contact with the outside world. It is, however, that portion of Honolulu immediately adjacent to the harbor at the mouth of Nu'uauu Stream which holds the longest continuous history of native and immigrant settlement and where the story of Hawai'i's common folk has been most compactly unfolded (...)"

As the intimate connection between the architectural district and the waterfront are called out as character-defining features of the National Register nomination, SHPD has significant concerns regarding a determination of no adverse effect to the district.

SHPD Architecture is in receipt of the FTA's December 11, 2008 letter inviting consultation with the Secretary of the Interior regarding potential adverse effect to the Pearl Harbor National Historic Landmark. SHPD looks forward to continuing consultation regarding this site. We are in receipt of the Historic Hawai'i Foundation's (HHF) December 10, 2008 letter which raises questions regarding the inadequacy of the description given in the Draft EIS to the vital significance of the National Historic Landmark.

Moreover, in reference to the above-named correspondence, please verify that the resources of the former Naval Air Station Barber's Point and lands west of the West Loch station were omitted because they will be fully consulted on in a separate Draft EIS at a later time. As referenced by HHF, discussion of the resources associated

with former Marine Corps Air Station 'Ewa Field should parallel the import of the newly designated Valor in the Pacific National Monument.

Discussion of effect determinations and the above-named points is scheduled to continue with consulting parties. SHPD Architecture participated in a driving tour of the proposed route (Airport alternative) with PB staff and the Historic Hawai'i Foundation on January 9. We will resume discussion of draft mitigation commitments following closer concurrence on effect determinations. Regarding Table 4-5, "Acquisitions and Displacements Summary," please provide an itemized list of how many parcel acquisitions and displacements by land use impact eligible historic resources. Finally, please note that National Register criteria considerations D and G are not cited regarding methodology. Federal Transit Administration has not yet completed its review for effect determinations pending our office's response to individual eligibility determinations.

- B. Archaeology: The Area of Proposed Effect (APE) was divided into 10 different sub-areas to evaluate below-ground effects. The proposed project covers the fundable twenty-mile segment of the corridor between East Kapolei and the Ala Moana Center with alternatives for both Fixed Guideway Transit Alternatives of the Salt Lake and Airport routes. The project does affect potential human burials, subsurface features and cultural deposits that have not yet previously been identified. We agree that once column locations are identified archaeological inventory work would focus on these locations and if historic properties are identified then mitigation plans should include archaeological monitoring, possible archaeological data recovery and burial treatment plans. SHPD participating in on-going 106 consultation on a Programmatic Agreement to address the above issues.
- C. Culture and History: SHPD Culture and History Branch concurs that the transit project as a whole will change the character of the physical features within the corridor (36CFR 800.5). SHPD is specifically concerned about the affect view planes from traditional lookout points such as Makakilo and Pu'u Kapolei. As stated in our September 26, 2008 correspondence: "Furthermore, we were encouraged that at our meeting it was indicated that indirect impacts to landscape and setting, including view sheds *makai* to *mauka*, will be examined to determine the broader impact of the corridor itself. We believe that this macroscopic dimension will aid in accurately reflecting the comprehensive effect of the proposed project and in turn facilitate identification of appropriate mitigation." Other examples of character changing impacts would include those to landscapes such as the Banana Patch community, Sumida Watercress Farm and Aiea Plantation Cemetery. At the same time, we do recognize and appreciate that some modifications to the alignment have been made specifically to minimize adverse effect.

The Oahu Island Burial Council (OIBC), Hui Malama I Na Kapono, and Office of Hawaiian Affairs have been consulted, as stipulated in the National Historic Preservation Act, Section

106. OIBC at their January 14, 2009, meeting summarized their consultation work with HTA but seemed to be only addressing the Programmatic Agreement concerns and not the Draft EIS or relevant studies. We will defer their comments on the Draft EIS at this time.

We understand that a Memorandum of Agreement is being developed to address the concerns of the Architecture and a Programmatic Agreement is being developed to address Archaeology and Cultural/History respectively. Also, please note that the Advisory Council on Historic Preservation, National Park Service, and the National Trust for Historic Preservation were not listed as consulting parties in the Draft EIS.

We have not reviewed the *Honolulu High Capacity Transit Corridor Project Archaeological Resources Technical Report*. In a separate transmittal shortly forthcoming, the SHPD will comment in more detail regarding the findings of the technical report. We look forward to the Archaeological Inventory Survey Plan (Phase I) which will be done by the construction phases, along with an Archaeological Inventory Survey Report(s) and an Archaeological Monitoring Plan.

If there are any questions, please contact Pua Aiu, SHPD Administrator, at 692-8015.

II. Aquatics and Water Resource Management

The proposed Honolulu High-Capacity Transit Corridor Route will cross the following streams: Honouliuli, Waikele, Kapakahi, Kalo'i Gulch, Waiawa, Waimalu, Kalauao, Aiea, Halawa, Moanalua, Kalihi, Kapalama, and Nu'uauu which all empty into the Pacific Ocean along the southern coast of the island of Oahu. All these streams are perennial except for Kapakahi and Kalo'i Gulch which are non-perennial. The Division of Aquatic Resources (DAR) has conducted many biological surveys in Waikele, Waiawa, Halawa, Moanalua, Kalihi, and Nu'uauu streams and has observed native macrofauna. The estuarine, lower and middle reaches native macrofauna which may be impacted by the transit corridor include native fish species such as *Stenogobius hawaiiensis*, *Eleotris sandwicensis*, *Mugil cephalus*, *Kuhlia xenura*, *Kuhlia sandwicensis*, and the native freshwater crustacean, *Macrobrachium grandimanus*. Other native macrofauna which migrate to the upper reaches would also be impacted during their migration through this corridor. Impacts on the native macrofauna and other aquatic resources can be minimized by avoiding any work in the stream channels or along banks. Impacts on the nearshore reefs and fauna would also be minimized by not disturbing the stream channels or banks and addressing heavy rainfall runoff from this project.

Additionally, the following mitigative measures should be implemented during the construction of the fixed rail transit system and associated areas to minimize the potential for erosion, siltation and pollution of the aquatic environment include:

1. Lands denuded of vegetation should be planted or covered as quickly as possible to prevent erosion;

2. Scheduling site work (particularly the excavation and grading) during periods of minimal rainfall;
3. Use to silt fences or other means to prevent sediments from entering the stream; and
4. Preventing construction materials, petroleum products, debris and landscaping products from falling, blowing or leaching into the aquatic environment.

We recommend the use of best management practices (BMP) for stormwater management to minimize the impact of the project to the existing area's hydrology while maintaining on-site infiltration and preventing polluted runoff from storm events. Stormwater management BMP's may earn credit toward LEED certification. More information on stormwater BMP's can be found at <http://hawaii.gov/dbedt/czm/initiative/lid.php>.

There may be the potential for ground or surface water degradation/contamination and we recommend that approvals for this project be conditioned upon a review by the State Department of Health and the developer's acceptance of any resulting requirements related to water quality.

A Stream Channel Alteration Permit is required by CWRM before any alteration(s) can be made to the bed and/or banks of a stream channel. The planned source of water for this project has not been identified in the Draft EIS report, therefore, we cannot determine what permits or petitions are required from our office, or whether there are potential impacts to water resources.

We recommend that the Final EIS disclose projected potable and non-potable water demands associated with the project, including indirect and cumulative effects such as the City and County's proposed transit oriented development that will surround the rail system. We also recommend that the proposed sources to meet these demands be identified.

If there are any questions, please contact Ken Kawahara, Water Deputy, at 587-0214.

III. Engineering

DLNR, Engineering Division, has reviewed the subject document, and have no comments at this time regarding flood zone(s) traversed by proposed project alignment. However, we do have the following general comments:

1. Column construction in streams will likely trigger comments related to aquatic habitat and biological/environmental issues. Response to these issues would have to be prepared.
2. As required by the City and County of Honolulu's Flood Plain Management Ordinance, any construction planned in a Flood Zone designated as AE (Floodway) will require a detailed floodway study and/or no risk certification.
3. A Conditional Letter of Map Revision (CLOMR) is required if there are any changes in water level (44 CFR 65.12).

4. Note that FEMA is conducting a Flood Insurance Risk Study that will update approximately 60 miles (Kaena Point to Kawaihoa Point) of coastal flood hazard boundaries. Preliminary study results have been issued to the City and County of Honolulu, Department of Planning and Permitting.

Please note that the project site must comply with the rules and regulations of the National Flood Insurance Program (NFIP) presented in Title 44 of the Code of Federal Regulations (44CFR), whenever development within a Special Flood Hazard Area is undertaken. Please be advised that 44CFR indicates the minimum standards set forth by the NFIP. Your Community's local flood ordinance may prove to be more restrictive and thus take precedence over the minimum NFIP standards.

If there are any questions, please contact Eric Hirano, Engineering Administer, at 587-0230.

IV. Land

Among the lands owned and managed by DLNR are two parcels in East Kapolei, Ewa, Hawaii, located west of the proposed North-South Road alignment and mauka and makai of Farrington Highway. The two parcels are identified by Tax Map Key Numbers (1) 9-1-17:86; and 9-1-18:05 (the "DLNR Parcels"). These parcels have excellent long-term development potential, and DLNR has accordingly identified these parcels as future income producing lands to support DLNR's operations and maintenance/management of the State's public lands and natural and cultural resources. DLNR has also communicated its desire to the City and County of Honolulu (the "City") to have these parcels rezoned to allow for commercial and/or other income-producing uses.

Various sections, figures, and tables in the Draft EIS provide for the fixed guideway alignment and a park-and-ride facility to be located within the DLNR Parcels, e.g., Figures 2-2, 2-3, 2-4, 2-5, 2-15, 2-38, 2-44, 4-3, Table 2-6, Appendix A. However, it is not clear whether these parcels are included among the properties identified by the City for acquisition (see Section 4.3 and Table 4-5) and whether compensation will be paid for any such acquisition.

The conveyance of any easement or other rights over the DLNR Parcels to allow such facilities, and the amount of compensation to be paid for such easement/rights, if any, requires the approval of the Board of Land and Natural Resources (BLNR). As of the date of this memorandum, BLNR has not granted any such approval, and therefore, BLNR's approval should be added to the list of Anticipated Permits and Approvals required for the proposed project (Table 4-37). It should also be noted, however, that DLNR has had prior discussions with the City regarding use of portions of the DLNR Parcels for the proposed transit project and DLNR's desire to rezone the DLNR parcels, and DLNR intends to continue to work with the City on these issues.

We understand that either route proposed in the Draft EIS involves some State Lands managed by other State agencies or entities. In most cases, these State Lands have been set aside to the government agency for a specific purpose, pursuant to Section 171-11, HRS. Any uses deviated from the specific purposes in the set aside require approval from the Governor and the BI.NR.

The State is currently prohibited from conveying any portion of ceded lands due to a Hawai'i Supreme Court decision dated January 31, 2008. If any proposed acquisition of property requires fee title conveyance of the ceded lands, the outcome of the appeal filed by the State to the US Supreme Court may affect the final design of the project.

For future easy reference, it may be helpful if the Final EIS contains a table on the acquisition with information on ownership and current uses on the affected properties.

If there are any questions, please contact Morris Atta, Land Administrator, at 587-0456.

V. Forestry and Wildlife

According to comments submitted September 15, 2008, the Division of Forestry and Wildlife (DOFAW) stated that on Page S-1 - *Abutilon* is mentioned as "threatened," but it is actually listed as "endangered" according to State and Federal law. DOFAW would like to provide the following for your consideration.

The existing State Department of Transportation Habitat Conservation Plan (HCP) for *Abutilon*, covers only a limited geographic area related to North-South road (DOT), Kapolei Parkway, University of Hawaii West Oahu, DHHL right-of-entry and subdivision, and DLNR future development plans (pgs 9-18). Additional DHHL lands are included under a Certificate of Inclusion registered with the Land Court. The City and County of Honolulu land ownership was identified in the original HCP (pg 9) and a Certificate of Inclusion issued for a portion of their lands. However, the current HCP does not include all affected lands or current planned activities within the rail transit corridor (see attached Table 3. Landownership of Parcels at Kapolei Properties). Activities and lands within the HCP area can be included by an additional Certificate of Inclusion, but activities outside the HCP area will need an amendment or new HCP.

Mitigation activities should address increased fire management measures. Although the current HCP includes a fire management strategy, it does not take the proposed project into consideration, so it does not address fire concerns for the project under review. The project under review could create new threats to the *Abutilon* reserve, with concern of discarded cigarettes or equipment sparks for example.

The level of fire management identified in the current HCP includes:

"A fire management strategy consisting for the following measures is being implemented to ensure that the plants are not accidentally destroyed.

- Identification of fire fighting resources available near the Kapolei population;
- Provide information to fire stations to assist them in protecting *A. menziesii* from fire;
- Identification of water resources near the Kapolei population.

The details of the fire management strategies are described in the Final Interim Management Report for *Abutilon menziesii* (DLNR DOFAW 2003, Appendix G)." (p. 21).

If additional plants are discovered outside the boundaries of the lands covered under the current HCP, then the transit corridor will need a new Habitat Conservation Plan (see attached information on HCP and ITL) or an amendment to the existing HCP. Additionally, should a plant survey of the transit corridor show no endangered plants in the Kapolei-Ewa area, it does not constitute a finding of no plants present because plants can emerge following rainfall or scarification. Therefore, it is recommended that multiple surveys are done and that the biology of endangered flora and fauna be considered, especially that of the *Abutilon*.

The issue of invasive species is not addressed in the Honolulu High-Capacity Transit Draft EIS. The implementation of this project creates risks related to the introduction of new harmful invasive species, weeds or pests that could be brought into Oahu by importation of heavy equipment and materials sourced from sites off island, be it from other islands or continental locations. For example the red imported fire ant is a serious pest in a number of southern and coastal states including: CA, TX, NC, AR, NM, DE, and in other areas around the world. Recent economic input analysis indicated that if established in Hawai'i, the estimated negative impacts to Hawai'i's economy could be as high as \$200 million within 20 years and it would affect our way of life and human health. Apart from the potential introductions from out-of-state import risks are the intra-state risks between islands. A number of pests are present on other islands in Hawai'i but not present or are under control on Oahu, e.g. miconia, little fire ant and coqui frogs. Appropriate mitigation would involve implementing prevention measures, paying close attention to pests at the site of origin for incoming equipment and materials, cleaning, inspections and treatment both before shipping and after arrival on Oahu would reduce these risks significantly.

The Draft EIS describes plans for the planting of trees and other landscaping projects. Nursery plants sourced from outer islands are a known pathway for "hitchhiker pests," and should be subject to inspections and appropriate treatment. Also, the plants that are considered for planting could themselves become harmful invaders or contribute to existing problems, if not screened properly. Species under consideration for planting should be reviewed using the University of Hawai'i, Weed Risk Assessment system that allows high-risk potentially harmful species to be identified, while low risk alternatives could be a more suitable species selected for this project.

The subject project Draft EIS did not address tree removal plans, or lack thereof, in the rail transit corridor. If tree removal is part of the construction process, there is concern in central Honolulu in the Kapiolani Blvd. area where a population of white tern, *Gygis alba* or Mamo-o-kū, is known to nest.

Further mitigation could involve implementing pre and post construction surveys to determine what plant species are present along the transit pathway and remove any potentially invasive species as a post construction mitigation action. If the prevention mitigation measures mentioned above are implemented successfully, this latter problem will likely be minor or insignificant.

If there are any questions, please contact Paul Conry, DOFAW Administer, at 587-4182.

VI. State Parks

The subject project Draft EIS does not acknowledge the transit corridors alignment near State Parks, and the impacts it may have on those areas.

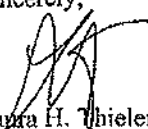

Section 5.4.1 of the Draft EIS states that the project will require direct property acquisition of several recreational areas, one of which is Ke'e-ehi Lagoon Beach Park, resulting in a section 4(f) use. Directly adjacent to the beach park is the Hawai'i Disabled American Veteran's (DAV) Keeki Lagoon Memorial that was set aside to the department and is operated and maintained by the Hawai'i DAV. Its location may place it near the alignment for both the Airport and Salt Lake alternatives, however, there is no mention of it in the document.

We also note that Aiea Bay State Recreation Area, also under our jurisdiction and a section 4(f) area, was discussed in the Draft EIS and determined to have no use based on the criteria for review of 4(f) properties. There is concern that the criteria used to make this determination is unclear.

If there are any questions, please contact Dan Quinn, State Parks Administrator, at 587-0292.

Thank you for the opportunity to submit comments.

Sincerely,

Layra H. Thielen, Chairperson
Department of Land and Natural Resources

State of Hawaii
P.O. Box 621
Honolulu, Hawaii 96809

Dear Chair Thielen:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal:

Historic Preservation

Preliminary effect determinations documented in the Draft EIS were refined in the Historic Effects Report: Honolulu High-Capacity Transit Corridor Project (RTD 2009d) issued by FTA on April 14, 2009. This report analyzes the project's direct, indirect, and cumulative impacts to historic properties. Consultation with the SHPD has continued since release of the Draft EIS with regard to these effect determinations. FTA has accepted adverse effect determinations on the National Historic Landmark and Chinatown Historic District as well as other historic resources. The eligibility, effect determinations, and Section 106 consultation are documented in Section 4.16, Archaeological, Cultural, and Historic Resources, of this Final EIS.

Naval Air Station Barbers Point is not included in the Project's APE because the Kapolei Extension is not part of the current Project; no further analysis of the Kapolei Extension will be conducted at this time. If the Kapolei Extension is considered and studied in the future, potential impacts to historic resources identified in this area would be addressed at that time.

Section 4.16.3 identifies right-of-way acquisition for each of the eligible historic resources. Right-of-way acquisitions for all properties are included in Appendix C of this Final EIS.

Visual impacts to the settings of historic resources were addressed in Historic Effects Report: Honolulu High-Capacity Transit Corridor Project (April 14, 2009d). In addition, Section 4.8 of this Final EIS includes the visual impact analysis of the Project. Figures and simulations that were included in the Honolulu High-Capacity Transit Corridor Project Visual and Aesthetics Resources Technical Report (RTD 2008e) and were utilized in the preparation of the Draft EIS have been copied into the FEIS to clarify the information from previous studies. Commenters on view effects are representative of the various viewer groups that have been considered in the visual and aesthetic conditions analysis presented in the Draft EIS and this Final EIS. Inclusion of the viewer group's responses, received during the Draft EIS comment period, resulted in refinement of the visual impact evaluation which resulted in revised ratings from moderate to significant for Views 12, 14, and 15 in the Downtown area as described in the Final EIS. The visual impact rating was refined to reflect the bulk and scale of the station as well as the other elements noted in the Draft EIS. The Draft EIS described several types of visual effects, and the refinements in this Final EIS reflect the same visual effects identified in the Draft EIS. The Draft EIS and this Final EIS concluded that changes to some views, including protected views and vistas, would be unavoidable, and the refinements confirmed this conclusion.

View planes from traditional look out points such as Puu Kapolei and Puu Makakilo were considered in the analysis of the Project as documented Honolulu High-Capacity Transit Corridor Project Visual and Aesthetics Resources Technical Report (RTD 2008e). The Draft and Final EIS acknowledge that the visual changes from the Project will likely be less obtrusive and minimal in wider vistas or regional panoramic views, such as from traditional look out points where the project elements serve as smaller components of the larger landscape. The project elements would not be dominant features in these views.

Mitigation measures to minimize visual effects of the Project and enhance the visual and aesthetic opportunities will be incorporated into the Project during final design as discussed in Section 4.8.3 of this Final EIS. Although mitigation measures will minimize many adverse visual effects by providing visual buffers and reducing visual contrasts between the Project elements and their surroundings, the Final EIS acknowledges, as concluded in the Draft EIS, that probable unavoidable adverse effects, such as view blockage, cannot be mitigated and will be significant (noted as a "High" level of visual impact in the Draft EIS) in some areas.

Chapter 5 of this Final EIS, Section 4(f) Evaluation, discusses the historic resources identified in Section 4.16 of this document. The Section 4(f) evaluation includes a discussion of the direct use, including de minimis use where the historic resources will not be adversely affected as described in 36 CFR Section 880.5 (Section 5.5.2 of this Final EIS). An evaluation

of the constructive use at the historic resources where the Section 106 process has resulted in an adverse effect and where the Project will not result in a direct use was completed. The Project will not restrict any access to historic resources, will have no adverse noise and vibration impacts (per FTA standards), and result in no ecological intrusions at these Section 4 (f) resources. Therefore, only visual impacts that substantially impair the historic value were considered for the Section 4(f) historic resources. This evaluation concludes that there will be no use of Section 4(f) resources since the Project will not substantially impact the features or attributes of the historic resources that contribute to NRHP eligibility (Section 5.6.3 of this Final EIS).

There may be potential impacts to previously identified or unknown archaeological resources during construction. As described in Section 4.18.11, Archaeological, Cultural, and Historic Resources [Construction Phase Effects], in this Final EIS, prior to construction, the Project will investigate the potential for subsurface deposits within the column locations and will mitigate during construction. SHPD will be consulted throughout the process.

The Oahu Island Burial Council, Hui Malama I Na Kupuna O Hawaii Nei, and the Office of Hawaiian Affairs are included in the list of Section 106 Consulting Parties as documented in Section 4.16, in this Final EIS.

While the Project was designed to avoid and minimize effects to historic resources, this was not always possible in meeting the Project's Purpose and Need. Therefore, a Programmatic Agreement (PA) was prepared to outline responsibilities and measures to mitigate or reduce adverse Project effects. The PA was developed during extensive consultation with Section 106 consulting parties and included mitigation measures suggested by these consulting parties when possible. The PA is included in the Appendix H of the Final EIS.

Aquatics and Water Resource Management

Section 4.14 of this Final EIS discusses the streams that will be crossed by the Project and permanent impacts to streams. Section 4.18.10 of this Final EIS discusses the temporary impacts to streams during construction. Streams affected by structural elements of the Project include Kaloi Gulch, Waiawa Stream and Springs, Moanalua Stream, Kapalama Canal Stream, and Nuuanu Stream. On September 15, 2009, the Army Corps of Engineers stated that its substantive concerns relating to Section 404 of the Clean Waters Act had been addressed and that the scope and intensity of impacts to jurisdictional waters of the United States are now relatively minor due to the extent of avoidance and minimization of impacts on the aquatic environment resulting from project site selection and design. Of the streams listed above, Kaloi Gulch is not under the jurisdiction of the USACE.

The analysis of aquatic biota from technical studies completed in technical studies prepared prior to the Draft EIS, and refinement as part of the "functions and values" assessment of each stream that the Project crosses, confirms the conclusion made in the Draft EIS that permanent or temporary structures placed in streams will interfere with migration by an amphidromous species through the project area as presented in Section 4.14.3 of this Final EIS.

Permanent and temporary (during construction) best management practices (BMPs) will be implemented to minimize the potential impacts to the aquatic environment as discussed in Section 4.14.3, Environmental Consequences and Mitigation [Water], in this Final EIS. Examples of Permanent BMPs include, but are not limited to bioretention areas, vegetated buffer strips, dry swales, water quality basin, and structural BMPs with oil/water separators. Section 4.18.10 Water Resources [Construction Phase Effects], in this Final EIS discusses BMP for in-water construction activities.

Mitigation regarding re-planting cleared areas to prevent erosion is discussed in Sections 4.18.8, Natural Resources [Construction Phase Effects], and 4.18.10, Water Resources [Construction Phase Effects], in this Final EIS.

Because of the construction schedule and difficulty in anticipating water events, DTS cannot entirely avoid construction during rainfall; however, BMP will be employed to minimize impacts associated with construction stormwater flow.

Section 4.18, Construction Phase Effects, in this Final EIS provide examples of BMPs that may be employed to protect the aquatic environment. BMPs will include methods to minimize possible pollution, soil erosion and turbidity caused by stormwater runoff, and construction activities near waters.

Permanent and temporary (construction-related) BMPs will be implemented for the park-and-ride lots and vehicle maintenance and storage yards to maintain on-site infiltration and prevent polluted runoff from entering streams and near shore waters. An integral part of the permanent BMPs is the inspection and maintenance plan to ensure that they operate as designed.

The Clean Water Branch of the State Department of Health has provided comment on the Draft EIS. Through the individual Section 401 Water Quality Permit, the Clean Water Branch of the State Department of Health will ensure compliance with the State's antidegradation policy (HAR, Section 11-54-1.1). Section 4.21, Anticipated Permits, Approvals and Agreements, has a list of Anticipated Permits in this Final EIS including a Stream Channel Alteration permit from the Department of Land & Natural Resources (DLNR), Commission on Water Resource Management.

Use of water during construction will include but not be limited to concrete mixing, dust management, and establishing landscape elements. It is anticipated the contractor will use non-potable water, where practicable, to construct the elevated guideway structures or utilize other construction methods to conserve water. Once the Project is operational, it is anticipated that non-potable water will also be used where practicable for landscaping and vehicle maintenance. Landscaping will use vegetation that requires minimal watering. The maintenance and storage facility will pursue Leadership in LEED Certification. This includes the use of sustainable practices and reduction of the use of resources which may include water and energy.

Permanent use of potable water is anticipated to be limited to station operations and maintenance operations restroom facilities. As discussed in Section 4.19.3 of the Final EIS, additional potable water supplies will be required to support the increase in population and

employment as well as restrooms mentioned above. The Project is not anticipated to be a major water consumer.

As described above, streams affected by structural elements of the Project are Waiawa Stream and Springs, Moanalua Stream, Kapalama Canal Stream, and Nuuanu Stream. Section 4.18.10, Water Resources [Construction Phase Effects], details the types of temporary construction phase impacts and mitigation measures. The City will obtain the required permits from Federal and State agencies as listed in Section 4.21 of this Final EIS. During the processing for these permits, any further aquatic and biological/environmental issues will be assessed and mitigation measures finalized as part of the permit process.

In Section 4.14.3 of the Final EIS, it states: As a linear feature, the guideway will cross several floodplains in Waipahu and Pearl Highlands. However, the Project will not cause significant floodplain encroachment as defined by USDOT Order 5650.2. The guideway and many stations will be elevated above the floodplain by piers; but some facilities, such as stairs, elevators, and traction power substations, will have to be built at ground level. These features could have minor effects on floodplains, depending on how and where they are placed within a floodplain see figures in this section. However, any such changes caused by the Project will be mitigated through design to comply with current floodzone regulations. There will be no notable adverse impacts on natural and beneficial floodplain values, and there will be no impact to water levels in flood zones.

As there will be no notable adverse impacts on natural and beneficial floodplain values, A Conditional Letter of Map Revision (CLOMR) will not be necessary.

Information noted. We have been in contact with the City and County of Honolulu's Department of Planning and Permitting.

Comments regarding the National Flood Insurance Program and the City and County's flood ordinances are noted.

Land Use

Comments regarding DLNR's development plans for land parcels are noted. Coordination by the City's Right-of-Way staff and DLNR is continuing.

The parcels that will be acquired for the Project are presented in and Appendix C of this Final EIS. This Appendix includes tables of the property acquisition by tax number and general land use. The City will continue to coordinate with DLNR regarding the use or transfer of any DLNR lands. The City will comply with Section 171-11, HRS, regarding the use of State Lands.

Ecosystems

The table, Summary of the Project's Effects on Threatened, Endangered, and Protected Species, in Section 4.13.3 of this Final EIS, lists *Abutilon menziesii* (kooloaula) as endangered.

Although the Project will have no effect on threatened, endangered, and protected species, mitigation will be implemented for the Abutilon plants, kooloaula. A State Incidental Take License for kooloaula was issued on March 18, 2005, to the HDOT. The City will secure a Certificate of Inclusion from the State for the Project. Mitigation measures have already been specified in a Habitat Conservation Plan (HCP) for the population of kooloaula, including the establishment of an 18-acre contingency reserve for the plants. Specific measures to protect and offset losses of the kooloaula have been established by the U.S. Fish and Wildlife Service (USFWS) in the existing HCP. If an HCP is needed or if the existing HCP needs to be amended, the City will implement the measures outline of the USFWS in the new or amended HCP. This will offset impacts to the plant, and there will be no unavoidable adverse environmental effect to the kooloaula. Additionally, prior to clearing and grubbing near the kooloaula contingency reserve, the area will be surveyed. If any kooloaula are found, a horticulturist approved by DLNR will be given an opportunity to remove the plants and transplant them to the contingency reserve.

Fire Management Plans, including worker education, access maintenance, designated smoking areas, identification of fire fighting resources, and other requirements, are being reviewed for other projects in the area and will be incorporated into the Project.

Prior to construction in the Kapolei-Ewa area, the construction area outside the HCP will be surveyed for existing Abutilon plants. If any are found, a new HCP will be prepared or the existing HCP will be amended.

The Project contract documents describe the requirements for construction equipment or material imported to Oahu from the mainland, neighbor islands, or foreign countries, be free of dirt, vegetative matter, and animals. Construction equipment will have to be washed before being brought to the Project site. On-site workers will be trained to recognize common invasive species growing in the construction area. The use of native (indigenous and endemic) and proven adapted species is encouraged. Criteria for cleaning, inspection, and treatment of plants that are at risk of harboring pests are included in the mitigation described in Section 4.18.9 of the Final EIS.

Section 4.18.8, Natural Resources, in this Final EIS describes that prior to construction, the City will survey all the large canopy trees to be pruned to be sure no chicks that have not yet fledged are present, including the State-listed threatened species, white tern.

Section 4.13.3, Environmental Consequences and Mitigation [Ecosystems], in this Final EIS discusses tree removal and specifically addresses the white tern. White terns select the largest high canopy trees for roosting and nesting. The pruning and removal of these trees are not expected to affect the white tern population because there are numerous other large canopy trees in the urban area of Honolulu that will not be affected by the Project and that could be used by the white terns.

Section 4(f) Resources

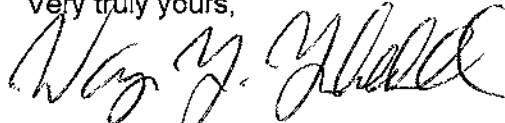

Section 4.5 in this Final EIS identifies Federal, State, local, and publicly-owned parks adjacent to the Project. This section also lists the Hawaii Disabled American Veteran's Memorial as a government facility adjacent to the Project.

Section 5.5.1, Park and Recreational Resources,] of the Final EIS presents the Section 4(f) evaluation of Keehi Lagoon Beach Park. Coordination with the City Department of Parks and Recreation will continue during final design and construction. Project design was intended to avoid impacts to the Hawaii Disabled American Veteran's Memorial, and the Project impact at Keehi Lagoon Park does not affect the Memorial.

Section 5.6.1, Park and Recreational Resources, [Evaluation of Constructive Use of Section 4(f) Resources] of the Final EIS presents a constructive use analysis in accordance with 23 CFR 774.15. Aiea Bay State Recreation Area was evaluated in the same Section. The analysis presented in the Final EIS concluded, "...the elevated guideway would be located mauka of the park, within the median of the adjacent highway and as a result, will not obstruct makai views. There will be no noise or vibration impacts from the Project...and features will not be substantially impaired, the Project will not result in a constructive use of the resource."

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Dear Mr. Yoshioka;

Subject: Honolulu High Capacity Transit Corridor Project Draft Environmental
Impact Statement (DEIS) and/Section 4(f) Evaluation

Thank you for providing the subject document for review and comments.

The State Department of Transportation (DOT) understands that the subject DEIS discusses a project by the City and County of Honolulu, Department of Transportation Services (DTS), for the development of a High Capacity Transit Corridor Project ("Project") that would provide a fixed guideway transit service on Oahu in a travel corridor between Kapolei, with potential expansion to the University of Hawaii at Manoa (UH Manoa) and Waikiki.

Four alternatives are identified via a series of screening and scoping studies. This DEIS evaluates those four alternatives:

1. No Build Alternative
2. Fixed Guideway Transit Alternative via Salt Lake Boulevard (Salt Lake Alternative)
3. Fixed Guideway Transit Alternative via the Airport (Airport Alternative)
4. Fixed Guideway Transit Alternative via the Airport and Salt Lake Boulevard (Airport & Salt Lake Alternative)

The Locally Preferred Alternative selected by the Honolulu City Council includes a fixed guideway transit system from East Kapolei to Ala Moana Center and planned extensions to West Kapolei, UH Manoa and Waikiki. The system would use steel-wheel-on-steel-rail technology and all parts of the system would either be elevated or in exclusive right-of-ways. The Project also requires the construction of transit stations and supporting facilities. Further, some city bus services will be reconfigured to align with the proposed transit stations.

The Project will generate significant impacts to DOT airports, highways and harbor facilities. The fixed guideway rail system should be viewed as part of a comprehensive, multi- and inter-modal transportation system. This requires early, continuous, direct coordination and careful design and construction planning with the DOT. The Project requires connectivity with other transportation and transit systems as well as all other means of transportation used by commuters and travelers such as, but not limited to, buses, taxis, shuttles, service vans, motorcycles, scooters, bicycles and walking. The Project must be carefully integrated within the existing systems and enable travelers' transfers between these systems. DOT therefore recommends that these linkages and public use patterns for all modes of travel (i.e. bus, bike, pedestrian, etc.) be further analyzed. DOT is particularly interested in the evaluations, findings and recommendations at the sites where DOT facilities are located.

The following comments are from the DOT's three modal divisions, who should be consulted during the Project's planning, design and construction phases for their concerns for impacts to right-of-ways, easements, real property and infrastructure.

AIRPORTS

The two airport alternatives will impact the airport system. DOT requests that DTS contact the Airports Division Planning Section at (808) 838-8810 and address the following issues:

1. The Airports Division understands that the Airport Alternative involves two stations on the Honolulu International Airport (HNL) property on Aolele Street. One is next to the new parking structure and the other is at Lagoon Drive.
2. The station adjacent to the new parking structure will be connected to the structure. Clear signage is necessary for rider's access of the other airport terminal buildings. There are several operational and engineering issues related to a transit station located near an Airport terminal in relative proximity of airport operational areas (AOA). DTS should meet with Airports staff and the Airports modernization team to address the rail station's location, its impact on airport operations and future airport improvements.
3. To ensure that the Lagoon Drive station meets the Federal Aviation Administration (FAA) FAA Part 77 obstruction height limits for the end of Runway 22R, DTS should submit a FAA Form 7460-1, Notice of Proposed Construction or Alteration, to the FAA.
4. DTS should also meet with the Transportation Security Administration (TSA) to review any security issues or requirements for the rail stations at HNL.

HARBORS

The project will generate impacts to the harbors system, particularly where the transit stations are adjacent to Honolulu Harbor. DOT requests that DTS address the following comments and initiate or continue coordination with the Harbors Division Planning Section at (808) 587-1888.

1. Page 2-32. The DOT understands that the rail system interfaces with Nimitz Highway in the area between the Pier 15 area and past the HECO power station area. Figures 2-33 and 2-34 show the two stations in this area. The stations appear to avoid conflicts with the entrances to Harbors' major shipping terminals.
 - a. DOT requests consideration for a station located at the Aloha Tower complex to provide direct access to the complex and to downtown Honolulu via Fort Street. If this location is given consideration, then Harbors Division is willing to discuss options for redeveloping its current office building into a combination parking structure and transit station, subject to the need to satisfy the community's concern regarding the image and appearance of downtown Honolulu and Nimitz Highway as a pathway to Waikiki.
 - b. Given the importance of this section of Nimitz Highway to the waterfront area and to downtown Honolulu, additional study is needed to ensure proper siting of a transfer station. Proper placement is critical for minimizing impacts to the harbor area, the highway system and the Aloha Tower complex, and also for maintaining waterfront access, pedestrian safety, a desirable visual and spatial atmosphere and the proper aesthetics for downtown Honolulu. DTS should consult with DOT and the downtown stakeholders on the location of this transit station.
2. Page 3-14. Please note that Kewalo Basin is DOT Harbors third Oahu harbor but is soon to be transferred to the Hawaii Community Development Authority (HCDA). Charter Boat operations as mentioned in the document occur at this harbor and not at Honolulu or Kalaeloa Barbers Point Harbor.
3. Page 3-14. Ocean Recreation is not an activity of DOT's commercial harbor system. Ocean Recreation is under the jurisdiction of the DLNR – Division of Boating and Ocean Recreation.
4. Page 3-14. Trucks carrying freight enter Honolulu Harbor through Nimitz Highway and also Ala Moana Boulevard (at Fort Armstrong). The roadway fronting Fort Armstrong is Ala Moana Boulevard and not Nimitz Highway.
5. Page 3-14. Please also include Kalihi Street in the discussion of freight movement. Eastbound container trucks utilize Kalihi Street to get onto Interstate Route H-1.

6. Page 3-44. The correct name for Oahu's second harbor is Kalaehoa Barbers Point Harbor. It is noted as Barbers Point Harbor on this page and elsewhere.
7. Page 3-48. It is noted that alternative routes may be required as an impact of the construction of the improvements. Any improvement required to facilitate alternative routes (turning radius, etc.) should be the responsibility of the Project as a mitigation measure.
8. Page 4-61. Kewalo Basin should also be included in the discussion of the makai edge.
9. Page 4-171. There is no "Kalaehoa Harbor 2020 Master Plan" or "Honolulu Harbor 2020 Master Plan". The Oahu Commercial Harbors 2020 Master Plan incorporates both Honolulu and Kalaehoa Barbers Point Harbors.

HIGHWAYS

DOT also confirms that there will be impacts to the highway system. At a significant number of locations, the rail line, transit stations and other Project support facilities will be functionally adjacent to, physically abut or transect highway system roadways and right-of-ways. The transit-oriented development (TOD) within the communities around the rail stations will also impact the highways system. DOT requests that DTS address the following comments and initiate or continue coordination with the Highways Division Planning Branch at (808) 587-1830.

1. Chapter 3 various pages. Planning horizon of 2030 is used throughout the document. Standard practice is 20 years after construction completion. With a construction completion in 2018, the planning horizon should be 2038.
2. Page 4-98 3rd paragraph. The reference, "The State of Hawaii regulates community noise pollution through HAR 11-16," is incorrect. The correct reference is HAR 11-46. In addition, Hawaii's noise levels are more restrictive than the Federal levels and the project needs to conform to both requirements. HAR 11-46-4 has maximum permissible sound levels in dBA (dBA defined as the A-weighted sound level or unit of measurement describing the total sound level of all noise as measured with a sound level meter using the "A" weighting network). The following is the maximum level.

	Day time (7am-10pm)	Night time (10pm-7am)
Class A	55	45
Class B	60	50
Class C	70	70

Class A includes all areas equivalent to land zoned residential, conservation, preservation, public space, open space, or similar type.

Class B includes all areas equivalent to lands zoned for multi-family dwellings, apartment, business, commercial, hotel, resort, or similar type.

Class C includes all areas equivalent to lands zoned agriculture, country, industrial, or similar type.

3. Kamehameha Highway Improvements -- Waihona Street to Center Drive. DTS should coordinate Project work with improvements to this area.
4. Design Criteria. DOT Highways requests all streetscape improvements by DTS utilize DOT Highway standard drawings, details and specifications. Particularly, as follows:
 - a. A visual picture record of assets within the highway right-of-way prior to construction shall be made by DTS and approved by DOT's Highway Landscape Architect for restoration afterwards. In general, all landscaping shall be restored to its original condition after construction is complete. DTS should provide As-built drawings in the form of both full size drawings and electronic files of all work within the highway right-of-way.
 - b. Work within the highway right-of-way shall employ DOT Highway standard Invasive Species Management specifications and Tree Protection zone construction detail. All transplantable trees as determined by DOT to be removed by construction shall be transplanted at DTS' expense to another State right-of-way site approved by DOT's Highway Landscape Architect.
 - c. DTS shall not move relocated utilities under DOT sidewalks and should consult with DOT for exceptions. New utility boxes shall be screened by landscaping or placed in underground vaults.
 - d. The handling of the anticipated additional trash in between stations needs further explanation.
 - e. All median underneath the rail shall be low maintenance rockscape or decorative paving with limited, shade tolerant plantings at intersections.
 - f. New plantings shall be non-invasive plants as defined by the Hawaii Chapter of the American Society of Landscape Architects. DTS shall employ native plants where they are the best choice for the conditions.

- g. The design of the rail should include measures to limit bird nesting and perches that produce bird droppings.

5. Construction Criteria.

- a. During construction, DTS shall maintain all landscaped areas to DOT Highway standards utilizing DOT maintenance specifications including mowing, edging and trimming, weeding, pruning and care of shrubs and trees, fertilizing, pesticide and herbicides, clearing gutters, swales and ditches, invasive plant removal and rubbish and debris removal and disposal.
- b. DTS shall be responsible for maintaining all irrigation impacted during construction and provide watering as necessary. All site furnishings that are removed during construction including but not limited to traffic signal poles and heads, irrigation controllers and valves, backflow preventers, fence fabric and utility boxes shall be delivered at DTS' expense to the DOT Highways Oahu District Baseyard or disposed of at DTS' expense if DOT does not desire to keep the items.

6 Farrington Highway - Fort Weaver Road to Interstate Route H-1.

- a. In recognition of Farrington Highway as the main street of Waipahu, DOT spent \$4 million dollars in 2002 for a main street revitalization project. In 2005, the project received the Betty Crocker Landscape Award from the Scenic Hawaii organization.

"This project sponsored by the State Department of Transportation helped transform a bleak, lifeless, uninviting part of Farrington Highway for motorists. The result is landscaping effort that quickly changed the area and which will continue to improve..."

- b. DOT's interaction with the Waipahu community has been overwhelming positive and the improvements to Farrington Highway have contributed to a greater sense of pride and renewal in the community. As a result, adjacent properties have been improved and new businesses have moved in along the highway.
- c. Since the Project is going to remove these significant improvements to Waipahu's main street and add a rail structure further affecting the aesthetics, DOT requests DTS consult with DOT and the Waipahu stakeholders to provide equitable improvements to the sidewalks to include material sidewalk improvements, street trees, site furnishings and undergrounding of overhead utilities.

- d. All existing median trees to be removed by Project construction shall be transplanted at DTS' expense to another State right-of-way site approved by DOT's Highway Landscape Architect.
7. Kamehameha Highway - Interstate Route H-1 to Aloha Stadium. Kamehameha Highway is the main street for two communities; Aiea and Pearl City. Since 2005, DOT has worked with the Aiea and Pearl City communities through an extensive public involvement process to identify improvements to this main street. Through this process, the community and DOT agreed to improvements that were suspended pending the outcome of rail. This Project installs a rail structure to the area, which could negatively impact the area aesthetics. Therefore, DOT requests that DTS consult with DOT and the Aiea and Pearl City stakeholders to provide equitable improvements to the sidewalks, such as material sidewalk improvements, street trees, site furnishings, enhancement of areas around Sumida Watercross farms and undergrounding of overhead utilities.
 8. Nimitz Highway - Nuuanu Stream Bridge to Halekauwila Boulevard.
 - a. Nimitz Highway from Nuuanu Stream Bridge to Halekauwila Boulevard abuts the downtown central business district waterfront and some of the most valuable real estate in the State of Hawaii. It is also the point of arrival for all cruise ship visitors to Oahu. Additionally, Hawaii Tourism Authority's research indicates over 80% of Oahu visitors' first impression of Hawaii is driving from the Airport to Waikiki via Nimitz Highway. For over 20 years, the downtown community has explored means to relocate the HECO power plant that detracts from this valuable waterfront area. The addition of a rail structure and station located near the HECO power plant will require further study of the Nimitz Highway corridor and a careful analysis of impacts to the Aloha Tower complex and adjacent harbor facilities. Also, care must be taken to maintain pedestrian safety as well as to avoid creating a less than desirable visual and spatial atmosphere for visitors and residents moving through this area. The aesthetics, image and appearance of downtown Honolulu are areas of great concern to the community. Therefore, DOT requests DTS consult with DOT and downtown stakeholders on this matter and to provide equitable improvements to the sidewalks including material sidewalk improvements, street trees and site furnishings.
 - b. Recognizing the importance of this stretch of Nimitz Highway, in 2008 DOT installed plantings of coconut palms. As such, all existing median trees to be removed by Project construction shall be transplanted at DTS' expense to another state right-of-way site approved by DOT's Highway Landscape Architect.

DOT appreciates the opportunity to provide comments. Given the anticipated and potential impacts to multiple DOT facilities, it would be beneficial to have DTS make periodic presentations to DOT as part of the on-going Project planning and coordination with DOT.

Mr. Wayne Yoshioka
Page 8
January 29, 2009

STP 8.3074

Presentations should cover issues such as the Project task list and timeline, coordination for design and construction phasing, environmental issues and mitigation measures and physical impacts to and integration with DOT airport, harbors and highway systems. Further, these meetings should include all or combinations of the modal divisions based on the particular subject matter or area and location being discussed.

If there are any questions regarding all three modal divisions of DOT, please contact Mr. David Shimokawa of the DOT Statewide Transportation Planning Office at (808) 587-2356.

Very truly yours,

BRENNON T. MORIOKA, PH.D., P.E.
Director of Transportation

Honorable Brennon T. Morioka, Ph.D., Director
Department of Transportation
State of Hawaii
869 Punchbowl Street
Honolulu, Hawaii 96813-5097

Dear Mr. Morioka:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Airports

1. *As stated in your letter, there are two stations proposed for Honolulu International Airport property. One station is next to the recently constructed parking garage and one at Lagoon Drive. The specific station locations are shown in Appendix B to the Final EIS. Project staff has and will continue to coordinate with HDOT Airports Division Planning staff.*

2. *DTS will continue to coordinate with HDOT Airports Division Planning staff, specifically on the connection between the rail station and airport terminals. Signage and wayfinding are being addressed in the station design process.*

3. *DTS has consulted with FAA and HDOT Airports Division during preparation of the Final EIS. The design included in the Final EIS meets the requirements of these agencies. FAA Form 7460-1 will be submitted to the Federal Aviation Administration at the appropriate time, which is about 2 years prior to construction. This has been added to the list of permits and approvals in Section 4.21 of the Final EIS.*

4. *DTS has consulted with the Transportation Security Administration (TSA) regarding security requirements and will continue to coordinate with TSA throughout design, construction, and implementation of the Project to ensure that security requirements and concerns are addressed.*

Harbors

1. *Your comment regarding the interface between the Project and Nimitz Highway is noted.*

a. *Thank you for being amenable to locating a station in your building. Station locations were selected in part to minimize negative effects and geometric challenges (such as building on a curve) and maximize opportunities to serve the community and promote ridership. The Downtown Station location was selected for Nimitz Highway between Alakea and Bishop Streets because it was the best location from a geometric design perspective and allowed the station to serve the center of town effectively.*

b. *The identified location for the Downtown Station emphasizes pedestrian safety by connecting the mauka and makai sides of Nimitz Highway with a concourse, thus providing access to the waterfront, Aloha Tower Marketplace, and Downtown destinations. Alternative Downtown Station locations were evaluated in Chapter 5 of the Final EIS.*

As stated in Section 2.5.5 of the Final EIS, design criteria developed for Project stations place highest emphasis on walk and bicycle access. Pedestrian access to stations, including accessible routes, shall be given first priority for safety reasons. The design criteria also state that, as a non-motorized mode, bicycles will be given second priority.

2. *In response to your comment, the reference to Kewalo Basin operations has been revised in the Final EIS.*

3. *In response to your comment, text in Section 3.3.3 of the Final EIS has been revised as follows: "Ocean transportation, shipbuilding and repair, commercial fishing, ocean recreation (as operated by the Division of Land and Natural Resources), and other support industries are the main activities in Oahu's commercial harbors."*

4. *In response to your comment, the sentence has been revised to read: "Trucks carrying freight enter and exit Honolulu Harbor on Nimitz Highway and Ala Moana Boulevard and use all major highways and freeways on Oahu."*

5. *In response to your comment, Kalihi Street has been identified as a freight route in the Final EIS.*

6. *In response to your comment, the reference to Kalaeloa Barbers Point has been revised in the Final EIS.*

7. *In the Final EIS (Section 3.5.7), a Maintenance of Traffic Plan and Transit Mitigation Program will identify measures to mitigate temporary construction-related effects on transportation. These plans and programs will be developed by the construction contractor for each phase, approved by the City, and coordinated with and approved by HDOT for those segments in HDOT highways.*

8. *The affected environment discussion referenced by the comment is found under the Kalihi to Ala Moana Center Landscape Unit heading in Section 4.8.2 of the Final EIS. The discussion mentions that the mountains and shoreline that define the mauka and makai edge of this landscape unit are dominant elements of the landscape. The Kewalo Basin is part of this landscape.*

9. *In response to your comment, Table 4-39 of the Final EIS has been revised to include "Oahu Commercial Harbors 2020 Master Plan improvements," and Kalaeloa Barbers Point Harbor and Honolulu Harbor will be removed in lieu of the Oahu Commercial Harbors replacement.*

Highways

1. *In 2005, the FTA provided guidance to RTD that a 2030 planning horizon could be used, provided that it is consistent with forecasts used by the local metropolitan planning organization (MPO). The planning horizon used for this project corresponds to that used by the Oahu Regional Transportation Plan developed by the OahuMPO. This provides consistency with the Island's long-range plan. 2030 was the longest comprehensive planning horizon existing in Honolulu at the time the Project was developed.*

2. *Our understanding is that HAR 11-46 regarding Community Noise Control is not intended to be used for transportation projects. As the purpose states: "It is the purpose of this chapter to define the maximum permissible sound levels, and to provide for the prevention, control, and abatement of noise pollution in the State from the following excessive noise sources: stationary noise sources; and equipment related to agricultural, construction, and industrial activities. It is also the purpose of this chapter to establish noise quality standards to protect public health and welfare, and to prevent the significant degradation of the environment and quality of life."*

3. *DTS will continue the ongoing regular coordination with HDOT as the Project progresses.*

4. *DTS has developed specifications and design criteria to address the City and County of Honolulu's architecture and landscape architecture requirements for the Project, including stations. Where appropriate, the City will use the applicable DOT Highway standards.*

a. *Landscape plans for work performed on State Highways will be prepared and submitted to HDOT for review. Construction contractors will be required to maintain designated landscape areas in accordance with Hawaii Standard Specifications,*

Section 643—Maintenance of Existing Landscape Areas. Section 4.8.3 of the Final EIS provides a more detailed description of applicable design criteria.

b. Your comment is noted and DTS will comply. Trees (suitable for transplanting) displaced by construction will be relocated to a City and County of Honolulu project nursery until they can be transplanted to another part of the project area. DTS will coordinate with HDOT's Highway Landscape Architect. This requirement is included in the project design criteria, which is summarized in Section 4.8.3 of the Final EIS.

Invasive species management during construction is discussed in Section 4.18.9 of the Final EIS.

c. DTS will coordinate with HDOT on the location of relocated utilities. As described in Section 4.8.3 of the Final EIS, tall vertical plantings for vines will be used to screen or minimize the impact of the traction power substation structures, as appropriate. Plants or vines will be a minimum of 6 feet high in secure areas while maintaining visibility to the entrances. New utility boxes will be screened by landscaping or placed in underground vaults.

d. A reference to development of a maintenance agreement has been added to Section 4.21 of the Final EIS.

e. For those areas of the Project in HDOT roadways, landscape plans, including those covering median areas, will be prepared and submitted to HDOT for review. This requirement has been added to Table 4-40 of the Final EIS.

f. The American Society of Landscape Architects' Invasive Species List has been incorporated into the design criteria as a "do not plant" list. A plant palette of native species has also been included with encouragement for their use and caution to consider water and nutrient requirements.

g. Design of the stations and guideway will include measures to limit bird nesting and perches, as appropriate. This is addressed in the Project design criteria.

5. Construction Criteria

a. The contractor shall be required to maintain designated landscape areas in accordance with Hawaii Standard Specifications, Section 643—Maintenance of Existing Landscape Areas. Section 4.18.3 of the Final EIS includes mitigation that vegetation is to be replaced as soon as practical after construction is completed.

b. The contractor shall be required to maintain designated landscape areas and repair damaged irrigation in accordance with Hawaii Standard Specifications, Section 643—Maintenance of Existing Landscape Areas and Section 644—Repair of Existing Sprinkler System. Detailed material salvage procedures are incorporated into the construction contract documents, specifically in Standard Specification 02 41 00—Demolition. The materials will be returned to HDOT at the Oahu District Baseyard.

6. *Farrington Highway/Fort Weaver Road to Interstate H-1*

a. *Comments regarding the Farrington Highway improvements are noted.*

b. *Comments regarding the effect which the Farrington Highway improvements have had on the Waipahu community are noted.*

c. *DTS will coordinate and consult with HDOT and other agencies, as appropriate, on the final design of the streetscape affected by the Project.*

d. *Your comment is noted and DTS will comply. Trees (suitable for transplanting) displaced by construction will be relocated to a City and County project nursery until they can be transplanted to another part of the project area. DTS will coordinate with HDOT's Highway Landscape Architect. This requirement is included in the Project design criteria.*

7. *DTS will coordinate and consult with HDOT and other agencies as appropriate on the final design of the streetscape affected by the Project.*

8. *(no title given)*

a. *DTS will coordinate and consult with HDOT and other agencies as appropriate on the final design of the streetscape affected by the Project.*

b. *Your comment is noted and DTS will comply. Trees (suitable for transplanting) displaced by construction will be relocated to a City and County project nursery until they can be transplanted to another part of the project area. DTS will coordinate with HDOT's Highway Landscape Architect. This requirement is included in the Project design criteria. Project staff will continue to coordinate with HDOT staff and provide updates as requested. In all cases, the City will work with HDOT and the local communities as final designs are developed for each area as noted earlier in the design criteria response. Street trees, sidewalks, and other hardscape and landscape improvements will be developed in coordination with HDOT to maintain an attractive environment along the entire corridor.*

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

DISABILITY AND COMMUNICATION ACCESS BOARD

919 Ala Moana Boulevard, Room 101 • Honolulu, Hawaii 96814
Ph. (808) 586-8121 (VTDD) • Fax (808) 586-8129

November 24, 2008

The Honorable Wayne Y. Yoshioka
Director
Department of Transportation Services
City and County of Honolulu
650 South King Street
Third Floor
Honolulu, HI 96813

Dear Mr. Yoshioka,

The Disability and Communication Access Board was disappointed that a representative was unable to attend our Board meeting on November 20, 2008 to dialogue with Board members on the issue of accessibility for persons with disabilities in the proposed rail system. We understand that a representative may be able to attend the next Board meeting scheduled January 15, 2009 and we look forward to his or her attendance.

At our November 20, 2008 Board meeting, we used the opportunity to coalesce some of our concerns on accessibility and wish to relay them to you in advance of the January 2009 meeting in the hopes that you or your staff are better prepared to engage in a meaningful dialogue with our Board.

Our Board has strong concerns that the project meet not only the minimum guidelines for accessibility, as required by law, but also be functional, safe, comfortable and usable for people with disabilities. It has been our experience, unfortunately, that many projects consider accessibility to be an afterthought to the conceptual design. Community presentations on the rail system to-date, including visuals and schematic drawings, do not appear to reflect the population of people with disabilities as a consideration in planning and designing the project. For that reason we strongly urge you to include our Board and other people with disabilities in the earliest phases of conceptual design so as not to limit options because a project is too late to change when already in an advanced stage of design.

The following are some of our preliminary concerns:

1. Since the system is elevated, what is planned for vertical access at all stations? What is planned for the entire route from the Park and Ride onto the train itself?
2. How are you planning to incorporate people with disabilities in obtaining feedback?

RECEIVED
NOV 24 2008
10:29 AM
TRANSPORTATION SERVICES
DEPARTMENT OF TRANSPORTATION SERVICES

The Honorable Wayne Y. Yoshioka
Director
Department of Transportation Services
November 24, 2008
Page 2

3. What access accommodations are planned for people with visual and hearing loss? Most of the time the emphasis is on mobility access only.
4. What is planned for maintenance, especially with elevators? Since the system is elevated, what will happen when the elevators do not work?
5. Will there be standardized criteria for all the stations since it appears that there may be different design consultants working on various stations?

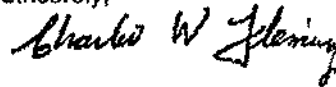

Are you addressing program non-architectural issues as well (i.e., policies regarding assistance animals, emergency egress, audible station announcements, etc.)?

The Disability and Communication Access Board would like to know what information has been learned from other systems (BART in San Francisco, METRO in Washington, D.C.) in terms of access deficiencies and how to avoid them here.

We look forward to your attendance at our January 2009 Board meeting.

Should you have any questions, please feel free to contact Francine Wai, Executive Director at 586-8121.

Sincerely,

CHARLES W. FLEMING
Chairperson

Mr. Charles W. Fleming, Chairperson
Disability & Communication Access Board
State of Hawaii
919 Ala Moana Boulevard, Room 101
Honolulu, Hawaii 96814

Dear Mr. Fleming:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Project staff have continued to communicate with the Disability and Communication Access Board and provided an additional update to the Board regarding the Project's status and design aspects as the Project progresses into Final Design. Such communication will continue throughout the Project to enable the Board to comment on the Project's design.

Project staff members met with the Board at its January 19, 2009, meeting to discuss the contents of your letter. To reiterate information that was discussed with the Board:

- 1. The transit system will be Americans with Disabilities Act (ADA) accessible. Elevators and escalators will be provided at all stations. In addition, level boarding will be provided to trains; therefore, stairs or lifts, as used on buses, will not be required to board the trains. Park-and-ride facilities will have handicapped spaces with ADA-compliant ramps and paths connecting the lots to the stations.*

In addition, sidewalks and bridges will be at least eight feet wide; pedestrian crossings will be signalized; and curb cuts will have tactile surfaces.

- 2. The Project will continue to solicit opinion and comment from the disabled community and will continue outreach efforts to the disabled community as a whole. This includes individuals with disabilities and accessibility issues.*
- 3. For riders who are blind or have low-vision, there will be texture changes in the pavement to identify important areas, including the edge of the platform. Braille and/or raised letter print and large print signage and verbal announcements will also be provided. For riders who are deaf/hard of hearing, directional, informational, and variable message signage will be provided at all stations.*
- 4. The maintenance schedule for elevators and escalators, as with the maintenance schedule for transit vehicles, will be developed to provide reliable service.*
- 5. There will be consistent standardized architectural design criteria for all stations. The design criteria will cover such issues as accessibility, signage, and ticketing.*

Lastly, system policies will consider input from the Board. While service animals will be allowed on trains, other animals, including comfort animals, will not be allowed per current policy with TheBus. Audible and visual information systems will be included in all stations. A project-specific Safety and Security Management Plan has been developed in accordance with FTA requirements. It defines the safety and surety activities and methods for identifying, evaluating, and resolving potential safety hazards and security vulnerabilities of these systems. The Honolulu Police Department, the Honolulu Fire Department, the Department of Emergency Management, and the Honolulu Emergency Services Department will continue to be involved in implementing the plan.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Regarding: Honolulu High-Capacity Transit Corridor Project
Draft Environmental Impact Statement/Section 4(f) Evaluation
November 2008

Dear Mr. Yoshioka,

The Disability and Communication Access Board would like to thank you for the opportunity to review the Honolulu High-Capacity Transit Corridor Project Draft Environmental Impact Statement/Section 4(f) Evaluation dated November 2008. The purpose of this review is to ensure that this project will take into account accessibility design requirements for persons with disabilities.

With respect to the Final Environmental Impact Statement, we recommend the following general statement should be included in the EIS/Section 4(f) Evaluation:

"All buildings, facilities, and sites shall conform to applicable federal, state, and county accessibility guidelines and standards. Hawaii Revised Statutes §103-50 requires all State of Hawaii or County government buildings, facilities, and sites to be designed and constructed to conform to the Architectural Barriers Act/Americans with Disabilities Act Accessibility Guidelines (36 CFR Parts 1190 and 1191) issued by the U.S. Access Board, and other applicable design standards as adopted and amended by the Disability and Communication Access Board. The law further requires all plans and specifications prepared for the construction of State of Hawaii or County government buildings, facilities, and sites to be reviewed by the Disability and Communication Access Board for conformance to those guidelines and standards."

The U.S. Department of Transportation, a major funding source for this project, has adopted and will enforce these design guidelines.

These comments are in addition to separate comments to your Department regarding the accessibility of the system (irrespective of the route taken) for persons with disabilities. The rail system will be a major transportation alternative for individuals with disabilities and it is critical that the design not only be minimally accessible to meet the requirements of the law but also take into account best practices for maximum usability and comfort to increase ridership.

Should you have any further questions, feel free to contact Mr. Curtis Motoyama, Facility Access Coordinator, or Mr. Gary Batcheller, Facility Access Specialist at 588-8121.

Sincerely,

FRANCINE WAI

Ms. Francine Wai, Executive Director
Disability and Communication Access Board
State of Hawaii
919 Ala Moana Boulevard, Room 101
Honolulu, Hawaii 96814

Dear Ms. Wai:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The transit system will comply with Americans with Disabilities Act (ADA) regulations. The system operation plan considers and complies with all ADA requirements, including the noted requirements. The requested language regarding accessibility has been added to Section 2.5 of the Final EIS with minor modifications.

The City will continue to work with the Disability and Communication Access Board regarding accessibility issues.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this

Ms. Francine Wai

Ref. No.: PL TRANS 7.18

January 29, 2009

Mr. Wayne Yoshioka, Director
Department of Transportation Services
City and County of Honolulu
650 South King Street, 3rd Floor
Honolulu, Hawaii 96813

Dear Mr. Yoshioka:

Re: Honolulu High-Capacity Transit Corridor Project Draft
Environmental Impact Statement/Section 4(f) Evaluation

Thank you for the opportunity to review the Draft Environmental Impact Statement ("DEIS"), Section 4(f) Evaluation, relating to the Honolulu High-Capacity Transit Corridor Project. Please include our comments and your responses in the Final Environmental Impact Statement ("FEIS").

We have the following general comments to offer:

1. Due to the high level of Archaeological Resources Occurrence identified in Chapter 4, Figure 4-50 of the DEIS, we recommend that an Archeological Inventory Survey Plan and Survey be conducted for the proposed route of the Honolulu High-Capacity Transit Corridor Project within the Kakaako and Kalaeloa Community Development Districts. All study and documentation should be coordinated with the State Historic Preservation Office, Department of Land and Natural Resources, State of Hawaii.
2. We are concerned about the impact of the Project to the Queen Street Park as noted on page 5-15 of the DEIS. It appears that the straddle-bent columns would be located within the Mauka portion of the park. Public parks within the Kakaako Community Development District represent an important and scarce resource. We recommend alignment of the Honolulu High-Capacity Transit Corridor in this area.

RECEIVED
PLANNING DIVISION

Mr. Wayne Yoshioka
Page Two
January 29, 2009

to lie entirely within the roadway right-of-way to avoid any loss of park space to straddle-bent columns.

3. Native Hawaiian re-internment burial sites are located within the Ewa portion of the Queen Street Park and within the Mauka Diamond Head corner of Mother Waldron Park. The City and County of Honolulu should coordinate with the State Historic Preservation Office and Oahu Burial Council in identifying and monitoring native Hawaiian burial sites during construction.
4. The Hawaii Community Development Authority ("HCDA") has planning and zoning jurisdiction within Kakaako and Kalaeloa Community Development Districts and a development permit from HCDA is a requirement for any development within these Districts. Development permits from the HCDA shall be required for construction of the transit guideway, transit stations and any other accessory structures associated with the Honolulu High-Capacity Transit Corridor Project within the Kakaako and Kalaeloa Community Development Districts.
5. Small businesses in Central Kakaako are a vital part of the State's economy and include nearly 200 businesses employing close to 1,000 people and generating approximately \$60 million in annual sales. Any impact to these businesses due to construction and operation of the transit project needs to be discussed in the FEIS.
6. Halekauwila Street is identified as the alignment for the Locally Preferred Alternative. It appears that the elevated guideway support columns will encroach into the traffic lanes on Halekauwila Street. If there will be a loss of a travel lane on Halekauwila Street, regional traffic impact due to the loss of travel lane needs to be addressed in the FEIS.

Mr. Wayne Yoshioka
Page Three
January 29, 2009

7. It appears that portions of the Locally Preferred Alignment and transit stations are located within lands owned by General Growth Properties, Inc. ("GGP") and Kamehameha Schools ("KS"). The HCDA is currently reviewing master plan applications submitted by both GGP and KS for the development of lands within the Kakaako Community Development District. We request that your department coordinate the alignment as well as the location and detailed design of the stations with the HCDA, GGP, and KS and report its findings and recommendations in the FEIS.
8. The issue of "elevated" or "at-grade" track for the Kakaako and Kalaeloa Districts does not appear to be fully explored. This issue needs to be analyzed in depth and (at a minimum) the Kakaako and Kalaeloa communities need to be engaged. Though the DEIS refers to the possibility of building sections of the transit corridor in Kapolei "at-grade", stakeholder discussions conducted in the Kalaeloa Community Development District have produced support for a grade-separated system. We request that the FEIS include community feedback and analysis of the costs and benefits of constructing "elevated" and "at-grade" tracks for this project.
9. The alignment of the Project within the Kalaeloa Community Development District will impact multiple landowners and created a level of confusion as to the timing, requirements and impacts to future program activities and plans. The FEIS should document any comments received from and response given to the Hawaii Army National Guard, Ford Island Properties, Department of Hawaiian Homes Land, Carmel Partners, Hawaii Public Housing Authority and the Veteran Administration with respect to alignment and other expected impacts of the project upon their land use and programs.
10. The Kalaeloa, Kapolei and Ewa Beach communities currently suffer from the lack of a multi-modal transportation system and the distance to employment centers. The DEIS does not discuss how the Honolulu High-Capacity Transit

Mr. Wayne Yoshioka
Page Four
January 29, 2009

Corridor Project will be integrated into a transit-bus-shuttle system and will meet the needs of these communities.

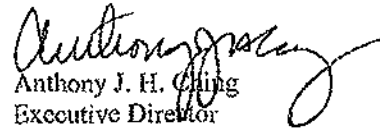

Along with the general comments listed above, specific comments include the following:

- Provide the extent of acquisition of additional right-of-way along alignment including size, location and dimension of anticipated right-of-way acquisition. Page 3-39, Table 3-21.
- Provide more detailed information on neighborhood parking programs. Page 3-44, Section 3.4.5.
- Industrial uses should also be included in the description of Kakaako. Existing Land Use Overview by Planning Area (last paragraph) Page 4-11, Table 4-2.
- Include Kalaeloa Master Plan and Kakaako Community Development District Mauka Area Plans in Future Land Use Plans and Policies, Page 4-13.
- Identify Symbol "H" on Page 4-32, Figure 4-12, as the John A. Burns School of Medicine.
- The Kakaako Community Development District is comprised of 614 acres, including the Makai Area. Page 4-42, Ala Moana-Kakaako. Please note that the Ala Moana Boulevard is not a part of Kakaako Mauka Area.
- Chapter 1, P. g. 1-7, Figure 1-4, Major Activity Centers in the Study Corridor refer to the Kalaeloa Industrial Park near Fort Barrette and Roosevelt Roads. The reference to the Kalaeloa Industrial Park is incorrect as this facility does not exist. The reference should instead refer to the Kalaeloa Community Development District.

Mr. Wayne Yoshioka

Mr. Anthony J.H. Ching, Executive Director
Hawaii Community Development Authority
State of Hawaii
677 Ala Moana Boulevard, Suite 1001
Honolulu, Hawaii 96813

Dear Mr. Ching:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

1. *Identification of archaeological sites will be conducted for the Project pursuant to the Programmatic Agreement (PA) described in Section 4.16 of the Final EIS. The PA is available in Appendix H of the Final EIS. The PA will include survey plans, surveys, and coordination. Kalaeloa is outside of the Project study area; therefore, it will not be impacted. Coordination with the State Historic Preservation Division is ongoing.*

2. *The Project design has been revised in the vicinity of the proposed Queen Street Park. The Project will not use land from the park.*

3. *Coordination with the Oahu Island Burial Council and the State Historic Preservation Division is on-going and includes evaluation and analysis of any potential impacts on native Hawaiian burial sites. Such sites are covered by the PA described above.*

4. Development permits from HCDA have been added to the List of Anticipated Permits in the Final EIS, Section 4.21 (Table 4-40).

5. An analysis of construction impacts on businesses is summarized in the Final EIS (Section 4.18.1) and detailed in Section 5.2.2 of the Honolulu High-capacity Transit Corridor Project Economics Technical Report (RTD 2008c). This and other technical reports are available at local libraries, DTS, on the project website at www.honolulustransit.org, and the offices of the City and County of Honolulu. The primary impacts are anticipated to result from inconveniences and disruptions to adjacent residents, businesses, and business customers that are inherent in any major construction project, which include:

- Presence of construction workers and materials.
- Temporary road closures and traffic diversions.
- Temporary reductions in parking availability.
- Airborne dust, noise, and vibrations.
- Businesses' temporary loss or change of visibility to their customers.

Control measures, as discussed in Section 4.18.1, Land Use and Economic Activity, of this Final EIS will mitigate these effects to protect residents' comfort and daily life and to prevent inconveniences and disruptions to the flow of customers, employees, materials, and supplies to and from area businesses. The Maintenance of Traffic Plan will address temporary effects on access to businesses during construction. Proposed mitigation to reduce adverse economic hardships for existing businesses along the project alignment during construction activities will include:

- Coordinating construction planning and phasing with nearby property owners and businesses.
- Developing a public involvement plan prior to construction to inform business owners of the construction schedule and activities.
- Initiating public information campaigns, including signs and lighting, to reassure people that businesses are open during construction and to encourage their continued patronage.
- Minimizing the extent and number of businesses, jobs, and access affected during construction.
- To the extent practicable, coordinating the timing of temporary facility closures to minimize impacts to business activities, especially those related to seasonal or high sales periods.
- Minimizing, as practical, the duration of modified or lost access to businesses.

- *Providing public information (e.g., press releases or newsletters) regarding construction activities, including advertisements in print and on television and radio.*
- *Phasing construction in each area so as to maintain access to individual businesses for pedestrians, bicyclists, passenger vehicles, and trucks during business hours and important business seasons.*
- *Providing advanced notice if utilities will be disrupted and scheduling major utility shut-offs during non-business hours.*

6. *As shown in Table 3-21 of the Final EIS, all travel lanes along Halekauwila Street will be preserved; however, the exclusive Ewa-bound right-turn only lane at South Street will be removed. Table 5-33 in Honolulu High-Capacity Transit Corridor Project Transportation Technical Report and Addendum 02 to the Transportation Technical Report (RTD 2009i) shows the column placement effects along Halekauwila Street.*

7. *The Project right-of-way team has contacted and will continue to coordinate with all property owners, including General Growth Properties, Inc., and Kamehameha Schools, along the alignment regarding all proposed partial and full acquisitions. All properties with right-of-way impacts are listed in Appendix C, Preliminary Right-of-Way Plans, of this Final EIS.*

8. *As stated in Section 2.2 of the Final EIS, prior to selecting an elevated fixed guideway system, a variety of high-capacity transit options were evaluated during the Primary Corridor Transportation Project (1998—2002) and Alternatives Analysis. Options evaluated and rejected included an exclusively at-grade fixed-guideway system using light-rail or bus rapid transit (BRT) vehicles, as well as a mix of options consisting of both at-grade and grade-separated segments.*

The Alternatives Screening Memorandum (DTS 2006a) recognized the visually sensitive areas in Kakaako and Downtown Honolulu, including the Chinatown, Hawaii Capital, and Thomas Square/Academy of Arts Special Design Districts. To minimize impacts on historic resources, visual aesthetics, and surface traffic, the screening process considered 15 combinations of tunnel, at-grade, or elevated alignments between Iwilei and Ward Avenue. Five different alignments through Downtown Honolulu were advanced for further analysis in the Alternatives Analysis, including an at-grade portion along Hotel Street, a tunnel under King Street, and elevated guideways along Nimitz Highway and Queen Street.

The Alternatives Analysis Report (DTS 2006b) evaluated the alignment alternatives based on transportation and overall benefits, environmental and social impacts, and cost considerations. The report found that an at-grade alignment along Hotel Street would require the acquisition of more parcels and affect more potential burial sites than any of the other alternatives considered. The alignment with at-grade operation Downtown and a tunnel through the Capital Historic District, in addition to the environmental effects such as impacts to cultural resources, reduction of street capacity, and property acquisition requirements of the at-grade and tunnel sections, would cost an additional \$300 million.

The Project's purpose is "to provide high-capacity rapid transit" in the congested east-west travel corridor (see Section 1.7 of the Final EIS). The need for the Project includes

improving corridor mobility and reliability. The at-grade alignment would not meet the Project's Purpose and Need because it could not satisfy the mobility and reliability objectives of the Project (see bullets below). Some of the technical considerations associated with an at-grade versus elevated alignment through Downtown Honolulu include the following:

- **System Capacity, Speed, and Reliability:** *The short, 200-foot (or less) blocks in Downtown Honolulu would permanently limit the system to two-car trains to prevent stopped trains from blocking vehicular traffic on cross-streets. Under ideal operational circumstances, the capacity of an at-grade system could reach 4,000 passengers per hour per direction, assuming optimistic five minute headways. Based on travel forecasts, the Project should support approximately 8,000 passengers in the peak hour by 2030. Moreover, the Project can be readily expanded to carry over 25,000 in each direction by reducing the interval between trains (headway) to 90 seconds during the peak period. To reach a comparable system capacity, speed, and reliability, an at-grade alignment would require a fenced, segregated right-of-way that would eliminate all obstacles to the train's passage, such as vehicular, pedestrian, or bicycle crossings. Even with transit signal priority, the at-grade speeds would be slower and less reliable than an elevated guideway. An at-grade system would travel at slower speeds due to the shorter blocks, tight and short radius curves in places within the constrained and congested Downtown street network, the need to obey traffic regulations (e.g., traffic signals), and potential conflicts with other at-grade activity, including cars, bicyclists, and pedestrians. These effects mean longer travel times and far less reliability than a fully grade-separated system. None of these factors affect an elevated rail system. The elevated rail can travel at its own speed any time of the day regardless of weather, traffic or the need to let cross traffic proceed at intersections.*
- **Mixed-Traffic Conflicts:** *The planned three-minute headways on the guideway will prevent effective coordination of traffic signals in the delicately balanced signal network in Downtown Honolulu. A three minute cycle of traffic lights would affect traffic flow and capacity of cross-streets. Furthermore, there would be no option to increase the capacity of the rail system by reducing the headway to 90 seconds, which would only exacerbate the signalization problem. An at-grade system would require removal of two or more existing traffic lanes on affected streets. This effect is significant and would exacerbate congestion. Congestion would not be isolated to the streets that cross the at-grade alignment but, instead would spread throughout Downtown. The Final EIS shows that the Project's impact on traffic will be isolated and minimal with elevated rail, and in fact will reduce system-wide traffic delay by 18 percent compared to the No Build Alternative (Table 3-14 in the Final EIS). The elevated guideway will require no removal of existing travel lanes, while providing a reliable travel alternative. When traffic slows, or even stops due to congestion or incidents, the elevated rail transit will continue to operate without delay or interruption.*

An at-grade light rail system with continuous tracks in-street, would create major impediments to turning movements, many of which would have to be closed to eliminate a crash hazard. Even where turning movements are designed to be

accommodated, at-grade systems experience potential collision problems. In addition, mixing at-grade fixed guideway vehicles with cars, bicyclists, and pedestrians presents a much higher potential for conflicts compared to grade-separated conditions. Where pedestrians and automobiles cross the tracks in the street network, particularly in areas of high activity (e.g., station areas or intersections), there is a risk of collisions involving trains that does not exist with an elevated system. There is evidence of crashes between trains and cars and trains and pedestrians on other at-grade systems throughout the country. This potential would be high in the Chinatown and Downtown neighborhoods, where the number of pedestrians is high and the aging population presents a particular risk.

- **Construction Impacts:** *Constructing an at-grade rail system could have more effects than an elevated system in a number of ways. The wider and continuous footprint of an at-grade rail system compared to an elevated rail system (which touches the ground only at discrete column foundations, power substations and station accessways) increases the potential of utility conflicts and discovery of sensitive cultural resources. In addition, the extra roadway lanes taken away for the system would result in increased congestion or require that additional businesses or homes be taken to widen the roadway through Downtown. Additionally, the duration of short-term construction impacts to the community and environment with an at-grade system would be greater than with an elevated system. Because of differing construction techniques, more lanes would need to be continuously closed for at-grade construction and the closures would last longer than with elevated construction. This would result in a greater disruption to business and residential access.*

Because it is not feasible for an at-grade system through Downtown to move passengers rapidly and reliably without significant detrimental effects on other transportation system elements (e.g., the highway and pedestrian systems, safety, reliability, etc.), an at-grade system would have a negative system-wide impact that would reduce ridership throughout the system. The at-grade system would not meet the Project's Purpose and Need and, therefore, does not require additional analysis.

The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS. However, the future extensions are not part of this Project; thus, they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time. The Project will not affect the Kalaeloa Community Development District. Fenced operation may be appropriate for the future extension through Kalaeloa and could be considered

when this extension is proposed for implementation. Chapters 2 and 8 of the Final EIS have been revised to include a discussion of the at-grade system.

9. As stated previously, the Project will not affect the Kalaeloa Community Development District. The area may be affected by a future project that would extend the system. The City would coordinate with HCDA at that time.

10. Section 3.4.2, *Effects on Transit*, of this Final EIS states that the bus network will be restructured to provide access from surrounding communities to the fixed guideway with more frequent bus service. In addition, because of the high frequency of the fixed guideway service (three-minute headways between trains during peak periods), riders transferring from buses to the fixed guideway will experience minimal wait times. Riders transferring from the guideway service to buses will benefit from improved frequencies on existing bus routes serving stations. Also, several new routes with high frequencies will be provided as feeders to the guideway system. Existing and future bus routes, including route numbers and frequencies, are provided as Appendix D, *Bus Transit Routes*, in this Final EIS. These include routes serving the Ewa Beach, Kapolei, and Kalaeloa areas.

The following responses address the specific comments listed in your letter:

- Appendix C in the Final EIS shows all required right-of-way acquisitions, including location and size. These requirements will be refined during the design process.
- Neighborhood parking programs can vary, but one example involves identifying on-street locations that would be restricted to residents of the area. Permits would be provided to residents to allow them to park in the designated spaces. As noted in Section 3.4.4, *Effects on Parking*, of this Final EIS, neighborhood parking is one of several potential strategies that could address spillover parking. Mitigation strategies would be determined in coordination with appropriate stakeholders.

In response to your comments, the following edits have been made to the Final EIS:

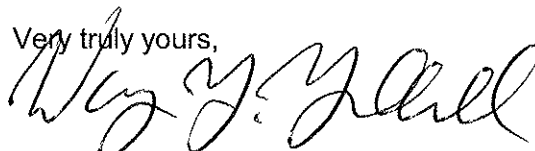

- Text in Table 4-2, *Existing Land Use Overview by Planning Area*, in the Final EIS now states: "Adjacent to Downtown, Kakaako contains a mix of large retail uses, industrial uses, restaurants, and theaters."
- The Kalaeloa Master Plan and the Kakaako Community Development District Mauka Area Plan have been added to the Section 4.2.2, *Affected Environment [Land Use]* of this Final EIS.
- The only community facilities called out by name on the figures in Section 4.5 are those that are impacted by the Project. This school is within one-half mile of the Project but is not impacted by the Project and, therefore, noted by symbol only.
- The Kakaako Community Development District size has been revised to 614 acres. See Section 4.6.2, *Affected Environment [Neighborhoods]*.

Mr. Anthony J.H. Ching
Page 7

- *Ala Moana Boulevard is not part of Kakaako Mauka Area (Section 4.6.2).*
- *Figure 1-4 has been revised to just refer to "Kalaeloa."*

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is fluid and cursive, with the first name "Wayne" being the most prominent.

RE: Honolulu High-Capacity Transit Corridor Project, Draft Environmental Impact Statement/Section 4(f) Evaluation, Island of O'ahu, Honolulu and 'Ewa Districts

Aloha e Wayne Y. Yoshioka,

The Office of Hawaiian Affairs (OHA) is in receipt of the above-mentioned letter dated November 12, 2008. The Department of Transportation Services – City and County of Honolulu (DTS) has submitted a copy of the Draft Environmental Impact Statement/Section 4(f) Evaluation (Draft EIS) for the Honolulu High-Capacity Transit Corridor Project (Project) to our office for review and comment. OHA has reviewed the project and offers the following comments.

The Draft EIS was prepared pursuant to the National Environmental Policy Act (NEPA), Section 4(f) of the U.S. Department of Transportation Act of 1966, Hawaii Revised Statutes (HRS) Chapter 343 and the Hawaii Administrative Rules, Title 11, Chapter 200. The review of this Draft EIS was triggered by both state and federal environmental and transportation policy laws and thus our comments on this document will reflect these laws and policies. OHA would also like to note that Section 106 consultation, pursuant to the National Historic Preservation Act of 1966 (NHPA), has also been triggered by this proposed action and is being conducted concurrent to the Draft EIS/Section 4(f) Evaluation.

The Role of OHA

OHA has substantive obligations to protect the cultural and natural resources of Hawai'i for its beneficiaries, the people of this land. The HRS mandate that OHA "[s]erve as the principal public agency in the State of Hawaii responsible for the performance, development, and

coordination of programs and activities relating to native Hawaiians and Hawaiians; . . . and [t]o assess the policies and practices of other agencies impacting on native Hawaiians and Hawaiians, and conducting advocacy efforts for native Hawaiians and Hawaiians.” (HRS § 10-3)

By direction of the statutory mandates, OHA continues to conduct advocacy efforts to protect the traditional cultural landscapes of Hawai‘i. This includes the protection of archeological and historic resources, the perpetuation of traditional and cultural practices, and the continued health of our terrestrial and marine ecosystems. The dialogue that has played out in the decision on whether the City should pursue the largest public works project in the history of the State of Hawai‘i has been controversial and widely publicized. OHA seeks not to weigh in on the controversial merits of development but seeks to assess the potential impacts that the Project will have on the landscape of the transit corridor.

Public Hearings for the Draft EIS

OHA is deeply concerned with format of the public hearings during the Draft EIS process. The public meetings were scheduled for 2 hours, but the local media reported that the first meeting on December 6, 2008 ended after thirty-one minutes. It was also reported that only ten residents offered testimony during the first meeting on December 6, 2008. OHA staff was able to attend the December 11, 2008 public hearing for the Draft EIS at Bishop Museum at 6:00pm. The meeting started shortly after 6:00pm with public comments being accepted at 6:05pm after a brief introduction by the project staff. After three members of the public offered testimony, the public hearing was officially closed at 6:12pm.

Our staff is concerned that members of the public who were not able to make it to the meetings on time may not have been afforded the opportunity to comment during these public meetings. Residents are often faced with many hardships, have many responsibilities and time commitments, may go to great lengths in order to attend public meetings, and are not always able to make the meetings precisely on time. The public should have been allowed to offer comments on the proposed project during the full two hours that was allotted and advertised for public comment.

Archeological, Cultural, and Historic Resources

Archeological, cultural, and historic preservation laws and regulations provide a regulatory context from which these resources will be identified, evaluated, and treated. As the Project is federally regulated by the NHPA, and its implementing regulation 36 CFR 800, an early determination of “adverse effects toward historic properties” was determined by the DTS and the Federal Transit Authority.

As a result of the determination of “adverse effects toward historic properties”, a Memorandum of Agreement (MOA) is being developed to address the adverse effects toward historic properties. According to the consultation process described in the EIS, the process would involve the State Historic Preservation Division (SHPD) and other consulting parties in discussions regarding adverse effects on historic properties resulting in an MOA.

To our knowledge, consultation with the SHPD and the O'ahu Island Burial Council (OIBC) has been taking place in recent months and the development of an MOA has been progressing. OHA asks that our office be included as a consulting party to the MOA, as OHA is a specifically named Native Hawaiian Organization in the NHPA. As Section 106 consultation has commenced with our office, we further request that consultation continue with our agency. Early and continued consultation with all parties of the MOA shows a proactive effort is being made by the lead agencies responsible for consultation under Section 106 regulations.

According to the Draft EIS, a phased approach to identify archeological resources, including burials will be used in the Project. As a phased archeological inventory survey will be completed as the project commences, the extent of archeological resources that may be present is yet to be seen. Therefore, a Programmatic Agreement (PA) is being developed by the leads of the Project which will stipulate the full extent of responsibilities prior to each construction phase, identify invited concurring signatories, and provide direction on mitigation of adverse effects. OHA would like to be offered an opportunity to review and provide comment on the PA upon its completion.

Mitigation measures for any potential archeological resources that may be affected during construction include archeological monitoring, preserving archeological resources, and burial treatment. Subsurface archeological resources including burials could be impacted by construction. OHA advocates for archeological monitoring in any ground disturbing activities associated with the project. At the very least, archeological monitoring should be performed in areas identified with a "Moderate" and "High" rating. Because an archeological monitoring plan is yet to be drafted and released we request to be provided this plan for review and comment upon completion. An approved archeological monitoring plan pursuant to the MOA should be enacted to set up a process to handle any archeological resources or iwi kūpuna that may be unearthed during construction.

OHA request DTS's assurances that should iwi kūpuna or Native Hawaiian cultural or traditional deposits be found during the construction of the project, work will cease, and the appropriate agencies will be contacted pursuant to applicable law. OHA would also like to be notified at that time.

Natural Resources

During early consultation for this project, concerns were expressed about the ko'oloa'ula (*Abutilon menziesii*), commonly known as the red 'ilima. The ko'oloa'ula is an endangered plant which is known to inhabit areas of Kapolei. The federal government is currently implementing a conservation plan for this endangered plant. OHA notes that the proposed project would encroach into within 200 feet of an established contingency reserve contained within a habitat conservation plan of these endangered plants. (DEIS, page 4-119) OHA realizes that mitigation measures have been specified for this habitat conservation plan that include future developments; however, we recommend that the incidental take license be reviewed to ensure that this particularly large and unique proposal will comply with specified measures previously determined. Therefore, we urge that the DTS reconsider their assertion of a finding of no effect

on any threatened, endangered or protected species (DEIS, page 4-125) until this is done. Also, has the DTS consulted with the U.S. Fish and Wildlife Service regarding seabird attraction preventative measures and incorporated them into their design plans? We would like to see a copy of DTS's Section 7 consultation.

Contaminated Sites

As the DEIS states on page 4-113, there are a number of properties proposed to be used that are contaminated. DTS should assess whether chemicals of potential concern are present in shallow soil or groundwater at these sites. If allowed to go forward, remediation of the contaminated areas before deconstruction will likely be necessary. Additionally, long-term biological and chemical monitoring should be established to measure any change in contaminant levels over time and the associated biological response.

OHA does appreciate that DTS proposes permanent best management practices (BMPs) to address water quality that include an inspection and maintenance plan to ensure that they are attaining their objectives. (DEIS, page 4-132)

Stormwater

Generally, OHA wishes to see stormwater as a resource to be captured and conserved rather than a nuisance to be channeled and drained away. The use of permeable paving materials can be used to retain some of the rain that falls, and catch basins can capture and help to slow the runoff thereby reducing turbidity. We hope that DTS can incorporate these ideas into their water management system, which already includes some of these concepts.

Pearl Harbor National Wildlife Refuge and Wetlands

OHA notes that the Pearl Harbor National Wildlife Refuge is listed habitat for endangered fauna and it exists within the project corridor. (DEIS, pages 4-123) In fact, DTS proposes to put a possible "maintenance and storage facility" (DEIS, page 4-132) a mere 1,000 feet from this protected habitat. OHA appreciates that the wetlands are to remain intact (DEIS, page 4-126); however, this in no way ensures that there will be no adverse effects to them.

For example, OHA sees that DTS proposes to fill in some wetlands. (DEIS, page 4-128) We also point out that the Draft EIS plainly states that this "maintenance and storage facility will include an increased level of BMPs because it would be the system's most industrial facility." (DEIS, page 4-132, emphasis added) OHA urges that strict BMPs should apply to this type of facility no matter where it is located and that since this is a "possible" location, placing it next to endangered species habitat is not the best citing for it. We recommend that alternative locations be analyzed in the EIS.

OHA seeks clarification that the classification of the receiving state waters for this estuary is Class 2. As such, we point out that DTS must be aware of the obligations to protect these waters for recreation, aquatic life (and wildlife), water supplies, and that any discharge must receive the best degree of treatment compatible with this class. Further, no new treated sewage discharges shall be permitted within estuaries. OHA notes that the Pearl Harbor estuary

will be impacted by this proposal and regardless of the current state of the water quality of any of the receiving waters; it is not to serve as an excuse for DTS to shirk their obligations. We also ask about compatibility with section 320 of the Clean Water Act and its associated National Estuary Program.

Energy

OHA would also like to point out that Hawai'i is re-inventing its energy portfolio. As such, DTS should consider that by 2020, 20% of Hawai'i's electricity is to be from renewable sources. Further, on January 28, 2008, Assistant Secretary of the Department of Energy and Governor Linda Lingle signed a groundbreaking Memorandum of Understanding (MOU) between the state government and the U.S. Department of Energy's Office of Energy Efficiency and Renewable Energy. The MOU estimates that Hawai'i can potentially meet between 60 and 70 percent of its future energy needs from clean, renewable energy sources.

As such, the legislature has recommended applicants consider the Leadership in Energy and Environmental Design (LEED) Green Building Rating System, which is the nationally accepted benchmark for the design, construction, and operation of high performance green buildings. OHA recommends the use of photovoltaic and small wind harvesting electrical generation for peripheral uses such as parking lot lighting. Solar energy should also be incorporated into the building plans. During construction, OHA urges the use of recyclable materials: steel studs and structural members, and wood products from certified sustainable sources. Landscaping should include native species and large trees to provide shade and cooling to buildings as well as parking lots. Additionally, state agencies are regulated by HRS §196-9 dealing with energy efficiency and environmental standards for state facilities, motor vehicles, and transportation fuel. Although the DTS is not obligated to adhere to this statute, as it is not a state agency, any efforts by your agency to comply with the standards set forth in the statute would show a good faith effort to minimize the impact that the Project will have on energy consumption.

Environmental Justice Concerns

OHA expresses some concern over the situation with the 100 percent minority Banana Patch community that will be dramatically affected by this proposal. OHA agrees that this community is unique and we recognize that this tight-knit community has been living there for generations. Displacement of this entire community is something that will have to be adequately addressed. We also point out that the residents of this area (who do not have access to basic infrastructure services such as water and sewage) are living in multi-generational housing, mainly as a result of economic circumstance, not so much as a result of cultural influences. (DEIS, page 4-55)

Signage as a Tool for Preservation

When cultural resources are affected, effective documentation of the resources and the cultural landscape in which it is located in should be considered as a mitigation measure. Signage related to the preservation of resources or the location of a relocated or displaced resource should be considered in order to preserve the history and culture of a landscape. This

mitigation measure could also have the potential to develop economic or community-based activities which would benefit the local communities that will be affected by the Project. Consultation regarding this matter could be conducted with local community organizations and local Hawaiian Civic Clubs.

Visual and Aesthetics Concerns

There is no doubt that the Project will create and produce visual and aesthetic effects on the landscapes within the transit corridor. Mitigation measures discussed in the DEIS focus on preserving visual resources and enhancing the project design to comply with applicable policies. The DEIS includes measures to consult with the communities surrounding each station for input on station design elements. OHA supports this measure and recommends consultation with each respective community's Neighborhood Board and Hawaiian Civic Club.

Many residents have expressed concerns over the visual and aesthetic impacts that the proposed project will have on the landscape. As a form of mitigating the effects the proposed project will have on the cultural landscape, we advocate that native plants should be incorporated into the landscaping and vegetation plans around the rail transit corridor including the transit stations when at all possible. Landscaping with native plants furthers the traditional Hawaiian concept of mālama 'āina and creates a more Hawaiian sense of place. This concept is one small way the cultural landscape can be preserved in an urban setting.

Thank you for the opportunity to comment. If you have further questions, please contact Jason Jeremiah by phone at (808) 594-1816 or e-mail him at jasonj@oha.org.

Dear Mr. Namuo:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal:

Public Hearings for the Draft EIS

All five Public Hearings on the Draft EIS were scheduled for two hours each. Though the Public Hearing Officer's section of hearing oral testimony from the public closed prior to the end of the meetings because of lack of public comment, the Public Hearing Officer stayed through the entire two-hour scheduled Hearing and would have been able to reconvene the Hearing if requested by a member of the public wishing to provide comment. In addition, individuals were able to speak with a court reporter to make official comments and/or place written comments into the record for the entire two-hour time period the Hearing was scheduled for. Thus, the public was allowed to offer comments for the entire two hours that were allotted and advertised to the public. In addition, comments were accepted on the website and in writing through February 6, 2009.

Archaeological, Cultural, and Historic Resources

FTA has extended an invitation to OHA to be a concurring party to the Programmatic Agreement (PA).

The PA prepared for this Project is included as Appendix H, Section 106 of the National Historic Preservation Act Programmatic Agreement, in this Final EIS. OHA has been a consulting party throughout the Section 106 process and has been requested to provide input to the process at several points during the process. OHA was invited to and participated in consultation meetings related to development of the PA under Section 106.

Archaeological site investigations will be conducted pursuant to the PA and described in Section 4.16 of the Final EIS. It will include survey plans, survey and coordination. SHPD will be consulted throughout the process.

Pursuant to Hawaii Revised Statutes Chapter 6E, work will stop and SHPD would be contacted at the time of discovery of any iwi kupuna or native Hawaiian cultural or traditional deposits. The City will notify OHA and other interested parties of the discovery and any action taken.

Natural Resources

Although the Project will have no effect on threatened, endangered, and protected species, mitigation will be implemented for the Abutilon plants, kooloaula. A State Incidental Take License for kooloaula was issued on March 18, 2005, to the HDOT. The City will secure a Certificate of Inclusion from the State for the Project. Mitigation measures have already been specified in and HCP for the population of kooloaula, including the establishment of an 18-acre contingency reserve for the plants. Specific measures to protect and offset losses of the kooloaula have been established by the USFWS in the existing HCP. If an HCP is needed or if the existing HCP needs to be amended, the City will implement the measures outline of the USFWS in the new or amended HCP. This will offset impacts to the plant, and there will be no unavoidable adverse environmental effect to the kooloaula. Additionally, prior to clearing and grubbing near the kooloaula contingency reserve, the area will be surveyed. Of any kooloaula are found, a horticulturist approved by DLNR will be given an opportunity to remove the plants and transplant them to the contingency reserve.

Section 4.13, Ecosystems, of this Final EIS explains that the Project will not adversely affect protected migratory waterbirds. Hawaii's waterbirds and migratory birds have adapted to multi-lane elevated freeways with thousands of automobiles, buses, tractor trailers, traveling at random intervals, at a rate that is 10-20 mph faster than the train, see Section 4.13.3, Environmental Consequences and Mitigation [Ecology], in this Final EIS.

As Hawaii's waterbirds and migratory birds have adapted in the past as discussed above, it is, therefore, reasonable to state that the birds would adapt over time to a fixed rail train that travels at a slower rate of speed (50 mph) than current traffic.

FTA has concluded Section 7 consultation. Appendix F of the Final EIS includes consultation correspondence, including correspondence with the USFWS. The USFWS did not express concern about seabird attraction.

No endangered species have been identified on either of the evaluated maintenance and storage facility sites.

Contaminated Sites

If the Project has to acquire or be built on contaminated property, the contamination will be remediated within the construction limits. The Project will not perform long-term biological and chemical monitoring as that responsibility resides with the responsible party, as described below. Further guidance is included in FTA Circular 5010.1D, which will be followed for the Project. This guidance provides:

"Contaminated Property (including Brownfields). Appropriate due diligence concerning contamination is conducted as a part of the NEPA process and before selection of a contaminated property in a capital project is considered.

Appraisals may consider contamination in determining the market value of the property. The terms, "contamination" and "hazardous material" are interpreted broadly to include all contaminants that can affect property value.

(a) The legal responsibility for hazardous material clean-up and disposal rests with parties within the property title chain and with parties responsible for the placement of the material on the property. Grantees must attempt to identify and seek legal recourse from those potentially responsible parties or substantiate the basis for not seeking reimbursement.

(b) During the NEPA process, the grant applicant will have considered not only the estimated project cost of appropriate remediation (remediation being any action, developed in consultation with appropriate regulatory agencies, to reduce, remove or contain contamination), the applicant will also have considered and taken action regarding the short and long-term liabilities associated with Brownfields, if applicable.

(c) To encourage the complete assessment of contamination prior to Project decision-making, FTA generally will not participate in the remediation of contamination discovered during construction.

(d) The grantee should contact FTA for technical assistance regarding contaminated property."

Stormwater

As noted, the Permanent Best Management Practices (BMPs) Plan will describe practices to be included as part of the Project to address stormwater quality before the water is discharged to streams or existing storm drain systems. The BMPs will promote a natural, low-maintenance, sustainable approach to managing and increasing stormwater quality.

Permanent BMPs, such as bioretention areas, vegetated buffer strips, dry swales, water quality basin, and structural BMPs with oil/water separators will be considered, as needed, during the park-and-ride site and the maintenance and storage facility design process. Selection of permanent BMPs will be site-specific and may be modified as a result of geotechnical data collection during final design.

The discussion of permanent BMPs has been revised in the Final EIS, Section 4.14.3, Environmental Consequences and Mitigation [Water]. As stated in this section, pollution prevention BMPs, such as regular inspection and cleaning of the drainage system, will need to be a part of the stormwater management plan that will be developed during Final Design. Permanent BMPs will be implemented for the maintenance and storage facility and the park-and-ride facilities. Permanent BMPs will also be installed for stormwater that drains from the guideway at all crossings of waterbodies. In some instances, the discharge of stormwater from the guideway may increase stormwater inflow to some waters as a result of rainfall collecting on impervious surfaces where infiltration currently occurs. However, because stormwater quality is not expected to be adversely affected, no streams or downstream marine waters would experience negative effects. Stormwater runoff will be filtered through landscaped median areas and sedimentation collars where possible. Stormwater will be filtered through specially designed bioinfiltration units near water bodies on the HDOH 303(d) list of water quality-limited segments (specifically Sites 4, 12, 18, and 19). In locations where space does not allow for their use, downspout filters will be installed on drains near impaired waters (Sites 7 and 30).

Permanent BMPs will be installed as part of the Project to address stormwater quality before the water is discharged to streams or existing storm drain systems. The BMPs will promote a natural, low-maintenance, sustainable approach to managing and increasing stormwater quality. At a minimum, all stormwater downspouts from the guideway will include erosion control BMPs and energy dissipation devices to prevent any scour of landscaped medians. An integral part of the permanent BMPs will be an inspection and maintenance plan to ensure that the BMPs operate as designed. The Project will consider the use of permeable paving materials in locations where runoff would not be polluted.

Pearl Harbor National Wildlife Refuge and Wetlands

No endangered species have been identified on either of the evaluated maintenance and storage facility sites. As the Project will not adversely affect endangered species, no alternatives have been evaluated. The environmental consequences of the Project, including at the proposed maintenance and storage facilities, are presented in Section 4.13.3 of the Final EIS.

The Army Corps of Engineers Section 404 permit triggers the need for Department Of Health's Clean Water Act, Section 401 Water Quality Certification for the Project.

The Clean Water Branch of the State Department of Health has provided comment on the Draft EIS. Through the individual Section 401 Water Quality Permit, the Clean Water Branch of the State Department of Health will ensure that the State's anti-degradation policy (HAR, Section 11-54-1.1) will be complied with. Permanent BMP's to protect water quality include vegetated swales, retention ponds, and grit removal structures; these are discussed above and in full detail in Section 4.14.3 of the Final EIS.

A large detention basin is proposed for the Leeward Community College Maintenance and Storage Facility Site, the preferred Maintenance and Storage Facility Site. The detention basin will overflow via a new 60-inch drain to the shore of Pearl Harbor at Middle Loch. This site is assigned to a Category IVB because nearshore waters supported, until recently, a mangrove forest. To meet avoidance alternative minimization requirements, structural elements of the drain will not be placed in waters of the U.S. The system will have a permanent oil/water/sand separator prior to the outfall, and any discharge entering Pearl Harbor will meet water quality requirements for the estuary. See Figure in Section 4.14.2. Impacts will be limited to infrequent flows generated by large storms. These treated flows will contribute fresh water to the Loch.

However, Pearl Harbor is considered to be an estuary because of the restricted exchange with the Pacific Ocean through a narrow mouth, and the substantial freshwater flows from a number of contributing springs and streams draining southern Oahu.

Energy

Future generation of electricity from renewable sources will enable the Project to provide additional reduction in fossil fuels. As a worst-case analysis, the Final EIS evaluates a future scenario where all electricity is generated from fossil fuels. Even in this scenario, fuel consumption islandwide would be lower with the Project in place compared to No Build conditions.

LEED standards will be followed for the maintenance and storage facility. There are no applicable LEED standards for the guideway. Where LEED classification is not available, the principles of the U.S. Green Building Council will be followed during the design and construction of the Project to include items such as recycling materials, instituting a waste management plan, use of fly ash in concrete, and using Low-VOC paints and coatings, and many others. Integration of photo-voltaic cells into stations and other project features could reduce net project electricity demand. The Project will incorporate other sustainable design measures, such as the use of native plants. While the Project is not regulated by HRS Chapter 196-9 requirements, DTS supports the intent of the statute by providing an efficient and sustainable system.

Environmental Justice Concerns

There is no reasonable alternative to displacement of the Banana Patch community. DTS has been coordinating with residents of the Banana Patch community since October 2008. Every household has been visited by DTS staff to discuss the Project, and potential relocation assistance.

A special community meeting was held at the Alpha Omega Christian Fellowship Church. Invitations were sent to each Banana Patch community household. At this meeting, a brief presentation was given on the Project and public testimony was recorded by a court reporter. A transcript is included in Appendix A, Comments Received on the Draft Environmental Impact Statement and Responses, of this Final EIS.

DTS will continue to work with individual property owners to provide relocation services. As stated in this Final EIS in Section 4.4.3, "Relocation services will be provided to all affected business and residential property owners and tenants without discrimination; persons, businesses, or organizations that are displaced as a result of the Project will be treated fairly and equitably." As a whole, the community cohesion is typical of a set of neighbors and is not particularly tight-knit.

Signage as a Tool for Preservation

As described in the Section 106 PA that is included as Appendix H to the Final EIS, the Project will document and provide cultural context for resources in the study corridor.

Visual and Aesthetic Concerns

The island's unique visual character and scenic beauty was considered in the visual and aesthetic analysis presented in the Draft EIS. The Project would be set in an urban context where visual change is expected and differences in scales of structures are typical. The following measures would be included with the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

- *Develop and apply design guidelines that would establish a consistent design framework for the Project with consideration of local context.*
- *Retain existing trees where practical and provide new vegetation.*
- *Shield exterior lighting.*
- *Coordinate the project design with the City's TOD program within DPP. DTS will consult with the communities surrounding each station for input on station design elements.*

The City and County of Honolulu is conducting workshops with communities where rail stations are proposed. The purpose of the workshops is to engage the public about rail stations and give opportunities to residents to contribute ideas about the appearance of station entryways in their neighborhood. Ideas generated at the workshops will be incorporated into the station planning process.

A landscaping plan has been outlined in the Final EIS in Section 4.8.3 to mitigate visual effects of the Project, including utilization of native plants, and replacement of trees and lost vegetation as appropriate.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Issuance of the Record of Decision under NEPA and acceptance of the Final EIS by the Governor of the State of Hawaii are the next anticipated actions and will conclude the environmental review process for this Project.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Comments on the Rail Transit DEIS:

1. Alternate plans anticipating possible lower population and tourism levels

Two major new factors that could affect future population levels on Oahu because of a potential shrinkage of a mainstay of our economy, tourism, have arisen in the past year or two, global warming and economic turmoil. "The tectonic plates have moved". Given that our situation has changed since rail transit plans were begun, we need to review the plans in this light, make adjustments and proactively anticipate possible further adjustment in subsequent phases.

The first one of the new factors is recognition of the seriousness of global warming and the effect human activity has on it. The exponential increase in long distance global tourism that we have seen in the past 50 years may roll back in response to restrictions on air travel due to global warming. Of course, it could be that new passenger ships that use sails plus auxiliary engines, maybe solar powered, could allow the maintenance of current air travel volume to Hawaii. But we cannot make reliable projections here and need to be prepared for different scenarios.

The second new factor is the current global financial turmoil which includes volatile oil prices and reduced wealth in our traditional sources of visitors. Of course, there is the potential that rising incomes in Asia, in particular in China, will offset lower North American family travel budgets. Perhaps Hawaii will succeed in substantially increasing its presence in high technology sectors, significantly expand agricultural production, or find another way to support our current or higher levels of resident population. But, again, we cannot make reliable projections so need to be prepared to move in alternative ways.

The result could well be that our population will either not grow any more or would even shrink. Just one effect of this possibility is that rail transit planning should not continue to assume that it is politically impossible for any portion of the existing road lanes to be occupied by a rail line on the surface. Putting the transit line on the surface through the Chinatown-Downtown- State Capitol Special District, for instance, would make a major difference with respect to concerns about the negative visual impact of an elevated rail line through this central and historical part of our city, which has been carefully protected by City ordinances for many years.

2. Salt Lake versus airport route

It would seem that adding a spur to the airport from a main line through Salt Lake, or a spur to Salt Lake from the airport, should be feasible and would add immensely more value to the transit system with relatively

little added construction cost or operational problems. This is a feature in many other rail transit systems. There could be "A" trains to the airport, or Salt Lake, and "B" trains to Kapolei from central Honolulu and vice versa from Kapolei to Honolulu.

3. Visual and cultural impact on Special Districts

An elevated rail line should not run through Chinatown-Downtown-the State Capitol Special District not only because of the special district status for 2 of those places but specifically because of the severe visual impact on the mauka-makai views that are part of the special district ordinances as well as the adjacent urban environment. The logical and traditional Hawaiian way of orienting oneself on islands is by reference to the radius of a circle, via mauka-makai views, and along the circle, via Ewa and Diamond for central Honolulu. Impeding or degrading those views would have a serious impact on important historic buildings and landscapes and a Hawaiian sense of place that everyone, including our economically important visitors, would sense and react to negatively.

4. Conceptual and detailed design

How well the conceptual and detailed design of all parts of the system is done, especially the elevated portions of the system and the stations, will significantly affect community acceptance. In general, all elements should be as visually unobtrusive as possible.

a. To do that, stations need to be individually designed. The landscape architect should be an equal partner from the beginning of the design process. The architectural design for each structure as a whole should be low-profile, not heroic or iconic. Each structure should be sensitively attuned to its urban and/or scenic landscape context, the architectural character of adjacent buildings and very well designed in its construction and details.

b. The structure for elevated portions of the system should be a thread of unobtrusively elegant sculpture that varies in color and form, chameleon-like, according to its context.

5. Impact on existing road lanes, sidewalk and planting space

Where an elevated structure is inserted in an existing road right of way corridor, what happens to the sidewalk and tree planting space if existing road travel lane capacity is to be maintained?

6. Impact on ability to provide future bicycle lanes

Interest in providing for more and safer bicycle travel via designated bicycle lanes has increased. If some of the right of way space is taken for the piers supporting an elevated rail line, how can bicycles be accommodated?

Honolulu, Hawaii 96802

Dear Ms. Gillmar:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

1. Ridership Forecasts and an at-grade alignment

Use of the adopted local Metropolitan Planning Organization (MPO) land use and socio-economic forecasts in developing travel forecasts is a requirement of the Federal transit planning process. In this case, the Project relies on information about the 2030 level of growth on Oahu.

The Alternatives Screening Memorandum (DTS 2006a) recognized the visually sensitive areas in Kakaako and Downtown Honolulu, including the Chinatown, Hawaii Capital, and Thomas Square/Academy of Arts Special Design Districts. To minimize impacts on historic resources, visual aesthetics, and surface traffic, the screening process considered 15

combinations of tunnel, at-grade, or elevated alignments between Iwilei and Ward Avenue. Five different alignments through Downtown Honolulu were advanced for further analysis in the Alternatives Analysis, including an at-grade portion along Hotel Street, a tunnel under King Street, and elevated guideways along Nimitz Highway and Queen Street.

The Alternatives Analysis Report (DTS 2006b) evaluated the alignment alternatives based on transportation and overall benefits, environmental and social impacts, and cost considerations. The report found that an at-grade alignment along Hotel Street would require the acquisition of more parcels and affect more potential burial sites than any of the other alternatives considered. The alignment with at-grade operation Downtown and a tunnel through the Capital Historic District, in addition to the environmental effects such as impacts to cultural resources, reduction of street capacity, and property acquisition requirements of the at-grade and tunnel sections, would cost an additional \$300 million.

The Project's purpose is "to provide high-capacity rapid transit" in the congested east-west travel corridor (see Section 1.7 of the Final EIS). The need for the Project includes improving corridor mobility and reliability. The at-grade alignment would not meet the Project's Purpose and Need because it could not satisfy the mobility and reliability objectives of the Project (see bullets below). Some of the technical considerations associated with an at-grade versus elevated alignment through Downtown Honolulu include the following:

- **System Capacity, Speed, and Reliability:** The short, 200-foot (or less) blocks in Downtown Honolulu would permanently limit the system to two-car trains to prevent stopped trains from blocking vehicular traffic on cross-streets. Under ideal operational circumstances, the capacity of an at-grade system could reach 4,000 passengers per hour per direction, assuming optimistic five minute headways. Based on travel forecasts, the Project should support approximately 8,000 passengers in the peak hour by 2030. Moreover, the Project can be readily expanded to carry over 25,000 in each direction by reducing the interval between trains (headway) to 90 seconds during the peak period. To reach a comparable system capacity, speed, and reliability, an at-grade alignment would require a fenced, segregated right-of-way that would eliminate all obstacles to the train's passage, such as vehicular, pedestrian, or bicycle crossings. Even with transit signal priority, the at-grade speeds would be slower and less reliable than an elevated guideway. An at-grade system would travel at slower speeds due to the shorter blocks, tight and short radius curves in places within the constrained and congested Downtown street network, the need to obey traffic regulations (e.g., traffic signals), and potential conflicts with other at-grade activity, including cars, bicyclists, and pedestrians. These effects mean longer travel times and far less reliability than a fully grade-separated system. None of these factors affect an elevated rail system. The elevated rail can travel at its own speed any time of the day regardless of weather, traffic or the need to let cross traffic proceed at intersections.
- **Mixed-Traffic Conflicts:** The planned three-minute headways on the guideway will prevent effective coordination of traffic signals in the delicately balanced signal network in Downtown Honolulu. A three minute cycle of traffic lights would

affect traffic flow and capacity of cross-streets. Furthermore, there would be no option to increase the capacity of the rail system by reducing the headway to 90 seconds, which would only exacerbate the signalization problem. An at-grade system would require removal of two or more existing traffic lanes on affected streets. This effect is significant and would exacerbate congestion. Congestion would not be isolated to the streets that cross the at-grade alignment but, instead would spread throughout Downtown. The Final EIS shows that the Project's impact on traffic will be isolated and minimal with elevated rail, and in fact will reduce system-wide traffic delay by 18 percent compared to the No Build Alternative (Table 3-14 in the Final EIS). The elevated guideway will require no removal of existing travel lanes, while providing a reliable travel alternative. When traffic slows, or even stops due to congestion or incidents, the elevated rail transit will continue to operate without delay or interruption.

An at-grade light rail system with continuous tracks in-street, would create major impediments to turning movements, many of which would have to be closed to eliminate a crash hazard. Even where turning movements are designed to be accommodated, at-grade systems experience potential collision problems. In addition, mixing at-grade fixed guideway vehicles with cars, bicyclists, and pedestrians presents a much higher potential for conflicts compared to grade-separated conditions. Where pedestrians and automobiles cross the tracks in the street network, particularly in areas of high activity (e.g., station areas or intersections), there is a risk of collisions involving trains that does not exist with an elevated system. There is evidence of crashes between trains and cars and trains and pedestrians on other at-grade systems throughout the country. This potential would be high in the Chinatown and Downtown neighborhoods, where the number of pedestrians is high and the aging population presents a particular risk.

- **Construction Impacts:** *Constructing an at-grade rail system could have more effects than an elevated system in a number of ways. The wider and continuous footprint of an at-grade rail system compared to an elevated rail system (which touches the ground only at discrete column foundations, power substations and station accessways) increases the potential of utility conflicts and discovery of sensitive cultural resources. In addition, the extra roadway lanes taken away for the system would result in increased congestion or require that additional businesses or homes be taken to widen the roadway through Downtown. Additionally, the duration of short-term construction impacts to the community and environment with an at-grade system would be greater than with an elevated system. Because of differing construction techniques, more lanes would need to be continuously closed for at-grade construction and the closures would last longer than with elevated construction. This would result in a greater disruption to business and residential access.*

Because it is not feasible for an at-grade system through Downtown to move passengers rapidly and reliably without significant detrimental effects on other transportation system elements (e.g., the highway and pedestrian systems, safety, reliability, etc.), an at-grade system

would have a negative system-wide impact that would reduce ridership throughout the system. The at-grade system would not meet the Project's Purpose and Need and, therefore, does not require additional analysis.

The Project's visual effects on Chinatown are discussed under the "Kalihi to Ala Moana Center Landscape Unit" heading in Section 4.8.2 of the Final EIS. The discussion notes the station and guideway will be dominant features in views along Nimitz Highway and that distant views over Nuuanu Stream and Honolulu Harbor will be partially blocked. It is acknowledged that the Project will have an adverse visual effect on the Chinatown Historic District. Please refer to Chapter 4.16 of the Final EIS for further discussion of effects on the Historic Chinatown District.

The overall objectives and design guidelines for the Chinatown District will be addressed during the ongoing station areas planning process. This process involves numerous aspects of transit system design with focus on characteristics and preferences of the communities adjacent to stations. In addition, the following mitigation framework will be included in the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

- Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.
- Coordinate the project design with City TOD planning and DPP.
- Consult with the communities surrounding each station for input on station design elements.
- Consider specific sites for landscaping and trees during the final design phase when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will serve to mitigate potential visual impacts.

Section 4.8.3 of the Final EIS, Design Principles and Mitigation includes information related to the mitigation framework described above. Specifically architecture and landscape design criteria include guidelines regarding site design, materials and finishes, and lighting, which apply to stations, station areas, and the guideway.

In addition, the Project will provide users, including tourists, with expansive views from several portions of the corridor by elevating riders above highway traffic, street trees, and low structures adjacent to the alignment. In Section 4.8.3 of the Final EIS, specific environmental, architectural, and landscape design criteria are listed that will help minimize visual effects of the Project.

Consistent with the request, as part of the design of stations, the City has begun a series of consultation meetings with the communities surrounding each project station to obtain input on station design elements.

2. Salt Lake versus Airport route

Both the Airport and the Salt Lake Alternatives were carried forward in the Draft EIS as neither had been selected as the Preferred Alternative at that time. While each of the alternatives includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana Center has been identified as the Preferred Alternative. The identification of the Airport Alternative as the Preferred Alternative was made by the City to comply with FTA's NEPA regulations that state that the Final EIS should focus on the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative, public input on the Draft EIS, and City Council Resolution 08-261 identifying the Airport Alternative as the Project. The selection of the Airport Alternative is described in Chapter 2 of the Final EIS. The discussion of the alternatives considered is included in Chapter 2 of the Final EIS and the Alternatives Analysis. Based on the City Council's direction under Resolution 08-261, the Salt Lake alignment will be carried forward as a planned extension. At such time that funding becomes available, a decision could be made to build the full connection or a spur.

3. Visual and cultural impact on Special Districts

Please see comment above regarding visual effects.

4. Conceptual and detailed design

Your comment regarding the design of the elevated structure is noted. Final Design of the structure is not yet underway, but every effort will be made to minimize the intrusive aspects of a large guideway structure within the context of structural strength requirements and available materials. Design of the columns and guideway will consider treatments to reduce aesthetic interference with the surrounding environment.

As discussed above, the City is conducting workshops with communities that will have rail stations. The purpose of the workshops is to engage the public about rail stations and provide opportunities to residents and businesses to contribute ideas about the appearance of station entryways in their areas. Ideas generated at the workshops will be incorporated into the station planning process. For more information and to get involved in this process, please visit the project website at www.honolulutransit.org.

5. Existing road lanes, sidewalk, and planting space.

All sidewalks will be preserved, although some may be narrowed to avoid additional impacts on adjacent properties. Table 3-25 in the Final EIS presents information on potential effects on pedestrian facilities due to the placement of fixed

guideway columns. Sidewalk plantings will be reestablished and even introduced where possible.

6. Future bicycle lanes

Existing bicycle lanes and shared-use roadways will be maintained throughout the transit corridor. Where future bicycle lanes are planned, sufficient space will be preserved for their construction. The Project is coordinating design with the update of the Oahu Bicycle Master Plan where possible. The effects on bicycle and pedestrian facilities are presented in Section 3.4.5 of the Final EIS.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is fluid and cursive, written over the typed name and title.

Honolulu, HI 96813

Dear Mr. Yoshioka:

Draft Environmental Impact Statement
Honolulu High-Capacity Transit Corridor Project
Honolulu and Ewa, Oahu

City and County of Honolulu, Department of Transportation Services proposes to construct a high-capacity rail system between East Kapolei and Ala Moana Center. The Draft Environmental Impact Statement includes a No Build and 3 Build Alternatives. The Build Alternatives would involve between 19 and 25 miles of elevated guideway and would include transit stations, a maintenance and storage facility, and park-and-ride facilities.

This review was conducted with the assistance of Karl Kim, UHM Urban and Regional Planning; Panos Prevedouros, UHM Civil and Environmental Engineering; Evelyn Cox, UHWO Biology; and Ryan Riddle, Environmental Center.

General Comments

We feel that the DEIS does not adequately capture the full range of costs and benefits associated with the proposed project. It appears to focus too narrowly on transportation elements rather than on the full range of social, environmental, and economic benefits and costs associated with the proposed project. While travel time savings are indeed an important potential aspect of the project, so too are other factors such as mobility, access, energy use, and economic issues. The DEIS also fails to adequately incorporate concepts of sustainability especially as it applies to project design.

In addition to our general comments we also have several specific comments.

Alternatives Considered (pp. S-2 – S-4)

The project calls for an elevated guideway. The benefits of this system compared to an at-grade system have not been sufficiently demonstrated. How much additional performance in terms of reduction in travel time is achieved by elevation compared to signal prioritization and other operating procedures that could be implemented with an at-grade system?

The benefits of being on the ground, up close to activity generators compared to proposed elevated stations in the middle of roadways have not been demonstrated. There is insufficient discussion of the benefits of an exclusive right-of-way and automation over an at-grade system operated by drivers. How do the labor savings associated with a fully automated system compare with the capital and environmental costs of building an elevated concrete structure?

The documents do not sufficiently describe the operating characteristics of the system vis-à-vis other competing technologies in terms of performance, convenience, and trip quality. If instead of building an expensive elevated transit system in which billions are spent on concrete structures, what if a comparable level of spending was on buses, at-grade light rail, and improvements to the energy grid? Given the unreliability of Oahu's electric system and the two recent islandwide blackouts, more attention should go towards design of a more appropriate system given apparent limitations in the present electrical infrastructure.

DEIS Base Travel Times (p. 1-5)

One of our faculty reviewers offered this anecdote questioning the DEIS' given vehicular travel time of 89 minutes from Kapolei to Downtown:

Having resided in Kapolei for a short period in 2007, I know from personal experience that the morning peak period travel time from Kapolei to downtown is always under 75 minutes in the absence of rain or any lane closure. I was startled that the DEIS uses a time of 89 minutes.

In a non scientific survey of people listening in to a radio program some measurements of travel time from the H-1 freeway to Alakea Street in downtown if they depart Kapolei between 6 AM and 7 AM were discussed. The average time of the callers was about 60 minutes. Therefore, roughly speaking the DEIS may be using a 50% overestimate of the travel time which leads to false benefits of travel times by rail.

The DEIS fails to demonstrate the root causes of traffic congestion. The real issue is traffic flow conditions on Nimitz Highway which varies widely as these travel times show: 11, 16 or 18 minutes with good conditions, 25, 30 or 41 minutes with poor conditions. This makes it clear that a roughly two mile long Nimitz Viaduct will provide a consistent travel time from airport-to-Alakea of about 6 minutes, reducing the peak hour trip from Kapolei to downtown

from about 60 minutes to about 40 minutes. A relatively modest investment solves a huge part of the morning commute congestion.

Note that rail will be providing airport-to-Alakea transit travel time of about 50 to 54 minutes depending on the route selected. The airport route provides the longest travel time for this origin-destination pair while the Salt Lake route a little shorter.

Alternatives and Technologies Considered but Rejected (p. 2-7)

The DEIS is inaccurate in claiming that OMPO rejected the Pearl Harbor Tunnel. The UH Congestion Study found that this alternative has substantial traffic benefits at a cost comparable to that of the rail. There has been no substantiation to the tunnel's alleged costs between 7 and 11 billion dollars.

Methodology (pp. 3-2 – 3-3)

The Synchro 6.0 software suite was used for intersection analysis. Synchro applied the HCM Operational Analysis methodology and intersection input data to estimate control delay at each study intersection. This traffic analysis method is not suitable for saturated conditions, and is not suitable for corridor and regional studies. HCM mentions these limitations. Almost all traffic elements along this corridor are oversaturated, thus HCM methodologies do not apply (unless the wrong data are used and degrees of saturation are low). Either way the output is wrong or misleading.

Future Conditions and Effects: No Build Alternative (p. 3-16)

On page 3-16 the DEIS states, "Even with \$3 billion in roadway improvements under the No Build Alternative, traffic delay in 2030 would increase by 44%". If one was to correctly model all the committed congestion relief projects in the Oahu Regional Transportation Plan 2030 and combine them with the fact that Oahu's population has been stagnant or falling (and bound to further fall due to the poor economy and housing prices), the highway congestion in 2030 could improve by at least 15%.

For example, the PM zipper alone will carry about 1,500 vehicles per hour through the Kalauao screenline with three or more people in them thus resulting in a person capacity of 4,500 going west. These are individuals removed from the existing network thus providing substantial traffic relief. The westbound utilization of the rail will be optimistically 6,000 people through the Kalauao screenline of whom at most half will be drivers and ex-carpoolers or 3,000 people. The PM zipper combined with a Nimitz flyover can potentially result in a continuous trip at 55 miles per hour from Iwilei to Waikēle to Kapolei. This commute is half as long in duration as that by rail. Therefore the PM zipper lane can potentially be more beneficial. However, the DEIS tries to convince us that major traffic congestion relief projects will not yield much relief whereas the

rail with its inferior speed and 15+ stops to Kapolei will yield superior travel time savings and traffic congestion improvements. Part of the reason is likely that planning models are insensitive to bottlenecks and only provide rough estimates based on some assumed values of capacity. One of our reviewers asserts that a regional microsimulation traffic model assessing the impacts with and without correctly modeled ORTP 2030 projects is needed to assess the benefits of the projects in Table 2-3 of the DEIS.

Transit Ridership (p. 3-26 – 3-34)

The description of patronage estimates for the system is weak. There is insufficient detail to adequately review and validate the estimates for ridership. Given advances in ridership forecasting and spatial analysis of trip origins and destinations, more disaggregate level information should have been provided. While the underlying model seems appropriate for regional highway planning, it seems less appropriate for analyzing a specific transit corridor or for estimating the demand for rail transit in specific neighborhoods or associated with individual stations. In particular, the travel behavior of pedestrians and those making shorter urban trips does not appear to be adequately captured. More attention should be given to public transit users. The forecasting method relies too heavily on out-dated population estimates and doesn't incorporate more recent changes in growth, development, and economic conditions. Additionally, there isn't sufficient distinction by trip purpose, nor adequate modeling of induced trips or behavioral changes associated with the construction of the system.

Specific improvements for the transit-dependent or households without access to private automobiles should be described as well as the station-by-station improvement in services for the elderly or persons with disabilities. The benefits or changes in level of transportation services for low income as well as other environmental justice populations should also be evaluated at the neighborhood or TAZ level. Many of the maps and displays lack sufficient detail in order to evaluate neighborhood or community-level impacts.

The increase in ridership related to transit oriented development should also be addressed. Efforts to validate the ridership forecasts should be described as well as an assessment of not just data quality, accuracy, and reliability but also assumptions regarding growth and development in the corridor served by the proposed transit system. The robustness of patronage estimates given changes in fuel prices, economic growth, employment, and other trip-making activities are not adequately demonstrated.

A related area of concern is the impacts of the system on bus ridership and service to communities in outlying areas. The extent to which the bus system will support and feed riders to the rail system should be described as well as the changes in service for all transit patrons. To what extent will there be duplicate bus and rail service?

Effects on Parking, Bicycle and Pedestrian Facilities, and Freight (pp. 3-41 – 3-44)

The analysis of transportation impacts fails to adequately cover the relationship between increased and improved rail services and changes in the level and distribution of bicycle, pedestrian and other trips. While some mention was made of improvements to pedestrian facilities, the effects of these investments on pedestrian tripmaking behavior aren't described. A more complete discussion of non-motorized travel demand and its relationship to improved transit services should have been included.

Environmental Analysis, Consequences and Mitigation (p. 4-1 – 4-175)

The benefits of the proposed system in terms of reduced air pollution, greenhouse gas emissions and dependency on fossil fuels have not been adequately described. The estimates of transportation impacts should have been related to both local greenhouse gas inventories and carbon budgets. The transit system has the potential of significantly affecting not just emissions but also patterns of local development that in turn shape land use, development, and travel behavior.

The environmental benefits of taking cars off the road have not been sufficiently quantified. It's not just the reduction in traffic, but also other costs (parking, repair and maintenance, safety, etc.) that should be quantified. The reduction in non-point source pollution associated with automobile use as well as the decreased disposal costs associated with motor vehicles might also have been described.

Environmental impacts associated with the proposed project were also inadequately described – namely the impacts associated with the production of concrete and the construction of an elevated system. A life-cycle approach to estimating environmental impacts over time for the various components of the system as well as alternatives should have been provided.

In regards to energy expenditure, a more thorough discussion of energy usage should be provided. Estimates of the per vehicle, per trip energy requirements of the proposed system compared to alternative travel modes (bus, private auto, etc.) should have been provided.

The DEIS should also discuss the potential public health benefits associated with public transit such as increased access to health facilities and a reduction in motor vehicle accidents.

Land Use (pp. 4-10 – 4-18)

Changes in the density of development associated with the proposed project should be discussed in the DEIS as well as the potential for reducing suburban sprawl and the preservation of green space, farmland, and areas for carbon sequestration.

Economic Activity (pp. 4-23 – 4-22)

increased access to improved transportation services on commercial and residential property values and the resulting increases in tax revenues should also be included. The potential for tax increment financing, improvement or benefit districts or other strategies for value capture should also be described. More discussion of fare policy should also be included in the DEIS. The cross-elasticity of transit fares as a function of changes in other transportation costs (bus, private automobile, etc.) should also be provided. A more coherent description of farebox revenues in the short-term as well as over the life of the project alongside articulation of transit fare policies should be provided.

The project's cash flow analysis anticipates the use of local funds for the first construction phase and a combination of local and federal funds for the remaining phases. The project should not begin until the full extent of federal funding is known in writing as part of the next Transportation Act of Congress. Additionally, the project should not start until a substantial portion of the federal funding (e.g., a portion that covers half of the cost of the first construction phase) has been actually released for the project.

Rail Travel Time Discrepancies

The DEIS clearly specifies that Kapolei-to-downtown travel time by rail is 50 to 54 minutes. This travel time estimate was clearly known in August 2008. Yet in September 2008 the City mailed all residents a large eight-page brochure the centerfold of which states that Kapolei to Ala Moana Center by rail will be 40 minutes. Why the discrepancy in figures?

Rail Extension

A Supplemental DEIS is needed to address the route beyond Ala Moana Center as the public's understanding of the project is of a rail system from Kapolei to UH with service to Waikiki. A Supplemental DEIS is required to assess the impacts for the whole corridor.

Two related observations from the supplementary report "Transportation Technical Report, Honolulu High-Capacity Transit Corridor are as follows:

Figure 3-29 shows that rail line overflies the freeway near the University of Hawaii. This is a scenario that the city vigorously disclaimed in the September to November 2008 time frame but then it presents it in official documents.

The Ala Moana Center station arrangement is a mystery. In the 20-mile plan, the station is approximately at the 3rd floor level. In the 30-mile plan the station is approximately at the 6th floor level. What is the exact plan for the Ala Moana Station and how can the guideway expand past the Ala Moana Center given the density, and height of buildings along Kona Street and Atkinson Drive? One reviewer suspects that roughly half a billion dollars would need to be expended to reconfigure (that is, to demolish and reconstruct)

the guideway alignment between Pensacola Street and Atkinson Drive, including the demolition of the 3rd floor station and the creation of a 6th floor station, if rail has any hope in reaching UH-Manoa or Waikiki via Kona Street.

TOD Potential

What is the impact of station generated traffic, noise and pollution to Transportation Oriented Development (TOD) potential and TOD plans? Where is the discussion and assessment?

Peak Hour Screenline Level-Of-Service Methodology

In the Transportation Technical Report the peak hour screenline level-of-service methodology is described. The DEIS states, "To measure and describe the local roadway network's operational status, an LOS grading system was developed to describe a facility's operation, ranging from LOS A (free-flow traffic conditions with little or no delay) to LOS F (over-saturated conditions where traffic flows exceed design capacity, resulting in long queues and delays). The operation of the roadway segments was calculated by comparing traffic volumes on roadway facilities to the saturated volume LOS thresholds for each individual facility. The LOS is reported for each individual screenline facility, then weighted by traffic volumes to report overall operating conditions across each screenline."

This is an ad hoc method that is not a national standard. It is not appropriate to use the Highway Capacity Manual's LOS measure without using the HCM methodology. The HCM LOS for freeway screenlines is based on density and speed not on volume-to-capacity ratio. Furthermore, the volume to capacity "method" in the DEIS was wrongly applied in the Alternatives Analysis. The table below shows that general purpose traffic was estimated to be 31% above capacity (estimate of 1.31) but by their numbers, the correct estimate is 62.5% over capacity (estimate of 1.625.) Capacities are not revealed everywhere in the DEIS, so the reviewer cannot check the same calculations in the DEIS.

AA Table 3-12		2030 Rail

Dear Mr. Rappa:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal:

General Comments

Environmental, social, and economic benefits and costs associated with the Project are covered in Chapters 4 and 6 of the Draft and Final EISs. Energy use is covered in Chapter 4 as well. Chapter 26 of the Design Criteria for the Project stations includes language on sustainability. This chapter states as a major objective of the Project that design of station sites, stations, buildings, the guideway, and ancillary structures shall be based on sustainable design approaches, methods of construction, and selection of materials.

Alternatives Considered

As stated in Section 2.2 of the Final EIS, prior to selecting an elevated fixed guideway system, a variety of high-capacity transit options were evaluated during the Primary Corridor Transportation Project (1998—2002) and Alternatives Analysis. Options evaluated and rejected included an exclusively at-grade fixed-guideway system using light-rail or bus rapid transit (BRT) vehicles, as well as a mix of options consisting of both at-grade and grade-separated segments.

The Alternatives Screening Memorandum (DTS 2006a) recognized the visually sensitive areas in Kakaako and Downtown Honolulu, including the Chinatown, Hawaii Capital, and Thomas Square/Honolulu Academy of Arts Special District. To minimize impacts on historic resources, visual aesthetics, and surface traffic, the screening process considered 15 combinations of tunnel, at-grade, or elevated alignments between Iwilei and Ward Avenue. Five different alignments through Downtown Honolulu were advanced for further analysis in the Alternatives Analysis, including an at-grade portion along Hotel Street, a tunnel under King Street, and elevated guideways along Nimitz Highway and Queen Street (Figure 2-4).

The Alternatives Analysis Report (DTS 2006b) evaluated the alignment alternatives based on transportation and overall benefits, environmental and social impacts, and cost considerations. The report found that an at-grade alignment along Hotel Street would require the acquisition of more parcels and could potentially affect more burial sites than any of the other alternatives considered. The alignment with at-grade operation Downtown and a tunnel under King Street, was not selected because of the environmental effects, such as impacts to cultural resources, reduction of street capacity, and property acquisition requirements of the at-grade and tunnel sections, which would cost an additional \$300 million.

The Project's purpose is "to provide high-capacity rapid transit" in the congested east-west travel corridor (see Section 1.7 of the Final EIS). The need for the Project includes improving corridor transit mobility and reliability. The at-grade alignment would not meet the Project's Purpose and Need because it could not satisfy the mobility and reliability objectives of the Project (see bullets below). Some of the technical considerations associated with an at-grade versus elevated alignment through Downtown Honolulu include the following:

- **System Capacity, Speed, and Reliability**—The short, 200-foot (or less) blocks in Downtown Honolulu would permanently limit the system to two-car trains to prevent stopped trains from blocking vehicular traffic on cross-streets. Under ideal operational circumstances, the capacity of an at-grade system could reach 4,000 passengers per hour per direction, assuming optimistic five minute headways. Based on travel forecasts, the Project should support approximately 8,000 passengers in the peak hour by 2030. Moreover, the Project can be readily expanded to carry over 25,000 in each direction by reducing the interval between trains (headway) to 90 seconds during the peak period. To reach a comparable system capacity, speed, and reliability, an at-grade alignment would require a fenced, segregated right-of-way that would eliminate all obstacles to the train's passage, such as vehicular, pedestrian, or bicycle crossings. Even with transit signal priority, the at-grade speeds would be slower and less reliable than an elevated guideway. An at-grade system would travel at slower speeds due to the

shorter blocks, tight and short radius curves in places within the constrained and congested Downtown street network, the need to obey traffic regulations (e.g., traffic signals), and potential conflicts with other at-grade activity, including cars, bicyclists, and pedestrians. These effects mean longer travel times and far less reliability than a fully grade-separated system. None of these factors affects an elevated rail system. The elevated rail can travel at its own speed any time of the day regardless of weather, traffic, or the need to let cross traffic proceed at intersections.

- **Mixed-Traffic Conflicts**— *The Project will run at three minute headways. However, three-minute headways with an at-grade system would prevent effective coordination of traffic signals in the delicately balanced signal network in downtown Honolulu. A disruption of traffic signal cycle coordination every three minutes would severely affect traffic flow and capacity of cross-streets. Furthermore, there would be no option to increase the capacity of the at-grade rail system by reducing the headway to 90 seconds, which would only exacerbate the signalization problem. An at-grade system would require removal of two or more existing traffic lanes on affected streets. This effect is significant and would exacerbate congestion. Congestion would not be isolated to the streets that cross the at-grade alignment but, instead, would spread throughout Downtown. The Final EIS shows that the Project's impact on traffic will be isolated and minimal with the elevated rail, and, in fact will reduce system-wide traffic delay by 18 percent compared to the No Build Alternative (Table 3-14 in the Final EIS). The elevated guideway will require no removal of existing through travel lanes, while providing a reliable travel alternative. When traffic slows, or even stops due to congestion or incidents, the elevated rail transit will continue to operate without delay or interruption.*

An at-grade light rail system with continuous tracks in-street would create major impediments to turning movements, many of which would have to be closed to eliminate a crash hazard. Even where turning movements are designed to be accommodated, at-grade systems experience potential collision problems. In addition, mixing at-grade fixed guideway vehicles with cars, bicyclists, and pedestrians presents a much higher potential for conflicts compared to grade-separated conditions. Where pedestrian and automobiles cross the tracks in the street network, particularly in areas of high activity (e.g., station areas or intersections), there is a risk of collisions involving trains that does not exist with an elevated system. There is evidence of crashes between trains and cars and trains and pedestrians on other at-grade systems throughout the country (e.g., Phoenix, Houston, LA). This potential would be high in the Chinatown and Downtown neighborhoods, where the number of pedestrians is high and the aging population presents a particular risk.

- **Construction Impacts**— *Constructing an at-grade rail system could have more effects than an elevated system in a number of ways. The wider and continuous footprint of an at-grade rail system compared to an elevated rail system (which touches the ground only at discrete column foundations, power substations, and*

station accessways) increases the potential of utility conflicts and impacts to sensitive cultural resources. In addition, the extra roadway lanes utilized by an at-grade system would result in increased congestion or require that additional businesses or homes be taken to widen the roadway through Downtown. Additionally, the duration of short-term construction impacts to the community and environment with an at-grade system would be considerably greater than with an elevated system. Because of differing construction techniques, more lanes would need to be continuously closed for at-grade construction and the closures would last longer than with elevated construction. This would result in a greater disruption to business and residential access, prolonged exposure to construction noise, and traffic impacts.

Because it is not feasible for an at-grade system through Downtown to move passengers rapidly and reliably without significant detrimental effects on other transportation system elements (e.g., the highway and pedestrian systems, safety, reliability, etc.), an at-grade system would have a negative system-wide impact that would reduce ridership throughout the system. The at-grade system would not meet the Project's Purpose and Need and, therefore, does not require further analysis.

The elevated system provides fast and reliable service without pedestrian or vehicle conflict and interfaces with the surrounding community at each station. The need for an elevated system is not dependent on automated operation. The Final EIS presents the costs and effects of constructing an elevated system.

The Final EIS in Chapter 2 addresses alternatives considered and rejected. The Transportation System Management (TSM) Alternative studied during the Alternatives Analysis phase increased bus service. The alternative included express bus service that operated as bus rapid transit in existing facilities. Bus frequencies would have been increased during peak periods to provide improved service for work-related trips, particularly from developing areas. The bus fleet was assumed to increase from 525 to 765 buses, and park-and-ride lots were assumed at West Kapolei, UH West Oahu, Waipio, and Aloha Stadium. The TSM would have improved transit travel times but it would have done little to improve corridor mobility and travel reliability. Roadway congestion also would not have been alleviated. Light rail transit (LRT) is also subject to the effects of traffic congestion even though it can generally manage its progress better than a bus. The challenge with LRT is that it has significantly lower capacity than the elevated guideway and is subject to the limitations of the local street system (i.e., cross-traffic, pedestrians, bicyclists, etc.). It also takes away existing roadway capacity which the elevated guideway does not.

The primary performance differences of the elevated guideway compared with any other choice studied are a significantly higher system capacity, shorter travel times, and overall higher reliability, as stated above. None of those can be matched by light rail or buses. The much higher performance and lower overall impact is the reason the City Council supported the elevated option in December 2006.

The electric grid is controlled by a private corporation, not the City and County of Honolulu. As stated in Section 4.11.3 of the Final EIS, HECO has stated they can readily

accommodate the needs of the fixed guideway system without additional generating capacity. Blackouts are not a common occurrence (though they do make news when they happen). Since trains and rail stations will be electrically powered, the system's infrastructure is being designed to handle service disruptions. For example, trains will draw power from many points along the route, so an outage in a few areas should not disrupt service. If electrical power is lost system-wide, then train brakes are designed to stop the rail cars even without power. Lights will stay on in trains and stations; back-up batteries will provide lighting for several hours. The train operations center will communicate with passengers via the public address system and intercom and provide guidance. If power is restored within a short time, service will resume. With a prolonged outage, the operations center will direct passengers to exit the trains and walk along a lighted emergency walkway on the guideway to the nearest station. For those unable to exit rail cars, help will be provided by emergency responders and transit staff. Passengers will be met at the train station by a coordinated response from emergency responders and city transportation workers.

Draft EIS Base Travel Times

The results provided in the comment are similar to data shown in Figure 1-10 in the Final EIS, which presents a 75-minute average highway drive time between Waianae and Downtown. As stated in Section 1.2 of the Final EIS, travel times in Table 1-1 Final EIS are modeled door-to-door. The numbers in Figure 1-10 and Table 1-1 in the Final EIS are identical to those in the Draft EIS.

The Nimitz Viaduct is part of State improvements to the highway system and, accordingly, was included in the transportation modeling conducted for 2030 No Build and Project conditions. Effects of the Nimitz Flyover on traffic conditions in 2030 are discussed in Section 3.4.2 of the Final EIS. Travel on the Nimitz Flyover was included for the following travel pairs under the No Build Alternative: Kapolei to Downtown, Ewa to Downtown, and Mililani to Downtown. As shown in Figure 3-7, the Nimitz Flyover does improve transit travel times with the No Build Alternative between certain travel pairs (e.g., between Mililani and Downtown) compared to 2007 conditions. However, as also shown in this figure, travel times improve substantially more with the addition of the Project.

According to Table 3-16 in the Final EIS, transit travel time via fixed guideway from the Honolulu International Airport Station to the Downtown Station will take 12 minutes.

Alternatives and Technologies Considered

A Pearl Harbor Tunnel was evaluated by the OahuMPO during preparation of the 2030 Oahu Regional Transportation Plan (ORTP). It was rejected from the project list, but included in the 2030 ORTP as an illustrative project, with a cost estimate of \$7 billion in 2005 dollars. The ORTP states that the illustrative project could prove beneficial as a transportation improvement, but that 2030 revenue projections could not support inclusion of the projects in the ORTP. Illustrative projects are not considered a part of the officially endorsed regional transportation plan. Any concerns with the cost estimation for projects associated with the ORTP should be directed to the OahuMPO, as it is not a City agency and is not directly related to the environmental review and planning process for the Project.

Methodology

A technical team evaluated potential approaches for intersection analysis. The team included DTS traffic engineers and traffic engineering consultants each with over 30 years of experience. DTS reviewed the approach with the City and State departments with expertise in traffic modeling, including the Department of Planning and Permitting (DPP) and the Hawaii Department of Transportation (HDOT). Through that process, it was determined that the most appropriate approach to analyzing intersection level-of-service (LOS) in the H-1 corridor was the use of the Highway Capacity Manual (HCM) methodology applied in the SYNCHRO software for the reasons listed in the following paragraphs in this subsection of your comment letter. This method has been used on similar projects, including Crenshaw/Prairie Transit Corridor Study (Los Angeles, CA), Salvation Army Hawaii Kroc Center Traffic & Parking Management Plan (Honolulu, HI), and the KRC/Kalakaua Affordable Housing Development (Honolulu, HI).

It should be noted that all LOS methodologies have their advantages and disadvantages. The HCM methodology is considered state-of-the-practice when assessing traffic impacts and is appropriate for verifying the effect of proposed mitigation measures on the transportation system on the Project. The HCM methodology provides a high level of confidence in the reporting of observed and forecast traffic conditions in the study area when identifying potential impacts or deficiencies of a roadway system.

The HCM methodology considers various characteristics of the roadway network, including signal timing plans, intersection geometry, vehicle and pedestrian movements, and storage bay lengths. Other conventional methodologies, such as Intersection Capacity Utilization (ICU) and Circular 212, do not account for parameters such as signal timings and the multi-modal nature of this corridor. HCM reports the delay experienced by vehicles traveling through an intersection and determines intersection operating conditions for varying ranges of delay. In congested areas and on roadways with closely spaced intersections, the HCM methodology employed in the SYNCHRO software considers upstream and downstream operations (i.e., queuing effects that extend from one intersection to the next). Queue lengths can be estimated for each turning movement to better model the actual traffic operating conditions to ascertain whether queuing extends between locations.

HCM is also the basis for the analysis of unsignalized intersections, of which there are 46 in the study corridor. Other methodologies, such as ICU and Circular 212, are not applicable for unsignalized intersection analysis. Using HCM for both types of intersections allows for a consistent approach to the analysis across the entire corridor.

The traffic analyses for the Draft and Final EISs, using the HCM methodology, did not conclude that all corridors in the study area are oversaturated. It is clear that some intersections are operating at oversaturated conditions, but this does not occur consistently across the study corridor. The locations of oversaturated conditions are generally isolated intersections. The only corridors that appear to be oversaturated based on this analysis are portions of the H-1 and H-2 Freeways. While the HCM methodology has limitations, under certain specialized circumstances it works well for corridor-level analysis. Where the prospect of saturated conditions was found, such as at major transit center stations, further analysis was performed using micro-simulation models to evaluate more detailed conditions. Hence, the use of the HCM

methodology is appropriate for the arterial-level intersection analysis conducted in this study. The results from the use of the HCM methodology provide an accurate representation of the potential traffic impacts that result from the Project.

Future Conditions and Effects: No Build Alternative

The travel forecasting completed for the Project was accomplished with consultation with the FTA. All projects in Table 2-4 of the Final EIS are included in the network and have been properly evaluated as part of the No Build and Build Alternatives. Population and employment projections were obtained from the City and County of Honolulu, DPP.

Travel time on the fixed guideway from the Iwilei Station to the East Kapolei Station will only take 36 minutes. This travel time will be consistent and reliable, regardless of conditions on the surrounding roadways. The fixed guideway system is planned to operate with two or three car trains with a capacity of between 325 and 500 passengers each. At three minute headways during the peak period, that provides capacity for over 8,500 passengers per peak direction per peak hour. This figure applies in both directions for a total system capacity of over 17,000 passengers per peak hour. The full capacity of the fixed guideway with four-car trains and 90 second headways is over 25,000 passengers per hour per direction or over 50,000 passengers total. However, once a vehicle leaves the zipper lane or Nimitz Flyover, that vehicle is still subjected to congestion on surrounding roadways.

Transit Ridership

The travel forecasting results were generated in accordance with consultation with the Federal Transit Administration (FTA). This guidance must be followed to qualify for consideration under the Federal New Starts funding program. The travel forecasts employ the OahuMPO four-step model that has been used for other recent transportation forecasting efforts on the island. Refinements completed between the Draft EIS and the Final EIS to account for airport visitor trips and non-home-based direct demand trips resulted in the ridership figures presented in the Final EIS. The data relied upon for the forecasts are based on the latest available from the OahuMPO. The transit ridership figures are the result of a refinement of the mode choice model based on an on-board survey completed in 2005 which has been calibrated and validated to conditions in the corridor. The mode choice model is specifically defined for the Honolulu transit corridor to account for all transit activities (TheBus as well as fixed guideway) such as boardings/alightings and all access modes to individual stations. These are presented for each station in Figures 3-9 and 3-10 and Table 3-20 of Chapter 3 in the Final EIS, respectively. Further information about the travel forecasting model is available in the Honolulu High-Capacity Transit Corridor Project Model Development, Calibration, and Validation Report (RTD 2009k) and the Honolulu High-Capacity Transit Corridor Project Travel Forecasting Results and Uncertainties Report (RTD 2009l). Both of these reports are available on the Project website (www.honolulutransit.org) and from DTS.

Pedestrian activity is identified as it relates to the use of the transit system. Short pedestrian trips, such as travel from an office to lunch, do not affect the function of the Project and are therefore not assessed. Pedestrian activity that is part of the use of the larger system is identified, such as pedestrian access to a rail station or a bus stop.

The EIS uses the socio-economic data that was available from OahuMPO at the time that the EIS work began, based on DBEDT's "Population and Economic Projections for the State of Hawaii to 2030" prepared in August 2004. The 2030 forecast year used in the EIS is consistent with FTA guidance for New Starts projects.

As the comment notes, DBEDT has prepared new forecasts at the County level, "Population and Economic Projections for the State of Hawaii to 2035" issued in January 2008. For use in travel forecasting these County-level forecasts must be disaggregated to the level of "Travel Analysis Zones" of which there are 764 on Oahu. At the time of the publication of the Draft EIS, these zonal-level forecasts had not been prepared and accepted by OahuMPO. That occurred in early 2009, by which point, there was insufficient time to rerun the model with the new forecasts.

The comment notes that the January 2008 DBEDT forecasts have lower population projected than the August 2004 forecasts. Specifically, the January 2008 population forecast for Oahu for 2030 is 3.3 percent lower than the August 2004 forecast. However, the 2030 employment forecast for Oahu from the January 2008 forecasts is 5.8 percent higher than the August 2004 forecast. Thus, it is not clear what the effect on ridership projections would be of using the January 2008 forecast, since the higher employment forecast would likely result in more work trips which are attractively served by transit, while the lower population forecast would likely result in fewer trips for other purposes.

There are 11 separate trip purposes in the OahuMPO travel demand model used in forecasting ridership and travel behavior. They are relied upon to describe trip-making behavior among users of the transportation system, including users and non-users of the fixed guideway. This information is detailed in the Oahu Metropolitan Planning Organization, December 17, 2002 guide to model form (included within the final documentation for the Travel Forecasting Model Development Project), which is available on the Project website.

As discussed in Section 3.4.2 of the Final EIS, research indicates that positive attributes (both perceived and real) are associated with the use of a fixed guideway system, thereby making the system more attractive than general bus transit. These benefits include such features as improved safety, security, visibility, convenience, speed, comfort, financial savings, and reliability. These features or attributes are not captured by the standard travel demand forecasting process. Transportation System User Benefits captures a set of benefits to transit riders—including reductions in walk times, wait times, ride times, number of transfers, and costs (converted to time)—in terms of savings in travel time. The main factors in determining benefits are travel time and cost. User benefits are measured in minutes and are a summary measure that incorporates travel-time and cost changes for all modes.

As shown in Figure 3-5, there will be positive user benefits for communities with high concentrations of transit-dependent households (greater than 25 percent of households without automobiles or where 25 percent or more of residents are unable to drive), as well as other defined groups within communities of concern. Data collected and used as indicators for these communities of concern include linguistically isolated households, transit-dependent populations, and areas with public housing and community services. Substantial positive user benefits for communities of concern are shown in or near Waipahu, Pearl Harbor Naval Base,

and Ala Moana Center. Overall, many communities of concern receive positive benefits from the Project. No community of concern will experience negative user benefits. Those areas with high transit dependence, such as Waipahu, Pearl City, Aiea, Kalihi, Iwilei, Chinatown, Downtown, Kakaako, Ala Moana, and Waikiki, as shown in Figure 3-5, benefit from more than 35 percent of the total user benefits.

As stated in Chapter 4, Section 4.7.3 of the Final EIS "effects of the Project also will result in benefits to transit users. These benefits include increased transit options, improved mobility, proximity to transit links, and access to expanding employment opportunities. As Chapter 3 illustrates, traffic and transit performance will improve within the study corridor, and these benefits can be realized by all populations. There are 21 stations proposed for the Project. Nine are in, or adjacent to, OahuMPO Environmental Justice (EJ) Areas. Therefore, people living in OahuMPO EJ Areas will have the same opportunity to access the transit and mobility improvements." As discussed in Section 2.5 of the Final EIS, all buildings, facilities, and vehicles will conform to applicable Federal, State, and County accessibility guidelines and standards, including Americans with Disabilities Act (ADA) Accessibility Guidelines. The law further requires all plans and specifications prepared for construction of State or County government buildings, facilities, and sites to be reviewed by the Disability and Communication Access Board for conformance to those guidelines and standards. The design criteria for stations call for pedestrian access to be as direct and safe as possible and shall be accessible in accordance with ADA. All guideway platforms will be high level (at the same level as the vehicle floor) to provide level boarding for all passengers and to accommodate wheelchairs. The criteria also state that buses and Handi-Van vehicles shall be given priority for vehicle access in terms of their proximity to station entrances. Each station will have escalators and elevators accommodate elderly and disabled riders.

The scale of the maps in the Draft and Final EIS was selected to appropriately illustrate the effects of the project. Where effects are compared at a corridor-wide level, then overview maps were provided; where the effects are location specific, such as effects to community resources, then more detailed maps were provided, such as Figures 4-9 through 4-12 in the Draft EIS.

Based on FTA directive, the travel demand forecasting model does not account for potential increases in ridership resulting from transit-oriented development (TOD) or changes to land use as a result of the fixed guideway project. The capacity calculations presented for the fixed guideway system only consider the basis for the analysis provided, not the full capacity of the system. The fixed guideway is planned to operate with two- or three-car trains with a capacity of between 325 and 500 passengers each. At three-minute headways during the peak period, that provides capacity for over 8,500 passengers per peak direction per peak hour. This figure applies in both directions for a total system capacity of over 17,000 passengers per peak hour. The full capacity of the fixed guideway with four-car trains and 90 second headways is over 25,000 passengers per hour per direction or over 50,000 passengers total. Accordingly, the fixed guideway system could be expanded to accommodate any increases in ridership resulting from TOD or other land use changes as a result of the Project.

As indicated in Chapter 2 of the Final EIS, bus service will be enhanced with the Project, and the bus network will be modified to coordinate with the fixed guideway system. Some

existing routes, including the peak-period express buses, will be altered or eliminated to reduce duplication of services provided by the fixed guideway system. Existing and future bus routes, including route numbers and frequencies, are shown in Appendix D of the Final EIS.

Effects on Parking, Bicycle and Pedestrian Facilities, and Freight

Currently, public transit complements non-motorized travel since many of those biking and walking use the bus service as part of their trip. The availability of bike racks on buses is an example of how these modes complement each other. As stated in Section 3.3.2 of the Final EIS, according to the on-board survey conducted in December 2005 and January 2006, 88 percent of passengers walked to access TheBus. The on-board survey revealed that 1 percent of passengers accessed TheBus by bicycle. More than 1,000 bikes are taken on TheBus daily for a monthly average of about 30,000 bikes (OTS 2009).

With the Project, the extent and distribution of bicycle and pedestrians trips would be substantially enhanced. As shown in Table 3-20 in the Final EIS, 30 percent of trips to fixed guideway stations will be by walking and bicycling. Overall, transit travel times will be reduced along the affected corridor thereby providing improved mobility for those bicyclists and pedestrians using public transportation. The enhancement of non-motorized travel demand with the Project would also be reinforced through station design features. As stated in Chapter 2 of the Final EIS (Section 2.5.5), design criteria developed for Project stations place highest emphasis on walk and bicycle access. Pedestrian access to stations, including accessible routes, shall be given first priority for reasons of safety. The design criteria also state that, as a non-motorized mode, bicycles will be given second priority and will be placed over all motorized vehicular access to Project stations.

As stated in Section 3.4.5 of the Final EIS, the Oahu Bike Plan is currently being updated. The draft update includes a prioritized list of bicycle projects developed using criteria that include access to transit. Several projects that would connect existing or future bicycle facilities to rail transit stations are included in the draft update. Outside station areas, the Project does not propose to independently restructure the plans for the bicycle and pedestrian systems in Honolulu.

Environmental Analysis, Consequences and Mitigation

The energy analysis, shown in Table 4-21 of the Final EIS, indicates that the Project will reduce overall transportation energy requirements by approximately 3 percent with the Project. Based on this, it is expected that the Project will have a beneficial impact on greenhouse gas emissions, as discussed in Section 4.9 of the Final EIS. Indirect effects to development patterns are addressed in Section 4.19 of the Final EIS.

Table 3-14 of the Final EIS provides the direct benefits to the transportation system of reducing automobile demand. These benefits are reflected in the Chapter 4 analyses to resources such as water quality, air quality, and energy use. Based on your comment, the indirect benefits to individual automobile users have been added to Section 3.6.1 of the Final EIS.

The energy and other resource requirements for construction are included in Section 4.17 of the Draft EIS. This material is further summarized in Section 4.19 of the Draft EIS. A life-cycle approach was not performed for the impact analysis for this project because there is no life cycle quantification for the No-Build Alternative. The amount of material for the various Build Alternatives is approximately the same so that a life-cycle approach does not differentiate between alternatives. The No Build Alternative would not meet Purpose and Need for the Project.

The Final EIS provides an estimate of transportation energy use for the Project. The trade-offs between what vehicle type uses the energy is not relevant to the total energy consumed.

In response to your comment, additional indirect health benefits related to level of activity have been added to Section 4.19 of the Final EIS. Indirect effects from reduced vehicle miles traveled, including a decrease in automobile accidents, has been added to Section 3.6.1 of the Final EIS.

Land Use

Section 4.19 of the Final EIS addresses indirect effects to development. The Project's primary indirect effect would be to alter development near the stations, bringing higher densities than presently planned or could otherwise be developed near transit stations. These land use effects could take the form of TOD or Transit-Supportive Development (TSD). If development occurs around stations, it is anticipated that City infrastructure would be improved in these areas. As mentioned in Section 4.19.2 of the Final EIS, TOD would be expected to occur in project station areas as an indirect effect of the Project. The increased mobility and accessibility afforded by the Project may increase the desirability and value of land near the stations, thereby attracting new real estate investment nearby (in the form of TOD). Planning and zoning around station areas will be conducted and established by the City's Department of Planning and Permitting under a process covered by the City's new TOD ordinance.

Regarding reducing suburban sprawl and preserving green space, farmland and carbon sequestration, Section 4.19.2 of the Final EIS also discusses the following: "At the study corridor level, the Project will support the development programmed in the Ewa Development Plan (DPP 2000), Central Oahu Sustainable Communities Plan (DPP 2002b), and Primary Urban Center Development Plan (DPP 2004a)."

These plans show development concentrated in existing travel corridors, therefore protecting green space and farmland. New growth is expected in the transit corridor, as explained in the Draft EIS. The combination of public land use policy in the above plans and the expected increase in density of development in the transit corridor may help to reduce suburban sprawl.

Economic Activity

The Final EIS references several economic studies that address the local construction economy. They include an assessment of the local labor supply, material availability,

competition for resources, and forecast cost escalation. Another study addresses the impact of project construction on employment, economic output, and earnings. Additionally, more in-depth economic analysis of the potential development impacts of the project can be found in the Economics Technical Report (RTD 2008c), which is a supporting document to the EIS and available on the Project website.

There is no direct relationship to other projects such as the Nimitz Flyover. Both projects will avail themselves of similar labor pools and materials sources. Both projects will be competitively bid. The fixed guideway project plans to begin construction in 2010, so economic conditions may be similar to now though indications are they will improve over the course of the project construction period.

Details of construction data such as costs of materials and costs of acquiring the materials can only be estimated. In Hawaii, some products must be imported as they are not available on the islands. Recognizing this, the Project has assessed the likely availability and escalation of critical commodities over the project construction period in developing Project cost estimates. The specifics of final costs related to the Project will be the purview of the contracting community who will be competitively selected to build the Project.

Every effort is being made to maintain as much of the economic benefit on the island and the expectation is that most of it will remain here. It is most likely to be more economically competitive to use local resources when possible. On the other hand, while there is some limited control over resources, most of the final decision-making about where to find materials and labor will rest with the competitively selected contractor for each project.

Section 4.18.1 of the Final EIS shows the anticipated job creation for the Project. The construction sector will most likely be the biggest beneficiary in the short term, but many industries that support the construction industry will also benefit. Most of the major construction work is similar to other roadway, bridge or building construction for which there is ample labor available locally based on discussions with local labor representatives. A few key positions with specialized expertise may need to be imported. Since most of the labor will be local and paid for at local wage rates, the benefit and all that stems from it will accrue locally to the advantage of local businesses and the local community. For those items unavailable on Oahu, such as vehicles and some raw materials, at least a portion of the benefit will leave the island. The percentage will vary depending on whether any elements not typically provided on the island could be brought here (e.g., assembling vehicles on Oahu instead of California or Japan). This decision will most likely be made by what is most cost-effective for the Project and the competitively-selected contractor/vendor that provides the specialty items.

Energy and Electric and Magnetic Fields

Section 4.11.3 of the Final EIS notes the Project will consume approximately 1 to 2 percent of the total projected electricity generated on Oahu in 2030. According to the Hawaiian Electric Company (HECO), the planned electricity generation capacity on Oahu will be sufficient to support the transit system, but the electricity distribution system will require various upgrades to support the system.

Maintenance and Storage Facility

Rail vehicles will be delivered from the port to the maintenance yard by truck. Final vehicle assembly will be completed on-site. Clearance is sufficient to access the site.

Cash Flow Analysis

Efforts have been made to secure stimulus funding and the City expects to receive \$4 million in stimulus funding once the Project enters Preliminary Engineering. Section 4.3 of the Final EIS discusses the economic effects of the Project and addresses the likely enhancement of tax base as a result of the Project (as well as the loss of tax base). Specific estimates of value at this stage would be purely speculative. In Chapter 6 of the Final EIS, more information is presented about other potential sources of revenue that could contribute to Project funding.

Section 4.19.2 of the Final EIS addresses the effects of the Project on property values. It is recognized that there is a likely upward effect on tax revenues as a result of improved access and proximity to the fixed guideway. The specific increases in value, at this stage, would be purely speculative. As noted in the comment, the opportunity raises the potential for tax increment financing or other special district financing. The potential of these options is detailed in Section 6.6, of the Final EIS.

The farebox policy and the associated revenues are described in Chapter 6 of the Final EIS. The City requires that between 27 and 33 percent of the operating and maintenance costs of the transit system be covered from farebox revenues. The assumption is that such a policy will remain in effect throughout the time horizon covered in the EIS. Increases in gas prices have led to significant increases in demand for transit in Hawaii and around the country.

Obtaining a Record of Decision (ROD) for the EIS is a good indicator of the project's ability to effectively compete for federal funding. The Project cannot begin prior to obtaining a ROD and count on federal funding for any work completed prior to the ROD. The City will not authorize work until a ROD is received. Waiting until later to collect additional funds will make the Project more expensive as the costs will rise over time. Chapter 7 of the Final EIS summarizes the FTA's evaluation of the Project.

Rail Travel Time

The 50-54 minute travel time referred to in the Draft EIS is a door-to-door time. As stated in Section 3.4.2 of the Final EIS, Figure 3-7 represents the time required to complete a trip from origin to destination and assumes that at least a portion of the trip will be made on the fixed guideway system. These times are door-to-door and include walking and transfers.

The 40 minute travel time provided in the eight-page mailing sent in October 2008 corresponds to Table 3-16 in the Final EIS, which reflects travel time from station-to-station on the fixed guideway system. For the sake of accuracy, the Ala Moana station is only three stations from downtown.

Rail Extension

The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS. However, the future extensions are not part of this Project; thus, they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time.

Since selection of a first project by City Council Resolution 07-039, project information has detailed the limits of the Project and illustrated other areas that were included in the Long-Range Plan as future or planned extensions. The future extensions are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS. The comment suggests presenting an evaluation of an action that is not proposed for implementation, which as stated above, is not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and of NEPA.

The City has shown in information materials provided on the Project, including information presented at public meetings and public hearings, that the Project is 20-miles of the full Locally Preferred Alternative and that planned extensions would be built when funding becomes available. Additional environmental documentation will be prepared when the extensions are considered for implementation.

The Project terminates at Ala Moana Center with a station platform approximately 35 feet above ground level. If a future extension is constructed beyond the center, it is proposed that service that terminates at Ala Moana Center would use the lower platform, while through service would use the upper platform. Riders going towards UH or Waikiki would use the upper platform, while those traveling Ewa could use either platform.

TOD Potential

Traffic studies conducted for the Draft and Final EISs considered additional vehicle and bus traffic generated by fixed guideway stations. That analysis is contained in Section 3.4.3 of Chapter 3 of the Final EIS. Measures also are identified in Section 3.4.7 of the Final EIS to mitigate traffic effects at the Pearl Highlands Station. In addition, the FTA Noise and Vibration Manual (2006 edition), which was used in the NEPA analysis of the Project, focuses on existing noise levels and existing land uses. The effect of the project on air quality in Honolulu is presented in Section 4.9 of the Final EIS. There are no identified hot spots associated with the station areas that require additional carbon monoxide analysis.

The analysis of direct impacts of the Project is focused on construction and operation of rail transit service. However, as discussed in Section 4.19.2 of the Final EIS, transit-oriented development (TOD) is expected to occur in project station areas as an indirect effect of the Project. The increased mobility and accessibility that the Project will provide may also increase the desirability and value of land near stations, thereby attracting new real estate investment nearby (in the form of TOD). Planning and zoning around station areas will be conducted and established by the City's Department of Planning and Permitting under a process covered by the City's new TOD Ordinance 09-4.

Peak Hour Screenline Level-of-Service Methodology

The LOS methodology used in the Draft EIS for the screenline facility analysis was based on the application of accepted and established national standards: (1) 2000 HCM (Transportation Research Board, 2000); and (2) roadway LOS thresholds adapted from Quality/Level-of-Service Handbook (Florida Department of Transportation [FDOT], 2002). The FDOT Handbook is based on information from the 2000 HCM.

The methodology used in the Draft EIS combines traffic volumes, roadway classification, speed, density, and peak-hour factors, and produces a LOS value based on projected peak-hour volumes. The LOS was calculated by comparing traffic volumes on a roadway facility to the saturated volume LOS thresholds for each individual facility. The resulting LOS is an accurate reflection of existing and future operations on the H-1 Freeway. The Draft EIS was designed to present a summary of the Project's effect on the transportation system. The detailed analysis of volumes and roadway capacity for each analyzed facility is provided in Tables 3-9 and 3-10 in the Final EIS.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Subject: Comments on the Honolulu High-Capacity Transit Corridor Project - Draft EIS

Dear Mr. Yoshioka:

The University of Hawai'i continues to support the Honolulu High-Capacity Transit Corridor Project as being an integral part of the multi-modal transportation solution to serving the needs of the University campuses on O'ahu as well as the larger O'ahu community.

We thank you for the opportunity to provide the attached comments from three of our campuses, University of Hawai'i at Mānoa, Leeward Community College and Honolulu Community College. We look forward to working closely with your planning and design team in assuring that all of our O'ahu campuses are adequately served.

Sincerely,

Brian K. Minaai
Associate Vice President for Capital Improvements

Subject: Draft Environmental Impact Statement – Honolulu High-Capacity Transit Corridor Project (HHCTCP)

Leeward Community College (LCC) has reviewed the Draft Environmental Impact Statement (DEIS) for the Honolulu High-Capacity Transit Corridor Project (HHCTCP) and submits the attached comments for your inclusion in the formal response by the University of Hawaii to the City and County of Honolulu's Department of Transportation Services (DTS). We would like to preface our comments by voicing our continuing support for the HHCTCP as being an integral part of the multi-modal transportation solution for our island residents. All components of this project that impact Leeward Community College (LCC) can certainly be mitigated. We look forward to working with you as we pursue mutually acceptable solutions with DTS officials and others in order to address the needs of the College's students, faculty, staff, and community.

As you know, LCC is the third largest of the UH 10-campus system, with an enrollment of nearly 7,000 students. In addition, LCC is considered a regional community asset with special events and performances that draw in excess of 100,000 patrons per year. Yet the campus is accessible by one (1) ingress and egress point. This makes the health and safety of all campus visitors, whether students or community members, a top institutional priority. Adding more development to this area, such as a rail station and rail system maintenance and storage facility, on the limited roadway network that presently exists requires thoughtful consideration as there are direct impacts to the LCC campus. On balance however, we do believe that the HHCTCP, combined with the LCC Second Access Road project, offers opportunities that would help remedy the campus access issue for the foreseeable future.

For your information, the campus continues on-going dialogue with engineers and planners connected with the HHCTCP. Our next meeting with HHCTCP officials is scheduled for February 19th, from 1:30 to 3:30 on the LCC campus. I would like to extend an invitation to you, Mike Unebasami, and/or your designated representatives to attend this meeting. I will forward an agenda to you as soon as it is available.

January 31, 2009

**Draft Environmental Impact Statement (DEIS) Comments
Honolulu High-Capacity Transit Corridor Project (HHCTCP)**

1. Vehicle and Maintenance Storage Facility

The Navy Drum Storage site, located directly Ewa of the campus, is one of two possible locations for the project's vehicle and maintenance storage facility. It is likely that this site will be selected due to its central island location and rail accessibility points from both the Ewa and Koko Head directions. In addition, this site would be in the first phase of the construction schedule due to the fact that testing of the rail system could not be conducted without the completion and access to this facility. The vehicle and maintenance storage facility would include several buildings for administration, a system control center, and employ approximately 150 people. It would include tracks for train storage and maintenance and the facility would be in operation 24 hours a day.

At the present time, the only access to/from the site would be by way of Waiawa and Ala Ike roads. This is also the only access to the campus. A permanent second access road to the vehicle and maintenance storage facility and LCC should be provided to ensure for adequate and safe vehicular movement and to address potential health and safety reasons should the need ever arise to evacuate the campus or the vehicle and maintenance storage facility due to man-made or natural emergencies. The Second Access Road Project's environmental assessment (conducted by the State Department of Transportation) was completed in January 2008 and construction of this roadway is imperative in order to serve the needs of the community, the current and expanding enrollment at the College, and future development of the vehicle and maintenance storage facility. The preliminary plans by the C&C for the vehicle and maintenance storage facility would complete approximately one half the length of the Second Access Road. Funding of the remaining roadway project to the Waipio Point Access Road should be a top priority.

Completion of the Second Access Road would fulfill the access needs identified in the original master plan of the College which was completed in 1966. Without this roadway, the students, faculty, staff, community, and in the future, the employees and contractors associated with the HHCTCP, will continue to see an increase in the time necessary to move to/from the area and navigate the bottleneck that is created several times per day at the intersection of Farrington and Kamehameha Highways with Waiawa Road.

In addition, according to the DEIS, the vehicle and maintenance storage facility may be used as a staging area for various phases of the HHCTCP construction. Without the Second Access Road project, this would continue to add increased truck and vehicular traffic and hasten the deteriorating conditions of the existing Ala Ike and Waiawa roadway infrastructure.

Other campus concerns regarding the vehicle maintenance and storage facility include:

- a) **LCC Observatory Impacts:** That lighting within the complex and associated track/roadway network is compatible with night time viewing from the LCC observatory complex.
- b) **Perimeter Boundaries:** That appropriate and secure perimeter boundaries around the complex and adjacent to the campus are created with sufficient lighting, fencing, and landscaping in order to reduce the threat of vandalism and property damage.
- c) **Air Quality:** That during the construction phase of this complex, that adequate measures and safeguards be taken to ensure that dust and other particulate matter is not released into the air. The Ewa side of the LCC campus, closest in proximity to the complex, contains our Native Hawaiian plant collection, automotive instructional facility, and an indoor/outdoor daycare facility. Air quality is of utmost importance. The campus requests that frequent air sampling tests be conducted during the construction phase of the complex.

2. LCC Transit Station

The HHCTCP plan includes the construction of a rail transit station on the Ewa side of the LCC campus. This is not a park-and-ride station/stop. The rail line would enter the LCC campus from the Ewa side of the property line, cross the LCC Ewa service road, and stop at the transit station situated on a parking lot that is home to four (4) portable buildings. These buildings are currently in use by the LCC Office of Continuing Education and Workforce Development (OCEWD – 3 buildings) and the University of Hawaii-West Oahu's (UHWO) Center for Labor, Education, and Research (CLEAR – 1 building). The rail line would then continue on a Koko Head direction, across an LCC parking lot, then crossing Ala Ike before traversing the H1/Farrington/Kamehameha highways. In order to construct the transit station, the C&C would have to acquire 3.94 acres of land from LCC and the UH. The transit station platforms would be approximately 300 feet in length.

Campus concerns regarding the transit station include the following:

- a) **LCC Portable Buildings:** The three (3) OCEWD portable buildings comprise approximately 5,500 gross square feet of space. These buildings house the LCC continuing education and workforce development administration, instruction, and support facilities. This community and public service program serves more than

3,800 students during the year through their various academic, workforce, and personal enrichment programs. Elimination of these buildings would require that suitable facilities are provided on the LCC campus in order to continue uninterrupted offerings of credit and non-credit programs to our students. This is also a revenue generating unit of LCC and as such closure or elimination of any program due to lack of adequate space or facilities has a direct impact on the campus operating budget.

- b) UHWO Portable Building: The other displaced portable building is related to the UHWO's Center for Labor, Education, and Research. LCC will defer all DEIS comments related to the impact of the transit station on this facility to the UHWO administration.
- c) Programmatic Impacts: Elimination of the parking lot near the OCEWD building complex will also eliminate the LCC motorcycle range lot and the forklift training site. This has a direct impact on the campus' ability to deliver these programs and services. Replacement facilities for these two programs are necessary. Without replacement facilities, the campus stands to lose its largest non-credit revenue generating program and will be required to terminate employment of instructors.
- d) Parking Impacts: According to the preliminary HHCTCP plans, the LCC campus would lose up to 180 parking stalls. This problem is even more profound given the fact that enrollment at LCC is at record levels. On-campus parking solutions must be found, especially during the construction phase of the project and up until the time that the rail system is actually operational. Replacement of the lost parking stalls can be mitigated by constructing a paved parking area in the overflow parking area on the makai side, or lower campus, area. Service road improvements would also be required.
- e) Roadway Impacts: The rail line will cross Ala Ike and the Ewa service road as trains enter/exit the campus boundaries. These roadways provide the only access to the lower campus facilities and services. It is critical that during the construction phase of the rail station, that access to the lower campus, either by these roadways or a campus-approved alternative, be maintained. Lower campus access is required for; daycare drop-off/pick-up services, emergency/medical vehicular access, contractor and building maintenance, observatory facilities, food service and bookstore deliveries, automotive instructional facility, nursing program facilities, the recreational court complex, and overflow parking.
- f) Security Impacts: Since the LCC transit station is not associated with a park-and-ride lot, then riders who utilize the LCC stop will likely be members of the LCC community...either students, faculty, staff, or the public at large attending a special event, theatrical performance, or other like service or program. Inasmuch that these services and programs are offered during set periods of the day, LCC will request that the transit stops be adjusted to coincide with the classes and activity schedule of the campus. It is requested that the transit station operational hours be restructured so that riders are not permitted to board or depart the rail line at LCC

during the non-class or non-activity times. This will certainly assist with potential security, vandalism, and property damage issues to the campus, the vehicle and maintenance storage facility, and the local neighborhood residents.

- g) Transit Station Ingress/Egress: Access to the station platforms will be via a station plaza and entrance ramp system of approximately 270' in length that would connect to the existing promenade walkway facing the mauka side of the Math and Science building. A rail system ticketing office is also planned at the entrance to the station. To ensure safe pedestrian (including ADA-related accommodations) access to/from the station, it is requested that the station walkways extend and connect to the existing LCC pedestrian corridors and walkways. It is not clearly evident from the preliminary plans or the DEIS that the two walkway systems are connected.

SUBJECT: HCC Comments on the Proposed Honolulu High Capacity Transit
Corridor Project Draft Environmental Impact Statement

Below please find Honolulu Community College's (HCC) comments on the aforementioned Draft Environmental Impact Statement (DEIS). These comments represent an abstract of comments provided to me by the HCC faculty and staff. As the process moves forward and project details are made clear, we plan to request further input from HCC stakeholders, including our students.

It is important to note that the Kapalama Station, which will be located on land currently owned by the University of Hawai'i-HCC, is only one of five stations included in all variations of the rapid transit system plan. With a development of this magnitude it is essential for us to be informed and involved in all phases of the planning and construction. In prior projects led by the City and County of Honolulu we have found that we are often times either not informed appropriately, and forced to make last minute accommodations for the project, or involved enough to ensure that the campus continues to operate as seamlessly as possible and that the project can be efficiently and effectively completed.

In summary, the DEIS proposes the following:

- The Kapalama rail station will be located at the corner of Dillingham Boulevard and Kokea Street.
- The rail system will travel along the entire length of the HCC's Main campus along Dillingham Boulevard.

Brian Minaai
January 28, 2009
Page 2

Below please find Honolulu Community College's (HCC) concerns:

Health and Safety: The areas in and around the Main HCC campus, particularly along Kokea Street and the Kapalama Canal, are congested and hazardous for parkers, walkers, and drivers. The project will undoubtedly increase hazardous conditions, due to the higher volume of commuters and vehicles. It is unclear in the proposal whether sidewalks, road widening, or other safety measures are going to be implemented in parallel to the rail project to ensure the safety of our students, employees, and the general public. Liability will become an increasing concern as volume grows after the initial opening of the Kapalama Station.

Primary Campus Entrance and Parking: As noted above, parking along Kokea Street is at a premium. The proposed location for the Kapalama Station is immediately adjacent to the primary entrance and parking lot, Lot 1 (see Attachment A), for students, faculty and staff. It can be assumed that unauthorized vehicles will enter the campus through the Kokea Street entrance and park in Lot 1. The campus is not prepared from a funding or planning perspective to relocate the entrance or parking and given the fiscal condition of the State it is doubtful that we will receive such funding. It is unclear in the proposal whether funding from the project will be allocated for traffic abatement or the relocation of the entrance and parking lot. Again, liability will become an increasing concern as rider volume grows.

Traffic: Although the ultimate goal for the rail project is to decrease traffic congestion, in the current configuration, the roads (Dillingham Blvd, Kokea St., and Kohou St.) will become even more congested. The intersections of Kokea Street and Kohou Street on Dillingham Boulevard are extremely congested during peak traffic hours. The DEIS does not include information on whether the support structure will impact the existing lanes and alleviate traffic at these intersections. The intersection of Alakawa Street and Dillingham Boulevard is also a high traffic area throughout the entire day (due to Costco, Home Depot, and Best Buy) and details on how the traffic will be managed for the left-turning lanes and the support columns should be addressed.

Future Growth and Capacity: HCC has one of the only remaining large, vacant, and developable parcels in the Kalihi-Palama area. The Campus' long term plans for the former City and County of Honolulu incinerator lot are to construct a Science and Technology Building to accommodate growing state workforce needs in STEM related fields. In 2006 the Legislature appropriated planning money that has not yet been released by the Department of Budget and Finance. Until we begin construction, the lot is being used for parking. A project of this magnitude will need space for a baseyard during construction and, once construction is completed, rail maintenance. Our concern is that we may lose this lot.

Brian Minaai
January 28, 2009
Page 3

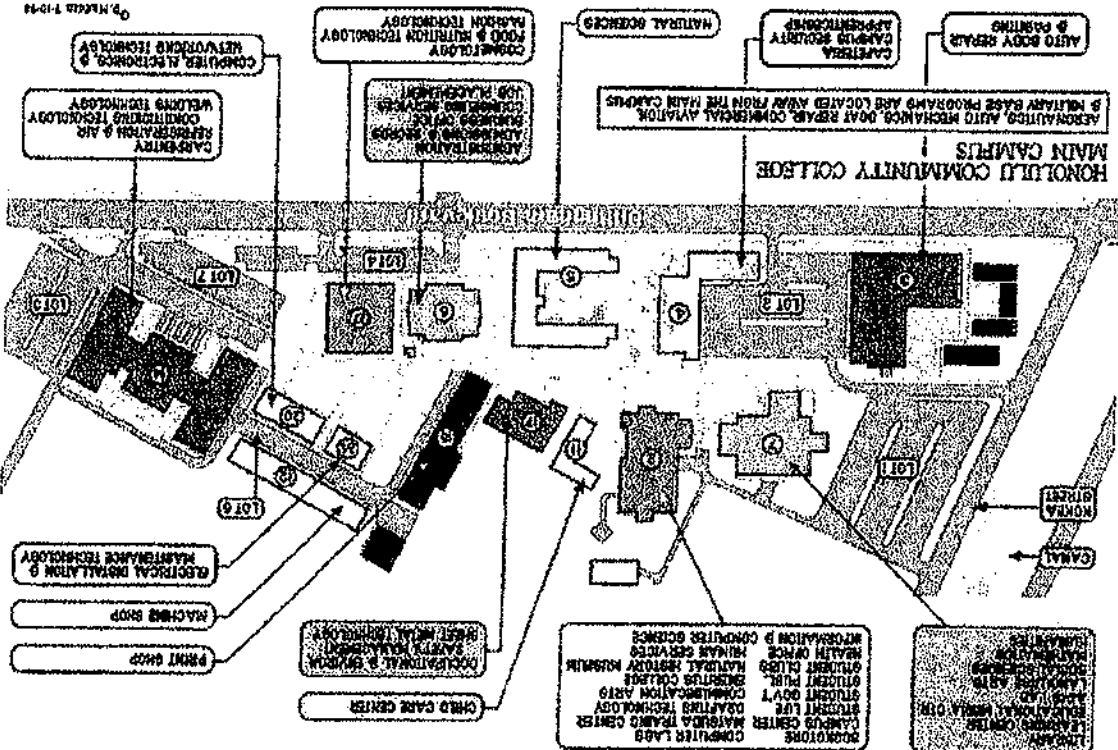

Infrastructure and Buildings: It is unclear in the current proposal whether buildings, particularly the portables (Buildings 71A-D) at the corner of the Kokea and Dillingham, will have to be moved or demolished to accommodate construction of the Kapalama Station or the rail system itself. In addition, the simulation of Dillingham Boulevard on Page 4-76, Figure 4-28 shows the removal of power lines. It is assumed that as part of the construction of the elevated guideway, the power line will be placed underground along the new right-of-way for Dillingham Boulevard, but because of the current configuration of buildings and roads we are unsure how this portion of the project can be completed without major interruptions to campus operations.

Noise: Noise as a result of the trains so close to the campus will be an issue. At a rail transit presentation given to the HCC constituency in October 2008, it was stressed that the train will make less noise than a city bus. However, this is misleading because train noise won't be heard in a vacuum and will not replace bus noise; rather it will add to the current level of bus and traffic noise. Furthermore, it can be assumed that traffic volume of large vehicles, such as The Bus, will increase in frequency and volume due to the Kapalama Station and new business development along the train route. This will simply compound train noise.

Environment: There are True Kamani Trees located along the south side of Dillingham Boulevard. The DEIS shows that these trees will be removed. We strongly recommend that these historic trees be preserved and transplanted somewhere on the HCC Main campus.

If there are any questions, please contact me at 845-9187.

CAMPUS MAP

CAMPUS MAP

DATE: January 2, 2009
FROM: University of Hawaii at Manoa
Office of the Vice Chancellor

Response to:
Honolulu High-Capacity Transit Corridor Project
Draft Environmental Impact Statement
Section 4(f) Evaluation
Dated November 2008

Comments:

The following comments are supplied by the University of Hawaii at Manoa (UHM) administration. We believe that these comments not only represent the opinion of the UHM administration but that they also reflect much of the UHM campus community's opinions on the transit topic.

Overall the UHM administration is in favor of establishing a high-capacity transit system that would serve the needs of the UHM and other UH campuses as well as the larger Oahu community. We believe that if done properly, this system could provide needed travel options, help to alleviate the growing traffic congestion and encourage transit oriented community development while supporting future growth, new development opportunities and connectivity for university campuses. While there is general support and agreement for the concept of the high-capacity transit system, how the system is designed and integrated into the community and that it integrally support the university's needs, are of specific concern. Furthermore, this Draft EIS does not, specifically or in detail, address the Mo'i'ili'i / UHM leg of the project, the comments herein will be particularly focused on that portion of the proposed transit system.

Meeting UHM's Primary Needs:

The University of Hawaii Manoa campus has an enrollment of **21,000 students and 6,000 faculty and staff**. UHM is largely a commuter campus. There is a noticeable difference to Honolulu's traffic when UH is not in session. The existing commuter condition puts street parking pressure on the surrounding neighborhoods and causes the campus to create more parking facilities. Having viable transportation options to the single occupant vehicle will help to alleviate the ongoing tension with the neighbors for parking and allow the limited campus space to be used in support of higher education programs rather than parking. In addition, a viable high-capacity transit system could support future growth at the university and not constrain that growth with the need to increase on-campus parking infrastructure. It is critically important for this transit system to serve inter-campus connectivity as major portions of the UH program expand to locations such as West Oahu and Kakaako. The core high-capacity line is important but to successfully serve the UH population's needs an effective feeder system of buses must be in place to support travel to and from the trains.

The Manoa campus is a center for athletic, artistic and academic events. Tens of thousands of people arrive for a single campus event. Traffic congestion is a deterrent for increased participation for these events. A properly integrated transit system should support greater community access and participation in these events.

It is of primary importance to the university that any transit system that interfaces with the campus provide a safe transportation mode for our students- in the stations and on the trains. Transit connections with the university should not compromise the safety and security of campus life and operations. The system should bring added economic value to the campus and surrounding community and it should not have detrimental visual or environmental impacts.

Meeting UHM's Secondary Needs:

A high-capacity transit system should enhance housing and transportation options for UH students, faculty, staff and the community. The transit line must not overwhelm or bifurcate the community but create economic vitality with improved livability and property values.

The Moi'ili'ili area is overdue for revitalization. The UHM administration is very interested in engaging Kamehameha Schools (KS), other property owners and the community, the City and County and other stakeholders to discuss the mutually beneficial opportunities for the redevelopment of the Moi'ili'ili area.

Kamehameha Schools has major property leases terminating in that area currently and over the next five years. UHM is considering new housing and commercial opportunities in the area, KS, and other property owners, are interested in improving the value of their holdings, the community wants safety, affordability, livability and it fears displacement. This impending redevelopment should not proceed in a piecemeal fashion. Any changes will effect the economy and character of the neighborhood. Issues of density, housing, commerce, zoning, infrastructure, and transportation will be fundamental considerations in the redevelopment of the area. In Table 2-3, *Committed Congestion Relief Projects* of the draft EIS, indicates that the University Avenue H-1 on and off ramps will be modified. These modifications, community planning and especially the introduction of the transit line must be considered holistically if the university/ Moi'ili'ili community will be integrated and invigorated and if this leg of the transit line is going to be useful and beneficial. It is critical that the City and County become engaged, in the immediate future, with UH, KS, the community and other stakeholders in planning the redevelopment of this community with the transit integration. If the City and County does not soon engage with these stakeholders, the redevelopment will proceed as needed and it will be much more difficult to include the transit line through the newly redeveloped community in the future.

Potential Visual Effects:

Included are images including a simulation and drawing of the University leg of the transit line. (Figures 1-3) These images do not show the further impact of the station. These images indicate that the design of the line is not integrated into the fabric of the community.

Figure 1- Existing Condition- University Ave and King Street – Looking Mauka up University Ave.

Figure 2- Transit Line Simulation- University Ave and King Street – Looking Mauka up University Ave.

**Figure 3- Elevation of Buildings with Transit line-
Corner of University Ave and King Street**

In Section 4.18.2 Indirect Effects-, on page 4-170 *Neighborhoods*, there is a statement, "... H-1 Freeway, have affected neighborhoods by cutting through and separating communities in the urban area and changing the character of communities. ... however effects as extensive as those caused by the construction of a new freeway would not occur". Although the transit line impacts along University Ave may not be as extensive as those caused by H-1 they are substantial, they have a high visual impact and they have, once again, the potential of negatively and irreversibly changing the character of the Mo'i'ili'i community as H-1 once did. The H-1 overpass has also had a detrimental impact in bifurcating the university/ Mo'i'ili'i community connection for the last forty years. This should not happen again. This is the time to look at the needs and aspirations of all parties, to once again make Mo'i'ili'i whole and to comprehensively plan for the beneficial integration of transit into the Mo'i'ili'i / UH community.

Dear Mr. Minaai:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

1. Vehicle Maintenance and Storage Facility. *A portion of a possible second access road will be built to provide access to the proposed maintenance and storage facility adjacent to Leeward Community College. A connection to the public street system makai of Waipahu High School would need to be completed by another entity and is not a component of the Project.*

Section 3.4.3 of the Final EIS describes the detailed traffic analysis that was conducted to determine the traffic effects of a maintenance and storage facility. The study found that 63 trips will be generated by vehicles using the facility during each a.m. and p.m. peak period. The traffic analysis concluded that these vehicle trips will not affect nearby intersections.

Addendum 02 to the Transportation Technical Report (RTD 2009i) provides further discussions regarding the traffic analysis conducted for the Project.

a) As stated in Section 4.8 of the Final EIS, there will be lighting associated with park-and-ride facilities, stations, the maintenance and storage facility, and trains, which include interior and safety lighting for the stations and interior lighting and headlights on the trains. For most of the alignment, light and glare associated with the guideway will generally be located in existing roadway rights-of-way, which currently produce transportation-related light and glare. Furthermore, the light intensity from trains is expected to be comparable to or less than existing buildings and vehicles along the alignment. Mitigation measures, such as shielding exterior lighting, will be included with the Project to minimize visual effects. In Section 4.8.3 of the Final EIS, specific environmental, architectural, and landscape design criteria are listed that will help minimize visual effects of the Project. This list includes exterior lighting standards. The Project will work with Leeward Community College (LCC) to minimize the undesirable effects of lighting on campus activities, including the observatory. As stated in Section 4.17.2 of the Final EIS, the design of the maintenance and storage facility will pursue Leadership in Energy and Environmental Design (LEED) Certification. This involves the incorporation of proven sustainable materials, methods, and technologies into its facility design to increase life-cycle value, including reduction of energy and resource use, and to enhance the health and comfort of employees and visitors. LEED is a performance-oriented system where credits are earned for satisfying criteria related to specific environmental impacts inherent in the design, construction, and operation, and maintenance of buildings.

b) The maintenance and storage facility will be fenced and secured, and will be staffed 24 hours a day.

c) All State and Local regulations for dust control and other air quality emission reduction controls will be followed. Where possible, if there are special requirements beyond emission controls during construction, the Project will work with LCC to identify sensitive receptors and minimize exposure.

2. LCC Transit Station

a. DTS will relocate and/or replace LCC buildings that are impacted by the Project.

b. The information regarding the portable building related to the University of Hawaii at West Oahu (UH West Oahu)'s Center for Labor, Education, and Research is noted. The Project will respond to questions received from UH West Oahu's administration.

c. Training facilities in the LCC parking area will be relocated, if necessary, for construction and operation of project facilities at that location.

d. Project staff has been coordinating with representatives from LCC regarding parking. A new permanent parking lot will be constructed in the lower campus area as requested, prior to construction of the station.

e. Project staff has been coordinating with representatives from LCC regarding the access road. A new permanent access road will be constructed that will connect to the lower campus area as requested, prior to construction of the station. Coordination with LCC and other affected members of the community will continue throughout construction of the Project.

f. DTS will work with LCC to determine if it is practicable to restrict hours of operation at the Leeward Community College Station to times when service is needed by the LCC community. It will not be possible to adjust hours of operation on a day-by-day basis.

g. As indicated in Section 3.4.2 of the Final EIS, access to stations will be enhanced to accommodate all appropriate modes, including bicyclists and pedestrians. The Leeward Community College Station entrance will connect to existing sidewalks or walkways wherever such opportunities are present. Project sidewalks and walkways will conform to Americans with Disabilities Act (ADA) requirements.

Honolulu Community College

Health and Safety — Stations will conform to applicable ADA and State requirements related to accessibility. DTS will work with State and City agencies to encourage the development of safe pedestrian and bicycle routes near stations.

Primary Campus Entrance and Parking — As noted in Section 3.4.4 of the Final EIS, stations with the highest estimated demand for spillover parking are at West Loch, Pearlridge, Iwilei, and Ala Moana Center. The Final EIS also notes that actual spillover parking at stations will be influenced by such factors as availability of parking, changing conditions that will affect actual access to stations, and future development in station areas. In Section 3.4.7 of the Final EIS, potential mitigation approaches are identified for parking effects, including spillover parking. As noted in that section, the approaches to mitigating effects of spillover parking will be unique to each station area. The City will conduct surveys to determine the extent of spillover parking demand near stations and implement one or more mitigation strategies as needed. The specific mitigation strategies and the schedule for implementation will be determined as the stations are opened.

Traffic — As shown in Table 3-21 in the Final EIS, additional right-of-way will be acquired along Dillingham Boulevard between Kaaahi to King Streets to provide space for columns in the median. The existing number of travel lanes (two in each direction) and left-turn lanes at intersections along Dillingham Boulevard, including Kokea, Kohou, and Alakawa Streets, will be retained.

Future Growth and Capacity — Dillingham Boulevard will require widening to the makai side. Additional right-of-way will be required to relocate the sidewalk farther makai and allow for the widening. This widening will not affect Honolulu Community College (HCC) on the mauka side of the street. A small portion of land at the mauka Koko Head corner of Kokea Street will be required for a station entrance. The City will work with HCC to minimize impacts to existing operations or access.

The decision regarding temporary construction yards is typically made by the construction contractor based on what works best for them. The contractor could approach HCC about the use of the available lot when that part of the Project begins construction. The Project has no plans to use that lot permanently.

Infrastructure and Buildings — In general, any operating facilities affected by the Project will be acquired or replaced. However, the Project does not plan to move or demolish Buildings 71A-D. The power lines may be placed below grade, but that has not been decided. To the extent possible, construction efforts will minimize the effect on adjacent homes, businesses, and other facilities, although there will be activity in the area that may have undesirable short-term effects. A Maintenance of Traffic Plan with detailed information about the Project's construction program and its immediate effects will be developed to provide assistance in negotiating the construction period.

Noise — As noted in Section 4.10 of the Final EIS, there are no noise impacts predicted for HCC. The number of buses on Dillingham Boulevard will decrease with the Project as more trips are made by train.

Environment — Street trees along the alignment are discussed in Section 4.15 of the Final EIS. Effects to street trees will be mitigated by transplanting existing trees or planting new ones, where possible. Other possible mitigation measures are discussed in Section 4.15.3 of the Final EIS.

Office of the Vice Chancellor

Meeting the University of Hawaii at Manoa's (UH Manoa's) Primary Needs — As indicated in Section 1.8 of the Final EIS, the purpose of the Project is to provide high-capacity rapid transit in the transportation corridor between Kapolei and UH Manoa. The Project described in Chapter 2 of the Final EIS will serve the corridor between East Kapolei and Ala Moana Center. Communities in East Honolulu will still benefit with the added bus service that will be provided to the Ala Moana Station. Future bus routes with the Project are shown in Appendix D of the Final EIS.

The Project is working with the Honolulu Police Department to develop a safety and security plan to minimize crime and vandalism on the guideway or at stations. Security will be provided in the form of surveillance cameras, lighting, fencing, barriers, on-site personnel, or other means.

Meeting UH Manoa's Secondary Needs — The comment about planning the area near the university holistically is noted. The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS. However, the future extensions are not part of this Project; thus, they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. For this Project, because the future extensions are not proposed for implementation at this time, they are not part of the

Mr. Brian K. Minaai
Page 5

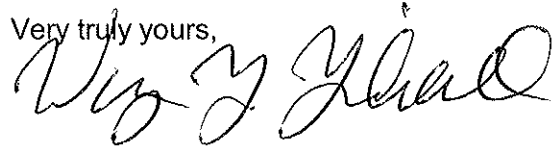

Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time.

The extension of the Project to the University is only noted as in Section 4.19 in the Cumulative and Indirect Effects of the Final EIS, but any planning for the Moilili area should include the future guideway.

The present Project terminates at Ala Moana Center. The images referenced in the comment do not accurately represent the Project. No detailed engineering has been completed on the University extension, and no details have been developed from which to develop accurate simulations.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

MEMORANDUM

TO: Mr. Wayne Yiohioka
Director, Department of Transportation Services
City and County of Honolulu

FROM: Panos D. Prevedouros, Ph.D. *PK*
Professor

SUBJECT: Comments on Rail Transit Draft EIS

My review was based upon the DEIS section 4F dated November 2008 and particularly of chapter three on transportation impacts. However, most of my comments refer to the supplementary report "Transportation Technical Report, Honolulu High-Capacity Transit Corridor Project, Prepared for: City and County of Honolulu, 417 pp, August 15, 2008" which includes much more detailed analyses and explanations on the traffic and transportation analyses that were the foundation of the results presented in the DEIS. Italics and quotes refer to direct passages from the subject DEIS and accompanying documentation.

(1) Traffic Analysis Methodology

Level-of-Service: The Synchro 6.0 software suite (Synchro) was used for intersection analysis. Synchro applied the HCM Operational Analysis methodology and intersection input data to estimate control delay at each study intersection.

This traffic analysis method is not suitable for saturated conditions, and is not suitable for corridor and regional studies. HCM mentions these limitations. Almost all traffic elements along this corridor are oversaturated, thus HCM methodologies do not apply (unless the wrong data are used and degrees of saturation are low.) Either way the output is wrong or misleading.

(2) Peak Hour Screenline Level-of-Service Methodology

To measure and describe the local roadway network's operational status, an LOS grading system was developed to describe a facility's operation, ranging from LOS A (free-flow traffic conditions with little or no delay) to LOS F (over-saturated conditions where traffic flows exceed design capacity, resulting in long queues and delays). The operation of the roadway segments was calculated by comparing traffic volumes on roadway facilities to the saturated volume LOS thresholds for each individual facility. The LOS is reported for each individual screenline facility, then weighted by traffic volumes to report overall operating conditions across each screenline

This is an ad hoc method that is not a national standard. It is entirely inappropriate to use the Highway Capacity Manual's LOS measure without using the HCM methodology. The HCM LOS for freeway screenlines is based on density and speed not on volume-to-capacity ratio. Furthermore, the volume to capacity "method" in the DEIS was applied wrongly in the Alternatives Analysis. The table on the top half of page 3, in which all black cells are the reviewer's corrections, shows that general purpose traffic was estimated to be 31% above capacity (estimate of 1.31) but by their numbers, the correct estimate is 62.5% over capacity (estimate of 1.625.) Capacities are not revealed everywhere in the DEIS, so the reviewer cannot check the same calculations in the DEIS.

(3) Forecasts

Neither the DBEDT (provider of some of the base forecasts), nor the City nor their consultants understand that most growth phenomena in a metropolitan area concerning city expansion and their traffic follow an S-curve depicted by many years of existence as a village, transitioning to a city, several years of growth into a metropolitan area followed by a very long period of maturity with small growth (and decrease) periods. This study erroneously assumes a large future growth for west Oahu and nightmare traffic scenarios whereas Oahu's population, development and tourist attraction have ended their sharp growth and have entered their mature level with a lot of negative bumps along the way. For example, DBEDT Data Book Table 1.06, Honolulu population in 2006 was 906,715 and it dropped to 905,601 in 2007 which was before the sharp economic downturn of late 2008 which is expected to last till 2011.

As shown in the figure on page 3, if S-shape forecasts were used, then the unrealistic demand levels shown in the Alternatives Analysis (AA) would never had appeared. However, something inexplicable happened between AA and DEIS: Screenline demands have been reduced by 28% without any explanation. As shown in the table on page 3, demands in the 2008 DEIS are lower by 28% for year 2030 compared to what they were in the 2006 Alternatives Analysis.

Such a discrepancy (28%) in demand produced by the OMPO forecasting model is highly suspect. Qualified alternatives such as TSM and Managed Lanes were dismissed based on high demand figures in the AA which were subsequently modified in the DEIS. A supplemental DEIS is needed to evaluate qualified alternatives with the reduced demand forecasts.

(4) Localized Traffic Analysis at and near Stations

... However, the nature of the system's operation is such that traffic could increase at localized levels, thereby requiring further analysis. These reasons include the following factors: [bullet list omitted]

While a number of good reasons are listed for induced and circulating traffic around stations (how were taxis accounted for?), the analysis is localized and the impacts of these trips on the whole are not assessed, therefore, the DEIS models produce underestimates of vehicular VMT, vehicle hours, pollution and regional congestion for the Rail scenario.

In general, this is a piecemeal analysis that is not appropriate for a project of this magnitude and with such pervasive construction and bus routing impacts.

(5) DEIS Does not Assess the Impacts of the Project as Defined to the Public

As described in the Draft EIS, the Locally Preferred Alternative, called the "Full Project," is an approximate 30-mile corridor from Kapolei to the University of Hawaii at Manoa with a connection to Waikiki. However, currently available funding sources are not sufficient to fund the Full Project. Therefore, the focus of the Draft EIS is on the "First Project," a fundable approximately 20-mile section between East Kapolei and Ala Moana Center. The First Project is identified as "the Project" for the purpose of the Draft EIS.

This is a hugely critical simplification and it must be rectified with a Supplemental DEIS. The DEIS should have included both the full project and the 20 mile minimum operating segment or fundable project or whatever the City wishes to call it. The people's understanding is that the rail system is Kapolei to UH with service to Waikiki. The routes beyond the Ala Moana Center are necessary to be assessed in the DEIS. We do not ask the city to assess its mayor's obfuscations of future rail service from Hawaii Kai to Waianae, but the proposal always has been Kapolei to UH.

A Supplemental DEIS is required to assess the impacts for the whole corridor. It is not possible to begin the system, finish it to Ala Moana Center, and when it comes time to expand it, the expansion impacts are such that preclude any expansion.

(6) No Build Assessment of ORTP 2030 Congestion Relief Projects

Page 3-16: "Even with \$3 billion in roadway improvements under the No Build Alternative, traffic delay in 2030 would increase by 44%".

If one was to correctly model all the committed congestion relief projects in ORTP 2030 (Table 2-3) and combine them with a the fact that Oahu population has been stagnant or falling (and bound to further fall due to poor economy and housing unaffordability), the highway congestion in 2030 could be improve by at least 15%.

For example, the PM zipper alone will carry about 1,500 vph through the Kalauao screenline with 3 or more people in them resulting in a person capacity of 4,500 going west. These are people removed from the existing network thus providing a substantial relief.

The westbound utilization of the rail will be optimistically 6,000 people through the Kalauao screenline of whom at most half will be drivers and ex-carpoolers or 3,000 people.

The PM zipper combined with a Nimitz flyover practically guarantee a continuous trip at 55 mph from Iwilei to Waikole to Kapolei. This commute is half as long in duration as that by rail.

Therefore, the PM zipper alone that carries more persons than rail can be more beneficial than rail. However, the DEIS tries to convince us that major traffic congestion relief projects will yield "peanuts" whereas the rail with its inferior speed and 15+ stops to Kapolei will yield superior travel time savings and traffic congestion improvements.

Part of the reason is likely that planning models are insensitive to bottlenecks and only provide rough estimates based on some assumed values of capacity. Until this author sees proof of use of a regional microsimulation traffic model assessing the impacts without and with correctly modeled ORTP 2030 projects, he asserts that the analysis method was inappropriate and largely incapable in assessing the benefit of the projects in Table 2-3 of the DEIS.

(7) TOD Potential Not Assessed

A final observation is that people may not realize the unintended consequences around some stations, particularly if they buy property in one of the city's Transit Oriented Development plans. For example, in the Pearl Highlands station, according to the DEIS estimates, over 1,700 vehicles in a day will come to park and take the rail, 300 vehicles will drop off passengers and over 300 buses will drop off and pick up over 8,000 transfer passengers. That's a lot of traffic, and that's station-only related traffic concentrate of the rush hours and this traffic will be on top of all the (heavy) regular traffic in the area.

The question then is... What's the impact of station generated traffic, noise and pollution to TOD potential and TOD plans? Where is the discussion and assessment?

(8) Over the H-1 Freeway at University Avenue?

This author clearly recalls incumbent mayor Hanneman's beating of political opponent Ann Kobayashi for her complaining about the rail guideway going over the H-1 freeway on its way to the UH-Manoa campus. Both City and Hannemann vigorously and rudely disclaimed this in the September to November 2008 time frame but then the City presents this image on the official website as of February 4, 2009. the proposed rail clearly overflies the freeway!

(9) Two Stations at Ala Moana Center?

The Ala Moana Center station arrangement is a mystery. In the 20 mile plan, the station is approximately at the 3rd floor level. In the 30 mile plan the station is approximately at the 6th floor level. What is the exact plan for the Ala Moana Station and how can the guideway expand past the Ala Moana Center given the density, and height of buildings along Kona Street and Atkinson Drive?

This author suspects that roughly half a billion dollars would need to be expended to reconfigure (that is, to demolish and reconstruct) the guideway alignment between Pensacola Street and Atkinson Drive, including the demolition of the 3rd floor station and the creation of a 6th floor station, if rail has any hope in reaching UH-Manoa or Waikiki via Kona Street.

(10) Why the Double Track by Aloha Stadium?

There is no explanation for this particularly wide double tracking by Aloha Stadium. What's the purpose, why has it not presented in detail and what is the cost of it?

(11) OMPO Never Rejected Pearl Harbor Tunnel as Claimed in Table 2-2

The DEIS is wrong in claiming that OMPO rejected the Pearl Harbor Tunnel. The UH Congestion Study found that this alternative has substantial traffic benefits at a cost comparable to rail's. There has been no substantiation to the tunnels alleged costs between seven and 11 billion dollars. Viable projects should not be excluded through unprofessional conduct.

(12) Federal Funding

The Project's cash flow analysis, which is presented in Section 6.4, anticipates the use of Local funds for the first construction phase and a combination of Local and Federal funds for the remaining phases.

The project must not start until the full extent of the federal funding is known in writing as part of the next Transportation Act of Congress, and the project should not start until a substantial portion of the federal funding (e.g., a portion that covers half of the cost of the first construction phase) has been actually released for the project. Anything else is simply reckless public policy.

(13) DEIS Base Travel Times Are Inaccurate.

Having resided in Kapolei for a short period in 2007, I know from personal experience that the morning peak period travel time from Kapolei to downtown is always under 75 minutes in the absence of rain or any lane closure. I was startled that the DEIS uses a time of 89 minutes.

I took the opportunity to ask people listening to a radio program that I participate to make some measurements of travel time from the H-1 freeway on-ramp to Alakea Street in downtown if they depart Kapolei between 6 AM and 7 AM. So far I received six qualified measurements of 49, 62, 75, 50, 62 and 59 minutes averaging at about 60 minutes. Therefore, roughly speaking the DEIS uses a 50% overestimate of the travel time which leads to false benefits of travel times by rail.

The DEIS fails to demonstrate the root causes of traffic congestion. The same travelers reported these airport-to-Alakea travel times: 18, 16, 41, 11, 30 and 25 minutes for an average of 23.5 minutes (DEIS uses 25 minutes). The real issue therefore is the traffic flow condition on Nimitz Hwy. which vary widely as these travel times show: 11, 16 or 18 minutes with good conditions,

25, 30 or 41 minutes with poor conditions. This makes it clear that a roughly two mile long Nimitz Viaduct will provide a consistent travel time from airport-to-Alakea of about 6 minutes, reducing the peak hour trip from Kapolei to downtown from about 60 minutes to about 40 minutes. A relatively modest investment solves a huge part of the morning commute congestion.

Note that rail will be providing airport-to-Alakea transit travel time of about 50 minutes (It is 50 to 54 minutes depending on the route selected. The airport route provides the longest travel time for this origin-destination pair.)

(14) How Will the Rail Cars Go to the Rail Yard?

The rail yard is located several miles inland with no direct access to the harbors. Yet the DEIS is silent as to how rail cars and rail equipment will be transported there since rail cars do not fit on regular flatbed trucks and even if they can be accommodated by length and by weight on custom flatbeds, they do not fit by height due to the existence of several overpasses along the freeway. What are the logistics and costs of this significant part of the construction?

(15) Rail Travel Times for Political Commercials and for NEPA Documents—Why the Double Standard?

The DEIS clearly specifies that Kapolei-to-downtown travel time by rail is 50 to 54 minutes. This travel time estimate was clearly known in August 2008. Yet in September 2008 the City mailed all residents (using taxpayer funds) a large eight page brochure the centerfold of which states that Kapolei to Ala Moana Center by rail will be 40 minutes! (For those unfamiliar with the alignment, the Ala Moana Center is five stations after Downtown.)

(16) TheBus Inventory

In reference to Table 3-12: TheBus 2007 Vehicle Inventory: Why is this inventory taken from "National Transit Database, 2007" and not directly from TheBus or the City? Why is the total passenger capacity not listed?

At any given time, what percentage of these buses are service ready as opposed to in repairs or waiting for repairs or parts, or damaged and beyond repair awaiting replacement? It is my understanding that a lot of buses (about 20%) sit at depots during peak periods and express bus "crush loads" are artificial due to limited scheduling of capacity. A case in point is the picture shown above. It was taken at 6:30 AM on a normal weekday in 2004. The freeway is bumper-to-bumper in the town-bound direction, yet at least 53 buses sit at the depot, many of them articulated (which are typically

assigned to the express routes.) How can TheBus "burst at the seams" as a pro-rail commercial claimed in late 2008 when many of the buses sit empty at the depot?

(17) TheBoat as a Threat to the Rail

TheBoat vessel inventory in page 3-31 is wrong. It should also be mentioned that its schedule reliability is poor due to frequent mechanical failures and high seas.

Since we spend the significant amount of \$6 million a year on TheBoat, why didn't the DEIS estimate the productivity and congestion reduction of this alternative transportation mode? Will TheBoat reduce rail's ridership?

(18) Unrealistic Fares

To maintain consistency with the travel demand analysis, the actual 2007 average fare of \$0.77 per linked trip was assumed to grow with inflation throughout the forecast period.

So the DEIS assumed that fares are the same as TheBus, which given the cost to build and operate the rail, this means that trips are essentially free to users and the general public pays for it. How can this possibly be reconciled with the Council's desire to cover 30% out of the fare box?

What kind of administrator, engineer and planner does it take to build a five billion dollar transit service and then charge a dollar per ride? I must have this answered so we are able to teach our students this "new math."

(19) Ho'opili

The EIS for the Ho'opili project analysis for permit application was done by a consultant other than Parsons Brinkerhoff. It shows projected 2030 freeway traffic conditions with and without rail transit. There's no difference; both are level of service F. It is clear that rail or not, traffic conditions along the subject corridor will be terrible. So the City clearly violated the intent of the NEPA process to clearly inform Oahu's citizens that rail is no solution to traffic congestion. We all know that the City used taxpayer money to do the exact opposite.

(20) Forecasts from the OMPO model

There is a long list of limitations of the OMPO model used to develop the all-important rail forecasts. Here are a few:

20.1) The model was developed in 1994 by Parsons Brinkerhoff. It is very old in terms of both architecture and data validity. It is also of interest that the same person who developed it as a Parsons Brinkerhoff forecaster now is an Federal Transit Agent who inspects the forecasts.

20.2) The model has parameters for dead attractions such as the Kodac Hula Show and the Dole Cannery, but has not parameters for Superferry, Ko Olina, Water Adventures Park, North Shore and Haleiwa.

20.3) The OMPO model is hardly a modern activity-based microsimulation platform. It is an old, aggregate platform with highly compartmentalized trip definitions such as

wh journey-to/from -work, home-based work
wo journey-to/from -work, home-based other
wn journey-to/from -work, non-based
ww journey-to/from-work, work-based
aw journey-at-work, work-based
an journey-at-work, non-based
nk not-work-related, home-based k-12 school
nc not-work-related, home-based college
ns not-work-related, home-based shop
no not-work-related, home-based other
nm not-work-related, non-home-based

It is also extremely cumbersome to use as use as this note tells all: *Each of the eleven trip purposes requires a separate application of program MC.* So just for the weekday morning travel one has to run the mode choice model 11 times to determine if rail will have any share of the passengers using coefficients that were “adjusted” from other cities. Given that TheBus share is high compared to other cities with bus systems, I suspect that the adjustments were very generous in favor of rail. The DEIS does not present or explain any of this.

20.4) The OMPO model depends on many assumed static capacities for various facilities. This makes it susceptible to range errors and easy manipulations. Note that the transit factor table depends on congested times. It would make sense that more people would choose transit from Kapolei to downtown if a time of 90 minutes is used instead of the correct time of 60 minutes. And that was done.

Same concern applies to arterial and freeway capacity which can be arbitrarily set too high or too low to satisfy the objective of the analysis such as “promote rail and undercut HOT lanes.”

Transit Factor Table

To begin the travel demand process, an estimate of congested times is required.

Capacity Table

The format of the capacity table records is as follows:

...
 7 27-31 Capacity for area type 5 (vehicles / lane / hour) F5.0
 ...
 3 05 1000 1050 1050 1050 1100 1150 1200 1300
 ...

Note: The capacities on the table are vehicles per lane per hour.

Thank you for the opportunity to provide comments.

**RE: DEIS Comments on the Honolulu High Capacity Transit Corridor Project --
(1) Proposed Project Phasing; and
(2) Airport Alternative Route**

Dear Director Yoshioka:

Thank you for allowing me to comment on the Honolulu High Capacity Transit Corridor Project for the Draft Environment Impact Statement (the "DEIS").

I respectfully submit that two changes should be made to the DEIS. First, the proposed construction phasing is not optimal. The first phase of the rail system should be from Aiea to Downtown rather than from East Kapolei to Waipahu. Second, the current Minimum Operating Segment (the "MOS") for the route should go through the airport and Pearl Harbor area rather than Salt Lake Boulevard.

1. The First Phase of the Rail System Should Go from Aiea to Downtown

The DEIS contemplates construction of the Honolulu rail system to be built in four phases, with each phase opening for operation upon completion of construction. (See DEIS, Fig. 2-44). The DEIS has the first phase and operating segment going from East Kapolei to Pearl Highlands, with a proposed complete opening sometime at the end of 2013. The second phase from Pearl Highlands to Aloha Stadium is not slated to open to the public until the end of 2016. (See, DEIS, p. 2-20).

Instead of the proposed phasing contained in the DEIS, the first phase of the rail system should go from Aiea (the Aloha Stadium stop) to Downtown Honolulu (the Aloha Tower stop) rather than East Kapolei to Waipahu.

There will simply be insufficient ridership of any rail system to justify opening the initial segment of the rail from East Kapolei to Waipahu. Significantly higher ridership will be garnered for an Aiea to Downtown phase. Garnering a high initial ridership during the first phase of the rail system will provide a more direct benefit to the community and more immediate traffic relief. Such an initial Aiea to Downtown phase can build greater community support, initial enthusiasm and long-term ridership for a Honolulu rail system than a little used East Kapolei to Waipahu phase.

Furthermore, it may take over a decade to construct the entire MOS. There are numerous unknowns that could occur during the construction of the MOS, including a continued economic slowdown that jeopardizes funding or a natural disaster such as a hurricane that could jeopardize construction cost estimates. By constructing the first phase from Aiea to Downtown rather than East Kapolei to Waipahu, the City will insure that even if these contingencies occur, the public will still have a rail system that it can glean significant benefits from. If the City runs out of financial resources or a natural disaster occurs, and all the City is able to construct is an East Kapolei to Waipahu segment, the public will have expended enormous public resources for a rail segment that does not make much practical sense.

An initial maintenance facility can be constructed in the industrial area surrounding the airport for an Aiea to Downtown phase. This should not be a barrier to starting construction of the rail in-town rather than from the West.

In the alternative, if the City must start the construction in Leeward Oahu, the DEIS phasing should be altered to initiate construction at the proposed Waipahu maintenance facility and progress eastward. Such a construction schedule is far more sensible than starting in East Kapolei where there are currently no residents or jobs.

2. Airport/Pearl Harbor Route Should be Selected

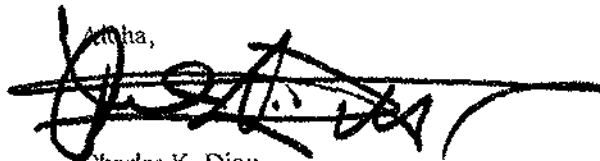

The DEIS examined three possible route configurations, one following Salt Lake Boulevard, one that goes to the Airport and Pearl Harbor and a third that examined both. (See, DEIS, p. 2-19).

The Airport route should be the MOS. This route will yield higher ridership and is far more sensible given Honolulu's demographic conditions. Given Honolulu's main industry is tourism and its second largest industry is defense, connecting the Airport and the Pearl Harbor areas makes much more sense than pursuing the Salt Lake Boulevard alignment. Furthermore, this route was the Locally Preferred Alternative in 1992, the last time Honolulu embarked on the rapid transit project.

The Honorable Lee Donohue
Honolulu City Council
530 South King Street, Room 202
Honolulu, Hawaii 96813

Dear Councilmember Donohue:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your predecessor's comments regarding the above-referenced submittal:

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- *Reduce the time that each area will experience traffic and community disturbances.*
- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*
- *Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- *Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

The financial plan is balanced for the entire Project so there will not be a situation in which only a portion of the system will be built. If there is a shortfall, additional revenue sources will be considered. Section 6.6 of the Final EIS discusses risks and uncertainties, as well as potential sources to cover shortfalls.

Your predecessor's preference for the Airport Alternative has been noted. While each of the alternatives includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative. The identification of the Airport Alternative as the Preferred Alternative was made by the City to comply with the FTA's NEPA regulations that state the Final EIS should identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection is detailed in Section 2.4 of the Final EIS and was based on consideration of the benefits of each alternative, public input on the Draft EIS, and City Council Resolution 08-261 identifying the Airport Alternative as the Project. Further, FTA's NEPA regulations for projects proposed to be funded with major capital investment funds, the level of detail necessarily increases between the Draft EIS and the Final EIS through preliminary engineering work (23 CFR 771.123 (j)).

The Honorable Lee Donohue
Page 3

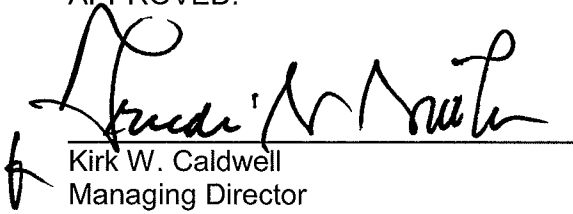

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

APPROVED:

Kirk W. Caldwell
Managing Director

Enclosure

January 14, 2009

Mr. Ted Matley
FTA Region IX
201 Mission Street, Suite 1650
San Francisco, CA 94105

Subject: Honolulu High-Capacity Transit Corridor Project

Dear Mr. Matley:

I would like to take this time to thank you and the Federal Transit Administration (FTA) on behalf of the citizens of the City and County of Honolulu for your expertise and diligent oversight of the Honolulu High-Capacity Corridor Project (Rail Project). Your oversight of the development of our Rail Project will assure our citizens that they will be rewarded with a rapid transit system that is fiscally sound, and will meet the needs of the communities now...and in the future...without undue burden given the current economic times, and risks associated with the development of systems of this complexity.

I would also like to convey to you my complete support for a rapid transit system for the City and County of Honolulu that will meet the needs of our citizens...being affordable, beneficial and with less financial risk associated with its development, construction and continued operations and maintenance.

In regards to my support, I have been intimately involved in the Rail Project since its inception with a keen interest in making sure that we follow through with meeting the aforementioned needs (tenets) of our citizens...again, being affordable, beneficial and with mitigated financial risk.

In my review of the Draft Environmental Statement (DEIS), I have several concerns in our ability to meet these tenets and the resulting financial burden that will be placed on our taxpayers. I have voiced my concerns through various means including several editorials (see attachments A, B and C) for your review. And through this letter, I would like to personally bring these concerns to your attention in your oversight capacity. In the end, my concerns can be summarized as fiscal in assuring that the citizens are not burdened with an unaffordable rapid transit system. These concerns are as follows:

1. General Excise Tax (GET) levels are down and would be expected to decline further due to the current economic situation we are experiencing on a global basis. In particular:

- GET collection over the first 20 months was \$246 million. If averaged over 15 years...the total would be about \$2.2 billion, which falls short of the overly-optimistic \$4.1 billion in GET surcharge revenues estimated for in the Draft Environmental Impact Statement (DEIS)
- According to the Presidents Budget for FY2007, stated in the Annual Report of New Starts Proposed Allocation of Funds for Fiscal Year 2007, there are 21 other transportation projects ahead of Honolulu's Rail Transit Project that have applied for Full Funding Grant Agreements (FFGA).

A failure in adequate funding would leave a heavy financial burden on the citizens of the City and County of Honolulu which would only result in additional taxes either through extensions and/or increases in the GET; increase in property taxes; and additional costs incurred through the issuance of bonds to fund the development of the Rail Project.

2. The proposed change from the Salt Lake Boulevard alignment to the Airport alignment appears unjustified and impractical in terms of benefit and costs. For instance:
 - Costs for the airport alignment are reported to add \$220 million more to the total price of the Rail Project, with an additional \$75 million to double-deck the platform and guideway at the Lagoon Drive Station. This is above the much more practical and affordable Salt Lake Boulevard route.
 - The 20-mile long Minimum Operable Segment (MOS) from East Kapolei to Ala Moana Center via Salt Lake Boulevard was approved by the Honolulu City Council in February 2007. Two days after the rail ballot initiative was approved in the November 2008 General Election, a move to switch the route from Salt Lake Boulevard to the airport was proposed, leaving a bitter taste in the mouths of those who voted for rail believing the line would run through Salt Lake Boulevard.
 - The proposed airport rail station appears to be too far from the passenger terminal, making it difficult, if not impractical, for visitors to use—especially with no connection into Waikiki.
 - The costs for operation and maintenance of the airport alignment over the Salt Lake Boulevard alignment would be higher and pose an additional burden to the taxpayers, especially if the first segment is built from East Kapolei to Waipahu.

The change to the Airport alignment from the Salt Lake Boulevard alignment for the near-term does not appear to be fiscally prudent, nor does it provide the benefit to the community and citizens.

3. The Draft EIS lists the airport alignment's daily ridership as 95,310, compared to a ridership of 87,570 by 2030 for Salt Lake Boulevard. The Salt Lake community questions this disparity, particularly since the DEIS does not explain how these numbers were determined.

I am submitting a copy of testimony from Ron Tober, chair of the technology selection panel (*see attachment D*), in response to a series of questions during a recent committee meeting. Based on his comments and expertise, the Salt Lake community and myself further

researched both the airport and Salt Lake Boulevard alignments. Here are several of our findings that question the validity of the airport alignment's 95,310 ridership count:

- Independent research conducted by a member of the Salt Lake Neighborhood Board shows several apparent inconsistencies in the Draft EIS. (*see attachment E*)
- There are about 7 million annual visitors to Hawaii. Seventy-one percent of those passengers go through the Honolulu International Airport, with the remaining 29 percent going to the neighboring islands.
- Asian visitors total approximately 2 million per annum, with the majority being Japanese. They arrive early in the morning and take buses to the hotels as part of the tour package. Check-in times are usually mid- to late-afternoons.
- Of the 21 major cities that launched rail systems since the 1970's, only 7 were connected to the airport (*see attachment F*). Most of the links to airports were built after the rail systems were launched. This is why the airport spur should be built later or concurrently with a spur into Waikiki.
- There are approximately 12,500 civilian employees with free base parking at Hickam and Pearl Harbor combined. Most military personnel either live on, or near, the bases...with very short commute times to their workplace.
- About 727 state and 15,000 private sector employees are at the airport. There are over 7,000 parking stalls at the airport, including the new 1,800 stall parking structure for employees and locals to use.
- Oahu has a population of approximately 900,000 residents, of which 60,000 – 70,000 residents currently live along a 4-mile stretch of Salt Lake Boulevard. These residents represent a solid ridership base and can generate more revenues and therefore less taxpayer subsidy for operation and maintenance costs.
- In comparison, when the Minimum Operable Segment (MOS) is completed and operational by 2018, the airport route's daily ridership estimate of 95,310 and transit-oriented development (TOD) opportunities will not be fully realized until 2030, as projected in the DEIS.
- The Salt Lake Boulevard alignment, with two proposed passenger stations, compared to four for the airport route, meets the Cost Effectiveness Index (CEI). A third station in Mapunapuna, with a 150 acres and one owner, would further increase Salt Lake Boulevard's CEI and ridership level (*see attachment G*).

In comparison, San Francisco International Airport (SFO) has over 34,000 workers, 6 million residents in Bay Area alone and approximately 16 million annual visitors, yet SFO has had difficulty in reaching projected daily ridership of 17,800 on the BART airport extension. Ridership levels are nowhere near what BART officials had hoped and the route is losing money.

The above concerns strictly address the need for fiscal accountability, especially in light of the current economic times we are experiencing...globally, and the impact that this will have on Hawaii's taxpayers. It is important that we take care of our citizens first in providing them the most affordable and beneficial rail transit system.

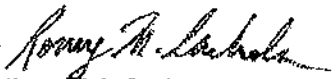

In view of the aforementioned statements and on behalf of the citizens of the City & County of Honolulu, I request that the FTA, given its oversight and responsibilities in the development of this rapid transit system, conduct a separate ridership analysis independent of the current ridership analysis to validate whether the Airport alignment or the Salt Lake Boulevard alignment should be preferred. Further, the community firmly believes that beginning the project in East Kapolei does not make sense since it will do little to relieve traffic gridlock. To ensure greater ridership and reduce traffic, the first segment should instead begin in Downtown and proceed towards Kapolei. Therefore, this analysis should also address the stationing and proposed sequencing of the work.

I would also request that the FTA look at the delivery approach proposed in segmenting the work, and consider the use of a "Master Contractor" with the experience and capability to undertake the responsibility in accepting in large part the risk associated with the integration of the rapid transit system components. And not allow the City and County of Honolulu and our taxpayers to deal with this risk.

On behalf of taxpayers who will be paying for this project, as well as the many others in the community who voted in favor of rail in the November 2008 election believing that it would pass along Salt Lake Boulevard, thank you for your consideration of the above requests. I look forward to your favorable response to these requests so that our taxpayers can be assured that this project is proceeding in a fiscally-prudent and cost-effective manner.

Please give this matter your immediate attention since it appears a resolution to change the alignment from Salt Lake Boulevard to the airport is pending before the City Council, which will make a final decision on January 28, 2009.

Sincerely,

Romy M. Cachola
Councilmember
District VII

Salt Lake a better choice than airport for rail route

By Romy M. Cachola

POSTED: 01:30 a.m. HST, Nov 26, 2008

Both Honolulu dailies endorse the airport route for the 20-mile minimum operable segment of the rail project. It is in everyone's best interest to carefully consider the following facts before stepping up to support the route.

» Construction cost. The airport route costs \$220 million more than the Salt Lake Boulevard (SLB) route. We need to avoid the mistakes of other cities and analyze whether funding estimates are what taxpayers can afford. For example, extending Denver's FasTracks, which was estimated in 2002 to cost \$4.7 billion, now costs \$7.9 billion. Denver officials are contemplating raising their sales tax to fund this increase.

» Ridership levels. The Draft Environmental Impact Statement lists 95,310 daily passengers on the train by the year 2030. This means that when the rail line is completed by 2018, ridership and transit-oriented development potential for the airport won't be reached for 12 more years. In comparison, you don't have to wait until 2030 with the SLB route, which would go through the densely populated community of Salt Lake, where there would be a solid ridership from day one.

The estimate of 95,310 daily passengers on the airport route is questionable. There are about 12,500 civilian employees with free parking at Hickam and Pearl Harbor and about 727 state and 15,000 private sector employees at the airport, and more than 7,000 parking stalls at the airport, including the new 1,800-stall parking structure.

These are all disincentives for employees at the airport, Hickam and Pearl Harbor to ride rail.

In comparison, San Francisco International Airport has more than 34,000 workers and higher visitor arrivals than Honolulu, yet SFO has had difficulty reaching a daily projected ridership of only 17,800 on a BART extension. Since the extension opened in 2003, ridership is nowhere near what BART officials had hoped and the route is losing money.

» Operation and maintenance costs. Currently, taxpayers subsidize the TheBus at \$130 million per year. With rail, the O&M cost for both is estimated at more than \$200 million.

When the initial rail segment is built from East Kapolei to Waipahu, who will ride it? This first segment might not relieve traffic since gridlock begins where H-1 and H-2 merge. As you extend the first segment, it will still be "a train to nowhere." With less ridership and farebox revenues, taxpayers will pay more for O&M, which will continue to increase until it reaches downtown.

The above arguments are good reasons to build the first segment from downtown to East Kapolei via SLB; delay the airport route and give the state/city ample time to plan and build a station closer to the passenger terminal; and construct a Waikiki spur.

The advantages of adding a SLB station in Mapunapuna are: 1. the landowner is willing to donate land and help with
<http://www.printthis.clickability.com/content?action=print&title=Salt+Lake+a+better+choice+than+airpor...> 1/14/2008

station construction costs, and 2. there are better opportunities for affordable housing and transit-oriented development.

The debate between Salt Lake Boulevard and the airport should not pit one community against the rest of the island. This is not a popularity contest but a serious pocketbook issue with billions of dollars at stake.

Other than encouraging commuters to leave their cars at home, a successful rail project shouldn't bankrupt taxpayers' pocketbooks. Simply put, the Salt Lake Boulevard route is cheaper and better than the airport.

Romy M. Cachola represents District 7 (including Mapunapuna, Airport, Hickam, Pearl Harbor, Salt Lake and Foster Village) on the Honolulu City Council.

OPEN FORUM

Salt Lake Route Saves Taxpayers' Money

By Romy M. Cachola

Immediately following the General Election, the Council proposed to change the route of the Honolulu Rail Transit Project from Salt Lake Boulevard to the airport.

The proposal surprised many voters who felt that the change was improper.

The media hinted at a political compromise in the selection of Salt Lake Boulevard for the 20-mile Minimum Operable Segment (MOS) of the rail project. The truth is, for the rail project, leaders in the Salt Lake community and I have not played political games. Instead, we have worked very hard to justify why Salt Lake Boulevard is the better route for the Honolulu Rail Transit Project.

Here are our findings:

Airport

- The rail station is too far away from the passenger terminal, making it a hassle to lug around suitcases. There is also little incentive for visitors to use rail since there is no connection into Waikiki.
- There are over 7 million annual visitors to Hawaii. 71 percent of passenger seats go through Honolulu

International Airport, with the remaining 29 percent going to the neighbor islands.

- Asian visitors, the majority of whom are Japanese, total approximately 2 million. They arrive early in the morning and are taken via buses to briefings or tours before checking in at their hotels in the afternoon.
- Out of 21 major U.S. cities that launched rail systems since the 1970s, only 7 were connected to the airport. Most of the airport spurs were built after the rail systems were launched.

Pearl Harbor/Hickam

- There are approximately 27,000 civilian employees combined at the airport, Pearl Harbor and Hickam with free parking on base.
- Most military personnel live on base or within a short driving distance.

Transit Oriented Development (TOD)/Housing

- The SLB alignment extends through Mapunapuna which encompasses 150 acres and is owned by a single landowner who is willing to donate

(continued on page 6)

OPEN FORUM (CONT.)

from page 3, Salt Lake...

land and help build a station. Adding a station in Mapunapuna would increase ridership for the SLB alignment and provide greater opportunities for affordable housing and TOD, particularly at:

1. Stadium Mall
2. K-Mart across Stadium Mall
3. Former Costco site
4. Salt Lake Shopping Center
5. Mapunapuna

Operation/Maintenance (O&M) & Construction Costs

- The SLB route is shorter and costs less than the airport route.
- When completed, the initial segment from East Kapolei to Waipahu, will have less ridership and won't relieve traffic gridlock. O&M costs and taxpayer subsidies will be more and will increase until the 20-mile MOS is completed. This will further burden taxpayers' pocketbooks.

Furthermore, we should look at the transit experiences of other cities and hopefully learn from their mistakes.

1. San Francisco's BART was extended to the airport in 2003 with a projected ridership of 17,800. Currently, they are hard pressed to meet projections, despite having 34,000

airport workers and higher visitor arrivals than Honolulu.

2. New York's Metropolitan Transportation Authority has proposed a 23 percent fare hike for the Long Island Rail Road and a 43 percent hike for Long Island Bus fares—a proposal which has angered passengers.
3. Denver's FasTracks transit extension, estimated in 2002 to cost \$4.7 billion, now costs \$7.9 billion. Officials may raise their sales tax to fund this increase.

Based on the above, we should be skeptical of the projected 95,310 riders for the airport route and the estimated \$220 million that will be added to the cost of construction. If the numbers provided in the Draft Environmental Impact Statement don't match, taxpayers will be faced with the following additional funding proposals:

- Extend the half percent GET collection beyond the Year 2022.
- Increase the GET to one percent.
- Borrow money by floating bonds.
- Increase property taxes.
- Raise fares.

We should think first and foremost

of the welfare of our taxpayers and select the route that is less costly and that will attract locals who will ride the rail despite a bad economy.

Leaders and residents of Salt Lake, although upset with the proposed route change immediately after the election and the deletion of \$30 million for SLB widening, have done an outstanding job in defending Salt Lake Boulevard as the better route.

Reduce rail burden on O'ahu's taxpayers

By Romy M. Cachola

A recent article in The Honolulu Advertiser reported that general excise tax collections are down compared with last year's totals because of the bad economy and declining visitor arrivals.

Funding for the city's 20-mile minimum operable segment of rail has always been a major concern for me.

The half-percent GET collection for rail for the first 20 months was \$246 million. If averaged out over the 15 years of collection, the total GET would be about \$2.2 billion, which falls short of the overly optimistic \$4.1 billion in GET surcharge revenues estimated in the draft environmental impact statement.

The following are other reasons for concern:

- With GET levels down, there may not be enough funds collected to build the eight-mile first segment from East Kapolei to Waipahu, which I suspect may cost around \$1 billion.
- The airport alignment, if selected instead of Salt Lake Boulevard, would add \$220 million more to the total price tag, plus an additional \$75 million to double-deck the platform and guideway at the Lagoon Drive station, according to the draft EIS.
- According to the president's budget for fiscal year 2007, as stated in the Annual Report on New Starts Proposed Allocation of Funds for Fiscal Year 2007, there are 21 other transportation projects ahead of Honolulu's rail project that have applied for full funding grant agreements.

I stated early on that we can expect one or more of the following proposals if our construction cost estimates are off:

- Extend the half-percent GET collection beyond 2022, the final year of tax collection.
- Increase the GET to 1 percent.
- Borrow money by floating bonds.
- Increase property taxes.

It seems that the administration's plan to fast-track the first segment of the project using collected GET funds is coupled with the notion that once construction begins there will be no stopping. This may explain why the administration is hinting at floating bonds sooner rather than later to make up for the shortage. If we are forced to borrow money, as I suspect we will be, the debt service will be an added strain on taxpayers.

Instead, I strongly suggest, if at all possible, that the city fast-track its application to secure a FFGA with the Federal Transit Administration before starting construction.

The benefits of an FFGA are that it:

- Defines the project scope.

- Establishes a firm date for project completion.
- Provides a mechanism for designating funds for future years.
- Leads to the development of accurate cost estimates.
- Permits the use of state and local funding for early project activities without jeopardizing future federal funding for those activities.

An FFGA will result in better predictability and transparency and hopefully prevent cost overruns and delays of the project. Also, an FFGA will give our taxpayers peace of mind and comfort in knowing that they won't be saddled with the burden of repaying long-term debt through borrowing. We would further save taxpayers' money if the more affordable Salt Lake Boulevard alignment, which has a solid ridership base, is selected.

The City Council and administration need to keep taxpayers' best interests in mind for this multi-billion-dollar project. A successful project is one that will not only encourage commuters to leave their cars at home but also won't bankrupt our taxpayers' pocketbooks.

Romy M. Cachola is the councilman for Council District VII (Salt Lake, Halawa, Mapunapuna). He wrote this commentary for The Advertiser.

Transportation Committee

9 am

Presentation on the Evaluation and Selection Report by the Fixed Guideway Technology & Evaluation Panel.

Councilmember Todd Apo: You mentioned a potential problem with Dillingham and the existing powerlines.

Ron Tober: That's correct.

Apo: So it's integrating an elevated system with existing powerlines?

Tober: I think it can be dealt with. It'll be a challenge for the engineers to come up with a way to do that.

Apo: So has nothing to do with the actual system. It's just a matter of what's there already and how to deal with it?

Tober: Correct.

Apo: the Salt Lake vs. airport route—I've been an advocate to get it back to the airport and Pearl Harbor. One way is to run lines through both of them. The other thing I've thrown out before is to run a line through one side and take a spur to the other side. Given what you've seen from the commercial (airport) and residential (Salt Lake) standpoints, if we look at doing it with a single line and a spur, any opinion on which one would make the most sense?

Tober: Meaning which direction the spur should come from?

Apo: I'm asking whether we should run a line through Salt Lake and take a spur through Pearl Harbor and the airport, or run the line through Pearl Harbor and the airport and take a spur through Salt Lake?

Tober: I think the day-to-day traffic, the potential that you have on Salt Lake, is greater. The airport has times of the day when you have lots of people coming in and when you have some dead periods of time at the airport. That's from my own personal experience. I came in yesterday afternoon at 5 pm and took a 5 pm bus from the airport to the hotel. Very little traffic going on at that point in time. So the daily ridership potential on Salt Lake is probably greater than at the airport. That's based in part on my own experience in running rail transit, which we did in Cleveland. So the spur probably is better taken to the airport. For when you have planes coming in and tourists and workers out there. Probably it's better coming off of the Waikiki-Downtown-Honolulu end of things, rather than the Kapiolani end of things.

Apo: Let me throw out a factor that you're not aware of.—the employment factor. If it was just the airport, I'd tend to agree with you pretty easily. But when you throw in the employment factor for Pearl Harbor, which is a major employer in that area, as well as the industrial area around the airport. We'd probably need to show you the numbers. You can do the evaluation. The significant daily peak traffic worker transportation that's needed through there. Would that affect your analysis?

Tober: It probably would. I haven't had many real experiences with Pearl and looking at that area. That very well could be a major factor in terms of where the greatest all-day ridership potential might be. That's something that I'm not aware of right now.

(1:52)

COMMENTS OF MARK TAYLOR ON
DRAFT ENVIRONMENTAL IMPACT STATEMENT
FOR HONOLULU RAIL TRANSIT PROJECT

December 9, 2008

Thank you for the opportunity to submit comments on the Draft EIS for the Honolulu Rail Transit Project. My name is Mark Taylor. I reside in the Salt Lake neighborhood of Honolulu and served from 1993 to 2007 as an elected member of the Aliamanu-Salt Lake-Foster Village Neighborhood Board.

I have three comments on the Draft EIS.

First, the opening paragraph of section 6.4.2 of the Draft EIS (entitled "Project Cash Flow") states that both the "Salt Lake and Airport Alternatives would be financially feasible." Yet this same paragraph states that the Airport Alternative would require \$1.4 billion in Federal funding, and that the FTA "has not been approached to consider the \$1.4 billion for the Airport Alternative."

Given that there is no indication that Federal funding at the \$1.4 billion level will even be considered by the FTA, how can the Draft EIS state conclusively that the Airport Alternative is "financially feasible"? Unless and until the FTA indicates in writing that it is willing to consider providing \$1.4 billion, the EIS should state that the Airport Alternative has not been shown to be financially feasible. To do otherwise is misleading and invites a fiscally imprudent policy decision on the initial transit alignment.

Second, Table 7-2 of the Draft EIS (entitled "Effectiveness of Alternatives in Improving Corridor Mobility") contains figures that appear questionable, if not incorrect.

- The table indicates that Transit Ridership in 2030 will be only 1% higher for the Airport Alternative than for the Salt Lake Alternative. Yet, it also indicates that Transit User Benefits will be 5% higher for the Airport Alternative than for the Salt Lake Alternative. This significant inconsistency should be either corrected or fully explained.
- The Airport Alternative's purported 5% advantage in Transit User Benefits equates to reduced travel time for all transit users of 800,000 hours per year compared to the Salt Lake Alternative. Yet, the Draft EIS indicates the Airport rail route actually takes longer to traverse than the Salt Lake rail route. In fact, assuming half of projected daily rail trips in 2030 include the portion of the system between Aloha Stadium and Middle Street, the Airport Alternative will increase travel time for rail users by over 500,000 hours per year¹. How can the Airport Alternative *decrease* travel time for *all* transit users by 800,000 hours per year when it *increases* travel time for *rail* transit users by 500,000 hours per year? Again, this significant inconsistency should be either corrected or fully explained.

Third, Table 7-7 of the Draft EIS (entitled "Cost-effectiveness of the Build Alternatives") indicates the Salt Lake Alternative is more cost-effective than the Airport Alternative, but only by a small margin. The figures in this table are derived by dividing the cost of the system under each build alternative by the number of hours of Transit User Benefits it produces. Therefore, if in fact there are any revisions to the Transit User Benefits in Table 7-2 in light of the discrepancies identified above, Table 7-7 should also be revised to reflect the impact on the relative cost-effectiveness of each build alternative.

Thank you again for the opportunity to comment.

¹ 90,000 projected daily trips multiplied by 1/2, multiplied by 2 minutes longer per trip, multiplied by 365 days per year, divided by 60 minutes per hour, equals 547,500 hours.

Council Chair Dela Cruz and Councilmembers,

CITY CLERK

HONOLULU, HAWAII

My name is Mark Taylor and I'm a seven-term member and past chair of the Aliamanu/Salt Lake/Foster Village Neighborhood Board. I grew up in the Salt Lake area, graduated from Moanalua High School and have owned a home in Salt Lake for the past twelve years.

As you've already heard in prior testimony, our Neighborhood Board has voted unanimously in favor of building a Honolulu rail transit system with an alignment that includes Salt Lake Boulevard. I'm here today to help explain why.

The purpose of rail transit is to move people. According to the City and County of Honolulu's online GIS system, there are about 50,000 people residing within a mile and a half of the Salt Lake transit station location proposed in the City Administration's Alternatives Analysis. In the Board's view, it would make no sense to construct a rail transit system that bypasses such a large concentration of potential riders (and Council constituents).

The major perceived drawback of a Salt Lake Boulevard alignment is that it would bypass Honolulu International Airport. However, this is less of a problem than it may appear, for a simple reason: air travelers carry luggage, and therefore are unlikely to use rail transit to go to and from the airport.

Other cities have realized this. In selecting a transit alignment, the Council should be aware that most transit systems built in the U.S. in the past 35 years DO NOT service the local airport. Of the 21 major mass transit and light rail systems launched in U.S. cities since 1970, only 7 connect directly to the airport (see attached table). And for the 7 that do have airport connections, in all cases the airport was not served when the system opened. On average, the airport connection was established 7 years after the system began operation.

In a couple of instances, Los Angeles and San Jose, the transit line runs fairly close to the airport, and there's a shuttle bus service between the closest transit station and the airport terminal. Such a solution could be adopted in Honolulu if the Council were to opt for a Salt Lake Boulevard transit alignment.

In conclusion, I urge the Council to make rail transit available to local taxpayers living in Salt Lake who have to commute back and forth to work every day, rather than to tourists exiting the airport who will wonder "what's that monorail thing?" as they peer out the window of their taxi or rental car.

This concludes my testimony. Mahalo for your attention.

**Subject: RESOLUTION 08-97 REVISIONS TO THE PUBLIC
 INFRASTRUCTURE MAP FOR THE PRIMARY URBAN CENTER
 DEVELOPMENT PLAN**

Dear Director Yoshioka,

Our company, Reit Management & Research LLC, is property manager for HRPT Properties Trust ("HRPT") and manages 150 acres of land in the Mapunapuna Industrial area that are owned by companies affiliated with HRPT.

The City Council is currently reviewing revisions to the Public Infrastructure Map for the Primary Urban Center for the Honolulu High Capacity Transit Corridor Project. We are requesting that the PIM amendments include a symbol for a transit station at Mapunapuna.

Mapunapuna is already a major job center, and a transit station would be a significant benefit to the thousands of people who work and do business in and around Mapunapuna. A Mapunapuna transit station could also capture ridership from nearby residential communities in Moanalua, Tripler, and eastern Salt Lake. Furthermore, with its proximity to Downtown and its location along the transit corridor between Kapolei and especially urban Honolulu, Mapunapuna has the potential to be redeveloped to include more usable industrial space and other office/commercial and residential land uses. In short, this area has great Transit Oriented Development (TOD) potential.

Office Locations:

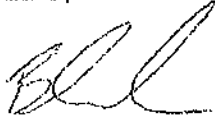

Albuquerque, NM • Austin, TX • Kansas City, KS • Los Angeles, CA • Minneapolis, MN • Newton, MA • Philadelphia, PA • San Diego, CA • Syracuse, NY • Washington, DC

Redevelopment of this area and an additional transit stop at Mapunapuna will significantly enhance transit ridership along this corridor.

Reit Management and HRPT are willing to assist the City and County of Honolulu to help realize the development of a transit stop at Mapunapuna.

We look forward to working with you. Please don't hesitate to contact me at 599-5800.

Mahalo,

Bradford Leach

February 2, 2009

Mr. Wayne Yoshioka, Director
Department of Transportation Services
650 South King Street, 3rd Floor
Honolulu, HI 96813

Dear Mr. *Wayne* Yoshioka:

Re: Comments Relating to the Draft Environmental Impact Statement (DEIS) for the Honolulu Rail Transit Project

Thank you for this opportunity to submit final comments on the aforementioned project on behalf of residents in my district.

My concerns include the following:

- I. Ridership Estimates
- II. First Segment from East Kapolei to Waipahu
- III. Alternative First Segment: Downtown to Kapolei
- IV. General Excise Tax Collection
- V. Construction Costs
- VI. Operation & Maintenance Costs
- VII. Transit-Oriented Development
- VIII. Other Concerns and Questions

I. RIDERSHIP ESTIMATES

The DEIS lists ridership for the airport alignment as 95,310 daily passengers by the Year 2030 and 87,570 daily passengers by 2030 for the Salt Lake Boulevard alignment (SLB). I am skeptical of both ridership projections, in view of the following:

A. Airport Visitors

Based on data from the Hawaii Tourism Authority, Hawaii has about 7 million mainland and international visitors each year. Of this amount, 71 percent go through Honolulu International

DIRECTOR'S OFFICE
DEPT. OF
TRANSPORTATION SERVICES

09 FEB 4 9 20

RECEIVED

Airport, while the remaining 29 percent go to the neighbor islands. Asian visitors, the majority of whom are Japanese, total approximately 2 million. Japanese visitors usually come in a tour group with a tour package, which includes airline, hotel and ground transportation, and attractions. They usually arrive in the morning. However, because check-in time at the hotel is in the afternoon, ground transportation is waiting for them to take them shopping or elsewhere until check-in. Therefore, they will not be likely to take the rail. Do ridership projections for the airport alignment take into consideration these figures?

There are other factors that may discourage visitors from riding the rail. First, the proposed passenger station on Aolele Street is too far away from the passenger terminals.

- What is the distance from the passenger station on Aolele Street to the domestic and international terminals? To the interisland terminal?
- When passengers disembark at the station on Aolele Street, how will they get to both passenger terminals? Will a walkway be built? If so, what's the estimated cost and who will be responsible for the costs of building and maintaining the walkway?

A second major factor that may discourage visitors from riding rail is that the rail line does not extend into Waikiki where a large majority of our visitors are staying. Having mentioned the above disincentives, please provide a breakdown in the number of visitors who are expected to ride the airport alignment. Will there be luggage compartments on the train to accommodate our visitors? Ron Tober, chair of the panel of experts who selected the technology for the rail system, noted several dead periods while personally observing passenger traffic at the airport. Mr. Tober also suggested that the Salt Lake alignment would provide for a better ridership base than the airport. To get a better gauge on visitor numbers, what are the frequencies for visitor arrivals?

B. Airport Employees

As for airport employees, there are about 727 state and 15,000 private sector workers at the airport. There are several factors that may discourage employees from riding the rail, foremost of which are the 7,000-plus parking stalls at the airport, which includes the State's new \$43 million, 8-level 1,800-stall parking structure, which was built to accommodate future increases in the number of people who use the airport. A good number of State and private sector employees have designated parking stalls at the airport. Furthermore, for security reasons, airlines' crewmembers have their own shuttle service to and from their hotels and back. In view of this, please provide a breakdown in the number of airport employees who are expected to ride the airport alignment.

C. Pearl Harbor and Hickam Employees

There are approximately 12,500 civilian employees combined at Pearl Harbor and Hickam. Please note that firstly, these civilian employees already enjoy the convenience of free parking on base. Secondly, the passenger station at Radford Drive is located outside of the base on Kanehamcha Highway. To get to their workplace, employees must walk over a mile onto the base. Thirdly, most military personnel either live on base or within a short driving distance. Those who live further away understandably prefer to drive for convenience and emergency purposes. Having mentioned the above, please provide a breakdown in the number of civilian employees, contractors and military personnel who are expected to ride the airport alignment. Do the ridership numbers take into account these factors?

D. Population Estimates From Aloha Stadium to Middle Street

The DEIS on page 4-39 lists the population in the Year 2000 for the transit corridor at about 552,100 and the population of the Aliamanu-Salt Lake area at more than 54,000. If residents in Foster Village and lower Halawa are included, along with several new condo and other housing development makai of Salt Lake Boulevard, the population count will surely be higher—possibly between 60,000 – 70,000. If you add shoppers and employees in the Mapunapuna industrial area, at Salt Lake Shopping Center, Stadium Mall, KMart and the new Target department store (which opens in March 2009), the numbers are quite substantial and add to the daily ridership count.

With the above facts stated, I strongly believe that the over 60,000 residents who live along the 4-mile stretch of Salt Lake Boulevard and those who work and shop in the area—including the new Target store which will open by March 2009—represent a solid and dependable ridership base. These are locals who will ride the rail despite a bad economy.

To get a more accurate picture of population and ridership levels for the Salt Lake Boulevard and airport alignments, please provide answers to the following:

- What is the projected population count for both alignments only for that portion of the MOS between the Middle Street Transit Center and the Aloha Stadium by the Year 2018 and the Year 2030?
- Out of the 95,310 estimated daily riders for the airport alignment, how many passenger boardings are attributed only for that portion between Aloha Stadium and the Middle Street Transit Center when the MOS is completed by 2018? By 2030? Please detail the methods used to arrive at those figures.
- Out of the 87,570 estimated daily riders for the Salt Lake Boulevard alignment, how many passenger boardings are attributed only for that portion between Aloha Stadium and the Middle Street Transit Center when the MOS is completed by 2018? By 2030? Please detail the methods used to arrive at those figures.

II. FIRST SEGMENT FROM EAST KAPOLEI TO WAIPAHU

I question the rationale for building the first segment from East Kapolei to Waipahu, particularly when it will do little to relieve traffic since gridlock begins where H-1 and H-2 merge. I am convinced that this MOS first segment: 1) will fall woefully short of bringing most commuters to their intended destination of urban Honolulu and beyond; and 2) will cost taxpayers more money, and this scenario will continue until you reach Downtown.

In view of the above, when completed, 1) Who will ride this first segment? 2) What is the estimated ridership for the first segment? 3) What's the estimated funding to complete the first segment from East Kapolei to Waipahu? 4) What is your estimated operation & maintenance costs? 5) What is the estimated taxpayer subsidy for operation & maintenance costs for this first segment? Please justify your numbers.

III. ALTERNATIVE FIRST SEGMENT: DOWNTOWN TO KAPOLEI

Ron Tober, chair of the technology selection panel, in testimony before the Council's transportation committee on February 22, 2008, stated his preference to begin the project from

Downtown towards Kapolei rather than from Kapolei towards Downtown. I support Tober's preference.

It seems that finding a suitable baseyard has been a major sticking point for the administration. Has the City considered construction of a subsidiary or layover baseyard? Can the City later build a permanent baseyard adjacent to the Leeward Community College when the transit line is extended to Waipahu and beyond?

Since the City already owns the Middle Street Transit Center, could a portion be used as a subsidiary or layover baseyard? There are several reasons for this:

- The transit line will connect to the Middle Street property.
- A subsidiary or layover baseyard could serve as a back-up in case operations at the permanent backyard are halted for any reason.
- The full use of the 100 rail cars for the entire 20-mile long first segment as stated in the DEIS will not be required, since the initial segment of the MOS may only be between 6-8 miles long and not the full 20 miles.
- The design and planning for a subsidiary or layover baseyard can still be incorporated into the overall design and plans for the Middle Street property.

Could a subsidiary or layover baseyard for rail double up to potentially service (repair, maintain and clean) existing City buses and handivans? How many rail cars are needed to service the approximately 6-8 mile long initial segment of the MOS?

IV. GENERAL EXCISE TAX COLLECTION

According to an article in the December 11, 2008, edition of the Honolulu Advertiser, the latest transit tax collection numbers are down from last year due to the bad economy. For the first 20 months of the tax collection, the total amount is \$246 million, or \$12.3 million per month. Over the 15-year period of General Excise Tax (GET) collection, or 180 months, the City can expect a total of \$2.2 billion in GET revenues, which is way short of the \$4.054 billion projected in the DEIS. So far, things aren't working out as planned. According to a Honolulu Advertiser article dated January 27, 2009, GET collections for the first half of Fiscal Year 2009 were down nearly 6 percent to \$79.4 million (not including the 10 percent collected by the State).

Page 6-4 of the DEIS states that general excise tax surcharge revenues are estimated to be \$4.054 billion (YOE \$) through FY 2023. For purposes of clarity, please note that Act 247 authorizing the half percent GET collection will be repealed on December 31, 2022—not through Fiscal Year 2023. What are you basing the amount (\$4.054 billion) on? Please provide yearly projections for the half percent GET collection and justifications for those projections.

Currently, debate on the cost of the 20-mile MOS in today's dollars, ranges from a low of \$3.7 billion to about \$5.3 billion. The administration maintains that the estimated amount of \$3.7 billion, which includes a contingency of \$1 billion, is enough to complete the MOS. With declining GET collection and added cost (airport alignment) comes the question: in case of a deficit in GET collection, how will the City make up the difference?

V. CONSTRUCTION COSTS

The airport route costs \$220 million more than the Salt Lake Boulevard (SLB) route plus \$75M for double decking the Lagoon Drive rail station. For the sake of our taxpayers, we need to carefully analyze whether funding estimates are what we can truly afford. If not, we run the risk of repeating the experiences of cities such as Denver, Colorado. Extending Denver's FasTracks system, which was estimated in 2002 to cost \$4.7 billion, now costs \$7.9 billion. Denver officials are now contemplating whether to raise their sales tax to fund this increase. In light of this, how confident are the administration and city consultants that the \$3.7 billion price tag, which includes a \$1 billion contingency, is more than enough to complete the MOS? Would the administration be willing to allow the City Council to cap MOS funding to no more than \$3.7 billion? If not, please explain.

Per the DEIS, we are unsure of the amount of funding that we will receive from the federal government. To save taxpayer money and avoid cost overruns & delays, would the administration be willing to obtain a Full Funding Grant Agreement (FFGA) and/or a Letter of No Prejudice (LNP) before construction? If not, please explain.

VI. OPERATION AND MAINTENANCE COSTS

The current policy on fare box revenue can cover only up to 30 percent of TheBus operation and maintenance costs. So currently taxpayer operation and maintenance subsidy is about \$130 million. What are the estimated operation and maintenance costs for the MOS? Taking into consideration that the \$2 fare for rail can be used to transfer onto TheBus or TheBoat as long as it's going one way, what is the estimated taxpayer subsidy?

In my research, New York City's Metropolitan Transportation Authority (MTA) is facing a huge \$1.2 billion budget deficit and is proposing to drastically cut service on its subways, buses and commuter railroads. According to the November 20, 2008 edition of the New York Times, the MTA is also proposing to raise fares by 23 percent in 2009 and by another 5 percent hike in 2011. Some riders would be hit harder than others. For example, fares for the Long Island bus would increase by 43 percent. All of these proposals have angered passengers. Under the 23 percent fare hike, the public's share to operate and maintain the subway would increase to 83 percent, while the cost of operating local buses borne by riders would rise to 48 percent. Will the city resort to fare increase or raising property tax to fund operation and maintenance shortfalls of our multi-modal transit system? What measures are needed to prevent large increases in operation & maintenance costs and large fare increases—similar to the experiences of other cities?

VII. TRANSIT ORIENTED DEVELOPMENT (TOD)

The SLB alignment extends through Mapunapuna which encompasses 150 acres and is owned by a single landowner who is willing to donate land and help build a passenger station. Adding a station in Mapunapuna would increase ridership, save taxpayer money and provide greater opportunities for affordable housing and potential TOD development. There are other TOD opportunities at Stadium Mall, K-Mart across Stadium Mall, the former Costco site (now Target department store), and the Salt Lake Shopping Center.

- Where are the TOD potentials along the Airport alignment, and how do they compare to the potential sites along the Salt Lake alignment discussed above?

- Why won't the City exhaust all efforts to include a transit station in the Mapunapuna industrial area, since the landowner is willing to assist with the construction of a transit station, which would reduce costs for the City and taxpayers?
- How far along will TOD be in the airport area by the time the MOS is completed in 2018? And 2030?

VI. OTHER CONCERNS AND QUESTIONS

- Page 4-88 of the DEIS says that the guideway could come within 10 feet of some facades along Dillingham Boulevard and would block views from the upper stories of mixed-use buildings Koko Head of Kalihi Street. What will be the impacts to residents of condominiums across Dillingham Shopping Plaza from McNeil Street to Waiakamilo Street?
- Table 3-21 on page 3-39 of the DEIS states that 10 feet of additional right-of-way will be acquired on the makai side of Dillingham, from Puuhale to the Costco Driveway, due to the effects of column placements. Will businesses and residential homes in the area be affected? If so, which ones? Will this require sidewalks to be moved back or sidewalk space to be smaller?

I hope the concerns I have expressed will merit your consideration. On behalf of my constituents, I would like to thank you for the opportunity to express our concerns on this very important transportation project for the residents and taxpayers of Oahu.

Very truly yours,

The Honorable Romy M. Cachola
Honolulu City Council
530 South King Street, Room 202
Honolulu, Hawaii 96813-3065

Dear Councilmember Cachola:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

This first section will address comments received in the January 14, 2009 letter:

1. *The General Excise and Use Tax (GET) forecast presented in the Final EIS takes the current economic downturn into account, including lower projections of tourism over the next several years, and slower growth projections in services, contracting, and rentals. The forecast assumes that GET surcharge revenues will grow from current levels as Oahu's population and economic activity increases, and as a function of inflation over the period. The financial plan is a dynamic document that will be updated as conditions warrant. DTS will continue to monitor and update the revenue forecasts and refine the financial plan as the Project proceeds through FTA's New Starts process. As stated in Chapter 6 of the Final EIS, GET collections will raise \$3.5 billion by 2022.*

In addition, the Federal New Starts program is expected to contribute \$1.55 billion and is subject to Congressional approval. The level of Federal funding described in the Final EIS is based on discussions with FTA about a reasonable level of support. While indications are positive, an official FTA commitment cannot be made until Congress acts to approve the Project's appropriation in a Full Funding Grant Agreement. Section 6.6 of the Final EIS describes the risks and uncertainties associated with project funding; however, 30 percent of the Project budget is contingency for just such eventualities.

Section 6.3 of the Final EIS describes the funding sources anticipated to be used to pay for the capital cost of the Project and the City's overall public transportation system. Capital costs of the Project, including finance charges, are expected to be fully paid for by a combination of FTA Section 5309 New Starts Funds and FTA Section 5307 Funds from the Federal government and the GET surcharge levied from 2007 through 2022.

2. As noted in Table 6-1 of the Draft EIS, the total cost of the Airport Alternative, including finance charges, is estimated to be \$226 million more than the Salt Lake Alternative, in FY 2008 dollars. The complete station costs for both alternatives are included in this differential cost (\$297 million for the Airport Alternative, \$255 million for the Salt Lake Alternative).

As shown on page 37 of 38 (Drawing Number RP029) in Appendix A: Conceptual Alignment Plans and Profiles of the Draft EIS, a side platform station without concourse is proposed for the Lagoon Drive Station, which is one of the simplest station designs for the Project. As mentioned above, all costs associated with station construction are included in the costs presented in the Draft and Final EIS documents.

While each of the alternatives includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative. The identification of the Airport Alternative as the Preferred Alternative was made by the City to comply with the FTA's NEPA regulations that state the Final EIS should identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection is detailed in Section 2.4 of the Final EIS and was based on consideration of the benefits of each alternative, public input on the Draft EIS, and City Council Resolution 08-261 identifying the Airport Alternative as the Project. Further, FTA's NEPA regulations for projects proposed to be funded with major capital investment funds, the level of detail necessarily increases between the Draft EIS and the Final EIS through preliminary engineering work (23 CFR 771.123 (j)).

The station at Honolulu International Airport is about 800 feet from the Interisland Terminal and about 600 feet from the Overseas Terminal. Pedestrian paths will be constructed by the Project that will connect the the rail station to the Overseas and Interisland Terminals. The cost of the pedestrian paths has not been isolated from the overall cost of the station, and maintenance agreements have not yet been completed. In addition, with the Project, bus service will be enhanced between the fixed guideway terminus at Ala Moana Center and Waikiki.

As shown in Table 6-3 of the Draft EIS the year 2030 annual operating and maintenance cost for the rail line is \$5 million more for the Airport Alternative than for the Salt Lake Alternative, in current year dollars. Section 6.4 of the Final EIS describes the funding sources to pay for ongoing operations and maintenance costs associated with maintaining the resulting transit system in a state of good repair. Operations and maintenance costs will be paid for from the same sources currently used for TheBus: Federal funding, fare revenues, and subsidies from the City's General and Highway Funds. Funding for guideway maintenance will be covered in the City's annual budgeting process and amounts to between 2 and 3 percent of the City's annual operating budget.

3. Based on the land use information in the travel model, the Salt Lake Alignment shows a population of 45,000 in 2030 and employment of 20,000. The Airport Alignment shows 21,000 population and 55,000 employees.

Figure 3-12 of the Draft EIS shows daily boardings and alightings for each station along the Salt Lake and Airport Alternatives. In 2030, there would be 16,140 daily boardings along the Airport alignment (Aloha Stadium, Pearl Harbor Naval Base, Airport, Lagoon Drive, and Middle Street Stations) and 10,170 daily boardings along the Salt Lake Boulevard alignment (Aloha Stadium, Ala Lilikoi, and Middle Street Stations).

Ridership projections for the forecast year of 2030 have been developed using the travel demand model, which was calibrated against collected traffic and transit ridership information and then validated against current counts to be sure it properly represents travel activity in the transportation system (Section 3.2.1 of the Final EIS). An on-board transit survey was completed in December 2005 and January 2006, and the latest socioeconomic information available as of October 2008 was incorporated. Traffic counts were collected in 2005, 2007, and 2008. . The model is based upon a set of realistic input assumptions regarding land use and demographic changes between now and 2030 and expected transportation levels-of-service on both the highway and public transit systems and is consistent with consultation with FTA.

Regarding the information provided in Attachment E, there is, at this point, no commitment from the FTA for a specific amount of federal funding. The \$1.2 billion has been discussed in the past and now \$1.55 billion has been identified in the Final EIS and reflected in FTA's approval for the Project to enter Preliminary Engineering. Neither has raised major concerns from the Federal government. All projects identify an anticipated federal amount in their pro forma cost analyses. The FTA will only commit the funding once the full environmental and New Starts processes have been completed. In the Honolulu case, because the percentage of local matching funds (75 percent or more) is so high compared to the average of less than 50 percent, the additional \$200 million is still well within a reasonable request.

Total transit ridership is not the same as user benefits. The user benefit measure, in this case, is the time savings that will accrue to users from the implementation of the fixed guideway and the changes that support its operation. Much of the bus system will remain the same or similar to now so it will have little or no effect on user benefits related to the guideway project. In other words, the 1 percent

comparison in the comment includes much more than the effect of the fixed guideway being evaluated in the Draft and Final EIS documents. The difference between Salt Lake and Airport alignments shows that more people (about 7,000 or 8 percent) will ride the guideway on the Airport alignment and save substantially more time than on the Salt Lake alignment. This time savings, as a measure of the contribution of the fixed guideway, is the major reason for the user benefit discrepancy.

The time analysis in the comment assumes all trips travel the entire length of the Salt Lake or Airport alignments. That is not the case. The main reason the Airport option shows an improvement is that there are many trips that are destined to Honolulu International Airport or Pearl Harbor/Hickam for work. The benefit comes from providing better access to the large number of people who cannot easily reach those destinations along the Salt Lake alignment. By contrast, the Salt Lake alignment has fewer trips starting or destined to the area. The fact that there are so many people with trips beginning or ending along the Airport alignment means all those people would benefit from much shorter travel times.

User benefits are calculated not only for the trips using the guideway but also for the overall transportation system as a result of the implementation of the guideway. In addition, the assumptions used in the calculations contained in the comment do not fully account for the true differences between the alternatives, so the conclusion in the comment is inaccurate.

Regarding your comment on visitor ridership, the number of visitors who will use the fixed guideway is relatively small compared to other users. For example, approximately 9,900 visitors will use the fixed guideway daily, of which about 1,800 are traveling to or from the Airport. There will be space available for luggage, but the exact design of the vehicle is not yet known. It is worth noting that the main reason for an Airport alignment is more closely associated with the very high employment numbers along that route than with visitors. The ridership at the Airport accounts for travel activity at the Airport but not by specific country of origin or purpose other than "visitor."

Regarding service to the airport, most of the systems listed in the table in Attachment F did not initially include service to the area airport because it was not in the middle of the alignment, as is the case in Honolulu.

Regarding ridership at Pearl Harbor and Hickam, travel forecasting does not differentiate among the types of employees who will use the fixed guideway. It identifies the population and employees (and other characteristics) in each zone from applicable data sources (e.g., U.S. Census) and determines trips that will use the system based on the system's ability to effectively serve the user's travel needs compared to other options available (e.g., car, bus, etc.). From the location, a sense of the type of employee in the zone of interest (e.g., military or military support) can be estimated, but it is not possible to break it down to military versus contractor versus civilian. The procedure used is in accordance with guidance issued by FTA.

available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- Match the anticipated schedule for right-of-way acquisition and utility relocations.
- Reduce the time that each area will experience traffic and community disturbances.
- Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.
- Match the rate of construction to what can be maintained with local workforce and available financial resources.
- Balance expenditure of funds to minimize borrowing.

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

The commenter's proposed single-contract delivery method does not inherently reduce financial risk to the City because any such contract would still contain limits on risk accepted by the contractor. Additionally, any risk transferred from the City to the contractor will be paid for by the City through a higher initial contract price. The City may select the level of risk to assume or to transfer to the contractor through any contracting method.

This second section will address comments in your February 2, 2009 letter in the same manner as submitted. Some responses in the first section are applicable to this letter as well:

I. Chapter 3 - Transportation

The ridership at the Airport accounts for travel activity at the Airport but not by specific country of origin or purpose other than "visitor." The Airport Alternative primarily serves major employment destinations. Visitor use accounts for a smaller percentage of ridership on this alternative.

The station is about 800 feet from the Interisland Terminal and about 600 feet from the Overseas Terminal. Pedestrian paths will be constructed by the Project that will connect the rail station to reach the Overseas and Interisland Terminals. The cost of the pedestrian paths has not been isolated from the overall cost of the station, and maintenance agreements have not yet been decided.

The number of visitors who will use the fixed guideway is relatively small compared to other users. For example, approximately 9,900 visitors will use the fixed guideway daily, of which about 1,800 are traveling to or from the Airport. There will be space available for luggage, but the exact design of the vehicle is not yet known. It is worth noting that the main reason for an Airport alignment is more closely associated with the very high employment numbers along that route than with visitors.

While travel-demand models do not distinguish among employees within a transportation analysis zone, the number of boardings and alightings at the Airport is a reasonable indication of the level of activity anticipated. As noted in Figure 3-10 of the Final EIS, about 6,000 people will use the Airport station each day, including visitor trips.

Travel forecasting does not differentiate among the types of employees who will use the fixed guideway. It identifies the population and employees (and other characteristics) in each zone from applicable data sources (e.g., U.S. Census) and determines trips that will use the system based on the system's ability to effectively serve the user's travel needs compared to other options available (e.g., car, bus, etc.). From the location, a sense of the type of employee in the zone of interest (e.g., military or military support) can be estimated, but it is not possible to break it down to military versus contractor versus civilian. This level of detail is difficult to develop at a usable level for forecasting trips. The procedure used is in accordance with consultation with FTA.

II. Chapter 2 – Alternatives Considered

Much of this was addressed in the response to the January 14, 2010 letter. In addition, the first segment is not expected to generate significant ridership. It will primarily be used to test equipment and operations before providing service to larger numbers of passengers as the guideway extends Diamond Head toward Downtown. Only a small number of cars (between two and four) will be needed to serve the first segment when it opens in 2014. The system will not achieve its full capacity and functionality until the line is opened to Downtown, although each segment will be opened as it is completed. As the segments are opened, additional vehicles will be needed as ridership grows.

The engineer's estimate for the first construction segment has not yet been completed. It will be funded primarily with local funds as part of the larger 20-mile project.

The estimated operating and maintenance cost for the fixed guideway is \$77 million a year for the entire 20-mile system. This is addressed in Chapter 6 of the Final EIS along with the basis for the numbers. There are no operating cost figures yet for the first segment as the Project in the EIS is defined as the entire length of the corridor. Operating costs for this segment will be relatively low compared to the complete operating costs.

As noted in Chapter 6, City policy states that the transit system as a whole must recover between 27 and 33 percent of operations costs from farebox revenue. Assuming

a 30-percent recovery from fares, that will generate about \$23 million a year. The remainder, the subsidy required for the full fixed guideway system or about \$54 million, will be budgeted for in the annual City budgeting process as is currently done for TheBus. The subsidy for the first segment between East Kapolei and Waipahu is not yet known, but will depend on ridership levels in the overall transit system.

No location has been identified closer to Downtown with sufficient available property to construct a maintenance and storage facility, either temporary or permanent. In addition, available property at Middle Street is not sufficient to support the vehicle fleet required in the year of opening for the Project. If a larger location were identified than those described in the Draft EIS, then it could be used to service both rail and bus vehicles. No such site has been identified.

The exact number of vehicles needed for the first segment will be determined with the Core Systems contractor, but it is estimated that between two and four vehicles will be needed.

III. Chapter 6 – Cost and Financial Analysis

Cash flow tables in support of the Draft EIS provide a year-by-year forecast of the General Excise and Use Tax (GET) surcharge. This information will be updated periodically as conditions warrant. An updated version of the cash flow information is part of the supporting material in the Final EIS. Chapter 6 of the Final EIS describes the financial resources anticipated to pay for ongoing operating and maintenance costs. Operating and maintenance costs will be paid for from the same sources currently used for TheBus—Federal funding, fare revenues, and City revenues from the General and Highway Funds. It is anticipated that with an integrated bus and rail system in place, a slightly higher percentage of the City's operating budget will be used for transit than is currently the case.

Section 6.3 of the Final EIS describes the funding sources anticipated to be used to pay for the capital costs of the Project and considers the current economic downturn. Capital costs of the Project, including finance charges, are expected to be fully paid for by a combination of FTA Section 5309 New Starts Funds and FTA Section 5307 Funds from the Federal government as well as revenues from the County GET surcharge levied from 2007 through 2022. Section 6.6 of the Final EIS discusses other sources of revenue that could be used if needed.

As discussed previously under Section II of your letter, the estimated 2030 operating and maintenance cost for the Project with the Airport Alternative is about \$77 million (2009 dollars) as noted in Table 6-3 of the Final EIS. Fixed guideway operation costs will represent between 2 and 3 percent of the City's annual operating budget.

IV. Chapter 4 – Environmental Analysis, Consequences, and Mitigation (Section 4.18)

Table 6-1 of the Draft EIS shows an estimated cost for the Airport Alternative of \$5.4 billion, including finance charges. Given this cost estimate, it is unlikely that the

Project can be completed for \$3.7 billion. The \$3.7 billion is also a 2006 number, and it is unrealistic to “cap” a cost estimate on a project that will naturally grow over time because of inflation. Furthermore, while we do not anticipate a shortfall, there needs to be some flexibility in the number to account for the ups and downs in the economy over time.

A Letter of No Prejudice (LNP) may be sought soon to take full advantage of local match funding. As per FTA policy, a Full Funding Grant Agreement (FFGA) cannot be requested until the New Starts process of design has been completed. Because the FFGA is anticipated in 2011, a delay in construction to wait for the approval of the FFGA would not save money. Instead, it would be more expensive because it would introduce a substantial inflation cost.

V. Other

The City's fare policy is to recover between 27 and 33 percent of operating costs from fares. Assuming continuation of that policy, the City will raise fares to maintain the required percentage of costs. The other 70 percent or so of the costs is the subsidy of the transit system and will be handled during the City's annual budgeting process. Operating and maintenance costs will be paid for from the same sources currently used for TheBus: Federal funding, fare revenues, and a City subsidy from the General and Highway Funds. This is discussed in Chapter 6 of the Final EIS. The operating costs for the fixed guideway system will be about 25 percent of the overall annual City transit budget. Should costs rise significantly, it will affect all aspects of the transit system, with rail representing only a part of the total.

Operating costs will rise over time. Good management of the system and a focus on cost control as the system and the service expands are necessary to prevent unjustifiable cost increases. These operating practices are not part of the Final EIS and will be determined by City Administration or another operating agency once the system is in operation.

As mentioned in Section 4.18.2 of the Draft EIS, TOD is expected to occur in project station areas as an indirect effect of the Project. The increased mobility and accessibility that the Project may provide will also increase the desirability and value of land near stations, thereby attracting new real estate investment nearby (in the form of TOD). Planning and zoning around station areas will be established and conducted by the City's Department of Planning and Permitting under a process in compliance with the City's new TOD ordinance.

The sidewalk will be moved marginally closer to the buildings on Dillingham Boulevard between McNeil Street and Waiakamilo Street. A median will be constructed in the center of Dillingham Boulevard, and the elevated guideway will be located in the median. The guideway will be about 30 feet above the center of Dillingham Boulevard as it passes by the Dillingham Shopping Plaza and McNeill Street. The view along Dillingham Boulevard is illustrated on Figure 4-28 (Viewpoint 12) of the Draft EIS. As

stated in Section 4.7.3 under the Kalihi to Ala Moana Center Landscape Unit heading, mauka and makai views will be obstructed from various points.

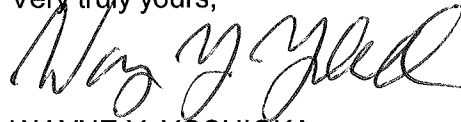

There are partial strip takes planned for the makai side of Dillingham Boulevard from Puuhale to the Costco Driveway. In addition there are full property takes planned for some parcels at the intersection of Mokauea Street and a few other locations between Puuhale Road and Kalihi Street. DTS has right-of-way staff that has met with and will continue to work with every impacted property owner concerning relocation and compensation.

Right-of-way impacts to businesses and residences were included in Appendix B of the Draft EIS and are included in Appendix C of the Final EIS. Sidewalks will be relocated as appropriate.

Table 3-25 in the Final EIS shows effects on bicycle and pedestrian facilities as a result of fixed guideway column placements. This table shows that sidewalks along Dillingham Boulevard will be rebuilt to a width of 6 to 8 feet (they are currently 4 to 7 feet wide).

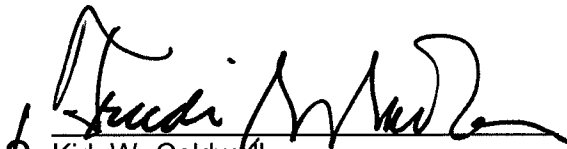

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

February 6, 2009

Mr. Wayne Y. Yoshioka
Department of Transportation Services
City and County of Honolulu
650 South King Street, 3rd Floor
Honolulu, HI 96813

Dear Mr. Yoshioka,

The Makiki Lower Punchbowl Tantalus Neighborhood Board No. 10 requests a Supplementary EIS (SEIS) to answer the following questions:

1. The DEIS does not answer how the rail effect the individual bus routes on the island. We are especially interested in bus routes 4, 17 and 18 and the buses along Beretania and King Streets. What will the existing routes throughout the island in the year 2020.
2. The latest population was not used in the DEIS that can out in January, 2008 from DBEDT which reduces the population figures that was used in the DEIS. The SEIS would have to show changes in the ridership and employment figures.
3. Although we have been in recession from December, 2007, the DEIS does not reflect that fact. Since this project will extend from 2009 to 2018, the SEIS should consider this recession effects with possible alternatives in financing and construction.
4. We are very concern that the project cost plus the contingency allocation does not take in consideration of this recession. This should be discussed in the SEIS.

Thank you for consideration.

Sincerely,

Charles Carole
Vice Chair

Mr. Charles Carole
Makiki/Lower Punchbowl/Tantalus,
Neighborhood Board No. 10
c/o Neighborhood Commission
530 South King Street, Room 406
Honolulu, Hawaii 96813

Dear Mr. Carole:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

To address your first concern, existing and future 2030 bus routes, including route numbers and frequencies, are provided as Appendix D in the Final EIS. The areas currently served by Routes 4, 17, and 18 will have either the same level of service or more frequent service in 2030 as they do today. Beretania and King Streets, between Downtown and East Honolulu, will have about the same level of service in 2030 as today.

For your second concern, the EIS uses the socio-economic data that was available from OahuMPO at the time that work on the EIS began, based on Department of Business, Economic Development & Tourism (DBEDT's) Population and Economic Projections for the State of Hawaii to 2030 prepared in August 2004. The 2030 forecast year used in the Draft and Final EISs is consistent with FTA guidance for New Starts projects.

Mr. Charles Carole
Page 2

DBEDT has prepared new forecasts at the County level, Population and Economic Projections for the State of Hawaii to 2035, which was issued in January 2008. For use in travel forecasting, these County-level forecasts must be disaggregated to the level of "Travel Analysis Zones" of which there are 764 on Oahu. At the time of publication of the Draft EIS, these zonal-level forecasts had not been prepared and accepted by OahuMPO. The January 2008 DBEDT forecasts have lower population projected than the August 2004 forecasts. Specifically the January 2008 population forecast for Oahu for 2030 is 3.3 percent lower than the August 2004 forecast. However, the 2030 employment forecast for Oahu from the January 2008 series is 5.8 percent higher than the August 2004 forecast. Thus, it is not clear what the effect on ridership projections would be of using the January 2008 forecast, since the higher employment forecast would likely result in more work trips that are attractively served by transit while the lower population forecast would like result in fewer trips for other purposes.

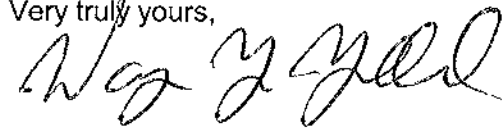

In response to your third concern, the financial plan for the Project is updated periodically to reflect changing economic conditions, including the economic downturn since the Draft EIS was released. Chapter 6 of the Final EIS reflects the latest information about the General Excise and Use Tax (GET) surcharge collections, escalation rates, costs, etc. The plan will be further updated as conditions warrant throughout the Project. Approximately 30 percent of the project budget is contingency.

Chapter 6 of the Final EIS describes the financial resources anticipated to be needed to pay for the capital costs of the Project and for ongoing operating and maintenance costs. Capital costs of the Project, including finance charges, are expected to be fully paid for by a combination of FTA Section 5309 New Starts Funds from the Federal government and the GET surcharge revenues collected from 2007 through 2022 on Oahu. Operating and maintenance costs will be paid for from the same sources currently used for TheBus, Federal funding, fare revenues, and City revenues from the General and Highway Funds. These funding assumptions are subject to a number of risks and uncertainties, as described in Section 6.6 of the Final EIS.

Special analyses have been undertaken to assess forecasts of GET and construction material escalation rates to gain a better understanding of the cost and revenue elements of the Project.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

SUBJECT: HONOLULU HIGH-CAPACITY TRANSIT CORRIDOR PROJECT
COMMENTS RECEIVED ON THE DRAFT ENVIRONMENTAL IMPACT
STATEMENT

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Construction drawings will be submitted to the Board of Water supply as part of the one-time review by City agencies. This will be done by the Final Design contractor, per construction segment, as designs become available. In addition, the City will coordinate the Project's design and construction schedule with the Board of Water Supply and will minimize impacts to Board of Water Supply customers, when feasible.

Wayne Hashiro, P.E., Director

SUBJECT: HONOLULU HIGH-CAPACITY TRANSIT CORRIDOR PROJECT
DRAFT ENVIRONMENTAL IMPACT STATEMENT COMMENTS

Thank you for the opportunity to review and comment on the Draft Environmental Impact Statement (DEIS) for the Honolulu High-Capacity Transit Corridor Project. We wish to provide the following comments regarding the design and construction of the guideway structure and appurtenances within the road right-of-way:

1. The DEIS has provided only limited discussion of the placement of the support columns and associated foundations for the elevated guideway structure and transit stations in relation to its impact to the existing utilities within the road right-of-way. In our experience in doing roadway projects, relocation of utilities has been a challenge because of the sheer number of existing utilities and the limited available space below the roadway pavement within the public right-of-way. These relocations would impact the construction related effect on traffic, and should be included in the discussion of Section 3.5.3, Construction-related Effects on Traffic, on page 3-46 of the DEIS, and also addressed in Section 3.5.7, Mitigation of Construction-related Effects, Maintenance of Traffic Plan, on page 3-48, including Table 3-26, Potential Peak-Period Temporary Lane Closures During Construction. In addition, with the aging existing infrastructure, oftentimes the construction activities, coupled with heavy equipment traversing over the construction area, has resulted in existing utilities breaking. In consideration of this, the project should consider the reconstruction of the roadway sections where the guideway support columns and station foundations are located within the City streets, and also the replacement of the appropriate utilities, so that it will not be necessary to come back in soon after with another road rehabilitation project that will involve additional cost and disruption to the traveling public and residents in the area.

2. The estimated cost for the utility relocations is not included as a separate item in the buildup of the transit system costs. What is this estimated amount, and how will the project proceed with the utility agreements with the various utility companies and agencies for the cost share for these relocations?

As the project moves forward, we would appreciate the close coordination by your project staff for transit project's design elements that may impact our department's CIP programs. If there are any questions, you may contact me at 768-8481.

MEMORANDUM

TO: CRAIG I. NISHIMURA, P.E., DIRECTOR
DEPARTMENT OF DESIGN AND CONSTRUCTION

FROM: WAYNE Y. YOSHIOKA, DIRECTOR

SUBJECT: HONOLULU HIGH-CAPACITY TRANSIT CORRIDOR PROJECT
COMMENTS RECEIVED ON THE DRAFT ENVIRONMENTAL IMPACT
STATEMENT

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As discussed in Section 4.18.2 of the Final EIS, "Communication and coordination have been initiated with the affected utility agencies and companies and will continue throughout design and construction. HDOT will be involved with utility coordination for utility work in state roadways and roadway rights-of-way. Design criteria will govern all new utility construction outside of buildings, as well as the support, maintenance, relocation, and restoration of utilities encountered or affected by project construction." Text has been added to Sections 3.5.3 and 3.5.5 of the Final EIS regarding the effects of utility relocation on traffic. As part of Design criteria, City agencies will be part of the "one-time" review of design and construction methods. This review will be conducted by the final design contractor, per construction segment. DTS will

Craig I. Nishimura, P.E., Director
Page 2

continue to coordinate with utilities, agencies and companies, regarding construction activities to minimize disruption of service.

The cost of utility relocations is included in the total capital estimate presented in Chapter 6 of the Final EIS and will be refined as design of the Project is completed.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

FROM: RUSSELL H. TAKARA, P.E., ACTING DIRECTOR

SUBJECT: HONOLULU HIGH-CAPACITY TRANSIT CORRIDOR PROJECT DRAFT ENVIRONMENTAL IMPACT STATEMENT/SECTION 4(F) EVALUATION

Thank you for giving us the opportunity to comment on the above Draft Environmental Impact Statement.

The Department of Design and Construction has additional comments as follows:

- At several places in the text of the DEIS there are references to Mother Waldron Park. For clarification, Mother Waldron *Neighborhood* Park includes both State- and City-owned lands, but is City-operated, and is the park's officially recognized name. The comfort station and other Art Deco-themed structures in this park are on the State Register of Historic Places. We would appreciate you making appropriate corrections and clarifications where needed.
- We suggest consideration be given to locating the proposed future McCully transit station to the *Diamond Head* side of the McCully Street-Kapi'olani Boulevard intersection. There is a unique opportunity at this location that land acquired to provide access to the transit station may also be secondarily used to serve the Ala Wai Community Park's users, as well as student, faculty, and staff of Tokai University. This would serve to locate the transit station more equi-distant between the Convention Center and Date Street transit stations and be more advantageous in general to the public, in our opinion. We also believe this station location would be more in line with the project objective stated in Section 4.4 of the DEIS of sharing benefits with other community services and government-owned facilities.

DEPARTMENT OF DESIGN AND CONSTRUCTION

FROM: WAYNE Y. YOSHIOKA, DIRECTOR

SUBJECT: HONOLULU HIGH-CAPACITY TRANSIT CORRIDOR PROJECT
COMMENTS RECEIVED ON THE DRAFT ENVIRONMENTAL IMPACT
STATEMENT

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

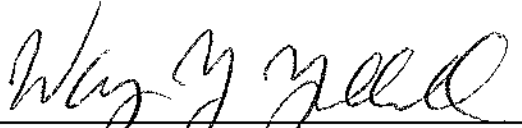

In response to your comment, references to the park name were changed to Mother Waldron Neighborhood Park in the Final EIS. The ownership of the park and the park's listing on the State Register of Historic Places have been changed in both Section 4.16 and Chapter 5 of the Final EIS.

Regarding the location of the future McCully Station, the Project has logical termini and independent utility from any extensions that may be constructed in the future. The future extensions to East Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS. The future extensions are not part of the Project; thus, they are not required to be evaluated under Chapter 343 of the Hawaii

Craig I. Nishimura
Page 2

Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation in the future, environmental analysis of the extensions (including associated station locations) and appropriate alternatives will be undertaken at that time.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Index	Section	Page No.	Comment	Response
1.	Chapter 343 Draft EIS Summary Sheet	N/A	No city permits?	
2.	Executive Summary	S-7	Water Resources - Need to mention BMPs to minimize pollution during construction.	
3.	Chapter 4	4-9	Environmental Effects, Proposed Mitigation Measures - Need to address BMPs during construction and spill prevention.	
4.	Chapter 4	4-125	Environmental consequences common to all alternatives - Wouldn't construction related pollution and contamination be less under the no-build alternative?	
5.	Chapter 4	4-127	Regulatory context for Surface and Marine Waters - Need to mention TMDLs for water quality limited segments listed under the State Section 303(d) list and corresponding waste load allocations to the City.	
6.	Chapter 4	4-128	Affected Environment, Surface and Marine Waters, Streams - Draft EIS mentions Section 303(d) list of impaired water bodies. Should mention TMDLs and waste load allocations to the City.	
7.	Chapter 4	4-132	Environmental Consequences, Surface and Marine Waters - EIS mentions typical post construction BMPs, but should also address BMPs during construction.	
8.	Chapter 4	4-162	Storm Water Quality - Need to address permanent post-construction BMPs.	

Index	Section	Page No.	Comment	Response
9.	Chapter 4	4-174	Water Resources – Need to correct statement that “Water resources have been degraded by past residential and farm development.” Much of the degradation is also due to industry and the military.	
10.	Chapter 4	4-176	List of Anticipated Permits – Might consider adding State NPDES industrial permits and hydrotesting permits; DPP building, grading, stockpiling, and construction dewatering permits; and ENV effluent discharge permits for hydrotesting.

SUBJECT: HONOLULU HIGH-CAPACITY TRANSIT CORRIDOR PROJECT
COMMENTS RECEIVED ON THE DRAFT ENVIRONMENTAL IMPACT
STATEMENT

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

1. The permit list for the Project has expanded and includes City permits. See Section 4.21 Anticipated Permits and Approvals in the Final EIS specifically Table 4-40.

2. and 3. Best Management Practices (BMPs) to manage construction stormwater and pollution have been added to Section 4.18 of the Final EIS. BMPs will be developed to mitigate potential impacts to streams and wetlands. Agency reviews conducted as part of the permit process will ensure that the permits identify proper control techniques to be implemented during construction. BMPs for in-water work and potential impacts of construction on streams and wetlands where no in-water work is required is discussed in the Final EIS Water Resources, Section 4.18.10.

4. *Construction-related impacts would be less under the No Build Alternative and are discussed in Section 4.17 of the Draft EIS.*

5. and 6. *The Hawaii Department of Health (HDOH) is in the process of determining Total Daily Maximum Loads (TMDLs) and waste load allocations for these waters. See Section 4.14.1, Background and Methodology, for summaries on water resources located in the study corridor that are regulated by a variety of Federal and State programs. The transit project will be coordinating with other City and County agencies to determine how to divide the City's allocations.*

7. *BMPs mitigation measures for construction stormwater were discussed in Section 4.17.8 Contaminated Media, Stormwater Quality, and Solid Waste of the Draft EIS and Section 4.18.10 Water Resources in the Final EIS.*

8. *Permanent Best Management Practices have been developed and are included in 4.14.3 of the Final EIS.*

9. *The sentence has been modified in Section 4.19.3 of the Final EIS to read "Water resources have been degraded by past residential, industrial, military and farm development."*

10. *As stated above, the list of permits needed for the Project has been revised in the Final EIS Section 4.21.*

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

In response to your letter of November 12, 2008, regarding the above-mentioned subject, the Honolulu Fire Department (HFD) reviewed the material provided and requires that the following be complied with:

1. Provide a fire apparatus access road for every facility, building, or portion of a building hereafter constructed or moved into or within the jurisdiction when any portion of the facility or any portion of an exterior wall of the first story of the building is located more than 150 feet (45 720 mm) from a fire apparatus access road as measured by an approved route around the exterior of the building or facility. (1997 Uniform Fire Code, Section 902.2.1.)
2. Provide a water supply, approved by the county, capable of supplying the required fire flow for fire protection to all premises upon which facilities or buildings, or portions thereof, are hereafter constructed or moved into or within the county.

On-site fire hydrants and mains capable of supplying the required fire flow shall be provided when any portion of the facility or building is in excess of the 150 feet (45 720 mm) from a water supply on a fire apparatus access road, as measured by an approved route around the exterior of the facility or building. (1997 Uniform Fire Code, Section 903.2, as amended.)

3. Submit civil drawings to the HFD for review and approval.

SUBJECT: HONOLULU HIGH-CAPACITY TRANSIT CORRIDOR PROJECT
COMMENTS RECEIVED ON THE DRAFT ENVIRONMENTAL IMPACT
STATEMENT

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

Your comment has been noted. Coordination with the Department of Parks and Recreation will continue throughout the duration of the Project.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

FROM: DAVID K. TANOUE, ACTING DIRECTOR 
DEPARTMENT OF PLANNING AND PERMITTING

SUBJECT: REQUEST FOR RAIL TRANSIT STATION DRAWINGS

We are requesting a set of the latest Station Drawings (10 percent completion) for our City's Honolulu Rail Transit Project. The preliminary information will allow our department to better understand the intended operation of the transit system and evaluate its effects on circulation and land use. This information will not only complement our work on on-going and subsequent Transit-Oriented Development (TOD) plans, and improve the efficiency of our TOD process, but also assist you with any permitting issues or requirements raised by these more detailed drawings.

We appreciate your department's willingness to work with the Department of Planning and Permitting on this effort. Should you have any questions, please call Bonnie Arakawa of my staff at 768-8048.

MEMORANDUM

TO: DAVID K. TANOUE, DIRECTOR
DEPARTMENT OF PLANNING & PERMITTING

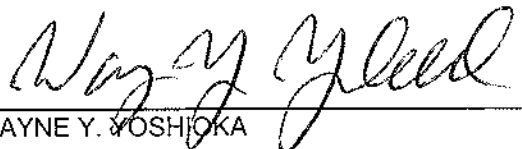

FROM: WAYNE Y. YOSHIOKA, DIRECTOR

SUBJECT: HONOLULU HIGH-CAPACITY TRANSIT CORRIDOR PROJECT
COMMENTS RECEIVED ON THE DRAFT ENVIRONMENTAL IMPACT
STATEMENT

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph address your comments regarding the above-referenced submittal:

As requested, station plans were provided to the Department of Planning and Permitting (DPP) on February 24, 2009. DTS will continue to work with DPP regarding permitting for the Project.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

FROM: *for*  DAVID K. TANOUE, ACTING DIRECTOR
DEPARTMENT OF PLANNING AND PERMITTING

SUBJECT: HONOLULU HIGH-CAPACITY TRANSIT CORRIDOR PROJECT DRAFT
ENVIRONMENTAL IMPACT STATEMENT (DEIS)/SECTION 4(f)
EVALUATION

In response to your request for comments on the Honolulu High-Capacity Transit Corridor Project DEIS, the Department of Planning and Permitting (DPP) has the following comments:

1. The Final Environmental Impact Statement (FEIS) should discuss any mitigation measures to be taken for loss in property values along the corridor where there are adverse impacts.
2. The FEIS should include a listing of all properties that are to be acquired in full or in part, their addresses and TMKs, and the estimated value at the time of acquisition.
3. *p. 1-7, Figure 1-4 Major Activity Centers in the Study Corridor:* Kalaeloa Industrial Park should be identified as "proposed".
4. *p. 2-25, Figure 2-14 East Kapolei Station (All Build Alternatives):* The map extent of this figure should be expanded to the southeast to show the pedestrian access and connectivity between the East Kapolei Station and the planned Kroc Community Center.
5. *p. 3-34, Table 3-18 Mode of Access to Fixed Guideway Stations – 2030 Build Alternatives:* This table should include bicycling as a mode of access. Bicycling is a key component of an integrated inter-modal transportation network and should be added as mode of access to Table 3-18 in the FEIS.

6. *p. 3-35, Access to Fixed Guideway Stations:* This section states that each station would have facilities for parking bikes, and each guideway vehicle would be designed to accommodate bicycles during off-peak hours. Bicycling as a mode of transportation should be strongly encouraged, and thus guideway vehicles should also be able to accommodate bicycles during peak hours. This should be clarified in the FEIS.

This section also states that sidewalks and crosswalks are currently available at stations or would become available as streets and sidewalks are built in developing areas. Emphasis should also be on creating an inter-modal transportation network in the neighborhoods surrounding the stations. The FEIS should address the need for identifying and developing safe and convenient pedestrian ways and bikeways to connect the existing residential areas with the transit stations. Sidewalks and bike paths leading to and from the transit station should be planned, designed, and constructed before the transit station opens.

7. *p. 3-41, Spillover Parking Effects on Station Areas:* This section states that the West Loch, Pearlridge, Iwilei, and Ala Moana Center stations were projected to have the largest demand for spillover parking and were selected for further study. A detailed table should be provided in the FEIS that shows for the Build Alternatives the spillover demand in the morning and evening peak periods for each of the four stations. Public input from community meetings held for the Waipahu Neighborhood TOD Plan indicated that residents felt strongly about the need for a park-and-ride facility at the West Loch station, and that without such a facility there would be spillover parking, particularly from residents living mauka of the freeway.
8. *p. 3-41, last bullet:* Although we agree with this bullet, it should be removed from this section or clarified. Spillover parking near stations would largely be from residents living in the surrounding neighborhoods and communities that are driving to the station. Residents living in future development in the station areas would have the greatest likelihood of walking to the transit station, and thus would not be a significant contributor to spillover parking.
9. *p. 3-43, Effects on the Bicycle and Pedestrian Network:* The FEIS should discuss ongoing work on the Oahu Bike Plan and discuss key recommendations of the Plan, if available, as they pertain to developing bike paths that link surrounding neighborhoods with the transit stations.

The FEIS should also disclose if pedestrians who are not taking transit would be allowed to use the mezzanine level of stations to cross streets. Creating a safe and convenient way for pedestrians to cross heavily traveled roadways is critical, particularly with the anticipated increase in pedestrian activity from transit patrons and TOD in the station areas, and a growing elderly population.

10. *p. 3-44, Parking:* This section states that parking surveys of on-street unrestricted parking supply would occur approximately six (6) months before implementation of the fixed guideway service. The FEIS should provide a schedule relating to when potential strategies will be decided and implemented vis a vis operation of the transit system.
11. *p. 4-12, Figure 4-2 Planning Regions and Planned Land Use:* This figure should include the routes of planned extensions to the west and east as shown on Figures 2-5 and 2-8, respectively.
12. *p. 4-13, Future Land Use Plans and Policies:* This section states that TOD Special Districts would encourage mixed-use, high-density, walkable communities around transit stations. The objective of TOD is not necessarily to promote high-density development, but rather development that is concentrated around the transit stations and at densities that are contextually appropriate for a given community.

The FEIS should also mention the Waipahu Town Plan (1995), Pearl Harbor Historic Trail Master Plan (2001), and Kalihi-Palama Action Plan (2004) as promoting transit-supportive development patterns, pedestrian-friendly environments, and an inter-modal transportation network.

13. *p. 4-20, Common to All Build Alternatives:* In addition to how the proposed project is consistent with the `Ewa Development Plan, the Final EIS should also discuss how the proposed project is consistent with section 4.1.3.2 Planned Transit Corridor, pages 4-8 and 4-9, of the Central O`ahu *Sustainable Communities Plan*. The Final EIS should further discuss how the proposed project is consistent with the rapid transit corridor as shown on the Public Facilities Map in Appendix A of both the `Ewa Development Plan and Central O`ahu *Sustainable Communities Plan*. Furthermore, the Final EIS should include a discussion of how the proposed project is consistent with the Public Infrastructure Maps for Ewa, Central O`ahu, and the Primary Urban Center.
14. *p. 4-43, Common to All Build Alternatives:* This section states that since the transit system will be elevated, it would not create a physical barrier to pedestrian

or other forms of travel within the study corridor. However, with anticipated increase in pedestrian activity from transit patrons and TOD in the station areas, mitigative measures to assure pedestrian safety should be identified in the FEIS. Pedestrians, especially the elderly, disabled, and young children, need safe access and adequate time to cross heavily traveled roadways.

15. *p. 4-57, Section 4.7.1 Background and Methodology:* There is mention that the Diamond Head and Punchbowl Special Districts may be affected but they are not discussed any further. It is not certain how these two (2) districts are impacted by the proposal. The Final EIS should discuss how the proposal meets the objectives and design guidelines for each of the Special Districts -- Chinatown, Hawaii Capital, and Waikiki.
16. There should be more discussion about alternative track profiles and configurations that would help to mitigate the negative visual impacts. This should include the various components of the tracks, i.e., tracks (height, widths, and profiles), columns (diameters, configurations, and heights), materials and finishes (concrete and steel), and landscaping (screening).
17. *p. 4-61, Kalihi to Ala Moana Center Landscape Unit :* Missing from this bulleted list of panoramic views is the view from the Kakaako Waterfront Park toward Punchbowl and the Koolau Range (PUC DP, June 2004). Furthermore, the panoramic and mauka-makai view corridors identified in the PUC DP should be graphically shown on a map in the FEIS.
18. *p. 4-63, Table 4-10:* Item 13, which describes the visual impact of the Chinatown station and guideway, conflicts with the description of environmental consequences to neighborhoods (Downtown) discussed on page 4-44. The latter states that the Project would not create a new barrier or affect the physical character of adjacent communities. This should be clarified in the FEIS and mitigative measures identified.

The FEIS should include visual simulations of each station in the Build Alternatives that show the mass of the station buildings in relationship to surrounding land uses/structures. The FEIS should include elevation views of each station that show the station from all sides in relation to surrounding uses. For example, views of the Salt Lake station should also be from the south side looking towards the three-story apartments. The FEIS should also include visual simulations of the Build Alternative that illustrates the visual impact to panoramic views and mauka-makai view corridors identified in the PUC DP.

19. *p. 4-75, Figure 4-27 Viewpoint 11 – Dillingham Boulevard at Kalihi, looking Mauka:* Regarding the simulation with the fixed guideway, what is the distance from the top of the future transit vehicle to the existing overhead utility lines. There may be a need to raise or relocate the existing lines. Please consult with Hawaiian Electric Company, Inc. regarding this matter for similar situations along the corridor since there is generally a safe electrical distance requirement.
20. *p. 4-84, Figure 4-36 Viewpoint 20 – Mother Waldron Park near Halekauwila Street/Cooke Street Intersection, looking `Ewa:* Why is the straddle bent guideway with double columns only utilized along Halekauwila Street in Kakaako? Couldn't the on-street parking be eliminated on one (1) side so that the guideway columns could be placed down the centerline of the roadway? This straddle bent guideway is rather bulky especially for the abutting senior housing units (major visual impact).
21. *p. 4-85, Common to All Build Alternatives:* This section states that RTD will coordinate with the City to identify the particular needs of each view. The FEIS should expand upon this and identify which City Department(s) would be consulted and what the methodology would be to achieving this so that appropriate mitigative measures are identified.
22. *p. 4-86, Fort Weaver Road to Aloha Stadium Landscape Unit:* This section states that the West Loch station and respective transit center would blend well with the bulk and scale of the Waipahu Town Center's densely developed commercial character. This statement should be revised as the Waipahu Town Center is far from being densely developed, particularly with the large surface parking lot adjacent to Farrington Highway.
23. *p. 4-93, Mitigation:* Information on the particular needs of each view (as stated on page 4-85) needs to be added. The relocation of trees within the station area should also be added as a mitigative measure.
24. There should be more discussion about the visual impacts of the guideway between Kamakee Street and Ala Moana Center.
25. In Section 4.7, the mitigation measures should be expanded with more discussions on how to minimize the negative visual effects.
26. *p. 4-138, Mitigation:* A bullet should be added that states that the first priority for street trees transplanting should be within the station area or neighborhood from where they were originally planted. For example, the trees along Farrington

Highway in Waipahu, a source of community pride, should be transplanted within the West Loch or Waipahu Transit Center station areas or elsewhere within Waipahu. This should also be added to Table 4-1 under the section pertaining to visual and aesthetic conditions.

27. *p. 4-161: Delete duplicate page.*
28. *p. 4-166, Station Area Development: This section states that the TOD Ordinance is expected to be enacted in 2008. The FEIS should update this information and state that the TOD Ordinance should be adopted in 2009.*
29. *p. 4-166 and p. 4-167, 'Ewa Plain: East Kapolei, UH West O'ahu, and Ho'opili: All references to the Hunt Development Group should be deleted since this organization is no longer working with the UH West O'ahu to develop the Private Development Lands.*
30. *p. 4-176, Table 4-37 List of Anticipated Permits: This section listing anticipated City permits and/or approvals is incomplete. Permits from DPP may include, but are not limited to building, grading, grubbing and stockpiling, trenching, dewatering, drain connection and subdivision. See attached table which is not a final list. The table also includes other permits and approvals that may be required from State and Federal agencies.*
31. *The project may be required to comply with Section II (Storm Water Quality) of DPP's "Rules Relating to Storm Drainage Standards".*
32. *Outside of specific areas, e.g., land under federal jurisdiction or the Kakaako District as designated in the Hawaii Revised Statutes, the Honolulu City Council is the authority for the granting of major permits within the special management area (SMA) as established by Chapter 25, Revised Ordinances of Honolulu (ROH). However, there is insufficient information in the EIS to determine which project sites and/or activities meeting the definition of development in ROH Section 25-1.3 would require a major (or minor) SMA use permit. Therefore, for portions of the project that are in or near the SMA boundary, the Final EIS should include an overlay of these project areas with SMA boundaries to determine if permits will be required. Please consult with the Land Use Permits Division of the Department of Planning and Permitting at 768-8013.*
33. *Park and ride, maintenance and power generation facilities located within the 100-year flood plain are subject to compliance with flood hazard requirements. In addition, the planning, design and construction of these facilities and the entire*

MEMORANDUM

TO: DAVID K. TANOUE, DIRECTOR
DEPARTMENT OF PLANNING & PERMITTING

FROM: WAYNE Y. YOSHIOKA, DIRECTOR

SUBJECT: HONOLULU HIGH-CAPACITY TRANSIT CORRIDOR PROJECT
COMMENTS RECEIVED ON THE DRAFT ENVIRONMENTAL IMPACT
STATEMENT

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

- 1. Property that will be directly affected by the Project will be purchased at market rates. As discussed in Section 4.4.3 of the Final EIS, "...compensation will be provided to affected property owners, businesses, or residents in compliance with all applicable Federal and State laws and will follow the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act (49 CFR 24)."*
- 2. Appendix B in the Draft EIS illustrated the tax map parcels (TMKs) that will be acquired by the City for the Project. Appendix B has been updated for the Final EIS and is now Appendix C.*
- 3. The suggested revision regarding Kalaeloa Industrial Park has not been made in the Final EIS. The label for this figure has been changed to read "Kalaeloa."*

4. *The suggested revision regarding the East Kapolei Station has been made in the Final EIS (Figure 2-17).*
5. *The "walk" column in Table 3-18 in the Draft EIS represents both walking and bicycling trips to fixed guideway stations. The column heading has been modified in the Final EIS (Table 3-20) to reflect both modes of access.*
6. *The Project is designed to be one part of a multi-modal transportation system. Bicycles will be allowed on transit vehicles as regulated by a bicycle policy. Access to stations will be in the form of bus, walking, bicycling, drop-off, and in some cases park-and-ride. The bus system will be modified to complement the rail transit system, with additional feeder buses connecting surrounding communities to the stations. While the Project is coordinating with City and State agencies to encourage development of enhanced pedestrian and bicycle facilities near the stations, the actual construction of such facilities is beyond the scope of the Project.*

As stated in Section 2.5.5 of the Final EIS, design criteria developed for Project stations place highest emphasis on walk and bicycle access. Pedestrian access to stations, including accessible routes, shall be given first priority for reasons of safety. The design criteria also state that, as a non-motorized mode, bicycles will be given second priority.

7. *Table 3-22 in the Final EIS shows estimated spillover parking demand at each station. As stated in Section 3.4.7 of the Final EIS, the approach to mitigating the effects of spillover parking will be unique to each station area. The City will conduct surveys to determine the extent of spillover parking near stations and implement one or more mitigation strategies as needed. Strategies to be used include, but are not limited to, parking restrictions (where parking causes safety or congestion problems) and shared parking arrangements (at locations where parking is available but dedicated to another purpose, such as retail centers, office uses, or places of worship). Implemented strategies will be monitored by the City, and necessary adjustments will be made as needed.*
8. *As future residential, commercial, and mixed-use development occurs around stations, both parking supply and demand could change over time and influence the extent of any spillover parking. The section analyzing potential spillover parking impacts has been left as it appeared in the Draft EIS, since it is describing potential conditions that could affect spillover parking demand and provides the best estimate of impacts based on the available information.*
9. *The Project is coordinating with City and State agencies to encourage development of enhanced pedestrian and bicycle facilities near the stations. The Oahu Bike Plan is currently being updated, and the final recommendations of the Bike Plan will come out after completion of the Project Final EIS. Section 3.4.5 has been revised to include the following language, "The Oahu Bike Plan is currently being updated and is scheduled to be adopted later in 2009. The Draft Master Plan includes a prioritized list of bicycle projects developed using criteria that include access to transit. Several projects that would connect existing or*

future bicycle facilities to rail transit stations are included in the Draft Master Plan."

Regarding use of the concourse/mezzanine level of stations by the general public, that decision has not been made. Some stations are being designed to accommodate such access, including potential pedestrian crossings. Whether that is allowed will depend on the fare policy that is implemented.

- 10. The specific mitigation strategies and the schedule for implementation will be determined as the stations are opened. Parking surveys will be conducted prior to starting construction of a station, and again within six months after opening of the station. Results of the surveys will be used to determine the appropriate mitigation strategy, which will be selected by the City and implemented as soon as feasible. Follow-up surveys will be conducted by the City to determine if the mitigation strategies are effective. Additional mitigation measures will be implemented as needed, as determined by the City. Strategies to be used include, but are not limited to, parking restrictions (where parking is causing safety or congestion problems, and shared parking arrangements (at locations where parking is available but dedicated to another purpose, such as retail centers, office uses, or places of worship).*
- 11. The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative effects sections of Chapters 3 and 4 of the Final EIS. However, the future extensions are not part of this Project; thus, they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative effects analysis) because they are not part of the proposed action to be taken by the City and FTA. If the extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time.*
- 12. High-density development is a component of transit-oriented development (TOD), to maximize transit ridership from adjacent mixed land uses. TOD principles incorporate context sensitivity into design for a given community. In response to your comment, Section 4.2.3 of the Final EIS has been revised to note that the Waipahu Town Plan (1995), Pearl Harbor Historic District Trail Master Plan (2001), and Kalihi-Palama Action Plan (2004) promote transit-supportive development patterns, pedestrian friendly environments, and an inter-modal transportation network.*
- 13. Section 4.2.2 of the Final EIS summarizes the goals and objectives of relevant transportation and land use plans and Section 4.2.3 of the Final EIS states that the Project will be consistent with the adopted State and Local government transportation and land use plans and polices. Additional detail regarding the*

specific plans mentioned can be found in Chapter 2 of the Land Use Technical Report. This includes the Primary Urban Center Development Plan, Ewa Development Plan, Central Oahu Sustainable Communities Plan, and their transit corridor components, as shown on the Public Facilities Maps (see Section 2.1.4 to 2.1.6 of the Land Use Technical Report). The Project is consistent with relevant transportation and land use plans, including the Public Infrastructure Maps. The technical report is available on the Project website (www.honolulutransit.org).

14. *The DTS has developed specifications and design criteria to address the City and County of Honolulu's requirements for accessibility and safety and security of the system, which includes pedestrian facilities. In addition, all stations will conform to applicable Americans with Disabilities Act (ADA) and local regulations, and DTS will work with State and City agencies to encourage the development of safe pedestrian facilities near stations.*
15. *The Diamond Head and Punchbowl Special Districts will not be affected by the Project and Section 4.8 of the Final EIS has been revised accordingly. The overall objectives and design guidelines for the Hawaii Capital and Chinatown Districts will be addressed during the station design process. This process will focus on characteristics and preferences of the communities adjacent to stations during the next level of planning and design for the stations.*
16. *Alternative track profiles and configurations were examined during the alternatives screening and conceptual design processes. The following measures will be included with the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:*
 - *Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
 - *Retain existing trees where practical and provide new vegetation.*
 - *Shield exterior lighting.*
 - *Coordinate the project design with the City's TOD program within the DPP.*

DTS will consult with the communities surrounding each station for input on station design elements.

Under the heading Design Principals and Mitigation in Section 4.8.3 of the Final EIS, specific environmental, architectural, and landscape design criteria are listed that will help minimize visual effects of the Project. Guideway materials and surface textures will be selected in accordance with generally accepted architectural principals to achieve effected integration between the guideway and its surrounding environment. Landscaping and streetscape improvements will help mitigate potential visual impacts.

17. *Mauka views from the Kakaako Waterfront Park toward Punchbowl and the Koolau Mountain Range will not be affected by the Project (see Section 4.8.3 Potential Visual Effects on Protected Views and Vistas-Kalihi to Ala Moana Center in the Final EIS). The middle ground of these panoramic views, where the*

Project will traverse, are dominated by other mid-rise to high-rise buildings. The panoramic and mauka-makai protected view corridors that are identified in the Primary Urban Center Development Plan and that will be affected by the Project are shown and discussed in Section 4.8 of the Final EIS.

18. *With respect to the Chinatown Station, the text in Section 4.5 of the Draft EIS has been revised in the Final EIS Section 4.6.3 to state that "Within the Downtown area, the Project will pass the historic districts of Chinatown and Merchant Street. Nimitz Highway is located along the perimeter of these two districts between the Downtown uses and Honolulu Harbor; therefore, the transit system will have little effect on their uses. However, it will contrast with their historic character." Mitigation measures for visual effects are discussed in Section 4.8.3 of the Final EIS and include retention of trees, where feasible, and shielding of exterior lighting along the guideway.*

As stated in Section 4.8 of the Final EIS, the simulations are intended to represent the scale and spatial relationships of project elements to other objects. These simulations serve several purposes: they were used to evaluate visual and aesthetic consequences, demonstrate the potential for mitigation, and provide a means of communicating the findings of the analysis. The stations that were simulated for the visual assessment generally depict those that are expected to have a comparatively greater visual effect (see Section 4.8.3 for specific figures for the Chinatown Station and for the Downtown Station). For a typical station prototype, please refer to Section 2 of the Final EIS. The prototype shows a cross-section view that is intended to more accurately show the guideway dimensions. DTS has considered your request for additional station simulations. However, it was determined that the existing simulations presented in the Final EIS adequately represent the Project.

The ongoing station design process is focusing on characteristics and preferences of the communities adjacent to each station.

Panoramic views along the alignment are represented by photographs included in the Final EIS: see Section 4.8.3 for specific figures, Viewpoint 5—Aloha Stadium, looking Ewa; Viewpoint 7—Keehi Lagoon Beach Park, looking Koko Head; and, Viewpoint 8—Keehi Lagoon Beach Park, looking Mauka. The simulations included in Section 4.8 of the Final EIS are intended to represent the range of scale and spatial relationships of project elements to surrounding lands uses and structures. However, they do not reproduce the entire field of view that individuals would perceive. Photographs typically produce a static field of view, but an individual's eyes constantly scan and selectively focus on a scene for content. As a result, photographs often do not show scenic features as prominently as they might appear to individual observers. The visual effects of the Project on these views are presented in the tables in Section 4.8 of the Final EIS.

The panoramic and mauka-makai protected view corridors that are identified in the Primary Urban Center Development Plan and will be affected by the Project are shown and discussed in Section 4.8 of the Final EIS.

19. *The clearance reference in the comments will be verified during final design. As stated in Section 4.18.2 of the Final EIS, communication and coordination have been initiated with the affected utility agencies and companies and will continue throughout design and construction. Utility rearrangements will occur as necessary to ensure that construction of the Project may proceed without affecting utility service.*
20. *Adjacent to the senior housing unit, there is an existing 14-foot-wide by 8.5-foot-high concrete box drainage culvert in Halekauwila Street that prevents placement of guideway columns down the middle of the roadway. Eliminating the parking on the makai side of the street would place part of the guideway in the park, which is a sensitive community resource. Parking could be eliminated along the mauka side of the road with the guideway placed inside the elderly housing property, but RTD felt the current design had fewer impacts to surrounding properties.*

The potential visual effects at Viewpoint 19 are discussed in Section 4.8.3 of the Final EIS. It is noted that the bulk and scale of the guideway and columns will contrast substantially with the scale and character of Mother Waldron Neighborhood Park and the adjacent residential building. Mitigation measures for visual effects are discussed in Section 4.8.3 of the Final EIS, as noted above.
21. *The sentence has been revised in the Final EIS to state, "RTD will coordinate with DPP regarding the particular needs of each view."*
22. *To correct the description of the Waipahu Town Center, the words "densely developed" have been deleted in the Final EIS.*
23. *DTS will coordinate with DPP through meetings that will include review of design plans. The objective will be to identify the particular needs of each view; however, changes to some views will be unavoidable. Street trees along the project alignment are discussed in Section 4.15 of the Final EIS. Mitigation measures to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates are discussed in Section 4.8.3 of the Final EIS. As stated in the mitigation discussion, existing trees will be retained where practical, including at station areas.*
24. *Visual effects of the guideway between Kamakee Street and Ala Moana Center are discussed in Section 4.7.3 of the Draft EIS. The discussion notes that no visually sensitive resources are located in this area, which is primarily big-box stores and smaller industrial buildings. The discussion has been expanded in the Final EIS to indicate that buildings will be removed to allow the cross-over from Queen Street to Kona Street. Please refer to Section 4.8.3, including the table; Potential Visual Effects on Protected Views and Vistas-Kalihi to Ala Moana Center in the Final EIS, for a discussion of visual effects along the mauka-makai view corridor on Piikoi Street.*
25. *More specific mitigation measures to address visual impacts of the Project are being developed through the station design and planning process. The initial station area plans and design guidelines were first developed through a series of interactive workshops in 2008 involving input from DTS, DPP, and the project*

design team. The next level of transit station design is focusing on integrating individual neighborhood characteristics and preferences of the communities served by stations. The Project is hosting a series of public station design workshops where the community is involved in the design of the stations. The workshops provide multiple opportunities for brainstorming station ideas, giving feedback on preliminary concepts, and finally a chance to review and comment on detailed station designs.

- 26. Transplanted trees should remain close to their original location whenever possible. Your comment makes both good ecological and economic sense as well as preserving the sense of pride a community has in its mature trees. This has been added to Table 4-1 and as a bullet under mitigation for impacts to Visual and Aesthetic Conditions. Please note that the mitigation listed in Section 4.8.3 of the Final EIS states that existing trees will be retained where practical and new vegetation will be provided. DTS will consider transplanting street trees within the same station area or neighborhood where they are removed if this is a viable option for the specific location.*
- 27. The duplicate page has been removed.*
- 28. Section 4.19.2 of the Final EIS has been revised to reflect the passage of Bill 10 (2008) by the City Council in March 2009, under Ordinance 09-4.*
- 29. Section 4.18.2 of the Draft EIS has been revised in the Final EIS. The reference to Hunt Development Group has been deleted.*
- 30. DTS staff has been working, and will continue to work with DPP staff, to identify, apply for, prepare, and obtain permits related to construction.*
- 31. The project design team will comply with DPP's "Rules Relating to Stormwater Drainage Standards."*
- 32. This permit has been identified on the List of as indicated in Section 4.21 of the Final EIS, a Special Management Area permit is being prepared to address this issue.*
- 33. In Section 4.14.3 of the Final EIS, it states: As a linear feature, the guideway will cross several floodplains in Waipahu and Pearl Highlands. However, the Project will not cause significant floodplain encroachment as defined by USDOT Order 5650.2. The guideway and many stations will be elevated above the floodplain by piers, but some facilities, such as stairs, elevators and traction power substations will have to be built at ground level. These features could have minor effects on floodplains, depending on how and where they are placed within a floodplain see figures in this section. However, any such changes caused by the Project will be mitigated through design to comply with current floodzone regulations. There will be no notable adverse impacts on natural and beneficial floodplain values and there will be no impact to water levels in flood zones. As there will be no impacts on floodplain values, a Conditional Letter of Map Revision (CLOMR) will not be necessary. According to the comments received from the U.S. Environmental Protection Agency, the predicted global*

sea level rise by the end of the century (2090-2099) is between 7 and 23 inches. The minimum elevation for any project feature is 5 feet above sea level; therefore, a rise of up to 2 feet would not directly affect any project feature.

- 34. Yes, the financial plans include estimated capital and ongoing operating and maintenance costs for the park-and-ride facilities.*
- 35. The "bump" in Figure 6-1 of the Draft EIS at year 2027 recognizes there will be a need to increase capital expenditures to refurbish or replace certain elements of the system after a decade of service.*
- 36. 2018 is the beginning of service on the full 21-mile rail line with costs of about \$45 million (2007 dollars) in subsidy in that year (in addition to any increased costs for TheBus and other transit system elements). This figure is not included in the Final EIS.*

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

MEMORANDUM

TO: LOUIS M. KEALOHA, CHIEF
HONOLULU POLICE DEPARTMENT

FROM: WAYNE Y. YOSHIOKA, DIRECTOR

SUBJECT: HONOLULU HIGH-CAPACITY TRANSIT CORRIDOR PROJECT
COMMENTS RECEIVED ON THE DRAFT ENVIRONMENTAL IMPACT
STATEMENT

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal:

The Honolulu Police Department's continued participation regarding safety and security planning is noted.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this

Louis M. Kealoha, Chief

Submission Content/Notes : to make the rail a desirable service that will be utilized and truly alleviate the awful leeward traffic mess, I would recommend the following:
Minimal stops with feeder buses or trollys (5-10 stops instead of 20), it has to be time efficient and better than driving or it won't be used. It should extend from downtown Kapolei to UH, via the airport, not Salt Lake. Appropriate stops would be Kapolei, east Kapolei at the Geiger Rd / Waipahu interchange, Leeward college, Pearl Ridge, airport, downtown, ala moana / waikiki, and UH Manoa. I would agree with Mr Dijou that pearl ridge - HNL be built first, that makes much more sense that in an underdeveloped area. Also, I would reconsider the steel wheels, they can be quite noisy, and with the rail traversing residential areas, best to be as quiet as possible. Thanks for the oppertunity to speak my mind.

Ms. Deborah Agles
dagles@juno.com

Dear Ms. Agles:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address your comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal:

The number of stations affects riders in two ways. If stations are too far apart, the system is not convenient as users must walk too far or drive a greater distance to access a station. If they are too near, the average travel speed is reduced. To balance these concerns, the average distance between stations is approximately one mile, with shorter distances in denser areas that have greater transit demand.

As shown in Table 3-15, there will be a significant improvement in transit speeds with the Project. As a result, major reductions in transit travel times will occur for several major markets, such as between developing areas in Ewa and Downtown. As shown in Figure 3-7 in the Final EIS, transit travel times will be better with the Project compared to No Build conditions.

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space.

The first phase of the Project must be connected to the maintenance and storage facility because, in addition to maintenance of equipment and ongoing operations, the maintenance and storage facility houses the main control center for the entire Project, and the required testing and operation of the system could not be completed without access to it. No location has been identified closer to Downtown with sufficient available land to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- Match the anticipated schedule for right-of-way acquisition and utility relocations*
- Reduce the time that each area will experience traffic and community disturbances*
- Allow for multiple construction contracts with smaller contract size to promote more competitive bidding*
- Match the rate of construction to what can be maintained with local workforce and available financial resources*
- Balance expenditure of funds to minimize borrowing*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS. However, the future extensions are not part of this Project; thus, they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time. Bus connections will be enhanced from Ala Moana Center to UH Manoa.

As stated in Section 4.10.3 of the Final EIS, the Project will cause no severe noise impacts. Moderate impacts will occur at upper floors of a few high-rise buildings (as shown in

Table 4-18 in the Final EIS). With the recommended mitigation in place (sound absorbing material and wheel skirts), the noise analysis indicates that the new noise generated by the Project will be lower than the existing noise levels in most places.

The project design includes an integrated noise-blocking parapet wall at the edge of the guideway structure that extends 3 feet above the top of the rail. The parapet wall will substantially reduce ground-level noise.

Wheel skirts will increase the benefit from the parapet wall at locations above the elevation of the track. The use of sound-absorptive materials below the tracks in the areas that will experience moderate noise impacts will reduce the Project noise levels from the upper floors to below the impact level. Once the Project is operating, noise levels will be re-measured to confirm that there are no noise impacts from the Project.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Submission Content/Notes : Not exactly sold on the "Rail" but because it has some what been decided that it will be coming, the airport route will serve a better cause. if us the "Tax payers" are going to pay for this project, the Airport route would be my preferred choice.
Most cities in America have there rail system routed in or near the airport, and for reasons that need no explanation.
My hope is that the City Council will make the right choice, and for the greater good of our Island, and not for political reasons.
On a side note this rail project in my personal opinion will not relieve traffic like its proposed to do. All it does is leaves behind someones legacy, and adds to ones resume saying that "when I was mayor I started the rail in Hawaii".
But leaves behind the on going "Bill" that we will have to pay forever.
Suggested thoughts:
Fix and correct our backwards freeways.
Open up our traffic choke points
Middle St. merge
Halawa / Stadium merge
H-2 merge.
Correct on & off ramps to create traffic flow. ETC.

Mahalo

Honolulu, Hawaii 96816

Dear Mr. Akana:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your preference for the Airport Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more

Mr. Cree Akana
Page 2

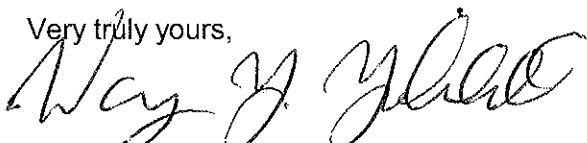

information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

To answer your comment regarding traffic effects from the Project, analysis of traffic impacts employs a Travel Demand Forecasting Model used by the Oahu Metropolitan Planning Organization. The approach has proven to be effective in estimating traffic impacts in other cities. This model is based on guidelines established by the FTA.

Information about the future performance of the highway system on Oahu with or without the Project is included in Chapter 3 of the Final EIS. Traffic conditions will be worse in 2030 under any circumstance and regardless of which solution is applied. The Alternatives Analysis Report stated this. The key point is that rail will improve conditions compared to what they would be if the Project were not built. With the fixed guideway system, total islandwide congestion (as measured by vehicle hours of delay) will decrease by 18 percent, compared to the No Build Alternative (as shown in Table 3-14 in the Final EIS). Accordingly, traffic conditions will be substantially better with the Project than any of the other potential solutions studied.

In addition to the fixed guideway, there are approximately \$3 billion in proposed transportation improvements included in the Oahu Regional Transportation Plan. These include widening the H-1 Freeway and other facilities at key choke points, adding a westbound zipper lane, and other substantial transportation projects. A list of these projects can be found in Table 2-4 of the Final EIS. The traffic assessment conducted for the Draft and Final EISs included these projects under the No Build and Build Alternatives.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Submission Content/Notes : Despite what's been in the news about what to build first, neither the Kapolei-Waipahu link nor the Pear City-downtown link will draw much ridership. For Kapolei-Waipahu, it makes no sense for someone working downtown to ride the rail to Waipahu and get off. Likewise, people in Pearl City probably won't ride it because they live on the Honolulu side of the H1/H2 merge, the bottleneck that causes grief for west and central Oahu commuters. The initial link should be built from Waipahu to downtown. Provide enough parking at the Waipahu station for commuters to leave their cars (like what they had at Village Park).

Dear Mr. Akana:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. The first phase of the Project must be connected to the maintenance and storage facility because, in addition to maintenance of equipment and ongoing operations, the maintenance and storage facility houses the main control center for the entire Project and the required testing and operation of the system could not be completed without access to it. No location has been identified closer to Downtown with sufficient available land to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations*
- *Reduce the time that each area will experience traffic and community disturbances*

- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding*
- *Match the rate of construction to what can be maintained with local workforce and available financial resources*
- *Balance expenditure of funds to minimize borrowing*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

As also discussed in Chapter 2 of the Final EIS, park-and-ride facilities are planned at East Kapolei, UH West Oahu, Pearl Highlands, and Aloha Stadium. These stations have been identified as having the highest demand for drive-to-transit access. Table 2-8 in the Final EIS shows the size and capacity of each park-and-ride facility. The East Kapolei facility will provide 900 parking spaces, and the Pearl Highlands facility will provide 1,600 spaces.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Submission Content/Notes : I voted no on the Primary Election for a rail system. Because of the money spend on the the type of system and the route. The beauty of the Island is also at stake. Yes we do have a traffic problem on the Island but the rail system the "Mayor" wants so bad it not what this island needs and not the answer. Viaduct like on the airport/nimitz is more close in certain areas, to solve the traffic problem. The people here on the island won't give up their cars, therefore, building such a high concrete blocks on the island will be worthless it will not help the traffic problem. I recently went to Los Angeles and I viewed their rail route in China town, the rail is on concrete blocks and looks awful going by a residential apartment area. "I do not want" such an awful looking piece of concrete going by my apartment building, if build it will go right by bedroom in Salt Lake. From what I heard on the Public Hearing on December 9, in Salt Lake there would be stations at the Stadium and Salt Lake Shopping Center. That is a joke, where are going all those people from Salt Lake park their cars there is not enough spaces for all the people with their cars in Salt Lake it is a dense populate residential area. The ones who do not have cars, do you think they will walk all the way down to the rail station, no they are not, they will take the closest bus available and not the rail. This is a hasty way of doing business, as previously said the island has a traffic problem, however, the present wanted system by the Mayor is not "it". The federal government will give money for any project "they would have the last time" now and thereafter. Please come up with friendlier riding system for the public, so the public will be able to use it and it will not destroy the beauty of this island. People where able to vote on the rail project, even though they are never able to use and affected by this rail system.

Dear Ms. Alarcon:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your opposition to the Project is noted.

Chapter 2 of the Final EIS summarizes the alternatives screening and selection process. Beginning in the fall of 2005, an initial screening process considered alternatives identified through previous transit studies, a field review of the study corridor, an analysis of current population and employment data for the study corridor, a literature review of technology modes, ongoing work completed as part of the Oahu Regional Transportation Plan 2030 (ORTP) prepared by the Oahu Metropolitan Planning Organization (OahuMPO) (OahuMPO 2007), and public and agency comments received during the formal Alternatives Analysis scoping process.

The screening process is documented in the Honolulu High-Capacity Transit Corridor Project Alternatives Screening Memorandum (DTS 2006a). Three scoping meetings were held during the screening process in December 2005, which included a presentation of initial

alternatives to the public, interested agencies, and officials to receive comments on the Purpose and Need, alternatives, and scope of the Alternatives Analysis. Refinements were made to the alternatives based on the public input during scoping.

After completion of screening in the winter of 2006, the following alternatives were studied in the Alternatives Analysis: No Build Alternative, Transportation System Management (TSM) Alternative, Managed Lane Alternative, and the Fixed Guideway Alternative. After review of the Alternatives Analysis Report and consideration of public comments, the City Council identified a fixed guideway transit system extending from Kapolei to UH Manoa with a connection to Waikiki as the Locally Preferred Alternative. This identification, which eliminated the TSM and Managed Lane Alternatives from further consideration, became Ordinance 07-001 on January 6, 2007. The NEPA process considered a range of alternatives that was consistent with the identified Locally Preferred Alternative. As discussed in Section 2.2, there were no alternatives that had not been previously studied and eliminated for good cause that would satisfy the Purpose and Need at less cost, with greater effectiveness, or less environmental or community impact.

The assessment of visual effect due to the Project as described in Section 4.8.3 of the Final EIS considers changes to the visual landscape and viewer responses to those changes. This includes the existing development along the Project alignment. Within the Project corridor the environment changes from rural at the Wai'anae end of the corridor to dense high-rise development at the Koko Head end.

As part of the design process, the City has developed design principles, which are identified in the Honolulu High-Capacity Transit Corridor Project Compendium of Design Criteria (RTD 2009m) that will be implemented in final design to minimize visual effects of the Project. For example, guideway materials and surface textures will be selected in accordance with generally accepted architectural principles to achieve effective integration between the guideway and its surrounding environment. Landscape and streetscape improvements will mitigate potential visual impacts, primarily for street-level views.

Other measures to address visual impacts of the Project are being developed through the station design and planning process. The initial station area plans and design guidelines were first developed with coordination between DTS and the Department of Planning and Permitting (DPP). The next level of transit station design focuses on integrating individual neighborhood characteristics of the communities served by the stations.

The following mitigation framework will be included in the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

- Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
- Coordinate the project design with City TOD planning and DPP.*
- Consult with the communities surrounding each station for input on station design elements.*
- Consider specific sites for landscaping and trees during the final design phase when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will serve to mitigate potential visual impacts.*

Section 4.8.3 of the *Final EIS, Design Principles and Mitigation* includes information related to the mitigation framework described above. Specifically architecture and landscape design criteria include guidelines regarding site design, materials and finishes, and lighting, which apply to stations, station areas, and the guideway.

As stated previously, during 2005 and 2006, the City and County of Honolulu conducted an alternatives screening process during which a wide variety of alternatives were examined. Remaining modal (for auto, transit), technology, and alignment options were combined to create alternatives that were evaluated in the Alternatives Analysis Report (2006a). A Managed Lane Alternative (such as a viaduct) was examined as one of the alternatives. While this alternative would have slightly reduced congestion on parallel highways, systemwide traffic congestion would have been similar to the No Build Alternative. This congestion would result from increased traffic on arterials trying to access the facility. Total islandwide vehicle hours of delay would have increased slightly with the Managed Lane Reversible Option compared to the No Build Alternative, indicating a slight increase in systemwide congestion. Transit reliability would not have been improved except for express bus service operating in the managed lanes. The cost per hour of transit time savings was determined to be approximately four times greater than that for the Fixed Guideway Transit Alternative. The Managed Lane Alternative would not have substantially improved service or access to transit for transit-dependent communities. Because of these findings, this alternative was eliminated when the City and County of Honolulu Council selected a fixed guideway transit system extending from Kapolei to UH Manoa with a connection to Waikiki as the Locally Preferred Alternative.

The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the *Final EIS*. However, the future extensions are not part of this Project, thus they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in the *Final EIS*. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time. Bus service between Ala Moana Center and these destinations will be enhanced until those extensions are built.

Ridership projections for the forecast year of 2030 were developed using the travel demand model, which was calibrated against collected traffic and transit ridership information and then validated against current counts to be sure it properly represents travel activity in the transportation system (Section 3.2.1 of the *Final EIS*). An on-board transit survey was completed in December 2005 and January 2006, and the latest socioeconomic information available as of October 2008 was incorporated. Traffic counts were collected in 2005, 2007, and 2008. The model is based upon a set of realistic input assumptions regarding land use and demographic changes between now and 2030 and expected transportation levels-of-service on both the highway and public transit system. Based upon the model and these key input

Ms. Renate Alarcon
Page 4

assumptions, approximately 116,000 trips per day are expected on the rapid transit system on an average weekday in 2030.

Residents will have several methods available to access the fixed guideway system. Park-and-ride lots will be available at several stations, including Aloha Stadium. The bus system will be enhanced and modified to coordinate with the fixed guideway system. The existing and future bus system, including route numbers and frequency, are provided in Appendix D of the Final EIS. Because of the high frequency of the fixed guideway service (every three minutes during peak periods and every six minutes during mid-day periods), riders transferring from buses to the fixed guideway will experience minimal wait times. Riders transferring from the guideway service to buses will benefit from improved frequencies on existing bus routes serving stations. In addition, bicycle parking will be available at all stations and offer an option where it is too far to walk.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Enclosure

December 8, 2008

Mr. Ted Matley
FTA Region IX

San Francisco, CA 94105

Mr. Wayne Yoshioka
Department of Transportation Services
City and County of Honolulu
650 South King Street, 3rd Floor
Honolulu, HI 96813

Dear Messrs. Matley and Yoshioka:

The Honolulu Chapter of the American Institute of Architects (AIA Honolulu) strongly supports the concept and implementation of a fixed guideway steel-on-steel rail system as an integral part of the future plans to meet the needs our growing island communities. We therefore offer the following comments and recommendations to assist the City in strengthening community support, enhancing our neighborhoods and environment, investing taxpayer money wisely, and ensuring Federal funding for the project.

Review of Project Goals and Objectives

A recent study by AIA National and the Center for Transportation Studies found that *"the success of transportation projects requires integrating transportation design with social, economic, and cultural resources. The time for looking at transportation projects through the single lens of mobility, or even simple access and connectivity, is long gone."* However, Chapter 1 of the Draft EIS outlines project goals and objectives that are focused almost exclusively on mobility concerns.

AIA Honolulu therefore recommends that the current project goals should be expanded and integrated with stronger community-planning objectives. We encourage the use of social, environmental, and aesthetic criteria – as well as economic efficiency – in the planning and design of transit system routes and supporting facilities. Transit system routes and facilities should further support land use objectives – including urban growth management and efficient transit mode linkages – and respect significant human, cultural and natural environments as defined by the City's Primary Urban Center Development Plan.

Other cities such as Portland, Salt Lake, and Sacramento have wisely integrated transportation, social, economic, and cultural objectives during the EIS process and as a result have built popular rail transit systems which not only transport people efficiently but also create desirable, livable communities. This emphasis on the bigger picture can best be summed up by the transit-planning protocol followed by Portland since the 1970's: *"We define what kind of place we want to be and then identify the appropriate transportation options to serve it."*

Likewise, it is our understanding that the Federal Transportation Administration's evaluation criteria for New Starts funding goes well beyond measuring mobility improvements. According to its *New Starts and Small Starts Evaluation and Rating Process*, proposed projects are graded against the full range of the following justification criteria¹¹:

AIA Honolulu
119 Merchant Street, Suite 402
Honolulu, Hawaii 96813-4452
Phone: 808.545.4242
Fax: 808.545.4243
Website: www.aiahonolulu.org

- *Transit Supportive Land Use Policies and Future Patterns*
- *Environmental Benefits*
- *Cost Effectiveness*
- *Mobility Improvements*
- *Operating Efficiencies*

We similarly recommend that the Honolulu Rail Transit project goals and objectives be amended to align closely with these key criteria in order to ensure qualification for Federal funding.

Additionally, because our island economy remains heavily dependent upon tourism, we feel it essential that the project objectives should address minimizing economic impact to the visitor industry and to our island's visual appeal. For instance, views from cruise ships and visitors' visual expectations of Hawaii, Honolulu, and Waikiki should be considered.

Review of Project Impacts

AIA Honolulu has also carefully reviewed the Draft EIS in relation to our chapter's public policies on transportation. We respectfully offer the following comments regarding the impacts an elevated guideway will have to our communities.

The City and County of Honolulu's Primary Urban Center Development Plan (PUC) is a comprehensive planning document mandated by the City's Charter to guide "the development and improvement of the City" into the year 2025.^{iv} The PUC clearly defines guidelines to "*preserve and enhance significant mauka or makai view corridors along major collector streets.*"^v Unfortunately, the proposed elevated rail structure will block mauka and makai view corridors particularly along Nimitz Highway through historic Chinatown and Downtown. Although the PUC provides criteria for protecting mauka views from the Ala Wai promenade^{vi}, the Draft EIS does not address visual impacts along the planned elevated segment serving the University of Hawaii at Manoa.

In addition, the PUC notes "*as demonstrated in leading cities throughout the world, recapturing visual and physical access to the urban waterfront can stimulate economic renewal and be a source of civic pride.*"^{vii} Examples of popular waterfront destinations that have removed their elevated transportation structures include San Francisco, Boston, Seattle, and Sydney. The PUC goes on to stress that a major impediment for Honolulu is Nimitz highway that "*effectively acts as a physical and visual barrier cutting off the waterfront from mauka pedestrian travel.*"^{viii} Elevated rail stations and structures along the waterfront will make a poor situation worse by introducing an additional physical and visual barrier. This will largely undo the tremendous past efforts by the State Department of Transportation to reintegrate the Aloha Tower with the rest of Downtown Honolulu.

AIA Honolulu also promotes the preservation and enhancement of historic and cultural districts such as Chinatown and the Hawaii Capital District. Our understanding is that the elevated Chinatown station and guideway structures would be approximately 40-50 feet above grade.^{ix} We therefore respectfully disagree with the finding that the elevated system will pose "no adverse effect" to our historic districts^x particularly when the Draft

EIS states that *"the project elements would contrast substantially with Chinatown's historic character"*^{xii} and that through the Downtown area *"the bulk and scale of the guideway would contrast with the more pedestrian scale [and] character of the streetscape."*^{xiii}

We are deeply concerned that despite documenting many of the significant visual and aesthetic impacts of the elevated guideway, the Draft EIS fails to propose mitigation measures to effectively counteract negative impacts on views, connection with the waterfront, historic districts, and pedestrian streetscapes. AIA Honolulu also recommends that rather than providing selective, localized views of the transit guideway and stations, broader visualization studies should also be performed. Panoramic mountain and waterfront views as defined by the PUC should be shown, keeping in mind the potential economic impact upon our tourist industry.

The AIA further advocates the creation of safe, healthy, and easily accessible environments for transit passengers as well as pedestrians and residents along the transit route. We are concerned that the areas below elevated rail structures and stations will become blighted, "nuisance" environments and that the lack of natural public sightlines into stations will diminish safety and security for passengers waiting on platforms. The proposed elevated platforms and concourses will also impede convenient access for both able-bodied and disabled users.

Finally, the AIA promotes sustainable planning, design, and operation of transit systems. Economic efficiency is also essential. The Draft EIS notes that it will take over 7 times the energy to construct an elevated guideway compared with an at-grade system.^{xiv} We wish to also emphasize that an elevated guideway will require substantially greater amounts of materials, construction, and time in comparison with at-grade systems. Similarly, elevated systems require increased electrical consumption to power elevators, escalators, and additional lighting. Increased and ongoing operating and maintenance costs for public restrooms, painting, graffiti mitigation, and landscaping should also be accounted for in life cycle cost estimates. AIA Honolulu therefore considers an elevated system to be the least sustainable and cost effective option available to our communities.

Recommendations

For these reasons, AIA Honolulu urges the City to consider a more flexible rail transit solution capable of running at, below, or above grade to accommodate the particular conditions within each community. Third rail technology should not be our only option. Widely used alternatives such as overhead lines would allow much greater flexibility and would more effectively accommodate social, economic, cultural, and community planning objectives. Flexible transit solutions would also more easily satisfy the FTA's funding justification criteria for:

- Transit Supportive Land Use Policies and Future Patterns
- Environmental Benefits
- Cost Effectiveness
- Mobility Improvements
- Operating Efficiencies

AIA Honolulu
119 Merchant Street, Suite 402
Honolulu, Hawaii 96813-4452
Phone: 808.545.4242
Fax: 808.545.4243
Website: www.aiahonolulu.org

Impacts to our visual, historic, and cultural resources would be mitigated. There would be fewer detrimental consequences for our tourist industry. More of the cultural indigenous character of our communities, neighborhoods, and pedestrian streetscapes would be preserved or even enhanced. Sustainable objectives would be more easily achieved with lower requirements for energy, material, construction, time, and cost. In comparison with elevated systems, at grade systems would require less taxpayer funding and offer greater flexibility and affordability in planning for future extensions.

AIA Honolulu sincerely thanks the City and County of Honolulu for this opportunity to offer our comments and recommendations publicly. We have enjoyed greater dialogue with the City on transit issues in recent months and we reaffirm our willingness to work together with the Mayor, his administration, its consultants, and the City Council on developing viable and effective regional community planning and urban design solutions for this historic project, including the possibility of alternative mass transit corridors.

Sincerely Yours,

Sidney C.J. Char, AIA

Honolulu, Hawaii 96813-4452

Dear Mr. Char:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Project Goals and Objectives—*Comments on the Project's Purpose and Need, and associated goals and objectives, were sought during the NEPA scoping period in March and April of 2007. The Project is a transportation project and includes the goal of supporting already planned development. The Project also supports the goals of the Honolulu General Plan and the Oahu Regional Transportation Plan by serving areas designated for urban growth. The social, environmental, aesthetic, and economic elements listed in the comment were evaluated in Chapter 4 of the Draft and Final EISs. Separately, the Department of Planning and Permitting (DPP) has developed a Transit Oriented Development Revised Ordinance of Honolulu (ROH 09-4) that will consider the Project in future land use planning.*

The following Project goals are shown in Table 1-4 of the Final EIS:

- *Improve corridor mobility.*

- *Improve corridor travel reliability.*
- *Improve access to planned development to support City policy to develop a second urban center.*
- *Improve transportation equity.*

In addition to the stated goals of the Project, the FTA evaluation will require the Project to address the five elements mentioned in the comment as part of the New Starts funding program. Those are also addressed in the Final EIS as part of the Evaluation of the Project in Chapter 7.

As stated in Section 4.2.3 of the Final EIS, the Project is consistent with the transportation and land use elements of adopted State and Local government plans. Cost-effectiveness is discussed in Section 7.4 of the Final EIS. As shown in Table 3-11 in Chapter 3 of the Final EIS, visitors will make up 11 percent of total daily travel in 2030. Given the importance of this market segment and potential environmental effects, visitors were recognized in the assessment of total travel demand. In addition, the identification of the Airport Alternative as the preferred alternative will allow visitors access to the high-capacity transit system for travel to or from the airport terminal.

Visual Impacts—*The island's unique visual character and scenic beauty was considered in the visual and aesthetic assessment presented in the Draft and Final EISs. It is acknowledged that views in Downtown and other areas will be blocked and some views will change substantially, resulting in significant visual effects. View changes are not likely to be obtrusive in wider vistas or regional panoramic mountain and waterfront views, such as from cruise ships, where the project elements serve as smaller components of the larger landscape.*

As stated previously, the island's visual character and scenic beauty was considered in the visual and aesthetic assessment presented in the Draft and Final EISs. It is acknowledged that the guideway and stations will noticeably contrast with Chinatown's historic character. In addition, views in Downtown and the other areas, including protected mauka-makai views, will be blocked and some views will change substantially, resulting in significant visual effects. Protected views and vistas are identified in policy documents that govern the project corridor. These policy documents include the following: Ewa Development Plan, Central Oahu Sustainable Communities Plan, and Primary Urban Center Development Plan. The protected views and vistas are identified in Figures 4-17 to 4-19 of the Final EIS. Viewer group responses on the Draft EIS resulted in the refinement of the visual impact rating for several key views described in Section 4.8 of the Final EIS. Several additional simulations and summary tables were added to illustrate project effects discussed in the Draft EIS including protected mauka-makai views (see Tables 4-9 through 4-14 and Figures 4-39 through 4-50). Views along major collector streets are included and described in Table 4-9. The assessment summarized in Table 4-9 acknowledges that some view obstructions and changes to views will be unavoidable and substantial. They will be most noticeable where the guideway and stations are nearby or in the foreground of views. This includes those who travel near the alignment. The degree of visual effect will vary with the alignment orientation, guideway and station height, and height of surrounding buildings and trees, along with the viewer's expectations of view quality. View changes are not likely to be obtrusive in wider vistas or regional panoramic views where the project elements serve as smaller components of the larger landscape as noted in Section 4.8

of the Final EIS. Sections 4.8.2 and 4.8.3 of the Final EIS discusses existing development along the project alignment. As noted in this section much of the project alignment is located within a predominantly urban area with dense development.

The assessment of visual effect due to the Project as described in Section 4.8.3 of the Final EIS considers changes to the visual landscape and viewer responses to those changes. This includes the existing development along the Project alignment. Within the Project corridor the environment changes from rural at the Waianae end of the corridor to dense high-rise development at the Koko Head end.

As part of the design process, the City has developed design principles, which are identified in the Honolulu High-Capacity Transit Corridor Project Compendium of Design Criteria (RTD 2009m) that will be implemented in final design to minimize visual effects of the Project. For example, guideway materials and surface textures will be selected in accordance with generally accepted architectural principles to achieve effective integration between the guideway and its surrounding environment. Landscape and streetscape improvements will mitigate potential visual impacts, primarily for street-level views.

Other measures to address visual impacts of the Project are being developed through the station design and planning process. The initial station area plans and design guidelines were first developed with coordination between DTS and the DPP. The next level of transit station design focuses on integrating individual neighborhood characteristics of the communities served by the stations.

The following mitigation framework will be included in the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

- Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
- Coordinate the project design with City TOD planning and DPP.*
- Consult with the communities surrounding each station for input on station design elements.*
- Consider specific sites for landscaping and trees during the final design phase when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will serve to mitigate potential visual impacts.*

Section 4.8.3 of the Final EIS, Design Principles and Mitigation includes information related to the mitigation framework described above. Specifically architecture and landscape design criteria include guidelines regarding site design, materials and finishes, and lighting, which apply to stations, station areas, and the guideway.

The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS. However, the future extensions are not part of this Project; thus, they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not

proposed for implementation at this time, they are not part of the Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time. As seen in Table 4-13 the panoramic views from the Ala Wai Canal Promenade toward the Koolau Mountain Range are Koko Head of study area and will have no visual effect.

The Chinatown Station and guideway will be dominant features in views along Nimitz Highway and mauka views of the Koolau Mountain Range will be blocked. The visual effects of the Project in Chinatown and through the downtown are listed in Table 4-9 and illustrated in Figures 4-30, 4-31, and 4-33 of the Final EIS. As stated above, Section 4.8.3 includes more detail on measures to minimize visual effect of the Project. The design criteria for the guideway and stations are presented in Section 4.8.3 of the Final EIS. One of the design criteria is to consider the historic and community context during design to reinforce the uniqueness of context or use.

Based on concerns raised by Section 106 consulting parties, preliminary effects determinations as shown in the Draft EIS were reevaluated and documented in the Honolulu High-Capacity Transit Corridor Project Historic Effects Report dated April 14, 2009. Both direct and indirect effects to historic properties were reevaluated in this report. The Project was determined to have an adverse effect to the Chinatown Historic District and no adverse effect to the Hawaii Capital Historic District. Following consultation, the State Historic Preservation Division (SHPD) concurred with the effect determinations on the Chinatown Historic District and the Hawaii Capital Historic District. These determinations of effect and the SHPD's concurrence are documented in Section 4.16 and Appendix H of the Final EIS.

Protected views and vistas that are identified in the Primary Urban Center Development Plan and may be affected by the Project are shown in Table 4-13 of the Final EIS and locations are identified on Figure 4-19.

Station Design—*DTS has developed design criteria to address the City's visual and aesthetic requirements for the Project, which will be implemented in Final Design as mitigation measures to minimize visual effects, such as those discussed previously in this letter. Guideway materials and surface textures will be selected in accordance with generally accepted architectural principles to integrate the guideway with its surrounding environment. Landscaping and streetscape improvements will mitigate potential visual impacts. Under the heading Design Principals and Mitigation of Section 4.8.3 of the Final EIS, specific environmental, architectural, and landscape design criteria are listed that will help minimize negative visual effects of the Project.*

In addition, the ongoing station area planning process involves numerous aspects of transit system design. The process addresses design and planning issues in an integrated manner and focuses on the characteristics and preferences of the communities adjacent to each station.

Safety and Security—*The majority of the rail system will travel in roadway medians. The areas below the guideway will continue to carry automobile traffic. The portions of stations*

at ground level are access buildings similar to other public areas, and will include access stairways, escalators and elevator banks with the possibility of space for small commercial uses. Elevated station platforms will have open views to the surrounding communities. All stations, park-and-ride facilities, and vehicles will include security cameras that are monitored at all times of operation, audible and visual messaging systems, and an intercom link to the system operations center. Security personnel will also patrol the system. Interior and safety lighting will be provided at all stations and park-and-ride facilities.

As discussed in the Final EIS Section 2.5.4 a project-specific Safety and Security Management Plan has been developed in accordance with FTA requirements to define the safety and security activities and methods for identifying, evaluating, and resolving potential safety hazards and security vulnerabilities of the system. It establishes responsibility and accountability for safety and security during the Preliminary Engineering, Final Design, construction, testing, and start-up phases of the Project. The Honolulu Police Department, the Honolulu Fire Department, the Honolulu Department of Emergency Management, and the Honolulu Emergency Services Department have been involved in preparing and will be part of implementing the plan. The plan addresses public safety and security concerns, including threats and hazards associated with the Project, specific issues that were identified through community outreach efforts, and design and architectural details to enhance safety.

The transit system will comply with Americans with Disabilities Act (ADA) requirements. Elevators and escalators will be provided at all stations. Also, level boarding will be provided to trains; therefore, stairs or lifts, as used on buses, will not be required.

Alternatives Considered—As stated in Section 2.2 of the Final EIS, prior to selecting an elevated fixed guideway system, a variety of high-capacity transit options were evaluated during the Primary Corridor Transportation Project (1998—2002) and Alternatives Analysis. Options evaluated and rejected included an exclusively at-grade fixed guideway system using light-rail or bus rapid transit (BRT) vehicles, as well as a mix of options consisting of both at-grade and grade-separated segments.

The Alternatives Screening Memorandum (DTS 2006a) recognized the visually sensitive areas in Kakaako and Downtown Honolulu, including the Chinatown, Hawaii Capital, and Thomas Square/Honolulu Academy of Arts Special District. To minimize impacts on historic resources, visual aesthetics, and surface traffic, the screening process considered 15 combinations of tunnel, at-grade, or elevated alignments between Iwilei and Ward Avenue. Five different alignments through Downtown Honolulu were advanced for further analysis in the Alternatives Analysis, including an at-grade portion along Hotel Street, a tunnel under King Street, and elevated guideways along Nimitz Highway and Queen Street (Figure 2-4).

The Alternatives Analysis Report (DTS 2006b) evaluated the alignment alternatives based on transportation and overall benefits, environmental and social impacts, and cost considerations. The report found that an at-grade alignment along Hotel Street would require the acquisition of more parcels and could potentially affect more burial sites than any of the other alternatives considered. The alignment with at-grade operation Downtown and a tunnel under King Street, was not selected because of the environmental effects, such as impacts to cultural resources, reduction of street capacity, and property acquisition requirements of the at-grade and tunnel sections, which would cost an additional \$300 million.

The Project's purpose is "to provide high-capacity rapid transit" in the congested east-west travel corridor (see Section 1.7 of the Final EIS). The need for the Project includes improving corridor transit mobility and reliability. The at-grade alignment would not meet the Project's Purpose and Need because it could not satisfy the mobility and reliability objectives of the Project (see bullets below). Some of the technical considerations associated with an at-grade versus elevated alignment through Downtown Honolulu include the following:

- **System Capacity, Speed, and Reliability**—The short, 200-foot (or less) blocks in Downtown Honolulu would permanently limit the system to two-car trains to prevent stopped trains from blocking vehicular traffic on cross-streets. Under ideal operational circumstances, the capacity of an at-grade system could reach 4,000 passengers per hour per direction, assuming optimistic five minute headways. Based on travel forecasts, the Project should support approximately 8,000 passengers in the peak hour by 2030. Moreover, the Project can be readily expanded to carry over 25,000 in each direction by reducing the interval between trains (headway) to 90 seconds during the peak period. To reach a comparable system capacity, speed, and reliability, an at-grade alignment would require a fenced, segregated right-of-way that would eliminate all obstacles to the train's passage, such as vehicular, pedestrian, or bicycle crossings. Even with transit signal priority, the at-grade speeds would be slower and less reliable than an elevated guideway. An at-grade system would travel at slower speeds due to the shorter blocks, tight and short radius curves in places within the constrained and congested Downtown street network, the need to obey traffic regulations (e.g., traffic signals), and potential conflicts with other at-grade activity, including cars, bicyclists, and pedestrians. These effects mean longer travel times and far less reliability than a fully grade-separated system. None of these factors affects an elevated rail system. The elevated rail can travel at its own speed any time of the day regardless of weather, traffic, or the need to let cross traffic proceed at intersections.
- **Mixed-Traffic Conflicts**— The Project will run at three minute headways. However, three-minute headways with an at-grade system would prevent effective coordination of traffic signals in the delicately balanced signal network in downtown Honolulu. A disruption of traffic signal cycle coordination every three minutes would severely affect traffic flow and capacity of cross-streets. Furthermore, there would be no option to increase the capacity of the at-grade rail system by reducing the headway to 90 seconds, which would only exacerbate the signalization problem. An at-grade system would require removal of two or more existing traffic lanes on affected streets. This effect is significant and would exacerbate congestion. Congestion would not be isolated to the streets that cross the at-grade alignment but, instead, would spread throughout Downtown. The Final EIS shows that the Project's impact on traffic will be isolated and minimal with the elevated rail, and, in fact will reduce system-wide traffic delay by 18 percent compared to the No Build Alternative (Table 3-14 in the Final EIS). The elevated guideway will require no removal of existing through travel lanes, while providing a reliable travel alternative. When traffic slows, or even stops due to congestion or incidents, the elevated rail transit will continue to operate without delay or interruption.

An at-grade light rail system with continuous tracks in-street would create major impediments to turning movements, many of which would have to be closed to eliminate a crash hazard. Even where turning movements are designed to be accommodated, at-grade systems experience potential collision problems. In addition, mixing at-grade fixed guideway vehicles with cars, bicyclists, and pedestrians presents a much higher potential for conflicts compared to grade-separated conditions. Where pedestrian and automobiles cross the tracks in the street network, particularly in areas of high activity (e.g., station areas or intersections), there is a risk of collisions involving trains that does not exist with an elevated system. There is evidence of crashes between trains and cars and trains and pedestrians on other at-grade systems throughout the country (e.g., Phoenix, Houston, LA). This potential would be high in the Chinatown and Downtown neighborhoods, where the number of pedestrians is high and the aging population presents a particular risk.

- **Construction Impacts**—*Constructing an at-grade rail system could have more effects than an elevated system in a number of ways. The wider and continuous footprint of an at-grade rail system compared to an elevated rail system (which touches the ground only at discrete column foundations, power substations, and station accessways) increases the potential of utility conflicts and impacts to sensitive cultural resources. In addition, the extra roadway lanes utilized by an at-grade system would result in increased congestion or require that additional businesses or homes be taken to widen the roadway through Downtown. Additionally, the duration of short-term construction impacts to the community and environment with an at-grade system would be considerably greater than with an elevated system. Because of differing construction techniques, more lanes would need to be continuously closed for at-grade construction and the closures would last longer than with elevated construction. This would result in a greater disruption to business and residential access, prolonged exposure to construction noise, and traffic impacts.*

Because it is not feasible for an at-grade system through Downtown to move passengers rapidly and reliably without significant detrimental effects on other transportation system elements (e.g., the highway and pedestrian systems, safety, reliability, etc.), an at-grade system would have a negative system-wide impact that would reduce ridership throughout the system. The at-grade system would not meet the Project's Purpose and Need and, therefore, does not require further analysis.

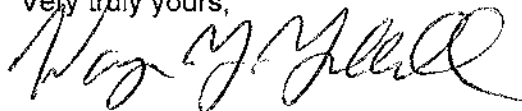

Cost Effectiveness—*The resources and costs associated with construction and operation on a lifecycle scale of an elevated system have been considered in project planning. The cost effectiveness of the Project is presented in Section 7.4 of the Final EIS. The comparison of cost effectiveness of the various alternatives considered is presented in the Alternatives Analysis Report (DTS 2006b) and summarized in Section 2.2.2 of the Final EIS. Tables 2-2 and 2-3 summarize the results of the Alternatives Analysis phase, including costs and environmental effects. As stated in Section 2.2.2, a transportation system management (enhanced bus service) alternative, two managed lane alternatives, and three fixed guideway alternatives were evaluated in the Alternatives Analysis Report based on their effectiveness in*

meeting the Project's goals and objectives related to mobility and accessibility, supporting planned growth and economic development, constructability and cost, community and environmental quality, and planning consistency. Energy use was also considered during the Alternatives Analysis phase. The analysis demonstrated that enhanced bus service would not meet the Purpose and Need for the Project. Additionally, this alternative would have required more transportation system energy and generated more air pollutant emissions than a fixed guideway alternative. The Managed Lane Alternative would have generated the greatest amount of air pollution and required the greatest amount of energy for transportation use. The Managed Lane Alternative would also have provided very little transit benefit at a high cost. The fixed guideway alternative will provide the greatest energy reduction. Further, the cost per hour of transit-user benefits would be between 160 and 240 percent less than the Managed Lane Alternative.

Rail Technology—*The Project's chosen technology ensures speed, reliability, and efficiency and is the only one that allows an automated, driverless system. As such, it will have a lower operating cost and support the highest ridership of all technologies examined. It may be operated above, at, or below grade. The requirement is that the system operates in an exclusive right-of-way. As stated previously, to preserve system speed, safety reliability, neither automobiles nor pedestrians can be allowed to cross the tracks. For at-grade operation, this would require a fenced right-of-way with no crossings. It is not possible to construct such a system in a number of areas along the alignment, including in and around Downtown, where roadways abut existing development. Regarding the energy delivery system, the Project already recognizes the effect of the elevated structure on the visual environment. Relying on an overhead catenary system would have exacerbated that effect.*

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

**American Planning Association Hawaii Chapter Comments on
Honolulu High-Capacity Transit Corridor Project
Draft Environmental Impact Statement (DEIS)
And Section 4(f) Evaluation**

APA Hawaii Chapter has been a consistent supporter of the Honolulu Fixed Guideway project due to the potential it holds for both improving transportation mobility and access among the population, and due to the effect it can have on a more compact and sustainable form of development for the communities and the neighborhoods along the corridor.

APAHI comments are provided in two parts: Part One provides general comments are provided regarding the EIS document and the transit project. Part Two gives focused attention and comments on three important areas along the corridor: Kapolei/Ewa District; Waipahu/ Pearlridge; and Kakaako/Ala Moana. These comments reflect APA's strong interest in place-making at both the station areas and in the radius of access to the stations, which is complementary to but different than TOD.

Part One: General Comments

We begin our comments by acknowledging that the preparers had a yeoman task of bringing together so much material and making it presentable to a wide range of interested parties. In that regard, we especially compliment the city and the preparers for their exciting and innovative use of clear graphics and visualization techniques. To our knowledge, this is the first time in Hawaii that video has been used to communicate content to those many who do not have the time or inclination to read through a lengthy, chart-laden document. The introduction overview video, the flyover feature, the interactive station graphics are excellent new tools that communicate the project visually and not just in words.

Continued Community Involvement

We want to encourage the City to continue to find ways to have ongoing community input and involvement throughout the design, construction and implementation phases. In particular, we believe that it is essential that each community develop a sense of ownership regarding its station(s) area and the system as a whole. This is best accomplished through early and frequent involvement that goes beyond one-way information sharing.

While APAHI supports the transit project, we continue to have reservations about both certain aesthetic issues, in particular, the proposed height at several urban locations, most notably Kakaako and Ala Moana. Heights at these stations has changed several times throughout the project, and we urge the City to continue to work with the community, APA and other professional organizations to find design review, value engineering and other means of generating alternate ideas for reducing the effects of a high guideway and station. At a minimum, the project and the Final EIS should go much farther in examining how landscaping and trees can help to not only mitigate/camouflage the guideway, but to provide shaded relief to pedestrians at street level.

Mitigations

In general, the lack of mitigations is a weakness of the Draft EIS which we would like to see corrected in the Final EIS. More attention to bringing better place-making features is essential. We would like to see drafts of the Design Guidelines that are mentioned. Most importantly, we believe that success of the transit project and its integration into the community, requires more attention to the details of how people/passengers are to access the station areas. What are the features of the sidewalks, crosswalks and amenities for pedestrian access, bicycle access, and bus access on a station-by-station basis? Without good (one might even say superior) access treatment that is safe, well-lit and pleasant, people will find other ways to travel than to use the transit. Good design brings good ridership.

Multi-Modal Access and Parking

Access by feeder bus is a critical piece of operations. More information should be provided on bus connections in the Final EIS, and it is expected that once the identification of bus access is started, that many adjustments and mitigation actions will be required. Which routes will run into

which stations? How are passengers transferring from one transit mode to another? What about private and school buses, how can they use the transit center?

The one access mode that is treated in the Draft EIS is auto access, mainly in the form of park and ride facilities. Regrettably, the size and features of these parking facilities only looks at the number of stalls needed to serve the commuter shed. Many of the garages are large and are likely to not fit well into the surrounding community without looking like fortresses. Yet, if not properly sized, some communities will suffer from commuters using their streets for parking. Much much more attention needs to be paid to the trade-offs for proper sizing and management of parking needs.

“Spillover Parking Effects on Station Areas” (Page 3-41) section states that the West Loch, Pearlridge, Iwilei, and Ala Moana Center stations are projected to have the largest demand for spillover parking and in need of further study. A detailed table should be provided in the FEIS that shows for the Build Alternatives the spillover demand in the morning and evening peak periods for each of the four stations. Public input from community meetings held for the Waipahu Neighborhood TOD Plan indicated that residents felt strongly about the need for a park-and-ride facility at the West Loch station, and that without such a facility there would be spillover parking, particularly from residents living mauka of the freeway.

In designing the parking facilities for station areas, configure parking so that it does not dominate the area. While it is important to consider utilizing on-street parking in certain station areas, take into consideration the protection of neighborhoods. Of the many tools that can be implemented to minimize the impact of parking; the four principal ones are “move it, share it, deck it, and wrap it.”

- Move it: Contrary to common practice, in which parking is located immediately adjacent to the station, broader community goals are best served when parking is moved away from the platform. The land nearest the station is the best land for development, so using it for parking means a lost opportunity. Placing parking a five to seven-minute walk from the station opens prime real estate for development.
- Share it: Sharing the parking among patrons who make use of it at different times of the day or week is an excellent way to minimize the space devoted to parking. The San Diego transit system, for example, shares one of its commuter lots with a multiplex theater. Transit riders use the parking on weekdays, and movie patrons use it on evenings and weekends. Shared parking can be operated privately or by a local parking authority. Parking fees offer an opportunity for additional revenue.
- Deck it: Structured parking is expensive. In Miami, for example, a basic parking garage without sprinklers costs \$6,000 to \$7,000 per space; more highly finished facilities in urban neighborhoods cost between \$10,000 and \$13,000 (creating an additional incentive to charge for parking). Charging for parking tends to be controversial for a transit agency because it is perceived as a deterrent to riders, but it is essential to finance needed facilities.

- **Wrap it:** In place of the typical suburban sea of surface parking, creative designers can wrap a parking structure with retail shops, eateries, residences, and services, such as dry cleaners. This mixed-use approach makes the parking structure more attractive as an urban place, allows people who park there to take care of errands, makes the walk to and from the parking lot more interesting, and creates a built-in clientele for the businesses. This approach allows surface parking to be used as a form of land banking.

Part Two: Focused comments on transit project sections

1) Comments on Kaka'ako-Ala Moana Section (South Street to Ala Moana Center)

Kaka'ako Stations

If the location of the planned station near South Street is shifted to either the mauka or makai side of Halekauwila Street so that it can be integrated into a private development project, what will be impact on the Halekauwila Street right-of-way in terms of column placements and station access from the sidewalk? If the station is directly above the right-of-way, what is the impact on the streetscape (e.g., tunnel effect, station access landings in the sidewalk area, etc.)? While this may seem to be a detailed question to raise in the DEIS stage, the station impacts at the location are magnified because of the narrow right-of-way on Halekauwila Street (see related comments below) and the intensity of existing and project development in this neighborhood.

The planned station makai of Queen Street diamondhead of Ward Avenue is situated entirely within General Growth property. While this is preferable to the taking of a small property fronting Queen Street, as originally proposed, it is unclear how well this placement, as well as the alignment of the guideway approach and departure to this station will fit the planned street system and future redevelopment of this vicinity. The proposed guideway alignment follows the approximate alignment of the Halekauwila Street extension, which is part of Hawai'i Community Development Authority's current Kaka'ako Mauka Area Plan, but is proposed for deletion in the proposed revision to the Mauka Area Plan in favor of new local streets laid out in a "grid" pattern. The guideway alignment would cut diagonally across this grid street pattern rather than following planned street rights-of-way. It is also unclear how the planned station would be integrated into new development of this area. This particular station site should therefore be discussed in more detail to explain how it would be consistent with and supportive of future redevelopment of this area.

Physical Impacts on Halekauwila Street and Kona Street Rights-of-Way Relative to Small Businesses in Central Kaka'ako

Both Halekauwila Street and Kona Street function as local streets, the latter primarily to provide vehicular access to light industrial uses. The rights-of-way of both streets are relatively narrow (50-ft width for Halekauwila; 40-ft for Kona), which constrains their capacity to accommodate columns for the proposed fixed guideway while still providing the travel lanes, parking lanes, sidewalks and potentially bicycle lanes necessary for them to adequately serve as local and

service streets to businesses as well as through traffic for all modes of travel. The Kona Street right-of-way is presently unimproved, lacking formal curbs, gutters, sidewalks, storm drainage systems and on-street parking spaces. Most existing uses along these streets lack sufficient off-street parking and loading spaces, so they depend heavily on the public right-of-way to serve this need.

The DEIS should expand the discussion of the impact of the guideway along these two streets, providing more detailed analysis of the effects of the guideway structure on adjacent uses and their operations. For example, it appears from the plans provided in the DEIS that 28 lots containing at least 80 small businesses along this segment of the rail alignment will have columns placed directly in front of their property. How may the placement of columns impede vehicular access to small lots and businesses? How are specific businesses and properties affected by the loss of on-street parking and loading spaces, including, in the case of Kona Street, the loss of informal parking and loading spaces?

Direct and Indirect Economic Impacts on Central Kaka'ako Small Lots and Small Businesses and on Urban Honolulu

Proposed property acquisition maps provided in the DEIS indicate that 9 private properties in Kaka'ako are slated for acquisition in their entirety. While the DEIS does not discuss details, we estimate that 20 small businesses that generate at least \$14.4 million in annual income are directly displaced by this action. It remains uncertain whether it is viable for these businesses to relocate. For one, many of these businesses, which are predominately service-oriented, may not be able to survive a significant interruption in operations from relocation. Second, these businesses are located in Central Kaka'ako, despite high land costs, largely to provide convenient access to their customers (Hawaii Alliance for Community-Based Economic Development, *A Study of Kaka'ako Mauka Businesses*, September 2007). Third, there is a dearth of industrial-zoned land in urban Honolulu east of Iwilei, and small industrial service establishments in Iwilei, as well, are being displaced by the higher-value commercial uses that are allowed in that industrial-commercial mixed-use zone. Consequently, the closest true industrial district for small business is Kalihi Kai, where there is little, if any vacant land.

An additional 28 properties in Central Kaka'ako containing a minimum of 30 small businesses are proposed for partial acquisition. While partial acquisition may not necessarily impell the closure of these businesses, construction of the fixed guideway will cause disruptions to the operations of these businesses and inconveniences to their customers, most likely resulting in loss of revenue that could lead, in turn, to business failure. If the businesses manage to survive the construction period, they will continue to struggle against the pressure of rising property taxes due to escalating real estate values brought by proximity to the transit line. If these businesses are forced to relocate due to economic pressure, this will exacerbate the competition for scarce industrial land in urban Honolulu and thereby raise the cost of doing business.

The direct and indirect impacts on the small business district of Central Kaka'ako are not trivial. These businesses employ an estimated 1,971 people and generate estimated annual sales of \$258,900,000 (Hawaii Alliance for Community Based Economic Development, October 2008). However, the indirect impacts extend well beyond Central Kaka'ako because the businesses in this neighborhood serve customers throughout urban Honolulu, including the major employment centers of the Downtown financial district, the Civic Center, Ala Moana and Waikiki. If the

service businesses in Central Kaka'ako disappear, where will residents and employees of urban Honolulu get their cars, appliances or equipment repaired? Where will the suppliers and storage facilities for Waikiki hotels reside? Where will professional and financial offices go for printing and supplies?

Proposed Mitigation Measures for Central Kaka'ako Business District

While transit may have distinct benefits for commuter travel and general mobility, there is a complex network of interdependencies between Central Kaka'ako and the residents and businesses of these surrounding urban districts that will be significantly impaired by the transit project, and we believe this has not been adequately acknowledged in the selection of the preferred alignment through Kaka'ako, the selection of the technology for that route, or in the suggested mitigation measures described in the DEIS. Given the significance of Central Kaka'ako as an employment center and as a service district for urban Honolulu, we believe that an alternative alignment along Kapi'olani Boulevard, as proposed in the rail transit project two decades ago, should be given renewed consideration. If a route through Central Kaka'ako is inevitable, then the City, perhaps with State participation, should develop a proactive program to ensure the preservation of an industrial service district in Central Kaka'ako. Adoption of zoning to allow industrial uses is a passive measure that is insufficient to accomplish this. What is needed are programs to write-down land and redevelopment costs and provide real property and other tax incentives and rebates for small businesses in this district.

Ala Moana Station

As an "end-of-line" station for the MOS with the highest volume of boarding, de-boarding and transferring passengers on the entire system in a vicinity that already experiences a complex mix of traffic, the Ala Moana Station area requires detailed attention to design that accommodates all modes of travel – bus, private passenger vehicle, delivery vehicles, pedestrian and bicycle – in a convenient, efficient, safe and attractive manner. There is very little discussion of this in the DEIS. On page 2-36, for example, it is stated that transit connections to Ala Moana Station will be provided by "enhanced bus service". What does that mean, exactly? While traffic studies may indicate that Kona Street presently has sufficient capacity to stage those buses, what if passenger volume exceeds projections? Perhaps most important, what facility enhancements are planned for the increased number of pedestrians that will be in this vicinity. What sidewalks will be widened? What crosswalks will be created or enhanced? What bus passenger waiting and loading areas will be developed? How will bicyclists be accommodated? How will conflicts between pedestrian, bicycle, bus and other vehicle movement be avoided or minimized. Will traffic signals or other controls be installed or modified?

Because space is so constrained at the Ala Moana Station site and pedestrian and bicycle pathways to the station are limited, we strongly recommend that a transit center be created on the presently unused property at 1391 Kapi'olani Boulevard (TMK 2-3-039: 011) adjacent to the Ala Moana Station. This could be done through either outright acquisition of the property or joint development with the current or possible future owner. If the latter, the transit center for the private trolleys at the rear of the new Nordstrom store nearby could serve as a model in microcosm for the Ala Moana Station Transit Center.

2) Comments on Waipahu to Pearlridge Section

Land Use Plans

The Future Land Use Plans and Policies Section, p. 4-13, should include summaries of the Waipahu Town Plan and the Pearl Harbor Historic Trails Plan.

Place-Node

The FEIS should include more discussion on the Waipahu Transit Station (Figure 2-18), the Leeward Community College Station (Figure 2-19), the Pearl Highlands Station (Figure 2-20), and the Pearlridge Station (Figure 2-21) in relation to place and node issues. Places need to be easy to get to and should be integrated physically and visually with their surroundings. This requires paying attention to how people can get around by foot, bicycle, public transportation, and the car – and in that order (Dittmar and Ohland, p. 31)

With the exception of the Pearlridge Station, which illustrates a connection to the Pearl Harbor Bike Trail, the above-referenced station areas are not pedestrian or bicycle friendly. The FEIS should include more discussion how these station areas will accommodate pedestrians and bicyclists. Also, a clear statement should be made whether bicycles will be allowed onto the transit platforms and into the cars and if so, where and how.

Parking

The Pearl Highlands Station should consider other parking location alternatives rather than a 1600 parking space parking structure adjacent to the station area. One alternative could include a shared parking approach to reduce the mass parking structure adjacent to a station area. Another alternative could be to charge for parking, which is controversial, but may be necessary for a form of value capture. Include a discussion in the FEIS related to these parking alternatives.

Neighborhoods

In Section 4.5.3 Environmental Consequences and Mitigation, include a discussion on pedestrian crossings along Farrington Highway and Kamehameha Highway in the Waipahu Neighborhood and Pearl City Neighborhood sections.

Visual and Aesthetic Conditions (Chapter 4.7)

Ft. Weaver Road to Aloha Stadium Landscape Unit (Viewpoints 1-4). Significant trees that are not preserved in place should be relocated, if possible, along the transit corridor.

The FEIS should include mitigative measures for Viewpoint 3, Kamehameha Highway at Ka'ahumanu Street, looking makai, since there is a high visual impact obstructing the views of the tree canopies in Neal S. Blaisdell Park.

3) Comments on Kapolei/Makakilo/Ewa District

The urban development/urban investment alternative. The Draft EIS says that improved transit is needed to serve, among other users, the large and increasing number of workers that reside in the Ewa District who commute to various job centers in urban Honolulu. More needs to be said about creating job centers in the Ewa District, for shorter commutes as well as so-called “reverse commutes.” We believe that as State, County and private parties continue to develop higher education campuses, high tech parks, industrial parks, in other words to create a “second city” the transit system will need to continue to evolve with an intra- Ewa “hub and spoke” and/or light rail transit system, not just an Ewa to downtown Honolulu system.

East Kapolei Station. The Draft EIS notes (p. 2-14) that “the East Kapolei Station would have one of the highest boardings in the system,” and would therefore have a park and ride lot. The schematic plan for the East Kapolei Station shows a “Proposed Park and Ride Facility – 12 acres/900 spaces.” There is no indication in the text or on the schematic plan regarding how buses, cars, bicycles, and pedestrians will gain access to this station. There should be some analysis and some conceptual plans for multi-modal access to the Station – especially for peak period conditions.

Ewa Development Plan – Draft Update/Revisions. The Draft EIS discusses (p. 4-13) “Future Land Use Plans and Policies,” should describe the recently released “Ewa Development Plan – Draft Update/Revisions.”

General Comment re: Projected “Total Daily Trips” – The Draft EIS (p. 3-17) projects an increase in Total Daily Trips, from about 3.26 million per day in 2007 to about 4.04 million per day in 2030. It would be helpful to provide the (DBED&T or other source) population projections for Oahu upon which these trips are projected. Some sensitivity analysis for error should be noted as well as the impacts of other factors that influence Total Daily Trip, including gas prices, home-based and tele-commute work, aging population, and similar lifestyle/lifecycle changes.

Dear Sir:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

General Comments

As part of the Final Design process, the DTS has developed specifications and Design Criteria to address the City's requirements for the Project. As discussed in Section 8.4 of the Final EIS, the City is conducting workshops with communities that will have rail stations. The purpose of the workshops is to engage the public about rail stations and provide opportunities to residents to contribute ideas about the appearance of station entryways in their communities. Ideas generated at the workshops will be incorporated into the station planning process. The overall process addresses design and planning issues in an integrated manner and focuses on the characteristics and preferences of the communities adjacent to each station. In addition, specific sites for landscaping and trees will be considered during Final Design when plans for new plantings will be prepared by a landscape architect.

Regarding the height of the guideway and stations, the designs continue to be revised to reflect community input and concerns. For example, recent changes have resulted in a lower proposed elevation for the Ala Moana Center station and guideway on Kona Street.

The station designs continue to be revised to address issues such as multi-modal access and connection to the surrounding environment. Place making around the station will be an important consideration that involves coordination between multiple agencies and the private sector. DTS is working with the Department of Planning and Permitting (DPP) to prioritize sidewalk improvements to coincide with station construction. The updated Oahu Bike Plan is being developed with transit access in mind to encourage connections. However, it should be noted that areas beyond the station itself are not part of the Project and therefore not addressed in this Final EIS.

Existing and future bus routes, including route numbers, are provided in Appendix D in the Final EIS. This appendix also includes a series of station area maps showing bus routes and connections to fixed guideway stations. As stated in Section 3.4.2 of the Final EIS, most fixed guideway stations will offer connections to local bus routes. In some cases, an off-street transit center either already exists or will be built to accommodate transfers. In other cases, an on-street bus stop with dedicated curb spaces or a pullout will be located adjacent to the fixed guideway station. Paratransit vehicles will be accommodated at all stations and, in some cases, space for private tour buses, taxis, and/or special shuttles also will be included.

Each station included an analysis of space requirements for all access functions, including private shuttles and school operations. The amount of space provided at each station was based upon both existing operations and possible future services.

Table 3-20 in the Final EIS identified mode of access from local bus and other modes to the stations. Transfers from bus to rail account for the largest share under any project alternative.

Regarding the park-and-rides, only one facility is planned to be in a garage; the others will be surface parking lots. The Pearl Highlands Station will have a multi-story parking garage with a direct access ramp from the H-2 Freeway to be used by buses and cars.

This station is surrounded by major roadways, including the H-1 and H-2 Freeways, Farrington Highway, and Kamehameha Highway, which will make it a very popular park-and-ride location.

Regarding spillover parking, a detailed table of station-by-station daily spillover demand has been added as Table 3-22 to the Final EIS. As noted in Section 3.4.4 of the Final EIS, actual spillover parking at guideway stations will be affected by several factors such as availability of parking, changing conditions that will affect actual access to stations, and future development in station areas.

As indicated in Section 4.6.3 of the Final EIS, ongoing coordination efforts with the public will help develop design measures that will enhance the interface between the transit system and the surrounding community.

West Loch, as well as Pearlridge, Iwilei, and Ala Moana Center, are all urban neighborhood stations that will be accessed primarily by bus, walking, bicycle, and passenger drop-off. However, the model also predicts some demand for parking at these locations. The City will conduct surveys to determine the extent of spillover parking near the stations and implement one or more mitigation strategies as needed. Potential strategies include the following:

- *Parking restrictions*
- *Parking regulation*
- *Permit parking*
- *Shared parking arrangements*

Once implemented, strategies will be monitored and adjustments will be made as needed.

As stated in Section 2.5.5 of the Final EIS, Pedestrian and Bicycle Access, design criteria developed for stations place the highest emphasis on walk and bicycle access. The Design Criteria provide specific direction for pedestrian and bicycle access features at stations. For example, the criteria state that adequate pedestrian circulation routes shall be provided with an emphasis on avoiding pedestrian and vehicular conflicts and enabling good visibility to each station entrance. This emphasis will be complemented by distinct and clear graphic signage. For bicycle access, the criteria include language stating that racks shall be placed at the station plaza near the station entrance where public visual surveillance is possible and/or where closed circuit television monitoring is present.

Draft EIS Comments

The ongoing station area planning and design process addresses issues raised by the commenter and focuses on the characteristics and preferences of communities surrounding each station. The City is conducting public station design workshops to engage the public about rail stations and provide opportunities to residents to contribute ideas about the appearance of station entryways in their communities. Ideas generated at the workshops will be incorporated into the station planning process. For more information and to get involved in this process, please visit the project website at www.honolulustransit.org.

Regarding impacts to Halekauwila Street, the guideway will be supported by straddle-bent columns within the existing right-of-way. As discussed in Section 4.8.3 of the Final EIS, this will create a sense of enclosure for drivers and pedestrians. Some of the on-street parking will need to be removed, but existing access will be maintained.

The columns needed to support the guideway along Halekauwila and Kona Streets will be spaced at intervals of 120 to 150 feet. As part of the Final Design process, RTD has developed specifications and design criteria to address the City's requirements for the Project, which will include final placement of columns. Minimizing effects to adjacent

land uses will be a key consideration. As indicated in Section 3.4.3 of the Final EIS, the guideway placements will not affect traffic operations. In addition, as shown in Table 3-25 of the Final EIS, no sidewalks will be closed as a result of the Project.

Table 3-24 in the Final EIS lists project-related effects on parking (on and off street) and loading zones. As shown in this table, loading zones on Kona Street will not be affected by the Project, but parking spaces will be removed to make room for support columns. Access to businesses will be maintained.

Acquisitions, displacements, and relocations are discussed in Section 4.4 of the Final EIS. Property will be purchased at market rates. As stated in Section 4.4.3 of the Final EIS, compensation will be provided to affected property owners, businesses, or residents in compliance with all applicable Federal and State laws and will follow the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act. It is beyond the scope of this EIS to predict where businesses will choose to relocate, if needed.

The DTS has considered the complexities and interdependencies of the Kakaako district and, overall, the Project is expected to strengthen the district's function as an employment center, although the nature of businesses in the future may be different than those in the past. The Project also could bring in new customers for businesses and services because of the increased mobility and access the new transit mode will bring to a wider region.

Kapiolani Boulevard was examined as a potential alignment during the Alternatives Analysis phase and was rejected for a variety of reasons, including impacts to traffic and right-of-way needs that would affect property access and would require removal of street trees, many of which are considered notable, excellent, or exceptional.

Ala Moana Center Station will be the busiest in the system and will continue to be a vital link for transportation services in the future. Currently, 42 buses serve Ala Moana Center on Kona Street in the a.m. peak hour, with 47 in the p.m. peak hour. These numbers will increase to 60 buses in the a.m. peak hour and 57 buses in the p.m. peak hour in the 2030 bus network. However, the number of routes operating will decrease from 21 routes to 11 routes. This consolidation of bus routes will make it easier for both residents and visitors, and create efficiencies in transfers from one mode to another. This is what is referred to as "enhanced service" in the Draft EIS.

During the peak hour, the University of Hawaii at Manoa will be served by 23 buses on Kona Street, while 21 buses will serve Waikiki. Average headways (time between buses) to both of these destinations will be less than three minutes. The major bus routes on Kona Street will be operated dynamically such that intervals between buses could be adjusted as passenger demands warrant to avoid transferring passengers accumulating on sidewalks. A seamless transfer is being designed to alleviate the types of problems referred to in your comments. This is possible with consolidation of bus routes on Kona Street, even as the number of transit riders is increasing.

A bus staging area has been identified and is being developed just Ewa of Pensacola Street between Kona Street and Waimanu Street. This staging area will accommodate

five 60-foot buses for schedule recovery and layover currently occurring along Kona Street, and to provide capacity for additional in-service buses.

Accommodating walk and bicycles access to stations will also be important. As stated previously, design criteria developed for stations place highest emphasis on walk and bicycle access.

In response to your comment, Section 4.2.2 of the Final EIS has been revised to include summaries of the Waipahu Town Plan (Waipahu Special Area Plan) (1995) and Pearl Harbor Historic Trail Master Plan prepared by the City and County of Honolulu (May 2001).

As indicated in Chapter 3 of the Final EIS, overall access to public transit will be enhanced with the Project. Substantial project ridership will be provided by local bus and people walking and biking to the station. Bus and walk/bike access to stations will account for 90 percent of total trips in the a.m. peak period (Table 3-20 in the Final EIS). Access to stations will be enhanced by accommodating bicyclists and pedestrians. Several stations will be located near existing or planned bicycle facilities.

Section 3.4.2 of the Final EIS describes station characteristics, including how various access modes will be accommodated by the Project. As is the case with all stations, the Waipahu, Leeward Community College, Pearl Highlands, and Pearlridge Stations will accommodate bicyclists by providing racks or lockers. Bus transfers will be provided at off-street facilities at several stations, including Waipahu, Pearl Highlands, and Pearlridge. Bus routes at these stations are noted in Figures 2-21, 2-23, and 2-24 of the Final EIS. No bus routes are identified at the Leeward Community College Station; however, given proximity to the college, walk access will likely be the dominant mode.

As also stated previously, design criteria developed for stations place highest emphasis on walk and bicycle access.

Park-and-ride facilities will be provided at stations with the highest demand for drive-to-transit access. Auto access will be provided at the Pearl Highlands Station, with park-and-ride stalls located in a garage.

As noted in Chapter 2 of the Final EIS, bicycle facilities in the form of racks and/or lockers will be provided near each station entrance. Bicycles will be allowed on trains and regulated by a bicycle policy that is being developed. Station area characteristics will be completed during Final Design.

As noted in Section 3.4.2 of the Final EIS, ridership information for the Project is based on demand projections, including demand for parking, for 2030. Location and sizing of the park-and-ride facilities is based on estimated long-term demand and availability of land near stations. There is currently no plan to charge for using park-and-ride facilities, but this may change in the future. The location of the Pearl Highlands park-and-ride was established after reviewing a variety of alternatives. With the direct ramp connection from the H-2 Freeway, this facility will have a large demand that can only be accommodated with a multi-level structure. Alternatives to surface parking lots, such as

shared parking, are possible in the future as transit-oriented development (TOD) occurs around stations.

The Final Design process will include consideration for appropriate pedestrian crossings along Farrington and Kamehameha Highways. As part of this process, DTS has developed specifications and design criteria to address the City's requirements for the Project. Section 4.6.3 of the Final EIS contains a general discussion of project-influenced pedestrian access within neighborhoods.

Street trees along the project alignment are discussed in Section 4.15 of the Final EIS. Twenty-eight Notable true kamani trees on the makai side of Dillingham Boulevard will be removed. As stated in your letter, trees on the makai side of the street are already periodically pruned because of the presence of utilities. Trees on the mauka side of Dillingham Boulevard are not pruned and will be preserved. The State Historic Preservation Division has determined that some trees on Dillingham Boulevard are eligible for the historic register. As illustrated in Table 4-33, the Project will not affect any trees on Kapiolani Boulevard. Affects to street trees will be mitigated by transplanting existing trees or planting new ones, where possible. Trees suitable for transplanting that are displaced by construction will be relocated to C&C project nursery until they can be transplanted to another part of the project area. The City will coordinate with Hawaii Department of Transportation's highway landscape architect. The location where street trees will be transplanted will be selected based on project-specific criteria that could include the following:

- Areas where existing landscaping will be lost along the corridor*
- Areas where opportunities exist for enhancing existing streetscapes near the study corridor*
- Areas where stations and parking lots will be constructed*
- Areas where shared benefits will be accomplished, such as areas adjacent to parks or historic sites*

In addition to transplanting existing trees, plans for new plantings will be prepared by a landscape architect during Final Design to further mitigate effects to street trees. To mitigate any substantial effects in areas that require tree removal, special attention will be given to developing landscaping plans so that new plantings will provide similar advantages to the community. If new plantings will not offer equitable mitigation (e.g., older mature trees that are removed), additional younger trees will be planted that will, in time, develop similar benefits.

The Final EIS acknowledges that the visual impact at Viewpoint 3 will be high, and that some views will be obstructed. Overall, it is noted in Section 4.8 of the Final EIS that changes to some views will be unavoidable, and depending on the degree of view obstruction or blockage, some view changes will be substantial. The viewer's response to this change will vary with exposure and sensitivity.

As stated in Section 4.8.3 of the Final EIS, the following measures will be included with the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

- Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
- Coordinate the project design with the City's transit-oriented development program within the Department of Planning and Permitting.*
- Consult with the communities surrounding each station for input on station design elements.*
- Consider specific sites for landscaping and trees during Final Design when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will mitigate potential visual impacts.*

The Project will provide users, including tourists, with expansive views from several portions of the corridor by elevating riders above highway traffic, street trees, and low structures adjacent to the alignment. In Section 4.8.3 of the Final EIS, specific environmental, architectural, and landscape design criteria are listed that will help minimize visual effects of the Project.

As discussed in Section 4.2.2 of the Final EIS, development plans for the Ewa area direct new growth and supporting transit facilities to growth centers. Section 4.2.3 of the Final EIS states that the Project is consistent with adopted State and Local government transportation and land use plans and policies. Part of the Ewa Development Plan vision for a transit corridor linking the City of Kapolei, Waipahu, and the Primary Urban Corridor (PUC) includes encouragement of higher-density residential and commercial development around the City of Kapolei transit node and the transit corridor.

While a 900-space park-and-ride facility will be provided at the East Kapolei Station, most of the demand is expected to come from local bus access.

Figure 2-17 in the Final EIS shows that there will be station entrances to the East Kapolei Station on both sides of North-South Road. There will be bus stops in front of both station entrances. There will be a pedestrian connection between the park-and-ride facility and the station entrance. There will also be an elevated platform and connecting bridge between the station entrances.

The East Kapolei and UH West Oahu Stations will be directly accessible from bike lanes on North-South Road and from cross streets at the stations. Bicycle riders will be able to park at the stations or take their bicycles onto the trains in accordance with a bicycle policy that will be developed.

In a recent conversation with the DPP, a representative indicated that the Ewa Development Plan update is still being reviewed. The City is expected to adopt the Plan by January 2010 (Bob Stanfield, March 2009).

The key change in the Ewa Development Plan update is creation of an "urban growth boundary." Those falling within it do not need to come before the City Council for a development plan amendment before applying for zoning. The Plan states that "[a]s part of the Development Plan vision for a transit corridor linking the City of Kapolei, Waipahu, and the PUC, higher density residential and commercial development should be encouraged around the City of Kapolei transit node and the transit corridor..." This vision remains in the adopted plan.

As stated in Section 4.2.2 of the Final EIS, development plans for the Ewa area direct new growth and supporting transit facilities to growth centers. Section 4.2.3 of the Final EIS states that the Project is consistent with adopted State and Local government transportation and land use plans and polices. The Ewa Development Plan is discussed in more detail in Section 2.1.5 of the Land Use Technical Report.

Population and employment projections are from the Hawaii Department of Business, Economic Development, and Tourism and are incorporated into the travel-forecasting model of the OahuMPO. All information upon which the forecasts rely is available from the OahuMPO and discussed in the Travel Forecasting Results and Uncertainties Technical Report.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Honolulu High-Capacity Transit Corridor Project

Welcome to the Honolulu High-Capacity Transit Corridor Project's Public Hearing for the Draft Environmental Impact Statement/Section 4(f) Evaluation.

This public meeting and hearing has been designed to inform the public about the transit project, explain materials contained in the Draft EIS, answer questions from the public, and collect public input on project issues related to the Draft EIS, Section 106 of the National Historic Preservation Act, Section 4(f) of the U.S. Department of Transportation Act, and floodplains affected by the project.

Please review the project information and ask project staff any questions about the project that you might have. The Draft EIS is available on the project website at www.honolulutransit.org.

You may provide official comments in several ways. Here at this Public Hearing you may provide oral comments to a court reporter who will record them for the record or use this form to provide written comments. After the meeting, you may provide an on-line comment at www.honolulutransit.org or use this form to send a written comment to the Department of Transportation Services. All comments must be postmarked or received by January 7, 2009 in order for them to be included in the Final EIS.

Mr. Leslie A. Among
1720 Ala Moana Boulevard, E103
Honolulu, Hawaii 96815

Dear Mr. Among:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall indentify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The proposed future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of this Final EIS. However, the future extensions are not part of this Project; thus, they are not required to be evaluated under Chapter 343 of the Hawai'i Revised Statutes and the NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in this Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time.

Mr. Leslie A. Among
Page 2

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

RECEIVED
DIRECTOR'S OFFICE
DEPT. OF TRANSPORTATION SERVICES
FEB 5 12:36

Dear Mr. Yoshioka,

The Draft Environmental Impact Statement – (DEIS) – of the City's proposed rail system is incomplete.

Before the public can make an informed decision about this project; they must have a point-by-point comparison of the possible transportation systems.

Your transportation team spent time mentioning the "Do Nothing" choice. In reality, "Doing Nothing" will never be a choice. The leeward coast needs relief.

The public was given the opportunity to vote whether they wanted rail or not, but they were not provided information to compare the systems in order to make an informed decision. Only Rail was advertised, - for months -, at public expense.

Colorful T.V. ads paid by the tax payers were at best 50% right. Your consultants were paid big dollars to push the Mayor's choice. At community meetings you only presented the rail project, - nothing about possible alternatives. The "Go Rail" team came to neighborhood meetings and presented the Mayor's message, but they couldn't or wouldn't answer the questions.

In the beginning of the rail discussion, the League of Women Voters secured one hour of T.V. time for a round-table discussion on transportation, but the City refused to participate. Rick Hamada provided time on his Monday morning program for discussion on the transportation issue, but after several programs, the City's team refused to participate.

During the Primary, the Mayor participated in only one community candidate forum. It showed that Panos Prevedouros presented many concerns to the Mayor's project. If the rail project is so right for Oahu, the Mayor's team and the Mayor should have been able to discuss the project and answer all community questions in detail. They refused to do so.

Another huge concern of this project is the cost. I don't think you can possibly know what the cost will be?, especially since major changes are being made weekly. The cost could end up being more than the City of Honolulu, the County of Oahu can afford. When we add up all the basic infrastructure projects that must be of priority, this rail project at \$5 BILLION plus is too costly for tax payers to handle. There are too many unknowns. Infact the Mayor was just in Washington D.C. with his hand out for Federal funds to pay for Oahu's basic projects. We can't afford this rail project now or maybe never, especially when we have alternative choices.

Professor Panos Prevedouros and his University students have presented a public report on transportation alternatives, but your team has ignored it.

There simply has not been an honest presentation of the financial and transportation impacts on Oahu.

I am very concerned that this DEIS does not fit our Hawaiian Sense of Place. We must step back and specifically compare all alternatives, -one to the other,- to be certain that we agree on a project that we can afford and that meets our needs.

Dear Ms. Anderson:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The "Do Nothing" alternative, or No Build Alternative as it is referred to in the Draft EIS, is the baseline study of existing and future characteristics of the study area. Thus, evaluating the No Build Alternative is mandatory and must remain as an alternative in both the Draft and Final EISs.

Public involvement concerning the Project has been continuous since the beginning of this Project through print, radio, and television media, as well as presentations by the Project Team to the community. Members of the Project Team were at public meetings and were available to answer questions at those meetings.

Regarding the cost of the Project, financial studies have been prepared for the Project and are discussed in Chapter 6. FTA imposes guidelines for estimating costs to prevent

Ms. Eve G. Anderson
Page 2

overruns. Cost estimates are carefully reviewed by various FTA representatives and risks and uncertainties are considered in developing financial plans for the Project. Chapter 6 of the Final EIS discusses this along with other financial information. The Federal government will contribute between 20 and 25 percent of the total capital cost. In addition, information on transportation impacts is included in Chapter 3.

In addition, the Project Team has studied various alternatives and ideas brought forth from those outside the Project and have determined, in conjunction with FTA, that the current selection of an elevated steel wheel on steel rail alternative will most benefit Oahu. Efforts are being undertaken to ensure that stations reflect the sense of place of the area where they are located. As discussed in Section 8.4 of the Final EIS, the City is conducting workshops with communities that will have rail stations. The purpose of the workshops is to engage the public about rail stations and give opportunities to residents to contribute ideas about the appearance of station entryways in their areas. Ideas generated at the workshops will be incorporated into the station planning process. For more information and to get involved in this process, please visit the project website at www.honolulutransit.org.

The alternatives presented in Chapter 2 of the Final EIS expand upon the Draft EIS. Section 8.6.1 in the Final EIS summarizes comments received from the public on alternatives considered. The Final EIS, as presented, documents and evaluates the economic, social, and environmental impacts on the natural and built environments of the alternatives, including the No Build. The Project is consistent with existing land use plans and transportation elements of adopted State and Local government plans.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Dear Mr. Appleby:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

Chapter 2, Section 2.5.7 of the Final EIS discusses park-and-ride facilities. The size and capacity of park-and-ride facilities are presented in Table 2-8. A total of 4,100 park-and-ride spaces are planned, distributed over four locations. As stated in Section 2.5.7 with the exception of Pearl Highlands, which will be a parking structure, all park-and-ride lots are expected to be constructed as surface parking. Criteria has been developed that will guide design of Project elements, including park-and-ride facilities. As indicated by Chapter 6 of the Final EIS (Section 6.3.2) potential operating and maintenance funding sources do not include revenues from Project park-and-ride facilities. There are currently no plans to charge for parking at park-and-rides.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulustransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299.

Mr. Ed Appleby
Page 2

Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Subject: DEIS for Rail Transit System

I want to make a comment and receive a
response concerning the DEIS on the Mayor's
Rail Transit DEIS.

- a. In Hawaii whenever construction is
done, Hawaiian bones or iwi are found.
This creates tremendous delays in
construction and increased costs. The
DEIS does not adequately address this
issue as it will become the major
issue of the construction. I want to
know what the contractors will do and
what provisions have been made to pay
for the increases in costs and
community concerns when construction
unearths Hawaiian bones.

Dear Mr. Arakaki:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

In the event that burials are encountered, they will be identified and managed in compliance with applicable laws. This will include consulting with project proponents, the Oahu Island Burial Council, State Historic Preservation Division, and recognized lineal and/or cultural descendents to develop burial treatment plans. While this could slow down the project development process, applicable laws will be followed. The treatment of burials discovered during construction will be included in the Programmatic Agreement (PA). This is discussed in Section 4.18.11 of the Final EIS. The complete PA is available in Appendix H of the Final EIS. The Project has built contingencies into the total Project cost estimates to account for the potential for burials to be found.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this

Evelyn Arakaki; 91-030 Amio Street, ewa beach hi 96706

December 6, 2008

To Mr. Wayne Yoshioka concerning the DEIS for the rail system.

Dear Mr. Yoshioka,

I would like to have this comment made to the DEIS on the rail transit system. A reply would be appreciated.

My comment: I have lived in Hawaii most of my life. We have a unique and beautiful sense of beauty many call it a Hawaiian sense of place. The visual image of an overhead train 30 feet over my head and which can be viewed from all over the south side of Oahu will be very ugly. The DEIS does not address this point that the train will be a visual blight and give a negative impression to our visitors. What will the city do and how much will it cost to make the train acceptable to the residents and contribute to the view instead of taking away our beauty?

Dear Ms. Arakaki:

**Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement**

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal:

The island's unique visual character and scenic beauty were considered in the visual and aesthetic analysis presented in Section 4.8 of the Final EIS. It is acknowledged that the guideway and stations will noticeably contrast with smaller buildings and change the character of some areas. In addition, some views Downtown and in the other areas, including protected views, will be blocked and some views will change substantially. Overall, the Project will be set in an urban context where visual change is expected and differences in scales of structures are typical. Noticeable changes to views will occur where the project elements will be near existing views or in the foreground of these views. Viewpoints not located near the alignment or stations will generally be less affected by changes in the visual environment because they will take in a longer, more expansive landscape.

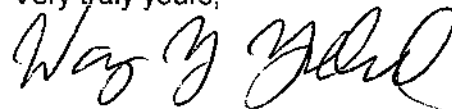

Guideway and column materials and surface textures will be selected in accordance with generally accepted architectural principles to integrate the guideway with its surrounding environment. Landscaping and streetscape improvements will mitigate potential visual impacts. In addition, the following measures will be included to minimize negative visual effects and enhance the visual and aesthetic opportunities that the Project creates:

- *Develop and apply design guidelines that establish a consistent design framework for the Project with consideration of local context*
- *Retain existing trees where practical and provide new vegetation*
- *Shield exterior lighting*
- *Coordinate project design with the City's transit-oriented development program within the Department of Planning and Permitting*
- *Consult with communities surrounding each station for input on station design elements*

The Project will provide users, including tourists, with expansive views from several portions of the corridor by elevating riders above highway traffic, street trees, and low structures adjacent to the alignment. In Section 4.8.3 of the Final EIS, specific environmental, architectural, and landscape design criteria are listed that will help minimize visual effects of the Project.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Issuance of the Record of Decision under NEPA and acceptance of the Final EIS by the Governor of the State of Hawaii are the next anticipated actions and will conclude the environmental review process for this Project.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Honolulu High-Capacity Transit Corridor Project

Welcome to the Honolulu High-Capacity Transit Corridor Project's Public Hearing for the Draft Environmental Impact Statement/Section 4(f) Evaluation.

This public meeting and hearing has been designed to inform the public about the transit project, explain materials contained in the Draft EIS, answer questions from the public, and collect public input on project issues related to the Draft EIS, Section 106 of the National Historic Preservation Act, Section 4(f) of the U.S. Department of Transportation Act, and floodplains affected by the project.

Please review the project information and ask project staff any questions about the project that you might have. The Draft EIS is available on the project website at www.honolulustransit.org.

You may provide official comments in several ways. Here at this Public Hearing you may provide oral comments to a court reporter who will record them for the record or use this form to provide written comments. After the meeting, you may provide an on-line comment at www.honolulustransit.org or use this form to send a written comment to the Department of Transportation Services. All comments must be postmarked or received by January 7, 2009 in order for them to be included in the Final EIS.

Dear Ms. Au:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final

Ms. Jane Au
Page 2

EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

December 8, 2008

Mr. Wayne Yoshioka
Director of Transportation Services
City and County of Honolulu
650 S. King St., 3rd Floor
Honolulu, HI 96813

Dear Mr. Yoshioka:

I have several questions regarding issues I feel are not adequately addressed in the Draft Environmental Impact Statement which was issued far too late for the voting public to review and, therefore, has become suspect of political overtones.

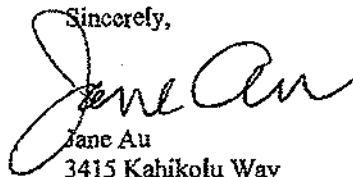

I am relieved that the Airport route is now being considered rather than the Salt Lake Route. I have been deeply concerned and depressed at the thought of this mammoth project running the length of our beautiful neighborhoods of Foster Village, Aliamanu and Salt Lake. I continue to be concerned about the aesthetics of this structure and its impact on the beauty of the Ewa flatlands and the overwhelming "bigness" of all that concrete running through the city areas. The stations also appear to be massive structures. I do not feel the DEIS has sufficiently addressed the issue of the visual effect of the transit system.

How will overhead structures, the noise and vibration levels and the interference during construction affect the many businesses and schools along the alignment? Will the businesses and schools be able to continue operation?

At the end of this project, the City will be forced to pay outrageous prices for property because land owners will have the upper hand. How seriously has the possibility of setting up a temporary rail yard near the airport or Aloha Stadium been considered?

I would also like to know what the future of Aloun Farms will be if they are forced to relocate.

Sincerely,

Jane Au

Dear Ms. Au:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your preference for the Airport Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been identified as the Preferred Alternative as described above. Compared to the other alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly lower impacts to the natural and built environment. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative.

The Alternatives Analysis phase, which preceded the EIS process, is documented in Chapter 2 of the Final EIS. It evaluated a range of modal and general alignment alternatives, in terms of their costs, benefits, and impacts. The scoping process for the Alternatives Analysis involved a presentation of the viable alternatives to the public and interested public agencies and officials to receive comments on the Purpose and Need, alternatives, and scope of the analysis. Scoping for the EIS followed the FTA process that provides for a culling of alternatives studied in the EIS through an Alternatives Analysis. The scoping process initiated for the Alternatives Analysis included a variety of highway, bus and fixed guideway options for consideration. During the later scoping effort for the EIS, the public was requested to propose alternatives that would satisfy the purpose and need at less cost or with greater effectiveness, less environmental or community impact and to propose alternatives that were not previously studied and eliminated for good cause. The only alternative that emerged that met these criteria was a fixed-guideway alternative following several alternative alignments. All reasonable alternatives that emerged from these processes were ultimately evaluated in the Draft and Final EISs.

The island's unique visual character and scenic beauty was considered in the visual and aesthetic analysis presented in the Draft and Final EISs. As discussed in Section 4.8 of the Final EIS, the Project will be set in an urban context where visual change is expected and differences in scales of structures are typical.

The assessment of visual effect due to the Project as described in Section 4.8.3 of the Final EIS considers changes to the visual landscape and viewer responses to those changes. This includes the existing development along the Project alignment. Within the Project corridor the environment changes from rural at the Wai'anae end of the corridor to dense high-rise development at the Koko Head end.

As part of the design process, the City has developed design principles, which are identified in the Honolulu High-Capacity Transit Corridor Project Compendium of Design Criteria (RTD 2009m) that will be implemented in final design to minimize visual effects of the Project. For example, guideway materials and surface textures will be selected in accordance with generally accepted architectural principles to achieve effective integration between the guideway and its surrounding environment. Landscape and streetscape improvements will mitigate potential visual impacts, primarily for street-level views.

Other measures to address visual impacts of the Project are being developed through the station design and planning process. The initial station area plans and design guidelines were first developed with coordination between DTS and the Department of Planning and Permitting (DPP). The next level of transit station design focuses on integrating individual neighborhood characteristics of the communities served by the stations.

The following mitigation framework will be included in the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

- Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*

- *Coordinate the project design with City TOD planning and DPP.*
- *Consult with the communities surrounding each station for input on station design elements.*
- *Consider specific sites for landscaping and trees during the final design phase when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will serve to mitigate potential visual impacts.*

Section 4.8.3 of the Final EIS, Design Principles and Mitigation includes information related to the mitigation framework described above. Specifically architecture and landscape design criteria include guidelines regarding site design, materials and finishes, and lighting, which apply to stations, station areas, and the guideway.

It should also be noted that the Project will provide users, including tourists, with expansive views from several portions of the corridor by elevating riders above highway traffic, street trees, and low structures adjacent to the alignment. In Section 4.8.3 of the Final EIS, Environmental Consequences and Mitigation under the heading Design Principals and Mitigation, specific environmental, architecture and landscape design criteria are listed that will help minimize visual effects of the Project.

The City will continue to consult with the communities surrounding each station for input on station design elements.

Noise and vibration levels during construction will be subject to and follow local noise ordinances, so construction noise and vibration will not affect how businesses and schools operate. During transit operations, no noise or vibration impacts are predicted for any schools or businesses on the proposed alignment.

Businesses and schools will still be able to operate during and after construction of the elevated guideway.

Lastly, every attempt is being made to minimize property takes and relocations along the proposed right-of-way, and is one reason for the decision to elevate the guideway. Property will be purchased at market rates. As stated in Section 4.4.3 of the Final EIS, those from whom property is to be acquired will be treated according to the requirements of the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act. It provides for purchase at fair market value and includes relocation assistance to those affected. The Uniform Relocation Act provides that those in need of relocation must be placed in comparable quarters. It should be noted that because of the design of the system, it impacts few properties compared to other projects of this size and requires full acquisition of only 33 properties as indicated in Section 4.4.3. The City has right of condemnation in cases where property owners attempt to demand rates substantially above the market rate for a property. There is not enough available land in the vicinity of either the Airport or Aloha Stadium for a maintenance and storage facility.

One of the two site options for a maintenance and storage facility is located within Aloun Farms. The other site option is located near Leeward Community College and is the site of a former Navy fuel drumming operation. This is the preferred alternative and discussions have been underway with the Department of Hawaiian Homelands to acquire it. If the Project can

Ms. Jane Au
Page 4

acquire this site, the impact on agricultural lands on Oahu will be much less than is described in the Draft EIS. Aloun Farms' headquarters, located at the site of the other maintenance and storage facility, will not have to move.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is fluid and cursive, with the first name "Wayne" being the most prominent.

Dear Ms. Avenido:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses comments regarding the above-referenced submittal:

Your preference for the Airport Alternative has been noted. While each of the alternatives includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana Center has been selected as the preferred alternative. The identification of the Airport Alternative as the preferred alternative was made by the City to comply with FTA's NEPA regulations that state that the Final EIS should focus on the preferred alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative, public input on the Draft EIS, and City Council Resolution 08-261 identifying the Airport Alternative as the Project. The selection of the Airport Alternative is described in Chapter 2 of this Final EIS. The discussion of the alternatives considered is included in Chapter 2 of this Final EIS and the Alternatives Analysis. As discussed in Section 3.4.2 of this Final EIS, the Airport Alternative will carry the most passengers with 116,000 daily passengers and 282,500 daily trips in 2030, thereby resulting in the greatest transit-user benefits. The Airport Alternative

Ms. Mary Avenido
Page 2

will also result in the fewest vehicle miles traveled and vehicle hours of delay, as well as provide access to major employment areas, including Honolulu International Airport, that will have substantially greater ridership than the other alternatives considered.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Issuance of the Record of Decision under NEPA and acceptance of the Final EIS by the Governor of the State of Hawaii are the next anticipated actions and will conclude the environmental review process for this Project.

Very truly yours,

Submission Content/Notes : Have you ever considered having the rail pre-fabricated and shipped here?

Seems that in the long run it would be cheaper, and use a company that already knows how to build a system.

Here it takes forever to get the Ft Weaver Road widened..first it is this and that, then bankrupt company, then out to new bid.

Get it from the mainland and pay the premium if they finish early like the Minnesota bridge.

Here it seems that the longer it takes to complete the better; just ship it and put it together. It would still mean jobs here and the completion time would be much faster.

Dear Ms. Avenido:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

To address your comment, the proposed segmental construction method (see Final EIS Appendix E, Construction Approach) maximizes the amount of work that can be completed off-site, with delivery and erection of pre-cast segments. Contractors will determine the most efficient location to cast the individual segments.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Submission Content/Notes : Here are my suggestions

1. We should start building the rail from East Kapolei instead of from town because the purpose of the rail is to reduce the traffic congestion on the island. If more people take the rail to town, that will not only reduce the traffic congestion from the more and more densely populated Kapolei, Waipahu and Eva areas, it will also relief the traffic jam in town. But if we start building it in town, people still have to drive to town to work. That doesn't really solve the traffic problem at all. We don't have to follow suit of other cities, we need to look at where the problems are on this island.

2. The rail should go through Salt Lake instead of the airport. The purpose of the rail is to serve the residents on the island, not tourists. Salk Lake area has a lot of female workers who don't drive, they rely on the bus to commute to work. If the rail goes through Salt Lake, the ridership will probably be higher than in any other areas.

Who will use the rail more? Or how can the rail be used more efficiently? The tourists who come for a visit and travel from the airport to downtown or the residents in Salt Lake who commute everyday to work?

Beside that, if the rail goes through the airport and the tourists take the rail to downtown or Waikiki, how many taxi drivers, travel agencies and car-rental companies will loose their jobs?

In a word, the rail will mostly be paid by the tax payers living on this island; serving the residents should be the priority and the primary purpose of building the rail, not the tourists, who come for visit maybe once in a year or maybe once in a life time.

Dear Ms. Baideme:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your support of the construction phasing has been noted. As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. The first phase of the Project must be connected to the maintenance and storage facility because, in addition to maintenance of equipment and ongoing operations, the maintenance and storage facility houses the main control center for the entire Project, and the required testing and operation of the system could not be completed without access to it. No location has been identified closer to Downtown with sufficient available land to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations*

- *Reduce the time that each area will experience traffic and community disturbances*
- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding*
- *Match the rate of construction to what can be maintained with local workforce and available financial resources*
- *Balance expenditure of funds to minimize borrowing*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

Your preference for the Salt Lake Alternative has also been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been identified as the Preferred Alternative as described above. Compared to the other alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly lower impacts to the natural and built environment. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative.

As discussed in Chapter 3, Section 3.4.2, 9,900 visitors will use the fixed guideway daily, of which 1,800 are to or from the airport. As seen, the Airport Alternative primarily serves residents.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Submission Content/Notes : I highly support a rail system and the airport route. I think it'll be easier to get tourists to not rent a car and use rail, than to get Salt Lake residents to stop using their car to use rail.

Hawaii is expensive enough to visit, so tourists are trying to cut their vacation costs wherever they can. I see tourists on the bus every morning (while I'm commuting to downtown) heading to the airport of Arizona Memorial or the Swap Meet. These tourists don't want to rent a car and pay \$20/day to park it at their hotel.

I don't think rail should only cater to tourists, but I think tourists will adapt to using the system a lot faster and appreciate it and reward us financially for it. Then hopefully, the residents will get of their own cars and follow!

Dear Ms. Barker:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 C.F.R. § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal:

Your preference for the Airport Alternative has been noted. While each of the alternatives includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana Center has been selected as the Preferred Alternative. The identification of the Airport Alternative as the Preferred Alternative was made by the City to comply with FTA's NEPA regulations that state that the Final EIS should focus on the Preferred Alternative (23 C.F.R. § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative, public input on the Draft EIS, and City Council Resolution 08-261 identifying the Airport Alternative as the Project. The selection of the Airport Alternative is described in Chapter 2 of this Final EIS. The discussion of the alternatives considered is included in Chapter 2 of this Final EIS and the Alternatives Analysis. As discussed in Section 3.4.2 of this Final EIS, the Airport Alternative will carry the most passengers with 116,000 daily passengers and 282,500 daily trips in 2030, thereby resulting in the greatest transit-user benefits. The Airport Alternative will also result in the fewest vehicle miles traveled and vehicle hours of delay,

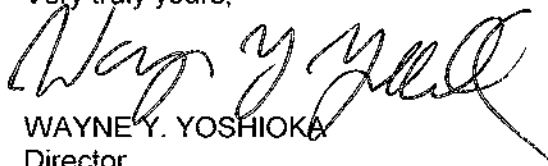

Ms. Audrey Barker
Page 2
February 16, 2010

as well as provide access to major employment areas, including Honolulu International Airport, that will have substantially greater ridership than the other alternatives considered.

With the Airport Alternative, tourists and residents will benefit by having more transportation options. Table 3-13 in the Final EIS shows daily person transit trips by purpose, broken down for residents and visitors. As seen in this table, transit trips for both groups increase with the addition of the Project compared to the No Build Alternative. Daily resident person trips by transit increase 24 percent with the Project compared to without the Project while daily visitor person trips by transit increase 19 percent with the Project compared to without the Project in 2030.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulustransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Issuance of the Record of Decision under NEPA and acceptance of the Final EIS by the Governor of the State of Hawaii are the next anticipated actions and will conclude the environmental review process for this Project.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

RE: Rail related routing of the proposed fixed Rail System

Dear Sirs:

This concerns the inquiry into a feasibility review for the proposed fixed Rail System. If we must have rail, I suggest that the preferred rail alignment be the existing 40 feet rail road right-of-way. This entails the Dillingham's OR&L right-of-way from the old Iwilei Train Station to the Leeward coast of Waianae.

Routing of the rail system through out the Ewa Plains (Kapolei-Aiea) could then be constructed at ground elevation as a possible alternative verses a costly elevated system.

The rail system should also service the Honolulu Airport Terminals which will enhance rail ridership. Please note that the lack of ridership of the elevated rail system in the City of Las Vegas does not serve the McCarran International Airport and is now under consideration.

Further consideration is requested for your planning review for a proposed bridge over the Aiea Wai canal extending University Avenue into Waikiki. The bridge primarily will be used for pedestrians and to include a bus/trolley service or possibly a state of the art light rail system usage linking Waikiki/Moiliili/UH Manoa school campus (i.e. Ft. DeRussy's Kuroda Field - UH Campus).

I champion the involvement of a planning team undertaken by the UH Engineering students/faculty for the development of the conceptual design for this task and to also include the overall beautification design implementation of the much needed University Avenue.

Respectfully,

S. Batufa

Dear S. Batula:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As described in Chapter 2 of the Draft EIS, several alignments were evaluated during the Alternatives Analysis process. One evaluated alignment was the historic OR&L line. A combination of issues, including utilities that have been placed in the right-of-way, poor location in several places, and the previous loss of the right-of-way in several locations, all contributed to the elimination of that option.

The Alternatives Screening Memorandum (DTS 2006a) recognized the visually sensitive areas in Kakaako and Downtown Honolulu, including the Chinatown, Hawaii Capital, and Thomas Square/Honolulu Academy of Arts Special District. To minimize impacts on historic resources, visual aesthetics, and surface traffic, the screening process considered 15 combinations of tunnel, at-grade, or elevated alignments between Iwilei and Ward Avenue. Five different alignments through Downtown Honolulu were advanced for further analysis in the Alternatives Analysis, including an at-grade portion along Hotel Street, a tunnel under King Street, and elevated guideways along Nimitz Highway and Queen Street (Figure 2-4).

The Alternatives Analysis Report (DTS 2006b) evaluated the alignment alternatives based on transportation and overall benefits, environmental and social impacts, and cost considerations. The report found that an at-grade alignment along Hotel Street would require the acquisition of more parcels and could potentially affect more burial sites than any of the other alternatives considered. The alignment with at-grade operation Downtown and a tunnel under King Street, was not selected because of the environmental effects, such as impacts to cultural resources, reduction of street capacity, and property acquisition requirements of the at-grade and tunnel sections, which would cost an additional \$300 million.

The Project's purpose is "to provide high-capacity rapid transit" in the congested east-west travel corridor (see Section 1.7 of the Final EIS). The need for the Project includes improving corridor transit mobility and reliability. The at-grade alignment would not meet the Project's Purpose and Need because it could not satisfy the mobility and reliability objectives of the Project (see bullets below). Some of the technical considerations associated with an at-grade versus elevated alignment through Downtown Honolulu include the following:

- **System Capacity, Speed, and Reliability**—*The short, 200-foot (or less) blocks in Downtown Honolulu would permanently limit the system to two-car trains to prevent stopped trains from blocking vehicular traffic on cross-streets. Under ideal operational circumstances, the capacity of an at-grade system could reach 4,000 passengers per hour per direction, assuming optimistic five minute headways. Based on travel forecasts, the Project should support approximately 8,000 passengers in the peak hour by 2030. Moreover, the Project can be readily expanded to carry over 25,000 in each direction by reducing the interval between trains (headway) to 90 seconds during the peak period. To reach a comparable system capacity, speed, and reliability, an at-grade alignment would require a fenced, segregated right-of-way that would eliminate all obstacles to the train's passage, such as vehicular, pedestrian, or bicycle crossings. Even with transit signal priority, the at-grade speeds would be slower and less reliable than an elevated guideway. An at-grade system would travel at slower speeds due to the shorter blocks, tight and short radius curves in places within the constrained and congested Downtown street network, the need to obey traffic regulations (e.g., traffic signals), and potential conflicts with other at-grade activity, including cars, bicyclists, and pedestrians. These effects mean longer travel times and far less reliability than a fully grade-separated system. None of these factors affects an elevated rail system. The elevated rail can travel at its own speed any time of the day regardless of weather, traffic, or the need to let cross traffic proceed at intersections.*
- **Mixed-Traffic Conflicts**—*The Project will run at three minute headways. However, three-minute headways with an at-grade system would prevent effective coordination of traffic signals in the delicately balanced signal network in downtown Honolulu. A disruption of traffic signal cycle coordination every three minutes would severely affect traffic flow and capacity of cross-streets. Furthermore, there would be no option to increase the capacity of the at-grade rail system by reducing the headway to 90 seconds, which would only exacerbate the signalization problem. An at-grade system would require removal of two or more existing traffic lanes on affected streets. This effect is significant and would*

exacerbate congestion. Congestion would not be isolated to the streets that cross the at-grade alignment but, instead, would spread throughout Downtown. The Final EIS shows that the Project's impact on traffic will be isolated and minimal with the elevated rail, and, in fact will reduce system-wide traffic delay by 18 percent compared to the No Build Alternative (Table 3-14 in the Final EIS). The elevated guideway will require no removal of existing through travel lanes, while providing a reliable travel alternative. When traffic slows, or even stops due to congestion or incidents, the elevated rail transit will continue to operate without delay or interruption.

An at-grade light rail system with continuous tracks in-street would create major impediments to turning movements, many of which would have to be closed to eliminate a crash hazard. Even where turning movements are designed to be accommodated, at-grade systems experience potential collision problems. In addition, mixing at-grade fixed guideway vehicles with cars, bicyclists, and pedestrians presents a much higher potential for conflicts compared to grade-separated conditions. Where pedestrian and automobiles cross the tracks in the street network, particularly in areas of high activity (e.g., station areas or intersections), there is a risk of collisions involving trains that does not exist with an elevated system. There is evidence of crashes between trains and cars and trains and pedestrians on other at-grade systems throughout the country (e.g., Phoenix, Houston, LA). This potential would be high in the Chinatown and Downtown neighborhoods, where the number of pedestrians is high and the aging population presents a particular risk.

- **Construction Impacts**—*Constructing an at-grade rail system could have more effects than an elevated system in a number of ways. The wider and continuous footprint of an at-grade rail system compared to an elevated rail system (which touches the ground only at discrete column foundations, power substations, and station accessways) increases the potential of utility conflicts and impacts to sensitive cultural resources. In addition, the extra roadway lanes utilized by an at-grade system would result in increased congestion or require that additional businesses or homes be taken to widen the roadway through Downtown. Additionally, the duration of short-term construction impacts to the community and environment with an at-grade system would be considerably greater than with an elevated system. Because of differing construction techniques, more lanes would need to be continuously closed for at-grade construction and the closures would last longer than with elevated construction. This would result in a greater disruption to business and residential access, prolonged exposure to construction noise, and traffic impacts.*

Because it is not feasible for an at-grade system through Downtown to move passengers rapidly and reliably without significant detrimental effects on other transportation system elements (e.g., the highway and pedestrian systems, safety, reliability, etc.), an at-grade system would have a negative system-wide impact that would reduce ridership throughout the system. The at-grade system would not meet the Project's Purpose and Need and, therefore, does not require further analysis.

Your preference for the Airport Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been identified as the Preferred Alternative as described above. Compared to the other alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly lower impacts to the natural and built environment. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative.

The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The proposed future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of this Final EIS. However, the future extensions are not part of this Project, thus they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in this Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time. Bus service between Ala Moana Center and Waikiki and UH Manoa will be enhanced until those extensions are built. University of Hawaii students have participated in several project planning activities. However, the Project terminates at Ala Moana Center and will not affect University Avenue.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Subject: Proposed Honolulu Rail Project

Mr. Ted Matley FTA Region IX 201 Mission Street, Suite 1650 San Francisco, CA 94105

Dear Sir,

These comments are in regard to the DEIS for the proposed elevated fixed rail system for Kapolei to Honolulu.

The original justification made for a fixed rail system was that it would "solve" our problems of traffic congestion that occur on H1 principally during the morning and afternoon commute times. When it was reported that this plan would do very little for traffic, the justification given to the public for why it was "needed" was changed to allege our need for an "alternative" to driving or using the bus system. Later, during the campaign to push the project to voters, the "need" for the the public to support the project was centered around its supposed beneficial "boost" to our local economy. When funds come into our local economy from outside then a "multiplier effect" might provide a modest boost to our economy. In this case, the overwhelming majority of funding comes from the pockets of local residents. There is no boost except to the few citizens who will feed from the public trough. The promotional campaign launched prior to the November referendum was heavily financed by both the unions and taxpayer money under the guise of an "information" program from the Mayor's office. Many citizens who do not support the project are upset at the blatant way in which the City Administration: 1. did everything it could to prevent the Stop Rail Initiative from even getting on the ballot, 2. spent taxpayer funds to clearly promote the project with misleading and incomplete information about it under the guise of an "informational campaign", and 3. suppressed the negative facts contained in the DEIS until two days before what turned out to be a very close election. The voters were hoodwinked about the supposed benefits of this project through a very deceptive yet slick advertising blitz.

Among the new facts that came out in the final hours before voters were able to cast their vote on the project included the increased price tag for rail. The public had been fed a steady diet of propaganda that always used a much lower figure (if \$3.7 billion can be considered "low"). The City has been successful in dismissing concerns about the costs for this project that will fall upon Honolulu's residents. The increase in the excise tax is seen as mostly invisible by most people even though it represents the largest transit tax imposed on individuals of any state and is also one of the most regressive methods of raising tax money, causing more distress upon lower incomes (if "invisibly"). The cost of living here has become even higher than it already was. It will become higher yet because of this project and because of the perpetual operating subsidy it will require.

These cost figures for the rail project are just estimates, of course. They significantly lag behind current realities. To the

degree that economic conditions are volatile the figures will be unreliable. Add to that the fact that the figures are prepared and cleared by the same self serving entities that may profit in one way or another due to the incestuous relationships of consultants, contractors and public figures involved. Finally there is the undeniable fact that no large public project in Hawaii has ever come in even remotely close to budget. An extra billion here. An extra billion there. Pretty soon it starts to add up to big money.

And how's that tax collection going? Not too well. World events transpired to reduce the take of this "invisible", and therefore seemingly painless, tax. Revenues are not keeping up with projections. Read the national news. It will get worse. And Hawaii's economy is not immune to the coming deep and prolonged recession. Residents here will suffer along with the rest of the world. Does this seem like a good time to burden us with the exorbitant costs of the most expensive rail transit project, per resident or per mile in the country? One that accomplishes so little?

Who would think so? Well, of course the giant mainland contractors who would profit from us to build it, of course. They have spent considerable money themselves to promote the project and to contribute generously to politicians who also support it. Those politicians thus have a personal interest in pushing the project for the benefit to their campaign coffers and to gain influence with the powerful unions who have a notoriously short sighted view of what is good for Hawaii. Basically, the unions use all their significant clout to support any large project that would funnel jobs to their members regardless of its merits or cost to taxpayers. The construction unions spent heavily before the election to influence the voters to approve the project. The big money spent to inundate the public with slick ads in the newspapers and relentless radio and television advertising for rail by the City and these others succeeded in deceiving just enough voters for a narrow victory to proceed with the project. Because of the understated costs and decreased revenues the need for additional tax increases and/or property tax increases in the future to prop up this project is obvious, and yet neither the City Administration nor the City Council has been forthcoming about this inevitability.

Beyond the cost or our ability to pay, this rail project is a very bad idea. As noted above, it will offer little relief to drivers on Oahu. Relatively few citizens use the existing bus mass transit system today. It is speculative to assume vastly more will use this new system that relies on feeder buses and is so limited in whom it would serve and where it would go. The predictions of time saved by the average commuter using rail over what could be achieved with express buses in dedicated lanes on H1 are negligible. The differences in costs of the two systems are huge. Further, once we have committed public resources to pursue rail, all other potential solutions will be foreclosed and future advances in technologies removed from consideration for Oahu. We will be stuck with a completely rigid and antiquated system for a very, very long time.

The alternatives to rail were never seriously considered. The fix was in for steel on steel fixed rail from the beginning. For example, the proposal for dedicated lanes for buses that was considered involved the taking of an existing lane away from drivers on the H1 and so was rejected as causing more congestion. They never reviewed a plan for dedicated lanes built separately and in addition to existing lanes. Cost of a separated HOV lane were inflated by assuming it needed to be elevated for the entire twenty miles to Kapolei and not considering an express bus system employing a much shorter elevated section that would simply go around or over highway bottlenecks. Other potential improvements to express bus systems were summarily dismissed, as were ideas involving strategic bypasses around the two major choke points on the H1. Major improvements to the H1 are sorely needed, and are not impossible, but would be under the purview of the State, not the City. Improvements to highways and an improved express bus system could serve the interests of the entire island, not just a tiny sliver of the population that might actually use the rail to Kapolei.

Elevated rail will be hideous, cutting through town near the waterfront and dissecting mauka / makai view planes, and noisy, with trains screaming by every three minutes night and day. This will be bad for tourism. When visitors see that Honolulu looks and sounds just like other mainland cities that are much, much larger they will see Honolulu as an urban environment, not a tropical one. They will travel to other destinations in the Pacific. Our economy will further suffer. This is why the Waikiki Improvement Association is opposed to elevated rail being run into Waikiki.

So the benefits for Honolulu of rail are skimpy and overstated and its downside is huge. Why is it being so doggedly pushed? Because it is basically nothing more than a development scheme. It is not about mass transit. It is all about the building of TODs out in what are now empty cane fields along the route. The City is preparing to give developers lucrative tax breaks and zoning exemptions to lure development. It is viewed as an opportunity for creating density where none exists by the entities listed above. It is interesting to note that one of the stations listed in the plan will stop in an empty field because the proposed development there has been withdrawn due to the current economic situation.

Starting the line out at Kapolei and building it in towards town is ludicrous. In twenty years people in Kapolei may possibly be able to ride it as far as Wahiawa? How is that going to help commuters or traffic conditions on the H1? Relief is needed by residents for traffic conditions near Honolulu. This project does little to alleviate traffic on the H1. Its truly outrageous cost is not justified by its sparse benefits to the island's residents. The elevated fixed rail being proposed for this beautiful city is not what we need or can afford. More imaginative solutions are called for, solutions centered around mass transit, not development of TODs. The plan, as it is now, is saturated with inefficiencies and has the very real possibility of being disastrous for Honolulu's citizens and the city itself.

Dear Mr. Bleecker:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Chapter 1 of the Final EIS discusses the Purpose and Need of the Project. The Project is intended to provide faster, more reliable public transportation service in the study corridor than can be achieved with buses operating in congested mixed-flow traffic, to provide reliable mobility in areas of the study corridor where people of limited income and an aging population live, and to serve rapidly developing areas of the study corridor. The Project also will provide additional transit capacity and an alternative to private automobile travel, as well as improve transit links within the study corridor. Implementation of the Project, in conjunction with other improvements included in the Oahu Regional Transportation Plan, will moderate anticipated traffic congestion in the study corridor.

The fixed guideway system will decrease traffic congestion. As shown on Table 3-9 in the Final EIS, volumes on the H-1 Freeway at the Kalauao Screenline will decrease during the a.m. peak hour with the addition of the fixed guideway system. This table shows 2,250 vehicles per hour (vph) will access the H-1 Freeway in the Koko Head-bound direction during the a.m. peak hour under 2030 No Build conditions. However, this number decreases to 11,260 vph with the addition of the fixed guideway system. This improvement addresses the first goal of the Project identified in Chapter 1 of the Final EIS, to improve corridor mobility.

In addition, the fixed guideway system will provide a reliable transportation option because it will operate in an exclusive right-of-way. The reliability will not deteriorate over time, even with projected population growth in the study corridor. This feature of the fixed guideway system addresses the second goal of the Project identified in Chapter 1 of the Final EIS, to improve corridor travel reliability.

The comment about the multiplier effect of construction dollars does not account for the fact that the funding is from "new" funding sources. These are funds that would not have been raised at all by local residents or others without the Project. Moreover, a substantial portion of the funds comes from the Federal government, and over 30 percent of the General Excise and Use Tax (GET) surcharge is paid by tourists and other off-island participants in the economy.

Regarding your comments about the November 2008 election, no election-related advertising was funded by the City and County of Honolulu. The NEPA process is unrelated to any electoral processes.

Your comments regarding finances for the Project are noted. As noted in Chapter 6 of the Final EIS, the Project is based on a financial plan that balances anticipated revenues with costs. This Chapter presents the \$3.5 billion current estimate of GET surcharge revenues and discusses uncertainties associated with the estimate. Revenues would be from the GET Surcharge and Federal funding from FTA Section 5307 and the FTA Section 5309 New Starts funds. GET collections have been lower than anticipated, but the plan is based on several years, which allows for ups and downs in the economy over the course of the collection period. Short-term trends can be accommodated within a range that keeps total revenue at a high enough level to cover the Project's construction costs. Additionally, the financial plan has been updated since the Draft EIS and takes into account the economic downturn. Operating costs that are not covered by fare collections will be funded from the same sources that fund TheBus: Federal funding and subsidy from the City's General and Highway Funds.

As also stated in Section 3.3.2 of the Final EIS, TheBus system serves more than 80 percent of Oahu's developed areas and has about 252,200 boardings on an average weekday. Honolulu has the fourth highest load factor (in terms of bus passenger trips per revenue hour) for bus service in the U.S. TheBus has the highest per capita ridership of any system in the U.S. without a rail system. It is a very well-used system and provides a good indication that ridership forecasts for the fixed guideway are reasonable.

As identified in Section 3.2.1 of the Final EIS, transit ridership forecasts for rail and bus service are based on a travel demand forecasting model used by the Oahu Metropolitan Transportation Organization (OahuMPO) for the Oahu Regional Transportation Plan. The OahuMPO model is based on "best practices" for urban travel models in the U.S. The model is updated approximately every five years to reflect changes in land use, socioeconomic conditions, and transportation network improvements. The model is approved by the OahuMPO Technical Advisory Committee. As indicated in the Final EIS, this modeling approach has proven to be effective in estimating ridership levels in other areas such as Los Angeles County, Salt Lake City, and the Denver region in the last 10 years. This model is based on guidelines established by the FTA. Comments about the speculative nature of the ridership projections and the increase in transit usage are inconsistent with the findings of the studies in Honolulu to date, as noted in Chapter 3 of the Final EIS, and experiences in other communities with recent rail openings, such as in Phoenix.

In addition, Chapter 3 of the Final EIS details the benefits of the Project in terms of travel time and congestion reduction. As shown in Figures 3-5 and 3-7 in the Final EIS, there will be significant transit travel-time benefits, even for areas not directly served by the fixed guideway. As shown in Table 3-14 in the Final EIS, congestion, as measured in vehicle hours of delay, will decrease 18 percent with the Project compared to No Build conditions.

Chapter 2 of the Final EIS summarizes the alternatives screening and selection process. Beginning in the fall of 2005, an initial screening process considered alternatives identified through previous transit studies, a field review of the study corridor, an analysis of current population and employment data for the study corridor, a literature review of technology modes, ongoing work completed as part of the Oahu Regional Transportation Plan 2030 (ORTP) prepared by the Oahu Metropolitan Planning Organization (OahuMPO) (OahuMPO 2007), and public and agency comments received during the formal Alternatives Analysis scoping process.

The screening process is documented in the Honolulu High-Capacity Transit Corridor Project Alternatives Screening Memorandum (DTS 2006a). Three scoping meetings were held during the screening process in December 2005, which included a presentation of initial alternatives to the public, interested agencies, and officials to receive comments on the Purpose and Need, alternatives, and scope of the Alternatives Analysis. Refinements were made to the alternatives based on the public input during scoping.

After completion of screening in the winter of 2006, the following alternatives were studied in the Alternatives Analysis: No Build Alternative, Transportation System Management (TSM) Alternative, Managed Lane Alternative, and the Fixed Guideway Alternative. After review of the Alternatives Analysis Report and consideration of public comments, the City Council identified a fixed guideway transit system extending from Kapolei to UH Manoa with a connection to Waikiki as the Locally Preferred Alternative. This identification, which eliminated the TSM and Managed Lane Alternatives from further consideration, became Ordinance 07-001 on January 6, 2007. The NEPA process considered a range of alternatives that was consistent with the identified Locally Preferred Alternative. As discussed in Section 2.2, there were no alternatives that had not been previously studied and eliminated for good cause that would satisfy the Purpose and Need at less cost, with greater effectiveness, or less environmental or community impact.

You also commented on the visual aspects of the Project. The island's unique visual character and scenic beauty was considered in the visual and aesthetic analysis presented in the Draft and Final EISs. As discussed in Section 4.8 of the Final EIS, the Project will be set in an urban context where visual change is expected and differences in scales of structures are typical. The following measures will be included with the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

- Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
- Coordinate the project design with the City transit-oriented development (TOD) program within the Department of Planning and Permitting.*
- Consult with the communities surrounding each station for input on station design elements.*

- *Consider specific sites for landscaping and trees during the Final Design phase when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will mitigate potential visual impacts.*

The Project will provide users, including tourists, with expansive views from several portions of the corridor by elevating riders above highway traffic, street trees, and low structures adjacent to the alignment. In Section 4.8.3 of the Final EIS, under the heading Design Principals and Mitigation, specific environmental, architecture, and landscape design criteria are listed that will help minimize visual effects of the Project.

A goal of the Project is to improve access to planned development to support City policy to develop a second urban center. As discussed in Section 4.19.2, Indirect Effects of the Final EIS, it is not expected that the Project would lead to an increase in the overall level of growth allowed or expected in the study corridor. Rather, it would focus the growth into patterns that would increase the number of viable travel mode options available to corridor residents and employees, including transit, walking, and bicycling. As an additional benefit, compact TOD would reduce the cost of providing utilities, facilities, and services to new residential and commercial developments. TOD is a planning model that works to create a pedestrian-friendly, mixed-use community that encourages people, including residents, workers, and visitors, to drive cars less and ride transit more. TOD provides options to an automobile-dependent lifestyle, and it encourages smart growth because it focuses development around transportation options. This encourages people to walk and, perhaps best of all, to have goods, services, and access to rail all in one location, which can simplify life.

Your letter also commented on the phasing of the Project. As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- *Reduce the time that each area will experience traffic and community disturbances.*
- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*
- *Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- *Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

Mr. Nicholas C. Bleecker
Page 5

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

Lastly, as stated previously, traffic conditions on the H-1 Freeway will improve as a result of the Project.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is fluid and cursive, written over the typed name below.

WAYNE Y. YOSHIOKA
Director

Honolulu High-Capacity Transit Corridor Project

Welcome to the Honolulu High-Capacity Transit Corridor Project's Public Hearing for the Draft Environmental Impact Statement/Section 4(f) Evaluation.

This public meeting and hearing has been designed to inform the public about the transit project, explain materials contained in the Draft EIS, answer questions from the public, and collect public input on project issues related to the Draft EIS, Section 106 of the National Historic Preservation Act, Section 4(f) of the U.S. Department of Transportation Act, and floodplains affected by the project.

Please review the project information and ask project staff any questions about the project that you might have. The Draft EIS is available on the project website at www.honolulutransit.org.

You may provide official comments in several ways. Here at this Public Hearing you may provide oral comments to a court reporter who will record them for the record or use this form to provide written comments. After the meeting, you may provide an on-line comment at www.honolulutransit.org or use this form to send a written comment to the Department of Transportation Services. All comments must be postmarked or received by January 7, 2009 in order for them to be included in the Final EIS.

Comment(s):

I live on Laakea Street in Foster Village. This street is parallel to Salt Lake Boulevard and directly across from Radford High School. I have lived in the same house on Laakea Street since my parents moved here in 1967 when I entered the fourth grade. At that time nothing was in-between Foster Village and the Aiea Shopping Center but a rough road and a few run down houses. Since then we have been surrounded by Makalapa Elementary School, the Stadium Marketplace, Stadium Mall, Halawa Valley Estates, Alii Plantation, the Aloha Stadium, Crosspointe subdivision, and CONSTANT noise from both the H-1 Freeway and Kamehameha Highway. From the front of my house looking toward Salt Lake Boulevard and Radford High School I can count 23 telephone and electricity wires strung across my view. I absolutely do not want the proposed rail to be anywhere near Salt Lake Boulevard. I do not live close enough to either of the proposed stations along Salt Lake Boulevard for it to be advantageous to me. It would still be faster to hop in my car and get to down town within 15 to 20 minutes. I do not want to hear constant rail traffic from 4 am to 12 pm each and every day. I do not want my property value to go down and other taxes to go up because of the rail. I do not want to exit my house and see the rail structure almost in my front yard; I would rather see all of the phone and power lines. I have learned to ignore them but could never learn to ignore that massive rail system looming above my neighbor's houses and blocking what portion of the mountains I can still see. I do not look forward to having Salt Lake Boulevard torn up again and ruined forever by the rail structure running down the whole length of it. I say NO to the Salt Lake Boulevard route and YES to the Airport/Nimitz route.

Dear Ms. Boyette:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

Your preference for the Airport Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more

Ms. Joanna Boyette
Page 2

information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Mr. David Bremer
bremerd001@hawaii.rr.com

Dear Mr. Bremer:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall indentify the Preferred Alternative (23 C.F.R. § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses comments regarding the above-referenced submittal:

Regarding your inquiry concerning the proposed Leeward Community College Station, while sections of Waikele, Waipahu, and Seaview are less than one mile, in a straight line, from the Leeward Community College Station, the network of highways and interchanges that separate these neighborhoods from the station makes it difficult to provide pedestrian, bicycle, or even auto or bus access from that area. It is more likely that residents of these neighborhoods will use the nearby Pearl Highlands Station to access the rail system. In addition, parts of Waipahu are within walking distance of the West Loch and Waipahu Transit Center Stations. Bicycle parking will be provided at all stations and will offer another option where it is too far to walk generally beyond one-half mile of the rail station. Also, many residents in these neighborhoods may find it more convenient to use a feeder bus route to reach the nearest station. Finally, a park-and-ride facility will be constructed at the Pearl Highlands Station, providing yet another access option.

Mr. David Bremer
Page 2
February 16, 2010

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulustransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Issuance of the Record of Decision under NEPA and acceptance of the Final EIS by the Governor of the State of Hawaii are the next anticipated actions and will conclude the environmental review process for this Project.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is fluid and cursive, with the first name "Wayne" and last name "Yoshioka" clearly distinguishable.

Subject: Honolulu Draft EIS comments

Dear Sirs,

Attached are my DEIS comments.

Aloha.

Jim Brewer

2/10/2009

Department of Transportation Services
City and County of Honolulu, 650 South King Street
3rd Floor, Honolulu, HI 96813

February 6, 2009

ALOHA,

These comments, following a few prefatory remarks, are submitted in accordance with the instructions from your DTS websites as indicated below.

I and my life partner and spouse, Renee Ing, have been public policy advocates and educators working to serve "the needs, hopes and dreams of Hawaii's Employee Families" for more than thirty (30) years.

Renee Ing retired from the City and County of Honolulu's Department of Parks and Recreation after thirty-three (33) of service to various communities.

I am a partially disabled U.S. Navy veteran, serving first in the amphibious navy, then two (2) years (1958-1960) on an admiral's staff in the Philippines—maintaining central classified files and then working in the staff legal office; and, after that, serving on the front lines of the Cold War in nuclear-powered Polaris fleet intercontinental ballistic missile submarines. My last submarine duty was aboard the USS Kamehameha (SSBN642). I am living my seventieth (70th) year of life and serving the 16th year as executive producer, editor and co-host of the public access television program—*Employees TODAY*, cable channel 54, Sundays at 5-6pm.

The following comments are submitted per the cut-and-pasted instructions enclosed within the following brackets: (this e-mailed copy contains typo-corrections as well as amendments designated in blue ink below)

[<http://www.honolulutransit.org/>

Making a Comment—The comment period for the project's Draft Environmental Impact Statement has been extended to February 6, 2009. During this period, comments on the Draft EIS will be accepted via:

- In writing to the Department of Transportation Services, 650 South King Street, 3rd Floor, Honolulu, Hawaii 96813. Comments must be received or postmarked by February 6, 2009.
- By clicking the "Contact Us" tab or [this link](#).

The public comment period is mandated by federal and state laws. All comments received will be considered as the Final is prepared by the FTA and the City. Relevant comments will be responded to in writing.

<http://www.honolulutransit.org/contact/>

Comments or Input About the Project

For online comments on the Draft EIS, please use the form below. Comments can also be sent to the Department of Transportation Services, City and County of Honolulu, 650 South King Street, 3rd Floor, Honolulu, HI 96813. Please include your name, address, telephone number and, if applicable, your organization or business whether you submit comments online or in writing.

Comments on the Draft EIS must be postmarked or submitted in person or via this website by February 6, 2009.

You may also use the form below for any other question, comment, or suggestion about the Project as well. Mahalo.

My comments and input about the Draft EIS for the Honolulu High-Capacity Corridor Project follow:

1. This is a thoroughly incomplete and misleading document. It offers Steel-on-Steel Rail and a ridiculous straw man of "No Build," as so-called "alternatives." One choice or nothing is absurd. This however is a very honest statement. There was only one choice from the very beginning.

2. This document should have examined and evaluated the rubber-tire-on-concrete automated bi-modal magnet-guided Virtual Rail/Super-Bus Rapid Transit (i.e., the Phileas Advanced Public Transport System), Urban Maglev—as opposed to Inter-City heavy bullet train-type MagLev (magnetic-levitation), and Mono-Rail,; as well as, Steel-on-Steel (SOS) Light and Heavy Urban Rail. This should have been done with the benefit of concrete and specific proposals requested officially by the City and County.

3. This DEIS document is the product of a several year campaign to impose on the people of O'ahu a predetermined Washington, D.C.-style Steel-on-Steel Rail "Public Works Project;" with a slight Bridge-to-Nowhere make-work smell to it.

This was done with only a façade of democratic public input. That was abundantly clear as the process proceeded; to those who were following the issue. You would hear this sentiment expressed all along the way at Council hearings, public meetings and elsewhere; which, by-the-way were not "informational" as described by FTA guidelines; but really Steel-On-Steel sales jobs evidently paid for with federal and local taxpayer money. **Is this not illegal? If not, it should be. If so, should the FTA not look into this matter?**

4. I refer to a slight smell of "bridge-to-nowhere" because of the extravagant cost of Steel-on-Steel (SOS). I am as convinced as anyone that we definitely need this elevated public rapid transit fixed guideway corridor project. However, I am convinced that a Phileas-like system is, by-far, the most affordable, cost-effective, flexible and future-adaptable system for O'ahu. (see this web address—

<http://etmag.homestead.com/AboutPhileasMagnetRailSuperExpress.html>)

All of this is especially relevant on this day (February 6, 2009) when I heard one economist on TV refer to America's economic crisis as a "depression" instead of recession.

[We are going to have to learn to live within our means as was the case in the late 1930s when I was born. We simply cannot pay the extravagant price being asked for this particular kind of urban rail (SOS)—which has been caught up with; and, is now, for instance, beginning to be left behind by automated magnetically and electronically-guided hi-tech BRT—fully automated BRT that can do everything urban steel rail can do; and, increasingly more so.]

5. I ask that we reconsider where we are now; and, in the spirit of consensus which was not seen in the 51% vote for SOS in November, 2009. Even then, when the fact of the long recession/depression had not yet sunk in, the poll conducted before the election showed 59% of O'ahu residents wanted "rail;" but 55% said that SOS was too expensive.

So, let's step back and take careful measure of everything with another DEIS. One that is informed and prompted by the realization of a radically changed recession/depression economy. A DEIS that will enable an unbiased procurement process to choose most prudently what will be best for the citizens of O'ahu among every "alternative" urban rail technology making their proposals and then re-look at them with new eyes.

Dear Mr. Brewer:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal:

As discussed in Chapter 2 of the Final EIS, additional alternatives, including other technologies, including Mag-lev and the Phileas system, were evaluated during the Alternative Analysis phase of the Project. The Alternatives Analysis phase evaluated a range of transit mode and general alignment alternatives in terms of their costs, benefits, and impacts relative to their ability to meet the Purpose and Need for the Project.

First, beginning in the fall of 2005, an initial screening process considered alternatives identified through previous transit studies, a field review of the study corridor, an analysis of current population and employment data for the study corridor, a literature review of technology modes, ongoing work completed as part of the Oahu Regional Transportation Plan 2030 (ORTP) prepared by the Oahu Metropolitan Planning Organization (OahuMPO) (OahuMPO

2007), and public and agency comments received during the formal Alternatives Analysis scoping process.

This screening process is documented in the Honolulu High-Capacity Transit Corridor Project Alternatives Screening Memorandum (DTS 2006a). Three scoping meetings were held during the screening process in December 2005, which included a presentation of initial alternatives to the public, interested agencies, and officials to receive comments on the Purpose and Need, alternatives, and scope of the Alternatives Analysis. Refinements were made to the alternatives based on the public input during scoping.

After completion of screening in the winter of 2006, the following alternatives were studied in the Alternatives Analysis: No Build Alternative, Transportation System Management (TSM) Alternative, Managed Lane Alternative, and the Fixed Guideway Alternative. After review of the Alternatives Analysis Report and consideration of public comments, the City Council selected a fixed guideway transit system extending from Kapolei to UH Manoa with a connection to Waikiki as the Locally Preferred Alternative. The selection, which eliminated the TSM and Managed Lane Alternatives, became Ordinance 07-001 on January 6, 2007. The fixed guideway system is the most cost-effective of all the alternatives studied. Less expensive options would not have improved system performance. The NEPA process considered a range of alternatives that were consistent with the identified Locally Preferred Alternative. The minimum operable segment or the "Project" was defined based on available funding and logical termini for the preparation of the EIS.

As stated in Section 2.2.3 in the Final EIS, the NEPA Notice of Intent published in March 2007 requested input on five transit technologies. A technical review process which occurred during development of the Draft EIS included the opportunity for public comment and was used in parallel with the alignment analysis to select a transit technology. The process included a broad request for information from the transit industry. Transit vehicle manufacturers submitted 12 responses covering all of the technologies listed in the Notice of Intent. An independent five-member technology panel composed of four transit experts and a transportation academic appointed by the City Council evaluated guided rubber-tire-on-concrete systems (e.g., Phileas bus system and VAL-type systems), monorail (which is a variation on rubber-tyred technology), steel-wheel-on-steel-rail systems, (e.g., light rail and rapid rail), and magnetic levitation (MAGLEV). The panel considered the performance, cost, and reliability of the proposed technologies. By a four-to-one vote, the panel chose a steel wheel operating on steel rail system. The four panel members selected steel-wheel technology because it is safe, reliable, economical, and non-proprietary. Proprietary technologies, meaning those technologies that would have required all future purchases of vehicles or equipment to be from a single manufacturer, such as Mag-Lev and the Phileas system, were eliminated because none of the proprietary technologies offered substantial proven performance, cost, and reliability benefits compared to steel wheel operating on steel rail. Selecting a proprietary technology also would have precluded a competitive bidding process, likely resulting in increased overall project costs. The panel's findings were summarized in a report to the City Council dated February 22, 2008 entitled "Independent Technology Selection Panel Report".

Chapter 8 of the Final EIS details the Project's public involvement activities, including scoping and Public Hearing dates. The public was afforded opportunities to comment on the

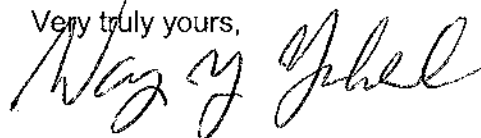

Mr. Jim Brewer
Page 3

project during one of the two public scoping meetings in December 2005 for the Alternatives Analysis and one of the three public scoping meetings for the preliminary engineering/EIS phase of the Project in March and April 2007. The Project also conducted five Public Hearings in December 2008 during the Draft EIS comment period in which the public was encouraged to provide comments on the Project. The Project conducted numerous Community Information Meetings, manned booths at public events, conducted Speakers Bureau presentations, and maintained a website and hotline to solicit public comment beginning in 2005 and extending through publication of the Final EIS. A list of these activities can be found in Appendix G of the Final EIS. The Project created the public involvement program according to FTA guidelines as required by SAFTEA-LU Section 6002. Regarding the November 2008 election results, the environmental review of the Project is independent of the electoral process or results. As mentioned earlier, NEPA review for this project began with the Notice of Intent published in the Federal Register on March 15, 2007.

The request for further evaluation of additional technology has been noted. However, no new information has been provided that would support re-evaluation of the technology.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

Your preference for the Airport Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more

Mr. Ernest Brezeale

Comments on the Honolulu DEIS

In order for the DEIS to provide meaningful information to all the interested parties in this project, the analysis of different options must be carried out with a high level of professionalism. The contractors who are tasked with the design and analysis of traffic/transit improvements must apply themselves with the same high professional standards to reviewing all the alternatives. The contractors must utilize all their knowledge from other projects in order to bring forth the best set of options for our community. In our case, the contractor for the Alternatives Analysis and the DEIS did not use the same level of professionalism to look at all the alternatives.

Unfortunately, this project is riddled with political bias. The current mayor of Honolulu is only interested in rail. At the first scoping meeting in June of 2006, the mayor said, "Don't talk to me about roads. If you want to build roads talk to someone else".

The Mayor's influence can be seen in the way alternatives were analyzed. The Mayor hired the contractor for the Alternatives Analysis.

With the Mayor's admitted disinterest in roads, it is not surprising that the contractor for the Alternatives Analysis used a drawing from some citizen group website for the design of the Managed Lane alternative. The contractor does not know who made the drawing on the citizen group website. The contractor spent zero hours designing a managed lane alternative of their own even though their company has extensive experience in this area.

All of the comments in the Alternatives Analysis regarding the design of the Managed Lane alternative are made by highly paid contractors commenting on a line drawing from a citizen website. No attempt was made to offer their expertise to improve the design. Since the citizen group website drawing of the Managed Lane had one exit near town, the Mayor's contractors spent hours explaining how Managed Lanes cause traffic jams and slow commuters down under such circumstances. This type of analysis is clearly biased.

November 10, 2007, the League of Women voters had a transportation forum to discuss the options before the city. Toru Hamayasu represented the city of Honolulu at that forum. In this presentation, Toru clearly states that the contractor Parsons Brinckerhoff used a drawing from the website that belonged to the community group honolulutraffic.com as their design for the Managed Lane Alternative. This video will be back on the honolulutraffic.com website in a few days. It has been available to the public for the last year. Unfortunately, the company Brightcove that stored the videos for the

honolulutraffic.com website has ended that part of their business. When the video is back on the website, I will file an amendment to these comments.

In order for this DEIS process to be valuable, the city of Honolulu must let the contractors engineer a *Managed Lane alternative of their own design*. This new work can then be included in a Supplemental DEIS. Only then will the alternatives included in the DEIS be meaningful and not biased. Only then can the FTA be assured that Honolulu is making a prudent decision.

Honolulu, Hawaii 96816

Dear Mr. Brizdle:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The identification of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. This letter addresses your comments from the above-referenced submittal.

We agree with your statement that "[i]n order for the D[raft] EIS to provide meaningful information to all the interested parties in this project, the analysis of different options must be carried out with a high level of professionalism." The Council on Environmental Quality (CEQ) recognizes the importance of maintaining the public's faith in the integrity of the EIS process, and avoidance of conflicts in the preparation of EISs is an important means of achieving this goal. As discussed in CEQ's, Guidance Regarding NEPA Regulations, 48 Fed. Reg. 34263 (1983), Section 1506.5(c) prohibits a person or entity entering into a contract with a federal agency to prepare an EIS when that party has at that time and during the life of the contract pecuniary or other interests in the outcomes of the proposal. The contract for EIS preparation does not include any incentive clauses or guarantees of any future work on the project. As required by CEQ regulations at 40 CFR 1506.5 (c), the contractor preparing the environmental impact statement and alternatives analysis executed a disclosure statement prepared by the City specifying that they have no financial or other interest in the outcome of the project.

Consistent with 40 CFR 1502.14, the City rigorously explored and objectively evaluated all reasonable alternatives, and for alternatives which were eliminated from detailed study, briefly discussed the reasons for their having been eliminated and devoted substantial treatment to each alternative considered in detail including the proposed action so that reviewers may evaluate their comparative merits. Project scoping was conducted in two phases, as allowed for in FTA guidance related to the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU). Early scoping was completed during the Alternatives Analysis phase and NEPA scoping was completed after selection of the Locally Preferred Alternative. The process is detailed as follows.

The Alternatives Analysis phase, as documented in Chapter 2 of the Final EIS, evaluated a range of modal and general alignment alternatives, including managed lanes, in terms of their costs, benefits, and impacts. The scoping process for the Alternatives Analysis involved a presentation of the viable alternatives to the public and interested public agencies and officials to receive comments on the Purpose and Need, alternatives, and scope of the analysis for the Alternatives Analysis. Scoping followed the FTA process that provides for a culling of alternatives studied in the EIS through an Alternatives Analysis. The following scoping meetings were held as part of the Alternatives Analysis phase of the Project:

- December 13, 2005: Neal S. Blaisdell Center Pikake Room at 777 Ward Avenue in Downtown Honolulu from 2:00 to 4:00 p.m. (agency scoping meeting)
- December 13, 2005: Neal S. Blaisdell Center Pikake Room at 777 Ward Avenue in Downtown Honolulu from 5:00 to 8:00 p.m. (open to the public)
- December 14, 2005: Kapolei Middle School Cafeteria at 91-5335 Kapolei Parkway in Kapolei from 7:00 to 9:00 p.m. (open to the public)

The scoping process initiated for the Alternatives Analysis included a variety of highway, bus and fixed guideway options for consideration. As a result of this scoping effort, the proposed Managed Lane Alternative was expanded. It was revised again during the Alternatives Analysis to improve its performance. Despite the improvements, the managed lane alternative was not able to meet the performance of the fixed guideway.

A second scoping opportunity was initiated in support of the Draft EIS in March of 2007. All meetings held were open to the public:

- March 28, 2007: Kapolei Hale at 1000 Uluohia Street from 6:00 to 9:00 p.m.
- March 29, 2007: McKinley High School at 1039 South King Street from 5:00 to 8:00 p.m.
- April 3, 2007 at Salt Lake Elementary School at 1131 Ala Liliko'i Street from 5:00 to 8:00 p.m.

In this later scoping effort, the public was requested to propose alternatives that would satisfy the purpose and need at less cost or with greater effectiveness, less environmental or community impact and alternatives that were not previously studied and eliminated for good cause. The only alternative that emerged that met these criteria was a fixed-guideway

alternative following two alternative alignments. All reasonable alternatives that emerged from these processes were ultimately evaluated in the Draft and Final EISs.

The FTA issued a Notice of Intent to prepare this EIS in the Federal Register on March 15, 2007. All interested individuals and organizations, as well as Federal, State, and Local agencies, were invited to comment on the Purpose and Need to be addressed by a fixed guideway transit system; the alternatives including modes, technologies and alignments to be evaluated; and environmental, social, and economic impacts to be analyzed. The alternatives evaluated in the Draft EIS are the result of the alternatives screening process and reflect comments received during the scoping process, as summarized in the Honolulu High-Capacity Transit Corridor Project National Environmental Policy Act Scoping Report (DTS 2007). Several scoping comments were received requesting reconsideration of the Managed Lane Alternative that was considered and fully evaluated during the Alternatives Analysis phase and found to perform substantially less effectively than the fixed guideway alternative that was selected for further analysis in the Draft EIS. Because no new information was provided that would have changed the findings of the Alternatives Analysis regarding the Managed Lane Alternative, it was not included in the Draft EIS for further consideration. Had information been provided that demonstrated greater effectiveness, the managed lane alternative would have been reconsidered in the Draft EIS.

Regarding alternatives studied, the Alternatives Analysis fully evaluated a reversible Managed Lane Alternative and documented that it performed poorly compared to the Fixed Guideway Alternative on a broad range of metrics. Based on public comments received on the Draft EIS, additional information, as summarized from the Alternatives Analysis Report and Honolulu High-Capacity Transit Corridor Project Alternatives Screening Memorandum, has been added to Chapters 2 and 8 of the Final EIS to explain why this alternative was rejected. Both the Alternatives Analysis Report and Screening Memorandum were available to the public. The following is a quote from Chapter 8, Section 8.6.12, of the Final EIS:

"A number of commenters stated that the alternatives studied did not properly address other options for the corridor. In particular, there was a concern that the Managed Lane Alternative was not included in the Draft EIS as an alternative."

The process of alternatives screening and selection is discussed in Chapter 2 and in Section 8.6.1 [of the Final EIS]. As discussed, alternatives were developed through three general phases: (1) the FTA Alternatives Analysis process; (2) the selection of a Locally Preferred Alternative; and (3) the NEPA scoping and Draft EIS process. The initial screening of alternatives is documented in the Honolulu High-Capacity Transit Corridor Project Alternatives Screening Memorandum (DTS, 2006a) (Screening Memorandum). The subsequent FTA Alternatives Analysis process is provided in the Honolulu High-Capacity Transit Corridor Project Alternatives Analysis Report (DTS 2006b) (Alternatives Analysis).

The initial screening process considered a wide range of alternatives, including "construction of a 'managed' two-lane elevated structure for transit vehicles and potentially carpools, as well as single occupant vehicles willing to pay a congestion-based toll," as described on page S-2 of the Screening Memorandum. The screening results for the Managed Lane Alternative are discussed on pages C-4 through C-5 of this report. The analysis found that

the transit mode share under the Managed Lane Alternative would hold constant with the No Build Alternative; the automobile mode share would increase; and the bike and walk mode share would decrease. Vehicle hours traveled would decrease, while vehicle miles traveled would increase slightly.

This initial screening process identified four alternatives that were presented at scoping meetings held to obtain public input. As described on page 5-2 of the Screening Memorandum, one of the alternatives recommended for further evaluation was the Managed Lane Alternative. The Managed Lane Alternative originally was described as follows:

“The Managed Lane Alternative would include construction of a two-lane grade-separated facility between Waiawa Interchange and Iwilei for use by buses, paratransit vehicles and vanpool vehicles (see Figure 5-1). The lanes would be managed to maintain free-flow speeds for buses, while simultaneously allowing High-Occupancy Vehicles (HOVs) and variable pricing for toll-paying single-occupant vehicles. Intermediate bus access points would be provided in the vicinity of Aloha Stadium and Middle Street. Bus operations utilizing the managed lanes would be restructured to use the Managed Lane and enhanced to provide additional service between Kapolei and other points Ewa of Downtown, through to the University of Hawai‘i at Manoa.”

The scoping process resulted in the revision of this proposed alternative. As discussed on page 6-1 of the Screening Memorandum:

“Based on scoping comments, a second operational option was included under the Managed Lane Alternative. The initial option proposed a two-lane grade-separated facility between Waiawa Interchange and Iwilei which would operate as one lane in each direction at all times of the day. The second option proposes similar infrastructure, but it would operate as a reversible facility with two lanes traveling Koko Head during the morning peak period, and then reversing to travel Ewa in the PM peak period. Both operational options would include restructured and enhanced bus operations by utilizing the managed lanes to provide additional service between Kapolei and other points Ewa of Downtown, and both would be managed to maintain free-flow speeds for buses. Providing that enough capacity existed, High-Occupancy Vehicles (HOVs) and toll-paying single-occupant vehicles would also be allowed to use the facility under either scenario; however, it is possible that under the initial option (one lane in each direction), there would not be enough excess capacity to allow toll-paying single occupant vehicles and still maintain reasonable speeds. Intermediate access points would be provided in the vicinity of Aloha Stadium and the Keehi Interchange.”

This alternative was further developed in the Alternatives Analysis Report, with additional features added to maximize the performance of the alternative, as discussed on page 2-4:

“The Two-direction Option would serve express buses operating in both directions during the entire day. The Reversible Option would serve peak-direction bus service, while reverse-direction service would use H-1. Twenty-nine bus routes, with approximately 93 buses per hour, would use the managed lane facility during peak hours for either option.

One limited-stop route and one local route would continually operate in the managed lane. A total of 27 peak-period express routes would operate in the peak direction using the managed lane facility. Of these, three would be new express routes serving developing areas and nine would be new routes developed for exclusive use of the managed lane. The nine new managed lane express bus system routes would originate from Kalaeloa, Kapolei, or Central Oahu and terminate at the Alapai Transit Center, Waikiki, or UH Manoa. Other peak-period, local and limited-stop routes would follow a route similar to the current structure but would use the managed lane for the line-haul portion of the route.

"A toll structure has been developed that ensures that the managed lane facility would operate to maintain free-flow speeds for buses. To maintain free-flow speeds in the Two-direction Option, it may be necessary to charge tolls to manage the number of HOVs using the facility. For the Reversible Option, three-person HOVs would be allowed to use the facility for free, while single-occupant and two-person HOVs would have to pay a toll."

As discussed on page 3-8 of the Alternatives Analysis Report, the enhanced bus system would include an increased fleet size, estimated at 321 buses beyond the existing fleet for the two-direction managed lane facility and 381 buses for the reversible managed lane facility, to provide a sufficient fleet to ensure that the alternative would function as planned.

Regarding the Managed Lane Alternative in particular, the Alternatives Analysis Report estimated total capital and operating costs for the Managed Lane Alternative. As discussed on page 2-16, capital costs for the Managed Lane Alternative were estimated to range between \$3.6 and \$4.7 billion, of which \$2.6 to \$3.8 billion would be for construction of the managed lanes. Transit operating costs for the Managed Lane Alternative would range between approximately \$251 and \$261 million as a result of additional buses that would be put in service under that alternative. These costs do not include the cost of maintaining the managed lane facility. Capital costs for the Fixed Guideway Alternative, including bus system costs, would range between \$5.2 and \$6.1 billion for the Full-corridor Alignments, of which \$4.6 to \$5.5 billion would be for the fixed guideway system. The costs would be \$4.2 billion for the 20-mile Alignment, of which \$3.6 billion would be for the fixed guideway system. Operating costs for the Fixed Guideway Alternative in 2030, in 2006 dollars, would be approximately \$192 million. The total operating costs for the Fixed Guideway Alternative, including the bus and fixed guideway, would range between approximately \$248 and \$256 million.

The capital cost of the Managed Lane Alternative thus is potentially somewhat lower than the 20-mile Fixed Guideway Alternative and even lower than the Full-corridor Alternative. Operating costs would be slightly higher. These cost factors were considered in conjunction with other project goals in evaluating the alternatives.

With respect to transit travel time benefit, the Managed Lane Alternative options would improve some trips that were particularly well-served by the managed lanes. In general, the Managed Lane Alternative would increase transit travel times by increasing traffic on the overall roadway system and creating more delay for buses. The H-1 Freeway leading up to the managed lanes would become more congested because cars accessing the managed lanes

would increase traffic volumes. Significant congestion would occur where the managed lanes connect to Nimitz Highway at Pacific Street near Downtown. Much of the time saved in the managed lane itself would be negated by the time spent in congestion leading up to the managed lane, as well as exiting the lanes at their downtown terminus. Furthermore, areas that are not directly served by the managed lane would not experience much positive change from the No Build Alternative. As discussed on page 3-14, the Alternatives Analysis Report found that, "although the Managed Lane Alternative would provide some travel-time improvement for certain areas, it has significant limitations with regard to improving travel times or transit service for a broader customer base.

As discussed on page 3-17, transit ridership would increase only 5.3 to 6.4 percent over the No Build Alternative, a small increase compared both to the cost of the Managed Lane Alternative and the increase that would result from the Fixed Guideway Alternative, which would increase transit ridership by 21 percent for the 20-mile alignment.

The volume of peak-hour vehicles in key areas would actually increase under the Managed Lane Alternative compared to the No Build Alternative. As discussed on page 3-27, the Fixed Guideway Alternative would reduce the number of vehicles by 3 to 12 percent.

With respect to the goal of providing equitable transportation solutions that meet the needs of lower-income transit-dependent communities, the Alternatives Analysis Report noted that the Managed Lane Alternative, "would not substantially improve service or access to transit for transit-dependent communities, as buses that use existing HOV facilities would be routed to the managed lane facility but would continue to be affected by congestion in other parts of their routes. Arterial congestion would increase in the study corridor with the Managed Lane Alternative, making bus access to the managed lanes less reliable" (page 6-8).

The Alternatives Analysis Report also considered consistency with existing land use planning and regional transportation planning. On page 6-13, the report concluded that the Fixed Guideway Alternative, "best serves the areas of Oahu that are designated for future growth and development. It is also the only alternative that is consistent with regional transportation system planning defined in the 2030 Oahu Regional Transportation Plan (OMPO 2006a)."

The evaluation of alternatives inevitably involves trade-offs. As stated on page 6-13 of the Alternatives Analysis Report, the "greatest trade-off among the alternatives is between the transportation benefit provided and the cost to implement alternatives. . . . The Managed Lane Alternative provides slightly more benefit [than the Transportation System Management (TSM) alternative, which had little effect on traffic], but at a substantial cost. While the Fixed Guideway Alternative would have the highest cost, it is also the only alternative that would provide a substantial transportation benefit, measured both by the benefit to transit users and in the reduction in congestion compared to the No Build Alternative."

The Alternatives Analysis findings are summarized in Table 2-2 in Chapter 2 of the Final EIS. The Managed Lane Alternative is discussed in Section 2.2.2 of this Final EIS. As stated in the Final EIS and supported by the lengthy analysis that preceded the preparation of the Draft EIS, the Managed Lane Alternative was not pursued because the Managed Lane Alternative

Mr. John Brizdle
Page 7

would not have achieved project goals and objectives, would not result in substantially fewer environmental impacts, and would not be financially feasible. For all of these reasons, it was not advanced to consideration in the EIS.

Your comments regarding statements made by politicians are not related to the NEPA environmental analysis of the Project. FTA is the federal lead agency and will continue to ensure compliance with NEPA as part of their responsibilities under NEPA and federal law.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Submission Content/Notes : I am temporarily living in Taiwan, but own property in Salt Lake. I am very upset that there was a vote on the rail project where the agreed route had been through Salt Lake. However, within hours of the public's Nov 4 vote endorsing the rail project, certain city council members were proposing to change the route -- including one who had fought tooth-and-nail against the entire project. The mayor and the council members are supposed to be the people's servants. This sudden switch was a betrayal. They should go back to the route endorsed earlier by both the Council and the people -- i.e. the Salt Lake route.

When the system is built out in the future, perhaps an airport spur could be added.

thanks. David Brown

Dear Mr. Brown:

**Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement**

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 C.F.R. § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses comments regarding the above-referenced submittal:

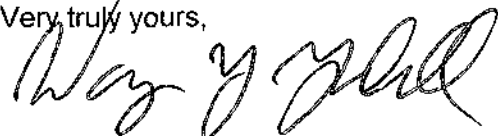

Your preference for the Salt Lake Alternative has been noted. While each of the alternatives includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana Center has been selected as the Preferred Alternative. The identification of the Airport Alternative as the Preferred Alternative was made by the City to comply with FTA's NEPA regulations that state that the Final EIS should focus on the Preferred Alternative (23 C.F.R. § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative, public input on the Draft EIS, and City Council Resolution 08-261 identifying the Airport Alternative as the Project. The selection of the Airport Alternative is described in Chapter 2 of this Final EIS. The discussion of the alternatives considered is included in Chapter 2 of this Final EIS and the Alternatives Analysis. As discussed in Section 3.4.2 of this Final EIS, the Airport Alternative will carry the most passengers with 116,000 daily passengers and 282,500 daily trips in 2030, thereby resulting in the greatest transit-user benefits. The

Mr. David Brown
Page 2
February 16, 2010

Airport Alternative will also result in the fewest vehicle miles traveled and vehicle hours of delay, as well as provide access to major employment areas, including Honolulu International Airport, that will have substantially greater ridership than the other alternatives considered.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Issuance of the Record of Decision under NEPA and acceptance of the Final EIS by the Governor of the State of Hawaii are the next anticipated actions and will conclude the environmental review process for this Project.

Very truly yours,

Dear Mr. Brown:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

The vehicle maintenance plan will be developed after selection of a vehicle contractor. Job specifications will be developed by the system operator and approved by the City. Operation is scheduled to begin in 2012 and job requirements may be expected to be established about a year before the positions are needed. Information about employment opportunities can be found under the Human Resources tab on the City's website at www.honolulu.gov.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulustransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

To: Djou, Charles
Subject: 1st Phase of Rail

Aloha Councilmember Djou,

To whom it may concern:

Councilmember Djou's proposal to construct the first phase of the rail, from the Aiea to the Pearl City area into Honolulu makes a lot of sense. Not just for the fact that this section of the rail will be usable immediately upon completion, taking people into the city but also due to the uncertain economic times we are in right now. Let's face it we just might not have the money to complete the whole thing, I really hope this doesn't happen but it is a strong possibility.

Starting the first phase from Kapolei to Waipahu makes no sense because I'm sure very few people are needing to get to Waipahu for work. The majority of the people need to get into the downtown area. If we should run out of money, this first phase would be a waste of hard earned money.

Mahalo nui loa,
Lora Burbage

Dear Ms. Burbage:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 C.F.R. § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal:

As described in Section 2.5.10 of the Final EIS, to support phased opening of the system, the first construction phase must be connected to a maintenance and storage facility, which requires considerable land. The first phase of the Project must be connected to the maintenance and storage facility because, in addition to maintenance of equipment and ongoing operations, the maintenance and storage facility houses the main control center for the entire Project, and the required testing and operation of the system could not be completed without access to it. No location has been identified closer to Downtown with sufficient available land to construct a maintenance and storage facility. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations*

Ms. Lora Burbage
Page 2
February 16, 2010

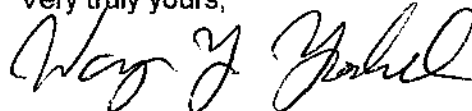

- *Reduce the time that each area will experience traffic and community disturbances*
- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding*
- *Match the rate of construction to what can be maintained with local workforce and resources*
- *Balance expenditure of funds to minimize borrowing*

The portion of the corridor Ewa of Pearl Highlands is less developed than the areas Koko Head. Right-of-way can be obtained more quickly; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted Koko Head from Pearl Highlands to Aloha Stadium, then Kalihī, and finally to Ala Moana Center.

The financial plan is balanced for the entire Project so there will not be a situation in which only a portion of the system will be built. If there is a shortfall, additional revenue sources will be considered. Section 6.6 of the Final EIS discusses risks and uncertainties, as well as potential sources to cover shortfalls.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Issuance of the Record of Decision under NEPA and acceptance of the Final EIS by the Governor of the State of Hawaii are the next anticipated actions and will conclude the environmental review process for this Project.

Very truly yours,

February 5, 2009

Mr. Wayne Yoshioka, Director
Dep't. Of Transportation Services
City and County of Honolulu
650 S. King Street, 3rd Floor
Honolulu, HI 96813

Dear Mr. Yoshioka:

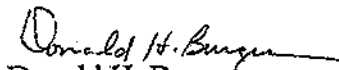

I am concerned about many impacts which will result from the proposed heavy rail system on Oahu and its construction, to be spread over many years. I spent 28 years in construction estimating and engineering, have reviewed the draft EIS, and do not believe the full force and effect of this proposed project has been adequately covered.

One question I have is with regard to commercial agricultural operations which will be subjected to moving and starting their operations over in a new location. Will it be possible to avoid losing a year more of income as local markets are without products or forced to import products at a much higher cost? Is an adequate amount included in the cost estimate to enable the displaced providers to do what they must to stay in business and provide adequate service during construction?

A greater concern is that of noise generated by passing trains, every few minutes during the day and far into the night. I believe the ability of students to concentrate on studies will be greatly diminished in schools near the tracks, and sleep will be disturbed in homes and condominiums, possibly resulting in Lawsuits on behalf of those affected.

Will passengers to and from the airport be able to transport luggage and other heavy items on the train? Has adequate cost of providing such amenities been considered?

Yours truly,

Donald H. Burger

Dear Mr. Burger:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Some land uses will need to change in order to accommodate the Project; however, impacts to the natural and built environments are minimized whenever possible. Coordination with affected property owners is ongoing, and every effort will be made to reduce impacts. The primary impacts are anticipated to result from inconveniences and disruptions to adjacent residents, businesses, and business customers that are inherent in any major construction project. These include the following:

- *Presence of construction workers and materials.*
- *Temporary road closures and traffic diversions.*
- *Temporary reductions in parking availability.*

- *Airborne dust, noise, and vibrations.*
- *Businesses' loss of visibility to their customers.*

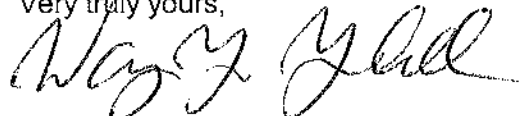

Proper controls – as discussed in Section 4.18 in the Final EIS – may mitigate these effects to protect residents' comfort and daily life and to prevent inconveniences and disruptions to the flow of customers, employees, materials, and supplies to and from area businesses, including agricultural business.

Those from whom property is to be acquired will be treated according to the requirements of the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act. This Act provides for purchase at fair market value and includes relocation assistance to those affected. The Project will not compensate for potential loss of agricultural income for those properties not acquired.

Regarding your concern about noise, as discussed in Section 4.10.3 of the Final EIS, the Project will include an integrated noise blocking parapet wall at the edge of the guideway structure that extends three feet above the top of the rail and a system specification for vehicles with wheel skirts. The parapet wall will substantially reduce ground-level noise. Wheel skirts will increase the benefit of the parapet wall at locations above the elevation of the track. Measures to reduce noise levels above the track elevation, such as sound-absorptive materials in the track area, will be evaluated during Preliminary Engineering for the Project. Once the Project is operating, noise levels will be measured to determine the actual extent of project noise impacts. There are no severely impacted areas in the corridor. In addition, there are no noise impacts predicted for any schools along the project alignment; noise levels due to operation of the trains is not expected to be above 55 dBA Leq(h) for classrooms during operation of the system. Mitigation measures for construction near schools will be finalized during the design and construction phase, when more information on the types of construction activities is determined. Lastly, the luggage policy for the system is not final, but the concept of the policy will be to allow luggage that does not interfere with the safety or comfort of other passengers. Project cost estimates include train features.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

OTS
RAPID TRANSIT

Honolulu High-Capacity Transit Corridor Project
Department of Transportation Services
650 N. King Street 3rd floor
Honolulu, HI. 96813

Dear Sirs:

I am writing to express my support for the rail project. I also would like to show and share a comment expressed by Councilman Charles Djou.

I support the rail project however; Councilman Djou offered some changes to this project, one of which I support the other I do not. The proposal I support from Councilman Djou is his viewpoint on where the project should start. In regards to the fact that monies to complete this rail project aren't 100% secured and the fact that it is very expensive, there is a chance we could run out of monies before completing the whole thing. Therefore I suggest that Councilman Djou comment "start the project in the Aiea area" be taken into consideration. This in turn would get the project in full operation where it's most needed. The Kapolei end can be completed over the back end of this operation. The changes in the route from Salt Lake to the airport I feel is poorly thought out from Councilman Djou. This portion I have address in a previous letter and I will not repeat it here.

Thank you for your support.

Sincerely,

Michael Burton

Dear Mr. Burton:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- *Reduce the time that each area will experience traffic and community disturbances.*
- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*

- *Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- *Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

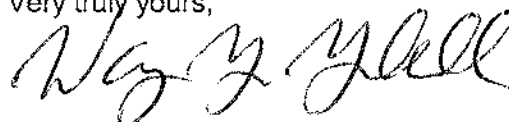

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

The financial plan is balanced for the entire Project so there will not be a situation in which only a portion of the system will be built. If there is a shortfall, additional revenue sources will be considered. Section 6.6 of the Final EIS discusses risks and uncertainties and potential sources to cover shortfalls.

Your preference for the Salt Lake Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been identified as the Preferred Alternative as described above. Compared to the other alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly lower impacts to the natural and built environment. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

DOTS
 RAPID TRANSIT

Dear DOTS:

I am a long-time resident of the Salt Lake community, I am writing to express my concern about the recent discussions and pending decision to reroute the rail from the Salt lake community. I don't understand the rationale behind this proposal but, I'd like to offer some constructive insight to this project.

The whole intention of the rail is to service the people of Oahu, especially along the corridor from Kapolei to downtown and onward to the University of Hawaii. My argument addresses the proposed change in the route from Pearl Harbor to the Airport rather than through the Salt lake community. If the intention of the Rail is to service the people Of Oahu than routing this project into a residential community would better serve its means by meeting the public where it is most convenient. This in turn would result in higher usage and a faster return on your investment

The proposed routing of the rail from the Pearl Harbor to the Airport would not be a wise use of public money because:

- 1) The rail will not be supporting the people of Oahu fully by bypassing densely populated communities along this route.
- 2) The rail infrastructure would intrude on large portions of federal land along this route. This in turn would result in large delays in the projects progression due to permitting of these intrusions along the route. These delays would amount to cost overruns on an already costly project.
- 3) Navigating around the physical structures within the airport industrial area if this is possible would again drive up the cost of this project tremendously.

I believe that there are council members who maybe holding onto the notion of tourist "taking the train to the plane" ideal. This I feel is fanciful thinking on behalf of some council members. Oahu is not like some of the major cities with rail like New York, Chicago, San Francisco or Los Angeles. Tourists in these cities are prone to catch a flight over night to somewhere; in Hawaii (with the exception of locals) more than likely they will be traveling with large bags. If this is the case, the same restriction that commuters on the bus experiences would apply here. If you can sit your bag on your lap or under your chair, then you're fine. Items bigger than that you'll have to catch a Cab. Lastly I

Dear Mr. Burton:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your support for the Salt Lake Alternative is noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been identified as the Preferred Alternative as described above. Compared to the other alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly lower impacts to the natural and built environment. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative.

In response to your first point, as provided in Section 3.4.2 of the Final EIS, the Airport Alternative will carry the most passengers with 116,000 daily passengers and 282,500 daily trips

Mr. Michael Burton
Page 2

in 2030, thereby resulting in the greatest transit-user benefits. The Airport Alternative will also result in the fewest vehicle miles traveled and vehicle hours of delay, as well as provide access to major employment areas including Honolulu International Airport, that will have substantially greater ridership than the other alternatives considered.

In response to your second point, as shown in Appendix C of the Final EIS, there is only a small need for right-of-way from Federal land. Right-of-way acquisitions will occur early in the planning process. In addition, the Airport Alternative will have approximately 5 percent fewer parcel acquisitions overall than would the Salt Lake Alternative.

Concerning your third point, navigation around physical structures within the Airport has been considered and reflected in design and costs of the Project.

The Airport Alternative primarily serves major employment destinations. As shown in Table 3-13, over half of all daily transit trips (bus and rail) will be work-related. However, as discussed in Section 3.4.2 of the Final EIS, over 9,900 visitors will use the fixed guideway daily, of which 1,800 will use the system to travel to or from the Airport. The luggage policy for the system is not final, but the concept of the policy will be to allow luggage that does not interfere with the safety or comfort of other passengers.

Regarding your comments on the Salt Lake Boulevard connection, the Salt Lake Boulevard alignment studied in the Draft EIS did not include a connection to Pearl Harbor. The alignment proposed in your letter would require property from the Navy and acquisition of private property.

The proposed route in the last paragraph of your letter would be more expensive than the Salt Lake alignment that was studied in the Draft EIS and would not directly serve the Airport. Lastly, the Project includes a station at Lagoon Drive and Aolele Street. This station will provide a transfer point to buses serving the Salt Lake neighborhood. New bus routes will be added to serve Salt Lake communities, including Foster Village.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Submission Content/Notes : I love the idea of a rail transit system on Oahu. However, I feel that the panel members selecting steel wheel on steel rail: Steve Barsony, Ken Knight, Henry Kolesar, Ron Tober, made the wrong choice. Would not a monorail system cost much less and take much less time to build. Monorails are also much safer, heavy rail systems can and do derail. Look up DERAILMENT under your favorite Search engine. You won't find any monorails there. What about Aesthetics? Elevated heavy rail, the guideway casts a wide shadow and blocks out much more of the sky.
YES to a Hawaii rail transit system!
NO to steel on steel!

Dear Mr. Cady:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As stated in Section 2.2.3 of this Final EIS, the NEPA Notice of Intent requested input on five transit technologies. A technical review process included the opportunity for public comment and was used in parallel with the alternatives analysis to select a transit technology. The process included a broad request for information that was publicized to the transit industry. Transit vehicle manufacturers submitted 12 responses covering all of the technologies listed in the Notice of Intent. An independent five-member technology panel composed of four transit experts and a transportation academic appointed by the City Council evaluated guided rubber-tire-on-concrete systems (e.g., Phileas bus system and VAL-type systems), monorail (which is a variation on rubber-tyred technology), steel-wheel-on-steel-rail systems, (e.g., light rail and rapid rail), and magnetic levitation (MAGLEV). The panel considered the performance, cost, and reliability of the proposed technologies.

Mr. Lyle Cady
Page 2

Proprietary technologies, meaning those technologies that would have required all future purchases of vehicles or equipment to be from a single manufacturer, were eliminated because none of the proprietary technologies offered substantial proven performance, cost, and reliability benefits compared to steel wheel operating on steel rail.

The panel accepted public comment twice as part of its review. By a four-to-one vote, the panel chose a steel wheel vehicle operating on steel rail system because it was considered safe, reliable, economical, and non-proprietary. Those results are documented in the panel's report to the City Council dated February 22, 2008 entitled "Independent Technology Selection Panel Report".

Limited experience with monorail systems in the United States does not support the assumption of cost savings compared to industry-standard steel wheel systems. Safety and reliability experience with the Seattle and Las Vegas systems have included falling parts, fires, and the need to evacuate the Seattle system using fire department ladder trucks.

Visual and aesthetic conditions are discussed in Section 4.8 of the Final EIS. The Project will be set in an urban context where visual change, including shade and shadow, is expected and differences in scales of structures are typical. Section 4.8.3 of the Final EIS states that "the fixed guideway and stations will be elevated structures. They will result in noticeable changes to views where project elements will be near existing views or in the foreground of these views." This change will also affect the location and extent of shadows. Overall, the shadow pattern created by the guideway and stations will change throughout the day and seasonally, depending on the alignment's direction, time of day, and time of year. The analysis states that shadow impacts along the alignment will vary with orientation, the height of the stations, guideway, surrounding trees and local development (Section 4.8.3 of the Final EIS). Shade and shadow effects are illustrated in the simulated views included in Section 4.8 of the Final EIS.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

bl would like you to know that this is a great move for the island. I would have attended UH or HPU for my masters degree but due to traffic issues on the island, I had to complete my education online. With this choice, I did not have to worry about driving and coming home late and tired with no time to spend with my family. In addition, this project will open up such great opportunities. I will now be able to apply for a higher paying job in town and not worry about traffic while living in the Leeward area. THANK YOU!!! Whatever routes we start with on this transit plan, is a start. Like Mufi says, it is something. Keep up the awesome work and I can't wait until the rail transit extends to EWA BEACH or near the area.

Thank you very much!

Ms. Nancy Campbell
colmenares@hawaii.rr.com

Dear Ms. Campbell:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your support for the Project has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is

discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The Project will connect to Ewa Beach via bus service from East Kapolei. Future bus routes, including frequencies, are shown in Appendix D of the Final EIS. The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The proposed future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS. The future extensions are not part of the Project, thus they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and the National Environmental Policy Act (NEPA). Under NEPA, environmental analysis is only required when there is a proposed action by a federal agency. Here, because the future extensions are not proposed for implementation at this time they are not part of the Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation at some time in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Other Submission Method :
Submission Date : 01/08/2009
Submission Content/Notes : The approved route shouldn't be changed as it was what the people voted for. And it is most logical to go through centers of populations, i.e. Salt Lake, as the rail's primary objective is to get the residents to and from their jobs with the least time possible. The airport can be connected later; connections to UH and Waikiki should get the priority over the airport.

why would they start the construction in the west side? isn't that weird? shouldn't they build at the most populated area to serve many people? if they build along waipahu to aloha stadium, and kalih to chinatown, that would benefit most of the people beauce that is where the congestion starts.

if they start in the left most area, who will benefit from that if they are traveling to the downtown honolulu? they still have to ride the bus and still pass waipahu, kalih,etc...

and besides, people from the center area are the ones who get unfair treatment. they have to wait for the buses from the west and the moment thus buses arrive, there's no more available seat and everything. western peopl already have "the boat" and the "Express buses". well if they ride from the west area and wants to go downtown, it will be nice if they stops at the center and ride the rail through downtown.

Mr. Jake Cargas
chrysler_87@yahoo.com

Dear Mr. Cargas:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal:

The design and construction of the approximately 20-mile transit Project is highly complex and will be developed in segments. The first segment of the Project is expected to be operational in 2012, as shown in Figure 2-42 of the Final EIS.

As described in Section 2.5.10 of the Final EIS, to support phased opening of the system, the first construction phase must be connected to a maintenance and storage facility, which requires considerable land. The first phase of the Project must be connected to the maintenance and storage facility because, in addition to maintenance of equipment and ongoing operations, the maintenance and storage facility houses the main control center for the entire Project, and the required testing and operation of the system could not be completed without access to it. No location has been identified closer to Downtown with sufficient available land to construct a maintenance and storage facility. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations*

Mr. Jake Cargas
Page 2

- *Reduce the time that each area will experience traffic and community disturbances*
- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding*
- *Match the rate of construction to what can be maintained with local workforce and resources*
- *Balance expenditure of funds to minimize borrowing*

The portion of the corridor Ewa of Pearl Highlands is less developed than areas Koko Head. As a result, right-of-way can be obtained more quickly and overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted Koko Head from Pearl Highlands to Aloha Stadium, then Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, they will be opened so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

As also discussed in Chapter 2 of the Final EIS, park-and-ride lots are planned at East Kapolei, UH West Oahu, Pearl Highlands, and Aloha Stadium. These stations have been identified as having the highest demand for drive-to-transit access.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Issuance of the Record of Decision under NEPA and acceptance of the Final EIS by the Governor of the State of Hawaii are the next anticipated actions and will conclude the environmental review process for this Project.

Dear Mr. Yoshioka:

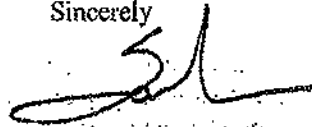

**Subject: *Honolulu High-Capacity Transit Corridor Project*
*Draft Environmental Impact Statement***

Castle & Cooke supports the acceptance of the Draft Environmental Impact Statement for the proposed Honolulu High-Capacity Transit Corridor Project. This project is critical to address O'ahu's growing transportation demands, particularly in Central O'ahu and 'Ewa where the majority of O'ahu's future population growth and urban development has been designated to occur. We support the rail transit system as a critical component of a multi-modal approach needed to address our transportation challenges for the betterment of all O'ahu residents.

We are pleased to see that the project includes provisions for the direct access from the H-2 Freeway to the Pearl Highlands Transit Station. We support the proposed H-2 access ramp to the park-and-ride structure as it represents a direct regional benefit of the transit project to existing Central O'ahu and North Shore commuters and will help support the future growth that has been designated for the Central O'ahu region.

Thank you for the opportunity to comment on the Honolulu High-Capacity Transit Corridor Project. If there are any questions, please contact Bruce Barrett, Executive Vice President, at 548-3746.

Sincerely

09 FEB 3 A10:49

Re: Honolulu High Capacity Transit Corridor EIS

Dear Messrs. Matley and Yoshioka:

The City of Honolulu recently completed a Draft Environmental Impact Statement ("EIS") for the proposed Honolulu High-Capacity Transit Corridor ("Project"), a 20-mile elevated rail line that will connect the town of Kapolei in west O'ahu to downtown Honolulu.

CBRE Consulting was contracted by Kamehameha Schools to provide insight to the economic impacts that could be expected from the development and operation of the Project. Principals at CBRE Consulting have close to 30 years experience in analyzing market, financial and economic impacts for both public sector and private sector clients, including extensive work on O'ahu and over 20 years experience in market and financial feasibility and economic impact studies for transit oriented development projects throughout the United States.

CBRE Consulting has analyzed the Draft EIS, as well as development impacts of numerous transit systems in North America. With regard to the proposed system in Honolulu, we offer the following observations and comments.

GENERAL COMMENT

Per our review of the Draft EIS we note that it measured economic impacts at a regional level without consideration of the impacts to property owners in between station areas. Table 4-1 in the EIS identifies impacts from acquisitions, displacement and relocation of businesses in a statistical manner – not mentioning potential problems other than blocking views. The Mitigation measures proposed in the Draft EIS are minimal and should be expanded.

Transit systems have wide ranging impacts depending on the specific land use characteristics along the route. Analysis of potential impacts should not be confined to a regional level. We recommend that the City examine the local impacts all along the route and at each station area.

MAJOR NORTH AMERICA TRANSIT SYSTEMS

There are dozens of transit systems in the U.S. and Canada comprised of subways, heavy rail, light rail and elevated systems (i.e. monorails). Since it was not possible to analyze development patterns for every transit system, CBRE Consulting compiled a short list of systems to study based on relevant characteristics and the availability of data.

CBRE Consulting performed case study research on elevated, fixed-guideway systems (i.e. Vancouver, Miami, and the San Francisco Bay Area) to identify key issues they faced and their resulting impacts on local real estate markets. CBRE also examined successful ground level rail systems across the U.S. to illustrate their impacts on the community. Cities examined included Portland and Los Angeles. The analysis examined both impacts during the construction period and throughout ongoing operations.

Impacts During Construction

Research findings universally indicate significant losses to businesses along the construction routes of major rail systems, regardless of type. Traffic disruptions, limited access, visibility issues, utility service interruptions, and a general tendency for people to avoid esthetically unappealing construction sites resulted in declines in customer numbers, sales, and in some cases, the closure of businesses.

Some of the most dramatic cases of this type of negative impact were in Vancouver, British Columbia and Salt Lake City where an estimated 30 percent of local businesses closed during the construction of TRAX. In Vancouver, an estimated 40 to 60 percent of the businesses failed along the construction route for SkyTrain's Canada Line in Vancouver, due to a reported 50 percent decline in local sales volume during construction. The most significant cause of the negative impact in these locations was the lack of public assistance provided to support impacted businesses.

Property Value Impacts – Near Stations

While there has been a significant amount of research into the impact of transit on real estate values, very few quantitative conclusions are applicable across all metropolitan areas. Every transit system is unique in terms of the population it serves, frequency of service, cost of service, local economic factors, public support, integration with neighborhoods, etc. However, some general conclusions can be drawn from our primary and secondary research.

1. While land prices in a transit corridor can often exhibit significant increases following the announcement of a new system due to speculative activity, following completion of the system, research indicates that lower density (generally residential) land values often decline.
2. The broad economic benefits of rail transit tend to be limited to suburban communities outside major metro areas like New York City, where commuting by car is extremely difficult. Urban infill locations suffer negative impacts if the rail systems are not well-

conceived and potential impacts thoroughly evaluated and mitigated early in the design process.

3. Research indicates that different climate and environmental conditions can create negative impacts. For example, in urban areas with hot and wet climate, such as Miami, elevated lines can provide shelter for homeless, increasing crime and litter and thereby detracting from commercial activity.
4. Weather is not the only cause of security problems under elevated lines. Solutions to mitigate these concerns can include the installation of surveillance cameras, increased police patrolling, emergency call boxes, and closed-circuit television monitoring. In some cases, extensive lighting and/or illumination has been used to create openness and high visibility.
5. Generally, the land uses that most consistently benefit from transit station proximity are office and high density residential. The former tends to command higher rents due to a desirable ease of access for employees. Residential values also increase if increased densities (i.e., multifamily development opportunities) are a part of well-conceived TOD plans.
6. The impact on retail values is mixed and tends to depend both on the type of retail use and the type of rail system. Elevated systems can cause visibility problems for small street-front locations but can be instrumental in bringing shoppers to large malls or big box retail outlets. The design and orientation of the station is critical.
7. Proactive planning efforts to allow high density residential and commercial development near stations are the primary cause of land value appreciation. An example of this is the SkyTrain system in Vancouver, where the local governments instituted long term regional planning to create new town centers around elevated transit stations.
8. Major developments do not occur near stations in the absence of healthy demand, increased density, or a substantial financial subsidy by local governments. Our research found dozens of station areas where no new development has occurred for 20 to 30 years following the transit operation.

Property Value Impacts – Mid-Line

The third quarter 2007 Journal of Real Estate Research published one of the few studies on transit corridor impacts on all property proximate to transit corridors. "The Impact of Transit Corridors on Residential Property Values" by John Kilpatrick, Ronald Throupe, John Carruthers and Andrew Krause, found that "proximity to the transit corridor alone without a direct access benefit conveys a negative impact on nearby housing values." A direct access benefit is defined as being within normal walking distance i.e. less than one-half mile from a station. These negative impacts result from increased noise, pollution, crime, and diminished views.

In addition to the literature research, our primary research across the U.S. and Canada indicated there are significant negative value impacts on properties immediately adjacent to the rail line. These were particularly pronounced along the BART East Bay and Los Angeles Metro Blue Line.

CBRE Consulting analyzed these general research findings in terms of their application to the proposed elevated Honolulu Rail system. In general, we believe that elevated rail would impair redevelopment due to a loss of visibility and access from Kamehameha Highway and Dillingham Blvd.

As shown in the case study examples, we would expect retail uses to suffer from visibility, access and traffic interruption services. Depending on whether or not public assistance is available, retail sales could decline and turnover could increase.

Mid-Line residential development will also be negatively impacted by noise and visual impairments. At a minimum, it will be important for the City to provide sound-proofing for residential units within viewing distance of the elevated line.

Another important concern is that the noise, light and view impairments from elevated rail lines will have a dramatic impact on the marketability of future low-rise and mid-rise workforce housing development along the route. Developers may be forced to build more expensive high-rise developments to avoid those impairments.

SUMMARY FINDINGS AND RECOMMENDATIONS

CBRE Consulting found that there are significant negative impacts on selected properties associated with transit systems in general, most notably in the case of elevated systems. Depending on the property type, these can include the following:

- Loss of view and shadowing;
- Excessive noise;
- Increased crime and vagrancy;
- Loss of visibility (for commercial);
- Increased challenges to future residential development if not planned in advance and provided public financing support; and
- Property access issues.

Although all of the rail systems described in our case studies resulted in some negative impacts on surrounding properties, at least during construction, various aspects of each successful system depended on:

- The commitment of municipalities to employment and density;
- A sound strategy for land assembly;
- Healthy real estate market conditions;
- The interface and integration of rail and real estate concessions with adjoining TOD;
- Careful phasing; and
- Public-private collaboration and the development of successful partnerships, including the establishment of the appropriate risk and revenue sharing mechanisms.

In order to minimize the negative impacts, CBRE Consulting has identified several potential mitigation options for the proposed Honolulu project, including the following:

During construction:

- Provide advertising dollars to inform community of construction activity and business operating hours
- Provide clear street signage for ingress/egress to business locations
- Provide direct financial assistance/low interest loans to businesses
- Sequencing construction to minimize removal of multiple blocks of street parking
- Provide advance notification to businesses and residents of traffic detours/delays and possible utility interruptions
- Implement cleaning program to regularly remove dirt and debris

After construction:

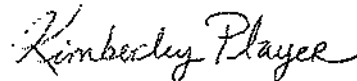

- Work with land owners and consultants to increase residential and commercial land use density within 1/4 mile of select stations to promote effective transit oriented development and increase ridership
- Redesign stations for central platform or one-sided platform to avoid creating 200-300 foot long tunnel effect at street level
- Integrate station design/construction with new development
- Provide secure parking at more stations and integrate with commercial development
- Ensure thoughtful Right-of-way acquisition so that acquisitions avoid leaving unusable out parcels.
- Provide compensation to residential property owners immediately adjacent to the elevated line
- Use landscaping /security fencing to minimize ability to assemble underneath the elevated rail lines
- Provide security cameras and increase police patrols to minimize vagrancy
- Provide as many left turn lanes as possible to allow access to local businesses
- Create sound barriers
- Provide assistance to individual property owners (e.g. rebates) for mitigation improvements (double glazed windows, fences etc)
- Fund public amenities around stations such as parks, community/cultural facilities, public art etc. (e.g., Metrotown)
- Restrict a "Fare Paid" area, i.e., riders must produce tickets to pass through gates vs. riding on the "honor system" like SkyTrain.

If you have any questions please do not hesitate to contact us at 213-613-3751.

Dear Mr. Jivorsky:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal:

All property owners adjacent to the Project have been notified and asked to participate in the environmental process. The discussion of direct impacts to property owners along the alignment that are not subject to acquisition or relocation were presented in the following sections of Chapter 4 in the Final EIS: Section 4.5, Community Services and Facilities; Section 4.6, Neighborhoods; Section 4.10, Noise and Vibration; and Section 4.16, Archaeological, Cultural, and Historic Resources. Other indirect and cumulative impacts along the route and at each station area are presented in Section 4.19. In the Final EIS, mitigation measures have been expanded upon in many sections. Section 4.1 of the Final EIS lists all the sections in that chapter that have been updated since publication of the Draft EIS.

Your additional comments regarding case study research on other major North American transit systems have also been noted.

Regarding your suggested construction mitigation options, the Project will continue its public involvement and education program throughout construction. Project representatives will work with businesses that will be affected by construction, as well as ensure that businesses and the general public are fully informed of current and upcoming construction activities. However, it is up to individual businesses to inform their customers of their operating hours during construction. As stated in Section 4.18 of the Final EIS, mitigation to reduce adverse economic hardships for existing businesses along the project alignment during construction will include the following:

- Maintain access to businesses during construction*
- Develop a public involvement plan prior to construction to inform business owners of the construction schedule and activities*
- Initiate public information campaigns to reassure people that businesses are open during construction and to encourage their continued patronage*
- Minimize the extent and number of businesses, jobs, and access affected during construction*
- To the extent practicable, coordinate the timing of temporary facility closures to minimize effects to business activities—especially those related to seasonal or high sales periods*
- Minimize, as practical, the duration of modified or lost access to businesses*
- Provide signage, lighting, or other information to indicate that businesses are open*
- Provide public information (e.g., press releases or newsletters) regarding construction activities and ongoing business activities, including advertisements in print and on television and radio*
- Phase construction in each area so as to maintain access to individual businesses for pedestrians, bicyclists, passenger vehicles, and trucks during business hours and important business seasons*
- Provide advance notice if utilities will be disrupted and schedule major utility shut-offs during non-business hours*

In addition, Section 4.18.3 and 4.18.5 discuss mitigation measures for visual and aesthetic and noise and vibration effects during construction. These measures will include:

- Removing visibly obtrusive erosion-control devices, such as silt fences, plastic ground cover, and straw bales, as soon as an area is stabilized*
- Locating stockpile areas in less visibly sensitive areas whenever possible so they are not visible from the road or to residents and businesses*
- Shielding temporary lighting and direct it downward to the extent possible*
- Limiting the times construction lighting could be used in residential areas*

- *Replacing removed street trees and other vegetation with appropriately sized vegetation as soon as practical after construction is completed in the same location or another location in accordance with City and State requirements*
- *Developing a monitoring plan with noise limits*
- *Construct temporary noise barriers or curtains*
- *Equipping construction equipment engines with adequate mufflers and intake silencers*
- *Strategically placing stationary equipment, such as compressors and generators*

The City will not provide financial assistance or low-interest loans to businesses during construction. Where acquisition of property will occur, compensation will be provided to affected property owners, businesses, or residents in compliance with all applicable Federal and State laws and will follow the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970.

Construction of the guideway is likely to be sequential, progressing from one block to the next, as shown in Appendix E of the Final EIS. As stated in Section 4.18.1 of the Final EIS, several public involvement strategies will be used to inform businesses and the public about construction activities, including roadway detours. These strategies include those listed in the bullet points above. Part of the mitigation associated with construction will be to regularly remove dirt and debris.

Regarding your post-construction mitigation suggestions, the Project is focused exclusively on the construction and implementation of rail transit service, which is analyzed in the Draft and Final EISs. However, as discussed in Section 4.19.2 of the Final EIS, transit-oriented development (TOD) is expected to occur in station areas as an indirect effect of the Project. The increased mobility and accessibility that the Project will provide will also increase the desirability and value of land near stations, thereby attracting new real estate investment nearby (in the form of TOD). Planning and zoning around station areas will be established and conducted by the City's Department of Planning and Permitting under a process covered by the City's new TOD ordinance (09-4).

To address your concern about the creation of a tunnel effect at stations, center platform stations generally have a greater total shaded area than a side platform station because of the need to widen and split the track structure prior to the station. Center platform stations are proposed where appropriate.

The City is conducting station workshops with communities that will have rail stations. The purpose of the workshops is to engage the public about rail stations and provide opportunities to residents and businesses to contribute ideas about the appearance of station entryways in their communities. Ideas generated at the workshops will be incorporated into the station planning process. For more information and to become involved in this process, please visit the project website at www.honolulutransit.org.

While there are over 4,100 parking spaces identified as part of the Project, the experience with park-and-ride facilities in Honolulu to date is limited. They have been generally underused. The lots that are part of the Project are located toward the Ewa end of the route and are based on consideration of parking demand using the travel demand forecasting model for the year 2030. Further, the projected mode of access shares were compared to observed data from several Mainland areas, notably San Diego. Given the history of park-and-ride use on the island, it seems prudent to evaluate any need for additional or larger facilities on the basis of empirical experience rather than commit substantial additional funding now. Any need for additional parking at the four stations with park-and-ride facilities would best be determined once experience is gained about their use. As stated in Section 2.5.4 of the Final EIS, security will be provided in the form of surveillance cameras, lighting, fencing, barriers, on-site personnel, or other means. DTS will discuss options with commercial developers interested in integrating additional parking for transit use into their proposed developments.

Where relocations will occur, compensation will be provided to affected property owners, businesses, or residents in compliance with all applicable Federal and State laws and will follow the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970. It is assumed that for the properties that will be partially acquired, existing land uses will not change.

Regarding security, the majority of the system will be placed in roadway medians, which is not conducive to being used as a shelter. Landscaping and other measures will be used where appropriate to discourage loitering. In addition, as stated in Section 2.5.4 of the Final EIS, security, including cameras, will be provided at all stations and on all trains; however, security personnel may not be physically located in all locations at all times.

During Final Design, detailed investigations will be conducted to reduce the anticipated access impacts to local businesses caused by guideway column placements. Section 3.4.3 of the Final EIS discusses impacts of the Project on the roadway network. Near properties that are owned by Kamehameha Schools, there is no loss of left-turn lanes at signalized intersections (as also shown in Appendix C of the Final EIS). However, restrictions for making left turns in and out of many driveways, including some owned by Kamehameha Schools, are expected due to construction of a raised median along Dillingham Boulevard.

As discussed in Section 4.10.3, to address noise issues, the Project includes an integrated noise-blocking parapet wall that extends three feet above the top of the rail and wheel skirts.

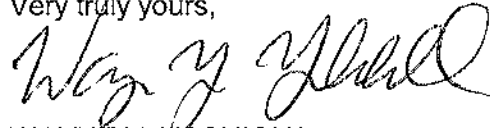

Your comments regarding mitigation improvements for individual property owners and public amenities have been noted; however, public improvements not related to the transit system are not within the authority of DTS. These are activities outside the Project and beyond the scope of the EIS.

Lastly, the system will operate as a proof-of-payment system, as described in Section 2.5.1 of the Final EIS.

Mr. Thomas Jivorsky
Page 5

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Issuance of the Record of Decision under NEPA and acceptance of the Final EIS by the Governor of the State of Hawaii are the next anticipated actions.

Very truly yours,

Dear Ms. Celshall:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal:

The Project is in exclusive elevated right-of-way, which will only accommodate rail vehicles. Providing additional bicycle facilities is beyond the scope of this Project. However, the Project is being carefully designed so it does not preclude future bicycle facilities from being built along routes where they are planned.

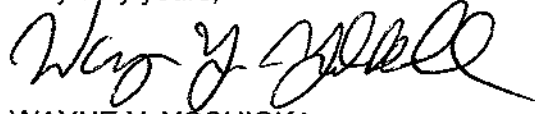

Many bicycle lanes planned by the City or State could connect to fixed guideway stations. The Oahu Bike Plan is currently being updated by DTS and is scheduled to be adopted in 2010. The Draft Master Plan includes a prioritized list of bicycle projects developed using criteria that include access to transit. Several projects that would connect existing or future bicycle facilities to rail transit stations are included in the Draft Master Plan. Additional information on the Oahu Bike Plan is available at <http://www.oahubikeplan.org>.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project

Ms. Emika Celshall

Dear Ms. Chan:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As stated in Section 4.10.3 of the Final EIS, the Project will cause no severe noise impacts. Moderate impacts will occur at upper floors of a few high-rise buildings (as shown in Table 4-18 in the Final EIS). With the recommended mitigation in place (sound absorbing material and wheel skirts), the noise analysis indicates that the new noise generated by the Project will be lower than the existing noise levels in most places.

The project design includes an integrated noise-blocking parapet wall at the edge of the guideway structure that extends 3 feet above the top of the rail. The parapet wall will substantially reduce ground-level noise.

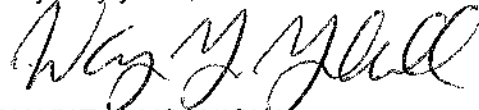

Wheel skirts will increase the benefit from the parapet wall at locations above the elevation of the track. The use of sound-absorptive materials below the tracks in the areas that will experience moderate noise impacts will reduce the Project noise levels from the upper floors

Ms. Bonnie Chan
Page 2

to below the impact level. Once the Project is operating, noise levels will be re-measured to confirm that there are no noise impacts from the Project.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Other Submission Method :
Submission Date : 12/01/2008
Submission Content/Notes : Portland, Denver, Washington D.C. and Charlotte is not in the middle of the ocean. I believe I heard on the CD that was sent to me, you are estimating 200,000 plus more people living on this island driving vehicles. If the roads are crowded imaging 200,000 plus people riding the transit. It doesn't make sense. Then you talk about 11000 jobs and that is good but what happens after the job is completed? The cost of everything else goes up, who has to survive the cost of a high economy? Isn't there enough foreclosures, retired people have to look for another job, homeless people, welfare people who is able to work but is not working owning nice cars and boats, and much more issues that will be affected. There should be a double decker for the freeway where everyone pays for the road from their own registration. By having the rail transit we are force to pay for something we may never use. Remember not everyone will ride the rail transit. This is not feasible and not fair for (hopefully we still have the middle class around) many retirees and elderly people. They don't get overtime nor do they get pay raise to up keep with high cost of living. One day you will be an elderly person and that is the only time you will realize the rail transit is not good for Hawaii because we live on a Island. I guess we love to spend other people money to get what we want. Why should there be a stop at the statium? The stops should be located from Kapolei to Pearl Harbor, Airport, Downtown, Waikiki, and Daimond Head. Place where most tourist will be affected.

Dear Mr. Chang:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your opposition to rail transit is noted. While not on the Mainland, Honolulu is a growing city with increasing traffic congestion. The Executive Summary of the Final EIS states: The Project is intended to provide faster, more reliable public transportation service than can be achieved with buses operating in congested mixed-flow traffic. It will provide reliable mobility in areas of the corridor where people of limited income and an aging population live and will serve rapidly developing areas of the corridor. The Project will also provide additional transit capacity and an alternative to private automobile travel, as well as improve transit links within the corridor. In conjunction with other improvements included in the Oahu Regional Transportation Plan 2030, the Project will help moderate anticipated traffic congestion in the corridor.

Mr. Charlie Chang
Page 2

After construction, the Project will directly provide a limited number of jobs, but more importantly will support other employment by providing workers with a fast and reliable transportation option. The transit system is designed to primarily serve local residents, with stations near residential and employment areas. Aloha Stadium provides an opportune location for a park-and-ride. Tourists will find the system convenient for many of their trips.

The Project will have stops at East Kapolei, Pearl Harbor, the Airport, and Downtown. The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The proposed future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of this Final EIS. Future extensions may have additional stops in Waikiki or the Diamond Head area. However, the future extensions are not part of this Project, thus they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and the NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in this Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time. As stated in Section 3.4.2 of the Final EIS, approximately 9,900 visitors are expected to use the system daily.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Honolulu High-Capacity Transit Corridor Project

Welcome to the Honolulu High-Capacity Transit Corridor Project's Public Hearing for the Draft Environmental Impact Statement/Section 4(f) Evaluation.

This public meeting and hearing has been designed to inform the public about the transit project, explain materials contained in the Draft EIS, answer questions from the public, and collect public input on project issues related to the Draft EIS, Section 106 of the National Historic Preservation Act, Section 4(f) of the U.S. Department of Transportation Act, and floodplains affected by the project.

Please review the project information and ask project staff any questions about the project that you might have. The Draft EIS is available on the project website at www.honolulutransit.org.

You may provide official comments in several ways. Here at this Public Hearing you may provide oral comments to a court reporter who will record them for the record or use this form to provide written comments. After the meeting, you may provide an on-line comment at www.honolulutransit.org or use this form to send a written comment to the Department of Transportation Services. All comments must be postmarked or received by January 7, 2009 in order for them to be included in the Final EIS.

Dear Mr. Chang:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

Your support for the Airport Alignment is noted. With the Project, residents of the Salt Lake neighborhood will have connections to the Airport. Four new bus routes will be added to provide service for Salt Lake area neighborhoods:

- *New Route 31 will connect passengers along Wanaka Street, Likini Street (Ewa of Ala Liliko'i), and Ala Ilima Street with the rail station at Lagoon Drive. Passengers can transfer to rail from Route 31 to access the airport.*
- *New Route 301 will connect passengers to rail stations at Aloha Stadium and the Middle Street Transit Center. Route 301 will serve passengers in Foster Village and along Salt Lake Boulevard, Keaka Street, Aliamanu Street, and Likini Street.*

Mr. Homer A. Chang
Page 2

Passengers can transfer to rail from Route 301 to access the Airport at either the Aloha Stadium Station or Middle Street Transit Center Station.

- *New Route 311 will provide service between Moanalua Valley, Salt Lake (serving Ala Napunani and Ala Ilima Streets), and the Airport.*
- *New Route 314 will connect passengers to the Aloha Stadium and Pearl Harbor stations. Route 314 will serve passengers along Salt Lake Boulevard, Bougainville, Radford Drive and Kamehameha Highway. Passengers can transfer to rail from Route 314 to access the airport.*

Existing and future bus routes, including route numbers and frequencies, are described in Appendix D of the Final EIS. The actual implementation of these routes may differ.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Submission Content/Notes : I feel the rail should start in the middle of town and work its way in both directions connecting with the University of Hawaii ASAP. Starting in the middle of a field is less expensive but who wants to ride around in the middle of a field? If ridership is the desired end result it must be built where the riders are. This is also important as with the economy as it is, the tax dollar from excise taxes is not going to be as projected. Raising property taxes, or the excise tax for this project should not be an alternative as people of Hawaii are having a hard enough time as it is. The airport rather than the Salt Lake route is also a better choice. Too bad there isn't a way to do it underground as it will make Oahu very ugly with trains running in the air blocking views and making noise.

The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- *Reduce the time that each area will experience traffic and community disturbances.*
- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*

Mr. Robert Chang
Page 2

- *Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- *Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

Your preference for the Airport Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been identified as the Preferred Alternative as described above. Compared to the other alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly lower impacts to the natural and built environment. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative.

Tunnel options were evaluated and eliminated during the Alternatives Analysis phase because they would not be financially feasible.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Comments of Charley's Taxi re
Draft Environmental Impact Statement/Section 4f) Evaluation
Honolulu High Capacity Transit Corridor Project
City and County of Honolulu, Oahu, Hawaii

Traffic Congestion Depresses Consumer Activity, Business Operations and the Economy

Traffic congestion directly and daily adversely impacts taxicab passengers, operators and drivers. Government policies have purposely induced traffic congestion to unacceptable levels. To spite 'automobility,' politicians punish innocent consumers and businesses who have become 'prisoners of congestion.' Traffic congestion does not simply affect the government subsidized transit buses, every transportation operator and business will experience higher costs and difficulties to fill customer demand and expectations, many of whom will become unable to ride TheBus or TheTrain.

We are deeply concerned about the impacts of the rail system to make congestion worse on the roads along and surrounding the rail route. Honolulu having the one of the fewest urban road miles in the US and territories, and with many narrow roads throughout the route, no promises of mitigation are sufficient to compensate for the permanent damage to traffic conditions. Private transportation providers' services to our customers will become more costly and difficult to fill.

Traffic congestion reduces productivity and raises fuel and labor costs for transportation providers. Travel delays increase fares to our passengers. Traffic congestion lengthen trip times that also become unreliable to show up for appointments on time. Since the city removed the 4th lane on the Ala Wai Boulevard in 2004, our taxi drivers experience travel delays to the tune of 4 to 6 lost trips a day. The loss of trips has caused taxi drivers to work longer hours and the 7th day in order to make up for the loss of trips due to traffic congestion.

With about 1400 licensed taxicabs in Honolulu, the number of trips lost per day approximates 7000 trips on any day of lost productivity. Having 1.6 passengers average per taxi trip, 11,200 potential taxi passengers are sacrificed a day in Honolulu. A recent congestion study (for cordon pricing experiment that was contemplated) in Manhattan showed similar loss of 5 taxi trips a day due to congestion.

Before this latest tourism downturn, congestion regularly limited supply as drivers were stuck in traffic. Our passengers therefore endured longer waits and travel times and higher fares. The frequency of 2-3 parades a week in Waikiki was a nightmare as fares doubled and tripled for a 2 mile trip in Waikiki, discouraging frustrated drivers from going into bad traffic.

Restaurant reservations schedules are thrown off due to traffic congestion, with a domino affect on later seatings. Theater schedules, parties and charity fund-raising events are similarly thrown off and delayed due to traffic congestion. Traffic congestion affects the economic engines that drive Hawaii's economy: Tourism, Military and Construction.

Since 1990, only 2.23 freeway miles have been added on Oahu even though tens of thousands of homes were added to West Oahu, the corridor for which the rail is planned. As if to buttress rail proposals, little has been done over decades to relieve the bottlenecks on H1/H2 merge and the Middle Street merge. Motorists gained 10-15 minutes in travel time just by widening one lane the length of 1.5 miles for the Waimalu off-ramp.

Excessive Dependence on Government Subsidies

Rail systems are more costly than bus systems because a rail system cannot operate with feeder buses, thus requiring two systems: TheTrains plus TheBuses. Heavier reliance on government subsidies for rail poses the same fiscal quagmire as rail systems elsewhere that threaten the economic stability of municipalities, states and nations today.

The federal contribution to the excessively high cost of rail pales in comparison to the local cost burden.

The proposed rail system's costs, risks, and liabilities are so excessive to be unsustainable without even greater tax increases on Honolulu's small and declining population of 900,000. Compared to other metropolitan areas, Oahu residents and businesses suffer a higher cost of living, highest costs of doing business, highest taxes, severely high cost of housing, highest electricity costs.

Threat to Economic Stability

The city has no process to assure independent oversight, accountability, performance and transparency over this proposed project. Hence, the prospects of mismanagement and the cost over-runs and delays can be expected to be much higher and longer than any other rail system built in the USA.

Honolulu has the dubious distinction of having one of the highest construction costs in the nation, where everything has to be shipped in, and therefore takes longer and farther to travel.

The city has no experience to manage a megaproject of the proposed size of TheTrain and its Transit-Oriented Developments.

The city is totally reliant on consultants to manage the proposed rail projects and the consultant in charge has a rather tarnished history not only in Boston but elsewhere.

The mayor may not complete his term beyond 2010 and there is no stronger political leader to champion this project in his stead.

The city and its rail advocates have failed to inform the public in the many millions spent on meetings, hearings, literature and advertisements, that the price of Honolulu's rail system — for its size and scope — is many, many times higher than other systems touted to promote the successes of rail systems.

Honolulu has a long history of delays in construction projects coming in on time, on budget. In recent times, construction projects have been stopped due to "iwi" discoveries, and the rail project traversing through downtown Honolulu promises to encounter many more iwi discoveries, for sure.

The current financial crisis has eliminated or lessened many of the prospective developers to participate in the Transit-Oriented Developments surrounding the proposed rail stations.

Prioritizing Commuters over Seniors with Multiple Disabilities

Chapter 1, Background, Purpose and need (DEIS pp 1-1 to 1-21)

The burgeoning transportation needs for seniors and disabled passengers are totally absent from this discussion. When why does the city focus exorbitant assets and resources (\$4 Billion-plus) for a commuter market that is a pittance in comparison to the needs of the senior population over 60 years in age, to grow to 284,350 by 2030?

Between 2000 and 2030, Oahu's population over 60 years of age is projected to increase by 134,157 or 189 percent (from 150,193 to 284,350), to become 25.4 percent, (from 17 percent in 2000) of Oahu's projected total 1,117,300 population in 2030.
Link to DBEDT: series2030report-appx-3.xls

A projected 1.3 percent increase in transit ridership is a pittance compared to the underserved needs of the seniors who suffer multiple disabilities and will therefore be unable to ride TheBus or TheTrain. There is no discussion of the impact that the rail system during construction and in operation will have upon the travel times of those seniors and disabled who will be unable to use TheTrain and who also find that HandiVan is inconvenient and unavailable to provide independence and reliability that is afforded to physically fit riders. This DEIS represents discrimination in the worst sense in that the aged population having multiple physical disabilities and economic hardships will suffer fewest transportation options, despite their most severe vulnerabilities.

Continuing History of Rationing Transit Bus Services

The proposed transit system's ridership will be limited by the number of buses and trains projected. Adding a train with feeder buses will reduce service access so as to further ration transit availability overall.

Ch1, 1.1 History and Conditions Leading to the Project

"The HRT&L streetcars were completely replaced by buses in 1942." DEIS, p. 1-1

Good timing, because ridership surged with less than 200 buses to 53,325,862 in 1942, 76,805,829 in 1943, 93,016,633 in 1944, and 85,245,013 in 1945 with 200 buses. In all the years since, ridership has never exceeded the 1943, 1944, 1945 numbers.

The city has failed to present FTA and the public with a true picture of TheBus performance and to compare it against the non-subsidized private operators' yields prior to the city & County of Honolulu's takeover of HRT in 1971. Ridership volume has declined and the yield per bus has likewise declined, despite the increase in population.

Statistics on TheBus performance indicates one or some of the following:

- 1 - that the city has rationed the number of buses in its fleet to stifle growth potential
- 2 - that demand for transit does not warrant additional capacity.
- 3 - to grow traffic congestion by withholding commuter bus capacity in order to justify a rail system.
- 4 - the moratorium on highway construction in order to call for the need of a rail system.

Since the City & County of Honolulu took over the transit system from HRT in 1971, the highest TheBus ridership in the 1980s — of 76,260,187 in 1984 with a 440 bus fleet — has never been duplicated in the 23 years to 2007, even though Population increased by 107,801:

1984	440 TheBus fleet	76,260,187 riders	173,319 avg riders per bus	797,800 population
2007	531 TheBus fleet	71,749,376 riders	135,121 avg riders per bus	905,601 population

From 1989 to 2006, the number of buses in TheBus fleet increased by 50 buses only, with 6 more TheBuses added in 2007:

1989 to 1992, TheBus fleet was 475 (period of the 1992 rail debate)
1995 to 2006, TheBus fleet was frozen at 525 for 11 years

Since 1973, the city has rationed commuter express bus services. Bus trips were not added commensurate with the increase of population and households in the Ewa/Waianae region.

TheBus trips have been concentrated on tourist ridership instead (Routes 8, 19, 20 and 22: Waikiki - Ala Moana Center, Waikiki - Airport & Pearl Harbor, Waikiki - Hanauna Bay.

See Excel Worksheet: Transit Buses/Ridership

Figure 1-2 (DEIS p.1-02) fails to include relevant statistics, such as:

- Ridership volume of TheBus declined since 1984
- Stagnation of fleet size in relation to population growth, bus trips in growth areas

Compare ridership yield per bus:

1955	29,658,374 riders, avg 241,125 riders x 123 buses
1956	19,900,409 riders, avg 243,093 riders x 123 buses
2006	70,384,355 riders, avg 134,065 riders x 525 buses
2007	71,749,376 riders, avg 135,121 riders x 531 buses

Figure 1-5 Population Distribution for Oahu (DEIS p1-8) fails to show the number of bus trips, schedules and routes assigned to population areas that would show the lack of or attempt to fill capacity to meet demand of new growth areas.

Figure 1-6 Employment Distribution for Oahu (DEIS p1-9) also fails to show the number of bus trips and routes assigned to growth areas.

Ch 1.5 (DEIS p 1-15) Why has the city failed to present TheBus' performance results? Why are taxpayers expected to foot the exorbitant investment for expanded transit services for the Leeward Corridor? Why are taxpayers expected to foot the exorbitant investment for a rail system whose capacity will likewise be permanently limited by the number of rail cars that are projected for this

History of Deferred Maintenance that add to higher costs ultimately

The City & County of Honolulu scoops up regular increases in taxes and fees while its infrastructure and facilities are in dilapidated conditions. Despite promises to "be honest, truthful, and accountable for the public's money," the mayor has failed to present the citizens of Honolulu with specifics and details on the worsened state of our infrastructure and costs to repair, renovate or replace same.

In his February 25, 2005 State of the City Address, Mayor Hannemann laid out in general terms the depth and magnitude of "the challenges" facing the citizens of Honolulu. Three of the many examples cited are found at <http://www.co.honolulu.hi.us/mayor/soc2005.pdf>

"The amount we pay each year in interest and principal stands at 194 million dollars, nearly 20 percent of our budget. Our debt service for 2006 is expected to increase by 40 million dollars over this year -- and that's just the increase. We've amassed a total debt of more than 3 billion dollars, about 3 thousand dollars for every man, woman and child in the City & County of Honolulu." (page 3 of 21)

"At the 40-year-old Neal Blaisdell Center, another heavily used facility, the arena is badly in need of a new air-conditioning system. Sections of the parking lot are sinking." (p 6 of 21)

"Staff shortages of 30 percent in many departments are the norm, and have not only affected our ability to properly serve the public, but had a terrible impact on the morale of our City work force, who have been told year after year 'to do more with less.'" (page 7 of 21)

The mayor (p 10) considers "filling potholes" as fixing the roads: "Our maintenance of roads will follow a plan and a schedule consisting of three parts: The first is that, quite simply, our City road crews will be filling potholes year round and not only in emergency. The second part is called first-aid, meaning a three-quarter to one-inch overlay of asphalt on existing roadways in rural areas...The third is major reconstruction of heavily used thoroughfares." In fact, the reconstruction plan has been meager and the heavily roads and arteries in downtown continue to be riddled "throw and go" pothole fillers.

Transit trips are projected to be longer than auto trips. Why should taxpayers underwrite high costs of rail for longer transit travel times?

Respectfully submitted,

Dale Evans
President & General Manager

Charley's was founded in 1938 by Charles S. and Helen H. Morita, and is Hawaii's oldest passenger ground transportation company. With nearly 300-plus drivers in a fleet of over 200 taxicabs, vans and limousines, Charley's serves over 2.5 million passenger trips a year on Oahu. Now in its third generation as a kama'aina small business, Charley's provides the very finest premium on-demand transportation service to the public, giving special care and attention for MediCab, Executive Car, Designated Driver for DUI Alternative, Taxi Airport Shuttle and the nation's only Japanese fluent taxi dispatch service. Charley's is the only local taxi company that has been officially recognized as an industry leader with industry and government awards.

Dear Ms. Evans:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal:

1. Consumer activity, business operations and the economy

When the Project is fully implemented, traffic congestion will improve compared to the forecasted state of traffic congestion if the Project were not carried out. Furthermore, the Project will be built in the median of major roads and will not reduce traffic lane capacity. As shown in Table 3-14 of the Final EIS, the analysis shows that islandwide vehicle hours of delay will decrease by 18 percent compared to No Build conditions. Traffic congestion will increase at one intersection near East Kapolei Station, one near UH West Oahu Station, three intersections near the Pearl Highlands Station, and at one intersection near Ala Moana Center (Kona/Keeaumoku Streets) (as shown in Table 3-23 of the Final EIS). However, mitigation will alleviate the delay. Mitigation measures are detailed in Section 3.4.7 of the Final EIS and often recommend widening or reconfiguring traffic lanes and intersections, signalization, and planning for pedestrian flows management.

Table 2-4 of the Final EIS outlines Committed Congestion-relief Projects in the Oahu Regional Transportation Plan 2030 that will be implemented in tandem with the Project.

Comments regarding taxicab operations and statistics are noted.

Comments regarding the effects of parades on taxicab operations in Waikiki are noted.

Comments regarding the effects of congestion on social activities are noted.

Over \$3 billion of roadway improvements are planned for Oahu between now and 2030 according to the OahuMPO Regional Transportation Plan. Some of those will benefit from stimulus funding under the American Recovery and Reinvestment Act, 2009. All those improvements are included in the No Build Alternative against which the Project's performance is measured. The Project will be needed to provide an alternative transportation mode to Ewa and other locations within the corridor. Roadways will continue to be heavily used, but they alone are not able to adequately meet current and future projected demand according to the analysis in Chapter 3 of the Final EIS, which covers Transportation.

2. Funding Sources

The Project is designed to integrate with a feeder bus network. According to the study "Rail Transit in America," available on the American Public Transportation Association website, the cost savings provided by rail are much greater than the subsidy to rail.

Chapter 6: Cost and Financial Analysis in the Final EIS describes the financial resources anticipated to be needed to pay for the capital costs and ongoing operating and maintenance costs. As the commenter notes, the majority of the resources are anticipated to come from local sources, although Federal funds are a significant part of the Project's Financial Plan.

Section 6.6: Risks and Uncertainties in the Final EIS discusses risks and uncertainties associated with the financial analysis presented in Chapter 6. Conditions on Oahu have been accounted for in structuring the financial analysis.

The taxes used to fund the Project will provide a system that will serve the vast majority (70 percent) of the population and employment within the corridor. It also furthers the policy guidance of the City Council regarding alternative modes and support of the development of Kapolei as Oahu's "second city." The capacity of the proposed system is sufficient to accommodate very large increases in demand over time. While the present design identifies approximately 8,000 passengers in the peak hour peak direction and provides the vehicles to handle that demand, the system can handle over 50,000 people an hour by adding cars to each train and reducing the time between trains.

3. Cost and Oversight

Management oversight of the Project will be undertaken in accordance with FTA's Project Management Oversight Operating Guidance (PMOOG). The FTA has multiple third-party oversight consultants to verify and propose revisions to the work done on the Project. The

process is designed to provide assurances that the work being done is consistent with the best practices in the industry and to avoid problems that have affected projects in the past.

Your comment regarding Oahu construction costs is noted. The Project's cost estimate in Chapter 6 reflects local cost factors.

The City will conduct a competitive bidding process in order to identify the necessary expertise to manage the construction and later the operation of the Project. Transit-oriented development (TOD) is not part of the Project and, other than the City establishing the appropriate policy foundation, will be primarily implemented by the private sector.

The City has hired qualified firms to support the Project's development. Consultants involved have experience with almost every major rail system development in the country as well as complementary experience in highway development work. Information about consultants is publicly available upon request

The environmental review of the Project is independent of the electoral process or results.

4. Public Involvement

The public information program is typical for a project of this scope and is required by NEPA because of federal action that is involved in the project. The design of the public involvement program must allow access to information and through multiple meetings and media. This will continue through the construction period and beyond.

5. Managing iwi kupuna Discoveries

The Project schedule accounts for discovery of iwi kupuna and treatment per State Historic Preservation Division regulations. The proper treatment of iwi kupuna has been coordinated with the Oahu Island Burial Council (OIBC) to ensure affected families are contacted and, when necessary, appropriate steps are taken to preserve, protect, or re-inter iwi discovered in the path of the Project. As much as possible, the effort will begin before construction to help address concerns in advance of actual construction. These efforts are memorialized in a Programmatic Agreement between the State Historic Preservation Division and the FTA with extensive participation from OIBC and other interested parties.

6. Transit Oriented Development

The Project's Financial Plan does not rely on private funding of any kind. Planning and zoning around station areas will be conducted by the City's Department of Planning and Permitting under a process covered by the City's new TOD ordinance (ROH 09-4). The TOD process will happen gradually as the opportunities present themselves.

7. Elderly and ADA service

Discussion of service for elderly and disabled users is included in Chapter 1 and has been accounted for in the analysis of the Project, including ridership projections. The needs of

seniors are not ignored, but commuters are still by far a significantly larger portion of the population according to the latest Census and are expected to be through 2030. As stated in Section 2.5 of the Final EIS (and reproduced below), the transit system will comply with regulations of the Americans with Disabilities Act (ADA). Elevators and escalators will be provided at all stations. In addition, level boarding will be provided to trains; therefore, stairs or lifts, as used on buses, will not be required. Those with wheelchairs, walkers, strollers, carts, or wheeled luggage will be able to access the rail platform and will have level boarding onto the train.

All buildings, facilities, and vehicles will conform to applicable Federal, State, and County accessibility guidelines and standards. HRS Section 103-50 requires that all State or County government buildings, facilities, and sites be designed and constructed to conform to the Architectural Barriers Act/Americans with Disabilities Act Accessibility Guidelines (36 CFR 1190 and 1191), issued by the U.S. Access Board, and other applicable design standards as adopted and amended by the Disability and Communication Access Board. The law further requires all plans and specifications prepared for construction of State or County government buildings, facilities, and sites be reviewed by the Disability and Communication Access Board for conformance to those guidelines and standards.

8. TheHandi-Van services

TheHandi-Van services are not directly impacted by the physical construction of the fixed guideway system. TheHandi-Van is a curb-to-curb operation not requiring posted bus stops to board and alight passengers. TheHandi-Van vehicles are able to access businesses, medical facilities, and other destinations using driveways and parking lots since TheHandi-Van has flexibility in selecting a route to a destination. TheHandi-Van services may experience some delays in service during construction in certain areas due to general traffic conditions. TheHandi-Van will be impacted no more than general purpose traffic. A Maintenance of Traffic (MOT) Plan will be prepared for each segment of fixed guideway construction. The MOT Plan documents traffic conditions and operations during the construction of the fixed guideway and identifies lane closures and other traffic detours due to the project construction. A part of this process is identification of required transit modifications during construction. Any impacts to TheHandi-Van operations due to access limitations will be identified and mitigated as appropriate.

9. Transit bus services

Figure 3-1 of the Final EIS offers the primary explanation why the transit ridership achieved in 1984 has not been surpassed even though the bus fleet has increased. Due to increasing traffic congestion, bus operating speeds deteriorated between 1984 and 1992. During this period, no other comparably sized bus system in the United States moved more riders per bus hour than the Honolulu service. This is according to annual reports filed by the transit operators with the Federal government.

Buses were added in Honolulu to maintain service levels. In 1989, there were 475 buses available for service as reported in The State of Hawaii Data Book 2000. The number of available buses increased to 495 in 1993 and 525 in 1995. In 2007, the total number of available buses was 531. However, increasing congestion required more buses to provide the

same level of service along the same route because the total trip time for one bus to serve the entire route was increasing. For example, Figure 1-11 of the Final EIS shows how afternoon scheduled trip times for selected routes have increased from 1992 to 2008 (Source: TheBus public timetables). The time for Route 52 (Circle Isle) to complete a trip has increased over 30 minutes, and the trip time for Ewa Beach has increased almost 60 minutes. The result has been that a bus can no longer make as many trips as it did in the past. This has required the need to add buses to routes to maintain the same interval between buses.

Over the past 10 years, the system operating speed has continued to decline. Even though the annual number of miles operated in revenue service has increased 11 percent from 1997 to 2007 per the National Transit Database, it took a 16 percent increase in the annual number of hours to operate those additional miles. This has contributed to higher operating costs.

Careful examination of Figure 3-1 of the Final EIS depicts two times when bus operating speeds slightly and temporarily increased. Both of these occasions were the result of concerted efforts to enact systematic and comprehensive improvements to TheBus system. The most recent of these was from 1999 to 2001. New service design substantially improved bus services in the Ewa and Waianae areas with the introduction of a wide array of new community circulators, local, and CountryExpress! bus routes.

The benefits of these improvements have been temporary. Increasing system usage and traffic congestion have combined to negatively impact the overall system operating speed as shown in Figure 3-1 of the Final EIS.

Since the early 1990s, the number of TheBus trips to and from Waikiki has decreased from over 1,050 trips to 994 trips today. For example, Route 8 had 189 trips to and from Waikiki in 1992; today the route has 143 trips. Similarly, Route 19 has experienced a decrease in trips to and from Waikiki from 125 to 71 trips today. The number of trips on Route 20 has decreased from 78 to 39 trips.

Figure 1-2 of the Draft EIS presents population, vehicle ownership, and vehicle miles trends for Oahu. The significant relationship in this graphic is the disproportionate increase in vehicle miles traveled compared to population and vehicle registrations. The consequence of the increase in vehicle miles traveled is congestion, causing slower operating speeds for all vehicles, including transit. This impact is depicted in Figure 3-- of the Final EIS.

The fleet size has not stagnated. However, to operate the same number of miles of service in 2007 at 13.2 miles per hour requires about 50 more buses than in 1984 when the operating speed was 14.7 miles per hour.

10. Population Growth

The purpose of Figures 1-5 and 1-6 of the Final EIS is to show population and employment distribution and growth for Oahu. Appendix D of the Final EIS includes existing and future bus routes, including route numbers and frequencies.

Figure 1-6 of the Final EIS shows employment distribution and growth for Oahu. Figure 3-1 shows the performance of TheBus over time in terms of average travel speed.

Section 3.3.2 of the Final EIS also shows information related to reliability in terms of schedule adherence and "turnbacks" (when a bus does not complete its route to be able to maintain schedule on the next trip). As noted above, Appendix D of the Final EIS includes information on both existing and future bus routes, including frequencies.

The Project is designed with 240-foot station platforms that can accommodate trains with up to four 60-foot cars. Each car can hold over 160 passengers, so a four-car train can carry more than 600 passengers. The train control system is being designed to accommodate 90-second headway service, or 40 trains per hour. Forty 4-car trains in an hour could accommodate at least 24,000 passengers per hour per direction. This demand is larger than is forecast to occur in 2030. 2030 peak hour demand for the Project is expected to be about 8,100 passengers per hour in the peak direction. This demand can be accommodated by operating 3-minute headway service with a mixture of two-car and three-car trains. A fleet of approximately 150 vehicles to accommodate this demand is budgeted for purchase as part of the Project. However, as noted above, more than three times as many passengers per hour can be accommodated at some future date merely by expanding the fleet size.

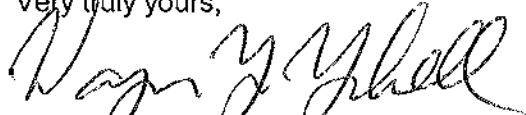

11. **Maintenance**

The Project's financial plan includes long-term maintenance costs, which are discussed in Section 6.4 of the Final EIS. Since deferred maintenance is not a desirable practice, it is not assumed as part of the financial analysis in the Final EIS.

As shown in Table 2-4 of the Honolulu High-Capacity Transit Corridor Project Travel Forecasting Results Report, 2030 a.m. peak-period travel times by transit will be less than by auto for many trips in the corridor. While travel will be faster than many trips by car, one significant advantage of the Project is that it offers reliability that cannot be guaranteed by any other travel mode available. The time from one end of the line to the other will be 42 minutes regardless of conditions on the highway, weather, or any other impediment. In effect, this means that during many days, trips on the Project will be shorter than by any other mode.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulustransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Re: Comments on the Honolulu High-Capacity Transit Corridor Project Draft
Environmental Impact Statement/Section 4(f) Evaluation

Dear Sirs:

I have reviewed the Honolulu High-Capacity Transit Corridor Project Draft Environmental Impact Statement/Section 4(f) Evaluation and offer the following comments. I do so from the perspective of a Honolulu resident and landowner deeply concerned about the current and future quality of life in Honolulu.

Without doubt, traffic and congestion are major issues impacting quality of life in Honolulu. These are not issues that will go away if ignored. However, based on my reading of the draft EIS, I am concerned that there are too many unanswered questions about the High-Capacity Transit Corridor that must be addressed before an informed and wise decision is forthcoming. The long term implications of such a decision are substantial and utmost care must be exercised at this time before committing future generations to decisions that will greatly influence the economic condition of residents, the City, and the State.

First, I am disappointed that the draft EIS was not released at a time that would have benefited the electorate in making choices during the November 4, 2008 election. My understanding based on press coverage is considerably different after I had the opportunity to peruse the draft EIS. For example, from the draft EIS, I learned that what has been analyzed is a corridor from Kapolei to Ala Moana. This is quite different from pre-election descriptions of the system that had corridor service beyond Ala Moana to UH Manoa and Waikiki. The cost and consequences of completing the system to include UH Manoa and Waikiki are not addressed in the draft EIS. We are looking at only

part of the system and can only make an 'act of faith' assumption that the total system can be completed within some unspecified budget. Public policy decisions of the magnitude of the Transit Corridor project cannot be treated so cavalierly. Much more rigor on the cost and consequences of the total system is absolutely essential. How, for instance, will the 40 foot platform at Ala Moana relate to buildings at Ala Moana that have heights well in excess of 40 feet?

Second, I am very concerned that the draft EIS provides insufficient information on the impact of the project on displaced residences and businesses. Instead of a detailed assessment of impacts, the draft simply implies that the impacts are minor or relatively small or limited. These inexact descriptors have no place in a document that is intended to provide unbiased information about a major public policy decision. Again, before informed and wise decisions are forthcoming, much more rigor on impacts on displaced residences and business is necessary.

Third, I am astounded by the estimates provided in Table 3-13 pertaining to daily person trips. In my opinion, the most significant category is 'Trips by Resident.' Under the 'No Build' scenario, transit daily person trips amount to 6% of total daily trips by residents. Under any of the 'build' alternatives, transit daily person trips amount to 7% of total daily trips by residents. The increased ridership with the Corridor project is at best, "underwhelming." I have a most difficult time in justifying how such an underwhelming change in ridership can justify the capital expenditure needed to implement the corridor project.

Finally, I am deeply troubled about planned revenue sources to finance the capital cost of the Corridor project - the General Excise and Use Tax Surcharge and the FTS Section 5309 New Starts program. At the time of the release of the Draft EIS, there were already clear signs that the U.S. and global economy were in a downward spiral that was unprecedented over the past 60-70 years. Today, the economic indicators are both clearer and worse, suggesting that an economic recovery is slow at best; and, federal deficits will be at all time highs for the foreseeable future. These conditions will severely impact both the Excise/Surcharge revenues and Section 5309 New Starts. In short, the revenue sources to cover capital costs are in serious jeopardy and must be considered as policy makers address the very real traffic and congestion issues in Honolulu.

In conclusion, I note that the incomplete nature of the draft EIS, inadequate estimates on the consequences associated with displaced residences and businesses, minimal gains in transit ridership by residents, and likely serious shortfalls in revenue sources for capital expenditures strongly suggest that City policy makers reopen its search for more modest and more effective solutions to the very real traffic and congestion issues we face in Honolulu.

I thank you hearing my concerns and trust that you will do what is best for current and future residents of Honolulu.

Sincerely,

A handwritten signature in black ink, appearing to be 'CC' or similar initials, written in a cursive style.

Dear Mr. Ching:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The NEPA process, including publication of the Draft EIS, began in 2007. In the summer of 2008, when the City Council decided to place the measure on the ballot, the schedule for the Draft EIS had already been established. Various design, agency coordination, and approval steps were required prior to publication of the Draft EIS. The normal distribution schedule was accelerated by the FTA and the City to ensure availability of the information prior to the general election.

City Council Resolution 07-039 directed that the first construction project be fiscally constrained by anticipated funding sources and to extend from East Kapolei to Ala Moana Center (the Preferred Alternative. The discussion of the alternatives considered is included in Chapter 2 of this Final EIS and the Alternatives Analysis.

The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The proposed future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS. The future extensions are not part of this Project; thus, they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time.

Future extensions are not precluded by the Project, as discussed in the Draft and Final EISs. The 35-foot-high station at Ala Moana Center is a practical solution for the first construction project to serve the shopping center and area properties. In the future, when funding is available, the extension would be designed to best accommodate the possibilities available at that time. The high-level option over the shopping center is still available and does not obviate the need for the 35-foot option built now. There are operating plans for the system that will continue to rely on the 35-foot station even after an extension is built.

For your information, as stated in Section 4.8.3 of the Final EIS, the station and guideway will be located between the Ala Moana Center and mid- to high-rise buildings, and will not substantially change the view from adjacent offices and residences.

Regarding the second point in your letter, acquisitions, displacements, and relocations were discussed in Section 4.3 of the Draft EIS and Section 4.4 of the Final EIS. Every property owner that will be partially or fully acquired due to the Project has been notified. A full list of impacted properties, parcel by parcel, is available in Appendix C of the Final EIS.

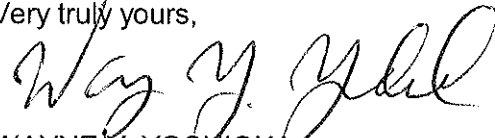

To address your third point, the 1 percent referenced is an islandwide figure that includes all travel during the day, including short trips in neighborhoods and trips in the North Shore, Kaneohe or Hawaii Kai which are not directly served by the Project. The most visible benefit of transit is within a corridor and during the peak times of the day. Table 3-12 shows daily islandwide trips, while Figure 3-11 in the Final EIS shows transit shares of home-based work trips during the a.m. two-hour peak period for key travel markets. As shown in Table 3-12, on a daily, islandwide basis, transit use is not expected to increase substantially. However, as shown in Figure 3-11, there is a substantial increase in transit trips during the a.m. peak period within the study corridor because of the Project. As stated in Section 3.4.2 of the Final EIS, for many travel markets, the transit share for trips under the Project would double or triple the share occurring under the No Build Alternative. For example, the commute-to-work transit share of the Kapolei to Downtown Honolulu travel market would increase from 23 percent under the No Build Alternative to 60 percent under the Project. In other words, more than half of the people going from Kapolei to Downtown for work in the morning would use transit with the Project, compared to only a quarter without the Project.

Mr. Chauncey T.K. Ching
Page 3

To address your final point, the capital plan for the project presented in Section 6.3 of the Final EIS considers the economic downturn. Section 6.6 of the Final EIS describes risks and uncertainties associated with these funding assumptions. The City will continue to monitor and update the revenue forecasts as the Project proceeds through FTA's New Starts process.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Subject: Objections to Rail DEIS

Dear Governor Lingle, Mr. Yoshioka and Mr. Matley,

I'm writing to express grave concerns over deficiencies in the DEIS for Honolulu's heavy rail system.

I found the draft EIS statement to be deficient in numerous areas and have specific questions and concerns about the following:

1. How will this project affect current traffic congestion?
2. The comparison of energy use of rail to bus should be done for hybrids, not traditional combustion engine as this report appears to have done.
3. It is unclear how congestion will be remedied during the many years of construction. Lanes of traffic are to be eliminate in certain areas. Where and when this will happen, and what will happen to congestion in those areas?
4. Will there be bike racks on the train and where will they be located? Will bikes be allowed on the train? Will there be a place for surfboards? What about luggage for airport passengers? What about construction workers' tools?
5. The impacts of relocations has not been adequately addressed for important food producers like Aloun Farms, 14 community facilities that will be "partially acquired" as well as small businesses that will not survive a move or reduction in operations. Historic and cultur al sites are also not adequately addressed.
6. There is insufficient information on plans to mitigate noise at the 16 schools that are adjacent to the alignment. How will the noise affect the learning environment?
7. The analysis of job creation does not adequately analyze job losses. There is no mention of what will happen to the jobs that are lost due to businesses downturn during construction?
8. The report does not adequately assess the potential harm an elevated rail system does

to our unique tourist industry and the image of Oahu. How will the tourists see noise and visual impacts of heavy rail? Will the more idyllic neighbor Islands absorb an even larger share of tourism and hurt our County's revenues?

9. The provisions for managing with lower than projected ridership and tax revenue support are inadequate.
10. The plan is also deficient in outlining how corrosion will be mitigated. BART in the SF bay area is made of aluminum. What will happen to steel in a salt air environment? An evaluation of steel vs. aluminum is lacking in this report.
11. Likewise, the DEIS plans for mitigation of graffiti on the concrete support pillars, stations and cars is inadequate. This deficiency will impact the accuracy of predicting the future cost of the project maintenance.
12. Finally, I have concerns that the ADA issues have not been adequately assessed. How long will the doors be open for to access the train? How will an elderly or handicapped person be able to get on and off the train in this time period? Please provide detailed plans on handling handicapped access. How does this effect the efficiency of the train and speed of commute?

Thank you for your thoughtful consideration of my concerns. Please feel free to call me if you have any questions about this letter.

Aloha,

Donna L. Ching

Dear Ms. Ching:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

1. A travel demand forecasting model was used to forecast traffic conditions at six screenlines during the a.m. and p.m. peak hours. The model showed that in 2030 the Project will reduce congestion at these locations by up to 11 percent during the a.m. peak hour and up to 10 percent during the p.m. peak hour over the 2030 No Build Alternative (as shown in Tables 3-9 and 3-10 of the Final EIS). In addition, vehicle hours of delay will decrease by 18 percent with the Project compared to the 2030 No Build Alternative (Table 3-14 of the Final EIS).

As shown in Table 3-23 of the Final EIS, project-related traffic will affect delay at six intersections in the corridor. The Project includes measures that will mitigate these effects (as discussed in Section 3.4.7 of the Final EIS). As a result, the Project will not affect traffic congestion.

2. The energy use analysis presented in the Draft and Final EISs includes all vehicles currently operating on Oahu, as presented in Section 4.11.1 in the Final EIS, "The analysis of operational energy consumption on Oahu was based on the transportation analysis prepared for the Project. Changes in overall transportation energy use for vehicles traveling on Oahu were assessed using daily [vehicle miles traveled] and speed values calculated from the transportation demand forecasting model." Hybrid vehicles do not account for a large enough percentage of the vehicle mix to change the project-wide energy consumption calculations.

3. As discussed in Chapter 3 of the Final EIS, a Maintenance of Traffic (MOT) Plan will identify measures to mitigate temporary construction-related effects on transportation. The contractor will develop the MOT Plan with approval from the City and the Hawaii Department of Transportation. The MOT Plan will address roadway closures for streets identified in Table 3-27 of the Final EIS. Additional temporary lane closures will occur during non-peak hours so that effects on heavy commuter traffic will be minimized. As stated in Section 3.5.7 of the Final EIS, an extensive public information program will be implemented to provide motorists with a thorough understanding of the location and duration of construction activities, as well as anticipated traffic conditions.

As stated in Section 3.4.3 and shown in Table 3-21 of the Final EIS, there will be no permanent reduction in the number of roadway travel lanes with the Project.

4. Bike racks will be available at all stations. Bicycles, surfboards, luggage, and construction workers' tools will be allowed on trains subject to some restrictions during heavy peak periods, according to policies that are yet to be developed. These items will be allowed on trains as long as they do not impede other passengers or pose safety risks.

5. The Hoopili site, which is one of the two site options being considered for a maintenance and storage facility, is located within Aloun Farms. The other site is near Leeward Community College and is the site of a former Navy fuel drumming operation. The Navy Drum site is the preferred site, and discussions are under way with the Department of Hawaiian Home Lands to acquire it. If the Project can acquire this site, the impact on agricultural lands on Oahu will be much less than is described in the Draft and Final EISs. Aloun Farms' headquarters, located at the site of the other proposed maintenance and storage facility, would not have to move

Relocations are discussed in Section 4.4 of the Final EIS, and impacts to archaeological, cultural, and historic resources are discussed in Section 4.15 of the Final EIS. A partial acquisition typically is either a narrow strip of land or a more substantial portion of a large parcel. It is assumed that for the properties that will be partially acquired, existing land uses will not change. For residential properties, if the right-of-way line comes within approximately five feet of a residential structure, it is considered a full acquisition. If the right-of-way line is more than five feet, it is generally considered a partial acquisition. For commercial properties, including situations where the commercial property could lose its function, full acquisition was considered. Businesses and residents from whom property is to be acquired will be treated according to the requirements of the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act. This Act provides for purchase at fair market value and includes relocation

assistance to those affected. The Act provides that those in need of relocation must be placed in comparable (living or business) quarters.

6. A noise barrier on the platform of the track is included as part of the project design and will reduce noise levels along the project alignment. Moderate impacts will occur at upper floors of a few high-rise buildings (as shown in Table 4-18 in the Final EIS). With the recommended mitigation in place (sound absorbing material and wheel skirts), the noise analysis indicates that the new noise generated by the Project will be lower than the existing noise levels in most places. No noise impacts are predicted for any schools along the project alignment. For schools and other noise-sensitive locations that do not have nighttime sleep activities, the FTA Transit Noise and Vibration Impact Assessment compares the existing maximum-hour noise level to the maximum-hour noise that the transit line will produce by itself. For the Salt Lake Alternative, between the Aloha and Ala Liliko'i Stations, the existing current maximum-hour Leq noise level at the school ranges from 60 to 65 dBA. A project noise level of 63 dBA or above would be an impact. The Project is predicted to have a maximum-hour Leq noise level of 51 dBA. Noise impacts are not predicted at schools and maximum-hour noise levels will stay the same.

In addition, construction noise will be a short-term impact, and all local noise ordinances will be followed to reduce noise annoyance to residences and schools.

7. An analysis of construction impacts to businesses is provided in Section 4.17.1 of the Draft EIS, 4.18.1 of the Final EIS, and Section 5.2.2 of the Economics Technical Report. This report is available at the City and County of Honolulu and DTS offices, as well as on the Project website (www.honolulutransit.org). Primary construction impacts are anticipated to result from inconveniences and disruptions to adjacent residents, businesses, and business customers that are inherent in any major construction project and include the following:

- Presence of construction workers and materials.*
- Temporary road closures and traffic diversions.*
- Temporary reductions in parking availability.*
- Airborne dust, noise, and vibrations.*
- Businesses' loss of visibility to their customers.*

Section 4.18.1 of the Final EIS states that proposed mitigation to reduce adverse economic hardships for existing businesses along the project alignment during construction may include the following:

- Coordinate construction planning and phasing with nearby property owners and businesses.*
- Develop a public involvement plan prior to construction to inform business owners of the construction schedule and activities.*

- *Minimize the extent and number of businesses, jobs, and access affected during construction.*
- *To the extent practicable, coordinate the timing of temporary facility closures to minimize impacts to business activities, especially those related to seasonal or high sales periods.*
- *Minimize, as practical, the duration of modified or lost access to businesses.*
- *Provide signage, lighting, or other information to indicate that business are open.*
- *Provide public information (press releases, newsletters) regarding construction activities and ongoing business activities, including advertisements in print and on television and radio.*
- *Phase construction in each area so as to maintain access to individual businesses for pedestrians, bicyclists, passenger vehicles, and trucks during business hours and important business seasons.*
- *Provide advance notice if utilities will be disrupted and schedule major utility shutoffs during non-business hours.*

Overall, the Project is estimated to increase jobs during the nine years of construction to an average of about 10,000 per year, see Table 4-34 in Final EIS.

8. Negative impacts of the rail system with respect to property values and tax impact, are detailed in the Economics Technical Report. Section 4.2.2 of the Draft EIS and Section 4.3.2 of the Final EIS summarize the impact of railway construction on Real Property Taxes.

Aesthetic effects of the system are described in Section 4.8 of the Final EIS. The Project is substantially different from systems in New York and Chicago, as it will have a different structural design. There is no evidence that the Project will have a negative impact on the tourism industry. Section 4.19 of the Final EIS states that the economic forecast is for continued steady growth. Planned projects are intended to continue to encourage and enable economic growth in the region. Continued focus on tourism is anticipated.

The Project will offer tourists a transportation alternative that links them directly with many key destinations and reduces the need for a car. Table 3-13 of the Final EIS shows daily person transit trips by purpose, broken down for residents and visitors. As seen in this table, transit trips for both groups increase with the addition of the Project compared to the No Build Alternative. Daily resident person trips by transit increase 24 percent with the Project compared to without, while daily visitor person trips by transit increase 19 percent with the Project compared to without the Project in 2030. As stated in Section 3.4.2 of the Final EIS, approximately 9,900 visitors are expected to use the system daily, of which 1,800 are to or from the airport.

The island's unique visual character and scenic beauty were considered in the visual and

aesthetic analysis presented in the Draft and Final EISs. The Project will be set in an urban context where visual change is expected and differences in scales of structures are typical. As part of the design process, the City has developed design principles, which are identified in the Honolulu High-Capacity Transit Corridor Project Compendium of Design Criteria (RTD 2009m) that will be implemented in final design to minimize visual effects of the Project. For example, guideway materials and surface textures will be selected in accordance with generally accepted architectural principles to achieve effective integration between the guideway and its surrounding environment. Landscape and streetscape improvements will mitigate potential visual impacts, primarily for street-level views.

Other measures to address visual impacts of the Project are being developed through the station design and planning process. The initial station area plans and design guidelines were first developed with coordination between DTS and the Department of Planning and Permitting (DPP). The next level of transit station design focuses on integrating individual neighborhood characteristics of the communities served by the stations.

The following mitigation framework will be included in the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

- Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
- Coordinate the project design with City TOD planning and DPP.*
- Consult with the communities surrounding each station for input on station design elements.*
- Consider specific sites for landscaping and trees during the final design phase when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will serve to mitigate potential visual impacts.*

Section 4.8.3 of the Final EIS, Design Principles and Mitigation includes information related to the mitigation framework described above. Specifically architecture and landscape design criteria include guidelines regarding site design, materials and finishes, and lighting, which apply to stations, station areas, and the guideway.

It should also be noted that the Project will provide users, including tourists, with expansive views from several portions of the corridor by elevating riders above highway traffic, street trees, and low structures adjacent to the alignment. The fact that this will be the only island with high capacity transit, with an efficient airport connector, may attract more tourists who value the convenience, potential cost savings, and decreased travel time between various tourist destinations along the Project's alignment. The Project is a rapid rail system. In Section 4.8.3 of the Final EIS, specific environmental, architectural, and landscape design criteria are listed that will help minimize visual effects of the Project.

9. Both ridership and financial discussions in the Final EIS address concerns about the uncertainties associated with ridership and financial markets. Ridership projections for the forecast year of 2030 have been developed using the travel demand model used by the Oahu Metropolitan Planning Organization (OahuMPO), which was calibrated against collected traffic and transit ridership information and then validated against recent counts to be sure it properly

represents travel activity in the transportation system (Section 3.2.1 of the Final EIS). An on-board transit survey was completed in December 2005 and January 2006, and the latest socioeconomic information available as of October 2008 was incorporated. Traffic counts were collected in 2005, 2007, and 2008. The OahuMPO model is based on "best practices" for urban travel models in the U.S. and is consistent with consultation with the FTA. The model is updated approximately every five years to reflect changes in land use, socio-economic conditions, and transportation network improvements. The model is approved by the OahuMPO Technical Advisory Committee. The model is based upon a set of realistic input assumptions regarding land use and demographic changes between now and 2030 and expected transportation levels-of-service on both the highway and public transit system. Based upon the model and these key input assumptions, approximately 116,000 trips per day are expected to use the rapid transit system on an average weekday in 2030. Since the Draft EIS was published, the travel demand model has been refined by adding an updated air passenger model (which forecasts travel in the corridor related to passengers arriving or departing at Honolulu International Airport), defining more realistic drive access modes (driving alone or car pooling) to project stations and recognizing a more robust off-peak non-home-based direct demand element (trips that do not originate at home) based on travel surveys in Honolulu.

The Project is one of the first in the country to design and undertake an uncertainty analysis of this type of travel forecast. The uncertainty analysis evaluates the variability of the forecast by establishing probabilistic upper and lower limits of ridership projections. FTA has worked closely with the City during this effort. A variety of factors were considered in the uncertainty analysis. Given all the factors considered, the anticipated limits for guideway ridership in 2030 is expected to be between 105,000 and 130,000 trips per day, bracketing the official forecast of 116,000 riders a day used for all calculations.

The capital plan for the Project is presented in Section 6.3 of the Final EIS, which includes a description of the amount of funding anticipated from various sources. The capital plan takes the current economic downturn into account. Section 6.6 of the Final EIS describes risks and uncertainties associated with these funding assumptions. The financial plan is a dynamic document that will be updated as conditions warrant.

10. Bay Area Rapid Transit (BART) is a steel-on-steel system, the same type as proposed for Honolulu. The issue of corrosion was a topic discussed by the technology panel, which found that corrosion is not a significant issue with steel-on-steel systems in any kind of climate. Steel-on-steel systems exist throughout the world, on other islands, in high-humidity climates, volcanic environments, etc. and they operate without issues. Nonetheless, corrosion is part of the design considerations to ensure the system performs as effectively as possible. The vehicle shell for the BART system is made of aluminum; however, the vehicle for Honolulu has not yet been designed, so it could be aluminum or some other equally effective material.

Corrosion-control measures will be applied to the Project's fixed-steel facilities and neighboring utility structures to provide proper operation over their lifetime. These measures include the following:

- Protective coating specification for steel aerial structures

- *Coating specification for stations*
- *Preventive measures against stray current corrosion*
- *Corrosion-control design of transit underground utilities and neighboring utilities owned by others*

11. *Section 4.6.3 of the Final EIS describes potential safety and security issues once the Project is operating. The discussion notes that to reduce the potential for crime, the FTA requires the development and implementation of a Safety and Security Management Plan for new fixed guideway projects (49 CMR 633). Graffiti is one of the safety and security issues that will be addressed. The Project is looking into using graffiti-resistant materials, where possible, to minimize graffiti. Graffiti removal is an anticipated maintenance activity and is reflected in project costs.*

12. *The transit system will comply with the Americans with Disabilities Act (ADA) requirements. Elevators and escalators will be provided at all stations. In addition, platforms will be level with trains for boardings; therefore, stairs or lifts, as used on buses, will not be required. The system operation plan considers all ADA requirements. Dwell time is anticipated to be 30 seconds at the station. This dwell time is incorporated into the station-to-station travel times presented in Table 3-16 of the Final EIS. As shown, travel from the East Kapolei Station to the Ala Moana Center Station will take 42 minutes.*

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Dear Ms. Ching:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- *Reduce the time that each area will experience traffic and community disturbances.*

DRAFT EIS FOR RAIL TRANSIT SYSTEM

- 1) What is the plan for the effect of rail construction on water, sewer, gas and electric utilities? Will there be disruptions of service? Does the budget cover all these contingencies?
- 2) If ridership turns out to be much lower than forecast, are fees going to be increased? Are taxes going to be raised? What is the forecast for number of riders per day (best estimate, range from low to high)?
- 3) Is corrosion of rail cars an issue to be concerned about?
- 4) In case of disaster, such as a hurricane or tsunami, will the train operate?
- 5) How are viewplanes affected by rail? Are the aesthetics of the structure and each station adequately addressed in the DEIS?
- 6) How are the schools (and the students in those schools) along the route going to be affected by the overhead structure, the continuous high current exposure and the intermittent noise and vibrations?
- 7) Will Aloun farms be relocated? If so, where will they go?
- 8) Will there be washrooms, convenience stores, and vending machines at the stations? Will the platforms have adequate seating?
- 9) Will bikes, surfboards and luggage be allowed on the train? Will there be any restrictions on time of day (i.e. not allowed during commute hours)? What is the size limitation?
- 10) Lanes will be taken away during construction. Where are the lane closures and what is the duration of closure? Are there traffic rerouting plans?
- 11) Bus routes will change. Will the public be notified of the changes and accommodations made for temporary stops? What happens to the express bus routes?
- 12) When and at what cost will spurs to the airport, UH-Manoa and Waikiki be built?
- 13) What pedestrian and bicycle amenities will be designed and built in or near transit stations?
- 14) Will there be seamless connections to bus service, bikeways, and other modes of transportation? Will there be park-and-ride lots near the transit stations? Will those lots have priority (i.e. be built first) over bus, bike and pedestrian access to the stations?
- 15) Will there be assistance devices for the elderly and handicapped? Will fares be subsidized to encourage ridership? If so, what is the target group for those subsidized fares? What percent of the cost of rail (construction, maintenance and interest paid on bonds) is expected to be paid with fares? What if fares do not meet this percentage? Will fares and/or taxes be raised? By how much?

16) Will there be subsidized transit passes for government employees? How about private companies doing the same for their employees? Will businesses that provide free parking to employees be required to offer an equivalent monetary amount to those who choose not to drive?

17) How will rail promote mixed-use, transit-oriented development that revitalizes established urbanized areas to focus new growth where infrastructure and access to jobs, shopping, services and recreation already exist?

18) What is the amount of carbon dioxide emitted by rail per person-mile when at maximum capacity? How does this compare to a Prius (50 mpg) with a solo driver? What is the maximum capacity of the proposed rail system?

19) How much energy does rail use (in kwh) per person-mile when at maximum capacity? Again, how does this compare to a Prius (50 mpg) with a solo driver?

20) Where will the power come from to operate the rail system? Will HECO build a power plant to run the rail? If not, is there enough current base load capacity to operate rail?

21) What are the plans (if any) to run rail on renewable sources of energy? I do not include palm oil as a renewable source of energy. Is photovoltaic, wind, concentrated solar, wave, methane from the landfill or OTEC being considered at all? If not, why not?

22) Will energy from HPOWER be used to power the rail system? If so, how much energy? Will there be any extra air pollution from HPOWER if this occurs?

Thank you for answering my questions on rail. Please send answers to:

Dear Mr. Ching:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your comments will be addressed in the same manner as submitted.

- 1) DTS will coordinate with all utilities prior to construction with regard to relocations and disruption of service. Section 4.18 of the Final EIS explains that construction effects will be temporary and limited. Businesses will be provided with advance notice if utilities are to be disrupted. Major utility shut-offs will likely be scheduled to occur during non-business hours. Costs related to utilities that require relocation are part of the overall budget for the Project.*
- 2) By City Council's current policy, ridership on the entire transit system is expected to pay for between 27 and 33 percent of the annual operating and maintenance*

costs. The City Council will adjust the fare to maintain that level of revenue. The balance of the operating costs will be part of the City's annual budget, which includes sources currently used for TheBus: Federal funding and subsidies from the City's General and Highway Funds.

The amount of service provided will be scaled to generally match the demand. If the service attracts fewer riders than expected, then less service may be provided by adjusting headways or train length, resulting in lower-than-expected operating and maintenance costs. The ridership estimate is presented in Section 3.4.2 of the Final EIS. The forecast is that 116,000 people will ride the system every day. The range of the forecasts based on the uncertainty analysis is from 95,000 to about 130,000. This is very high ridership, which further indicates how much the system is needed currently and in the future.

- 3) *Corrosion-control measures will be applied to the Project's fixed-steel facilities and neighboring utility structures to provide proper operation over their lifetime. These measures include the following:*
 - *Protective coating specification for steel aerial structures*
 - *Coating specification for stations*
 - *Preventive measures against stray current corrosion*
 - *Corrosion-control design of transit underground utilities and neighboring utilities owned by others*
- 4) *The system will be designed to meet earthquake and hurricane design standards. The system will have an upper limit on operating wind speed. Vehicles will be stored during weather events that exceed the operating limits.*
- 5) *The viewpoints analyzed in this Final EIS Section 4.8 are intended to incorporate a variety of perspectives (e.g., vehicular pedestrian, and elevated) and a wide range of views. Visual simulations of the Project were developed to represent the range of scale and spatial relationships of project elements to other objects. Some of the simulations are also intended to represent view corridors identified as protected resources in pertinent policy documents. The simulations serve several purposes: they were used to evaluate visual and aesthetic consequences of the Project, demonstrate the potential for mitigation, and provide a means of communicating the findings of the analysis. Generally, simulations were prepared for viewpoints where the Project would have a comparatively greater visual effect. A greater emphasis was placed on identifying views and preparing view simulations toward the Project, because this best represents what most viewers would see and the greater variety of views that would be experienced.*

In Section 4.8.2 of the Final EIS, the Project's visual effects in the Ewa Plain are discussed under the "East Kapolei to Fort Weaver Road Landscape Unit" heading. Visual effects in the Pearl City area, including East Loch, are discussed

under the "Fort Weaver Road to Aloha Stadium Landscape Unit" heading. Visual effects in the Salt Lake area and Kalihi are discussed under the "Aloha Stadium to Kalihi Landscape Unit" heading. Visual effects along Dillingham Boulevard, in Downtown, and at Irwin Park are discussed under the "Kalihi to Ala Moana Center Landscape Unit" heading. Throughout these landscape units, the potential for the guideway and stations to block protected mauka-makai views and vistas of features and landmarks will vary. For an overview of these landscape areas, please review Figure 4-16 in the Final EIS.

Public view planes that are assessed in Section 4.8 of the Final EIS include views along streets and highways, mauka-makai view corridors, panoramic and significant landmark views from public places, views of natural features, heritage resources, and other landmarks. The City's General Urban Design Principles state that "[s]uch public views shall be protected by appropriate building heights, setbacks, design and siting controls" and that "[t]hese controls shall be determined by the particular needs of each view and applied to public streets and to both public and private structures." The guideway and some stations will partially block mauka-makai public views from streets that intersect the alignment (see Section 4.8.3 of the Final EIS). RTD will coordinate with the City to identify the particular needs of each view; however, changes to some views will be unavoidable. Depending on the degree of view obstruction or blockage, some view changes will be substantial (see Table 4-9 in the Final EIS for those viewpoints with a "significant" visual impact rating). The viewer's response to this change will vary with exposure and sensitivity and depend on the alignment orientation, guideway and station height, as well as the height of surrounding trees and buildings.

Other measures to address visual impacts of the Project are being developed through the station design and planning process. The initial station area plans and design guidelines were first developed with coordination between RTD and the Department of Planning and Permitting (DPP). The next level of transit station design focuses on integrating individual neighborhood characteristics of the communities served by stations.

View changes will be less notable in wider vistas or panoramic views where the project elements serve as smaller components of the larger landscape. Generally, the project elements will not be dominant features in these views. As stated in Section 4.8.3 of the Final EIS, the measures listed below will be included with the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that the Project will create:

- Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
- Coordinate the project design with City TOD planning and DPP.*
- Consult with the communities surrounding each station for input on station design elements.*
- Consider specific sites for landscaping and trees during the final design*

phase when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will serve to mitigate potential visual impacts

Section 4.8.3 of the Final EIS, Design Principles and Mitigation includes information related to the mitigation framework described above. Specifically architecture and landscape design criteria include guidelines regarding site design, materials and finishes, and lighting, which apply to stations, station areas, and the guideway.

The Project will provide users, including tourists, with expansive views from several portions of the corridor by elevating riders above highway traffic, street trees, and low structures adjacent to the alignment. In Section 4.8.3 of the Final EIS, specific environmental, architectural, and landscape design criteria are listed that will help minimize visual effects of the Project.

- 6) No noise impacts are predicted at schools along the alignment. In addition, no vibration effects are projected for the Project.*
- 7) One of the two site options for a maintenance and storage facility presented in the Final EIS is located within Aloun Farms. The other potential site is near Leeward Community College and is the site of a former Navy fuel drumming operation. This is the preferred site. The impact on agricultural lands on Oahu will be much less than is described in the Final EIS if this site is selected. Aloun Farm's headquarters would not have to move if the preferred site near Leeward Community College is selected. However, Aloun Farms' land is leased from D.R. Horton and may be developed in the future. If Aloun Farms is to be relocated, the City will follow the requirements of 49 CFR Part 24, Subpart D – Payments for Moving and Related Expenses, as well as the Uniform Relocation Assistance and Real Property Acquisition Policies Act.*
- 8) Each station will have a secured public restroom. Patrons will ask the station attendant for access to the restroom. DTS does not intend to compete with private enterprise by placing retail within stations, although station plazas are designed to complement nearby private development. Final internal configurations of stations will be completed as station planning is finalized.*
- 9) Bicycles, luggage, and surfboards will be allowed on fixed guideway vehicles, as regulated by bicycle and luggage policies to be developed. The policies will establish restrictions regarding times of day and size limitations.*
- 10) Table 3-27 in the Final EIS describes the location of temporary lane closures resulting from project construction. As discussed in Chapter 3 of the Final EIS, a Maintenance of Traffic (MOT) Plan will identify measures to mitigate temporary construction-related effects on transportation. The contractor will develop the MOT Plan with approval from the City Department of Transportation Services and the Hawaii Department of Transportation. The MOT Plan will address roadway*

closures for streets identified in Table 3-27 of the Final EIS. Additional temporary lane closures may occur during non-peak hours to minimize effects on heavy commuter traffic.

- 11) Existing and future bus routes, including route numbers and frequencies, are provided in Appendix D of the Final EIS. As noted in Section 2.5.6 of the Final EIS, "bus service will be enhanced and the bus network will be modified to coordinate with the fixed guideway system." Some existing bus routes, including peak-period express buses, will be altered or eliminated to reduce duplication of services provided by the fixed guideway system. As stated in Section 3.5.7 of the Final EIS, some bus stops will be temporarily relocated during construction and some bus routes will be rerouted. A public information program will be conducted to inform transit riders of service changes during construction.*
- 12) The Project has logical termini and independent utility from any extensions that may be constructed in the future. The future extensions to East Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS. The future extensions are not part of the Project; thus, they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation at some time in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time. The timing and cost of possible rail extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa have not been determined at this time.*
- 13) As stated in Section 3.4.2 of the Final EIS, several stations will be located at or near existing or planned bicycle facilities. Each station will have facilities for parking bikes, and each guideway vehicle will be designed to accommodate bicycles. Sidewalks and crosswalks are currently available at stations or will become available as streets and sidewalks are built in developing areas. As stated in Section 2.5.5 of the Final EIS, Pedestrian and Bicycle Access, design criteria developed for stations place the highest emphasis on walk and bicycle access. The Design Criteria provide specific direction for pedestrian and bicycle access features at stations. For example, the criteria state that adequate pedestrian circulation routes shall be provided with an emphasis on avoiding pedestrian and vehicular conflicts and enabling good visibility to each station entrance. This emphasis will be complemented by distinct and clear graphic signage. For bicycle access, the criteria include language stating that racks shall be placed at the station plaza near the station entrance where public visual surveillance is possible and/or where closed circuit television monitoring is present.*

- 14) *There will be seamless connections from the fixed guideway to buses, bikeways, and other modes of transportation. Section 3.4.2 states that the bus network will be restructured to provide access from surrounding communities to the fixed guideway with more frequent bus service. In addition, because of the high frequency of the fixed guideway service (three-minute headways between trains during peak periods), riders transferring from buses to the fixed guideway will experience minimal wait times. Riders transferring from the guideway service to buses will benefit from improved frequencies on existing bus routes serving stations. In addition, several new routes with high frequencies will be provided as feeders to the guideway system. Existing and future bus routes, including frequencies, are provided in Appendix D of the Final EIS.*

As stated previously, access to stations will be enhanced by accommodating bicyclists and pedestrians. Several stations will be located at or near existing or planned bicycle facilities, and sidewalks and crosswalks will be provided. As stated in Section 2.5.7 of the Final EIS, park-and-ride facilities will be constructed at East Kapolei, UH West Oahu, Pearl Highlands, and Aloha Stadium. These stations have the highest demand for drive-to-transit access. The size and capacity of each park-and-ride facility are provided in Table 2-8 in the Final EIS. Priority is given to bicycle and pedestrian access.

- 15) *The transit system will comply with Americans with Disabilities Act (ADA) requirements. Elevators and escalators will be provided at all stations. Also, level boarding will be provided to trains; therefore, stairs or lifts, as used on buses, will not be required to board the trains. Park-and-ride facilities will have handicapped spaces with ADA-compliant ramps and paths connecting the lots to the stations. In addition, sidewalks and bridges will be at least 8 feet wide; pedestrian crossings will be signalized; and curb cuts will have tactile surfaces. For riders with low vision, there will be texture changes in the pavement to identify important areas, including the edge of the platform. Braille and/or raised letter print and large print signage and verbal announcements will also be provided. For riders with hearing loss, directional, informational, and variable message signage will be provided at all stations.*

The current fare policies for TheBus, including reduced fares for elderly, disabled, and other groups, will be continued for the fixed guideway system. As detailed in Chapter 6 of the Final EIS, between 27 and 33 percent of the operating cost for the entire transit system, including buses, will be covered by fares. Section 6.4.2 of the Final EIS describes the funding sources to pay for ongoing operating and maintenance costs associated with maintaining the resulting transit system in a state of good repair. Operating and maintenance costs will be paid for from the same funding sources currently used for TheBus: Federal funding, fare revenues, and subsidies from the City's General and Highway Funds. Section 6.6 of the Final EIS describes risks and uncertainties associated with these funding assumptions.

- 16) *As described in Chapter 2 of the Final EIS, the bus and rail systems will have a unified fare structure, including monthly passes that work for both modes. Current fare policy will be continued. It is up to individual employers to provide parking as well as subsidized passes to employees.*
- 17) *As stated in Section 4.19.3 of the Final EIS, the Project, when combined with supportive public policies and favorable real estate market conditions, could attract transit-supportive development (TSD) and TOD within station areas. TSD includes land uses such as office space and multi-story residential buildings near transit stations. Office uses generate more transit riders per square foot of space than any other land use. TOD is more intensive and deliberately planned to integrate with transit and generally includes pedestrian-oriented moderate- to high-density mixed uses.*

In March 2009, the City Council approved and the Mayor of Honolulu signed Bill 10 (2008) (Ordinance 09-4), which defines the City's approach to TOD around fixed guideway stations. New zoning regulations for TOD will address parking standards, new density provisions, open space, and affordable housing. Financial incentives for TOD could include public-private partnerships, real property tax credits, and infrastructure financing. While the Project is coordinating with City and State agencies to encourage development of enhanced pedestrian and bicycle facilities and other land use changes near stations, the actual construction of such facilities and zoning changes are beyond the scope of the Project. The special districts also encourage public input into the design of TOD neighborhood plans to reflect unique community identities.

The potential for TOD differs at each station site. Factors that could spur TOD, beyond the addition of a transit station, include available and undeveloped land, adoption of TOD zoning and policies, other real estate investment in the area, and market demand for new and additional floor space. In developed areas, such as Waipahu and Downtown, TOD could occur in the form of redevelopment of existing uses. The presence of underutilized buildings and uses could spur redevelopment.

- 18 and 19) *The direct comparison of carbon dioxide emissions between automobiles and transit rail cannot be made without knowing the energy sources providing the electricity. The utility (HECO) that will provide electricity for the Project primarily uses fuel oil to generate electricity, but the HECO grid is supplemented with independent power producers that generate electricity through renewable resources. As noted in Section 4.9.3 of the Final EIS, the Project will result in a daily reduction of 171 metric tons of carbon dioxide when compared to the No Build Alternative. For an at-capacity system, approximately 25 grams of carbon dioxide are emitted per passenger mile. Approximately 150 grams of carbon dioxide are consumed per 1/50th of a gallon of gasoline consumed.*

As noted in Section 4.11.1 of the Final EIS, an average rail vehicle consumes 62,700 British thermal units (BTUs) per vehicle mile of service. A single vehicle

has a capacity of approximately 160 passengers. Therefore approximately 390 BTUs are consumed per passenger mile at capacity. Consumption of 1/50th of a gallon of gasoline consumes 2,500 BTUs.

- 20) *The power for the transit system will be drawn from the electrical grid maintained by HECO. As presented in Section 4.11.3 of the Final EIS, the Project will consume approximately 1 to 2 percent of the total projected electricity generated on Oahu in 2030. The planned electricity-generating capacity on Oahu will be sufficient to support the transit system, but the electricity distribution system will require various upgrades to support the system (HECO 2008). The power demands of the system are such that the voltage and current requirements can only be met by a major utility. HECO is currently soliciting proposals to supply up to 100 megawatts of non-firm renewable-energy-generating capacity to be operational between 2010 and 2014. Currently, HECO's transmission system receives 11 percent of its total generating capacity through renewable resources.*

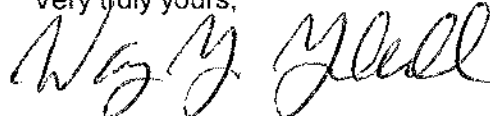

Combining this energy requirement with the reduction in energy due to savings in roadway vehicle miles traveled (VMT), the Project is expected to reduce overall energy requirements by approximately 3 percent. The emissions generated due to the power requirements are expected to reduce the emission savings calculated for roadway VMT changes due to the Project, as shown in Table 4-20 of the Final EIS, but even with the additional emissions due to power generation, the Project is still predicted to reduce overall regional emission burdens.

- 21) *HECO is moving toward renewable energy generation. As that happens, the fixed guideway will also benefit from such new sources of energy. In addition, the integration of photovoltaic cells into stations and other project features could reduce net project electricity demand.*

- 22) *The system will consume electricity from all sources in use by HECO. Electricity from HPOWER cannot be segregated from other energy consumption on Oahu.*

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

December 10, 2008

Mr. Wayne Yoshioka
Department of Transportation Services
City & County of Honolulu
650 S. King St., 3rd Floor
Honolulu, HI 96813

Dear Mr. Yoshioka:

I would like to add my support to Councilman Djou's plan of building the initial phase of the rail system through the airport, and between the Aloha Tower and Aiea, and add that I would personally like to see the rail built between Aloha Tower and Pearl City.

I'm not a rocket scientist nor a mathematician, but it seems logical to me that relieving the congestion up ahead of traffic and closer into town will result in a trickle "westward" effect for those in West and Central Oahu. "Unclogging" the blockage or dam up ahead would result in:

- 1) helping to clear the blockage to the flow of the "automobile river" and thereby opening up a clearer and quicker path for those of us in the rear, for no matter how much of a relief in traffic there is at the rear (Kapolei and Waipahu), if there is congestion up front, it will make no difference in travel time for those of us at the rear (please excuse my redundant efforts to make a point).
 - a. like an escalator... as you're going up or down an escalator, and if somehow there's a pile-up or stoppage ahead of you, although you may be the only person at the clear end of the line, you'll be heading right into the pile-up ahead of you, and end up in a mess.

A rail route between Aloha Tower and Aiea (or Pearl City) through the airport would also:

- 1) allow more residents from, not only the Kapolei/Ewa area, but from other Oahu districts to access the rail as a means of transportation

- a. residents of West as well as Central Oahu and beyond would be provided an option of being able to drive to a point in Aiea (or Pearl City) and then ride the rail either to the airport or further into downtown for business, school and/or leisure.
 - b. make it more desirable and accessible for town residents and business people who are frequent commuters to the neighbor islands, and who may welcome the rail with open arms.
 - c. result in increased rail usage by residents from Pearl City to Halawa, and, combined with the number of possible rail user from Central Oahu, there could subsequently, be a decrease in the number of cars in traffic from Pearl City into downtown
- 2) make it more desirable for airport area employees and those needing to catch a flight in the morning to ride the rail, as these residents might find the rail more convenient than facing traffic and parking hassles and this, in turn, would alleviate the parking and traffic problems at the airport and potentially take additional cars off the road in the mornings

If one chooses to, or needs to, drive into town, with traffic being alleviated up front, commute time would decrease and gas mileage would increase.

I live in Mililani and have been selfishly wondering how a rail system from Kapolei to Waipahu would benefit my family and other residents in Central Oahu and beyond when traveling to and from town in the morning and afternoon rush hours. Simply put, this route will not be a benefit to any of us. We would still be facing the same traffic mess for years to come.

And, if the initial phase of the rail is built in Kapolei, I doubt very much if it will have an impact on the travel time of residents in that area of the island. Again, if there is a "bottleneck" up front, it doesn't matter if you relieve the traffic in the Kapolei/Ewa area -- the back end of the bottleneck. In order to get beyond Waipahu, rail riders from Kapolei/Ewa

would probably need to transfer in Waipahu to some form of vehicular transportation and will still add to, and have to deal with, any traffic bottlenecks between Pearl City and town.

Size of available land and immediate cost has been mentioned as the primary reason for overriding logic and efficiency. It is hoped that our elected servants are elected because the people believe in their creative and innovative intelligence and concern for the general well-being of the community as a whole, and realize that taking short cuts for the sake of immediate convenience will eventually cost us more in the long run.

A public official had the will to get this rail system developed on Oahu in spite of opposition, controversy, and concerns re cost, routes, etc. I believe his guiding words were, "If there's a will, there's a way." Why not follow his example and look for ways to improve our traffic and transportation challenges as logically and efficiently as possible.

Mahaio,

Elaine Chu

Ms. Elaine Chu
94-526 Alapoi Street
Mililani, Hawaii 96789

Dear Ms. Chu:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

Your comments have all been noted. As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- *Reduce the time that each area will experience traffic and community disturbances.*

Ms. Elaine Chu
Page 2

- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*
- *Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- *Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center. As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Dear Mr. Chu:

**Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement**

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses comments regarding the above-referenced submittal:

Conversion of existing land use to transportation use refers to any land not currently part of transportation right-of-way that will become part of the overall transportation system. This includes, for example, right-of-way needed for the rail guideway, park-and-ride facilities, stations, and the maintenance and storage facility. The EIS is intended to satisfy NEPA requirements and discloses impacts to the natural and built environment. Within this process of documentation, land use changes due to the Project are disclosed. Amendments to existing land use plans are at the discretion the City and County of Honolulu.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this

Mr. Michael Chu

Mr. Wayne Yoshioka P.E. Director
Department of Transportation Services
650 South King Street 3rd Flr.
Honolulu, H 96813

SUBJECT: Honolulu High Capacity Transit Corridor Project, Draft EIS

Dear Wayne:

Thank you for allowing me to comment on the draft EIS. I look forward to your response to my comments below.

1. The Honolulu Advertiser (11/20/08) reported that limited rail service will become available in 2013 between West Loch and Waipahu. Is this the first construction phase of the project and is this equivalent to construction of the rail system between the West Loch Station and the Waipahu Transit Center as depicted in the draft EIS maps (Fig. 2-6)?
2. Figure 2-5 shows the rail following the North-South Road, then veering east across the proposed Hoopili project area, makai of Farrington Highway. However if you visit the DR Horton/ Hoopili web site they show the rail going all the way up to Farrington and then turning east following the Farrington alignment. Which is correct?
3. Table 4-1 (land use) states that 145 to 165 acres of existing land uses need to be converted to "transportation use." What is transportation use? Is this a new land use category, a new zoning designation?
4. Little is discussed in the draft with regards to the park and ride facilities. What kind of parking capacity will they have? Will they be at grade lots or multi-level structures? Will any special design guidelines be created for them or will only the existing LUO standards be used? Will fees be charged for parking? How much?
5. I understand that the rail superstructure will be approximately 30 ft. in height. Is this to the top or bottom of the superstructure?

Yours Truly

Michael S. Chu

Dear Mr. Chu:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

To address your first two comments, the first construction phase of the Project is expected to open in 2012 between West Loch and Pearl Highlands. Figure 2-42 of the Draft EIS illustrates the construction phases. The alignment that was shown in the Draft EIS is correct. Likewise, differences in the alignment shown on the DR Horton website for the Hoopili development project area may exist; however, the alignment through the Hoopili project area shown in the Draft EIS is correct.

Next, "transportation use" is not a new land use category or a zoning designation. It is the transfer through sale of private or public property to the public transportation agency who then owns the land. Land that is converted to "transportation use" is not available for private use – commercial, industrial, or residential.

Mr. Michael S. Chu
Page 2

Your fourth comment concerns park-and-ride facilities. Chapter 2, Section 2.5.7 of the Final EIS, discusses park-and-ride facilities. The size and capacity of park-and-ride facilities are presented in Table 2-8. A total of 4,100 park-and-ride spaces are planned and distributed over four locations. As stated in Section 2.5.7, with the exception of Pearl Highlands, which will be a parking structure, all park-and-ride lots are expected to be constructed as surface parking. Criteria will be developed that will guide design of Project elements, including park-and-ride facilities. As indicated by Chapter 6 of the Final EIS (Section 6.3.2), potential operating and maintenance funding sources do not include revenues from Project park-and-ride facilities. There are currently no plans to charge for parking at park-and-rides.

Lastly, Appendix B of the Final EIS provides a profile (the height above ground) for the track for the entire system. For much of the system, the track height is approximately 30 feet above ground. The superstructure will be approximately 10 feet thick.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Submission Content/Notes : The light rail system should be built first from Waipapu to Ala Park area. The reason is to relieve the present unbearable traffic bottleneck in the Middle Street portion of H1. This is the main reason for the rail system for the City of Honolulu. After we built this portion of the rail system, then we should plan for an underground system for downtown Honolulu. Build a right rail system we can all proud of! Not an ugly elevated overhead system through downtown Honolulu and Waikiki. Perhaps President Obama will help his native land to fund this rail project.

Dear Mr. Chun:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- *Reduce the time that each area will experience traffic and community disturbances.*

- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*
- *Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- *Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

Regarding your request for an underground system, due to cost and geotechnical constraints, an underground transit system is not a feasible option.

The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS. However, the future extensions are not part of this Project; thus, they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time. Other extensions, such as Central Oahu, have been considered and may be undertaken at some point after the current Project is completed.

The island's unique visual character and scenic beauty was considered in the visual and aesthetic analysis presented in the Draft and Final EISs. As discussed in Section 4.8 of the Final EIS, the Project will be set in an urban context where visual change is expected and differences in scales of structures are typical. The following measures will be included with the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

- *Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
- *Coordinate the project design with the City's transit oriented development program within the Department of Planning and Permitting.*

- *Consult with the communities surrounding each station for input on station design elements.*
- *Consider specific sites for landscaping and trees during the final design phase when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will serve to mitigate potential visual impacts.*

It should also be noted that the Project will provide users, including tourists, with expansive views from several portions of the corridor by elevating riders above highway traffic, street trees, and low structures adjacent to the alignment. In Section 4.8.3 of the Final EIS, Environmental Consequences and Mitigation under the heading Design Principals and Mitigation, specific Environmental, Architecture and Landscape Design Criteria are listed that will help minimize visual effects of the Project. More information about the visual effects in the downtown area is discussed in Section 4.8.3 of the Final EIS.

Lastly, as described in Chapter 6 of the Final EIS, Federal funding is proposed to fund a portion of the Project's capital costs.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Submission Content/Notes : Dear Sirs,

I was not a supporter of the HNL Rail Transit, I will yield to the results of the recent general election. In light of our State's overall economy, I feel construction of the HNL Rail Transit will create the critical surge the construction of the HNL Rail Transit will do to stimulate our State's sluggish economy during this national economic downturn.

It is my opinion that we initiate the construction of the HNL Rail Transit from Oahu's economic hub, downtown Honolulu. This will provide the taxpayers of Oahu the most immediate ridership between downtown to PearlCity and vice versa. This route will have the most immediate financial re-payment. Secondly, the airport route can be easily implemented into this initiate route.

Starting from West Oahu, the ridership impact into downtown Honolulu will not materialize for an additional 3 - 4 years due to the distance from downtown Honolulu and the overall cost will be much higher in comparison to the downtown Pearl City route.

For the above reasons, I favor Councilman Charles Dijou's concept.

Sincerely,
Wayne G.K. Chun

Dear Mr. Chun:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- *Reduce the time that each area will experience traffic and community disturbances.*

- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*
- *Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- *Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

As also discussed in Chapter 2 of the Final EIS, park-and-ride lots are planned at East Kapolei, UH West Oahu, Pearl Highlands, and Aloha Stadium. These stations have been identified as having the highest demand for drive-to-transit access.

Please review Section 2.5.8 of the Final EIS regarding the maintenance and storage facility. The two potential locations (one near the Hoopili station and the other near Leeward Community College) for the maintenance and storage facility are detailed in Figures 2-38 and 2-39. Either of these sites will require less relocation and will have fewer property impacts than a maintenance facility in a developed urban area such as Downtown Honolulu. Construction methodologies in these less-developed areas can be refined more easily to reduce impacts to the natural and built environments.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Other Submission Method :
Submission Date : 01/02/2009
Submission Content/Notes : I have the following suggestions.

1. Maintenance Facility location, looking over the DEIS the LCC site would look like a better site than the Hoopili when you consider construction costs due to you will not need bring elevated guideway down to grade level. Also this site has a more central location, the Hoopili site however has more land area, would be less of an impact on surrounding areas and closer to the Kane Power Plant. Which could be a benefit if there was a power outage. This site would provide less impact to surrounding area due to its rural location.
2. Bicycles, I see mention of parking areas for bikes at stations however will bikes be allowed on the rail cars? Allowing them on the rail cars will allow greater mobility options for the users of the rail system.
3. On the Airport route will passengers be allowed to bring on baggage, and if they are allowed how will this be addressed when transferring onto the bus?
4. I see that there will be numerous Traction Power Substations along the rail route will there be any Hazmat issues with the transformers in these substation?
5. Concerning the Traction Power Substations will there be security at the stations. Some will be located in secure area however some will be in isolated areas surrounded only by chain link fencing.

Mililani, Hawaii 96789

Dear Mr. Colon:

**Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement**

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal:

As described in Chapter 2 of the Final EIS, the site near Leeward Community College has been identified as the preferred location for the maintenance and storage facility. This site is the closest to the Downtown area that meets the site requirements for this facility.

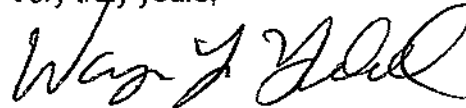

Bicycles will be allowed on trains, as regulated by a bicycle policy to be developed. In addition, the luggage policy for the system is not final, but the concept of the policy will be to allow luggage that does not interfere with the safety or comfort of other passengers. No change to bicycle and luggage policies on TheBus is proposed at this time.

Regarding your question on potential hazardous material issues with the traction power substations, there should be no hazardous material issues. The traction power substations will be secured within a locked building. They will not be accessible to the public.

Mr. Guillermo Colon
Page 2

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Issuance of the Record of Decision under NEPA and acceptance of the Final EIS by the Governor of the State of Hawaii are the next anticipated actions and will conclude the environmental review process for this Project.

Very truly yours,

Submission Date : 01/05/2009

Submission Content/Notes : Dear Sirs,

I'm writing to share my thoughts regarding the draft Environmental Impact Study (EIS).

I will not address the Air Port vs. Salt Lake route alignment here, as I believe that is still being decided by the City Council. I will share my thoughts on that with them.

1. The Goals and Objectives of this project are not adequately defined and documented in this report. Many of the issues coming up could be addressed and resolved much quicker and better if everyone had a better idea of what we were trying to accomplish. (Planning and defining are (or should be) half the work). Are we trying to get people out of their cars? Reduce freeway traffic congestion? Commute traffic? Get people around town faster? Improve our tourist industry? Reduce carbon emissions? Replace The Bus with a rail line? What? The Objectives should dictate the design and route and stations.

2. The project does not contain adequate detailed measurable criteria for judging and evaluation the ultimate success or failure of the project. Are the total cost and the reduction of the number of cars on the freeways in the corridor the only measures we are going to use? By the way, your projections of future freeway traffic are incorrect. There will not be such a large increase in this traffic because when they get there; there will be no place to park! Forecast the parking situation and costs and I think you will agree.

3. Doesn't it make more sense to start where we can get the biggest and earliest "bang for our buck"? If we start it in the empty fields of Kapolei and run it to Waipahu, the rider ship will be very low for a long time. We will have high construction costs and operating costs and little revenue or effect on our Goals (Don't forget we will have to start paying for it whether we have construction delays or not). If we ran it from the Stadium to town (with a good Park and Ride at the Stadium (traffic from H1, H2 and H3 could park here and ride in), the rider ship and revenue would be high and the Goals would be impacted much sooner. Phase 2 should be from town to Waikiki and UH for the same reasons.

4. Why is the route not using the (existing and government owned) Oahu Railroad right of way? This would cause much less disruption, be cheaper and faster to build because of less land acquisitions and provide a shorter, faster, cheaper route.

5. Why is the alignment using Fort Barrette Road instead of Renton Road or Kapolei Parkway? Either of these would be shorter, faster, cheaper and be less disruptive during construction. (Remember, no matter where we put it most people are going to have to ride The Bus or drive their cars to get to the rail Station. So, we don't have to have the rail go by everyone's front door.)

6. There are not enough Park and Rides in the system (except for Kapolei, which may have too many). Remember, people are not going to give up their cars completely and most people will have to take The Bus or their cars to get to the rail station. Also, the Park and Rides need to adequately address Moped and bike use and provide for adequate safety and security for people and property.

7. This document does not adequately address and document the

interface and integration of the rail and The Bus. To be successful, The Bus must provide an effective collection and disbursement system for each station. This document also does not address the means by which this coordination at higher administrative levels will occur.

8. Does the system have too many stations? Each station requires the train to slow down and speed up as well as sit for a period in the station. The number of stops significantly affects the speed of travel. If we have too many stations close to town and Waikiki we may shift bus riders to the rail and overload the rail and reduce the effectiveness of The Bus and not get any more cars off the road. We need to think of the Rail as a Wholesale operation (fast movement of large groups of people over long distances. And, rely on The Bus for Retail "short hops". To get people to give up their cars, the alternative must be noticeably faster and cheaper and at least close to as clean, comfortable and safe.

9. I don't see anything in this EIS about dealing with luggage for riders going to or coming from the airport. No use using an Airport alignment if riders can't take their luggage. Oops there go all the tourists and a lot of locals. (And tourists rent and then drive a lot of cars!

10. Because this is being referred to as Rail, will it fall under the Federal agencies that regulate Railroads? Will the workers be able to join the national railroad unions and their pay, benefits and working conditions negotiated at a National level?

11. We can take our bikes on The Bus. Will we be able to take our bikes on Rail?

12. When we built the Stadium, we did not take into account the salt air and humid conditions here, which have resulted in continuing high maintenance costs. What are you doing to insure that we don't experience the same result with the Rail system (and Stations)?

Sincerely
Terrence Conlan

Dear Mr. Conlan:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your comments have been noted. This letter responds to testimony points. Per your first point concerning the goals and objectives for the Project, these goals and objectives are listed in Table 1-4 and described in Section 1.8 of the Draft EIS. The project goals are to improve corridor mobility, corridor travel reliability, access to planned development to support City policy to develop a second urban center, and transportation equity.

To answer your second point, Chapter 7 of the Draft EIS lists the measures that were used to evaluate the Fixed Guideway Transit Alternatives. Evaluation was based on the local goals for the Project (as described in Chapter 1 of the Draft EIS) as well as FTA criteria for evaluating projects proposed for funding under the Section 5309 New Starts Program. Table 7-1 in the Draft EIS lists the evaluation measures that were used based on the proposed action goals and objectives. Evaluation measures included transit ridership, travel time, benefits to transit-dependent communities, and development within station areas compared to the existing

amount of development. In addition, environmental effects, cost-effectiveness, and financial feasibility were also evaluated.

Ridership projections for the forecast year of 2030 have been developed using the travel demand model used by the Oahu Metropolitan Planning Organization (OahuMPO) for the Oahu Regional Transportation Plan (ORTP), which was calibrated against collected traffic and transit ridership information and then validated against current counts to be sure it properly represents travel activity in the transportation system (Section 3.2.1 of the Final EIS). An on-board transit survey was completed in December 2005 and January 2006, and the latest socioeconomic information available as of October 2008 was incorporated. Traffic counts were collected in 2005, 2007, and 2008. The model is based upon a set of realistic input assumptions regarding land use and demographic changes between now and 2030 and expected transportation levels of service on both the highway and public transit system. OahuMPO undergoes model updates every five years to reflect land use and transportation network changes. The model is approved by the OahuMPO Technical Advisory Committee. Based upon the model and these key input assumptions, approximately 116,000 trips per day are expected to use rapid transit system on an average weekday in 2030. Since the Draft EIS, the travel demand model has been refined by adding an updated air passenger model (which forecasts travel in the corridor related to passengers arriving or departing at Honolulu International Airport), defining more realistic drive access modes to project stations and recognizing a more robust off-peak non-home-based direct demand element (trips that do not originate at home) based on travel surveys in Honolulu.

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- Reduce the time that each area will experience traffic and community disturbances.*
- Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*
- Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

As described in Chapter 2 of the Final EIS, several alignments were evaluated during the Alternatives Analysis process. One evaluated alignment was the historic OR&L line you mention in your fourth point. A combination of issues, including utilities that have been placed in the right-of-way, poor location in several places, and the previous loss of the right-of-way in several locations all contributed to the elimination of that option. The Project is fully grade-separated to eliminate potential conflicts with traffic and eliminate the effects of congestion and incidents on the system. Placing any part of the system in mixed right-of-way would affect reliability of the entire system.

Your fifth point regarding using Fort Barrette Road instead of Renton Road is beyond the Waianae end of the Project. When the planned extensions are evaluated in the future, a range of alternatives will be evaluated for each of them. Renton Road, Fort Barrette Road, and Kapolei Parkway are likely alignments to be considered when the Kapolei extension is evaluated, once funding is identified.

Your concerns about park-and-ride locations in the sixth point are noted. While there are more than 4,100 spaces identified as part of the Project, the experience with park-and-ride facilities in Honolulu to date is limited. They have been generally underused. The lots contained in the Project are located toward the Ewa end of the route and are based on consideration of parking demand using the travel demand forecasting model for the year 2030. Further, the projected mode of access shares were compared to observed data from several Mainland areas, notably San Diego. Given the history of park-and-ride use on the island, it seems prudent to evaluate any need for additional or larger facilities based on empirical experience rather than commit substantial additional funding now. Any need for additional parking at the four stations with park-and-ride facilities would best be determined once experience is gained about their use. Bicycle racks will be provided at every fixed guideway station. Park-and-ride facilities will accommodate moped and motorcycle parking. Security will be provided in the form of surveillance cameras, lighting, fencing, barriers, on-site personnel, or other means.

Regarding the seventh and eighth points, TheBus system will be altered to provide improved connections with the rail system. Bus routes or portions of bus routes will be altered or eliminated to reduce duplication of services with the rail system. Certain local bus routes will be rerouted to provide frequent and reliable connections to the nearest rail station. Because of the high frequency of rail service (every three minutes during peak periods and every ten minutes during off-peak periods), riders transferring from buses to trains will experience minimal wait times. Riders transferring from trains to buses will benefit from improved frequencies on existing bus routes serving stations. In addition, several new bus routes with high frequencies will be provided as feeders to the rail system. Since these routes will primarily operate in residential areas, they will provide greater reliability versus routes operating along congested arterials. Additional information regarding existing and future bus routes, including frequency, is included in Appendix D of the Final EIS.

The number of stations affects riders in two ways. If stations are too far apart, the system is not convenient as users must walk or drive too long of a distance to access a station. If they are too near, the average travel speed is reduced. To balance these concerns, the

average distance between stations is approximately one mile, with shorter distances in denser areas that have greater transit demand.

With completion of the fixed guideway, rail and bus service will each be administered by the City and County of Honolulu. This consolidated administration and management will facilitate the coordination in the planning, operations, and other aspects of an integrated transit system in Oahu.

Per the ninth and eleventh points, the luggage policy for the system is not final, but the concept of the policy will be to allow luggage that does not interfere with the safety or comfort of other passengers. In addition, bicycles will be allowed on the system and regulated by a bicycle policy to be developed in the future.

Regarding the tenth bullet, this Project falls under the FTA, not the Federal Railroad Administration. The Project is regulated by FTA policy. Employees will either work for the transit authority or a private operator that is contracted with the agency.

Lastly, corrosion-control measures will be applied to the Project's fixed steel facilities and neighboring utility structures to provide proper operation over their lifetime. These measures will include the following:

- Protective coating specification for steel aerial structures*
- Coating specification for stations*
- Preventive measures against stray current corrosion*
- Corrosion-control design of transit underground utilities and neighboring utilities owned by others*

Project operating and maintenance costs detailed in Section 6.4 of the Final EIS also include preventive maintenance of the rail system and stations.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Dear Department of Transportation:

In my judgment, it makes more sense if the first leg starts downtown and goes to Salt Lake and then Pearl City to secure significant ridership. If you begin at Kapolei and just go to Pearl City, I can't imagine many people riding.

Aloha,

Jack Corteway

Dear Mr. Corteway:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- *Reduce the time that each area will experience traffic and community disturbances.*

Mr. Jack R. Corteway
Page 2

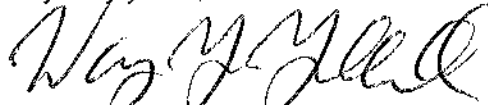

- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*
- *Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- *Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

As stated in Section 2.2.3 of this Final EIS, the NEPA Notice of Intent requested input on five transit technologies. A technical review process included the opportunity for public comment and was used in parallel with the alternatives analysis to select a transit technology. The process included a broad request for information that was publicized to the transit industry. Transit vehicle manufacturers submitted 12 responses covering all of the technologies listed in the Notice of Intent. An independent five-member technology panel composed of four transit experts and a transportation academic appointed by the City Council evaluated guided rubber-tire-on-concrete systems (e.g., Phileas bus system and VAL-type systems), monorail (which is a variation on rubber-tyred technology), steel-wheel-on-steel-rail systems, (e.g., light rail and rapid rail), and magnetic levitation (MAGLEV). The panel considered the performance, cost, and reliability of the proposed technologies.

Proprietary technologies, meaning those technologies that would have required all future purchases of vehicles or equipment to be from a single manufacturer, were eliminated because

Ms. Liz Crowder
Page 2

none of the proprietary technologies offered substantial proven performance, cost, and reliability benefits compared to steel wheel operating on steel rail.

The panel accepted public comment twice as part of its review. By a four-to-one vote, the panel chose a steel wheel vehicle operating on steel rail system because it was considered safe, reliable, economical, and non-proprietary. Those results are documented in the panel's report to the City Council dated February 22, 2008 entitled "Independent Technology Selection Panel Report" which is available on the Project website: www.honolulustransit.org under the "Library" tab.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Draft EIS on Honolulu Rail Transit
Commentary

Pardon me, but I have not seen enough "concrete," factual information provided to support building and maintaining an elevated rail transit system in Honolulu. Talk and promises are cheap, and the reality of this project would be devastating, not only aesthetically but financially, for us now and for our keiki's generations to come.

Even after reading the Draft EIS, too many questions remain unanswered; why is elevated rail necessary, where will the money come from, and where is the logic in touting our "second city" if we need to spend so many billions of dollars to get there? Rail would "provide accessibility to new development in the 'Ewa-Kapolei-Makakilo area in support of the City's policy to develop this as a 'second city,' ..."

Even the projected billions in costs is only a minimum estimate, the reality of the costs will be much higher.

As it is, our own Council on Revenues is lowering its projections every week, so how can we even venture to go ahead with this massive project with no end in sight of looming shortfalls?

Who leads these municipal projects, self-serving politicians and the construction industry? Until our leaders prove to us they are capable of maintaining their existing responsibilities and ongoing projects in our Honolulu and upgrade our infrastructure, we have no business committing money we do not have to start another ill-fated, short-term gain (construction jobs), long-term loss project.

Construction of elevated rail for Honolulu is insane for obvious reasons, at-grade light rail (LRT) is a compromise at best. I understand that AIA Honolulu has prepared a compelling, must-read, factual report supporting LRT, presenting glaring, substantial differences between the two systems in overall construction costs and time, operation and maintenance costs, visual, environmental and traffic impact, and comparable references to current systems in North America.

I am more inclined to trust the assessment of those who spend their own money and whose livelihoods depend on sound planning and critical thinking rather than the assessment of those who spend taxpayers money and whose livelihoods continue on whether their decisions are sound or not.

We must unite in enlightenment! Don't fall for this. Educate yourselves, think standing up, read the facts, do the math, and do not be afraid to challenge "those who go along unquestioningly with popular opinion, with potentially dangerous or fatal consequences."

Dear Ms. Culvyhouse:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The Alternatives Screening Memorandum (DTS 2006a) recognized the visually sensitive areas in Kakaako and Downtown Honolulu, including the Chinatown, Hawaii Capital, and Thomas Square/Honolulu Academy of Arts Special District. To minimize impacts on historic resources, visual aesthetics, and surface traffic, the screening process considered 15 combinations of tunnel, at-grade, or elevated alignments between Iwilei and Ward Avenue. Five different alignments through Downtown Honolulu were advanced for further analysis in the Alternatives Analysis, including an at-grade portion along Hotel Street, a tunnel under King Street, and elevated guideways along Nimitz Highway and Queen Street (Figure 2-4).

The Alternatives Analysis Report (DTS 2006b) evaluated the alignment alternatives based on transportation and overall benefits, environmental and social impacts, and cost considerations. The report found that an at-grade alignment along Hotel Street would require

the acquisition of more parcels and could potentially affect more burial sites than any of the other alternatives considered. The alignment with at-grade operation Downtown and a tunnel under King Street, was not selected because of the environmental effects, such as impacts to cultural resources, reduction of street capacity, and property acquisition requirements of the at-grade and tunnel sections, which would cost an additional \$300 million.

The Project's purpose is "to provide high-capacity rapid transit" in the congested east-west travel corridor (see Section 1.7 of the Final EIS). The need for the Project includes improving corridor transit mobility and reliability. The at-grade alignment would not meet the Project's Purpose and Need because it could not satisfy the mobility and reliability objectives of the Project (see bullets below). Some of the technical considerations associated with an at-grade versus elevated alignment through Downtown Honolulu include the following:

- **System Capacity, Speed, and Reliability**—*The short, 200-foot (or less) blocks in Downtown Honolulu would permanently limit the system to two-car trains to prevent stopped trains from blocking vehicular traffic on cross-streets. Under ideal operational circumstances, the capacity of an at-grade system could reach 4,000 passengers per hour per direction, assuming optimistic five minute headways. Based on travel forecasts, the Project should support approximately 8,000 passengers in the peak hour by 2030. Moreover, the Project can be readily expanded to carry over 25,000 in each direction by reducing the interval between trains (headway) to 90 seconds during the peak period. To reach a comparable system capacity, speed, and reliability, an at-grade alignment would require a fenced, segregated right-of-way that would eliminate all obstacles to the train's passage, such as vehicular, pedestrian, or bicycle crossings. Even with transit signal priority, the at-grade speeds would be slower and less reliable than an elevated guideway. An at-grade system would travel at slower speeds due to the shorter blocks, tight and short radius curves in places within the constrained and congested Downtown street network, the need to obey traffic regulations (e.g., traffic signals), and potential conflicts with other at-grade activity, including cars, bicyclists, and pedestrians. These effects mean longer travel times and far less reliability than a fully grade-separated system. None of these factors affects an elevated rail system. The elevated rail can travel at its own speed any time of the day regardless of weather, traffic, or the need to let cross traffic proceed at intersections.*
- **Mixed-Traffic Conflicts**—*The Project will run at three minute headways. However, three-minute headways with an at-grade system would prevent effective coordination of traffic signals in the delicately balanced signal network in downtown Honolulu. A disruption of traffic signal cycle coordination every three minutes would severely affect traffic flow and capacity of cross-streets. Furthermore, there would be no option to increase the capacity of the at-grade rail system by reducing the headway to 90 seconds, which would only exacerbate the signalization problem. An at-grade system would require removal of two or more existing traffic lanes on affected streets. This effect is significant and would exacerbate congestion. Congestion would not be isolated to the streets that cross the at-grade alignment but, instead, would spread throughout Downtown.*

The Final EIS shows that the Project's impact on traffic will be isolated and minimal with the elevated rail, and, in fact will reduce system-wide traffic delay by 18 percent compared to the No Build Alternative (Table 3-14 in the Final EIS). The elevated guideway will require no removal of existing through travel lanes, while providing a reliable travel alternative. When traffic slows, or even stops due to congestion or incidents, the elevated rail transit will continue to operate without delay or interruption.

An at-grade light rail system with continuous tracks in-street would create major impediments to turning movements, many of which would have to be closed to eliminate a crash hazard. Even where turning movements are designed to be accommodated, at-grade systems experience potential collision problems. In addition, mixing at-grade fixed guideway vehicles with cars, bicyclists, and pedestrians presents a much higher potential for conflicts compared to grade-separated conditions. Where pedestrian and automobiles cross the tracks in the street network, particularly in areas of high activity (e.g., station areas or intersections), there is a risk of collisions involving trains that does not exist with an elevated system. There is evidence of crashes between trains and cars and trains and pedestrians on other at-grade systems throughout the country (e.g., Phoenix, Houston, LA). This potential would be high in the Chinatown and Downtown neighborhoods, where the number of pedestrians is high and the aging population presents a particular risk.

- **Construction Impacts**—*Constructing an at-grade rail system could have more effects than an elevated system in a number of ways. The wider and continuous footprint of an at-grade rail system compared to an elevated rail system (which touches the ground only at discrete column foundations, power substations, and station accessways) increases the potential of utility conflicts and impacts to sensitive cultural resources. In addition, the extra roadway lanes utilized by an at-grade system would result in increased congestion or require that additional businesses or homes be taken to widen the roadway through Downtown. Additionally, the duration of short-term construction impacts to the community and environment with an at-grade system would be considerably greater than with an elevated system. Because of differing construction techniques, more lanes would need to be continuously closed for at-grade construction and the closures would last longer than with elevated construction. This would result in a greater disruption to business and residential access, prolonged exposure to construction noise, and traffic impacts.*

Because it is not feasible for an at-grade system through Downtown to move passengers rapidly and reliably without significant detrimental effects on other transportation system elements (e.g., the highway and pedestrian systems, safety, reliability, etc.), an at-grade system would have a negative system-wide impact that would reduce ridership throughout the system. The at-grade system would not meet the Project's Purpose and Need and, therefore, does not require further analysis.

Ms. MJ Culvyhouse

Submission Method : Website
Other Submission Method :
Submission Date : 12/29/2008
Submission Content/Notes : Airport route will provide cost savings to locals and tourists alike. This will MAKE money for the state if TOURISM is more accessible.

San Diego does not provide airport route...bad for visitors and locals.
ONLY THE TAXI COMPANIES PROFIT!! Look at your priorities.

Cities like San Francisco, Chicago, London, Paris, Stockholm, etc...have
TOURISM and local convience as their top priority!

Dear Mr. Custer:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses comments regarding the above-referenced submittal:

Your preference for the Airport Alternative has been noted. While each of the alternatives includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana Center has been selected as the Preferred Alternative. The identification of the Airport Alternative as the Preferred Alternative was made by the City to comply with FTA's NEPA regulations that state that the Final EIS should focus on the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative, public input on the Draft EIS, and City Council Resolution 08-261 identifying the Airport Alternative as the Project. The selection of the Airport Alternative is described in Chapter 2 of this Final EIS. The discussion of the alternatives considered is included in Chapter 2 of this Final EIS and the Alternatives Analysis. As discussed in Section 3.4.2 of this Final EIS, the Airport Alternative will carry the most passengers with 116,000 daily passengers

Mr. Jonathon Custer
Page 2

and 282,500 daily trips in 2030, thereby resulting in the greatest transit-user benefits. The Airport Alternative will also result in the fewest vehicle miles traveled and vehicle hours of delay, as well as provide access to major employment areas, including Honolulu International Airport, that will have substantially greater ridership than the other alternatives considered.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Issuance of the Record of Decision under NEPA and acceptance of the Final EIS by the Governor of the State of Hawaii are the next anticipated actions and will conclude the environmental review process for this Project.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka", written in a cursive style.

SCHULER DIVISION

January 19, 2009

Honorable Wayne Y. Yoshioka, Director
 Department of Transportation Services
 City and County of Honolulu
 650 South King Street, 3rd Floor
 Honolulu, Hawaii 96813

Dear Mr. Yoshioka:

Subject: Comments on the Draft Environmental Impact Statement (DEIS) for the Honolulu High Capacity Transit Corridor Project

Thank you for allowing us the opportunity to provide comments on the subject DEIS. As you are aware, we are the developers of the master planned Ho'opili project in East Kapolei, and have been and will continue to be a strong supporter of this project. The transportation infrastructure is reaching its limits in being able to move people efficiently through the West Oahu to East Honolulu corridor. The proposed project will increase the infrastructure capacity in the long-term and provide transportation alternatives to residents along this corridor. It will also be able to support the planned growth in the West Oahu region.

We have reviewed the document and provide the following comments.

Chapter 2, Alternatives Considered:

Page 2-14—the section dealing with Transit Centers stated that Transit centers would be constructed as stand-alone facilities or as part of park and ride lots at:

UH West Oahu
 West Loch
 Pearl Highlands
 Aloha Stadium

The following is a listing of each of the stations, the stations types and if a park and ride or transit center is being proposed at the station.

Station	Station Type	Park and Ride	Transit Center
East Kapolei Station	Elevated Platform and Connecting Bridge	12 Acres for 900 Spaces	No
University of Hawaii, West Oahu	Elevated Platform and Concourse	(2)-5 Acre Sites for 500 Spaces each (Total 1,000 Spaces)	Yes (Page 2-14, but not identified on Figure 2-15)
Ho'opili Station	Elevated Platform	No	No
West Loch Station	Elevated Platform and	No	Yes (Page 2-14)

	Concourse		
Waipahu Transit Center Station	Elevated Platform and Concourse	No	Not mentioned on Page 2-14, Mentioned in Figure 2-18 but not located on map
Leeward Community College Station	Platform	No	No
Pearl Highlands Station	Elevated Platform and Connecting Bridge	11 Acres for 1,600 Spaces	Yes (Page 2-14, but not identified on Figure 2-20)
Pearlridge Station	Elevated Platform and Concourse	No	No
Aloha Stadium Station	Elevated Platform and Concourse	7 Acres for 700 Spaces	Yes (Page 2-14, but not identified on Figure 2-22)
Ala Liliko'I Station	Elevated Platform and Concourse	No	No
Aloha Stadium Station	Elevated Platform and Concourse	7 Acres for 700 Spaces	Yes (Page 2-14, but not identified on Figure 2-24)
Arizona Memorial Station	Elevated Platform and Concourse	No	No
Pearl Harbor Naval Base Station	Elevated Platform and Concourse	No	No
Honolulu International Airport Station	Elevated Platform and Concourse	No	No
Lagoon Drive Station	Elevated Platform	No	No
Middle Street Transit Center Station	Elevated Platform and Concourse	No	Not mentioned on Page 2-14, Mentioned in Figure 2-29 but not located on map
Kalihi Station	Elevated Platform	No	No
Kapalama Station	Elevated Platform	No	No
Iwilei Station	Elevated Platform	No	No
Chinatown Station	Elevated Platform and Concourse	No	No
Downtown Station	Elevated Platform and Concourse	No	No
Civic Center Station	Elevated Platform	No	No
Kakaako Station	Elevated Platform	No	No
Ala Moana Station	Elevated Platform	No	No

From the information provided:

1. Is the City limited to the specific type of station listed in this chapter or could any one of the three proposed configurations be used (i.e. Side platforms without mezzanine, Side platforms with mezzanine, or Center platform with mezzanine)?
2. Does mezzanine mean concourse as is used in identifying the specific stations in the figures?
3. Is there some criteria for the proposed "Transit Centers" and some idea of the area (acres) required for each of these centers?
4. There seems to be more Transit Centers being proposed than what is listed on page 2-14.

On page 2-24, the key components of each transit station are described in a "sidebar." We note that there is no mention of public restrooms (even automated public toilets) or what form of security will be provided (including security cameras).

Page 2-36 Park and Ride Lots—are the park and ride lots limited to the locations identified in the DEIS or is there some flexibility to house the required number of spaces in and around the transit stations by incorporating more parking into redevelopment or development adjacent to the station. For example, if an entertainment facility were being built near the station, the parking for the entertainment center could be shared and used for the park and ride since the need for parking for the transit should be at different times when the parking would be needed for the entertainment facilities. Allowing these types of joint uses and incorporating the park and ride needs into the development would seem to be mutually beneficial to both the City and the developers.

Pages 2-37 and 2-38 Vehicle Maintenance and Storage Facility—This section identifies a 41 acre area adjacent to the existing HECO Substation at Ho’opili and another 43 acre site near the Leeward Community College (Navy Drum Site) as possible sites for the maintenance facility.

This 41 acre site is also indentified on the Conceptual Alignment Plans and Profiles (Drawing No.: RP004a). However, on the Conceptual Right-of-Way Plans (Drawing No.: RW006a) the proposed Maintenance and Storage Facility is identified as a 12 acre site. Please clarify the actual land requirements for this facility.

Also, while the statement in the document is correct that the site is currently in agricultural use, the existing lessee, Aloun Farms, has a lease from us for its entire processing and office facilities located within the footprint of the proposed vehicle maintenance facility. The processing facility lease expires in 2017. The Aloun Farms facilities house all of their administrative support staff and process all of the produce grown on the property as well as other properties they have under lease elsewhere. Given the need for the Transit Vehicle Maintenance facility at some time when the initial segments of the transit system are being constructed (Page 2-39), early notification on a decision of which site will be selected would provide our tenant with as much time as possible to plan for a transition.

While an alternative Vehicle Maintenance and Storage Facility is shown adjacent to the existing HECO Substation at Ho’opili, we are concerned that the DEIS did not fully discuss the visual and noise impacts from 24-hour day operations on surrounding uses within the proposed Ho’opili project. Also not described, is the visual and land use impacts from the “Elevated Access Tracks” that would connect to the Fixed Guide-way on the proposed Ho’opili project.

In addition, the proposed transit maintenance facility located northeast of and adjoining to the HECO Ewa Nui Substation, as depicted in DEIS Figure 2-41, as well as Figure RP004a (Sheet 5) of Appendix A (Conceptual Alignment Plans and Profiles), would appear to preclude the planned development of an east-west internal Ho’opili roadway connection mauka of Farrington Highway to link the mauka Project lands to the east and west of the transit facility. The transit facility would appear to prevent the linkage of 1st Avenue and 2nd Avenue. This would require traffic between the mauka east and west Project areas to circulate on Farrington Highway to travel between the two areas, thus placing additional traffic volumes along Farrington Highway and increasing traffic volumes at the Farrington Highway intersections providing mauka area access to Project mauka area.

If the maintenance facility site in Ho’opili is selected, it would be desirable to locate the transit yard further east or west, or reconfigure the transit facility, to allow a corridor for roadway connection between the east and west sections of the Ho’opili area mauka of Farrington Highway. Another possibility would be to make a portion of the access/perimeter transit facility roadway a public roadway.

Page 2-38 Traction Power Substations—The project will require traction power substations approximately every mile. Are these substations planned to be located in the existing transit right-of-way below the elevated tracks or will a stand-alone site be required? Would the space requirements be limited to each site being 640 square feet (40 x 16) or will the actual footprint required be larger?

On page 3-53, in the “sidebar” entitled “Summary of Findings: Transportation Conditions and Effects”, we note that under the category of “Effects of the Build Alternatives”, there is no mention of the traffic impacts from cars generated from the “Proposed Park-and-Ride Lots” on streets immediately surrounding such facilities.

Table 4-1, Page 4-4, “Land Use (Section 4.1) – land acquired for transportation use” - While we would concur that approximately 88 acres of prime and statewide-important farmlands would be affected, the land in East Kapolei has long been planned as part of the Second City of Oahu. This is discussed on page 4-20 but not included in the summary of impacts on page 4-4. The implementation of the HHCTC project has long-term effects on the pattern of land use on Oahu. It will positively enhance and reinforce the linear pattern of development, reducing the pressure for development of agricultural lands in Central Oahu and rural areas elsewhere on the island. This is not discussed on page 4-20.

Table 4-1, Page 4-4, “Economic Activity (Section 4.2) – property tax revenue” - While we would concur that property acquired from private owners and converted to a transportation use would result in a direct reduction in property tax revenues, at least initially, over the long-term, with resulting higher-density transit-oriented development around transit stations, there will probably be a long-term net gain in property tax revenues, off-setting the initial loss in property tax revenues. This is discussed as an impact or possible outcome on pages 4-24 (also pages 4-166 and 4-167) but not included in the summary of impacts on page 4-4.

Table 4-1, Page 4-5, “Acquisitions, Displacements, and Relocations (Section 4.3)” - The land under the selected Vehicle Maintenance and Storage Facility site would eliminate either landowner’s opportunities for development of their respective sites. In the case of the Ho’opili project, the impacts of the use of the site will not be limited to the loss of property, but a Vehicle Maintenance and Storage Facility at Ho’opili could have major visual and noise impacts on the surrounding land uses within the proposed Ho’opili project. As previously noted, the DEIS did not fully discuss the visual and noise impacts from 24-hour day operation of the Vehicle Maintenance and Storage Facility on surrounding uses within the proposed Ho’opili project. Also not described, is the visual and land use impacts from the “Elevated Access Tracks” that would connect to the Fixed Guide-way on the proposed Ho’opili project.

Page 4-10, Section 4.1.2 Affected Environment—This section includes the following three categories of Farmland:

1. Prime Farmland
2. Unique Farmland
3. Farmland of statewide importance

No reference is provided as to the sources for these categories. There have been a few studies such as the Land Evaluation and Site Assessment (LESA) system and the Agricultural Lands of Importance to the State of Hawaii (ALISH) system done over time with different rating and category systems for agricultural lands. Also, recently the Legislature enacted new laws on

designating Important Agricultural Lands (IAL). To minimize confusion, it maybe appropriate to either reference the three categories listed with the three other efforts or reference one or all of the three existing sources to identify agricultural lands in Hawaii.

Page 4-28, Figure 4-9 – While Figure 4-3 indicates the “Future Campus of UH West Oahu” and the “Future Salvation Army Kroc Center”, Figure 4-9 does not indicate these important community resources and facilities, even though they are currently not in operation (but will be by the time the transit stations are built).

Pages 4-57 to 4-93 – Much emphasis was made on discussing the impacts of the elevated fixed guide-way from surrounding areas, however there did not appear to be any analysis of the visual impacts from the Vehicle Maintenance and Storage Facility, at either of the proposed locations. As previously noted, the DEIS did not appear to discuss the visual impacts from 24-hour day operation of the Vehicle Maintenance and Storage Facility on surrounding uses within the proposed Ho’opili project, including outdoor lighting pollution (assuming outdoor storage and maintenance). Also not described are the visual impacts from the “Elevated Access Tracks” that would connect to the Fixed Guide-way on the proposed Ho’opili project.

Page 4-103, Figure 4-39 – There is no mention of the noise impacts of the Vehicle Maintenance and Storage Facility on the proposed Ho’opili project. Also the noise impacts from the East Kapolei, UH West Oahu and Ho’opili transit stations are also not shown. We can assist by providing anticipated ambient noise levels at the Hoopili transit station site.

Page 4-171, Table 4-36 – There is no mention of DHHL’s East Kapolei 1 (between UH West Oahu, North-South Road, Kapolei Parkway and Kapolei Golf Course) and East Kapolei 2 (between Ho’opili, North-South Road and Ewa Villages) projects.

We appreciate the opportunity to provide comments on the Draft EIS. Should you have any questions regarding this matter please feel free to contact us directly at 521.5661.

Sincerely,

Dean Uchida, Vice President

Dear Mr. Uchida:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The configurations included in the Draft and Final EISs are representative of the proposed configurations for most stations. Other configurations, such as the unique configuration of the Ala Moana Center Station, are possible depending on cost and technical issues. The City is receiving input from stakeholders and surrounding communities regarding station design.

In the Draft EIS, the terms mezzanine and concourse were used interchangeably. For the Final EIS, the term concourse is used to clarify the reference.

Transit center design criteria have been developed to accommodate bus transfers and other potential intermodal transfers. The size of each transit center depends on the number of buses and other modes to be accommodated, but they will fit within the space already identified in the individual station graphics shown in Chapter 2 (Figures 2-17 through 2-37) of the Final EIS.

While bus transfers will occur at most stations, the off-street bus transit centers will be constructed as part of the Project at four locations: UH West Oahu, West Loch, Pearl Highlands, and Aloha Stadium. Transit centers are discussed further in Section 2.5.6 of the Final EIS. Each station will have a secured public restroom; however, patrons will be required to ask the station attendant for access to the restroom. Security, including cameras, will be provided at all stations. The City, working with the Honolulu Police Department and community groups, will develop a security plan for the stations. Security measures are further discussed in Section 2.5.4 of the Final EIS.

Park-and-ride requirements could be accommodated through shared use. The park-and-ride demand shown in Table 3-22 of the Final EIS reflects the estimated weekday demand for an independently operating system. All or a portion of the capacity could be provided in shared facilities as long as weekday availability for transit users meets the demand identified in the Final EIS.

The Hoopili maintenance and storage facility would be 41 acres in size. Drawing No. RW006a in Appendix C has been corrected in the Final EIS to reflect this.

The Final EIS identifies the site near Leeward Community College as the preferred site for the maintenance and storage facility. If the preference for the location of the maintenance and storage facility changes, D.R. Horton will be notified as soon as practical.

The Hoopili maintenance and storage facility option would require large expanses of pavement to accommodate access to the guideway and a number of buildings, including maintenance facilities, a vehicle wash area, storage track, system control center, and employee parking. The proposed 41-acre site is an open flat agricultural area adjacent to an electrical substation. The maintenance and storage facility, including elevated access tracks, would contrast with the open, rural, country-like setting. In addition, the facility buildings and tracks would be highly visible from mauka foothill residences. Development of surrounding properties, however, would reduce the visual contrast of the maintenance and storage facility. Location of the maintenance and storage facility at this location would result in a moderate visual effect. Light and glare is expected to be low with a limited level of reflective surfaces and will be reduced further by appropriate design measures (see Section 4.8.3 Environmental Consequences and Mitigation). Overhead site lighting at the maintenance and storage facility will be provided for safety and visibility. The guideway will introduce an elevated linear structure and urban elements to what is currently an open, rural, and country-like setting.

The following measures will be incorporated into the Project's maintenance and storage facility regardless of its location to minimize adverse visual effects and enhance the visual and aesthetic opportunities that it creates. It should be noted, however, that the Leeward Community College maintenance and storage facility site is the preferred site for the Project.

- *Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
- *Retain existing trees where practical and provide new vegetation.*
- *Shield exterior lighting.*

As discussed in Section 4.17.2 of the Final EIS, noise will be produced at either maintenance and storage facility. The nearest noise-sensitive use is approximately 700 feet from the center of the site near Leeward Community College. There are no noise-sensitive land uses near the Hoopili site. As a result, no noise impacts will occur due to the Project.

The Project will include an integrated noise blocking parapet wall at the edge of the guideway structure that extends three feet above the top of the rail and a system specification for vehicles with wheel skirts. The parapet wall will substantially reduce ground-level noise. Wheel skirts, which will be included as noise mitigation in project design, will increase the benefit of the parapet wall.

Measures to reduce noise levels above the track elevation, such as sound-absorptive materials in the track area, will be evaluated during preliminary engineering of the Project. Once the Project is operating, noise levels will be measured to determine the actual extent of project noise impacts.

To address linkages in the vicinity of the Hoopili site, some reconfiguration of the site is possible. The access roadway to the site could be public, but internal roadways serving the site would need to be secure.

With regard to conditions on Farrington Highway, Section 3.4.3 of the Final EIS presents information on a traffic analysis that was carried out for the two potential locations of the maintenance and storage facility. The analysis was based on the expected future roadway network serving the sites as well as future traffic volumes during the a.m. and p.m. peak periods. The results of the traffic analysis indicated that there will be no major effects on nearby intersections and roadways near either facility.

The locations of the traction power substations are shown in Appendix B of the Final EIS. They are generally located on the same property already being affected by the adjacent station; however, this is not possible in all locations. The sites will need to be large enough to house the substation and also to provide access for maintenance. For a stand-alone site not associated with a station or other project feature, the total site area will be approximately 50 by 60 feet. Text about traffic impacts resulting from the proposed park-and-ride facilities has been added to the summary of effects shown in Table 3-1 in the Final EIS.

The summary of environmental effects and proposed mitigation measures to avoid, minimize, or reduce impacts presented in Table 4-1 of the Draft EIS are specific to the land required for the Project. As described in Section 4.19.3 Cumulative Effects, of this Final EIS, current land use plans anticipate extensive development of the Ewa plain irrespective of whether or not the project is built. Thus, the project may have the effect of intensifying land use in the

areas near the planned stations; however, the overall development plan will not be substantially altered by the Project. The State of Hawaii prepared an Environmental Assessment (EA) of the effects of two major transportation projects, the North-South Road and Kapolei Parkway) in the Ewa area. The evaluated growth-inducing and cumulative impacts of the projects under the Hawaii Environmental Policy Act, see EA § 3.15.4.

In regards to property tax revenue, Table 4-1 in the Draft EIS illustrates direct effects from the Project. The discussion in Section 4.18.2 pertains to possible long-term effects that could be indirectly caused by implementation of the Project.

The title of Table 4-1 has been revised in the Final EIS to state "Summary of Direct Environmental Effects and Mitigation Measures to Avoid, Minimize, or Reduce Impacts." This should alleviate confusion between direct effects caused by the project and indirect effects that are discussed in Section 4.19 of the Final EIS.

Visual and noise effects at the Hoopili maintenance and storage facility are discussed in regards to an earlier comment in this letter. As discussed above, the Leeward Community College maintenance and storage facility option would require large expanses of pavement to accommodate a number of buildings including maintenance facilities, a vehicle wash area, storage track, system control center, and employee parking. The proposed 43-acre site near the Leeward Community College is vacant and undeveloped. This site is on a flat knoll makai of the H-1 Freeway/Farrington Highway interchange. The maintenance and storage facility buildings would be highly visible from low-lying areas makai of the interchange and from residences on the foothills above. However, the facility would not contrast substantially with elements of the surrounding visual character, which include the highway interchange, community college buildings, and adjacent parking lots.

Visual effects and mitigation at the Leeward Community College and Hoopili maintenance and storage facilities are discussed in response to previous comments in this letter. As presented in the Land Use Technical Report for this Project, relevant laws that define the land use types described in the Draft and Final EISs include:

- Federal Farmland Protection Policy Act (FPPA) (7 USC 4201-4209).
- Hawaii Farmland Preservation Act (State of Hawaii Department of Agriculture, Act 183).
- The Geology, Soils, Farmlands, and Natural Hazards Technical Report identifies the source of the agricultural designations of "prime," "unique," and "statewide important" to be from the ALISH data with additional information provided by soils and land use data.

If an area is designated as "prime" or "unique" yet has a planned or existing land use for development, this was taken into consideration when determining the suitability of the site for the transit system, as explained in Section 4.2 of the technical report. The technical reports are available on the Project website (www.honolulutransit.org).

Mr. Dean Uchida
Page 5

In the Draft EIS, Figure 4-9 shows only the existing community resources and facilities within one-half mile, Kapolei to Fort Weaver Road. Table 4-36 of the Draft EIS presents planned and foreseeable actions in the study corridor. Both the Salvation Army-sponsored Kroc Center in Kapolei and the University of Hawaii West Oahu campus are listed.

Visual effects and mitigation at the Leeward Community College and Hoopili maintenance and storage facilities are discussed in response to previous comments in this letter. There is no noise-sensitive land use in the vicinity of the East Kapolei, UH West Oahu, and Hoopili stations or the Hoopili maintenance and storage facility site option. Per USDOT policy, proposed development that has not completed permitting for construction at the time of the Record of Decision is not considered in the noise impact analysis.

The Department of Hawaiian Home Lands East Kapolei 1 (Kanehili) and East Kapolei 2 projects have been added to Table 4-39, Planned and Foreseeable Actions in the Study Corridor, Section 4.19.3 Cumulative Effects, in this Final EIS.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Enclosure

America's Builder

SCHULER DIVISION

January 22, 2009

Honorable Wayne Y. Yoshioka, Director
 Department of Transportation Services
 City and County of Honolulu
 650 South King Street, 3rd Floor
 Honolulu, Hawaii 96813

Dear Mr. Yoshioka:

Subject: Comments on the Draft Environmental Impact Statement (DEIS) for the Honolulu High Capacity Transit Corridor Project

These comments are being provided as an addendum to our comments of January 19, 2009.

Page 3-4, Tables 3-1 and 3-2 indicate that 6% of the 2,790,000 daily trips by residents use transit, and 5% of the 364,400 daily trips by visitors use transit in 2007. Thus, approximately 5.8% of the total daily resident and visitor trips use transit.

Page 3-23, Table 3-13 shows the no build alternative and the Airport-Salt Lake Alternative

	2007	2007	No Build	No Build	Airport-Salt Lake	Airport-Salt Lake
Resident Transit	165,900	6%	205,700	6%	248,200	7%
Resident Total	2,790,000		3,452,700		3,452,500	
Visitor Transit	17,600	5%	19,800	5%	23,700	6%
Visitor Total	364,400		430,700		431,400	
Total Transit	183,500	5.8%	225,500	5.8%	271,900	7%
Total Trips	3,154,400		3,883,400		3,883,900	

Page 3-36, Table 3-19 Estimated Transit User Benefits Resulting from 2030 Build Alternatives

It appears that the table extracted information from the Oahu OMPO Travel Demand Forecast Model.

Page 4-23, Section 4.2 Economic Activity. This section identifies the PUC as the primary location for non-agricultural jobs on Oahu (approximately 74%). The study reviewed trends and forecasts from the three development and sustainable plan areas in the study corridor (PUC, Ewa and Central Oahu). The job growth for the corridor was projected at 1 percent per year from 2000 to 2030.

Employment Forecast	2000	2030	Annual Growth Rate
Oahu	501,100	630,700	0.8%
Study Corridor	399,300	524,200	0.9%

We understand that the OMPO model makes certain assumptions regarding the jobs being generated in the Ewa-Kapolei Region. With the anticipated build out of the UHWO Campus, the Kroc Center and De Bartolo project on DHHL lands, and the anticipated development-redevelopment opportunities being created by the "Transit Oriented Development" (TOD) around the proposed transit stations, we would expect that the job generation numbers outside of the Primary Urban Center (PUC) would increase significantly and thus have some impact on the resident daily trips.

We believe that some analysis should be done to assess not only the reduction in vehicle trips for residents with the transit project but also the compounded impact of reduced vehicle trips due to quality jobs being created or relocated out of the PUC.

We appreciate the opportunity to provide comments on the Draft EIS. Should you have any questions regarding this matter please feel free to contact us directly at 521.5661.

Sincerely,

A handwritten signature in black ink, appearing to read "Dean Uchida".

Dear Mr. Uchida:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal:

The number and percent of total transit trips has been added to Table 3-3 and Table 3-12 in the Final EIS.

Table 3-19 in the Draft EIS (Estimated Transit User Benefits Resulting from 2030 Build Alternatives) represents information extracted from the OahuMPO Travel Demand Forecasting Model. This table has been updated in the Final EIS (now appearing as Table 3-17). The information is still from the Travel Demand Forecasting Model.

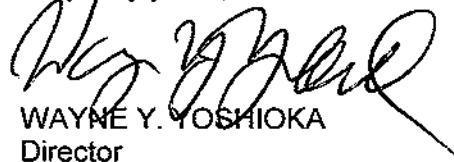

The Travel Demand Forecasting Model used for the Project reflects population and employment numbers anticipated with the development of Hoopili, UH West Oahu campus, Kroc

Mr. Dean Uchida
Page 2

Center, and the De Bartolo project. However, based on FTA guidance, the model cannot account for the benefits resulting from transit-oriented development or increases in land use as a result of the fixed guideway project. Daily person trips and vehicle miles traveled for the No Build Alternative forecast travel patterns without the fixed guideway system.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Issuance of the Record of Decision under NEPA and acceptance of the Final EIS by the Governor of the State of Hawaii are the next anticipated actions and will conclude the environmental review process for this Project.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Honolulu, Hawaii 96813

Dear Mr. Yoshioka;

Subject: Honolulu Rail Transit Draft Environmental Impact Statement
Comments

I am writing this letter to provide comments on the Honolulu Rail Transit Draft Environmental Impact Statement on behalf of the Hawaii Chapter of the American Society of Landscape Architects.

The Honolulu rail transit presents many opportunities to improve the quality of life of Honolulu's residents and visitors. Through smart sustainable growth, light rail could create new long term economic opportunities, revitalize the sense of place of Honolulu's main streets and communities, protect environmental resources, and improve human health and quality of life.

The rail route is located on the main streets of several distinct Oahu communities: Waipahu, Aiea, Pearl City, Salt Lake City, downtown Honolulu and Kalihi. Seize this opportunity to build a rail system that reflects Hawaii's rich sense of place and helps build more vibrant communities. Promote smart development by rezoning areas near rail stations with higher density, abundant pedestrian and bicycling facilities, street trees and reducing automobile parking spaces.

Employ a sustainable design and construction approach that limits climate impacts, biodiversity loss and resource depletion. Link our natural and built systems to achieve a balanced environmental, social and economic outcome that improves the health of our communities and regenerates our environment. Don't degrade surrounding sites, risk human and environmental health or introduce new invasive plants. Use as many local products and recycled waste products as possible.

In summary, make human and environmental health, smart and sustainable development the top priorities and create a legacy we can all be proud of for many generations. Feel free to contact me at 223-8458 if you have any questions.

Sincerely yours,

Chris A. Dacus, President
Hawaii Chapter of the American Society of Landscape Architects

Dear Chris Da:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Efforts are being undertaken to ensure that stations reflect the sense of place of the area where they are located. As discussed in Section 8.4 of the Final EIS, the City is conducting workshops with communities that will have rail stations. The purpose of the workshops is to engage the public about rail stations and provide opportunities to residents to contribute ideas about the appearance of station entryways in their areas. Ideas generated at the workshops will be incorporated into the station planning process. For more information and to get involved in this process, please visit the project website at www.honolulutransit.org.

The Project is focused on construction and implementation of rail transit service, which is evaluated in the Draft and Final EISs. As discussed in Section 4.19.2 of the Final EIS, transit-oriented development (TOD) is expected to occur in project station areas as an indirect effect of the Project. The increased mobility and accessibility that the Project may provide may also increase the desirability and value of land near stations, thereby attracting new real estate

investment nearby (in the form of TOD). Planning and zoning around station areas will be established by the City's Department of Planning and Permitting under the City's new TOD ordinance.

In March 2009 the City Council approved and the Mayor of Honolulu signed Bill 10 (2008) (Ordinance 09-4), which defines the City's approach to TOD around rail stations. Zoning regulations will address parking standards, new density provisions, open space (including landscaping and street trees), and affordable housing. Financial incentives could include public-private partnerships, real property tax credits, and infrastructure financing. While the Project is being coordinated with City and State agencies to encourage development of enhanced pedestrian and bicycle facilities and other land use changes near stations, the actual construction of such facilities and zoning changes are beyond the scope of this Project.

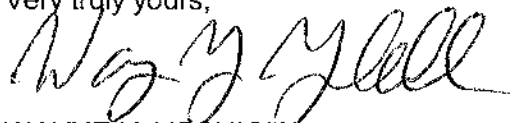

Sustainability, the local economy, the community, and the environment will continue to be considered during project development and construction. Chapter 4 of the Final EIS describes how overall energy demand, air pollution, and water pollution will decrease because of the Project.

A discussion on the possible introduction of invasive species to Oahu has been added to Section 4.18.9 of the Final EIS. Criteria for cleaning, inspection, and treatment of plants that are at risk of harboring pests will be part of the landscaping requirements. Species that can be harmful invaders or contribute to existing problems will not be used for project plantings. Construction equipment from other islands or counties will have to be pressure washed and inspected before being brought to the construction site. Plantings will favor native plants.

Lastly, effects to surrounding neighborhoods are described in Section 4.5 of the Final EIS. Additional information on the community health benefits of transit have been added to the Indirect Effects section of the Final EIS.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Submission Content/Notes : Comments on "Honolulu High-Capacity Corridor Project Draft Environmental Impact Statement
1/13/09

I wish to comment on noise considerations for the proposed new transit system for Honolulu having been a practicing acoustical engineer in Hawaii for over 20 years.

The most important thing is to have reasonable background noise levels in your home wherein you can use normal voice, TV and radio sound levels when a train goes by. You should not have to use strained, loud voices to talk to each other or to raise your TV remote volume every time a train passes by. During the quiet night time you should not be awoken by train passes.

The Department of Housing and Urban Development (reference 1) states: "Noise can cause or increase sleeplessness, irritability and anxiety. There have been numerous acts of violence, including murder, associated with noise. Noise negatively impacts health, safety, comfort and productivity".

Different Federal Agencies have different noise impact rules to protect you from excessive noise.

EPA recommends that ideally interior background noise levels of 45 decibels dBA Leq for residences (reference 2). In reference 1 HUD's regulations do not contain standards for interior noise levels. Rather a goal of 45 decibels is set forth and the attenuation requirements are geared toward achieving that goal. It is assumed that with standard construction any building will provide sufficient attenuation so that if the exterior level is 65 dBA Ldn or less, the interior level will be 45 dBA Ldn or less (the outdoor-to-indoor noise reduction implied is 20dBA).

Here in Hawaii many hundreds of housing units face traffic (and potentially transit) noise sources with open sliding glass doors on their lanais and open glass jalousie windows having outdoor-to-indoor noise reductions of 10dBA or less allowing noise inside the homes that is subjectively twice (or more) as noisy as a 20 dBA noise reduction.

The Federal Highway Administration (FHWA) suggests interior levels of 52 decibels as being acceptable by taking "Feasibility" and "Reasonableness" into account. (Table 3-4, reference 3). The Federal Transit Administration (FTA) does not explicitly recommend acceptable indoor noise levels, but assumes that typical housing has 'quality' windows that are closed providing an outdoor-to-indoor noise reduction of 25dBA and honors HUD's exterior level of 65 dBA Ldn (page 3-10, reference 3).

Improper transit noise studies could lead to many families suffering excessive noise inside their homes. There could be class action law suits after the mainland consultants and contractors are gone. The DEIS must address the additional noise impact caused by many homes

now using natural ventilation year around with open lanai doors and windows and not the assumption that the 'typical' home has closed fenestration. After litigation, many hundreds of homes could get the needed new windows and doors to close for reducing traffic and transit noise as well as the needed air-conditioning. Who pays for this and the extra electric bill costs? Who pays the attorneys fees? What are the carbon energy footprint implications of all these additional AC units?

From the DEIS report I have these comments as well as technical questions which are numbered and underlined.

A) According to the Honolulu Advertiser article on 3/11/08, "severe noise" may occur at 55 locations, all at Salt Lake, and "moderate noise" at 397 other locations ...". This article only mentioned Federal Highway Administration (FHWA) rules from a Parsons Brinckerhoff's report dated 5/07/08.

The DEIS, now shows zero (0) "severe" noise impacts and "moderate" impact at only 49 locations and seems to only mention Federal Transit Administration (FTA) rules. The Executive Summary states there are only 18 to 24 residential buildings subjected to "moderate impact".

It is now understood that the impact calculations in the 3/11/08 article did not include any noise reduction measures (reference 4).

A-1 Please explain what factors or considerations changed the overall noise analysis so favorably – noise reduction measures or noise impact criteria rules or what?

B) B-1 What source noise mitigation measures were assumed in the DEIS analysis?

B-2 Was slowing down the trains in any areas utilized to develop the final analyses to reduce noise impact in sensitive areas?

According to the Executive Summary in the DEIS, parapet walls and wheel skirts would only reduce noise levels by 2 to 5 dBA. The DEIS states that "sound-absorptive materials in the track area" and other mitigation measures will be evaluated during the preliminary engineering stage. Reference 3, Chapter 6 also states: "These mitigation measures work to maintain a rail system in its as-new condition. Without incorporating them into the system, noise levels could increase up to 10 dB."

B-3 When will these source mitigation measures be shown in the cost studies?

B-4 Shouldn't the DEIS state that specifications and maintenance of mitigation measures should include significant penalties for non-compliance? (reference 3, Chapter 6)

C) The low parapet walls allow a strong one-bounce noise path off the sides of the train to propagate to high-rise locations. See Figure 2.8 in reference 3.

C-1 Was sound absorption in the parapet walls considered to abate this phenomenon?

C-2 If not, why not?)

D) In Reference 3, Section 3.3, Pg. 3-14; it states "in some cases, both FHWA and FTA methods should be used, such as when both highway and transit cause significant noise, but at different times of day. An example would be a transit alignment that shares the right-of-way with an arterial road with heavy traffic. Traffic noise may dominate during the peak commuting hours but not during off-peak periods when transit continues to operate. In this case, both sets of criteria would be used to determine whether impact occurs from neither, one or each mode."

D)D-1 Have FHWA noise impact and mitigation methods been utilized in developing the DEIS, and, if not, why not?

E) Hawaii's famous weather allows natural ventilation in most homes with open windows all year around. This causes all types of traffic noise commonly to be at least twice as noisy inside many typical Hawaiian homes compared to typical homes on the mainland. FTA Standards assume that "typical buildings" have "about 25dBA outdoor-to-indoor noise reduction" with windows closed (Page 3-10, reference 3). I have measured outdoor-to-indoor noise reductions of only 7dBA with opened glass louvered windows and open lanai sliding glass doors having direct line-of-sight to the noise source. For example, such conditions will exist along Salt Lake Blvd. Perhaps 10dBA should be used for open Hawaiian housing.

E-1 Were outdoor-to-indoor noise reduction data of typical open fenestration obtained from measurements or the literature?

E-2 Was the quality of fenestration in buildings considered since it includes:

a) open to closed sliding doors on lanais; b) open jalousies to closed jalousies with window AC units and c) open sliding glass windows to fixed glass windows with central AC.?

E-3 For estimating noise mitigation costs what interior noise level was considered acceptable?

E-4 Was there a count of housing units requiring AC units for sound proofing and some consideration of operating costs for the home owner?

F) To account for such unique phenomena, Table 3-4, FHWA Abatement Criteria in reference 3 states that FHWA allows individual state agencies (with their consultants) to define the actual criteria that trigger mitigation studies (sound proofing) of potentially impacted residences. Table 3-4 implies outdoor-to-indoor noise reductions of 15 dBA can be assumed to allow outdoor noise levels of 67dBA Leq(h) to be the triggering criteria noise level for sound proofing of homes allowing 52dBA Leq(h) inside the homes.

Note for homes with normal, closed windows; the 67dBA triggering outdoor noise level allows about 7dB more (may be twice as noisy) than recommended by EPA (reference 2) for interior levels. For homes with open windows and doors, interior levels may be about 15dBA greater (maybe three times noisier) than EPA's recommendations. Our state agency (with their consultants) should address our unique low outdoor-to-indoor noise reduction for our many naturally ventilated homes.

In mainland housing with heating and/or air conditioning, sound proofing may include replacing or upgrading windows and doors. As a starting point, reference 3, page 3-15, considers the cost range of \$25,000 to \$30,000 (2002 mainland dollars) per benefited residence to be reasonable. This estimate does not include some kind of air conditioning that would have to be considered in sound proofing naturally ventilated Hawaiian homes.

F-1 Were any estimates calculated for noise levels inside typical homes along the guideway and, if so, what levels were found?

G) Reference 3, Section 6.5 states: maximum noise level "is often desirable to include computations of L max in environmental documents, particularly for rail projects, because the noise from an individual train passby is quite distinguishable from the existing background noise" L maxshould be reported in environmental documents."

G-1 Were maximum noise levels calculated? If not, why not?

H) How noisy would the proposed transit system be to residents with open windows and doors if there was no motor vehicle traffic noise? Using outdoors-to-indoors noise reductions of 10 dBA, the transit "Noise Exposure" levels shown in Figures 4-39 to 4-42 indicate that 91% of all 42 residential locations measured would be in excess of HUD guidelines and 29% would be in excess of FHWA guidelines. Over the next decade or so, the makeup of motor vehicular traffic may be radically modified e.g. there may be all electric vehicles such that engine noise would be substantially reduced. Also it is possible that tire/road interfacing noise may be reduced by new breakthroughs in tire tread design and road pavement design as well as enforcing vehicle speed limits by high-tech devices.

H-1 Were these possibilities considered?

I) Reference 3, Chapter 3, Table 3.3 notes that the "Allowed Noise Exposure Increases" decrease as the cumulative noise level increases. "The justification for this is that people already exposed to high levels of noise should be expected to tolerate only a small increase in the amount of noise in their community."

The "Existing Ldn" traffic noise levels shown in Figures 4-39 to 4-42 indicate that about three-fourths (75%) of all 42 residential locations with closed windows are in excess of HUD and FHWA guidelines and that all (100%) of housing with open fenestration are in excess of HUD

guidelines and 79% are in excess of FHWA guidelines.

Thus most residents along the proposed guideway are already exposed to high levels of traffic noise, it is predictable that some residents may complain about the additional noise from the transit and take legal action, particularly since the new noise will be quite distinguishable from the existing background noise.

Note that in some cases the transit noise may dominate over regular traffic during peak rush hours when traffic slows down to stop-and-go levels (Levels of Service D through F) as well as after, say 10 pm, causing residents to positively identify transit noises and to be more conscious and irritative of them during times of high cumulative noise levels.

I-1 Because building noise reduction is so low in so many residential units and people may be already irritated by high traffic noise levels, does it not behoove the project to incorporate all stated noise mitigation measures shown in reference 3, Table 6-12 in order to improve the lifestyle of impacted residents as well to reduce the probability of class action law suits?

Kaneohe, Hawaii 96744

Dear Mr. Darby:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Response to A-1: Noise reduction measures of wheel skirts, sound absorptive material and short noise barriers (parapet walls) were added to the Project. These measures successfully mitigate noise impacts. FTA noise impact criteria were used for both analyses.

Response to B-1: Wheel skirts, sound absorptive material and short noise barriers (parapet walls) were included in the Project design, resulting in a substantial reduction in noise.

Response to comment starting "According to the Executive Summary in the Draft EIS ...": The above quotation regarding mitigation measures is a footnote from Table 6-12 in the FTA Manual that specifically refers to wheel and track maintenance activities and is not relevant to the use of wheel skirts or parapet walls.

Response to B-2: No, slowing down the trains was not a mitigation measure used to reduce noise impact in sensitive areas.

Response to B-3: Parapet walls, wheel skirts, and sound absorptive material are included in the Project cost estimate presented in Section 6 of the Final EIS.

Response to B-4: The Project will include a maintenance program, the cost of which is covered in the operating and maintenance cost estimates. Maintenance includes all elements of the Project, including the parapet walls and noise mitigation elements. Penalties for non-compliance of maintenance activities are outside of the scope of this Project.

Response to C and C-1: The need for this additional acoustical treatment was preliminarily evaluated in the Draft EIS. The Final EIS includes the results of the analysis at high-rise locations, where this treatment is applicable.

Response to D and D-1: This is a Rail Transit project, not a "highway/transit project" as presented in Section 3.3 of the FTA Guidance Manual.

Response to E-1: It is unclear to what "data" the commenter is referring in question E-1. Following FTA Guidelines, the environmental team did not analyze indoor noise levels.

Response to E-2: Consideration of the quality of building features would only be necessary if the features were of obvious substandard condition or quality and were unlikely to provide standard acoustical performance when closed. This is not the condition in the project area.

Response to E-3: The FTA noise analysis bases the impact analysis on the change in exterior noise level caused by the Project. Therefore, the interior noise levels were not analyzed.

Response to E-4: As the Project will not cause any severe adverse noise impacts, air conditioning equipment will not be necessary or installed.

Response to F: This is an FTA project, not an FHWA highway project; thus, FTA impact evaluation methodology and criteria apply. The criteria of other agencies, such as the Federal Aviation Administration (FAA) and the Environmental Protection Agency (EPA), apply to undertakings of those agencies.

Response to F-1: FTA criteria apply to outdoor human use areas; therefore, indoor noise levels were not addressed.

Response to G-1: According to the FTA Manual (p. 2-25, Section 2.5.7), "The Lmax descriptor is not recommended for transit noise impact assessment...". Separately described maximum noise levels are not necessary to the calculation of the Day Night Average Sound Level (Ldn) which is the prescribed metric (sound descriptor) to be used in an FTA noise impact analysis for residential uses or the Equivalent Sound Level (Leq) that is used for sensitive uses

Mr. Ronald Darby
Page 3

without a "sleeping" component. The maximum sound level is included in the Sound Exposure Level descriptor of rail transit noise that was used to calculate future project operational Ldn and Leq noise levels. The information provided in Appendices E and F of the FTA Guidelines may be used to calculate the Lmax if desired.

Responses to H and H-1: The same decibel level would be with motor vehicle noise present. The Project noise exposure values presented in the Final EIS include only project-generated noise. The Project is an FTA project; therefore, FTA criteria are applicable. Future noise reduction measures are speculative, and are not considered.

Response to Section I: Comment noted.

Response to I-1: All appropriate, feasible, and reasonable noise mitigation measures were discussed in the Draft EIS. As previously noted, areas experiencing noise impacts have received additional mitigation analysis in the Final EIS and additional mitigation has been committed where it is feasible and reasonable to do so.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

A. Additional information and comments related to determining noise impact in my first submittal, reference 1.

Reference 2 states "*For residential land use, the noise criteria are to be applied outside the building locations at noise-sensitive areas with frequent human use including outdoor patios, decks, pools, and play areas. If none, the criteria should be applied near building doors and windows. However, for locations where land use activity is solely indoors, noise impact may be less significant if the outdoor-to-indoor reduction is greater than for typical buildings (about 25 dB with windows closed). Thus, if the project sponsor can demonstrate indoor activity only, mitigation may not be needed*".

However, in Hawaii many residential buildings were built for natural ventilation only, often using operable glass jalousies and open sliding glass doors to enjoy our tradewinds. Table 7: "Building Noise Reduction Factors" of reference 3 shows the outdoor-to-indoor noise reduction of open windows to be 10 dBA and includes: "NOTE: The windows shall be considered open unless there is firm knowledge that the windows are in fact kept closed almost every day of the year."

Even when a window air-conditioner is used with the jalousies closed, the outdoor-to-indoor noise reduction is less than 20 dBA depending largely on the degree of air-tightness that can be achieved.

In order to illustrate the impact of traffic and transit noise on the interior of Hawaiian homes along busy roadways that may have transit guideways, I have modified Figure 3-1 from reference 2. See attachment. It contains the standard plot for measured noise levels obtained at exterior locations near buildings as well as interior noise levels assuming an outdoor-to-indoor noise reduction of 20 dBA for random buildings as circles and the same buildings as asterisks if the noise reduction was only 10 dBA, e.g. open windows.

It can readily be seen that many of the buildings cited in Appendix A of reference 4 that are now considered "No Impact" or "Moderate Impact" should be "Moderate Impact" or "Severe Impact" if open windows are acknowledged.

The DEIS should refine the concept of the modified Figure 3-1 or create some other means to account for the diversity of fenestration found in Hawaiian buildings and factor it into the "Projected Project Noise Exposure Levels" in Appendix A in reference 4.

Dear Mr. Darby:

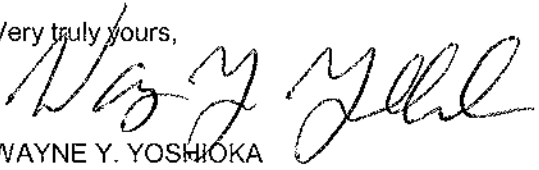

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

The noise analysis conducted for the EIS follows Federal criteria. Please refer to the Noise Technical Report available on the project website (www.honolulutransit.org) for more information on the methodology of the noise analysis. It is outside the scope of this Project to redefine Federal guidelines.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Submission Content/Notes : I am a retired State worker who is a supporter of rail. When I worked I heard a lot of comments from mothers of young children who said that they didn't ride the bus because they needed their cars in case their children got sick unexpectedly and they needed to get to them quickly. I recently returned from a trip to Washington, D.C. and rode their great Metro system. In their Metro brochure on fares and passes I noticed a "Guaranteed Ride Home" phone number where people can register in advance for a ride home in case of an unexpected personal emergency or unscheduled overtime. Has anything like this been discussed in the planning of the rail system for Honolulu?

Dear Ms. Davis:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

"Guaranteed Ride Home" can be a beneficial program for companies to offer their employees. One of the benefits of the fixed guideway system is that in many cases, parents may be able to travel to their children's school or daycare more quickly on the rail than by road. However, Guaranteed Ride Home would not be a service provided by the transit agency but may be offered by private employers.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Submission Content/Notes : Comments re: Draft EIS Honolulu High Capacity Corridor Project

Flawed selection and alternative process: Public not consulted in the development of route alternatives or type of plan. Toll lanes could accommodate bus, taxi, tour bus, handicap vans, emergency vehicles, and enforcement, and be utilized 24 hours a day instead of mostly peak hours. The toll alternative would be viable only if multipurpose and flowed to university, and Waikiki, and tie into the windward, and eastward traffic. Alternatives to split ewa and central traffic flows, and to facilitate Pali, Like Like, and H1 east have not developed or pursued.

Existing and future transit populations neglected. The Dillingham and Kakaako route flow through low population light industrial in Kalihi, and future middle to high income residential in the urban core kakaako. A Waipahu, pearl city, pearl ridge, Salt lake boulevard, king street, olomea, vineyard, punchbowl, king, to university route, with spurs to the airport, Waikiki by university avenue or kalakaua with connection to Ala moana and the convention center would serve the highest existing and future low and moderate income residential, and tourist populations. A king vineyard route, weather multipurpose or single use, ties in fluidly with windward and eastward traffic, reaches the legislature, city council, courts, state and county services, provides healthcare alternatives at Straub, Kuakini, Queens, and Kaiser hospitals, offers greater access to university and college resources, access to entertainment venues like blaisdell has the most development potential along streets with ample room for additional private and public transportation, possesses existing excess capacity and right of ways, is the most direct route, and would bring tourist directly to the capital, historic, and arts district.

Rail oriented cities developed around historic freight and passenger rail with links to intercity and interstate rail lines. A king street orientation could be an inner city backbone and effectively facilitate inner city passengers within and to the urban core. Intercity extensions to central or ewa and leeward could be secondary. The most congested area is from Pearl City to University, the primary urban core. Park and ride at Pearl city juncture could aid feeder buses to a multi purpose toll, bus, or rail.

Major populations excluded. No plan considers the future and existing population in Central Oahu (planned for thousands of residences), or the isolated low to moderate income public transit intensive Leeward coast. The Kapolei portion is inferior to a King, university route where multifamily low to middle income populations already reside and are bordered by high density underutilized residential and mixed use zoned real estate. Future middle to high income single family suburban communities in Central and Ewa plains will be two to three car households as they mature, and are not typical public transit intensive communities. Windward, and eastward traffic is completely ignored. Kapolei route may provide developers the infrastructure for rapid urbanization of the ewa plain.

Full utilization of rail capacity will not likely be achieved with projected population of 1.13 million by 2035, a maximum honolulu population of

1.5m or 2m at most, and projected populations far below comparable rail oriented cities. Riders will at first be intercity displaced bus riders, with the remaining rider predictions questionable. Inner city transport will not be served by the current choice. The cost of an additional transit authority has not been determined. The city is unable to maintain its existing infrastructure. Higher subsidies and fees for the bus and the rail seem likely. A multipurpose elevated toll, bus, or rail could generate additional revenue and provide flexibility.

Lack of coordination between city and state to resolve congestion. insufficient plan to accommodate existing automobiles and additional 100,000 or more cars by 2035, and county failure to utilize existing capacity and to complete arterial lane improvements, are the most pressing quality of life and productivity issues facing the island of oahu.

Federal funds should be devoted to the highest volume transit projects, and possibly ones that have sought and obtained private investors. Projects that accelerate urban sprawl and exacerbate traffic congestion need to be discouraged. Intercity routes to outlying, isolated, existing populations, inner city backbones, or connecting intercity lines ought to be considered separately, with inner city lines as a priority.

Mr. Albert Del Rio
1245 Maunakea Street, #212
Honolulu, Hawaii 96817

Dear Mr. Del Rio:

**Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement**

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal:

The overall public information program has been continuous since the beginning of the Project in 2005. The Alternatives Analysis phase evaluated a range of transit mode and general alignment alternatives in terms of their costs, benefits, and impacts. During the fall of 2005 and winter of 2006, the City and County of Honolulu completed the alternatives screening process that is documented in the Honolulu High-Capacity Transit Corridor Project Alternatives Screening Memorandum (DTS 2006a). Scoping meetings were held and included a presentation of alternatives to the public and interested agencies and officials in which they could provide comments on the Purpose and Need, alternatives, and scope of the Alternatives Analysis. Refinements were made to the alternatives based on this input. In total, 75 fixed guideway alignment options were screened.

Scoping for the NEPA process confirmed that there were no alternatives that had not been previously studied and eliminated for good cause that would satisfy the Purpose and Need at less cost, with greater effectiveness, or less environmental or community impact.

The City also held five public hearings in December 2008 throughout the study corridor. Both City and consultant employees were available to answer questions. Attendees were given the opportunity to make official comments on the Project by providing testimony to the Public Hearing Officer (which was recorded by a court reporter), giving a private statement to a court reporter, or submitting their comments in writing. More information concerning the public hearing process can be found in Chapter 8 of the Final EIS.

In "Chapter 2 – Alternatives Considered" of the Alternative Analysis Report, November 2007, as well as in Chapter 2, Alternatives Considered, of the Final EIS, two options were considered for the Managed Lane Alternative—Two-direction and Reversible. This alternative would have provided a two-lane elevated toll facility between Waipahu and Downtown Honolulu, with variable pricing strategies to maintain free-flow speeds for transit and high-occupancy vehicles (HOVs)." The Two-direction Option would have served express buses operating in both directions during the entire day. To maintain free-flow speeds in the Two-direction Option, it may have been necessary to charge tolls to manage the number of HOVs using the facility. For the Reversible Option, three-person HOVs would have been allowed to use the facility for free, while single-occupant and two-person HOVs would have had to pay a toll. The Reversible Option was found to be optimal.

The findings are summarized in Chapter 2 of the Final EIS as follows: The Managed Lane Alternative was evaluated for its ability to meet project goals and objectives related to mobility and accessibility, supporting planned growth and economic development, constructability and cost, community and environmental quality, and planning consistency. While this alternative would have reduced congestion on parallel highways, system-wide traffic congestion would have been similar to the No Build Alternative as a result of increased traffic on arterials trying to access the facility. Total islandwide vehicle hours of delay would have increased with the Managed Lane Alternative compared to the No Build Alternative, indicating an increase in systemwide congestion (Table 2-1, Final EIS).

The Managed Lane Alternative would not have supported planned concentrated future population and employment growth because it would not have provided concentrations of transit service that would have served as a nucleus for transit-oriented development. The Managed Lane Alternative would have provided little transit benefit at a high cost. The cost-per-hour of transit-user benefits for the Managed Lane Alternative would have been two to three times higher than that for the Fixed Guideway Alternative. Similar to the TSM Alternative, the Managed Lane Alternative would not have had substantially improved service or access to transit for transit-dependent communities. No funding sources were identified for the Managed Lane Alternative. Toll revenues from the Managed Lanes Alternative would have paid for ongoing operations and maintenance while remaining revenues would have been used to repay debt incurred to construct the system.

The Managed Lane Alternative would have generated the greatest amount of air pollution, required the greatest amount of energy for transportation use, and would have resulted in the largest number of transportation noise impacts of all the alternatives evaluated. Because the Managed Lane Alternative would have served a shorter portion of the study corridor, it would have resulted in fewer displacements and would have impacted fewer archaeological, cultural, and historic resources than the Fixed Guideway Alternative. The Managed Lane Alternative would not have affected any farmlands. Visually, the elevated structure would have extended a

shorter distance, but it would have been more visually intrusive because its elevated structure, with a typical width of between 36 and 46 feet, would have been much wider than the Fixed Guideway Alternative.

After the Alternatives Analysis was completed, several scoping comments were received requesting reconsideration of the Managed Lane Alternative that was considered and rejected during the Alternatives Analysis. Because no new information was provided that would have changed the findings of the Alternatives Analysis regarding the Managed Lane Alternative, it was not included in the Draft EIS for further consideration.

Various highway improvements have been considered for Oahu. The State of Hawaii Department of Transportation, which is responsible for the freeway system, has evaluated needs for the freeway system and identified the highway projects that would be most efficient at reducing congestion on Oahu. The projects are listed in Table 2-4 of this Final EIS and included in the analysis for all project alternatives. Broad island-wide transportation approaches were reviewed by the OahuMPO during the development of the 2030 Oahu Regional Transportation Plan (ORTP). The selection of a fixed guideway transit system began with that planning process.

Existing and future transit populations are not neglected. As stated in Section 1.2 of the Final EIS, 63 percent of Oahu's population and 80 percent of employment are located within the study corridor. By 2030, these distributions will increase to 69 percent and 83 percent, respectively.

Ridership projections for the forecast year of 2030 have been developed using the travel demand model used by the Oahu Metropolitan Planning Organization (OahuMPO), which was calibrated and validated to current year conditions. The OahuMPO model is based on "best practices" for urban travel models in the U.S. and consistent with guidance from the FTA. The model is updated approximately every five years to reflect changes in land use, socio-economic conditions, and transportation network improvements. The model is approved by the OahuMPO Technical Advisory Committee. The model is based upon a set of realistic input assumptions regarding land use and demographic changes between now and 2030 and expected transportation levels-of-service on both the highway and public transit system. Based upon the model and these key input assumptions, approximately 116,000 trips per day are expected to use the rapid transit system on an average weekday in 2030. Since the Draft EIS was published, the travel demand model has been refined by adding an updated air passenger model, defining more realistic drive access modes to project stations and recognizing a more robust off-peak non-home-based direct-demand element based on travel surveys in Honolulu.

Figures 3-9 and 3-10 in the Final EIS present revised ridership numbers for each fixed guideway station. As shown in Figure 3-9, between 650 and 820 passengers will exit the fixed guideway system at each station between Kalihi and Iwilei during the a.m. two-hour peak period. In addition, 840 passengers will exit the system at Kakaako during the a.m. two-hour peak period.

Similar alignments following North and South King Streets were evaluated in the Alternatives Analysis and would have resulted in less transit use than the Project. While an alignment on South King Street would have served some areas beyond walking distance to project stations, it would not have served several areas of dense development, including Chinatown, Downtown, Kakaako, and Ala Moana Center, and would have resulted in fewer

overall transit-user benefits. The South King Street alignment had low ridership and served the fewest number of residences and employment areas of all the alignments studied in the downtown area. In addition, it would not have offered good connections for a future extension to Waikiki. The North King Street alignment was rejected because it impacted a greater number of historical properties and cultural practices, had higher capital costs, had greater noise impacts than the Dillingham Boulevard alignment, and was inefficient to connect to the Airport or Nimitz Highway near Chinatown. Vineyard Boulevard was ruled out during the screening process because it was located farther from commercial and employment areas.

As noted in Section 2.5.6 of the Final EIS, bus service will be enhanced and the bus network will be modified to coordinate with the fixed guideway system. Some existing bus routes would be altered or eliminated to reduce duplication of services provided by the fixed guideway system. Buses removed from service in the study corridor would be shifted to service in other parts of the island. Future bus routes and frequencies are shown in Appendix D in the Final EIS.

As stated in Chapter 2 of the Final EIS, a park-and-ride facility will be located at Pearl Highlands Station near where the H-1/H-2 Freeways merge. In addition, Central Oahu will be served by enhanced bus service connecting to the fixed guideway at Pearl Highlands. As stated in Chapter 3 of the Final EIS, system improvements, including traffic signal priority, automated vehicle identification, and off-vehicle fare collection, could complement frequent bus service at the East Kapolei, Pearl Highlands, and Ala Moana Center Stations. These bus improvements will reduce travel time and improve intermodal transfers. Bus and fixed guideway departures and arrivals will be coordinated and predictable to minimize transfer time and total trip time.

In addition, Table 3-14 in the Final EIS shows an 18-percent decrease in vehicle hours of delay islandwide with the project versus without. Figure 3-8 shows that there will be transit user-benefits islandwide because of the Project, while Figure 3-5 shows benefits for transit-dependent households. Accordingly, Central Oahu and Leeward residents will experience benefits with the fixed guideway alignment from East Kapolei to Ala Moana Center via the Airport.

The effectiveness of rail transit is more closely linked to the population density of an area served than to the total population of an area. As described in Chapter 1 of the Final EIS, the majority of the population on Oahu is located in a narrow corridor, which makes it ideal to support rail transit.

Forecasts indicate that riders who are predicted to use the train are those who will find it is more beneficial than another transportation alternative. Some fixed guideway riders are those that currently use TheBus or other modes. Forecasts indicate that more than 40,000 vehicles will be removed from roadways as a result of the Project. Most guideway systems are attractive to automobile users because of the time benefit and the lower stress levels during the ride.

The funding of operating and maintenance costs is described in Chapter 6 of the Final EIS. The City Council's current policy is that between 27 percent and 33 percent of operating costs of the transit system (TheBus, TheHandi-Van, the fixed guideway, etc.) must be recovered from fares collected. Unless that policy is changed, the subsidy will be about 70 percent of the operating cost. In 2030, the operating cost of the fixed guideway will be about \$77 million each year in 2009 dollars (compared to \$222 million for TheBus and TheHandi-Van). After applying farebox revenues, the operating cost of the fixed guideway will be about \$54 million each year and will be allocated from the City's annual budget as is currently done for all transit services.

Mr. Albert Del Rio
Page 5

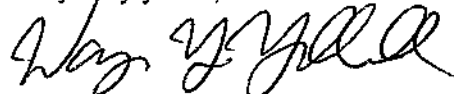

The OahuMPO is responsible for coordinating transportation planning on Oahu. The OahuMPO is comprised of City and State officials. The ORTP is a long-term vision document that outlines transportation goals, objectives, and policies for Oahu. The ORTP guides future development of the major surface transportation facilities and programs. The ORTP contains roadway improvements planned for the island. These improvements were included in the travel forecasting conducted for the Project. A list of projects is shown in Table 2-3 of the Final EIS. The ORTP includes City and State projects.

The Project addressed in the Draft and Final EISs is the best option among those studied in the Alternatives Analysis and approved by the City Council in 2006.

Lastly, the Project is focused exclusively on construction and implementation of rail transit service, which is evaluated in the EIS. As mentioned in Section 4.19.2 of the Final EIS, transit-oriented development (TOD) is expected to occur in project station areas as an indirect effect of the Project. This will change the trend toward urban sprawl and is made possible largely by the fixed guideway's influence on the patterns of growth around stations and along the route. Planning and zoning around station areas will be conducted and established by the City's Department of Planning and Permitting in compliance with the City's new TOD ordinance (09-004).

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Issuance of the Record of Decision under NEPA and acceptance of the Final EIS by the Governor of the State of Hawaii are the next anticipated actions and will conclude the environmental review process for this Project.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Enclosure

Full utilization of rail capacity will not likely be achieved with projected population of 1.13 million by 2035, a maximum honolulu population of 1.5m or 2m at most, and projected populations far below comparable rail oriented cities. Riders will at first be intercity displaced bus riders, with the remaining rider predictions questionable. Inner city transport will not be served by the current choice. The cost of an additional transit authority has not been determined. The city is unable to maintain its existing infrastructure. Higher subsidies and fees for the bus and the rail seem likely. A multipurpose elevated toll, bus, or rail could generate additional revenue and provide flexibility.

Lack of coordination between city and state to resolve congestion.
insufficient plan to accommodate existing automobiles and additional 100,000 or more cars

by 2035, and county failure to utilize existing capacity and to complete arterial lane improvements, are the most pressing quality of life and productivity issues facing the island of oahu.

Federal funds should be devoted to the highest volume transit projects, and possibly ones that have sought and obtained private investors. Projects that accelerate urban sprawl and exacerbate traffic congestion need to be discouraged. Intercity routes to outlying, isolated, existing populations, inner city backbones, or connecting intercity lines ought to be considered separately, with inner city lines as a priority.

Dear Mr. Del Rio:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The overall public information program has been continuous since the beginning of the Project in 2005. Chapter 2 of the Final EIS summarizes the alternatives screening and selection process. Beginning in the fall of 2005, an initial screening process considered alternatives identified through previous transit studies, a field review of the study corridor, an analysis of current population and employment data for the study corridor, a literature review of technology modes, ongoing work completed as part of the Oahu Regional Transportation Plan 2030 (ORTP) prepared by the Oahu Metropolitan Planning Organization (OahuMPO) (OahuMPO 2007), and public and agency comments received during the formal Alternatives Analysis scoping process.

The screening process is documented in the Honolulu High-Capacity Transit Corridor Project Alternatives Screening Memorandum (DTS 2006a). Three scoping meetings were held during the screening process in December 2005, which included a presentation of initial alternatives to the public, interested agencies, and officials to receive comments on the Purpose

and Need, alternatives, and scope of the Alternatives Analysis. Refinements were made to the alternatives based on the public input during scoping.

After completion of screening in the winter of 2006, the following alternatives were studied in the Alternatives Analysis: No Build Alternative, Transportation System Management (TSM) Alternative, Managed Lane Alternative, and the Fixed Guideway Alternative. After review of the Alternatives Analysis Report and consideration of public comments, the City Council identified a fixed guideway transit system extending from Kapolei to UH Manoa with a connection to Waikiki as the Locally Preferred Alternative. This identification, which eliminated the TSM and Managed Lane Alternatives from further consideration, became Ordinance 07-001 on January 6, 2007. The NEPA process considered a range of alternatives that was consistent with the identified Locally Preferred Alternative. As discussed in Section 2.2, there were no alternatives that had not been previously studied and eliminated for good cause that would satisfy the Purpose and Need at less cost, with greater effectiveness, or less environmental or community impact.

The City held five public hearings in December 2008 throughout the study corridor. Both City employees and project consultants were available to answer questions about the Project. Attendees were given the opportunity to make official comments on the Project by providing testimony to the Public Hearing Officer (which was recorded by a court reporter), giving a private statement to a court reporter, or submitting their comments in writing. More information concerning the public hearing process can be found in Chapter 8 of the Final EIS.

In Chapter 2 – Alternatives Considered of the Alternative Analysis Report, November 2007, as well as in Chapter 2 – Alternatives Considered of the Final EIS, two options were considered for the Managed Lane Alternative—Two-direction and Reversible. This alternative would have provided a two-lane elevated toll facility between Waipahu and Downtown Honolulu, with variable pricing strategies to maintain free-flow speeds for transit and high-occupancy vehicles (HOVs). The Two-direction Option would have served express buses operating in both directions during the entire day. To maintain free-flow speeds in the Two-direction Option, it may have been necessary to charge tolls to manage the number of HOVs using the facility. For the Reversible Option, three-person HOVs would have been allowed to use the facility for free, while single-occupant and two-person HOVs would have had to pay a toll. The Reversible Option was found to be optimal.

The findings are summarized in Chapter 2 of the Final EIS as follows: The Managed Lane Alternative was evaluated for its ability to meet project goals and objectives related to mobility and accessibility, supporting planned growth and economic development, constructability and cost, community and environmental quality, and planning consistency. While this alternative would have reduced congestion on parallel highways, system-wide traffic congestion would have been similar to the No Build Alternative as a result of increased traffic on arterials trying to access the facility. Total islandwide vehicle hours of delay would have increased with the Managed Lane Alternative compared to the No Build Alternative, indicating an increase in system-wide congestion (Table 2-1, Final EIS).

The Managed Lane Alternative would not have supported planned concentrated future population and employment growth because it would not have provided concentrations of transit service that would have served as a nucleus for transit-oriented development. The Managed Lane Alternative would have provided little transit benefit at a high cost. The cost-per-hour of transit-user benefits for the Managed Lane Alternative would have been two to three times higher than that for the Fixed Guideway Alternative. Similar to the Transportation System Management (TSM) Alternative, the Managed Lane Alternative would not have had substantially improved service or access to transit for transit-dependent communities. No funding sources were identified for the Managed Lane Alternative. Toll revenues from the Managed Lanes Alternative would have paid for ongoing operations and maintenance while remaining revenues would have been used to repay debt incurred to construct the system.

The Managed Lane Alternative would have generated the greatest amount of air pollution, required the greatest amount of energy for transportation use, and would have resulted in the largest number of transportation noise impacts of all the alternatives evaluated. On the other hand, because the Managed Lane Alternative would have served a shorter portion of the study corridor, it would have resulted in fewer displacements and would have impacted fewer archaeological, cultural, and historic resources than the Fixed Guideway Alternative. The Managed Lane Alternative would not have affected any farmlands. Visually, the elevated structure would have extended a shorter distance, but it would have been more visually intrusive because its elevated structure, with a typical width of between 36 and 46 feet, would have been much wider than the Fixed Guideway Alternative.

After the Alternatives Analysis phase was completed, several scoping comments were received requesting reconsideration of the Managed Lane Alternative that was considered and rejected during the Alternatives Analysis process. However, because no new information was provided that would have changed the findings of the Alternatives Analysis regarding the Managed Lane Alternative, it was not included in the Draft EIS for further consideration.

Various highway improvements have been considered for Oahu. The State of Hawaii Department of Transportation, which is responsible for the freeway system, has evaluated needs for the freeway system and identified the highway projects that would be most efficient at reducing congestion on Oahu. The projects are listed in Table 2-3 of the EIS and included in the analysis for all project alternatives. Broad islandwide transportation approaches were reviewed by the OahuMPO during the development of the 2030 Oahu Regional Transportation Plan (ORTP). The selection of a fixed guideway transit system began with that planning process.

Existing and future transit populations are not neglected. As stated in Section 1.2 of the Final EIS, 63 percent of Oahu's population and 80 percent of employment are located within the study corridor. By 2030, these distributions will increase to 69 percent and 83 percent, respectively.

Ridership projections for the forecast year of 2030 have been developed using the travel demand model used by the Oahu Metropolitan Planning Organization (OahuMPO), which was calibrated against collected traffic and transit ridership information and then validated against recent counts to be sure it properly represents travel activity in the transportation system (Section 3.2.1 of the Final EIS). An on-board transit survey was completed in December 2005 and January 2006, and the latest socioeconomic information available as of October 2008 was incorporated. Traffic counts were collected in 2005, 2007, and 2008. The OahuMPO model is based on "best practices" for urban travel models in the U.S. and consistent with consultation with the FTA. The model is updated approximately every five years to reflect changes in land use, socioeconomic conditions and transportation network improvements. The model is approved by the OahuMPO Technical Advisory Committee. The model is based upon a set of realistic input assumptions regarding land use and demographic changes between now and 2030 and expected transportation levels-of-service on both the highway and public transit system. Based upon the model and these key input assumptions, approximately 116,000 trips per day are expected to use the rapid transit system on an average weekday in 2030. Since the Draft EIS was published, the travel demand model has been refined by adding an updated air passenger model (which forecasts travel in the corridor related to passengers arriving or departing at Honolulu International Airport), defining more realistic drive access modes (driving alone or car pooling) to project stations and recognizing a more robust off-peak non-home-based direct demand element (trips that do not originate at home) based on travel surveys in Honolulu.

Figures 3-9 and 3-10 in the Final EIS present revised ridership numbers for each fixed guideway station. As shown in Figure 3-9, between 650 and 820 passengers will exit the fixed guideway system at

each station between Kalihi and Iwilei during the a.m. two-hour peak period. In addition, 840 passengers will exit the system at Kakaako during the a.m. two-hour peak period.

Similar alignments following North and South King Streets were evaluated in the Alternatives Analysis phase and would have resulted in less transit use than the Project. While an alignment on South King Street would have served some areas beyond walking distance to project stations, it would not have served several areas of dense development including Chinatown, Downtown, Kakaako, and Ala Moana Center and would have resulted in fewer overall transit-user benefits. The South King Street alignment had low ridership potential and served the fewest number of residences and employment areas of all the alignments studied in the downtown area. In addition, it would not have offered good connections for a future extension to Waikiki. The North King Street alignment was rejected because it impacted a greater number of historical properties and cultural practices, had higher capital costs, greater noise impacts than Dillingham Boulevard, and was inefficient to connect to the Airport or Nimitz Highway near Chinatown. Vineyard Boulevard was ruled out during the screening process because it was located farther from commercial and employment areas.

As noted in Section 2.5.6 of the Final EIS, bus service will be enhanced and the bus network will be modified to coordinate with the fixed guideway system. Some existing bus routes would be altered or eliminated to reduce duplication of services provided by the fixed guideway system. Buses removed from service in the study corridor would be shifted to service in other parts of the island. Future bus routes and frequencies are shown in Appendix D in the Final EIS.

As stated in Chapter 2 of the Final EIS, a park-and-ride facility will be located at Pearl Highlands Station near where the H-1/H-2 Freeways merge. In addition, Central Oahu will be served by enhanced bus service connecting to the fixed guideway at Pearl Highlands. As stated in Chapter 3 of the Final EIS, system improvements, including traffic signal priority, automated vehicle identification, and off-vehicle fare collection, could complement frequent bus service at the East Kapolei, Pearl Highlands, and Ala Moana Center Stations. These bus improvements will reduce travel time and improve intermodal transfers. Bus and fixed guideway departures and arrivals will be coordinated and predictable to minimize transfer time and total trip time.

In addition, Table 3-14 in the Final EIS shows an 18-percent decrease in vehicle hours of delay islandwide with the project versus without. Figure 3-8 shows that there will be transit user-benefits islandwide as a result of the Project, while Figure 3-5 shows benefits for transit-dependent households. Accordingly, Central Oahu and Leeward residents will experience benefits with the fixed guideway alignment from East Kapolei to Ala Moana Center via the Airport.

The effectiveness of rail transit is more closely linked to the population density of an area served than to the total population of an area. As described in Chapter 1 of the Final EIS, the majority of the population on Oahu is located in a narrow corridor, which makes it ideal to support rail transit.

Forecasts indicate that riders who are predicted to use the train are those who will find that it is more beneficial than another transportation alternative. Some fixed guideway riders are those that currently use TheBus or other modes. Forecasts indicate that approximately 40,000 vehicles will be removed from roadways as a result of the Project. Most guideway systems are attractive to automobile users because of the time benefit and the lower stress levels during the ride.

The funding of operating and maintenance costs is described in Chapter 6 of the Final EIS. The City Council's current policy is that between 27 percent and 33 percent of operating costs of the transit system (TheBus, TheHandi-Van, the fixed guideway, etc.) must be recovered from fares collected. Unless that policy is changed, the subsidy will be about 70 percent of the operating cost. In 2030, the

Mr. Albert Del Rio
Page 5

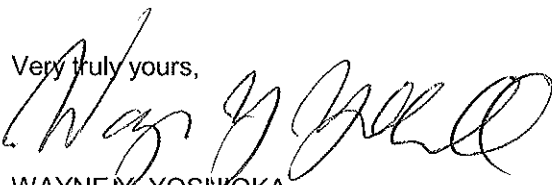

operating cost of the fixed guideway will be about \$77 million each year in 2009 dollars (compared to \$222 million for TheBus and TheHandi-Van). After applying farebox revenues, the operating cost of the fixed guideway will be about \$54 million each year and will be allocated from the City's annual budget as is currently done for all transit services.

The OahuMPO is responsible for coordinating transportation planning on Oahu and is comprised of City and State officials. The ORTP is a long-term vision document that outlines transportation goals, objectives, and policies for Oahu. The ORTP guides future development of the major surface transportation facilities and programs. The ORTP contains roadway improvements planned for the island. These improvements were included in the travel forecasting conducted for the Project. A list of projects is shown in Table 2-3 of the Final EIS. The ORTP includes City and State projects.

The Project addressed in the Draft and Final EISs is the best option among those studied in the Alternatives Analysis phase and approved by the City Council in 2006.

Lastly, the Project is focused exclusively on the construction and implementation of rail transit service, which is evaluated in the EIS. As mentioned in Section 4.19.2 of the Final EIS, transit oriented development (TOD) is expected to occur in project station areas as an indirect effect of the Project. This will change the trend toward urban sprawl and is made possible largely by the fixed guideway's influence on the patterns of growth around the stations and along the route. Planning and zoning around station areas will be conducted and established by the City's Department of Planning and Permitting in compliance with the City's new TOD ordinance (09-004).

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Submission Date : 02/03/2009

Submission Content/Notes : Fine, build the rail between Farrington highway and Ala Moana center. Now compare the population density between Farrington highway and Kapolei and between Ala Moana center and Hawaii Kai. Then think about it and stop messing around. You are a tool of the developers and polocation. The problem is that these developers will be living for half as long as the people building and using this. Put in on the ground & built it where the people are!!!

The EIS system is inherently flawed.

First, how can you have a discussion with someone when they say something then you respond (like I am doing right now) then they say they took your response into consideration. That is it. That is all you have to do. Now consider how easy that would be if individuals (PB) did not want to present an objective EIS. Is that what the person reading this is supposed to be? Think objectively? Is that what DOT hired you to be? I think not. The process does not evaluate the impact.

Secondly, under no measure can you say that you even attempted to address cumulative impacts. It is so bias and subjective that 1+1+1 is not even remotely an appropriate to think about it. Perhaps, if you should start with the premise that it is small remote island in the middle of the biggest ocean in the world, then you'll realize the cumulative impact is enormous. Do you consider where the materials are manufactured? The safety standards in those countries? Are those people making a living wage? Where the fossii fuel comes from to manufacture the raw materials and power the rail? Finally, does is enhance O'ahu's NATURAL environment? . Maybe some of these basic ideas will help your 'cumulative' analysis. When all is done, the rail may be a good thing, but the EIS is a political tool. In the end I hope you the best, but for now it is a sad, mudane example of environmental assessment for the next generation.

Dear Mr. Dicken:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As described in Chapter 1 of the Final EIS, one purpose of the Project is to improve access to planned development to support City policy to develop a second urban center. The corridor from Kapolei to UH Manoa (the study corridor) is well suited for the fixed guideway project. In 2000, 63 percent of Oahu's population of 876,200 and 80 percent of its 501,100 jobs were located within the study corridor. By 2030, these distributions will increase to 69 percent of the population and 83 percent of the employment as development continues to be concentrated into the Primary Urban Corridor and Ewa Development Plan areas. As stated in Section 1.3.1 of the Final EIS, 2,036,000, or 73 percent, of the approximately 2,790,000 islandwide daily trips, and 350,000, or 64 percent, of the 544,000 a.m. peak-period work-related trips are currently generated within the study corridor. The study corridor attracts an even higher percentage of islandwide work-related trips with 446,000, or 82 percent, of a.m. peak-period work-related trips having destinations within the study corridor.

The Alternatives Screening Memorandum (DTS 2006a) recognized the visually sensitive areas in Kakaako and Downtown Honolulu, including the Chinatown, Hawaii Capital, and Thomas Square/Academy of Arts Special Design Districts. To minimize impacts on historic resources, visual aesthetics, and surface traffic, the screening process considered 15 combinations of tunnel, at-grade, or elevated alignments between Iwilei and Ward Avenue. Five different alignments through Downtown Honolulu were advanced for further analysis in the Alternatives Analysis, including an at-grade portion along Hotel Street, a tunnel under King Street, and elevated guideways along Nimitz Highway and Queen Street.

The Alternatives Analysis Report (DTS 2006b) evaluated the alignment alternatives based on transportation and overall benefits, environmental and social impacts, and cost considerations. The report found that an at-grade alignment along Hotel Street would require the acquisition of more parcels and potentially affect burial sites than any of the other alternatives considered. The alignment with at-grade operation Downtown and a tunnel through the Capital Historic District, in addition to the environmental effects such as impacts to cultural resources, reduction of street capacity, and property acquisition requirements of the at-grade and tunnel sections, would cost an additional \$300 million.

The Project's purpose is "to provide high-capacity rapid transit" in the congested east-west travel corridor (see Section 1.7 of the Final EIS). The need for the Project includes improving corridor mobility and reliability. The at-grade alignment would not meet the Project's Purpose and Need because it could not satisfy the mobility and reliability objectives of the Project (see bullets below). Some of the technical considerations associated with an at-grade versus elevated alignment through Downtown Honolulu include the following:

- **System Capacity, Speed, and Reliability:** The short, 200-foot (or less) blocks in Downtown Honolulu would permanently limit the system to two-car trains to prevent stopped trains from blocking vehicular traffic on cross-streets. Under ideal operational circumstances, the capacity of an at-grade system could reach 4,000 passengers per hour per direction, assuming optimistic five minute headways. Based on travel forecasts, the Project should support approximately 8,000 passengers in the peak hour by 2030. Moreover, the Project can be readily expanded to carry over 25,000 in each direction by reducing the interval between trains (headway) to 90 seconds during the peak period. To reach a comparable system capacity, speed, and reliability, an at-grade alignment would require a fenced, segregated right-of-way that would eliminate all obstacles to the train's passage, such as vehicular, pedestrian, or bicycle crossings. Even with transit signal priority, the at-grade speeds would be slower and less reliable than an elevated guideway. An at-grade system would travel at slower speeds due to the shorter blocks, tight and short radius curves in places within the constrained and congested Downtown street network, the need to obey traffic regulations (e.g., traffic signals), and potential conflicts with other at-grade activity, including cars, bicyclists, and pedestrians. These effects mean longer travel times and far less reliability than a fully grade-separated system. None of these factors affect an elevated rail system. The elevated rail can travel at its own speed any time of the day regardless of weather, traffic or the need to let cross traffic proceed at intersections.
- **Mixed-Traffic Conflicts:** The planned three-minute headways on the guideway will prevent effective coordination of traffic signals in the delicately balanced signal network in Downtown Honolulu. A three minute cycle of traffic lights would affect traffic flow and capacity of cross-streets. Furthermore, there would be no option to increase the capacity of the rail system by reducing the headway to 90 seconds, which would only exacerbate

the signalization problem. An at-grade system would require removal of two or more existing traffic lanes on affected streets. This effect is significant and would exacerbate congestion. Congestion would not be isolated to the streets that cross the at-grade alignment but, instead would spread throughout Downtown. The Final EIS shows that the Project's impact on traffic will be isolated and minimal with elevated rail, and in fact will reduce system-wide traffic delay by 18 percent compared to the No Build Alternative (Table 3-14 in the Final EIS). The elevated guideway will require no removal of existing travel lanes, while providing a reliable travel alternative. When traffic slows, or even stops due to congestion or incidents, the elevated rail transit will continue to operate without delay or interruption.

An at-grade light rail system with continuous tracks in-street, would create major impediments to turning movements, many of which would have to be closed to eliminate a crash hazard. Even where turning movements are designed to be accommodated, at-grade systems experience potential collision problems. In addition, mixing at-grade fixed guideway vehicles with cars, bicyclists, and pedestrians presents a much higher potential for conflicts compared to grade-separated conditions. Where pedestrians and automobiles cross the tracks in the street network, particularly in areas of high activity (e.g., station areas or intersections), there is a risk of collisions involving trains that does not exist with an elevated system. There is evidence of crashes between trains and cars and trains and pedestrians on other at-grade systems throughout the country. This potential would be high in the Chinatown and Downtown neighborhoods, where the number of pedestrians is high and the aging population presents a particular risk.

- ***Construction Impacts:*** *Constructing an at-grade rail system could have more effects than an elevated system in a number of ways. The wider and continuous footprint of an at-grade rail system compared to an elevated rail system (which touches the ground only at discrete column foundations, power substations and station accessways) increases the potential of utility conflicts and discovery of sensitive cultural resources. In addition, the extra roadway lanes taken away for the system would result in increased congestion or require that additional businesses or homes be taken to widen the roadway through Downtown. Additionally, the duration of short-term construction impacts to the community and environment with an at-grade system would be greater than with an elevated system. Because of differing construction techniques, more lanes would need to be continuously closed for at-grade construction and the closures would last longer than with elevated construction. This would result in a greater disruption to business and residential access.*

Because it is not feasible for an at-grade system through Downtown to move passengers rapidly and reliably without significant detrimental effects on other transportation system elements (e.g., the highway and pedestrian systems, safety, reliability, etc.), an at-grade system would have a negative system-wide impact that would reduce ridership throughout the system. The at-grade system would not meet the Project's Purpose and Need and, therefore, does not require additional analysis.

The Draft and Final EISs have been prepared according to the processes required by the NEPA and Hawaii Revised Statutes Chapter 343.

Discussion of indirect and cumulative effects of the Project can be found in Section 4.19 of the Final EIS. This section lists the documents where you can find the details of the information used for the

summary. "The CEQ regulation at 40 CFR 1500 et seq. and HRS 343 (HAR 11-200) require an assessment of indirect and cumulative impacts. This section summarizes the assessment of these impacts. For more information on land use impacts associated with TOD, see the Honolulu High-Capacity Transit Corridor Project Land Use Technical Report (RTD 2008b). For more information on study corridor and regional economics, see the Honolulu High-Capacity Transit Corridor Project Economics Technical Report (RTD 2008c)."

In addition, the selected construction contractors will be responsible for supplying materials to the project worksite. Materials will be acquired according to "Buy American" regulations.

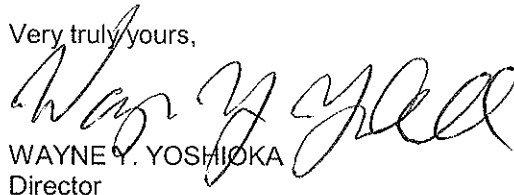

As with all fossil fuel, any used to support construction and operation of the Project would be extracted from the earth. The selected transit technology will be electrically powered, industry-standard steel wheel on steel rail powered from a third-rail system. The transit system will obtain electricity from the grid on Oahu and will be a customer of HECO. The transit system will require approximately 17.9 megawatts (MW) of electrical power to operate. This represents 1 percent of the existing combined electrical generating capacity on Oahu by HECO and independent power producers. Renewable sources of electrical generating capacity account for 11 percent of the total electrical generation on the island. HECO is currently soliciting proposals for non-firm renewable-energy generating capacity of up to 100 MW that would be available between 2010 and 2014.

As noted in Section 4.11.3 of the Final EIS, future transportation energy consumption will be reduced by 3 percent as a result of the Project. During the EIS phase, specific information with regard to contractors or material suppliers was not available.

As stated previously, a cumulative impact analysis was conducted to analyze past, present, and reasonably foreseeable future actions. "Federal guidance was used in evaluating the Project's cumulative effects, specifically the CEQ's Considering Cumulative Effects under the National Environmental Policy Act."

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Honolulu, Hawaii 96817

Dear Mr. Duarte:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

Along Dillingham Boulevard, the roadway must be widened on the makai side; and there will be partial acquisition of property to accommodate this widening. Please refer to Appendix C of the Final EIS for more information regarding right-of-way needs in the Dillingham Boulevard area. The City has notified all property owners whose property may be impacted by the Project and will continue to be in contact with those owners throughout the right-of-way process.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink that reads "Wayne Y. Yoshioka".

Comments of the E Noa Corporation
February 4, 2009
on
The Honolulu High-Capacity Transit Corridor Project
Draft Environmental Impact Statement/
Section 4(f) Evaluation
dated November 2008

Our comments are restricted to one major area of concern with two facets, namely, participation of private transportation companies in the planning of transit systems and the formulation of public-private partnerships in the operation of such systems. This area of concern is essentially ignored in "The Honolulu High-Capacity Transit Corridor Project Draft Environmental Impact Statement/Section 4(f) Evaluation" (DEIS).

Findings

A search of the EIS document reveals the following:

1. With two exceptions, all references to "buses" are to those operated by City and County under contract to Oahu Transit Services (OTS).
2. The only reference to "public-private partnerships" is in section 6.2.3 relating to funding sources for ongoing capital expenditures. It states that the DEIS did not assume any private sources of capital to fund the project, though it noted joint developments or other public-private partnerships might reduce the cost to the City or allow adding of additional elements. (p. 6-6)
3. The only reference to private transportation companies was in reference to station characteristics. It was noted that: "Paratransit vehicles would be accommodated at all stations and, in some cases, space for private tour buses, taxis, and/or special shuttles also would be included." (p. 2-36)

4. In the section related to the TSM (Transportation System Management) Alternative, which had been rejected in the Alternatives Analysis (2006), it was noted that a few comments in the scoping meetings or the public information sessions had suggested providing "...additional bus service with either school buses or private vehicles". The DEIS concluded that these suggestions were not materially different than those considered as part of the initial TSM alternative and therefore further analysis was not warranted. (p. 2-7&8)

Conclusions Based on Findings

A review of the findings leads to the following conclusions:

1. There is no indication in the DEIS that any consideration has been given to the possibility of private transportation companies that provide regularly scheduled services to the public supplementing the services provide by City and County OTS buses or to the forming of mutually beneficial public-private partnerships with such firms with the exception of dismissing the possibility out of hand as noted in point 4 in Findings above.
2. There is no reference in the DEIS to federal statutory and regulatory authority relating to the participation of private transportation companies in the planning process or to public private partnerships involving such companies or to the protection of private providers of transit from competition from federally assisted transit providers or other similar provisions.
3. There is no recognition in the Draft EIS that a privately owned transportation company exists in Honolulu that provides regularly scheduled transit services to the public or portions thereof, namely E Noa's pink line, yellow line, University of Hawai'i at Mānoa Shuttle, and Mililani Shuttle.

The Legal Framework

The requirement for participation of private providers of public transportation services, which provide regularly scheduled services,

in the planning of transit and similar projects is clearly laid out in federal law, regulations, and circulars.

Of the five purpose clauses set forth in 49USC §5301(f), three of them emphasize the importance of involving private transportation companies:

- “(f) General Purposes.--The purposes of this chapter are—
- (1) to assist in developing improved mass transportation equipment, facilities, techniques, and methods with the cooperation of public and private mass transportation companies;
 - (2) to encourage the planning and establishment of areawide urban mass transportation systems needed for economical and desirable urban development with the cooperation of public and private mass transportation companies;
 - (3) to assist States and local governments and their authorities in financing areawide urban mass transportation systems that are to be operated by public or private mass transportation companies as decided by local needs.”

The section of the law relating to “private enterprise participation in metropolitan planning and transportation improvement programs and relationship to other limitations” states that: “(a) Private Enterprise Participation. - A plan or program required by section 5303, 5304, or 5305 of this title shall encourage to the maximum extent feasible the participation of private enterprise.” [49USC §5306(a)]

3. The section of the law relating to public participation requirements states in part that: “Each recipient of a grant shall... (2) develop, in consultation with interested parties, including private transportation providers, a proposed program of projects for activities to be financed... and (6) consider comments and views received, especially those of private transportation providers, in preparing the final program of projects.” [49USC §5307(c)(2) and (6)]

4. The General Provisions on Assistance, which state in part that: “Financial assistance provided under this chapter to a State or local governmental authority may be used ...to operate mass transportation equipment or a mass transportation facility in

competition with, or in addition to, transportation services provided by an existing mass transportation company, only if

- a. The Secretary of Transportation finds the assistance is essential to a program of projects required under sections 5305-5306 of this title; (and)
- b. The Secretary of Transportation finds that the program, to the maximum extent feasible, provides for the participation of the private mass transportation companies. [49USC §5323(a)(1)(A) and (B)]

5. The portion of Federal Transit Administration (FTA) Circular C 9300.1A, Chapter VI, relating to private enterprise, states in part that:

"PRIVATE ENTERPRISE CONCERNS . The concerns of Federal transit law regarding private enterprise focus mainly on including the private sector in participating in local transit programs... and protecting private providers of transit from competition with federally assisted transit providers.

a. **Participation by Private Enterprise.** Both Federal transit law and joint FHWA/FTA planning regulations (discussed in Appendix A of the circular) impose strong requirements for private as well as public sector participation as transportation programs are developed. Plans and programs required for Federal transit assistance must encourage the participation of private enterprise to the maximum extent feasible.

Federal law recognizes the special concerns of private transportation providers that compete with public mass transit authorities. By law, existing private transportation providers are afforded certain safeguards from competition. Specifically, FTA is prohibited from providing Federal assistance to a governmental body that provides service in competition with, or supplementary to, service currently provided by a private transportation company, unless FTA finds that the local transportation program developed in the planning process provides for participation by private transportation companies to the maximum extent feasible.

Accordingly, Federal transit law and the joint FHWA/FTA planning regulations direct special attention to the concerns of private transit providers in planning and project development. Joint FHWA/FTA planning regulations specifically require that private transit providers, as well as other interested parties, be afforded an adequate opportunity to be involved in the early stages of the plan development and update process."

It should be noted that neither the City and County nor its consultants have included E Noa in the preparation of the Alternatives Analysis. There was no response from the City and County to E Noa's letter of January 7, 2006, outlining the federal requirements and offering to work with the City in the planning process. There was a single meeting of E Noa and Department of Transportation Services officials, initiated by E Noa, on February 27, 2006, at which E Noa described the relevant federal laws, regulations, and circulars relating to public agencies and private providers of transit services, as discussed above, and outlined some of the potential opportunities for public-private partnerships in the area of transit. There was no follow-up by the City and County or its consultants to this initiative on E Noa's part.

Clearly, it is obligatory upon applicants for and recipients of federal funding to avoid damaging private providers of public transportation services financially and otherwise. Even more importantly, the applicants for and recipients of federal transit funding should vigorously look for opportunities to creative cooperative arrangements with private transportation companies that provide regular transit service to residents as well as visitors in order to furnish more comprehensive and cost-effective services to the public.

"Leave All This to Later"

Both the spoken and unspoken attitude of the City and County appear to be to leave all discussions of public-private partnerships with respect to transit services to some future date and to substantially ignore the legal requirements for the participation in the planning process of private transportation carriers providing regularly

scheduled service to the public, such as E Noa, to some future date, if at all.¹

This "do it later, if at all" approach makes no sense. First of all, the time to include private transportation carriers, providing regularly scheduled service to the public, in the planning process is when the planning is occurring, such as in the preparation of the draft EIS. It is important to note that simply providing a statement at a public information meeting is not the kind of participation envisioned by federal law.

Second, the prior "Alternative Analysis" and the present EIS are the planning documents in which the City and County sets forth its basic approach to providing transportation services in the Honolulu High-Capacity Corridor. If there is no substantive discussion of the potential for developing public-private partnerships with private transportation carriers providing regularly scheduled service to the public in these fundamental planning documents, then the likelihood of such partnerships being considered as essential elements in the planning program, either in the present or the future, is minimal. They might be a nice add-on, but they are not part and parcel of the philosophy underlying the planning of the new transit system.

In Conclusion

"The Honolulu High-Capacity Transit Corridor Project Draft Environmental Impact Statement/Section 4(f) Evaluation" is deficient in the following respects:

1. The failure to include private transportation carriers providing regularly scheduled service to the public in the planning process;

¹ "Opportunities for public-private partnership to enhance the project that can be delivered with limited public funds" is listed on page S-7 of the Alternatives Analysis as an issue to be resolved later. From the context of the statement, it is not possible to tell whether the Alternatives Analysis is referring to public-private partnerships in relation to construction and/or operation of the rail system, transit oriented development, or reduction of the modal splits by utilizing private transportation companies providing regularly schedules transit services.

2. The failure to recognize the relevance of federal statutes and regulations relating to private transportation carriers providing public service and to public-private partnerships; and
3. The failure to address the possibility of public-private partnership with private transportation carriers providing regularly scheduled service to the public as a means for improving the efficiency and effectiveness of the transportation service proposed for the high density corridor.

We reiterate the willingness of E Noa Corporation, an existing private provider of regularly scheduled public transportation services serving both residents and visitors, to work closely with the City and County of Honolulu and its consultants in the development of a public-private partnership that will contribute significantly to the success of the proposed transit system.

Mr. Tom Dinell
E Noa Corporation
P.O. Box 235873
Honolulu, Hawaii 96823

Dear Mr. Dinell:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

In your letter, you raise various issues specifically and generally. Your overarching concern appears to be related to participation of private transportation companies in the planning of transit systems and the formulation of public-private partnerships in the operation of such systems. This letter also addressed the three specific conclusions raised on the last two pages of your letter.

The purpose of the Project is to provide high-capacity rapid transit in the highly congested east-west transportation corridor between Kapolei and UH Manoa, as specified in the Oahu Regional Transportation Plan 2030 (ORTP) (Oahu MPO 2007). See Sections 1.7 and 1.8 of the Final EIS for a full discussion on the purpose and need of the Project. The need for the Project is based on the following goals: Improve corridor mobility, Improve corridor travel reliability, Improve access to planned development to support City policy to develop a second

urban center, and Improve transportation equity. As discussed in Chapter 8 of the Final EIS, the Transportation System Management (TSM) Alternative was evaluated during the Alternatives Analysis process. Additional information was added to Section 2.2.2 of the Final EIS to clarify why this and other alternatives performed poorly and were eliminated from further consideration. In short, the TSM Alternative was developed to evaluate how well a combination of relatively low-cost transit improvements could meet the study area's transportation needs. FTA requires that the TSM Alternative reflect the best that can be done for mobility without constructing a new transit fixed guideway. While the TSM alternative did not specifically look at the use of private transportation carriers, they would have faced the same constraints and inability to meet the Project's Purpose and Need. Bus service was optimized, per FTA guidelines, by increasing service but without building a new fixed guideway for transit, such as a system of dedicated bus lanes. The analysis demonstrated that the Purpose and Need for the Project could not be met through a lower-cost, bus-based alternative, whether or not it included the use of private transportation carriers.

Your quotation from Capital Program: Grant Application Instructions, Circular 9300.1A, October 1, 1998, is incomplete. The complete language from Circular 9300.1A(9)(a) is as follows:

Participation by Private Enterprise. Both federal transit law and joint FHWA/FTA planning regulations (discussed in Appendix A of the circular) impose strong requirements for private as well as public sector participation as transportation programs are developed. Plans and programs required for federal transit assistance must encourage the participation of private enterprise to the maximum extent feasible.

Federal law recognizes the special concerns of private transportation providers that compete with public mass transit authorities. By law, existing private transportation providers are afforded certain safeguards from competition. Specifically, FTA is prohibited from providing federal assistance to a governmental body that provides service in competition with, or supplementary to, service currently provided by a private transportation company, unless FTA finds that the local transportation program developed in the planning process provides for participation by private transportation companies to the maximum extent feasible.

Accordingly, federal transit law and the joint FHWA/FTA planning regulations direct special attention to the concerns of private transit providers in planning and project development. Joint FHWA/FTA planning regulations specifically require that private transit providers, as well as other interested parties, be afforded an adequate opportunity to be involved in the early stages of the plan development and update process. While FTA supports the participation of private transit providers in local mass transportation programs, FTA no longer imposes prescriptive requirements for determining whether a grant applicant has made adequate efforts to integrate private enterprise in its transit program, as explained in the FTA Federal Register Notice "Private Enterprise Participation," of April 26, 1994.

FTA relies on the local planning process, which must comply with rigorous planning and private enterprise requirements, and the joint FHWA/FTA planning regulations. To determine the adequacy of a grant applicant's efforts to incorporate private enterprise in its transit program, FTA monitors compliance with statutory and regulatory private enterprise requirements as part of the annual audits and the triennial reviews under the urbanized area formula program.

The above section directly addresses the issues you raised in your letter. First, the planning process provides for participation by private transportation companies to the maximum extent feasible. As discussed above, the integration of private enterprise occurs during the local planning process. The FTA recommends that to be more involved in transportation planning or service delivery, private providers should: attend metropolitan planning organization (MPO) meetings, comment on the transportation improvement program (TIP), and participate in the statewide transportation improvement program (STIP). See FTA, Federal Transit Administration Private Enterprise Participation in Transportation Planning and Service Delivery, available at http://www.fta.dot.gov/laws/leg_reg_180.html (viewed Sept. 17, 2009).

Also, as mentioned above, the Alternatives Analysis analyzed the implementation of a bus-only transportation system, which could be run by either public or private transportation providers. This analysis found it would not meet the Purpose and Need of the Project.

The following is a summary of the public participation opportunities provided by the MPO and during development of the TIP and STIP, all of which include a fixed guideway that will serve the H-1 travel corridor.

MPO. *The Oahu Metropolitan Planning Organization (OahuMPO) updates and revises the ORTP every five years in accordance with federal regulations. It is an essential part of the continuing, cooperative, and comprehensive statewide multimodal transportation planning efforts conducted in Hawaii. It focuses on improving mobility with a series of strategies and programs to address future transportation needs. According to its website (www.oahumpo.org), OahuMPO has developed a Participation Plan to ensure compliance with the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU) legislation. Under SAFETEA-LU, metropolitan planning organizations are required to develop a participation plan that documents a process for providing interested parties with reasonable opportunities to be involved in the metropolitan planning process. The Participation Plan includes policies that ensure early and continuing public involvement in transportation planning and decision-making processes of the OahuMPO.*

As discussed in Chapter 1 of the Final EIS, as part of its work to update the ORTP, OahuMPO surveyed Oahu residents about transportation issues in 2004. The ORTP 2030 development was a system planning effort that identified and prioritized the H-1 travel corridor as having the greatest need for improved transit service. Seventy percent of the respondents believed that rail rapid transit should be constructed as a long-term transportation solution. During development of the ORTP 2030 in 2004 and 2005, the need for a fixed guideway system was identified and a range of future transportation scenarios for Oahu were evaluated.

TIP. TIP describes and prioritizes the surface transportation programs and projects that the OahuMPO has selected for implementation during the program period. The TIP is the adopted list of public transit, highway, bicycle, and pedestrian projects that will receive federal transportation funds in the near future. The TIP covers a period of four years and contains two additional years for information only. A new TIP is adopted every three years. The TIP, as approved by the OahuMPO and governor (or designee), is the Oahu element of the Statewide TIP (STIP). As with the development of the ORTP, discussed above, early public input and public outreach is required and part of the process. See OahuMPO, "What is the Transportation Improvement Program?", available at <http://www.oahumpo.org/programs/whatistip.html> (visited, May 26, 2010).

STIP. The STIP is a four-year program implementation plan that identifies federal, state, and county transportation projects, statewide, that intend to be funded, in part, with federal highway and transit funds. The STIP is reviewed by the Hawaii Department of Transportation (HDOT), governor, Statewide Transportation Advisory Committee, OahuMPO, and the Federal Highways Administration and FTA for major projects involving those federal agencies. Public involvement, review, and comment are a required component of the STIP process. See HDOT, *Process for Development of a New STIP*, available at http://hawaii.gov/dot/highways/STIP/STIP%20Development%20Schedule%20and%20Revision%20Processes_File%20L.pdf.

In addition to the above opportunities to be involved in the early stages of the plan development and update process that led to the planning for a fixed guideway that will serve the H-1 travel corridor, the City provided many opportunities to participate in the Project's environmental review process. As discussed in Chapter 8 of the Final EIS, agencies, non-governmental groups, and the public have been engaged throughout the planning process for the Project, as required by federal and state law. NEPA mandates agency and public participation in defining and evaluating the impacts of the project alternatives. The Project has followed SAFETEA-LU guidance for federally funded projects. To reach as many community members as possible, a wide variety of public involvement tools were used throughout the Project. For example, the Project maintains an active Speakers Bureau to provide informational presentations to community groups, agencies, and organizations. A full list of Speakers Bureau presentations is included in Appendix G of the Final EIS. To date, more than 2,500 comments on the Project have been submitted through the website and more than 600 have been received via the telephone information line.

The City started working with the public early on in the planning process. An initial Notice of Intent was published for the Project on December 5, 2005. Three scoping meetings were held in December 2005. The comment period for these scoping meetings ended on January 9, 2006. Another series of scoping meetings was held prior to beginning the Project's Preliminary Engineering (PE)/EIS phase. A Notice of Intent was published on March 15, 2007. Agencies, non-governmental groups, and the public were again given the opportunity to comment on the Project's Purpose and Need alternatives, or other project issues. Three public scoping meetings were held in March and April 2007. Project information was disseminated throughout the study corridor in the form of community updates, participation in Town Hall meetings, and informational displays. Subsequently, a series of five public hearings were held

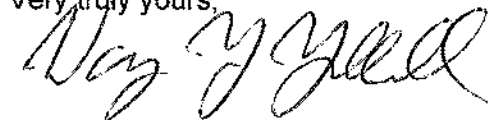

to give interested parties an opportunity to submit comments on the Project and the analysis contained in the Draft EIS. The comments received are addressed in this Final EIS.

Second, the Project recognizes relevant federal statutes and regulations applicable to the Project. As discussed above and in the Final EIS, many opportunities were provided during preparation of the ORTP, TIP, and STIP, which included a fixed guideway that will serve the H-1 travel corridor. In addition, many opportunities were provided for participation in the NEPA environmental review process. The above described processes comply with the federal statutes you cited in your letter; i.e., 49 USC §5301(f), 49 USC §5306(a), 49 USC §5307(c)(2) and (6), and 49 USC §5323(a)(1)(A) and (B). The local and state transportation planning organizations and the Project have encouraged, to the maximum extent feasible, the participation of private enterprise and interested parties through multiple public hearings and meetings, and the use of the project web site to convey information about upcoming contracts and opportunities for private sector involvement. In addition, the City has consulted with private enterprise and interested parties and considered comments and views received in preparing the final EIS for the Project.

Third, although the Draft EIS demonstrates the effectiveness of the Project without specific reference to private transportation carriers, it does not preclude the possibility of public-private partnerships from occurring. Among other things, private transportation carriers may bid on the services to be offered by the Project. In addition, as stated in Section 2.5.6 of the Final EIS, in some cases, there will be room at stations for private tour buses. Section 3.2.6 of the Honolulu High-Capacity Transit Corridor Project Transportation Technical Report references privately owned transportation companies, including the Leeward Oahu Transportation Management Association (LOTMA) and the Mililani Shuttle. In response to your comment, additional references to private operators in Section 3.3.2 of the Final EIS have been added. The text in Section 3.3.2 of the Final EIS now reads: "In addition to public transportation services described previously, various privately owned transportation companies offer transit or ridesharing services to the public, including the Leeward Oahu Transportation Management Association (LOTMA), the Mililani Trolley, and E Noa Corporation. LOTMA provides carpool matching and emergency ride home services in the Ewa and Central Oahu areas. E Noa Corporation operates a variety of services serving the Koko Head and Waianae ends of the corridor with connections to Downtown and tourist centers."

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Dear Ms. Ebey:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- *Reduce the time that each area will experience traffic and community disturbances.*
- *Allow for multiple construction contracts with smaller contract size to promote more*

Ms. Kathleen Ebey
Page 2

competitive bidding.

- *Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- *Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

Lastly, as discussed in Chapter 2 of the Final EIS, park-and-ride lots are planned at East Kapolei, UH West Oahu, Pearl Highlands, and Aloha Stadium. These stations have been identified as having the highest demand for drive-to-transit access.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

**Honolulu High Capacity Transit Corridor Project
Draft Environmental Impact Statement
Comments**

Aloha:

The opportunity to review the environmental impacts of this project is appreciated.

First off let me introduce myself, my educational background is in structural engineering at the UofH, I hold a BS, and MS degree from the department of Civil engineering. I currently work at an engineering firm and am working towards obtaining licensure as a professional engineer. I am involved with several engineering organizations including currently serving in leadership roles as president of the ASCE younger members, and also serving on the board of directors of the Engineers and Architects of Hawaii (EAH). The following comments are my own and should not be associated with my employer or the organizations I am involved in. or anybody else.

I should also mention that I did not have sufficient time to go over the document in detail, these comments are the product of a quick first pass reading of approximately 80% of the document. I trust others will pick up on any details I will miss.

First of all, taking the broad view, this project seems to justify the need for transit based on projected population growth, not needs that exist today. This seems counterintuitive to me, first of all the immediate needs that exist today should take precedence over the needs that are possible in the future. My first question:

1) Why is the project supposed to be starting in the Kapolei end?

It makes more sense to start with constructing the Honolulu end of the project. The justification for my

1 of 11

argument is plain to see, given that mass transit works best in high density areas. Downtown has the high density now, even after the 2030 projections. Downtown will still have a substantially higher population density than the Kapolei end of the proposed system, as shown in the bar graph below, produced with data in the EIS:

Another reason for starting in town is that in the unfortunate event that the project goes over budget, or financing falls through and all the phases cannot be completed the maximal benefit to the public would be achieved if the finished part is in Downtown. The greater density of the downtown area will ensure better ridership of an incomplete system, my next question:

Why is population growth as opposed to population density used as the primary criterion for justifying the planning of the system?

And here is a question relating to the source of the 2030 number:

Are the projections of population growth based on data before the economic "crisis" and recession we are currently in? If the current downturn has not been factored in, the projections should be revised accordingly.

Although I did not go over the financial aspect of the report, I suspect that it would be best financially to do the downtown end because construction within the highly developed area will be more expensive. As inflation continues the relentless march on, I expect the earlier we spend the money, the better it will be for the project. To conclude: While I do support the concept of having a rapid transit system in

Honolulu, the implementation of the system as it is presented in this impact statement has some flaws, the most obvious to me is that this project should start at the town end, there is no question in my mind, the final EIS should be written with that assumption.

One of the other critical things that is not addressed sufficiently in the EIS is the changes in land use that are direct and implied. What I see is a lot of agricultural land being developed and this action is just dismissed. The final EIS should include consideration of the loss of agricultural land indirect to this project. That is the land lost due to developments that this rail system supports. Looking at figure 2-5 on page 2-15 the initial line of this system is all farm fields ! I believe that we should tread lightly there and endeavor to preserve land that can be productive agriculturally to be used for that purpose. Some of this land even has a special classification to recognize how good it is. The land is conferred with the impressive title of being "Prime", "Special", or "Unique". Land in Hawaii is a finite resource, the proposed rail route permanently changes the use of 88 acres of land to non-agricultural and the report calls this insignificant. I believe that absolutely any piece of agricultural land that is converted to a non agricultural use is a very serious matter and should not be taken lightly. The cavalier attitude to developing agricultural land troubles me deeply, our own Governor Linda Lingie makes good arguments (quoting a .gov website):

"Hawai'i produces only 15 percent of its own food. That's not acceptable and shouldn't be for the State. We need to take action now to increase food self-sufficiency for Hawai'i and preserve and strengthen the agriculture industry for future generations.

We must increase our efforts to protect the best agricultural lands from development and preserve them for agriculture into the future and we must strengthen our commitment to providing infrastructure and water for agriculture. Increasing our food self-sufficiency will contribute to our own communities rather than sending our dollars out of the State for imported food."

Again, any reduction of agricultural land is counter to our state's goals and great lengths should be taken to avoid such an action. The quick dismissal of the significance of the agricultural land involved in this project cannot be in the final version of the EIS, and mitigating measures must carefully be considered for all the agricultural land affected either directly or indirectly.

The claim is made that "all of the affected properties designated as prime, unique, or of statewide importance and/or actively being farmed are owned by individuals, corporations, or agencies that plan to develop them in conformance with the Ewa Development Plan (DPP 2000)". However, on the DPP's website for the Ewa Development Plan, the first sentence is "The Plan protects prime agricultural lands". This discrepancy must be corrected in the final version of the EIS. I would like the following loaded question addressed in completely in the final version of the EIS:

It is not acceptable to use prime agricultural land as a site for a maintenance and storage facility when a clear alternative is present.

Is this transit system being built to benefit the people of the island to help the congestion problem or is it a tool for the owners of the undeveloped land that is in agricultural use in the right hand side of figure 2-5? I do hope that the latter option is not true, but whoever owns the large tracts along the route stands to profit greatly. Those land owners should be paying the largest share of the construction cost of the

rail system. From what I gather this is not the case. I have been taught that while serving the public, the image of corruption should be avoided as much as corruption itself. The final EIS should leave it's readers absolutely no doubt as to who the beneficiaries of the project are. (it should benefit ALL of the people on Oahu) I don't want people living in areas on the island removed from the rail system footing the bill for an improvement that serves primarily to make large landowners richer.

If as a last resort, the rail line must fly over agricultural land, especially land classified as prime, unique, or statewide important, I suggest that the land underneath the line be allowed to remain cultivated, the rail above could obtain an easement on the agricultural land instead of condemning it outright and changing its use. Thus the only land that would be made useless for agriculture is that occupied by the piers supporting the rail. Further mitigating measures would have to be taken due to the effect of shading, and the area of the piers, but at least the impact would be minimized.

Another mitigating measure that should be considered is a change in the route shown on figure 2-5. It appears that there is more development down on the 'Ewa side of the page (lower right) The final EIS should seriously consider turning down Fort Weaver Road and continuing down to the bottom of the page ending up near Geiger Road an extension out to Kapolei could be added later This would keep the agricultural areas untouched while serving an area that is already developed.

On page 1-1, in the first column under section 1.1.1, The wording implies that the OR&L was a passenger system serving the 'Ewa plain. This is a bit misleading, as far as I know the OR&L was primarily used for transport of Agricultural goods, with primary cargos being cane, pincapple, trash, and oil. Passenger service was not the primary purpose of that line Here is my question:

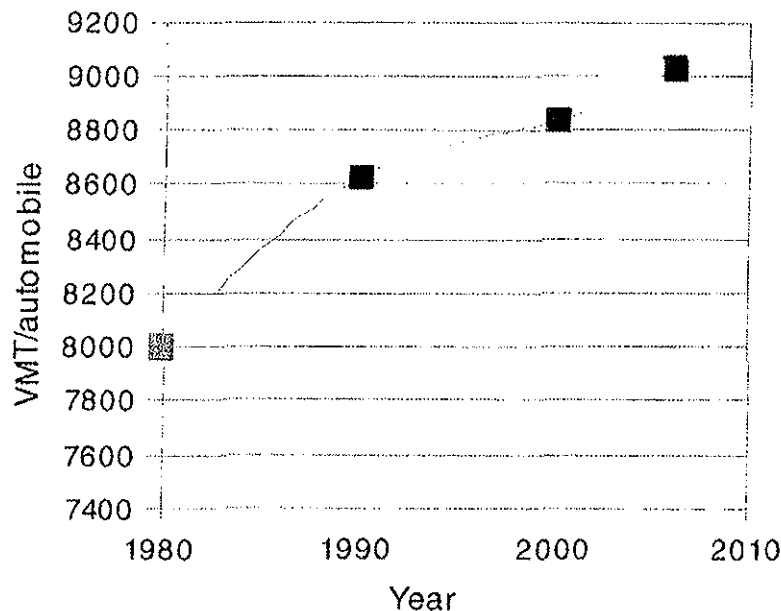

Can you please state accurately what kinds of things were carried on the OR&L, and expand on the history of the OR&L a bit to avoid misrepresenting the history?

And another one comes to mind:

Why can't a rail system connecting parts of our island carry light cargo when passenger traffic is light (at night)? This would keep a few trucks off the road, and would curb emissions a bit. The planners of the rail system should give serious consideration to carrying a more diverse cargo to get the most benefit from the system, and the conclusions of that consideration should be included in the finalized version of the EIS document

On page 1-2 a graph is shown indicating population, vehicle registrations, and vehicle miles traveled with respect to time. When reviewing this graph, I noticed a disturbing trend that indicates a problem with the way development on Oahu has taken place. Since I am too young to have had a say in the decisions to create the "second city" of Kapolei, I will make a slight digression to state that the "second city" concept seems like a terrible idea for many reasons that I may touch on in reviewing the impact of the proposed rail system. Getting back to figure 1-2, using the same data, but presenting Vehicle Miles Travelled (VMT) per registered vehicle vs. time, a clear trend towards longer drives can be seen. If VMT is plotted per person, a similar trend exists. Please take a look at the graph below:

VMT per automobile registered by year

The trend towards more driving per person is an indicator of fundamental problems in our planning. So another question, that has far reaching implications comes to mind:

Will the proposed rail system increase VMT per capita by supporting more development in Kapolei, thus more people with cars with long commutes, or will the system decrease VMT per capita by providing alternatives to driving?

Looking at Figure 2-7, it appears that the sharp curves leading into the airport would substantially slow the system down:

Has consideration been made to reconfiguring the commuter terminal of the airport to allow a more streamlined rail route at that location?

On the first column of page 3-2 in 3.1.1 The modeling approach is "proven effective" I would like to see some back up given, and a estimated margin of error presented with the model's results. This error should be based on modeling existing systems and changes to them, and comparing the model's conclusions with actual measured data.

On page 3-7 under TheBoat Service heading, the second paragraph describes shuttle system to get TheBoat patrons onto other modes in the public transportation. I would imagine a similar system of supporting shuttles would be devised for the proposed rail transit. This supporting shuttle system and revisions to the bus schedules to accommodate the rail system should be a part of the final EIS and should be evaluated in the same level of detail as the rest of the system.

The data presented in figure 3-1 shows a decrease in average bus travelling speeds, and is attributed to

increased traffic congestion, I would like to know if any of the trend is associated with changes in the bus schedule and routes. If the bus has relatively more peak time runs in the city now and more runs in off peak time and in the less travelled areas in the past, that would also contribute to the trend. I would like this explored and presented in the final EIS, with summary of all the factors and their respective contributions that might cause the trend shown.

In section 3.4.2, effects on Transit. The supporting calculations and data are not presented. Along with any projected information, the assumptions going into the models should be clearly stated, this seems to be a problem typical to the entire document.

I would like the final EIS to consider the possibility of express routes that do not stop at all stations. If all the trains skipped every other station and were staggered such that all the stations were serviced, could a faster travel time on the one track be achieved?

On page 4-4, under 4.2 it is stated that the project is not expected to result in substantial adverse affects on property tax revenue, however a couple lines above, a 1.2 million reduction in tax revenue is mentioned. First of all, I assume the 1.2 Million is an annual number, is that correct? I am not a poor man, however 1.2 Million, although pale in comparison to the costs in this project, it a very significant number to me. I would like the final EIS to state a mitigating measure to account for this loss of revenue. I suggest for a mitigating measure: re-zoning already developed areas along the route to a higher density to make up the deficit in property tax.

The proposed mitigation options to the impacts to Community Services and Facilities outlined in section 4.4 should be described in detail on a case by case basis, not enough detail is given in the draft.

It is stated that development and re-development along the project as well as scale of the transit system would not have substantial effect on community character - this statement is false, and should be omitted in the final version. The scale of the transit often dwarfs surrounding architecture, and would certainly alter neighborhoods in potentially positive and negative ways. These effects shold be explored and reported in the final version of the EIS

Regional pollutant emissions are supposed to be reduced between 3.2 and 4.0 percent Because these numbers are not presented with margins of error, I am led to question the rigor of your calculations. In the final EIS the numbers should be presented with margins of error and a probabilistic analysis should be undertaken to get a better understanding of the chances of the expected performance of the system. For instance, what life cycle of the system's various components is assumed in your calculation? are the emissions associated with material acquisition, manufacture, transport, construction, and maintainence of the entire system, and the no-build options considered in the calculation? If there is no consideration of these factors in a life cycle analysis type of calculation, there should be. Otherwise, present your assumptions and calculations in the final report. Looking only at tailpipe emissions for the two in place systems could lead to faulty conclusions.

In section 4.9, vibration is said to have no impacts. I have done some assessments of vibrations on structures in my professional function, and based on my personal experience I do believe that with appropriate measures there is probably going to be no damage and everybody will be fine. However the perception of neighboring tenants and owners will be that the new train is causing every bit of damage to their properties. The EIS should consider this hypersensitivity to vibration that will be caused by the installation of the new system, and should outline a plan to do thorough pre-construction surveys of the adjoining properties to avoid having the repair bills for unrelated damage sent to the government.

My comments relating to the emissions calculations also apply to the energy, provide margins of error, probabilistic analysis, life cycle assessments, and energy associated with material procurement, manufacture, transport, etc.

On page 4-9 under the summary of section 4.14, proposed Mitigation Measures, strike "or" and replace with "and". The world needs more trees.

On page 4-13 under "Farmlands" it is noted the much of the 'Ewa plain is classified as farmland and prime agricultural land. How is it expected to have the required population density to support transit stations there? There should be no stations planned on farm land, it does not make sense.

Page 4-20 under Mitigation it is stated that the effects on different types of land uses in the study corridor would be minimal. This is false, building a stations in the middle of a piece of Agricultural land will catalyze the change in use of the land in the general area from agricultural to something non-agricultural. This effect would be anything but minimal and is against our state's goal of improving food self sufficiency Mitigation of this must be described in detail in the final version.

Figure 4-7 on page 4-21 does not show the full extent of the actively farmed land in the hatched area, a closer look should be taken at the aerial photograph underlay, it can be seen that the cultivated land extends significantly beyond the boundaries shown. If this error is carried into the calculations, they should also be corrected.

On page 4-27 near the end of the "Methodology" text block, it is mentioned that calculations are based on average persons per household and that displaced employees is based on a similarly rough number. In the final EIS, a census should be conducted to get the actual definite number, go knock on some doors and talk with the people to determine how many are there.

Table 4-5 on page 4-26 should include parcel acquisitions, partial and full by land use.

On page 4-26 it is stated that existing land uses would not change, a large portion of the system is based on the assumptions that land use WILL change. All occurrences of this discrepancy should be corrected in the final version of the EIS.

On page 4-28 the land in 'Ewa is described as rural and agricultural, this does not justify starting construction of a mass transit system out there. Transit serves population density, start the line downtown, set aside space for it in Ewa just in case it is needed. Building the line where there is no dense development does not make sense

On page 4-33 there is a typo on the third line under the Cemeteries heading, please fix it for the final version

On page 4-55 It states that income determinations cannot be made - this is a false statement, The authors could conduct their own census. This should be done for the final EIS

On page 4-55 the the middle column in the left side describes a community that embodies many of our cultural ideals including family cohesion, sense of community, local food production, etc. great care should be taken to preserve this, the group should be kept together and if they are relocated, it should be to such a place where they will be able to practice a subsistence lifestyle similar to what the currently enjoy. Any relocation should be of the group as a whole and should be to a place that has

potential for high agricultural production and a similar proximity to the other communities.

In table 4-10, the word "Dominant" is used in 4 separate occasions, and the word "prominent" is used on three other occasions. The system design should fit in a bit better, so such strong words don't need to be used.

In the doctored photos marked SIMULATION, Power lines and street lights are shown adjacent to the fixed guideway. I would like to see utility transmission conduits incorporated on the fixed guideway and street lights mounted to the guideway wherever possible. The installation of the rail system should include removal of power poles and light poles and overhead power lines wherever possible, this would lessen the visual clutter experienced by citizens that look skyward and would make the elevated structure appear more like it belongs there.

In figure 4-19 the streetlight shown would cast a dark shadow under the fixed guideway in the configuration shown, mount some lights on the bottom side of it instead and remove the high light.

In Figure 4-24 consider planting some trees in the median between the gigantic posts

The caption for figure 4-25 states that the guideway as shown would not noticeably conflict with the view's character - I disagree with this statement.

The caption for figure 4-25 states that the existing trees would soften the effect. This is false, the picture clearly show existing trees on the left side of the figure being removed, I suggest planting new things on the median to soften the effect.

Figure 4-29 This view is quite ugly it would look much nicer at grade or underground... also the reflection in the water is not true to life, the building's reflection would obstruct that of the station.

Figure 4-36 - I feel sorry for the people living in the top floor of that building... I suspect the beam element supporting the fixed guideway, it appears that the beam's section should be deeper, has a preliminary structural analysis been done to establish that the member shown is realistic. Also, the straddle bents could be done in a more architecturally pleasing way.

Page 4-93 add to the points under mitigation:

- *Relocate visible utilities onto the fixed guideway structure whenever possible to mitigate visual clutter caused by all of the things above driver's and pedestrian's heads
- * Design an architecturally interesting cast column that is appropriate to the surroundings (the plain round one is ugly)
- * Colored concrete should be considered for all elements.
- * Employ post-tensioned concrete columns or steel columns as opposed to the conventional ones shown to minimize member size and mitigate the visual impact of the columns on the surrounding landscape.

On page 4-99 in the first column near the top of the page it is stated that geologic strata underlying the track is a factor in vibrations transferred to adjacent buildings. Does this statement hold true for elevated systems such as the proposed one?

8/6/11

The DEIS states that the proposed Build Alternatives will have no effect on endangered and protected waterbirds despite the fact that waterbird habitats exist within the project boundaries. The justification for this claim given in the DEIS is that

"Over time, the waterbirds would adjust to new structures built for the Project since the wetlands would remain intact. This is expected because the waterbirds have continued to occupy the wetlands after the construction of nearby buildings and overhead utilities and the construction or widening of adjacent roads or highways."

Have any studies been conducted that investigate the environmental impacts of development on endangered waterbirds and protected waterbirds and their habitats? If so, please provide sources for each study and state whether or not the study findings support the DEIS claim that there will be no effects. Did the previous construction activities (construction of nearby buildings and overhead utilities and the construction or widening of adjacent roads or highways) result in noise intensity and duration, site disturbance, and all other environmental impacts to the endangered waterbirds' and protected waterbirds' habitat equivalent to each of the proposed Build Alternatives? If so, please provide evidence that supports this claim. Was the proximity from previous construction activity to wetlands and/or endangered waterbird and protected waterbird habitat the same as the proximity from the proposed construction activity to the wetlands and/or endangered waterbird and protected waterbird habitat? Will the noise in the areas where endangered waterbirds were observed remain the same after any of the proposed Build Alternatives are complete and operational? If not, the environmental impacts of noise on endangered waterbird and protected waterbird habitat must be investigated in any final EIS and mitigating measures must be provided.

What is the accuracy of the each field survey conducted and bird point counts? What is the margin of error? If accuracy cannot be guaranteed, a potential for environmental impacts to endangered terrestrial fauna exists. These impacts must be identified in any final EIS, and measures to mitigate these impacts must be included in any final EIS.

Are the "numerous canopy trees" in the Tern habitat enough to support the existing and future white tern population? What is the basis of the claim in the DEIS that the other large canopy trees in urban Honolulu will result in no impact to the white tern population? Please provide sources to substantiate this claim.

How were field surveys conducted? The DEIS explains the procedure for conducting point counts but not field surveys. Any final EIS must include the procedure followed for conducting field surveys.

Why was 8 minutes the duration used for point counts? Please provide a justification for the use of this time interval. One study found that on average 55% of all initial species detections occurred within the first 5 minutes, and 82% of all initial species detections occurred within the first 10 minutes, of 15-minute long point counts regardless of time of day or use of aural stimuli. If the results of this study hold true for Hawaii, only about a 75% of all species were detected over the 8-minute period. Were single or multiple visits conducted? Bartlet, et al. (1999) recommended two visits.

What time of day were point counts conducted and was any aural stimuli used

9 of 11

The results of the Water Quality Impact Assessment for the EPA must be included in any final EIS and the public must have an opportunity to comment on this study.

What permanent BMPs will be implemented to ensure there is no change in the amount of infiltration? An increase in infiltration relative to existing conditions can have positive environmental impacts. Have any studies been conducted to determine if this is feasible?

The DEIS states that because the Project would rely on electric propulsion, minimal pollutants would be generated on the guideway relative to pollutants generated by roadway traffic. Has a study been conducted that confirms this assumption? If so, please provide a source.

The DEIS does not acknowledge the fact that floodplains provide ecological benefits beyond groundwater recharge and infiltration, including but not limited to maintenance of biodiversity and fish habitats. In fact, the DEIS states the contrary by saying "the only beneficial functions for the floodplains analyzed in the study corridor are the recharge of groundwater and drainage conveyance". Please provide evidence to support this claim.

It is my understanding that the foundations for the proposed structure are expected to be large diameter drilled shafts, in some cases very deep, on the order of hundreds of feet. The final EIS should present study on the effects of the drilling and installation of such foundations on the groundwater system. Also The large volume of earth moved to create the foundation needs to go somewhere, this impact should also be assessed in the final EIS.

The DEIS lists a number of ways the volume of hazardous materials used and extent of worker exposure *could* be limited as a means for mitigation. This list of mitigating measures *must* be implemented in order to adequately mitigate environmental impacts of hazardous waste.

Will this project be built to a LEED™ standard?

What measures will be taken to avoid corrosion?

If ridership turns out to be much lower than forecast, are fees going to be increased? Are taxes going to be raised? What is the forecast for number of riders per day (best estimate, range from low to high)?

Lanes will be taken away during construction. Where are the lane closures and what is the duration of closure? Are there traffic rerouting plans?

What is the amount of carbon dioxide emitted by rail per person-mile when at maximum capacity? How does this compare to a Prius (50 mpg) with a solo driver? What is the maximum capacity of the proposed rail system?

How much energy does rail use (in kwh) per person-mile when at maximum capacity? Again, how does this compare to a Prius (50 mpg) with a solo driver?

Where will the power come from to operate the rail system? Will HECO build a power plant to run the rail? If not, is there enough current base load capacity to operate rail?

Please send your responses to my comments to:

Mr. Aaron Erickson
1348 Alewa Drive
Honolulu, Hawaii 96817

Dear Mr. Erickson:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- *Reduce the time that each area will experience traffic and community disturbances.*

- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*
- *Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- *Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

The financial plan is balanced for the entire Project so there will not be a situation in which only a portion of the system will be built. If there is a shortfall, additional revenue sources will be considered. Section 6.6 of the Final EIS discusses risks and uncertainties, as well as potential sources to cover shortfalls.

Neither population growth nor population density was the primary criterion for planning the system; however, the effectiveness of rail transit is closely linked to the population density of the area served than to the total population of an area. As described in Chapter 1 of the Final EIS, the majority of the population on Oahu is located in a narrow corridor, which makes it ideal to support rail transit. The purpose of the Project is discussed in Section 1.7 and the need for the Project is discussed in Section 1.8 of the Final EIS.

Regarding the source of the 2030 number, the projections on population growth were prepared in 2007 by the Oahu Metropolitan Transportation Organization (OahuMPO) for the Oahu Regional Transportation Plan. These projections predate the current economic recession. It is not anticipated that the OahuMPO will update its projections to reflect current conditions in time for inclusion in the Final EIS. The limits of the analysis have been disclosed.

Your letter also had some comments regarding land use. The Ewa Development Plan strives to designate some areas for dense development while preserving other areas for agriculture. Many of the acres for the Project considered prime, unique, or of statewide importance are located at the Hoopili site, which is one of two sites proposed for a maintenance and storage facility. The site designated as the preferred alternative is near Leeward Community College and was formerly used for Navy fuel drumming operations. Discussions are ongoing with the Navy to acquire it. If the Project can acquire this site, the impact on agricultural lands on Oahu will be much less than is described in the Draft and Final EISs.

Your comments regarding agricultural land have been noted. However, as shown in Section 4.2, Land Use of the Final EIS, the Natural Resources Conservation Service has completed a farmland conversion impact rating for the Project and determined that the site need

not be given further consideration for protection and that no additional sites need to be evaluated.

Your letter also had a question as to the goals of this Project. Table 1-4 of the Final EIS lists the following project goals: improve corridor mobility, improve corridor travel reliability, improve access to planned development to support City policy to develop a second urban center, and improve transportation equity. The Project will benefit a majority of the residents and employees of Honolulu, as noted in Chapter 1 of the Final EIS, including future residents in the growing areas on the Ewa Plain. While developers may also benefit from the guideway being located within their project areas, the island as a whole gains by having future development concentrate around station areas as opposed to the present sprawl that ultimately costs everybody more.

Regarding your comment about land underneath the guideway, the guideway structure requires access for inspection and maintenance; however, aside from a small area directly under the structure, the Project will not convert land use along the alignment.

In addition, your comment about changing the route near the Ewa end of the Project has been noted. A Fort Weaver Road alignment was evaluated and rejected in the Alternatives Analysis. It would have been the most expensive option for serving the Ewa area, and no space would have been available to provide park-and-ride and bus transfer facilities.

The OR&L provided freight and passenger service. Chapter 1 of the Final EIS has been revised to reflect this.

Regarding your comment about possibly using the system for courier services, courier-type use of the system is possible. The difficulties with loading and unloading of cargo from the elevated passenger platforms and trains preclude the use for heavy cargo operations.

Your next question was about vehicle miles traveled (VMT) capacity. As shown in Table 3-14 in the Final EIS, VMT will decrease 4 percent islandwide as a result of the Project when compared to the 2030 No Build Alternative.

The route shown in Figure 2-7 meets Project Design Guidelines. The DTS Rapid Transit Division is working with the airport to coordinate the Project with the airport's planned improvements to the commuter terminal.

To address your question about page 3-2 of the Draft EIS, the travel forecasting techniques used for the Project are detailed in the Travel Demand Forecasting Results and Uncertainties Report and the Model Development, Calibration, and Validation Report. All future forecasting has an element of uncertainty associated with it. In the case of the Project, the anticipated limits for guideway ridership in 2030 is expected to be between 105,000 to 130,000 trips per day, bracketing the official forecast of 116,000 riders a day used for all calculations. Even at the low end of the range, the Project meets FTA requirements for cost-effectiveness. Before it is used in forecasting, the model is calibrated against empirically collected traffic and transit ridership information and then validated against current counts to be sure it properly represents the travel activity in the transportation system. Sensitivity tests (e.g., changing highway speeds or transit fares) are performed to ensure the results are stable and predictable within reasonable expectations of consistency.

Regarding your comment about TheBus system, information on existing and future bus routes, including route numbers and frequency, is provided in Appendix D of the Final EIS. These routes include feeder bus service for the fixed guideway system. The revised bus system was incorporated into 2030 modeling projections.

In response to your next point, the average operating speeds for TheBus (1984-2007) reflect a variety of factors, such as bus route configurations and operating characteristics. However, another major contributing factor is the overall condition of Honolulu traffic in which the buses have been operating. The decline in bus traveling speeds would be worse if not for adjustments made by DTS and Oahu Transit Services (operator of TheBus). New routes have been introduced, including CountryExpress! Routes C and E, CityExpress! Routes A and B, and Route 1L. These routes provide limited-stop service, and many of them operate on the H-1 Freeway for a portion of their route. Other routes, such as Routes 11, 43, and 52, have been routed onto the H-1 and H-2 Freeways to bypass local traffic on Kamehameha Highway. All these routes provide all-day, seven-day-a-week service. Urban trips have been cut from the system and suburban trips have been added. Schedule performance is monitored and evaluated constantly. TheBus reported a minor increase in speed in FY 2008. This increase from 13.23 miles per hour in FY 2007 to 13.28 miles per hour in FY 2008 is partly attributable to the higher gasoline prices recorded in the later half of the fiscal year when prices were more than \$4.00 per gallon. These higher gasoline prices resulted in lower traffic volumes and less congestion and delay for transit. Since gasoline prices have declined, traffic volumes have increased on roadways with a corresponding impact on speeds.

The Draft and Final EISs are a summary of more detailed technical reports prepared for each discipline covered in the document, including for Section 3.4.2 of the Draft and Final EISs. The information about travel speed, reliability, access, transfers, comfort and convenience, and user benefits is discussed in more detail in the Transportation Technical Report (RTD 2008a), Addendum 02 to the Transportation Technical Report (RTD 2009), Travel Forecasting Results and Uncertainties Report (RTD 2009), and the Model Development, Calibration, and Validation Report (RTD 2009f). These reports are available at libraries, City and County of Honolulu offices, and on the project website at www.honolulutraffic.org.

The Project has analyzed express service; however, such service would not provide substantially improved travel times for most users and could be a source of confusion for some riders. Trains will operate every three minutes in each direction during peak periods and will take 42 minutes to travel from East Kapolei to Ala Moana Center. The planned operation will accommodate future demand projected for the Project.

The reference in Chapter 4 to the \$1.2 million loss in tax revenue will be more than offset by growth in the corridor. The number is stated to reflect the fact that portions of properties along the route will be acquired to accommodate the Project, taking them off taxpayer roles. The \$1.2 million is a very small portion of the total annual revenue from property taxes. As noted in Section 4.18 of the Draft EIS, based on experience in other cities, the loss will be more than made up by increases in property value as a result of the Project. The City may also decide to follow your suggestion and modify zoning in some areas, but the shortfall will be covered even if that does not occur.

Potential impacts for community services and facilities were presented in Section 4.4.3 of the Draft EIS and Section 4.5.3 of the Final EIS. General mitigation measures are also

presented; individual mitigation measures specific to each parcel will be developed as Final Design progresses.

Aesthetic and visual consequences of the Project are presented in Section 4.8.3 of the Final EIS. Within the urban core neighborhoods of Kalihi-Palama, Downtown, Ala Moana-Kakaako, Waikiki, and McCully-Moilili, the scale of transit development will not dwarf the surrounding architecture. As the Airport Alternative was selected as the Preferred Alternative for the Final EIS, the fixed guideway will not dwarf the airport facilities. For those neighborhoods in West Oahu (Ewa, Waipahu, Pearl City, and Aiea), the route for the fixed guideway will be within the heavily traveled corridors of Farrington and Kamehameha Highways and will not dwarf these roadways. The scale of development and redevelopment will be consistent with adopted State and Local plans and policies identified in Section 4.2.2 of the Final EIS.

The analysis presented is an operational analysis of the Project's design year, as required by NEPA. It is neither a life-cycle analysis nor a probabilistic analysis. The analysis is a comparative analysis among alternatives. Section 4.9.3 of the Final EIS discusses environmental consequences and mitigation for air quality. This includes updated regional pollutant emissions. For details on these calculations, including margin of error, refer to the [Air Quality and Energy Technical Report \(2008g\)](#) available at libraries, City and County of Honolulu offices, and on the project website at www.honolulutraffic.org.

Pre-construction surveys will be conducted by the contractor in areas where vibration may be present due to construction activities. Section 4.10.3 of the Final EIS states that vibration levels at adjacent properties will not exceed 65 VdB for the elevated rail transit. This level is less than the FTA criterion of 72 VdB for residential buildings and other structures where people normally sleep.

Your next comments on specific pages, figures, and/or tables of the Draft EIS will be addressed paragraph by paragraph in bullets for ease of following:

- Your comment on Page 4-9 - As stated in Section 4.14 of the Draft EIS, most existing trees along Farrington Highway can be transplanted. In addition to transplanting existing trees, plans for new plantings will be prepared by a landscape architect during Final Design to further mitigate effects to street trees. If new plantings do not offer equitable mitigation (e.g., older mature trees that are removed), additional younger trees will be planted that will, in time, develop similar benefits. Your suggested change will not be made in the Final EIS.*
- Your comment on Page 4-13 -: As discussed in Chapter 2 of the Final EIS, the East Kapolei Station is located on North-South Road (under construction) near the planned Salvation Army Kroc Center, and approximately 1 mile Koko Head of the UH West Oahu Station. This area of East Kapolei is undergoing development that will be a mixture of residential, recreational, educational, industrial, and commercial land uses. The location of the terminus will support one of the project goals to "improve access to planned development to support City policy to develop a second urban center," as defined in the Ewa Development Plan. As part of this development, the immediate area is also planned for a future Department of Hawaiian Home Lands housing development. Kroc Center, scheduled to open in 2010, will be a 15-acre family support, education, recreation, and cultural arts facility for the general public and will provide services*

for low-income children, seniors, and families. Projected year of opening (2019) ridership shows that the East Kapolei Station will have among the highest boardings in the system.

- *Your comment on Page 4-20: The Ewa Plain has land that is classified as farmland and prime agricultural land. Some of this land has been designated for development in the Ewa Development Plan. Transit-oriented development will occur in these areas and will provide some of the transit riders. Other transit riders will drive or take buses from outlying areas to the stations in the Ewa Plain.*
- *Your comment on Figure 4-7, Designated Agricultural Lands, Kapolei to Fort Weaver Road: The figure was updated in the Final EIS to reflect the location of actively cultivated farmland. The calculations used in the Draft EIS are correct; however, the hatched graphic representation in the figure was updated to match the aerial photography.*
- *Your comment on Page 4-27: The Draft EIS fully discloses the methods used to estimate residential and business displacements. These methods are consistently applied throughout the Draft EIS to evaluate alternatives with one another. The additional cost of performing door-to-door interviews would not change the results of the analysis.*
- *Your comment on Table 4-5: Land uses for each parcel acquisition are provided in Appendix B to the Draft EIS. Updated information on parcel acquisition is shown in Appendix C of the Final EIS.*
- *Your comment on Page 4-46: Section 4.3.3 of the Draft EIS states, "It is assumed that for properties that would be partially acquired, existing land uses would not change." The emphasis is on partial acquisition; the methodology for differentiating "partial" and "full" acquisitions is defined in Section 4.3.1 of the Draft EIS.*

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- *Reduce the time that each area will experience traffic and community disturbances.*

- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*
- *Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- *Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

- *Your comment on Page 4-33: Thank you for your comment. Your suggested correction has been noted and the sentence under the "Cemeteries" heading has been revised to state, "One near Aloha Stadium and one near Waimano Home Road are adjacent to the alignment."*
- *Your comments on Page 4-55: As described in Section 4.6.5 of the Draft EIS, income determinations were made for the census tracts and are presented in Table 4-9. Currently, the U.S. Census does not publish data at the census block level. Public outreach described in Section 4.6.4 of the Draft EIS did identify the Banana Patch community even though available data from the U.S. Census and the OahuMPO method did not identify this community as an Environmental Justice population. Adding the individual income determinations would not change the conclusion for the analysis of the Banana Patch community. In addition, an update to the community outreach activities that have occurred since publication of the Draft EIS for the Banana Patch community is presented in Section 4.7.5 of the Final EIS.*

Specific mitigation measures for individual properties that are displaced will be developed on a case-by-case basis as the design progresses and the number and amount of partial and full acquisitions are refined. The City has been coordinating with residents of the Banana Patch community since October 2008. Every household has been visited by City staff, right-of-way staff, and engineering staff to discuss the Project as well as special needs and relocation assistance for residents who will be displaced. At the time the Draft EIS was published, community cohesion was assumed to be a concern of the residents of the Banana Patch. After meeting with the residents of this community, the City learned that the residents were primarily interested in the right-of way process and relocation issues. Therefore, community cohesion was removed from the Final EIS as a concern. The City will continue to work with individual

property owners to provide relocation services. Section 4.4.3 in the Final EIS states, "...to all affected business and residential property owners and tenants without discrimination; persons, businesses, or organizations that are displaced as a result of the Project will be treated fairly and equitably." The Project will follow the requirements of the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act and the USDOT's implementing regulations of 49 CFR Part 24.

This Act provides for purchase at fair market value and includes relocation assistance to those affected. It also requires that those in need of relocation be placed in comparable quarters.

- Your comment on Table 4-10: The analysis of visual and aesthetic resources in Section 4.7 of the Draft EIS recognizes that the guideway and stations will noticeably contrast with smaller buildings and that these project elements will be prominent or dominant, depending on context. In addition, views will be blocked and some views will change substantially. Overall, the Project will be set in an urban context where visual change is expected and differences in scales of structures are typical. Project impacts are minimized whenever possible; however, avoidance of all impacts is not always possible. Accurate disclosure of impacts must be discussed in environmental documents. See the visual section of the Final EIS, Section 4.8, as it has been updated and expanded with additional view analysis since the Draft EIS.*
- Regarding utilities in simulated photos: The open portion of the guideway structure contains tensioning cables and is not available for utilities. In addition, future maintenance access for the utilities would require openings in the structure, which would weaken it. Access would either have to be provided from below with a lift-truck or would require closure of the transit operations from above.*
- Your comment on Figure 4-19: The streetlight shown is well beyond the area that will be affected by construction of the Project and likely will not be modified.*
- Your comment on Figure 4-24: Plans for new tree plantings will be prepared by a landscape architect during Final Design. Details can be found in Section 4.15 of the Final EIS.*
- Your comments on Figure 4-25: Your comment is acknowledged. The caption has been revised to state, "The guideway will be more visible than the highway in the background. It will also noticeably conflict with the views' character."*
- (Your letter states Figure 25 however the language is on Figure 4-28 of the Draft EIS) Figure 4-28 of the Draft EIS states, "The Kapalama Station and guideway would be dominant features in views along Dillingham Boulevard. The existing trees would soften this effect." The statement has been revised as follows, "...remaining trees will soften this effect." It is true that some existing trees will be removed to build the Project. The Draft EIS states, "effects to trees would be mitigated by transplanting existing trees or planting new ones." Specific sites for relocating trees will be considered during Final Design when plans for*

new plantings will be prepared by a landscape architect. Depending on the specific area and the size and type of existing trees, trees will help soften the guideway structures in some view planes. Details can be found in Section 4.15.3 of the Final EIS.

- *Your comment on Figure 4-29: The Alternatives Screening Memorandum (DTS 2006a) recognized the visually sensitive areas in Kakaako and Downtown Honolulu, including the Chinatown, Hawaii Capital, and Thomas Square/Academy of Arts Special Design Districts. To minimize impacts on historic resources, visual aesthetics, and surface traffic, the screening process considered 15 different combinations of tunnel, at-grade, or elevated alignments between Iwilei and Ward Avenue. Five different alignments through Downtown Honolulu were advanced for further analysis in the Alternatives Analysis, including an at-grade portion along Hotel Street, a tunnel under King Street, and elevated guideways along Nimitz Highway and Queen Street.*

The Alternatives Analysis Report (DTS 2006b) evaluated the alignment alternatives based on transportation and overall benefits, environmental and social impacts, and cost considerations. The report found that an at-grade alignment along Hotel Street would require the acquisition of more parcels and affect more burials than any of the other alternatives considered. The alignment with at-grade operation Downtown and a tunnel through the Capital Historic District, in addition to the environmental effects such as impacts to cultural resources, reduction of street capacity, and property acquisition requirements of the at-grade and tunnel sections, would cost more than \$300 million more than the least expensive alternative.

The Project's purpose is "to provide high-capacity rapid transit" in the congested east-west travel corridor. The need for the Project includes improving corridor mobility and reliability. The at-grade alignment would not meet the Project's Purpose and Need because it could not satisfy the mobility and reliability objectives of the Project. Some of the technical considerations associated with an at-grade versus elevated alignment through Downtown Honolulu include the following:

- **System Capacity, Speed, and Reliability:** *The short, 200-foot blocks (or less) in Downtown Honolulu would permanently limit the system to two-car trains to prevent stopped trains from blocking vehicular traffic on cross-streets. Under ideal circumstances, the capacity of an at-grade system could reach 4,000 passengers per hour per direction, assuming optimistic five minute headways. Based on travel forecasts, the Project will need to carry approximately 8,000 passengers by 2030. Moreover, the system can be readily expanded to carry over 25,000 in each direction by reducing the interval between trains (headway) to 90 seconds during the peak period. To preserve a comparable system capacity, speed, and reliability, an at-grade alignment would require a fenced, segregated right-of-way that would eliminate all obstacles to the train's passage, such as vehicular, pedestrian, or bicycle crossings. Even with transit signal priority, the at-grade speeds would be slower and less reliable than an elevated guideway. The at-grade system would travel at slower speeds due to the shorter blocks, tight and short radius curves in places within the constrained and congested Downtown street network, the need to obey traffic regulations (e.g., traffic signals) along with other vehicles, and potential conflicts with other at-*

grade activity such as cars, bicyclists, and pedestrians. These effects mean longer travel times and far less reliability than a fully grade-separated system. None of these factors affect an elevated rail system. The elevated rail can travel at its own speed any time of the day regardless of weather, traffic or the need to let cross traffic proceed at intersections.

- **Mixed-Traffic Conflicts:** *With the planned three-minute headways, the short cycle of traffic lights would affect traffic flow and capacity of cross-streets. Furthermore, there would be no option to increase the capacity of the system by reducing the headway to 90 seconds. An at-grade system would also require removal of two or more existing traffic lanes on affected streets. This effect is significant and would exacerbate congestion for those who choose to drive. Congestion would not be isolated to the streets that cross the at-grade alignment but instead would spread throughout Downtown. The Final EIS shows that the Project's impact on traffic will be isolated and minimal, and in fact will reduce system-wide traffic delay by 18 percent compared to the No Build Alternative (Table 3-14 in the Final EIS). That is because the elevated guideway will require no removal of existing travel lanes, while providing an attractive, reliable travel alternative. When traffic slows, or even stops due to congestion or incidents, the elevated rail transit will continue to operate without delay or interruption.*

The at-grade light rail, with its continuous tracks in-street will create major impediments to turning movements, many of which would have to be closed to eliminate a serious crash hazard. Even where turning movements are designed to be accommodated, at-grade systems experience significant collision problems. In addition, mixing at-grade fixed guideway vehicles with cars, bicyclists, and pedestrians presents a much higher potential for conflicts compared to grade-separated conditions. Where pedestrian and automobiles cross the tracks in the street network, particularly in areas of high activity (e.g., station areas or intersections), there is a risk of collisions involving trains that does not exist with an elevated system. There is evidence of crashes between trains and cars and trains and pedestrians on other at-grade systems throughout the country. This potential would be especially high in the Chinatown and Downtown neighborhoods, where the number of pedestrians is very high and the aging population presents a particular risk.

- **Construction Impacts:** *Constructing an at-grade rail system could have more effects than an elevated system in a number of ways. The wider and continuous footprint of an at-grade rail system compared to an elevated rail system (which touches the ground only at discrete column foundations, power substations and station accessways) increases the potential of utility conflicts and discovery of sensitive cultural resources. In addition, the extra roadway lanes taken away for the system would result in increased congestion or require that additional businesses or homes be taken to widen the roadway through Downtown. Additionally, the duration of short-term construction impacts to the community and environment with an at-grade system would be considerably greater than with an elevated system. Because of differing construction techniques, more lanes would need to be continuously closed for at-grade construction and the closures would last longer than with elevated construction. This would result in a greater*

disruption to business and residential access.

Because it is not feasible for an at-grade system through Downtown to move passengers rapidly and reliably without significant detrimental effects on other transportation system elements (e.g., the highway and pedestrian systems, safety, reliability, etc.), an at-grade system would have a negative system-wide impact that would reduce ridership throughout the system. The at-grade system would not meet the Project's Purpose and Need and, therefore, does not require additional analysis.

DTS considered your request to revise Figure 4-29. However, it was determined that the simulation presented in the Draft EIS adequately represents the Project. The simulations are primarily intended to represent the scale and spatial relationships of the project elements to other objects.

- Your comment on Figure 4-36: The structural size depicted is approximately correct based on structural load analysis and will be confirmed during Final Design. As described in the Draft EIS, the simulations show type, size, and location of features, but final finishes have not been determined.*
- Your comment on Page 4-93: Since providing access for maintenance and repair could affect system reliability, utilities will not be hung from the structure. Structural aesthetic features are still under revision. Tinted concrete is being considered and may be used. Column type will not substantially change column size. Steel supports would result in a mix of materials between support and structure, creating a visual incongruence.*
- Your comment on Page 4-99: The geologic strata are a factor, but since this is an elevated system, the only contact with the ground is the support columns; therefore, any vibration created by trains is dampened by the support columns and not transmitted into the ground.*

Your letter also contained several comments and questions regarding endangered and protected waterbirds and their habitats. We are not aware of any studies that investigate the impacts of development on waterbirds and their habitats. The Project will not convert waterbird habitat, including wetlands, into transportation facilities. The Project will stay within existing roadway corridors along most of its route; however, some upland sites are planned for a maintenance and storage facility and park-and ride lots, but they are not close to any waterbird habitat.

Although this Project did not monitor the noise intensity, duration, or other environmental impacts associated with construction of existing facilities near waterbird habitat, it is expected that construction of the Project will be similar and comparable to the construction effects of existing facilities, although not equivalent in all aspects at all times. In addition, you are correct that there are virtually no areas along the corridor, in proximity to waterbird habitat, where there has not been major construction of roads, utility lines, bridges, elevated freeways, buildings, and other existing structures.

The standard error, not the margin of error, of the following parameters was presented in the Honolulu High-capacity Transit Corridor Project Ecosystems and Natural Resources

Technical Report (RTD 2008j): The average number of individuals of each species per station and the average number of species per station or average richness for each corridor segment. By providing the standard error of the averages and the sample size, the data provide what is conventionally required in the presentation of averages. From these statistics, one can derive confidence limits for the estimated population parameter, if desired.

The accuracy of these parameters cannot be guaranteed nor do they have to be. The true values of the population parameters will almost always remain unknown, and therefore, it is common to estimate the reliability of the estimated parameter by setting confidence limits to it. There is no way to guarantee that the estimate, such as the average number of zebra doves at each point count station, is accurate. We can only express the degree of confidence in the average as a probability.

Field surveys were observations conducted while walking or driving around. Confidence limits cannot be placed on such observations since the manner in which the observations were conducted do not lend themselves to statistical analyses. However, what we say we saw, not how many, is accurate.

How confident we are in the estimate of population parameters has no bearing on whether there is a potential for environmental impacts, regardless of species. The design of the point counts was to determine what birds were present along the corridor and provide an index of abundance. Field surveys were designed to record what species were observed there.

The Ecosystems and Natural Resources Technical Report (RTD 2008j) states that, "White terns may be directly affected by the Project between Kalihi to University and Waikiki because this species uses mature canopy trees as roosting and nesting sites almost exclusively. These trees could be affected by construction of the fixed guideway system."

VanderWerf (2003) indicates that while the white tern population on Oahu is still relatively small and restricted in range, it is increasing and robust. While white tern habitat is limited to large trees in southeastern Oahu, VanderWerf also indicates that if the population grows, they may move inland to other coasts of the island and to other islands. While not as comprehensive, our tern sightings during observations along the corridor show a similar geographic distribution as VanderWerf found in 2001 to 2003. Therefore, we can state that the tern population on Oahu still has area to expand (Vanderwerf, E.A. 2003. "Distribution, abundance, and breeding biology of white terns on Oahu, Hawaii." *Wilson Bull.*, 115(3):258-262).

The procedures for field surveys were presented in Section 3.12 of the Ecosystems and Natural Resources Technical Report (RTD 2008j), which can be found at the Department of Transportation Services, City and County of Honolulu offices, and on the project website (www.honolulutransit.org).

Scott, et al., (1986) used an eight-minute count period for their variable circular plot method to estimate bird densities in Hawaiian forests. They determined that the interval was long enough to allow an observer to accurately record all birds observed.

The count period was selected as a compromise between efficiency and effectiveness. Point counts by Blondel, et al., (1981) were conducted for 20 minutes, and as the commenter

points out, studies by Dettmers, et al., (1999) (not Bartlett, et al.) indicate that 5- or 10-minute intervals are adequate (Scott. J.M., S. Mountainspring, F.L. Ramsey, C.B. Cameron. 1986. "Forest bird communities of the Hawaiian Islands: Their dynamics, ecology, and conservation." Studies in Avian Biology No. 9, Blondel, J., C. Ferry, and B. Frochot. 1981. "Point counts with unlimited distance." Studies in Avian Biology No. 6:414-420. Cooper Ornithological Society, Dettmers, R., D. A. Buehler, J.G. Bartlett, and N.A. Klaus. 1999. "Influence of point count length and repeated visits on habitat model performance." JWM 63(3):815-823. 1999).

The authors (Dettmers, et al., 1999) did not recommend two visits, but stated that the one visit data did not perform as well in their model. Their quote: "The current point count recommendations also suggest conducting only 1 visit/point, but we found that models developed from 2 visits/point consistently performed somewhat better than single visit models across all count durations and species. We concluded that conducting 2 visits/point will likely result in habitat models that perform better than models developed from a single visit. However, as with count duration, the potential benefits of increased model performance should be weighed against the additional costs in time and resources required to complete extra visits to each point."

Regardless, during the alternative routes analyses, each route was surveyed once via the modified point-count method using eight-minute count periods. After the Preferred Alternative route was selected, this route was re-sampled using the same method giving two samples to determine the presence or absence of species and their relative abundance.

Lastly, point counts were conducted from 7 a.m. to 11 a.m. All birds heard and seen were recorded, and no aural stimuli were used.

The Water Quality Impact Assessment was part of the Water Resources Technical Report (RTD 2008k) and is available to the public on the Technical Report CD-ROM that was part of the Draft EIS, which is available from DTS, on the project website at www.honolulultransit.org or at libraries where the Draft EIS was available for public review. A Water Quality Impact Assessment was reviewed by the U.S. Environmental Protection Agency (EPA). Permanent Best Management Practices (BMPs) will include vegetated swales, retention ponds, and grit removal structures as well as other methods and are discussed in Section 4.18.10 of the Final EIS.

No pollutants will be generated on the guideway as pollutant loading is not typical for electrical propulsion transit (APTA 2003). Due to the power requirements of the guideway, however, emissions will be generated offsite at the power plant. While these emissions have not been quantified, the energy analysis indicates that the Project will require 2 percent less energy than the No Build Alternative. This analysis accounts for both roadway vehicle propulsion energy and light rail transit power requirements. Based on this, it is expected that the total emission burden generated by the Project will be lower than that for the No Build Alternative.

Yes, floodplains can have other functions besides groundwater recharge and infiltration, but in this urban area, these are the major functions. The word "only" was replaced by "major" in the Final EIS.

In addition, the foundations can affect one or both of the groundwater systems on Oahu. Most of the foundations and drilled shafts will be completed in the water table aquifer, which is

generally non-potable and used for irrigation water or industrial uses. The critical groundwater system you are more likely referring to is the Southern Oahu Basal Aquifer, which was designated a Sole Source Aquifer by EPA. In order for a federally-funded project to be built above a designated Sole Source Aquifer, a Ground Water Impact Assessment must be prepared to meet the coordination requirements of Section 1424(e) of the Safe Drinking Water Act. After evaluating the Ground Water Impact Assessment completed for this Project, EPA concurred that the Project should have no significant impacts on groundwater, either during long-term operation of the system or during its construction. The vast majority of the drilled shafts will not penetrate the aquifer, and those that do will only penetrate by a few tens of feet. The shafts will be quickly filled with concrete to seal off any possible route in which contaminants could enter the aquifer. The Ground Water Impact Assessment is available to the public as part of the Water Resources Technical Report (RTD 2008k), which is included on the Technical Report CD-ROM that was part of the Draft EIS. Efforts will be made to either reuse the material removed for the foundations when possible or properly disposed of it at a site permitted by the Hawaii Department of Health.

This list of methods to limit the volume of hazardous materials used and the extent of worker exposure provides examples of how worker exposure will be limited. In addition, the Project will comply with applicable rules and regulations, such as those of the U.S. Occupational Safety and Health Administration and the Hawaii Occupational Safety and Health Division. Workers will be required to comply with material labels.

To address your next comment, there are no Leadership in Energy and Environmental Design (LEED) standards for transit systems. Project buildings, such as the maintenance and storage facility, will be built considering LEED principles.

Regarding corrosion, control measures will be applied to the Project's fixed-steel facilities and neighboring utility structures to provide proper operation over their lifetime. These measures include the following:

- Protective coating specification for steel aerial structures.
- Coating specification for stations.
- Preventive measures against stray current corrosion.
- Corrosion-control design of transit underground utilities and neighboring utilities owned by others.

The next concerns in your letter addressed ridership. By City Council's current policy, ridership on the entire transit system is expected to pay for between 27 and 33 percent of the annual operating and maintenance costs. The City Council will adjust the fare to maintain that level of revenue. The balance of the operations costs will be part of the City's annual budget, which includes sources currently used for TheBus: Federal funding and subsidies from the City's General and Highway Funds.

The amount of service provided will be scaled to generally match demand. If the service attracts fewer riders than expected, then less service may be provided by adjusting headways or train length, which would result in lower-than-expected operating and maintenance costs. The

Mr. Aaron Erickson
Page 15

ridership estimate is presented in Section 3.4.2 of the Final EIS. The forecast is that 116,000 people will ride the system every day. The anticipated limits for guideway ridership in 2030 is expected to be between 105,000 to 130,000 trips per day, bracketing the official forecast of 116,000 riders a day used for all calculations. This is very high ridership, which further indicates how badly needed the system is and will be in the future.

You also had a question about lanes being taken away during construction. As discussed in Chapter 3 of the Final EIS, a Maintenance of Traffic (MOT) Plan will identify measures to mitigate temporary construction-related effects on transportation. The contractor will develop the MOT Plan, and it must be approved by the City and/or the Hawaii Department of Transportation. The MOT Plan will address temporary lane closures and duration for streets identified in Table 3-27 of the Final EIS. Rerouting plans will be included in the MOT Plan.

The direct comparison of carbon dioxide emissions between automobiles and transit rail cannot be made without knowing the energy sources providing the electricity. The utility (HECO) that will provide electricity for the Project primarily uses fuel oil to generate electricity, but the HECO grid is supplemented with independent power producers that generate electricity through renewable resources. As noted in Section 4.9.3 of the Final EIS, the Project will result in a daily reduction of 171 metric tons of carbon dioxide when compared to the No Build Alternative. For an at-capacity system, approximately 25 grams of carbon dioxide are emitted per passenger mile. Approximately 150 grams of carbon dioxide are consumed per 1/50th of a gallon of gasoline consumed.

As noted in Section 4.11.1 of the Final EIS, an average rail vehicle consumes 62,700 British thermal unites (BTUs) per vehicle mile of service. A single vehicle has a capacity of approximately 160 passengers. Therefore, approximately 390 BTUs are consumed per passenger mile at capacity. Consumption of 1/50th of a gallon of gasoline consumes 2,500 BTUs.

Lastly, the Project will consume approximately 1 to 2 percent of the total projected electricity generated on Oahu in 2030. The planned electricity generation capacity on Oahu will be sufficient to support the transit system, but the electricity distribution system will require various upgrades to support the system.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Enclosure

Subject: FW: Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Project

From: ernst [mailto:blernst@hawaii.r.com]
Sent: Wed 2/4/2009 4:32 PM
To: wyoshioka@honolulu.gov; Matley, Ted <FTA>
Subject: Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Project

Dear Mr. Wayne Y. Yoshioka and Mr. Ted Matley:

I am concerned about the transit choice since it appears that "Steel wheels on steel rails" was selected by the Mayor before any meetings were held or any facts collected from each of the manufacturers of other systems.

There are other methods that are quieter and cheaper to build. A few, such as "Maglev" could be built and the savings used for additional miles of track and additional stations for the same overall cost of Steel Wheels on Steel Rails. We need a system that serves the University of Hawaii, the International Airport and communities all the way out to the West coast of Oahu. The system should be built as a single project, with all of the track and stations in one project, and it should be built as quickly as possible rather than a project that takes forever.

You should use monetary incentives in the contracts that reward construction companies for completing projects ahead of schedule.

Conversely, the same companies should be fined for exceeding projected completion dates on specific portions of the project. The construction of the Federal Prison at the Honolulu Airport is a wonderful example of how construction should proceed. It was built quickly and went into operation rapidly.

The draft Environmental Impact Statement for the city's rail transit project is unacceptable because it is written solely for a steel wheel on steel rail system. There are other forms of fixed rail that may be better, quieter and more cost-effective

than steel wheels. Please rewrite this EIS to cover the other technologies, such as monorail and maglev, to ensure that the city will obtain the best transit system and at the best price.

Sincerely,
William L. Ernst

Dear Mr. Ernst:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

No comparative project has ever been built within the U.S. Therefore, no data is available to support a cost estimate. Some of the savings recognized in other countries for beam-track vehicles would not apply in the U.S. because of requirements to include an emergency egress walkway. Also, the smaller structures proposed in the comment result in shorter span-lengths, which increases the number of columns required and the cost to construct both the additional foundations and columns.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka", is written over the typed name.

Submission Content/Notes : I am a support of rail even though I will rarely use it. It will take time for ridership to reach its peak given the fact that builders and businesses will adjust to having the rail in Honolulu. However, I see no incentives to ride these public transits, including TheBus, even if they are near me. Sure, it is less expensive, but it's not enough to remind people there are alternative ways of travel.

The City should consider a permit auction or a density compensation fee for new cars arriving in Honolulu. Cars arriving to the islands should be limited or controlled. A limited number of new car permits should be auctioned, and/or fees assessed on each new car sold or arriving in Honolulu. A one-time cost of, say \$500 or \$1000, to each car brought to the islands would encourage resell of existing cars, reduce future traffic growth, and help encourage those living near the rail systems and bus systems to use them and dispersing the number of new cars owned by everyone else.

The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses comments regarding the above-referenced submittal:

Your idea to limit the number of vehicles on Oahu could reduce traffic; however, it is outside the DTS' authority to implement. In addition, limiting the number of vehicles would not meet the Project's stated goals to improve mobility or transportation equity.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulustransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Issuance of the Record of Decision under NEPA and acceptance of the Final EIS by the Governor of the State of Hawaii are the next anticipated actions and will conclude the environmental review process for this Project.

Very truly yours,

The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the

Imoa Faletogo
Page 2

Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Mr. Wayne Y. Yoshioka
Department of Transportation Services
City and County of Honolulu
650 King Street, 3rd floor
Honolulu, HI 96813

Dear Mr. Yoshioka,

Thank you for the opportunity to share our concerns and questions related to the Honolulu Rail Transit project and its potential effect on our business. We understand the complexities of such a massive undertaking and we hope our comments may assist the process.

While we have a number of stores along the proposed route, this letter is specific to our Zippy's Dillingham restaurant, located at 1210 Dillingham Boulevard, within a shopping and business complex. We opened in July 1980 and serve the local community through our 24 hour restaurant, fast food operation and bakery. As you may know, over the years our establishment has become a favorite spot for residents, students and employees of businesses in Kapalama and its surrounding areas.

Our comments and concerns on the potential effects of the project are as follows.

1. **Impact of construction on our customer experience.** As our store sits on property immediately adjacent to Dillingham Boulevard and the proposed rail route, we anticipate being adversely affected by noise and dust, dewatering and excavation. We would appreciate information at least 90 days in advance on specific construction scheduling, including dates and time of day as well as proposed methods to minimize impact.
2. **Impact on traffic.** We have entrances off of Dillingham for Koko Head and Ewa bound traffic that are critical to our customer flow and must remain unobstructed throughout the process. We would also be concerned with any restriction of traffic flow Koko Head bound turning left from Dillingham Boulevard onto Kohou Street as well as vehicle and pedestrian access across the bridge over Kapalama Stream. As this thoroughfare is already heavily congested during early morning and mid afternoon hours, we expect that construction will further impede customer access to our store, extend our employees' commutes and delay deliveries. Advanced information on proposed traffic flow during the various stages of construction would be beneficial.
3. **Street Upgrades.** With the opening of the stations, we foresee a need to improve the crosswalks across Dillingham Boulevard in consideration of the safety of increased pedestrian traffic moving to and from the station and the neighboring businesses. We are particularly concerned for the safety of our

- employees and customers using the rail during evening and early morning periods when proper lighting is essential.
4. **Available Parking.** We understand that the Kapalama Station will include parking and unless adequate stalls are available, rail user parking may overflow into our shopping complex's lot. Specifics on the station, its parking capacity and overflow contingency plans would be appreciated.
 5. **Store Visibility.** Dependent on the height of the rail and the placement of the support columns, we have concerns the visibility of our restaurant and its signage from the eastbound lanes and from across the street. We would be interested in how this circumstance might be addressed.
 6. **RPT Considerations.** We would be interested in any adjustments the county is considering for real property taxes for those areas immediately impacted by construction and rail operation. In addition, we'd like to know what mechanisms might be instituted to require "pass through" of any related savings from landlord to tenant.

In general, timely communication of the final plans for construction and information on the operation of the rail transit system would be crucial for our store, our patrons and neighbors along the route. We intend to be proactive and prepare ourselves for the temporary disruptions brought by construction and more importantly to evolve our products and services as customer habits and the business landscape change with the introduction of rail service.

While we have listed our major concerns please be assured that we also appreciate the many benefits and opportunities development of rail transit will bring to our island. Please feel free to contact me directly if you require further clarification on any of the above.

Sincerely,

Dear Mr. Yokota:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal for Zippy's Dillingham, 1210 Dillingham Boulevard:

Your comments will be addressed in the same manner as submitted.

1. *Construction*

Section 4.18.1 of the Final EIS discusses the effects construction will have on businesses. Communication and coordination with businesses will occur throughout the construction period. Access to businesses near construction activities could be temporarily affected, but access will be maintained.

The contractor will be given parameters, such as the number of lanes that may be closed and the procedures for closures, and will develop a Maintenance

of Traffic (MOT) Plan that must be reviewed and approved by the City and/or the Hawaii Department of Transportation (HDOT).

Proposed mitigation may include the following:

- Coordinate construction planning and phasing with nearby property owners and businesses.*
- Develop a public involvement plan prior to construction to inform business owners of the construction schedule and activities.*
- Initiate public information campaigns, including signs and lighting, to reassure people that businesses are open during construction and to encourage their continued patronage.*
- Minimize the extent and number of businesses, jobs, and access affected during construction.*
- To the extent practicable, coordinate the timing of temporary facility closures to minimize impacts to business activities—especially those related to seasonal or high sales periods.*
- Minimize, as practical, the duration of modified or lost access to businesses.*
- Provide public information (e.g., press releases or newsletters) regarding construction activities and ongoing business activities, including advertisements in print and on television and radio.*
- Phase construction in each area so as to maintain access to individual businesses, pedestrians, bicyclists, passenger vehicles, and trucks during business hours and important business seasons.*
- Provide advance notice if utilities will be disrupted and schedule major utility shutoffs during non-business hours.*

2. Traffic during construction

As discussed in Chapter 3 of the Final EIS, the MOT Plan will identify measures to mitigate temporary construction-related effects on transportation. The contractor will develop the MOT Plan, which will be reviewed and approved by the City and/or HDOT. The MOT Plan will address roadway closures for streets identified in Table 3-27 of the Final EIS. The MOT Plan will also address the relocation of freight loading zones that could be temporarily affected. All left-turns at signalized intersections along Dillingham Boulevard will remain after the guideway is in place.

Section 4.18.1 of the *Final EIS* discusses several public involvement strategies that will be used to inform businesses and the public about construction activities, including roadway detours. These strategies include a public involvement plan developed prior to construction to inform business owners of the construction schedule and activities, public information campaigns to reassure people that businesses are open during construction and to encourage their continued patronage, and public information regarding construction activities and ongoing business activities provided in print and on television and radio.

3. Street upgrades

Over time there could be increased pedestrian traffic around station areas. It is expected that transit patrons and other pedestrians will use existing signalized crosswalks near the station at Kokea and Kohou Streets.

Higher volumes of pedestrians and bicycles are expected near stations. DTS will work with other City departments and HDOT to identify and improve key pedestrian and bicycle routes to stations and to improve overall safety and accessibility near station entrances. All stations will have security lighting.

4. Available parking
