No parking will be provided at the Kapalama Station. Chapter 3 of the *Final EIS* discusses measures to address the effects of parking spillover near stations. As noted in Section 3.4.4 of the *Final EIS*, station areas with the highest estimated demands for spillover parking are at West Loch, Pearlridge, Iwilei, and Ala Moana Center. Section 3.4.7 of the *Final EIS* states that the City will consider strategies in coordination with appropriate stakeholders to mitigate any loss of parking supply and for increased demand from spillover parking near stations.

5. Store visibility

The Project will be set in an urban context where visual change is expected and differences in scales of structures are typical. Section 4.8.3 of the *Final EIS* acknowledges that along Dillingham Boulevard, "mauka-makai views will be obstructed from various points... and visual effects will be moderate." Note that the guideway will be in the highway median, which is a busy thoroughfare comprised of several lanes of traffic, and the support columns will be spaced at substantial intervals of 120 to 150 feet. As part of the *Final Design* process, the DTS has developed specifications and design criteria to address the City's requirements for the Project, which will include final placement of columns. Minimizing effects to adjacent land uses will be a key consideration.

6. RPT considerations

The City has not proposed any property tax rate changes or credits associated with construction of the Project.

Mr. Paul S. Yokota
Page 4

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is written in a cursive, flowing style.

Mr. Wayne Y. Yoshioka
Department of Transportation Services
City and County of Honolulu
650 King Street, 3rd floor
Honolulu, HI 96813

Dear Mr. Yoshioka,

Thank you for the opportunity to share our concerns and questions related to the Honolulu Rail Transit project and its potential effect on our business. We understand the complexities of such a massive undertaking and we hope our comments may assist the process.

While we have a number of stores along the proposed route, this letter is specific to our **Zippy's Pearlridge** restaurant, located at the **Pearlridge Center** on Kamehameha Highway, a major shopping and business complex. We opened in June 1986 and serve the local community through our fast food operation and bakery. As you may know, over the years Zippys has become a favorite spot for residents and employees of businesses in Pearl City and its surrounding areas.

Our comments and concerns on the potential effects of the project are as follows.

1. **Impact of construction on our customer experience.** As our store sits immediately adjacent to the highway, we anticipate being adversely affected by noise and dust, dewatering and excavation. We would appreciate information at least 90 days in advance on construction scheduling including dates and time of day as well as methods proposed to minimize impact.
2. **Impact on traffic during construction.** We would be concerned with any restriction of traffic flow Koko Head bound turning left from Kamehameha Highway onto Pali Momi Street which runs adjacent to the mall. The highway is already heavily congested during early morning and mid afternoon hours and we expect that construction will further impede customer access to our store, extend our employees' commute and delay deliveries. Advanced information on proposed traffic flow during the various stages of construction would be beneficial.
3. **Street Upgrades.** With the opening of the station, we foresee a need to improve the crosswalks across Kamehameha Highway in consideration of the safety of increased pedestrian traffic moving to and from the station and from the businesses on either side of the highway. We are particularly concerned for the safety of our employees and customers using the rail during evening and early morning periods when proper lighting is critical.

4. **Store Visibility.** Dependent on the height of the rail and the placement of the support columns, we are concerned of the visibility of our restaurant and its signage from the eastbound lanes and from across the highway. We would be interested in how this circumstance might be addressed.
5. **Available Parking.** We understand that there may be a private developer involved in the Pearlridge station and we'd be interested in the parking capacity and proposed inclusions in the facility. Should transportation be provided from the station to the mall, and if station parking is inadequate we anticipate passengers attempting to use mall parking facilities instead. We'd appreciate information on proposed overflow parking contingencies.
6. **RPT Considerations.** We would be interested in any adjustments the county is considering for real property taxes for those areas immediately impacted by construction. In addition, we'd like to know what mechanisms might be instituted to require "pass through" of any related savings from landlord to tenant.

In general, timely communication of the final plans for construction and information on the operation of the rail transit system would be crucial for our store, our patrons and neighbors along the route. We intend to be proactive and prepare ourselves for the temporary disruptions brought by construction, and more importantly to evolve our products and services as customer habits and the business landscape change with the introduction of rail service.

While we have listed our major concerns, please be assured that we also appreciate the many benefits and opportunities development of rail transit will bring to our island. Please feel free to contact me directly if you require further clarification on any of the above.

Sincerely,

A handwritten signature in black ink, appearing to read 'Paul S. Yokota', written over a horizontal line.

Dear Mr. Yokota:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal for Zippy's Pearlridge, Pearlridge Center:

Your comments will be addressed in the same manner as submitted.

1. *Construction*

Section 4.18.1 of the Final EIS discusses the effects construction will have on businesses. Communication and coordination with businesses will occur throughout the construction period. Access to businesses near construction activities could be temporarily affected, but access will be maintained.

The contractor will be given parameters, such as the number of lanes that may be closed and the procedures for closures, and will develop a Maintenance of Traffic (MOT) Plan that must be reviewed and approved by the City and/or the Hawaii Department of Transportation (HDOT).

Proposed mitigation may include the following:

- *Coordinate construction planning and phasing with nearby property owners and businesses.*
- *Develop a public involvement plan prior to construction to inform business owners of the construction schedule and activities.*
- *Initiate public information campaigns, including signs and lighting, to reassure people that businesses are open during construction and to encourage their continued patronage.*
- *Minimize the extent and number of businesses, jobs, and access affected during construction.*
- *To the extent practicable, coordinate the timing of temporary facility closures to minimize impacts to business activities—especially those related to seasonal or high sales periods.*
- *Minimize, as practical, the duration of modified or lost access to businesses.*
- *Provide public information (e.g., press releases or newsletters) regarding construction activities and ongoing business activities, including advertisements in print and on television and radio.*
- *Phase construction in each area so as to maintain access to individual businesses, pedestrians, bicyclists, passenger vehicles, and trucks during business hours and important business seasons.*
- *Provide advance notice if utilities will be disrupted and schedule major utility shutoffs during non-business hours.*

2. Traffic during construction

As discussed in Chapter 3 of the Final EIS, an MOT Plan will identify measures to mitigate temporary construction-related effects on transportation. The contractor will develop the MOT Plan, which will be reviewed and approved by the City and/or HDOT. The MOT Plan will address roadway closures for streets identified in Table 3-27 of the Final EIS. The MOT Plan will also address the relocation of freight loading zones that could be temporarily affected. All left

turns at signalized intersections along Kamehameha Highway will remain upon completion of the fixed guideway system.

In addition, Section 4.18.1 of the Final EIS discusses several public involvement strategies that will be used to inform businesses and the public about construction activities, including roadway detours. These strategies include a public involvement plan developed prior to construction to inform business owners of the construction schedule and activities, public information campaigns to reassure people that businesses are open during construction and to encourage their continued patronage, and public information regarding construction activities and ongoing business activities provided in print and on television and radio.

3. *Street upgrades*

The nearby Pearlridge Station will have a concourse connecting both train platforms to entrances on each side of Kamehameha Highway. Therefore, it will not be necessary for transit patrons to cross the highway at-grade. However, over time there could be increased pedestrian traffic around station areas. It is expected that pedestrians in this area will use the existing signalized crosswalk at Kaonohi Street.

Higher volumes of pedestrians and bicycles are expected near stations. DTS will work with other City departments and HDOT to identify and improve key pedestrian and bicycle routes to stations and to improve overall safety and accessibility near station entrances. All stations will have security lighting.

4. *Store visibility*

Store signage that is below the elevation of the guideway will be visible under the guideway to travelers on Kamehameha Highway.

5. *Available parking*

To address your first comment under this heading, a private developer is not involved in the Pearlridge Station. Regarding your second comment, Section 3.4.7 of the Final EIS identifies potential mitigation approaches for parking effects, including spillover parking. As noted in this section, the approaches to mitigating effects of spillover parking will be unique to each station area. Mitigation strategies will be determined in coordination with appropriate stakeholders.

6. *RPT considerations*

The City has not proposed any property tax rate changes or credits associated with construction of the Project.

Mr. Paul S. Yokota
Page 4

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is fluid and cursive, with the first name "Wayne" being the most prominent.

Mr. Wayne Y. Yoshioka
Department of Transportation Services
City and County of Honolulu
650 King Street, 3rd floor
Honolulu, HI 96813

Dear Mr. Yoshioka,

Thank you for the opportunity to express our concerns and questions related to the Honolulu Rail Transit project and its potential effect on our business. We understand the complexities of such a massive undertaking and we hope our comments may assist the process.

While we have a number of stores along the proposed route, this letter is specific to our **Zippy's Waimalu** restaurant, located at **98048 Kamehameha Highway**, adjacent to a shopping and business complex. We opened in April 1972 and we serve the local community through our 24 hour fast food operation and bakery. As you may know, over the years Zippys has become a favorite spot for residents and employees of businesses in Pearl City and its surrounding areas.

Our comments and concerns on the potential effects of the project are as follows.

1. **Impact of construction on our customer experience.** As our store sits immediately adjacent to the highway, we anticipate being adversely affected by noise and dust, dewatering and excavation. We would appreciate information at least 90 days in advance on specific construction schedules, including dates and time of day as well as methods proposed to minimize impact.
2. **Impact on traffic during construction.** We would be concerned with any restriction of traffic flow Koko Head bound turning left from Kamehameha Highway onto Kanuku Street which runs adjacent to our store. We also have a right turn entrance off the highway westbound that is critical to our customer traffic and must remain unobstructed throughout the process. As the highway is already heavily congested during early morning and mid afternoon hours we expect that construction will further impede customer access to our store, extend our employees' commute and delay deliveries. Advanced information on proposed traffic flow during the various stages of construction would be beneficial.
3. **Street Upgrades.** With the opening of the station, we foresee a need to improve the crosswalks across Kamehameha Highway specifically at Kanuku Street in consideration of the safety of increased pedestrian traffic moving to and from the station and from the businesses on either side of the highway. We are

particularly concerned for the safety of our employees and customers using the rail during evening and early morning periods when proper lighting is critical.

4. **Store Visibility.** Dependent on the height of the rail and the placement of the support columns we are concerned of the visibility of our restaurant and its signage from the eastbound lanes and from across the highway. We would be interested in how this circumstance might be addressed.
5. **Available Parking.** We understand that there may be a private developer involved in the Pearlridge station and we'd be interested in the parking requirements as well as the capacity and proposed inclusions in the facility.
6. **RPT Considerations.** We would be interested in any adjustments the county is considering for real property taxes for those areas immediately impacted by construction. In addition, we'd like to know what mechanisms might be instituted to require "pass through" of any related savings from landlord to tenant.

In general, timely communication of the final plans for construction and information on the operation of the rail transit system would be crucial for our store, our patrons and neighbors along the route. We intend to be proactive and prepare ourselves for the temporary disruptions brought by construction and more importantly to evolve our products and services as customer habits and the business landscape change with the introduction of rail service.

While we have listed our major concerns, please be assured that we also appreciate the many benefits and opportunities development of rail transit will bring to our island. Please feel free to contact me directly if you require further clarification on any of the above.

Enclosure

February 3, 2009

Mr. Wayne Y. Yoshioka
Department of Transportation Services
City and County of Honolulu
650 King Street, 3rd floor
Honolulu, HI 96813

Dear Mr. Yoshioka,

Thank you for the opportunity to express our concerns and questions related to the Honolulu Rail Transit project and its potential effect on our business. We understand the complexities of such a massive undertaking and we hope our comments may assist the process.

While we have a number of stores along the proposed route, this letter is specific to our **Zippy's Waiau** restaurant, located at **450 Kamehameha Highway**, in a shopping and business complex. We opened in November 1978 and we serve the local community through our 24 hour fast food operation, restaurant and bakery. As you may know, over the years Zippys has become a favorite gathering spot for residents and employees of businesses in Pearl City and its surrounding areas.

Our comments and concerns on the potential effects of the project are as follows.

1. **Impact of construction on our customer experience.** As our store sits immediately adjacent to the highway, we anticipate being adversely affected by noise and dust, dewatering and excavation. We would appreciate information at least 90 days in advance on specific construction scheduling including dates and time of day as well as methods proposed to minimize impact.
2. **Impact on traffic during construction.** We would be concerned with any restriction temporary or permanent of the u-turn access both Ewa and Koko Head bound through the medial strip on Kamehameha Highway in the store's immediate vicinity. Our main entrance is a right turn off of the highway, Ewa bound which must remain unobstructed throughout the process. As the highway is already heavily congested during early morning and mid afternoon hours, we expect that construction will further impede customer access to our store, extend our employees' commute and delay deliveries. Advanced information on proposed traffic flow during the various stages of construction would be beneficial.
3. **Street Upgrades.** With the opening of the station, we foresee a need to improve the crosswalks across Kamehameha Highway in consideration of the safety of increased pedestrian traffic moving to and from the station landings. We are particularly concerned for the safety of our employees and customers using the rail during evening and early morning periods when proper lighting is critical.

4. **Store Visibility.** Dependent on the height of the rail and the placement of the support columns we are concerned of the visibility of our restaurant and its signage from the eastbound lanes and from across the highway. We would be interested in how this circumstance might be addressed.
5. **RPT Considerations.** We would be interested in any adjustments the county is considering for real property taxes for those areas immediately impacted by construction. In addition, we'd like to know what mechanisms might be instituted to require "pass through" of any related savings from landlord to tenant.

In general, timely communication of the final plans for construction and information on the operation of the rail transit system would be crucial for our store, our patrons and neighbors along the route. We intend to be proactive and prepare ourselves for the temporary disruptions brought by construction, and more importantly to evolve our products and services as customer habits and the business landscape change with the introduction of rail service.

While we have listed our major concerns, please be assured that we also appreciate the many benefits and opportunities development of rail transit will bring to our island. Please feel free to contact me directly if you require further clarification on any of the above.

Dear Mr. Yokota:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal for Zippy's Waiau, 450 Kamehameha Highway:

Your comments will be addressed in the same manner as submitted.

1. *Construction*

Section 4.18.1 of the Final EIS discusses the effects construction will have on businesses. Communication and coordination with businesses will occur throughout the construction period. Access to businesses near construction activities could be temporarily affected, but access will be maintained.

The contractor will be given parameters, such as the number of lanes that may be closed and the procedures for closures, and will develop a Maintenance of Traffic (MOT) Plan that must be reviewed and approved by the City and/or the Hawaii Department of Transportation (HDOT).

Proposed mitigation may include the following:

- *Coordinate construction planning and phasing with nearby property owners and businesses.*
- *Develop a public involvement plan prior to construction to inform business owners of the construction schedule and activities.*
- *Initiate public information campaigns, including signs and lighting, to reassure people that businesses are open during construction and to encourage their continued patronage*
- *Minimize the extent and number of businesses, jobs, and access affected during construction.*
- *To the extent practicable, coordinate the timing of temporary facility closures to minimize impacts to business activities—especially those related to seasonal or high sales periods.*
- *Minimize, as practical, the duration of modified or lost access to businesses.*
- *Provide public information (e.g., press releases or newsletters) regarding construction activities and ongoing business activities, including advertisements in print and on television and radio.*
- *Phase construction in each area so as to maintain access to individual businesses, pedestrians, bicyclists, passenger vehicles, and trucks during business hours and important business seasons.*
- *Provide advance notice if utilities will be disrupted and schedule major utility shutoffs during non-business hours.*

2. *Traffic during construction*

As discussed in Chapter 3 of the Final EIS, an MOT Plan will identify measures to mitigate temporary construction-related effects on transportation. The contractor will develop the MOT Plan, which will be reviewed and approved by the City and/or HDOT. The MOT Plan will address roadway closures for streets identified in Table 3-27 of the Final EIS. The MOT Plan will also address the relocation of freight loading zones that could be temporarily affected. All left turns at signalized intersections along Kamehameha Highway will remain upon completion of the fixed guideway system. The U-turns near the Waiau Zippy's will be removed permanently.

In addition, Section 4.18.1 of the Final EIS discusses several public involvement strategies that will be used to inform businesses and the public about construction activities, including roadway detours. These strategies include a public involvement plan developed prior to construction to inform business

owners of the construction schedule and activities, public information campaigns to reassure people that businesses are open during construction and to encourage their continued patronage, and public information regarding construction activities and ongoing business activities provided in print and on television and radio.

Higher volumes of pedestrians and bicycles are expected near stations. DTS will work with other City departments and HDOT to identify and improve key pedestrian and bicycle routes to stations and to improve overall safety and accessibility near station entrances. All stations will have security lighting.

3. *Street upgrades*

The closest station to this location will be Pearlridge, which will have a concourse connecting both train platforms to entrances on each side of Kamehameha Highway. Therefore, it will not be necessary for transit patrons to cross the highway at-grade. However, over time there could be increased pedestrian traffic around station areas. It is expected that pedestrians in this area will use the existing signalized crosswalk at Kuleana Road.

4. *Store visibility*

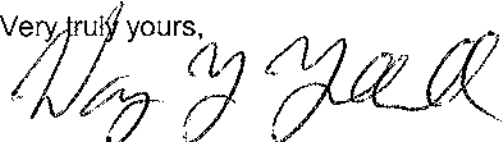

Store signage that is below the elevation of the guideway will be visible under the guideway to travelers on Kamehameha Highway.

5. *RPT considerations*

The City has not proposed any property tax rate changes or credits associated with construction of the Project.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Enclosure

February 3, 2009

Mr. Wayne Y. Yoshioka
Department of Transportation Services
City and County of Honolulu
650 King Street, 3rd floor
Honolulu, HI 96813

Dear Mr. Yoshioka,

Thank you for the opportunity to express our concerns and questions related to the Honolulu Rail Transit project and its potential effect on our business. We understand the complexities of such a massive undertaking and we hope our comments may assist the process.

While we have a number of stores along the proposed route, this letter is specific to our **Zippy's Pearl City** restaurant, located at **806 Kamehameha Highway**, adjacent to a shopping and business complex. We opened in June 1986 and we serve the local community through our 24 hour fast food operation, restaurant and bakery. As you may know, over the years Zippys has become a favorite gathering spot for residents and employees of businesses in Pearl City and its surrounding areas.

Our comments and concerns on the potential effects of the project are as follows.

1. **Impact of construction on our customer experience.** As our store sits immediately adjacent to the highway, we anticipate being adversely affected by noise and dust, dewatering and excavation. We would appreciate specific information at least 90 days in advance on specific construction scheduling including dates and time of day as well as methods proposed to minimize impact.
2. **Impact on traffic during construction.** We would be concerned with any restriction of traffic flow Koko Head bound turning left from Kamehameha Highway onto Puu Momi Street which serves our complex. We also have a right turn entrance off the highway Ewa bound that is critical to our customer traffic and must remain unobstructed throughout the process. The highway is already heavily congested during early morning and mid afternoon hours and we expect that construction will further impede customer access to our store, extend our employees' commute and delay deliveries. Advanced information on proposed traffic flow during the various stages of construction would be beneficial.
3. **Street Upgrades.** With the opening of the stations, we foresee a need to improve the crosswalks across Kamehameha Highway in consideration of the safety of increased pedestrian traffic moving to and from the station landings. We are particularly concerned for the safety of our employees and customers using the rail during evening and early morning periods when proper lighting is critical.

4. **Store Visibility.** Dependent on the height of the rail and the placement of the support columns, we are concerned of the visibility of our restaurant and its signage from the eastbound lanes and from across the highway. We would be interested in how this circumstance might be addressed.
5. **RPT Considerations.** We would be interested in any adjustments the county is considering for real property taxes for those areas immediately impacted by construction. In addition, we'd like to know what mechanisms might be instituted to require "pass through" of any related savings from landlord to tenant.

In general, timely communication of the final plans for construction and information on the operation of the rail transit system would be crucial for our store, our patrons and neighbors along the route. We intend to be proactive and prepare ourselves for the temporary disruptions brought by construction, and more importantly to evolve our products and services as customer habits and the business landscape change with the introduction of rail service.

While we have listed our major concerns, please be assured that we also appreciate the many benefits and opportunities development of rail transit will bring to our island. Please feel free to contact me directly if you require further clarification on any of the above.

Sincerely,

A handwritten signature in black ink, appearing to read 'Paul S. Yokota', written in a cursive style.

Dear Mr. Yokota:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal for Zippy's Pearl City, 806 Kamehameha Highway:

Your comments will be addressed in the same manner as submitted.

1. *Construction*

Section 4.18.1 of the Final EIS discusses the effects construction will have on businesses. Communication and coordination with businesses will occur throughout the construction period. Access to businesses near construction activities could be temporarily affected, but access will be maintained.

The contractor will be given parameters, such as the number of lanes that may be closed and the procedures for closures, and will develop a Maintenance

of Traffic (MOT) Plan that must be reviewed and approved by the City and/or the Hawaii Department of Transportation (HDOT).

Proposed mitigation may include the following:

- Coordinate construction planning and phasing with nearby property owners and businesses.*
- Develop a public involvement plan prior to construction to inform business owners of the construction schedule and activities.*
- Initiate public information campaigns, including signs and lighting, to reassure people that businesses are open during construction and to encourage their continued patronage.*
- Minimize the extent and number of businesses, jobs, and access affected during construction.*
- To the extent practicable, coordinate the timing of temporary facility closures to minimize impacts to business activities—especially those related to seasonal or high sales periods.*
- Minimize, as practical, the duration of modified or lost access to businesses.*
- Provide public information (e.g., press releases or newsletters) regarding construction activities and ongoing business activities, including advertisements in print and on television and radio.*
- Phase construction in each area so as to maintain access to individual businesses, pedestrians, bicyclists, passenger vehicles, and trucks during business hours and important business seasons.*
- Provide advance notice if utilities will be disrupted and schedule major utility shutoffs during non-business hours.*

2. Traffic during construction

As discussed in Chapter 3 of the Final EIS, an MOT Plan will identify measures to mitigate temporary construction-related effects on transportation. The contractor will develop the MOT Plan, which will be reviewed and approved by the City and/or HDOT. The MOT Plan will address roadway closures for streets identified in Table 3-27 of the Final EIS. The MOT Plan will also address the relocation of freight loading zones that could be temporarily affected. All left turns at signalized intersections along Farrington Highway will remain upon completion of the fixed guideway system.

In addition, Section 4.18.1 of the Final EIS discusses several public involvement strategies that will be used to inform businesses and the public about

construction activities, including roadway detours. These strategies include a public involvement plan developed prior to construction to inform business owners of the construction schedule and activities, public information campaigns to reassure people that businesses are open during construction and to encourage their continued patronage, and public information regarding construction activities and ongoing business activities provided in print and on television and radio.

Higher volumes of pedestrians and bicycles are expected near stations. DTS will work with other City departments and HDOT to identify and improve key pedestrian and bicycle routes to stations and to improve overall safety and accessibility near station entrances. All stations will have security lighting.

3. *Street Upgrades*

The closest station to this location will be either Pearl Highlands or Pearlridge, and employees and customers will likely take a bus from one of these stations to reach this location. It is expected that pedestrians in this area will use the existing signalized crosswalk at Puu Momi Street.

4. *Store visibility*

Store signage that is below the elevation of the guideway will be visible under the guideway to travelers on Kamehameha Highway.

5. *RPT considerations*

The City has not proposed any property tax rate changes or credits associated with construction of the Project.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

February 3, 2009

Mr. Wayne Y. Yoshioka
Department of Transportation Services
City and County of Honolulu
650 King Street, 3rd floor
Honolulu, HI 96813

Dear Mr. Yoshioka,

Thank you for the opportunity to share our concerns and questions related to the Honolulu Rail Transit project and its potential effect on our business. We understand the complexities of such a massive undertaking and we hope our comments may assist the process.

While we have a number of stores along the proposed route this, letter is specific to our **Zippy's Waipahu** restaurant, located at **94-180 Farrington Highway**, on the southeast corner of a shopping and business complex. We opened in April 1971, renovated in 2009 and we serve the local community through our 24 hour fast food operation, restaurant and bakery. As you may know, over the years Zippys has become a favorite gathering spot for residents and employees of businesses in Waipahu and its surrounding areas.

Our comments and concerns on the potential effects of the project are as follows.

1. **Impact of construction on our customer experience.** As our store sits immediately adjacent to the highway, we anticipate being adversely affected by noise and dust, dewatering and excavation. We would appreciate specific information at least 90 days in advance on specific construction scheduling including dates and time of day as well as methods proposed to minimize impact.
2. **Impact on traffic during construction.** We would be concerned with any restriction of traffic flow Koko Head bound turning left from Farrington Highway onto Leaku Street which serves our complex. Our store is also directly accessed through a right turn entrance off of the highway, Ewa bound which is our main entrance and must remain unobstructed throughout the process. The highway is already heavily congested during early morning and mid afternoon hours and we expect that construction will further impede customer access to our store, extend our employees' commute and delay deliveries. Advanced information on proposed traffic flow during the various stages of construction would be beneficial.
3. **Availability of parking.** We understand that the Waipahu station will include parking on the makai side of Farrington Highway which is currently occupied by a car lot. We are concerned that unless adequate stalls are available, rail passengers are likely to overflow into our complex's parking lot. Westbound rail

passengers in particular, would be likely to attempt this as the step down for the elevated station lands on our side of the highway. Specifics on the station and its parking capacity and overflow contingency plans would be appreciated.

4. **Street Upgrades.** With the opening of the station, we foresee a need to improve the crosswalks across Farrington Highway, particularly those closest to the Leoku Street in consideration for the safety of increased pedestrian traffic moving to and from the station landings. Employees in the area and customers using the rail will also increase the traffic on these crosswalks.
5. **Store Visibility.** Dependent on the height of the rail and the placement of the support columns, we are concerned of the visibility of our restaurant and its signage from the eastbound lanes and from across the highway. We would be interested in how this circumstance may be addressed.
6. **RPT Considerations.** We would be interested in any adjustments the county is considering for real property taxes for those areas immediately impacted by construction. In addition, we'd like to know what mechanisms might be instituted to require "pass through" of any related savings from landlord to tenant.

In general, timely communication of the final plans for construction and information on the operation of the rail transit system would be crucial for our store, our patrons and neighbors along the route. We intend to be proactive and prepare ourselves for the temporary disruptions brought by construction, and more importantly to evolve our products and services as customer habits and the business landscape change with the introduction of rail service.

While we have listed our major concerns, please be assured that we also appreciate the many benefits and opportunities development of rail transit will bring to our island. Please feel free to contact me directly if you require further clarification on any of the above.

Dear Mr. Yokota:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal for Zippy's Waipahu, 94-180 Farrington Highway:

Your comments will be addressed in the same manner as submitted.

1. *Construction*

Section 4.18.1 of the Final EIS discusses the effects construction will have on businesses. Communication and coordination with businesses will occur throughout the construction period. Access to businesses near construction activities could be temporarily affected, but access will be maintained.

The contractor will be given parameters, such as the number of lanes that may be closed and the procedures for closures, and will develop a Maintenance of Traffic (MOT) Plan that must be reviewed and approved by the City and/or the Hawaii Department of Transportation (HDOT).

Proposed mitigation may include the following:

- Coordinate construction planning and phasing with nearby property owners and businesses.*
- Develop a public involvement plan prior to construction to inform business owners of the construction schedule and activities.*
- Initiate public information campaigns, including signs and lighting, to reassure people that businesses are open during construction and to encourage their continued patronage*
- Minimize the extent and number of businesses, jobs, and access affected during construction.*
- To the extent practicable, coordinate the timing of temporary facility closures to minimize impacts to business activities—especially those related to seasonal or high sales periods.*
- Minimize, as practical, the duration of modified or lost access to businesses.*
- Provide public information (e.g., press releases or newsletters) regarding construction activities and ongoing business activities, including advertisements in print and on television and radio.*
- Phase construction in each area so as to maintain access to individual businesses, pedestrians, bicyclists, passenger vehicles, and trucks during business hours and important business seasons.*
- Provide advance notice if utilities will be disrupted and schedule major utility shutoffs during non-business hours.*

2. Traffic during construction

As discussed in Chapter 3 of the Final EIS, an MOT Plan will identify measures to mitigate temporary construction-related effects on transportation. The contractor will develop the MOT Plan, which will be reviewed and approved by the City and/or HDOT. The MOT Plan will address roadway closures for streets identified in Table 3-27 of the Final EIS. The MOT Plan will also address the relocation of freight loading zones that could be temporarily affected. All left-

turns at signalized intersections along Farrington Highway will remain upon completion of the fixed guideway system.

In addition, Section 4.18.1 of the Final EIS discusses several public involvement strategies that will be used to inform businesses and the public about construction activities, including roadway detours. These strategies include a public involvement plan developed prior to construction to inform business owners of the construction schedule and activities, public information campaigns to reassure people that businesses are open during construction and to encourage their continued patronage, and public information regarding construction activities and ongoing business activities provided in print and on television and radio.

Higher volumes of pedestrians and bicycles are expected near stations. DTS will work with other City departments and HDOT to identify and improve key pedestrian and bicycle routes to stations and to improve overall safety and accessibility near station entrances. All stations will have security lighting.

3. Availability of Parking

The Waipahu and West Loch Stations are not planned to have park-and-ride facilities. As noted in Section 3.4.4 of the Final EIS, station areas with the highest estimated demands for spillover parking are at West Loch, Pearlridge, Iwilei, and Ala Moana Center. Section 3.4.7 of the Final EIS states that the City will consider strategies in coordination with appropriate stakeholders to mitigate for any loss of parking supply and for increased demand from spillover parking near stations.

4. Street Upgrades

The nearby West Loch Station will have a concourse connecting both train platforms to entrances on each side of Farrington Highway. Therefore, it will not be necessary for transit patrons to cross the highway at-grade. However, over time there could be increased pedestrian traffic around station areas. It is expected that pedestrians in this area will use the existing signalized crosswalk at Leoku Street.

5. Store visibility

Store signage that is below the elevation of the guideway will be visible under the guideway to travelers on Farrington Highway. Signage may also be visible from the guideway itself.

6. RPT considerations

The City has not proposed any property tax rate changes or credits associated with construction of the Project.

Mr. Paul S. Yokota
Page 4

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

TO THE MAYOR

Phoenix rail lesson

Phoenix just opened a new 20-mile light-rail system, built for \$1.4 billion.

Why does our government project \$5.3 billion for our 20-mile system? Are the Phoenixians that much smarter than us to elect a government that provides them with the same length system for almost \$4 billion less? Wow!

What could we taxpayers do with \$4 billion in our own pockets? Think about it. Perhaps for the billion-dollar required sewage upgrade, to "keep Honolulu from bankruptcy" as Mayor Mufi so ominously declared, and still have a few billion left?

Gerhard C. Hamm
 Wāhalaē Ika

BUT AGAIN, SOMEONE HAS TO PAY

Mr. Steven Fekete
430 Keoniana Street, Apt. 313
Honolulu, Hawaii 96815

Dear Mr. Fekete:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

The conditions between Phoenix and Honolulu are different. The systems are both 20 miles long, but the Phoenix line is estimated to carry less than half the riders of the Honolulu system and take more than twice as long to travel the 20 miles. Moreover, the Phoenix line removes two lanes of traffic along most of the route. There are numerous alternative routes available for motorists in the Phoenix metro area. The Honolulu Project will not remove any travel lanes. It will add to the capacity of the overall transportation system without reducing the existing, limited roadway supply. Phoenix did not need to preserve highway capacity; Honolulu must. To accomplish that, the system must be elevated (underground is more expensive). The cost of an elevated system is higher than an at-grade line such as the recently opened system in Phoenix, but the Honolulu system will have a much higher capacity and will be more reliable.

Mr. Steven Fekete

Re: Rail System

I've had ^{many} questions regarding the rail system. Whenever I've heard Mafi speak about this system, he's never addressed my concerns and articles in the newspapers haven't either.

Finally, some of my concerns have been addressed in the brochure "Honolulu on the Move" I now know it does run on electricity + plans of what to do if we have power outages. Prolonged outages were also addressed.

However, if that happens there will be no airconditioning! How will people rest being above ground when that happens + the train stops between stations? How are you going to get them to safety? There will be senior people, pregnant women (some with children) wheelchair riders not to mention other handicapped riders.

Finally, will there be a security person riding each train in case of incidents? Will there also be security at each station so robberies + attacks of any kind can be handled? Some riders will have to ride early in the _(even)

morning + late in the evening due to their jobs.

These questions have never been answered either in the papers, on television, or in one of Mufi's many appearances!

I was born + raised in Hawaii + don't drive. I have been a bus rider since I was 5 years old and am now a retired senior citizen of sixty-six. We are lucky to have an excellent bus system, the best in the country!

I will never ride the rail system as the route will not be in the Makiki area. Perhaps my concerns stem from the fact that I am highly claustrophobic - The thought of being trapped above ground with no air-conditioning frightens me. Thank God for this bus system. More people should leave their cars at home + ride the bus to relieve the traffic mess. Parents now-days indulge their children with a car; I know some families give each child a car on their 16th birthday. What a traffic mess we have on our hands.

More Islanders should use the bus! You can sleep, read, listen to music, do crossword puzzle or just bring the ride! I see so many problems happening with the rail system including money spent during this hard time!! Stephanie R. Ferricks

Honolulu, Hawaii 96822

Dear Ms. Fernandes:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Since trains and rail stations will be electrically powered, the system's infrastructure is being designed to handle service disruptions. For example, trains will draw power from many points along the route, so an outage in a few areas should not disrupt service for the system overall.

If electrical power is lost system-wide, then train brakes are designed to stop the rail cars even without power. Lights will stay on in trains and stations; backup batteries will provide lighting for several hours. The train operations center will communicate with passengers via the public address system and intercom to provide guidance.

Ms. Stephanie Fernandes
Page 2

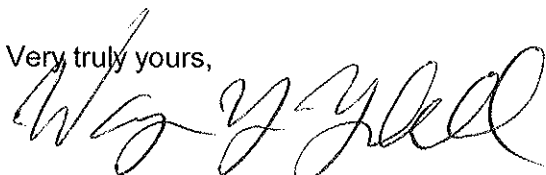

If power is restored within a short time, service will resume. With a prolonged outage, the operations center will direct passengers to exit the trains and walk along a lighted emergency walkway on the guideway to the nearest station. For those unable to exit rail cars, such as the groups referenced in your letter, help will be provided by emergency responders and transit staff. Passengers will be met at the train station by a coordinated response from emergency responders and city transportation workers. There will be no air conditioning during power outages.

As discussed in the Final EIS Section 2.5.4 Safety and Security Measures, a project-specific Safety and Security Management Plan has been developed in accordance with FTA requirements to define the safety and security activities and methods for identifying, evaluating, and resolving potential safety hazards and security vulnerabilities of the system. It establishes responsibility and accountability for safety and security during the Preliminary Engineering, Final Design, construction, testing, and start-up phases of the Project. The Honolulu Police Department, the Honolulu Fire Department, the Honolulu Department of Emergency Management, and the Honolulu Emergency Services Department have been involved in preparing and will be part of implementing the plan. The plan addresses public safety and security concerns, including threats and hazards associated with the Project, specific issues that were identified through community outreach efforts, and design and architectural details to enhance safety.

Lastly, your comments regarding TheBus have been noted. Bus service will continue to support the rail system.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

December 9, 2008

Honolulu Hale
530 S. King Street Honolulu, HI 96813

Dear Mufi Hannemann,

The rail system may reduce traffic in the future, and may allow it to build high-density, affordable homes so the children and grandchildren will have a place to live within walking distance of a rail stop, but if you think about it, it is going to cost the Oahu people a whole lot of money.

The city will have to figure out where to get the millions of dollars it will cost to maintain the system. It looks like we're going to pay a lot more in excise and property taxes. The number of people using the system will be minimal. We're going spend billions of taxpayer dollars on a system that will be used by only a small part of the population. Traffic will still be bad and we'll all have to deal with worse traffic while they build the system. Another thing is public has until January 7th for a 400 pages report which is approximately one month from now. There are two big holidays coming up, even the most prepared would find responding thoughtfully a severe burden. With these busy events coming up, it would make the traffic worst.

I do hope that you would understand my opinion. The rail is a great system that would make our life easier but it's just really not necessary for system that's taking more space in Oahu that a small part of population will be using. I would like to here what you have to say so please write back.

Sincerely,

Eddielyn Fernandez

Dear Ms. Fernandez:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal:

As stated in Section 3.2.1 of the Final EIS, ridership projections for the forecast year of 2030 have been developed using the travel demand model, which was calibrated and validated to current year conditions. The model is based upon a set of realistic input assumptions regarding land use and demographic changes between now and 2030 and expected transportation levels-of-service on both the highway and public transit system. Based upon the model and these key input assumptions, approximately 116,000 trips per day are expected to use the rapid transit system on an average weekday in 2030. Since the Draft EIS was published, the travel demand model has been refined by adding an updated air passenger model, defining more realistic drive access modes to project stations, and recognizing a more robust off-peak non-home-based direct-demand element based on travel surveys in Honolulu.

Chapter 6 of the Final EIS discusses funding sources for the capital costs and the ongoing operating and maintenance costs of the Project. City funding for the capital cost of implementing the Project is expected to come from the 0.5 percent General Excise and Use Tax

surcharge. This surcharge has been in place since January 1, 2007, and will expire December 31, 2022. City funding for transit operating and maintenance costs comes from the General and Highway Funds, which receive revenue from a variety of currently existing taxes. Whether any of these taxes will be raised in the future will be decided as part of the City's annual budget process and would most likely be decided on a variety of issues, not just transit costs. Fixed guideway operating costs will represent between 2 and 3 percent of the City's annual operating budget.

Regarding whether the Project is needed and who will use the system, no other option that has been studied has been able to function as effectively based on the criteria upon which the system was selected (i.e., mobility, support of future land use plans, equity, and reliability). More specifically, projections are that 116,000 people will use the Project each day. That is about the equivalent of half the traffic on the H-1 Freeway. If necessary, the Project can handle many more riders than that by reducing headways or adding additional trains.

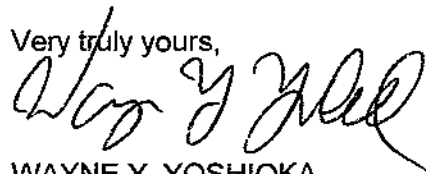

The system is built in the median of major roadways and, accordingly, it will not take away from existing travel lanes on the roads once in operation; therefore, all the added capacity is new. As shown in Table 3-14, roadway congestion (as measured by vehicle hours of delay) will decrease 18 percent with the Project compared to without.

The exact impact of construction activity on traffic is not yet known. As discussed in Section 3.5.7 of the Final EIS, a Maintenance of Traffic (MOT) Plan will be developed in advance by the contractor with approval from the City and the Hawaii Department of Transportation. The MOT Plan will identify measures to mitigate temporary construction-related effects on transportation and will address roadway closures for streets identified in Table 3-27 of the Final EIS. As stated in Section 4.18.1 of the Final EIS, several public involvement strategies will be used to inform businesses and the public about construction activities, including roadway detours.

Lastly, in response to concerns about the length of the review period, the deadline for comments on the Draft EIS was extended from January 7 to February 6, 2009.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Issuance of the Record of Decision under NEPA and acceptance of the Final EIS by the Governor of the State of Hawaii are the next anticipated actions and will conclude the environmental review process for this Project.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

SUBJECT: HONOLULU HIGH CAPACITY TRANSIT CORRIDOR PROJECT

RE: 10 REASONS WHY A TRANSIT STOP IS NOT NEEDED AT THE AIRPORT

The following is for your consideration:

1. Most people arriving here by plane are tourists on tour packages; as such, both they and their luggage are transported between the airport and their hotel by the tour operator. Since most hotels for tourists are in Waikiki, the transit system will be of no use to get them from the airport to Waikiki since it terminates at Ala Moana Center.
2. Many visitors from the Orient arrive in the early hours of the morning; consequently, their hotel room is not available until after 2:00 PM. Therefore they are taken on tour buses to visit various locations on the island then delivered to the hotel at the time they can be registered and given a room.
3. People not on tours, after deplaning must go to baggage claim to retrieve their luggage. After getting their luggage, they can not go back into the terminal. Consequently, to use the transit system, they will have to find their way with their luggage to the transit stop. From the diagram in The Advertiser showing only one transit stop, getting there from baggage claim area will be very difficult, especially for the elderly or handicapped.
4. For any traveler with luggage using the transit system for transportation to

their residence will have the problem of getting from a transit station to their residence. Again a challenge for the elderly or physically disabled.

5. Conversely, people wanting to go to the airport will have the problem of getting themselves and their luggage to a transit stop. For the elderly and physically challenged this may be insurmountable.

6. Arriving at the airport, getting from the transit stop to a ticketing area of the terminal will be another challenge since airline ticketing is spread from one end of the terminal to the other, most of which will not be near the transit stop. This will be especially true for inter-island travelers.

7. Flight crews are transported between the airport and their hotel by ground transportation provided by the airline for which they work. Again since most of them are billeted in Waikiki, the transit system will be of no use to them.

8. Other workers in the vicinity of the airport live all over the island, many nowhere near the transit line. Getting to and from work, the transit system will be of little use to them.

9. If such workers were to use the stop at the airport, they will then have the problem of getting from there to their work place which may not be nearby.

10. All of these reasons will work to deter people from using the transit system for transportation to and from the airport. Most people will continue to do exactly what they do now, take a taxi, shuttle service or private automobile to and from the airport to be delivered to the ticketing area for their departing airline, picked up at baggage claim for transportation to their residence or going to and from their work place.

Lastly, have you thought of the absurdity of passengers getting off an airplane after an 8-9 hour flight, getting on a train to go to Ala Moana Center? Get REAL!!

Sincerely yours

Charles M. Ferrell

Dear Mr. Ferrell:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal in the same manner presented:

1. and 2. Your comments regarding visitor use of the fixed guideway system have been noted. The Airport Alternative primarily serves major employment destinations. Visitor use accounts for a smaller percentage of ridership on this alternative. Of the 116,000 daily fixed guideway boardings, approximately 1,800 will be visitors traveling to or from the Airport. Approximately 8,100 daily fixed guideway boardings will be made by visitors for other uses, such as shopping or visiting sites of interest.

3. The Airport Station is about 800 feet from the Interisland Terminal and about 600 feet from the Overseas Terminal. Pedestrian paths will be constructed by the Project that will connect the overseas Terminal to the concourse level of the rail station. All station facilities,

Mr. Charles M. Ferrell
Page 2

including access routes to the station from the airport terminals, will conform to applicable Americans with Disabilities Act (ADA) and local regulations.

4. and 5. Tourists may use rail to transport luggage. Other modes of transportation that currently exist are other options. Fixed guideway riders have several options available to travel to and from the rail system. As noted in Section 2.5.6 of the Final EIS, bus service will be enhanced and the bus network will be modified to coordinate with the fixed guideway system. There will also be coordinated transfers between the fixed guideway system and the bus, which will minimize wait times. In addition, as stated in Section 3.4.2 of the Final EIS, sidewalks and crosswalks will be available at all station areas and all station facilities will comply with applicable ADA and local regulations.

6. As stated previously, the Airport Station for the fixed guideway will not be significantly farther from the terminals than the existing parking garage.

7. Your comment regarding flight crews has been noted.

8. and 9. Workers will have several options available when traveling to or from the fixed guideway system. As mentioned above, the bus service will be enhanced to coordinate with the fixed guideway system, thus minimizing wait times when transferring. Bicycle parking will be allowed at all stations, and bicycles will be allowed on the train as regulated by a bicycle policy. Park-and-ride facilities will be located at East Kapolei, UH West Oahu, Pearl Highlands, and Aloha Stadium, allowing people to drive to access the system. Lastly, stations will have spaces for passenger drop off (kiss-and-ride).

10. The Airport Alternative will primarily serve major employment destinations, such as Pearl Harbor Naval Base. Visitor travel to and from the Airport accounts for a smaller percentage of daily ridership on this alignment. The Project is but one of many transportation choices visitors and residents will have available to them.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

CC City Council Members

Dear Sir or Madam:

Feb 5, 2009

I have read the Executive Summary of the DEIS on the proposed \$4.7 billion rail project and I have a few questions. As someone who will never live long enough to see it built, would not ride it anyway, and knows no one who will; I am most concerned about its cost and its effect upon our economy. The advocates of the rail project used my tax dollars to buy votes with one-sided ads that claimed this project would create jobs and help the economy. My questions are:

1. If cost estimates are exceeded (as everyone on Earth expects) or if ridership revenues are less than expected (another certainty), where will the government (city or state) get the money?
2. If you are going to tax the non-riders so that the riders can pay less and be subsidized, will you tax other non-users (i.e. the entire state) as well or will you just tax those that can't escape?
3. If it becomes obvious that rail will not create jobs, pay for itself, be affordable, or solve our traffic problems, can this project be terminated and the existing columns and pillars be converted to tombstones for the politicians responsible for this mess?

Sincerely,

William H. Follmer

Dear Mr. Follmer:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal:

Your comments will be addressed in the same manner as submitted.

1. *Both ridership and financial discussions in the Final EIS address concerns about the uncertainties associated with ridership and financial markets. Section 6.3 of the Final EIS describes the funding sources anticipated to be used to pay for the capital costs of the Project and takes into account the current economic downturn. Capital costs of the Project, including finance charges, are expected to be fully paid for by a combination of FTA Section 5309 New Starts Funds and FTA Section 5307 Funds from the Federal government and revenues from the County General Excise and Use Tax (GET) surcharge levied from 2007 through 2022. Section 6.6 of the Final EIS*

discusses the risks and uncertainties associated with the funding and other sources of revenue that could be used if needed.

In addition, Section 6.4 of the Final EIS describes the funding sources to pay for ongoing operating and maintenance costs associated with maintaining the resulting transit system in a state of good repair. Operating and maintenance costs will be paid for from the same sources currently used for TheBus: Federal funding, fare revenues, and subsidies from the City's General and Highway Funds. Funding for guideway maintenance will be covered in the City's annual budgeting process and amounts to between 2 and 3 percent of the City's annual operating budget.

Ridership projections for the forecast year of 2030 have been developed using the travel demand model used by the Oahu Metropolitan Planning Organization (OahuMPO) for the Oahu Regional Transportation Plan (ORTP), which was calibrated and validated to current year conditions. The model is based upon a set of realistic input assumptions regarding land use and demographic changes between now and 2030 and expected transportation levels-of-service on both the highway and public transit system. OahuMPO undergoes model updates every five years to reflect land use and transportation network changes. The model is approved by the OahuMPO Technical Advisory Committee. Based upon the model and these key input assumptions, approximately 116,000 trips per day are expected to use rapid transit system on an average weekday in 2030. Since the Draft EIS was published, the travel demand model has been refined by adding an updated air passenger model, defining more realistic drive access modes to project stations, and recognizing a more robust off-peak non-home-based direct-demand element based on travel surveys in Honolulu.

The Project is one of the first in the country to design and undertake an uncertainty analysis of this type of travel forecast. An uncertainty analysis evaluates the variability of the forecast by establishing probabilistic upper and lower limits of ridership projections. FTA has worked closely with the City during this effort. A variety of factors were considered in the uncertainty analysis. Given all the factors considered, the anticipated limits for guideway ridership in 2030 is expected to be between 105,000 to 130,000 trips per day, bracketing the official forecast of 116,000 riders a day used for all calculations.

2. Funding sources for the Project, including allowance for contingencies, are documented in Chapter 6 of the Final EIS. The primary funding source for capital costs is the County's GET surcharge, which applies to Oahu only.

3. Overall, the Project is projected to increase jobs during the nine years of construction to 7,500 in total (see Table 4-34 in the Final EIS). The financial plan is balanced for the entire Project so there will not be a situation in which only a portion of the system will be built. If there is a shortfall, additional revenue sources will be considered. Section 6.6 of the Final EIS discusses risks and uncertainties, as well as potential sources to cover shortfalls. Islandwide congestion (as measured by vehicle hours of delay) will decrease 18 percent with the Project compared to the No Build

Mr. William H. Follmer
Page 3

Alternative (see Table 3-14 of the Final EIS). Column size and location make them impractical for use as tombstones.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Issuance of the Record of Decision under NEPA and acceptance of the Final EIS by the Governor of the State of Hawaii are the next anticipated actions and will conclude the environmental review process for this Project.

Very truly yours,

**Draft Environmental Impact Statement, Honolulu High-Capacity Transit Corridor
Project, Island of O'ahu**

Dear Mr. Yoshioka,

Thank you for the opportunity to review and comment on the above document. Ford Island Properties LLC ("FIP") presently controls several properties in the 'Ewa District that likely will be impacted by the proposed transit corridor project. FIP leases from the United States Navy the 400 acre residential area along the 'Ewa coastline known as the Waterfront at Pu'uloa (formerly the Iroquois Point Naval Housing area), which contains 1,461 single-family and townhome residential dwellings. In addition, FIP recently negotiated the lease of approximately 498 acres of property situated along Roosevelt Avenue within Kalaeloa (formerly known as Naval Air Station Barbers Point). FIP owns an additional 53 acres of land in Kalaeloa, adjacent to the abovementioned 498 acres. In total FIP controls ±550 acres of land in Kalaeloa. FIP's Kalaeloa properties currently comprise a mix of vacant land, occupied buildings and older vacant buildings. FIP acquired its leasehold interest in the Kalaeloa lands for their potential for redevelopment to higher and better uses.

As a landowner/lessee with a significant property interest in the 'Ewa region, we offer the following comments.

1. We note that the Draft EIS identifies the preferred alternative as a transit corridor extending from East Kapolei to the University of Hawai'i at Manoa. However, Figure 2-5 indicates a planned extension of the transit corridor linking the proposed East Kapolei Transit Station to an eventual transit station in West Kapolei near Kalaeloa Boulevard. Figure 2-5 depicts the alignment of the planned extension in a manner that is generally consistent with the transit route alignment depicted in the aforementioned Kalaeloa Master Plan. We note that the proposed planned extension through Kalaeloa, as shown in the current Draft EIS, could impact the development potential of approximately ten (10) parcels of FIP's lands in Kalaeloa. As such, while we recognize that the planned extension is beyond the scope of the Draft EIS, we respectfully request that FIP be included in any discussions concerning the eventual implementation of the planned extension as it may have a significant impact upon FIP's Kalaeloa properties.
2. As a landowner and lessee in the Kalaeloa area, we wish to point out that Kalaeloa will eventually emerge as a significant development area in the 'Ewa region, and as such, should be referenced and acknowledged in transit planning. While the text on page 2-14

acknowledges that the proposed East Kapolei transit station will serve local and express transit commuters from 'Ewa, 'Ewa Beach, Kapolei and Kalaeloa, we note a general omission and/or inaccuracy among the figures in the Draft EIS with regard to its references to Kalaeloa. Figure 1-3 includes the labels "Kapolei, Kalaeloa, 'Ewa, and Ewa Beach. Figure 1-4, entitled Major Activity Centers, identifies "Kalaeloa Industrial Park" as site number 5 and locates it roughly in the area where Fort Barrette Road enters Kalaeloa and intersects with Roosevelt Avenue and Saratoga Road. However, we are not aware of any existing or planned development called the Kalaeloa Industrial Park in this region. Figures 1-5, 1-6, 2-5, 4-14 and 4-39 only reference Kapolei and 'Ewa. Figure 2-38 references Kapolei, East Kapolei, 'Ewa and 'Ewa Beach. Figure 3-7 references Kapolei and Ewa. Figure 4-2, which identifies land uses in the region, depicts no industrial land use in the location of the Kalaeloa Industrial Park identified in Figure 1-4. Figure 4-3 only references East Kapolei. Figure 4-43 references Kapolei, 'Ewa, and 'Ewa Beach. We request that the various figures be corrected to accurately and uniformly reference major place names in the 'Ewa region, including Kalaeloa.

Again, thank you for the opportunity to comment on the Draft EIS. We look forward to receiving a copy of the Final EIS upon its completion. Should you have any questions regarding our comments, please contact me at (808) 585-7900.

Very truly yours,

Dear Mr. Colon:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

While the study corridor included in the Draft and Final EISs extends from Kapolei to UH Manoa and Waikiki, the Project includes the construction of a fixed guideway system from East Kapolei to Ala Moana Center via the Airport. The Project has logical termini and independent utility from any extensions that may be constructed in the future. The future extensions to East Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS. The future extensions are not part of the Project; thus, they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for

Mr. Steve Colon
Page 2

implementation at this time they are not part of the Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation at some time in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time. Ford Island properties would be consulted when the extensions are evaluated.

In addition, maps have been clarified in the Final EIS. For maps that pertain only to the Project rather than the entire study corridor, detail has not been added for Kalaeloa. The label in Figure 1-4 has been revised to say "Kalaeloa."

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

February 4, 2009

Mr. Wayne Yoshioka
Director Dept. of Trans. Services
City & County of Honolulu
630 S King Street
Honolulu, HI 96813

Dear Mr. Yoshioka,

Thank you and the project team for sending me a copy of the Draft Environmental Impact Statement for the High Capacity Transit Corridor Project and inviting me to submit comments about it. As one who has had some studies in landscape architecture and urban planning while in college just over 30 years ago, and having an ongoing interest in public transportation planning it is appreciated. I was not able to read the entire document thoroughly and will not be able to comment as much as I wish so I will try to be brief on the topics I want to comment and suggest the most.

I commend the planners and those who prepared the document for a very thorough comprehensive and well balanced study. Well done.

Page 4-93: Mitigation: I hope an architect would be involved to help blend the station design at China Town and Doyntown. Also to soften the effects where straddle beam construction such as shown on 4-84.

Page 4-101: Noise Impact Mitigation: I did not find any indication of how fast the trains would be operating in the areas identified as having moderate noise impact. From the maps I figure that as many of those areas are in a highly urban area, in close proximity to a station, the trains will normally be operating slower than in the more open western portions of the route. I anticipate that in the Kakaako area (curves) and Pearl Highland area (Station and curve) the trains may be averaging only 30 mph or less. If noise is still a problem at those speeds, may have to consider higher noise reducing baffles along to side of the guideway that faces the high rises in close proximity.

Maintenance/Storage area: My preference is for the spot between Waipahu and Leeward Comm. College. It is a more central location for more efficient staging of trains. The Hoopili site has extra non-revenue trackage required to access it and two crossings of Farrington Hwy. The eastern crossing looks awkward visually because of the acute angle of crossing.

Plans and Profiles in Appendix A: I understand there is a master plan already for the development of Hoopili and the East Kapolei area. It would be very helpful to show what the adjacent street patterns alongside and under the guideway would be like. Otherwise having an elevated guideway in an open undeveloped area would not make sense. The ROW could be fenced off and any roads needing to cross would go over the track by overpass.

Construction Phasing: Page 2-30, 2-40: For an opening segment, it is best to have a segment long enough and serving enough residences and businesses to encourage use and appear useful. This encourages continued public support. I would consider a West loch to Aloha Stadium to be a superior opening segment than the Kapolei to Pearl Highlands segment, even though the opening date may be later. Having the maintenance area by Leeward Comm. College, and crossovers already planned near the West Loch and

Aloha Stadium stations would allow this. While creating a spur and incentive for developing of East Kapolei is a goal of the project, I see moving people between three communities, (Aiea, Pearl City, Waipahu) with a stadium and shopping center to be a bigger priority. I do not see what the big hurry is for about doing East Kapolei first. It can wait. The projected transit oriented development will be slow to take place until the route gets past Pearl City or reaches West Kapolei.

Finally, even though The city council has already chosen the Airport Alternative and I was not able to attend the earlier public presentations of the alternatives, I wanted to be on record as preferring the Salt Lake Alternative. It is based on the lower overall cost and the presence of the high density residential area there. Such a route will greatly improve public transportation service between Salt Lake and Aiea and points west which currently is slow and indirect. I am somewhat skeptical of the extent military areas creating transit demand as employment centers when Hickam will not be directly served and most of the Pearl Harbor employment areas are a long walk or require a connecting shuttle. I thought the Salt Lake Alternative suffered from having only one station of its own along its stretch. I wonder, if a station is being planned for the Lagoon Dr area, why could there not be a station close to Puuloa Rd serving that industrial area plus a neighborhood close by. I would also have moved the Aloha Stadium station closer to Halawa Stream on the south edge of the parking area to strike a balance of serving the residential area along Halawa Stream and the Stadium Marketplace businesses as well as the stadium. The walking distance from the park and ride lot would not be much longer than next to the stadium, and connecting busses have a better route to Ahuimanawa and Halawa neighborhoods. These would have increased ridership.

While living and working in Waialea means that I will be using the trains only seldom, I am looking forward to the project's implementation.

Sincerely yours,

Gregory Forest

Dear Mr. Foret:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your comments will be addressed in the same manner as submitted.

Comment regarding page 4-93 of the Draft EIS: As part of Final Design, DTS developed design criteria to address the City and County of Honolulu's requirements for the Project. In addition, the ongoing station area planning process involves numerous aspects of transit system design. The process addresses design and planning issues in an integrated manner and focuses on the characteristics and preferences of the communities adjacent to each station. Guideway and column materials and surface textures, including straddle-bents, will be selected in accordance with generally accepted architectural principles to achieve effected integration between the guideway and its surrounding environment. Architects will be among the team members working on the Final Design.

Comment regarding page 4-101 of the Draft EIS: Noise levels were modeled with the train at the top run speed proposed between stations: 45 miles per hour (mph) for stations less

than one-half mile apart, 50 mph for stations between one-half mile and 1 mile apart, and 55 mph for stations 1 or more miles apart. Noise levels may be less in areas where the train speed is slower, such as near stations and curves. The approach taken in the Final EIS is a conservative one so that all potential impacts are considered.

Comment regarding maintenance/storage area of the Draft EIS: As described in Section 2.5.8 of the Final EIS, the site near Leeward Community College has been identified as the preferred location for the maintenance and storage facility.

Comment regarding plans and profiles in Appendix A of the Draft EIS: At this time, developments in East Kapolei and Hoopili are speculative since they have not been zoned, subdivided, permitted, or undergone right-of-way acquisitions. Accordingly, their roadway networks will not be incorporated in Appendix A of the Final EIS. At-grade operation with roadway overpasses would be possible in the East Kapolei and Hoopili area; however, it would result in substantially less usable land and disrupt future connectivity.

Comment regarding construction phasing: As described in Section 2.5.10 of the Final EIS, to support phased opening of the system, the first construction phase must be connected to a maintenance and storage facility, which requires considerable land. The first phase of the Project must be connected to the maintenance and storage facility because, in addition to maintenance of equipment and ongoing operations, the maintenance and storage facility houses the main control center for the entire Project and the required testing and operation of the system could not be completed without access to it. No location has been identified closer to Downtown with sufficient available land to construct a maintenance and storage facility. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations*
- *Reduce the time that each area will experience traffic and community disturbances*
- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding*
- *Match the rate of construction to what can be maintained with local workforce and resources*
- *Balance expenditure of funds to minimize borrowing*

The portion of the corridor Ewa of Pearl Highlands is less developed than the areas Koko Head. Right-of-way can be obtained more quickly; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted Koko Head from Pearl Highlands to Aloha Stadium, then Kalihi, and finally to Ala Moana Center.

Your preference for the Salt Lake Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been identified as the Preferred Alternative as described above. Compared to the other alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly lower impacts to the natural and built

environment. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative.

The Alternatives Analysis phase, which preceded the EIS process, is documented in Chapter 2 of the Final EIS. It evaluated a range of modal and general alignment alternatives, in terms of their costs, benefits, and impacts. The scoping process for the Alternatives Analysis involved a presentation of the viable alternatives to the public and interested public agencies and officials to receive comments on the Purpose and Need, alternatives, and scope of the analysis. Scoping for the EIS followed the FTA process that provides for a culling of alternatives studied in the EIS through an Alternatives Analysis. The scoping process initiated for the Alternatives Analysis included a variety of highway, bus and fixed guideway options for consideration. During the later scoping effort for the EIS, the public was requested to propose alternatives that would satisfy the purpose and need at less cost or with greater effectiveness, less environmental or community impact and to propose alternatives that were not previously studied and eliminated for good cause. The only alternative that emerged that met these criteria was a fixed-guideway alternative following several alternative alignments. All reasonable alternatives that emerged from these processes were ultimately evaluated in the Draft and Final EISs.

Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts, and mitigation commitments.

The feasibility of a station in the Mapunapuna area was explored. There is a considerable elevation difference between the Salt Lake community and Mapunapuna requiring a 4 percent grade on the alignment crossing Puuloa Road. This is too steep a grade for locating a station. Further, once the 4 percent grade is achieved, the alignment enters a horizontal curve as it crosses Moanalua Stream, which also does not allow for a station. The first location where the horizontal and vertical alignments would permit a station is within Fort Shafter. Here a station is precluded because of military security reasons.

Station placement for the Salt Lake Alternative had considered several trade-offs. The Aloha Stadium Station was located in coordination with the stadium's owner to provide optimal access to the stadium for events and to the park-and-ride and bus users that will comprise the majority of the station's users.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

To Whom It May Concern:

I am concerned about your ambitious timetable regarding the rail transit system. I believe you should conduct a more in depth study on alternate transit such as elevated toll highway lanes and a more expansive bus system. I am also concerned about burial grounds, historical sites and the loss of pristine views of this island that is too small for a fixed rail system. You have done studies in other counties on their rail systems but it doesn't compare with Honolulu because of our size, were just too small. The future of this island is to move toward a green economy like electric cars because once the rail is built it will continue to draw power and require unwanted maintenance and when the power goes out so does the rail. It seems that Mayor Mufi Hannemann is trying to push this project through before he leaves office and isn't telling us everything about the ultimate costs, so slow down before you jump to the wrong conclusions.

Dear Mr. Fowler:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your comments have been noted. To address your first concern, we would like to direct you to the project schedule, which is illustrated in Figure 2-42 of the Final EIS.

In addition, the Managed Lane and Bus Rapid Transit Alternatives have been previously evaluated and eliminated. In "Chapter 2 of the Alternative Analysis and Chapter 2 of the Final EIS, two options were considered for the Managed Lane Alternative—Two-direction and Reversible. This alternative would have provided a two-lane elevated toll facility between Waipahu and Downtown, with variable pricing strategies to maintain free-flow speeds for transit and high-occupancy vehicles (HOVs)." The Two-direction Option would have served express buses operating in both directions during the entire day. To maintain free-flow speeds in the Two-direction Option, it may have been necessary to charge tolls to manage the number of HOVs using the facility. For the Reversible Option, three-person HOVs would have been

allowed to use the facility for free, while single-occupant and two-person HOVs would have had to pay a toll. The Reversible Option was found to be optimal.

The findings are summarized in Chapter 2 of the Final EIS as follows: The Managed Lane Alternative was evaluated for its ability to meet project goals and objectives related to mobility and accessibility, supporting planned growth and economic development, constructability and cost, community and environmental quality, and planning consistency. While this alternative would have reduced congestion on parallel highways, system-wide traffic congestion would have been similar to the No Build Alternative as a result of increased traffic on arterials trying to access the facility. Total islandwide vehicle hours of delay would have increased with the Managed Lane Alternative compared to the No Build Alternative, indicating an increase in system-wide congestion (Table 2-2, Final EIS).

The Managed Lane Alternative would not have supported planned concentrated future population and employment growth because it would not provide concentrations of transit service that would serve as a nucleus for transit-oriented development. The Managed Lane Alternative would have provided little transit benefit at a high cost. The cost-per-hour of transit-user benefits for the Managed Lane Alternative would have been two to three times higher than that for the Fixed Guideway Alternative. Similar to the TSM Alternative, the Managed Lane Alternative would not have substantially improved service or access to transit for transit-dependent communities. No funding sources were identified for the Managed Lane Alternative. Toll revenues from the Managed Lane Alternative would pay for ongoing operating and maintenance while remaining revenues would be used to repay debt incurred to construct the system.

The Managed Lane Alternative would have generated the greatest amount of air pollution, required the greatest amount of energy for transportation use, and would have resulted in the largest number of transportation noise impacts of all the alternatives evaluated. Because the Managed Lane Alternative would have served a shorter portion of the study corridor, it would have resulted in fewer displacements and would have impacted fewer archaeological, cultural, and historic resources than the Fixed Guideway Alternative. The Managed Lane Alternative would not have affected any farmlands. Visually, the elevated structure would have extended a shorter distance, but it would have been more visually intrusive because its elevated structure, with a typical width of between 36 and 46 feet, would have been much wider than that of the Fixed Guideway Alternative.

After the Alternatives Analysis was completed, several scoping comments were received requesting reconsideration of the Managed Lane Alternative that was considered and rejected during the Alternatives Analysis. Because no new information was provided that would have changed the findings of the Alternatives Analysis regarding the Managed Lane Alternative, it was not included in the Draft EIS for further consideration.

The Transportation Systems Management (TSM) Alternative studied during the Alternatives Analysis increased bus service. The alternative included express bus service that operated as bus rapid transit in existing facilities. Bus frequencies would have been increased during peak periods to provide improved service for work-related trips, particularly from developing areas. The bus fleet was assumed to increase from 525 to 765 buses, and park-and-ride

Mr. Robert Fowler
Page 3

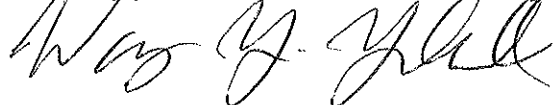

lots were assumed at West Kapolei, UH West Oahu, Waipio, and Aloha Stadium. The TSM Alternative would have improved transit travel times, but it would have done little to improve corridor mobility and travel reliability. Roadway congestion also would not have been alleviated.

Consultation in compliance with Section 106 of the National Historic Preservation Act continued through development of a Programmatic Agreement during completion of the Final EIS. Because of comments received about Section 106 resources during the Draft EIS comment period, effects to historic resources, including indirect and cumulative effects, were reevaluated. A final finding of effects summary has been presented in Section 4.16 of the Final EIS, and the Section 4(f) analysis presented in Chapter 5 has been updated to reflect these changes. Section 4.15.3 of the Draft EIS indicated that the Project will use a phased approach to identify subsurface archaeological sites and burials. Toward that end, the Project is developing an agreement with the State Historic Preservation Division and other consulting parties to guide that effort and to mitigate potential adverse effects, including visual. In the Final EIS, visual effects of the Project are described in Table 4-9. The effectiveness of rail transit is closely linked to the population density of the area served. As described in Chapter 1 of the Final EIS, the majority of the population on Oahu is located in a narrow corridor, which supports rail transit.

Lastly, according to information provided by the Hawaiian Electric Company (HECO), transportation accounts for 63 percent of Hawaii's imported oil while electrical generation consumes only 30 percent of imported oil. The transit system will allow for a decrease in automobile use, thereby reducing the amount of oil required for transportation while only using about 1 or 2 percent of the existing electrical generating capacity. As discussed in Section 4.11.3 of the Final EIS, the Project will reduce daily transportation energy demand by 3 percent compared to the No Build Alternative. HECO is moving toward renewable energy generation. As that happens, the fixed guideway will also benefit from such new sources of energy.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Dear Mr. Friar:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your opposition to the Project has been noted. Noise effects from the Project are detailed in Section 4.10 of the Final EIS. The Project will cause no severe noise impacts. Three receptors will experience moderate impacts that will occur on the fifth through ninth floors of residential buildings. The Project includes several features to reduce noise from the system, including an integrated noise-blocking parapet wall at the edge of the guideway structure that extends three feet above the top of the rail and a system specification for vehicles with wheel skirts. Wheel skirts on trains will also increase the benefit of the parapet wall at locations above the elevation of the track. In addition, the use of sound-absorptive material under the tracks in the three areas with moderate impacts will reduce the project noise exposure at upper floors to below the moderate noise impact threshold. With mitigation, the Project will not generate any noise impacts.

Chapter 3 of the Final EIS states that adding substantial passenger capacity in 2030 with more buses is not feasible in some key locations along the system because of roadway capacity

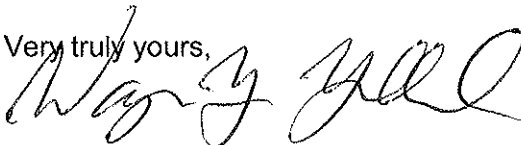

constraints. Increasing frequency would require headways at five minutes or less. Further, the Downtown street network cannot support the number of buses that would be required to meet projected demand. As a result of growth in traffic congestion and the lack of exclusive right-of-way for transit vehicles, bus speeds have gradually declined over the past several years and would continue to decline under the No Build Alternative.

In addition, the Transportation System Management (TSM) Alternative studied during the Alternatives Analysis increased bus service. The alternative included express bus service that operated as bus rapid transit in existing facilities. Bus frequencies would have been increased during peak periods to provide improved service for work-related trips, particularly from developing areas. The bus fleet was assumed to increase from 525 to 765 buses, and park-and-ride lots were assumed at West Kapolei, UH West Oahu, Waipio, and Aloha Stadium. The TSM Alternative would have improved transit travel times, but it would have done little to improve corridor mobility and travel reliability. Roadway congestion also would not have been alleviated.

With the Project, bus service will be enhanced and the bus network will be modified to coordinate with the fixed guideway system. Some existing bus routes, including peak-period express buses, will be altered or eliminated to reduce duplication of services provided by the fixed guideway system. Buses removed from service in the study corridor will be shifted to service in other parts of Oahu, resulting in improved transit service islandwide. Certain local routes will be rerouted or reclassified as feeder buses to provide frequent and reliable connections to the nearest fixed guideway station. Bus routes and frequencies with the Project are shown in Appendix D of the Final EIS.

Lastly, Chapter 6 of the Final EIS describes the financial resources anticipated to be needed to pay for the capital costs of the Project and for ongoing operating and maintenance costs. Capital costs of the Project, including finance charges, are expected to be fully paid for by a combination of FTA Section 5309 New Starts Funds from the Federal government and the General Excise and Use Tax surcharge revenues collected from 2007 through 2022 on Oahu. Operating and maintenance costs will be paid for from the same sources currently used for TheBus, Federal funding, fare revenues, and City revenues from the General and Highway Funds. These funding assumptions are subject to a number of risks and uncertainties, as described in Section 6.6.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

To: Yoshioka, Wayne
Subject: Honolulu Transit Project DEIS

I would like to comment on a few of my many concerns about this project that are not covered to my satisfaction in the DEIS. My two main concerns have always centered around cost as it pertains to projected usage and available jobs for Hawaiian workers.

As to costs, touched upon in Chapter 1, what if we go "over budget" or we don't receive the federal money as expected? What if the increased GET tax is not enough to pay for the citizen's portion of the project? What if ridership does not materialize as anticipated? What if all of your mitigation efforts, which are very poorly explained throughout the report, do not work well enough to "mitigate"?

In Chapter 2 of the report on page 5 you state—"The managed lane alternative would not have supported the planned concentrated future population and employment growth because it would not provide concentrations of transit service that would serve as a nucleus for TOD". This statement reminds me of the tail wagging the dog, in that I was under the distinct impression that this project was to relieve traffic congestion, and not the other way around! What is the source used for stating that there are "no funding sources" for this alternative?

On page 13 of Chapter 2, you talk about "committed congestion- a relief project in the Oahu Regional Transportation Plan 2030. Can you expand on the meaning of this project? Did I also read correctly that there was need for a traction power substation EVERY MILE? On page 38 they talk about the provision for vehicular propulsion and auxiliary power to be housed in a steel "box" with dimensions of 40'long by 16'wide by 12"wide! Where will they be located and how will they be protected as they will contain transformers, rectifiers, batteries and ventilation-all connected to an existing electrical grid?

On page 39 of Chapter 2, you do address use of the "local" work force, stating that one of the reasons for the phase approach to the entire project is to "match the rate of construction to what can be maintained with the local workforce and resources". Can you elaborate on the skill level needed for much of this project and if the work force has the capacity to take on such a huge and daunting task? Again, I sense the tail is wagging the dog!

On to Chapter 3 page 2-What is an on board transit survey? It appears that one was completed and became part of the OMPD travel demand forecasting model which was used to "predict" future traffic conditions and Transit ridership. Then on page 26 it is stated that "under any build alternative average travel time on transit would improve dramatically, enhancing overall mobility and accessibility". Is this statement inclusive of all time getting from point A(initial departure) to point B(final destination)? Then you go on to say, "In some cases, transit travel times would be 1/2 of today's time". Could you give a specific example?

Page 28-table 3-5 really has me confused! Station to station travel times with down time are clearly stated in columns, but two of the columns are missing 7 stats/times and the other two are missing 5stats/times. How can you come up with a realistic total when you're missing so much information? I must also state that I have never believed for one moment that the down time at each station was realistic to what is needed for people to get on and off any form of public transportation SAFELY.

Chapter 3 page 37 states that there will be no reduction of the number of roadway lanes upon completion of the project (table 3-21), but as I continued through this section to page 43 I was alarmed to realize that some areas would lose their 4' bike lanes and have to co-mingle with traffic on a shared lane that was now downsized to 14' wide. Other areas would see more narrow sidewalks with pedestrians having less space. It would appear we're robbing Peter(The people) to pay Paul(The train), and it feels like a very slippery slope for public safety.

Finally-pages 48-50 talk about a Traffic Plan on how you minimize construction effects, but is there a plan in place? The same question is asked about a Transit Mitigation Plan-is there one in place?

My concerns do continue, especially where the esthetics of this project are concerned. In your initial summary on page 6 you talk about this project as "trying to enhance the visual and esthetic opportunities that it creates". Looking beyond the horrendous cost and all the political wheeling and dealing, I hate to see this beautiful island blighted with this "steel elephant" and our grandchildren choked with a financial burden they do not deserve nor can ill afford.

Dear Ms. Frith:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Recognizing that costs are a constant variable and ridership forecasting is subject to uncertainties, the FTA requires that both be developed according to procedures defined over the past three decades of experience with this type of project. The capital plan for the Project is presented in Section 6.3 of the Final EIS, which includes a description of the amount of funding anticipated from various sources. The capital plan takes the current economic downturn into account. Section 6.6 of the Final EIS describes risks and uncertainties associated with these funding assumptions. The financial plan is a dynamic document that will be updated as conditions warrant. If the Project is over budget, other sources of revenue have been identified in Section 6.6 of the Final EIS to cover such shortfalls; however, 30 percent of the Project budget is contingency for just such eventualities.

Regarding ridership projections, the Project is one of the first in the country to design and undertake an uncertainty analysis of this type of travel forecast. The uncertainty analysis

evaluates the variability of the forecast by establishing probabilistic upper and lower limits of ridership projections. FTA has worked closely with the City during this effort. A variety of factors were considered in the uncertainty analysis, including the following:

- *Variations in assumptions regarding the magnitude and distribution patterns of future growth in the Ewa end of the corridor*
- *The impact of various levels of investment in highway infrastructure*
- *The expected frequency of service provided by the Project*
- *Park-and-ride behavior with the new system in place*
- *The implications on ridership of vehicle and passenger amenities provided by the new guideway vehicles*

Given all the factors considered, the anticipated limits for guideway ridership in 2030 is expected to be between 105,000 and 130,000 trips per day, bracketing the official forecast of 116,000 riders a day used for all calculations.

As far as mitigation, the proposed measures are based on what has worked on other projects and the need for specific improvements as a result of the Project.

As described in Section 1.8 of the Draft EIS, one purpose of the Project is to support planned development. Section 2.1.2 of the Draft EIS explains that the Managed Lane Alternative would not have qualified for local excise and use tax surcharge funding. Because single-occupant vehicles would have been permitted, even if tolled, Federal New Starts funding could not have been used.

The Oahu Regional Transportation Plan (ORTP) is a long-term vision document that outlines transportation goals, objectives, and policies for Oahu. The ORTP guides future development of the major surface transportation facilities and programs. Projects in the ORTP are broken down into several categories, including island-wide, transit, and congestion relief. Congestion-relief projects are roadway projects that increase roadway capacity. Table 2-4 of the Final EIS lists congestion-relief projects included in the 2030 ORTP. These projects were included in all 2030 model projections conducted for the Project. The Project is included as a transit project in the ORTP. Additional details may be found in that plan. As described in Chapter 2, traction power substations will be located approximately every mile. They will be enclosed and locked. Their locations are shown in Figures 2-8 through 2-11 of the Final EIS.

Construction activities for the majority of the transit system are similar to roadway and building construction. Appendix E of the Final EIS details construction methods that are used for both rail transit and elevated highway construction and were employed on the H-3 freeway. Experienced labor is locally available. A limited number of specialists will be needed to work with locally available labor in certain areas, such as transit power and signaling specialists working with local electricians to install system equipment.

An on-board survey was provided to bus riders to obtain ridership information for bus routes, including boardings and alightings. The survey was also used to collect information about ridership during different times of the day. The results of the survey were then incorporated into the travel demand forecasting model. Figure 3-7 of the Final EIS shows a.m. peak-period transit travel times for 2007 and 2030 with and without the Project. As shown in this figure, travel times are shorter with the fixed guideway. For instance, travel time from Kapolei to Pearl Harbor is approximately 100 minutes under No Build conditions but 45 minutes with the Project. These transit travel times include walking, possible bus travel to the stations, and other components of the entire trip.

Table 3-15 of the Draft EIS shows station-to-station travel time for each alternative; however, not every station is served by each of the alternatives studied in the Draft EIS. For instance, the Airport Alternative will serve stations on Kamehameha Highway (Pearl Harbor, Airport, and Lagoon Drive). The Airport Alternative will not serve stations along Salt Lake Boulevard, such as Ala Lilikoi, and accordingly, travel times are not applicable (represented by the n/a on the table) for this station. In addition, there are two potential sites being considered for the Aloha Stadium Station; the location varies based on the alternative. Accordingly, the information is not missing; it just does not apply to that station.

Regarding dwell time, Section 2.5.1 of the Final EIS indicated that trains will be capable of reaching 50 miles per hour or faster, and will achieve an average, including dwell times at stations, of 30 miles per hour or faster. The estimated dwell time at stations is based on experience with other rail systems that operate multi-car trains with each car having multiple doorways to allow quick and safe passenger access and egress.

In a few cases, narrow rights-of-way make it necessary to reduce the width of travel lanes, bike lanes, and sidewalks to accommodate the guideway support columns. This was done to minimize impacts to existing buildings and property. Americans with Disabilities Act (ADA) requirements and local regulations for sidewalk widths are being followed throughout the Project. As shown in Table 3-25 of the Final EIS, bicycle lanes will not be taken away as a result of the Project.

The Maintenance of Traffic Plan and Transit Mitigation Plan will be developed by the contractor with approval from the City and the Hawaii Department of Transportation prior to starting construction. These plans cannot be created until Final Design is completed for the system.

The assessment of visual effect due to the Project as described in Section 4.8.3 of the Final EIS considers changes to the visual landscape and viewer responses to those changes. This includes the existing development along the Project alignment. Within the Project corridor the environment changes from rural at the Wai'anae end of the corridor to dense high-rise development at the Koko Head end.

As part of the design process, the City has developed design principles, which are identified in the Honolulu High-Capacity Transit Corridor Project Compendium of Design Criteria (RTD 2009m) that will be implemented in final design to minimize visual effects of the Project. For example, guideway materials and surface textures will be selected in accordance with

generally accepted architectural principles to achieve effective integration between the guideway and its surrounding environment. Landscape and streetscape improvements will mitigate potential visual impacts, primarily for street-level views.

Other measures to address visual impacts of the Project are being developed through the station design and planning process. The initial station area plans and design guidelines were first developed with coordination between DTS and the Department of Planning and Permitting (DPP). The next level of transit station design focuses on integrating individual neighborhood characteristics of the communities served by the stations.

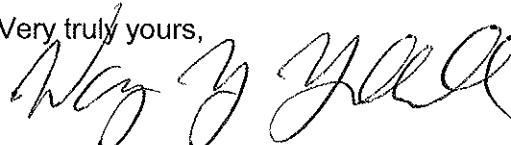

The following mitigation framework will be included in the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

- Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
- Coordinate the project design with City TOD planning and DPP.*
- Consult with the communities surrounding each station for input on station design elements.*
- Consider specific sites for landscaping and trees during the final design phase when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will serve to mitigate potential visual impacts.*

Section 4.8.3 of the Final EIS, Design Principles and Mitigation includes information related to the mitigation framework described above. Specifically architecture and landscape design criteria include guidelines regarding site design, materials and finishes, and lighting, which apply to stations, station areas, and the guideway.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Dear Mr. Froelich:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

As stated in Section 4.19.2 of the Final EIS, transit-oriented development (TOD) is expected to occur in project station areas as an indirect effect of the Project. Planning and zoning around station areas will be conducted and established by the City's Department of Planning and Permitting under a process covered by the City's new TOD ordinance 09-4. It is likely that the City will adopt zoning rules that will allow more dense development near transit stations. However, changes in zoning are not a part of this Project.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this

Mr. William Froelich

Submission Date : 11/20/2008
Submission Content/Notes : I am pro the airport route as opposed to Salt Lake. Having grown up in New York and Connecticut, with rail the primary method of public transportation, I walked to the train station, about 2 miles. It's just easier than driving and finding and paying for parking in New York City. Salt Lake residents can walk, bus, bike or drive to pick up the train at the Lagoon station (be sure there is free parking). We have good weather here! Not steet, freezing rain and snow. Be smart! Put it where it will get the most use and decrease the most traffic. People will adjust to anything that makes their life cheaper and easier. The Salt Lake residents will adjust to picking up their train a few miles away. Adult commuters where I grew up, took their "station car", a cheap, get around car, 15 - 20 minutes to the station, picked up the train for the 60 minute ride to New York, and walked to their offices. It's what you do when you live or work in a crowded city. We are no different. It's just not yet second nature to us. The airport route has the potential to service a much wider population.

Ms. Kathleen Fung
(No address or e-mail provided)

Dear Ms. Fung:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been

Ms. Kathleen Fung
Page 2

completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

REGARDING DRAFT ENVIRONMENTAL IMPACT STATEMENT

TO: MR. WAYNE YOSHIOKA
Dept. of Transportation Services
City and County of Honolulu
650 So. King St., 3rd Floor
Honolulu, Hi 96813

From: Mrs. Leatrice Fung
3088 La Pietra Circle
Honolulu, Hawaii 96815

I am very much against the Draft Environmental Impact Statement (Deis) for the following reasons:

- Rail is completely dependent on fossil fuel (much of it foreign fossil fuel) throughout it's life. This is exactly the opposite of what we should be doing. We should be reducing our dependency on fossil fuels. Vehicle energy is moving away from fossil fuels. Every few years there is an improvement away from fossil fuels. Rail is the worse climate warmer.
- The need to replace our sewer system is much more important than building the rail system. Our untreated sewage leaking, discharging, or gushing out of our sewage pipes is not only hygienically unsafe but disgusting and repulsive. The accident on McCully last month was unnecessary and shameful.
- The visual blight of elevated rail lines throughout town will be an eye sore wherever it goes. Imagine the height of the rail around Nordstrom being 145' above ground.
- The noise blight of the rail system 79db at 50 ft. will cause nerves to fray, the gradual deterioration of the neighborhoods accompanied with economic costs, and reduced property taxes.
- Rail will create increased traffic congestion in town as supporting pillars take away valuable road space.
- Hot lanes provide cheaper/better solutions to our traffic problems so why not save the money? Our state budget is over \$1 billion in debt this year before we even start.

Sincerely yours,

Leatrice Fung

Dear Mr. and Mrs. Fung:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal:

Your preference for the No Build Alternative has been noted. The No Build Alternative does not address the Project's needs or meet its purpose as established in Sections 1.7 and 1.8 of the Draft EIS. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been identified as the Preferred Alternative as described above. Compared to the other alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly lower impacts to the natural and built environment. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically

supported one of the alternatives, more than 75 percent were in support of the Airport Alternative.

The Alternatives Analysis phase, which preceded the EIS process, is documented in Chapter 2 of the Final EIS. It evaluated a range of modal and general alignment alternatives, in terms of their costs, benefits, and impacts. The scoping process for the Alternatives Analysis involved a presentation of the viable alternatives to the public and interested public agencies and officials to receive comments on the Purpose and Need, alternatives, and scope of the analysis. Scoping for the EIS followed the FTA process that provides for a culling of alternatives studied in the EIS through an Alternatives Analysis. The scoping process initiated for the Alternatives Analysis included a variety of highway, bus and fixed guideway options for consideration. During the later scoping effort for the EIS, the public was requested to propose alternatives that would satisfy the purpose and need at less cost or with greater effectiveness, less environmental or community impact and to propose alternatives that were not previously studied and eliminated for good cause. The only alternative that emerged that met these criteria was a fixed-guideway alternative following several alternative alignments. All reasonable alternatives that emerged from these processes were ultimately evaluated in the Draft and Final EISs.

Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts, and mitigation commitments.

Regarding your comment on fossil fuels, the Project will consume approximately 1 to 2 percent of the total projected electricity generated on Oahu in 2030. HECO is moving toward renewable energy generation. As that happens, the fixed guideway will also benefit from such new sources of energy. In addition, the integration of photovoltaic cells into stations and other project features could reduce net project electricity demand.

Per your next comment, the enabling legislation for the General Excise and Use Tax (GET) surcharge precludes the use of the collected funds for the wastewater system.

The Project has evaluated visual blight issues. Near Ala Moana Center, the guideway will be approximately 30 feet above the existing ground. There is no proposal to construct any portion of the Project or potential future extensions 145 feet above the ground. Section 4.8 of the Final EIS addresses the visual effects of the Project.

The assessment of visual effect due to the Project as described in Section 4.8.3 of the Final EIS considers changes to the visual landscape and viewer responses to those changes. This includes the existing development along the Project alignment. Within the Project corridor the environment changes from rural at the Wai'anae end of the corridor to dense high-rise development at the Koko Head end.

As part of the design process, the City has developed design principles, which are identified in the Honolulu High-Capacity Transit Corridor Project Compendium of Design Criteria

(RTD 2009m) that will be implemented in final design to minimize visual effects of the Project. For example, guideway materials and surface textures will be selected in accordance with generally accepted architectural principles to achieve effective integration between the guideway and its surrounding environment. Landscape and streetscape improvements will mitigate potential visual impacts, primarily for street-level views.

Other measures to address visual impacts of the Project are being developed through the station design and planning process. The initial station area plans and design guidelines were first developed with coordination between DTS and the Department of Planning and Permitting (DPP). The next level of transit station design focuses on integrating individual neighborhood characteristics of the communities served by the stations.

The following mitigation framework will be included in the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

- Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
- Coordinate the project design with City TOD planning and DPP.*
- Consult with the communities surrounding each station for input on station design elements.*
- Consider specific sites for landscaping and trees during the final design phase when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will serve to mitigate potential visual impacts.*

Section 4.8.3 of the Final EIS, Design Principles and Mitigation includes information related to the mitigation framework described above. Specifically architecture and landscape design criteria include guidelines regarding site design, materials and finishes, and lighting, which apply to stations, station areas, and the guideway.

As stated in Section 4.10.3 of the Final EIS, the Project will cause no severe noise impacts. Without mitigation, moderate impacts would occur at upper floors of a few high-rise buildings (as shown in Table 4-18 in the Final EIS). With mitigation in place (sound absorbing material, parapet wall and wheel skirts), the noise analysis indicates that the new noise generated by the Project will be lower than the existing noise levels in most places.

In addition, as seen in other cities, the value of properties with access to transit stations is higher than for properties that are distant from the system. In addition, other development, including retail, businesses, schools, etc., could occur near transit stations.

The Airport Alternative will not result in any lanes being taken away. Some lane widths will be reduced to accommodate column placement; however, this will not affect roadway capacity. Table 3-21 of the Final EIS presents information regarding the effects of column placement on streets and highways. As shown in Table 3-23 of the Final EIS, project-related traffic will affect six intersections in either the a.m. and/or p.m. peak hours. At these intersections (one near East Kapolei Station, one near UH West Oahu Station, three near the Pearl Highlands Station, and one near Ala Moana Center Station), traffic volumes under the Project will increase delay compared to the No Build Alternative. The Project will include

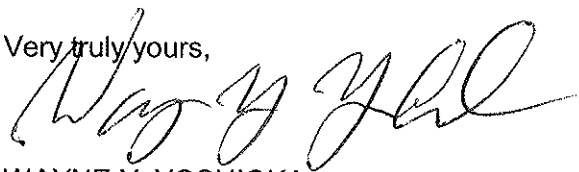

measures to mitigate impacts at these intersections. Mitigation measures are discussed in Section 3.4.7 of the Final EIS.

Lastly, your preference for HOT lanes is noted. In Chapter 2 of the Final EIS, as well as in Chapter 2 of the Alternatives Analysis, the total capital costs for the Managed Lane Alternative would range between \$3.6 and \$4.7 billion, of which \$2.6 to \$3.8 billion would be for construction of the managed lanes. The transit operating costs for the Managed Lane Alternative would range between approximately \$251 and \$261 million because of additional buses that would be put in service under that alternative. These costs do not include the cost of maintaining the managed lane facility. In Chapter 6 of the Final EIS, the capital costs of the Fixed Guideway Alternative, including bus system costs, will be \$4.6 billion in 2009 dollars for the East Kapolei to Ala Moana Center Airport Alignment. Total operating costs for the Project, including TheBus, TheHandi-Van, and the fixed guideway, will be approximately \$298 million.

The Fixed Guideway will be more cost-effective over the long-term. Funding sources for the capital investments include a State GET surcharge, City General Obligation bonds, and FTA funds. Only the Fixed Guideway Alternative could be funded with the GET surcharge. The GET is expected to generate \$3.5 billion through 2022 and the FTA's agreement to consider at least \$1.55 billion for Federal contribution to the Project through the New Starts program for the Fixed Guideway. No funding sources were identified for the Managed Lane Alternative. Toll revenues from the Managed Lane Alternative would pay for ongoing operations and maintenance while remaining revenues would be used to repay debt incurred to construct the system.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Dear Mr. Furuhashi:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

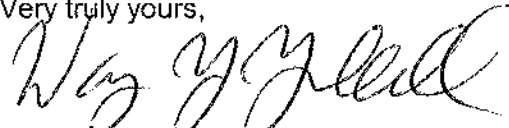

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

Noise measurement locations and results are shown in Figures 4-53 through 4-56 in Chapter 4 of the Final EIS. As discussed in this chapter, park-and-ride lots are located in undeveloped or commercial areas. The nearest distance from a residential use to a park-and-ride lot will be more than 1,000 feet. There are no noise impacts regarding park-and-ride lots for the Project due to their distance from sensitive noise receptors. Traffic impacts related to park-and-ride lots are described in Section 3.4.3 of the Final EIS. Intersections near each park-and-ride lot were analyzed to determine potential effects from park-and-ride traffic. Conceptual layouts of transit centers and park-and-ride facilities are provided in Chapter 2 of the Final EIS. Appendix B, Conceptual Alignment Plans and Profiles, in the Final EIS also shows the relationship of each facility with nearby surroundings. These documents are located on the project website at: www.honolulutransit.org under the "Library" tab.

Mr. Dexter Furuhashi
Page 2

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Subject: Comments on EIS for Honolulu Fixed Guideway Mass Transit System

I have not even bothered to read the EIS, primarily because I learned from my previous participation in testifying before the Honolulu City Council and its Transportation Committee, attending, speaking at, and asking questions at numerous public "mis"information meetings and other public forums; that the complete process has been co-opted by the Mayor, certain City Councilpersons, DTS and the contractors, Parsons Brinckerhoff and InfraConsult, with apparent collusion or at least acquiescence by DTA officials and members of the Hawaii

Congressional delegation.

I have consistently supported a fair and competitive bidding process for the selection of both the technology and the vendor (which is allegedly the FTA policy), but with the elimination of the HSST Maglev, we have lost the environmental war in the transportation arena since the environmental footprint of the proposed steel wheel on steel rail system, will dwarf that of the HSST Maglev, including guideway size/width, air pollution, noise pollution, aesthetics and cost.

It is a sad day for the mis-informed citizens and taxpayers of Honolulu; when their Mayor and other public officials can lie to them and cheat them, and the local print and broadcast media as well as our federal officials do not hold them accountable.

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As stated in Section 2.2.3 of this Final EIS, the NEPA Notice of Intent requested input on five transit technologies. A technical review process included the opportunity for public comment and was used in parallel with the alternatives analysis to select a transit technology. The process included a broad request for information that was publicized to the transit industry. Transit vehicle manufacturers submitted 12 responses covering all of the technologies listed in the Notice of Intent. An independent five-member technology panel composed of four transit experts and a transportation academic appointed by the City Council evaluated guided rubber-tire-on-concrete systems (e.g., Phileas bus system and VAL-type systems), monorail (which is a variation on rubber-tired technology), steel-wheel-on-steel-rail systems, (e.g., light rail and rapid rail), and magnetic levitation (MAGLEV). The panel considered the performance, cost, and reliability of the proposed technologies.

Proprietary technologies, meaning those technologies that would have required all future purchases of vehicles or equipment to be from a single manufacturer, were eliminated because none of the proprietary technologies offered substantial proven performance, cost, and reliability benefits compared to steel wheel operating on steel rail.

The panel accepted public comment twice as part of its review. By a four-to-one vote, the panel chose a steel wheel vehicle operating on steel rail system because it was considered safe, reliable, economical, and non-proprietary. Those results are documented in the panel's report to the City Council dated February 22, 2008 entitled "Independent Technology Selection Panel Report".

There is one operating urban magnetic levitation system in the world, and it has less than five years of operating record. Maglev would likely require more energy than the steel wheel on steel rail system, thus having a greater affect on air pollution. While the system is quieter, other systems may be designed to match the noise level of magnetic levitation when in operation. The assumed visual benefits for beam-track vehicles would not apply in the U.S. because of requirements to include an emergency egress walkway. In addition, the smaller structures proposed in the comment result in shorter span lengths, which increases the number of columns required and the percentage of views blocked by the support structure, which would result in higher costs.

In addition, the magnetic levitation system would not provide a net benefit or proven cost savings and would not change the selected alternative. In fact, the operators of the High Speed Surface Transport system have declined to make operating expenses available. No comparative maglev project has ever been built in the U.S. Therefore, no data are available to support a cost estimate. Some of the savings recognized in other countries for beam-track vehicles would not apply in the U.S. because of requirements to include an emergency egress walkway. In addition, shorter span lengths increase the number of columns required, and thus the cost to construct both the additional foundations and columns. With no comparative data available to support an operating cost estimate, there are no means to verify the statement regarding maglev's operating and maintenance costs compared to a steel wheel system.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Dear Ms. Garces:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the

Ms. Ginalynn Garces
Page 2

Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

As shown in Figure 3-7 in the Final EIS, transit travel time from Kapolei to Downtown in 2030 will take approximately 55 minutes with the Project compared to approximately 90 minutes under No Build conditions.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

DC#4227-R

The City Council, which earlier this year indicated it would play a major role in selection of the transit system technology, has basically "taken a back seat" to the city administration in recent months. It was unable to pass a resolution for the proper ballot question for November, to have a transit authority—which the city wanted—develop a fixed guideway transit system. Instead, it accepted the wording of a transit foe and we were left with the steel wheels question. The city, for its part, ignored the council and apparently went ahead with this EIS long before the ballot question was approved by the council. Approval of steel wheels on the ballot does not eliminate other suppliers from the competition, but the EIS basically just "brushes off" three other technologies by using a recommendation from a highly suspect (so-called) expert panel. This limiting of alternatives was referred to in the state's review of the EIS as "troubling."

I am not here to support two of those eliminated technologies, and intend to speak only as a proponent of the HSST elevated urban magnetic levitation system. Chapter 02 of the EIS covers Alternatives Considered. In Section 2.1.3, magnetic levitation is listed as a proprietary system unproven in the U.S. Because it is not in the U.S. does not make it unproven. Using this rationale would leave us still traveling in covered wagons. In fact, the Federal Transit Administration has called the HSST a mature technology, and the system has been in revenue service in Nagoya, Japan since early 2005 with a reliability rating of well over 99 percent.

The section goes on to state that "none of the proprietary technologies offered substantial proven performance, cost, and reliability benefits compared to steel wheel operating on steel rail." Concerning the HSST, that statement is not only misleading but is patently false. Compared to steel wheel systems, the HSST mag-lev is faster, much quieter, and safer (because of its wrap-around-the-beam configuration). Its guideway also is not only less obtrusive but will be at least 20 percent cheaper to build. This is extremely important when one examines guideway length for the three alternatives and compares associated costs given in Chapter 06 with expected sources of funds.

The city has funding for a 20-mile minimum operable segment (or MOS) but includes an alternative in Section 2.2.2 that shows a combined airport and Salt Lake alternative of 25 miles. Not only does this alternative place the project over even projected budgets but it excludes any extension to the UH-Manoa campus. Personally, I strongly favor the airport and military base routing over one on Salt Lake Boulevard. If, however, the HSST were allowed to compete, and were to win the transit competition, it might be possible to satisfy most of the interested parties.

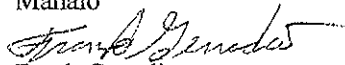

If the amount of labor and materials planned for the MOS were applied to HSST development, an additional five miles of guideway could be constructed within the MOS budget and timelines. This would accommodate the airport alignment, extension to UH-Manoa, and spurs into the Salt

Lake area as well as Waikiki. The only way to take advantage of the costs savings associated with the mag-lev is to ensure that guideway specifications are left open to suppliers in the Request for Proposals (or RFP). In Figure 2-9, the Draft EIS shows a guideway of 28-32 feet, as well as a parapet wall (for noise mitigation). This solid structure bridge is much larger than what is needed for the HSST, two beams with open space between the beams and a cross-section of 21 feet—with no need for noise mitigation walls. The narrower profile of the mag-lev guideway, coupled with the much lower sound level of the system, also will result in less impact on homes, businesses, and other facilities along the transit route. Obviously, if the Figure 2-9 chart becomes the specification in the RFP, the mag-lev cost advantage is negated. I will be submitting a comment that this chart be deleted, or shown as an example applicable only for steel wheel systems.

Finally, the costs for operations and maintenance shown in Table 6-3 reflect steel wheel on steel rail amounts anywhere from \$12-18 million more per year than would be needed for the mag-lev. Despite an extra ten percent in electricity to levitate its train cars, the HSST's virtually frictionless running results in lowered costs along with a smoother ride. Over 30 years of operations, that equates to \$360-540 million in savings to island taxpayers.

The bottom line is precisely that: Prevent the HSST mag-lev from competing and we pay more money for what may be an inferior system. If the city is so certain that steel wheel on steel rail is superior, modify this EIS appropriately, keep the RFP specifications general enough to enable all suppliers to have a chance, and allow the HSST to compete. After testifying at the City Council the other day, I had a discussion with a steel wheels supporter outside the chamber. He told me that adding evaluations of other technologies in the EIS would cost an additional \$1.5 million. Let us place that expenditure in perspective. Compared to the 5.4 billion year-of-expenditure dollars for an airport alignment, it is .0000277 percent, or one 36,000th of the cost. This would certainly be money well spent. Take the delay, spend the money, really open the competition, and do something positive for this island's taxpayers and commuters.

Dear Mr. Genadio:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal:

As stated in Section 2.2.3 of this Final EIS, the NEPA Notice of Intent requested input on five transit technologies. A technical review process included the opportunity for public comment and was used in parallel with the alternatives analysis to select a transit technology. The process included a broad request for information that was publicized to the transit industry. Transit vehicle manufacturers submitted 12 responses covering all of the technologies listed in the Notice of Intent. An independent five-member technology panel composed of four transit experts and a transportation academic appointed by the City Council evaluated guided rubber-tire-on-concrete systems (e.g., Phileas bus system and VAL-type systems), monorail (which is a variation on rubber-tired technology), steel-wheel-on-steel-rail systems, (e.g., light rail and rapid rail), and magnetic levitation (MAGLEV). The panel considered the performance, cost, and reliability of the proposed technologies.

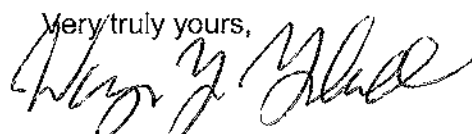

Mr. Frank Genadio
Page 3

and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly lower impacts to the natural and built environment. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative.

The selection of the Airport Alternative as the Project is described in Chapter 2 of the Final EIS. The discussion of alternatives considered is included in Chapter 2 of the Final EIS and the Alternatives Analysis. As provided in Chapter 3.4.2 of the Final EIS, the Airport Alternative will carry the most passengers with 116,000 daily passengers and 282,500 daily trips in 2030, thereby resulting in the greatest transit-user benefits. The Airport Alternative will also result in the fewest vehicle miles traveled and vehicle hours of delay when compared to other alternatives evaluated, as well as provide access to major employment areas including the Honolulu International Airport, that will have substantially greater ridership than other alternatives considered.

Additionally, with this Project, additional extensions are possible in the future. 23 CFR 771.111(f) states "The action evaluated in each EIS...shall not restrict consideration of alternatives for any other reasonable foreseeable transportation improvements". Future transit improvements, including an extension to the U.H. Manoa campus will not be precluded by the implementation of the Project.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

January 31, 2009

Mr. Yoshioka:

Attachments to this letter contain three pages of general comments and ten pages of specific comments on the draft Environmental Impact Statement produced by the City and County of Honolulu for its High-Capacity Transit Corridor Project. I believe that you and Mayor Hannemann still have time to correct your current direction toward holding a steel wheel on steel rail-only competition, and hope that you seriously consider "reversing course."

I am sure that your department and the contractor team are aware of persistent critical comments in letters and postings to online newspaper articles concerning the transit project. There are the obvious postings from the Stop Rail Now group, but there also are a number of people (aside from me) who want transit but do not like the obvious attempts by the city to limit the competition.

Whether or not members of the State Legislature are serious about making an attempt to seize or delay the surcharge collections going into the special fund for transit, there is little doubt that transit foes are continuing to look for ways to end the project. I recommend that the city make an announcement that there will, indeed, be a fair and open competition for both the guideway development and the transit technology. It would not only deflect a considerable amount of criticism but may return some previous supporters to full backing for the project. Aloha.

It is necessary to preface my general and specific comments to the draft EIS because, although I remain a strong supporter of fixed-rail, I have become disillusioned by the way in which the project has been handled by the administration of the City and County of Honolulu (the City) and the Honolulu City Council. I am a former member of the Committee for Balanced Transportation (CBT), which was formed as a non-partisan tax-exempt group to foster education for integrated transportation and advocate for a rapid transit system for the island of O'ahu. To assist with that goal, a small grant was received a few years ago from the American Public Transportation Association and (perhaps) \$2,000 remained as of mid-2008. I terminated my CBT membership when I learned in December through a newspaper article that more than \$342,000 (from "contributions" made by transit contractors and their employees and Outrigger Enterprises Inc.) had been "funneled through" the CBT in its "Go Rail Go" guise to back the City's steel wheel on steel rail (SWSR) advocacy. I also was (perhaps I still am) a member of the Transit Solutions Advisory Committee (TSAC; now known as the Transit Advisory Committee) formed by Mayor Mufi Hannemann. There have been no TSAC meetings in the past several months or, if there have been meetings, I have not received an invitation. While a member of the CBT, I also served as a CBT representative to the Citizen Advisory Committee (CAC) of the O'ahu Metropolitan Planning Organization.

As much as I would have liked to continue my (completely voluntary) effort as a member of the City's team, the change in my status stems from my public support for a fair and open competition among all transit system suppliers that qualified, based on the City's own criteria in its Request for Information. I believe that the HSST urban magnetic levitation (mag-lev) system currently operating in Nagoya, Japan would be a strong competitor—if allowed to compete. It also is necessary for me to state that I have no formal connection with the HSST's supplier, Mitsubishi-Itochu, and have not and will not receive any compensation from their companies. My sole intention is seeing Honolulu obtain the best transit system at the best price.

Presumably, the City is meeting all of the legal requirements of the Federal Transit Administration (FTA) before it pursues federal funding for the transit project. It is, however, apparently ignoring the "spirit" of FTA guidelines while following a course of action that is not in the best interests of O'ahu taxpayers and commuters. The EIS must be modified to cover all qualifying rail systems—even if it means additional expenditure of planning and analysis funds

and a delay in the document's completion. (Personally, I feel that the contracted analytical team should have produced a comprehensive product with funding allocated to date.) One has to be impressed by the number of analysts who have worked on this project and their levels of education and experience (as given in the draft EIS)—but one also has to wonder at the seeming lack of imagination and vision shown by the city. Based on what is contained in the draft EIS, particularly in documents from two to three years ago, it appears that the whole process was used to orchestrate for an SWSR system.

My support for the HSST actually stems from a trip to Japan made by Mayor Hannemann and three members of the City Council in 2005. They praised the HSST and were even pictured demonstrating how little effort it took to move the (levitated) 52-ton train (Honolulu Star-Bulletin, October 2005). I then started research into learning more about an urban mag-lev, leading to my advocacy. Both high-speed and urban mag-lev systems operate or are under development in several nations and will undoubtedly continue to proliferate. The Maglev 2008 Conference in San Diego in December demonstrated the level of interest in modernizing U.S. transportation systems. Critics of the mag-lev cite the thousands of miles of steel rail tracks throughout the continental United States that would no longer be of use, leading to the extra expense of building mag-lev guideways. There is no such concern on the island of O'ahu, where we will "start from scratch." Implementation of a modern mag-lev system in Honolulu would not only be effective but would, in fact, be an attraction for this tourism-oriented city.

Concerning the document, a general statement on property acquisition is needed. The tables and paragraphs in Chapter 4 are all based solely on an SWSR system. The numbers would probably apply as well to a rubber tire on concrete rail system but would likely be lower for both monorail and mag-lev systems, which require less space along their guideways.

The discussions in Chapter 5 concerning acquisition of properties, including some of historical significance, are all applicable only to SWSR systems. Analysis of impacts on these properties must be made for each of the other forms of fixed-rail. In the cases of the monorail and mag-lev, the impact would certainly be lessened because of the (relatively) narrower width of their guideways.

The discussion on costs in Chapter 6 applies only to SWSR systems. Rather than comment specifically on each section of the chapter as well as the costs given elsewhere in the document, the following is a summation of the major costs associated with implementation of the HSST urban mag-lev system. (NOTE: I did not find detailed costs for the Hitachi monorail—and will leave any justification for that system up to its supplier. The costs for the HSST are based on presentations made by Itochu representatives to the Honolulu City Council.)

The draft EIS lists costs for the (now selected) Airport Alternative at \$5.433 billion. A steel wheels bridge construction (using 49 percent of total cost) would be \$2.662 billion, or a cost per mile of \$133 million. The HSST supplier estimates construction for the mag-lev guideway would be \$570 million less, or \$2.092 billion, resulting in a cost per mile of \$105 million. Using the steel wheels budget of \$2.662 billion, at least 25 miles of mag-lev guideway could be built (i.e., enough to reach the campus of the University of Hawaii [UH] in Manoa, an important link for ridership, with spurs to the Salt Lake Shopping Center and Waikiki).

Operations and maintenance (O&M) costs also will be cheaper using the HSST. Despite a need for about ten percent additional electricity to levitate the train, the virtually frictionless running of the mag-lev is estimated at 20 to 30 percent less (than an SWSR system) per year. Enormous savings would be realized over 30 years, considerably easing the burden on taxpayers' funding for the transit subsidy. O&M cost comparisons are given on page 8 of the specific comments, for EIS page 6-7. O&M costs savings alone would enable guideway extension into Central O'ahu, a major ridership area. Given the significant savings that can be realized with the HSST, how is it possible for the City to justify limiting the competition to SWSR systems?

The City's plan also is disappointing in its lack of any foresight for some form of express service, which would be likely to create a significant boost in ridership—particularly from West O'ahu into Downtown Honolulu and (eventually) UH and Waikiki. The EIS mentions more than once the possibility of having train operators. Any modern system should be capable of fully automated operations controlled from the transit operations center, and an operator would do nothing more than add to O&M costs.

I remain hopeful that the City will realize that the present course of action is detrimental to the best interests of the taxpayers and commuters of O'ahu, and will pursue a fair and open competition among all qualified transit system suppliers. This can be accomplished by not "tailoring" the specifications (particularly for the guideway) to favor SWSR systems, and by placing a statement prominently up front in any Request for Proposals that states something like "All guideway developers and transit system suppliers that qualified under the City's Request for Information are invited to bid."

IT IS TIME FOR A 21ST CENTURY SOLUTION!

I will end my general comments with the following extract from President Barack Obama's Inaugural Address: "And those of us who manage the public's dollars will be held to account, to spend wisely, reform bad habits, and do our business in the light of day, because only then can we restore the vital trust between a people and their government."

Specific Comments on Draft Environmental Impact Statement - Frank Genadio

<u>Page</u>	<u>Paragraph Title (abbreviated)</u>	<u>Statement on Which Comment is Based</u>
<u>Comment and Rationale</u>		

7	Purpose of the Draft EIS	Notice of Intent published in federal register
	<p>The actual statement in the Notice of Intent is pertinent to my criticism of the city's actions to date. It states that "The draft EIS would consider five distinct transit technologies: Light rail transit, rapid rail transit, rubber-tired guided vehicles, a magnetic levitation system, and a monorail system." The EIS does not come close to anything resembling a consideration of technologies other than steel wheels on steel rails (SWSR), presumably fitting into the first category above (since it is not planned as being "rapid").</p>	

8	Purpose of the Draft EIS	<p>...core 19-mile alignment... ...along Salt Lake Boulevard...first</p>
	<p>City Council action has changed the alignment; change "19-mile" to "20-mile" and change "along Salt Lake Boulevard" to "along a route by Honolulu International Airport"</p>	

S-4	Alternatives Considered	<p>"The panel's report resulted in the City establishing steel wheel operating on steel rail as the technology... This eliminated the other technologies from further consideration."</p>
-----	-------------------------	---

This statement should be removed because several meetings of the City Council followed the technology panel meetings, which were—to say the least—incomplete because of the requirements of the "Sunshine Law." The council never did pass a bill concerning technology and the panel's recommended SWSR system never received more than four (of nine) positive votes in any committee or full council meeting. It took a while to realize that the panel was, in fact, an SWSR "set-up" with four of five members having either no or very little knowledge of non-SWSR systems. The fifth member, Professor Panos D. Prevedouros (with whom I seldom agree but did in this case), criticized its proceedings extensively in the Honolulu Star-Bulletin's April 17, 2008 edition, in a column titled "Transit panel selection was case study in manipulation." The EIS seems to "downplay" the impact the panel's selection had on subsequent events; for example, it does not provide the names of panel members. The names of the other four panelists must be added so that FTA and U.S. Department of Transportation officials can determine for themselves whether or not this group was objective—or was, in fact, made up of men with little knowledge of non-SWSR systems. Recommend the addition of their names: Chair Ron Tober, Ken Knight, Henry Kolesar, Steve Barsony, and Panos Prevedouros.

S-7	Noise and Vibration	<p>A solid parapet wall...to reduce noise levels.</p>
	<p>Change "...noise levels." to "...noise levels if a steel-wheel-on-steel-rail system is selected." Parapet walls and wheel skirts would not be required for the HSST urban magnetic levitation (mag-lev) system because of its much lower noise level. (I do not have noise data on the conventional monorail but it is also likely that such mitigation measures would not be needed.) It also should be noted that the City has never indicated what the (added) costs might be for mitigation measures.</p>	

Specific Comments on Draft Environmental Impact Statement - Frank Genadio

<u>Page</u>	<u>Paragraph Title (abbreviated)</u>	<u>Statement on Which Comment is Based</u>
<u>Comment and Rationale</u>		

2-3	2.1.1 Screening of a Broad Range...	Emerging rail concepts were eliminated because they have never been proven in real-world use and would not meet the rapid implementation schedule for the project.
-----	-------------------------------------	--

This statement should be reworded for clarity to "Emerging rail concepts, other than fixed guideway, were eliminated..." Emerging rail concepts are not defined.

2-7	Table 2-2 Alternatives...Rejected	Last three rows under technologies.
-----	-----------------------------------	-------------------------------------

These three rows need to be removed because of the extremely weak rationale for rejection given in the table. There probably are proprietary aspects of every system being considered for Honolulu's transit project. Suppliers of these three rail technologies, if allowed to compete, would undoubtedly work with City officials to ease any proprietary concerns. The added statement for Magnetic Levitation, "unproven in U.S.," is ridiculous. The first use of a steam locomotive was in the United Kingdom in 1804, and the first commercial use in the United States was in 1829. If anything unproven in the U.S. cannot be considered, we would still be moving people and cargo in covered wagons. It should be noted that the Mitsubishi-Itochu HSST urban mag-lev is now approaching four years of extremely high reliability revenue service in Nagoya, Japan.

2-8	2.1.3 Alternatives Consideration...	Statement in discussion of panel selection that ends with "...none of the proprietary technologies offered substantial proven performance, cost, and reliability benefits compared to steel wheel operating on steel rail."
-----	-------------------------------------	---

This is just another attempt in the document to justify SWSR systems, and is patently false concerning the HSST mag-lev. Compared to any steel wheels system's performance, the HSST is faster (at 62.5 miles per hour compared to 55), much quieter (in the range of an average television level in a home, or at least twice as quiet as noise-mitigated SWSR), and smoother riding because it is levitated above its guideway beam. As of late last year the HSST had carried more than 30 million passengers with a reliability rating of more than 99.9 percent; can any SWSR system match that? As for cost, the HSST supplier estimates that, at current costs, the 20-mile minimum operable segment (MOS) guideway could be built for \$570 million less than SWSR. For operations and maintenance (O&M) costs, despite about ten percent electricity (needed to levitate the train), the HSST O&M costs would be considerably less per year than SWSR (see details for page 6-7 comment). These benefits are indeed substantial, and indicate that the panel's goal was to justify the City's choice, not perform a real evaluation of each of the suppliers that met the criteria in the Request for Information (RFI). The irrelevancy of the panel makes the remainder of the EIS incomplete because all of its analyses are based solely on SWSR systems. The last two paragraphs of this section (2.1.3) should be removed as the first step in the necessary re-write of this EIS.

<u>Page</u>	<u>Paragraph Title (abbreviated)</u>	<u>Statement on Which Comment is Based</u>
<u>Comment and Rationale</u>		
2-9	2.2 Alternatives Evaluated in...EIS	Last paragraph on "A connection to..." Based on City Council action, reword this sentence to "A connection to a station along Salt Lake Boulevard could be built as a phasing option.....and Ala Moana Center along the route servicing the Honolulu International Airport." A global search of the document is recommended to change to the new primary option of servicing the airport.
2-9	2.2 Build Alternatives	Sentence that states "The system would use steel wheel on steel rail technology." Based on discussions above, change sentence to read "The system would use a form of fixed-rail technology." A "global" change throughout the document from "steel wheel on steel rail" to "fixed-rail" is recommended.
2-9	2.2.2 Build Alternatives	Sentence that states "All parts of the guideway would be elevated, except near Leeward Community College, where it would be in exclusive right-of-way." This presumes that it has already been determined that the maintenance and storage facility will be at LCC. Earlier in the document, it is indicated that the facility may instead be sited along Farrington Highway. A change from "Leeward Community College" to "the system's maintenance and storage facility" is suggested. A better solution might be a short extension (eventually part of the West Kapolei line) from the westernmost terminus of the MOS into Kalaeloa that could accommodate a facility sited on the flat land that is being acquired by the state. This could be cheaper to build and sooner to be in operation than a facility near LCC.
2-19	End of second paragraph on left	Change "assumed in to be place" to "assumed to be in place" Self-explanatory.
2-19	Transit Technology	Replace first sentence with more general wording. Recommend that first sentence read "The selected transit system will be a form of fixed-rail powered by electricity (Figures 2-9A through 2-9C depict the type of guideway required for each rail technology)."
2-20	Figure 2-9	Example Vehicle on Elevated Guideway This figure's title should be changed to "Example Steel Wheel on Steel Rail or Rubber Tire on Concrete Vehicle on Elevated Guideway" and the graphic listed as Figure 2-9A. Figures 2-9B and 2-9C should be added and show the guideways for Conventional Monorail and Elevated Magnetic Levitation systems. If the EIS is left as is, and this graphic becomes part of the specifications in any bid or Request for Proposals—leaving suppliers required to build an elevated guideway of 28-32 feet wide—the monorail and mag-lev cost advantages are negated. These two systems are capable of operating on much narrower (and, therefore, less costly and obtrusive) guideways.

- 2-38 Vehicle Maint. and Storage Facility Discussion of LCC site.
 It needs to be pointed out that a considerable amount of leveling is required to flatten the ground for a site adjacent to Leeward Community College. It should be noted that this will add to overall system costs.
- 3-27 Figure 3-9 A.M. Peak-Period Transit Travel Times
 The figure reflects times based on local operations (i.e., stops at every station). There must be thought given to some form of express service, and this must be done before the start of construction for the first segment of the MOS. Station bypasses by express trains, which would increase costs, are the best type of express service; however, consideration should at least be given to skip-station operations during rush hours. Every effort should be made to halve rush hour transit times in 2030 between West O'ahu and destinations in Downtown and Waikiki, to ensure that commuters will see substantial gains from transit use (including time from home to departure station and arrival station to destination) over operation of their privately owned vehicles.
- 3-39 Table 3-21 Column Placement Effects on Streets and Highways
 The figure title should be changed to "Column Placement Effects on Streets and Highways for the Steel Wheel on Steel Rail Bridge" and additional tables should be made for other rail forms. The summary is likely to be different, particularly for monorail and mag-lev guideways.
- 3-42 Table 3-23 Potential Effects on Parking due to Fixed Guideway Column Placement
 The figure title should be changed to "Potential Effects on Parking due to Fixed Guideway Column Placement for the Steel Wheel on Steel Rail Bridge" and additional tables should be made for other rail forms. The summary is likely to be different, particularly for monorail and mag-lev guideways.
- 3-50 Construction Phasing Wording on phasing of construction
 Reword to indicate airport routing first, based on City Council route change.
- 4-5 Table 4-1 Acquisitions, Displacements, and Relocations
 Identify this table as applying to SWSR systems, and add tables reflecting what the acquisitions and displacements numbers would be for other forms of rail.
- 4-5 Table 4-1 Community Services and Facilities
 Identify this table as applying to SWSR systems, and add tables reflecting what the partial acquisitions and displacements numbers would be for other forms of rail.
- 4-8 Table 4-1 Noise and Vibration
 Identify this table as applying only to SWSR and rubber tire on concrete systems, and make a statement that noise mitigation measures are not necessary for monorail and mag-lev systems.

<u>Page</u>	<u>Paragraph Title (abbreviated)</u>	<u>Statement on Which Comment is Based</u>
<u>Comment and Rationale</u>		
4-9	Table 4-1	Street Trees Identify the numbers in this table as applying only to SWSR and rubber tire on concrete systems, and provide new calculations (which are likely to be fewer) for monorail and mag-lev systems.
4-33	Cemeteries	Typo in second sentence. Change "...Stadium-Cand.." to "...Stadium and..."
4-36	Airport Alternative Proper usage.	Change "Airforce" to "Air Force"
4-39	4.5.2	Affected Environment – Neighborhoods In second paragraph, second sentence, change "White" to "Caucasian" as better usage.
4-42	Table 4-8	Year 2000 Demographic Characteristics... Suggest heading changes from "White" to "Caucasian" and "Black" to "African-American" as better usage in table and accompanying text on page.
4-45	Ala Moana-Kaka'ako Self-explanatory.	Change "...(TOD) is..." to "...(TOD) are..."
4-47	Regulatory Context Self-explanatory.	Change "...statues,..." to "...statutes,..."
4-47	Defining Environmental Justice Areas	Change "...Black,..." to "...African-American,..." See above on usage; note how it fits better with other terms.
4-51	Table 4-9	Demographic Characteristics of O'ahuMPO... Suggest heading changes from "White" to "Caucasian" and "Black" to "African-American" as better usage.
4-65	Figure 4-17	Viewpoint 1; and
4-66	Figure 4-18	Viewpoint 2; and
4-72	Figure 4-24	Viewpoint 8; and
4-75	Figure 4-27	Viewpoint 11; and
4-76	Figure 4-28	Viewpoint 12; and
4-80	Figure 4-32	Viewpoint 16; and
4-84	Figure 4-36	Viewpoint 20

These conceptual graphics do not appear to be in scale with the graphic in Figure 2-9, which indicates that the SWSR bridge will be 28-32 feet wide. These figures seem to indicate a guideway only slightly wider than the (5-foot wide) vehicles below. Note the relatively narrow shadow of the guideway in Figure 4-27. Viewpoint 20 seems a little closer to what is expected to be the guideway's

Specific Comments on Draft Environmental Impact Statement - Frank Genadio

<u>Page</u>	<u>Paragraph Title (abbreviated)</u>	<u>Statement on Which Comment is Based</u>
<u>Comment and Rationale</u>		

width, but still appears too narrow based on its shadow against the length of the vehicle below. These conceptual graphics need to be redone to more accurately reflect the width of the guideway; the addition of overhead views is suggested. Similar renderings will be needed for monorail and mag-lev guideways.

- | | | |
|-------|------------------------------|--|
| 4-91 | Salt Lake Alternative | First full paragraph on right
Change "...views along the steam..." to "...views along the stream..." |
| 4-95 | 4.8.2 | Last two sentences of last paragraph.
Should "...Improvement Plan..." be "...Improvement Program...?" |
| 4-97 | Figure 4-37 | Typical Sound Levels
The term "rail" in two places should be changed to "steel wheels on steel rails" and 50-foot readings should be added for the other three rail systems: rubber tires on concrete, monorail, and magnetic levitation. Discussion of the noise levels of these technologies should be added throughout the Section 4.9.1 discussion. |
| 4-100 | Table 4-15 | Number of Residential Buildings, Parks, and Schools with Noise Impacts; and |
| 4-101 | Table 4-16 | Noise Impacts
The term "Created by Steel Wheel on Steel Rail Systems" should be added to the title of both tables, as well as Figures 4-39, 4-40, 4-41, and 4-42 on subsequent pages. Further study should be initiated to create tables and figures for the other three rail technologies. |
| 4-108 | Electric and Magnetic Fields | Effect of HSST mag-lev needs to be evaluated
Since magnetism is used to levitate the train, effects of the HSST mag-lev should be included in this specific area. The HSST supplier has testified to the Honolulu City Council that the system has no effect on passengers with pacemakers, so minimal impact is anticipated. |
| 4-137 | Table 4-29 | Summary of Street Tree Effects/Transplanting...
The number of trees requiring removal or transplanting might be considerably less for the much narrower guideways needed for monorail and mag-lev systems; added tables are needed. |
| 4-149 | Table 4-32 | Airport Alternative grouping; and |
| 4-150 | Table 4-32 | Airport & Salt Lake Alternative grouping
Change "CINCPACFLT" and "CINCPAC" to "COMPACFLT" and "PACFLT" respectively in both places. The Commander of the U.S. Pacific Fleet is no longer referred to as a Commander in Chief. |
| 4-166 | 4.18.2 | Station Area Development
The first sentence needs to be updated relative to TOD ordinance in 2008. |

- Frank Genadio

Specific Comments on Draft Environmental Impact Statement

<u>Page</u>	<u>Paragraph Title (abbreviated)</u>	<u>Statement on Which Comment is Based</u>
		<u>Comment and Rationale</u>

- | | | |
|-------|----------------------------------|---|
| 4-166 | 4.18.2 | 'Ewa Plain, East Kapolei, UH West O'ahu, and Ho'opili
The Hunt Development Group may have pulled out of its agreement with UH; paragraph needs update. |
| 4-171 | Table 4-36 | First entry: Ka Makana Ali'i
May need an update; is DeBartolo still involved in this development? |
| 5-3 | 5.2 | Description of the Project
Change "...steel-wheel-steel-rail..." in the last sentence of the first paragraph to "...fixed-rail..." to ensure that a subsequent competition remains open to suppliers of all forms of rail that met the City's criteria in the RFI. |
| 5-3 | 5.3 | Next to last line on right side of page.
Change "...affects..." to "...effects..." |
| 5-8 | Table 5-2 | Airport Alternative grouping; and |
| 5-9 | Table 5-2 | Airport & Salt Lake Alternative grouping
Change "CINCPACFLT" and "CINCPAC" to "COMPACFLT" and "PACFLT" respectively in both places. The Commander of the U.S. Pacific Fleet is no longer referred to as a Commander in Chief. |
| 5-24 | Measures to Minimize Harm | Guideway design as narrow as possible.
This statement must be challenged because earlier in the document it is specifically shown as 28-32 feet across. The City is well aware that narrower guideways can be used for both the monorail and mag-lev systems. Since width is a concern, the City must allow suppliers of all forms of fixed-rail to compete. This comment also applies to paragraphs of the same name on pages 5-25, 5-26, and 5-28. |
| 6-3 | Table 6-1 | Capital Cost Estimates for the Build Alternatives...
This table, in fact, this whole chapter and tables reflect costs associated only with SWSR systems. Similar tables, along with discussion, must be developed for the other forms of fixed-rail transit. |
| 6-4 | General Excise and Use Surcharge | Discussion of 0.5 percent surcharge
A sentence needs to be added at the end of this paragraph: "The amount collected through the GET surcharge currently is reduced by ten percent, which goes into the general fund handled by the State Legislature." No relief is anticipated; in fact, the legislature may consider moving all surcharge collections into the general fund for a period of time. |

6-7	Fare Revenues	Fare box recovery ratio
-----	---------------	-------------------------

Operating and maintenance (O&M) costs for the HSST mag-lev are estimated to be considerably less than any SWSR system. Based on the City Council resolution for revenues to be maintained between 27 and 33 percent of annual O&M costs, the average fare for passengers will be less with the HSST. Conversely, increasing the percentage from the fare revenues—based on use of the HSST—to equal what would have been required with an SWSR system would reduce the transit subsidy. It should be noted that City O&M estimates seem to have increased considerably from earlier figures. The City’s “Honolulu Rail Transit” brochure distributed throughout the (voting) community in 2008 indicated O&M at “about \$60 million per year in today’s dollars.” Table 6-3 shows the following: for Salt Lake routing - \$63 million in 2007, \$123 million in YOE; for Airport routing - \$68 million in 2007, \$133 million in YOE; and for a combined Airport and Salt Lake alignment - \$96 million in 2007, \$187 million in YOE. HSST O&M is estimated between 20 and 30 percent less per year than SWSR; using 25 percent as an average, its advantage is as follows: for Salt Lake routing - \$47.25 million in 2007, \$92.25 million in YOE; for Airport routing - \$51 million in 2007, \$99.75 million in YOE; and for a combined Airport and Salt Lake alignment - \$72 million in 2007, \$140.25 million in YOE. Using YOE dollars for the now-selected Airport routing, 30-year savings with the HSST would be \$997.5 million. If a dual Airport and Salt Lake alignment materializes, use of the HSST would save \$1.4025 billion. O&M costs savings alone would enable guideway extension into Central O’ahu, a major ridership area.

6-11	System Operation	Project costs based on train operators
------	------------------	--

Perhaps all project costs should be recalculated based on fully automated train operations. No modern train system should be considered that requires train operators; there are enough necessary expenses, so the unnecessary expenses should be eliminated up front. Train operators in a grade-separated urban rail transit system are redundant in the 21st Century.

7-11	Important Trade-offs	Last paragraph
------	----------------------	----------------

Needs to be rewritten, based on City Council action on the alignment.

541	Appendix C	Construction Process
-----	------------	----------------------

This appendix needs to be rewritten to include construction processes for the non-SWSR fixed-rail systems.

596	Comment Sheet	From Hawaii Department of Transportation (DOT)
-----	---------------	--

I strongly support DOT Comment Number 2 that elimination due to proprietary technology is not sufficient reason to eliminate alternatives to SWSR systems.

1045	D.R. Horton Schuler	Comments on scoping meetings.
------	---------------------	-------------------------------

The comment that “...Maglev systems are not only extravagantly expensive and untested in real-world public transit operational settings.” is incorrect. Perhaps Mike Jones was referring to the high-speed mag-lev. The HSST urban mag-lev, compared to SWSR systems, is not only less expensive to build but also less expensive to operate and maintain. It also has been thoroughly tested in revenue service in Nagoya, Japan for almost four years. Renderings of the proposed Ho’opili development in

West O'ahu show a train station inside a public (retail?) building. This is possible with the quiet mag-lev, but I would not recommend it for any SWSR system. Mr. Jones should reconsider his earlier comment.

1160 Frank Genadio Start of my comments during scoping meetings.
 I see nothing in these comments, covering the next three pages, that is contradictory to my current position on each subject. I see that at least a couple of state legislators recently brought up the issue of possibly taking a look at nuclear power. It is about time, and all forms of alternative energy should be "on the table" for powering the transit system.

1494 Fixed Guideway Alternatives "Comments on reducing the range of technologies under consideration are encouraged."
 Seeing this statement again, after reading through the comments in the scoping meetings, makes one believe that the City really had little interest in public input. Despite the supposed restriction on not expressing preferences, I noticed that a number of people mentioned technology and advocated monorail and mag-lev—but there was not much mention of SWSR systems. Several people stressed limiting system noise. I even noticed (early) preference for monorail or mag-lev from a couple of people who seem to have changed their minds later, probably to keep their jobs (i.e., after the City administration decided that SWSR is the system of choice). If public comments are really to be considered in making transit decisions, why is it not even possible for the non-SWSR systems to compete?

1502 Project Alternatives Analysis Report "No information was received that would eliminate one or more of the transit technologies currently under consideration."
 The statement above, in a report dated May 30, 2007, followed City policy throughout the years of 2005-2007. Within the first two months of 2008, this policy disappeared as the City pressed for selection of a SWSR system, even including the "charade" of the (so-called) expert panel of four steel wheels advocates.

1571 Transit Advisory Task Force "...structure for the fixed guideway would be only 26 feet wide,..."
 Two points to note from the guideway width given as 26 feet in this paper: 1) The EIS graphic mentioned above indicates an SWSR guideway of at least 28 feet; and 2) The guideway for the HSST mag-lev would be only 21 feet wide—including open space between the beams. (NOTE: I have no information for conventional monorail; presumably, its guideway also would be narrower than the steel wheels bridge.)

1571 Transit Advisory Task Force Costs for the guideway
 Apparently, the task force received data from the city to determine costs for extensions of the system. These costs are obviously based on SWSR systems—and are considerably higher than what would be needed for the HSST mag-lev guideway. Since the date of this report is December 11, 2006, why did this task force only show costs for SWSR, or why did DTS provide only such data?

Specific Comments on Draft Environmental Impact Statement - Frank Genadio

<u>Page</u>	<u>Paragraph Title (abbreviated)</u>	<u>Statement on Which Comment is Based</u>
<u>Comment and Rationale</u>		

1715 Transit Scoping Meeting Comments My personal comments

Pages 1715 (A210)-1718 (A213) are comments I made on the scoping meetings. At that time, I was fully supportive of the City's transit project and fully expected to see a fair and open competition among all forms of fixed-rail. Other than my disappointment at the City's (apparent) refusal to open the competition—with closing it obviously making my advocacy for the mag-lev irrelevant—I see nothing that I would wish to change in my comments. With added park-and-ride lot surface, the amount of solar power generated can be even greater than stated in these older comments.

App. E City Correspondence

Letters to those who commented.

The City's standard response in letters to those who commented on technology during the scoping process states the following: "Vehicle and system technologies will not be selected prior to the draft Environmental Impact Statement. Comments about issues related to vehicle and system technologies will be considered when specifications are developed." Each of these letters was signed by Melvin N. Kaku, Director (at that time) of the Department of Transportation Services. In effect, the City has contradicted its own statements made in 2006 by eliminating non-SWSR system technologies long before publication of the draft EIS. If this does not violate the letter of FTA guidelines, it certainly violates the spirit. Basically, the City deferred any discussion relative to technology through 2007 as being too early for analysis. It then quickly convened an uncalled for (so-called) expert panel, which selected SWSR as the technology in a week that included only two public meetings, and then treated SWSR as the only technology to be considered—even though it never received more than four positive (of nine possible) votes in any meeting of the Honolulu City Council. The whole process has been tainted by maneuvering and insincerity by the City administration—and must be re-accomplished.

Mr. Frank Genadio
92-1370 Kikaha Street
Kapolei, Hawaii 96707

Dear Mr. Genadio:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal:

As stated in Section 2.2.3 of this Final EIS, the NEPA Notice of Intent requested input on five transit technologies. A technical review process that included the opportunity for public comment was used in parallel with the alignment analysis to select a transit technology. The process included a broad request for information that was publicized to the transit industry. Transit vehicle manufacturers submitted 12 responses covering all of the technologies listed in the Notice of Intent. Rubber tire on concrete systems, such as the Phileas system, were evaluated by a five-member panel appointed by the City Council that considered the performance, cost, and reliability of the proposed technologies. The panel accepted public comment twice as part of its review. By a four-to-one vote, the panel chose a steel wheel operating on steel rail system. The four panel members selected steel-wheel technology because it is mature, proven, safe, reliable, economical, and non-proprietary. Proprietary

technologies, meaning those technologies that would have required all future purchases of vehicles or equipment to be from a single manufacturer, were eliminated because none of the proprietary technologies offered substantial proven performance, cost, and reliability benefits compared to steel wheel operating on steel rail. Selecting a proprietary technology also would have precluded a competitive bidding process, likely resulting in increased overall project costs. The panel's findings were summarized in a report to the City Council dated February 22, 2008.

Magnetic levitation and monorail require a different guideway design that would have different impacts from a steel wheel on steel rail system. The guideway design and the impact analysis are being completed for the steel wheel on steel rail technology that will be used for the Project. As previously stated, other forms of fixed rail were eliminated in the scoping process and analysis of impacts to properties has been conducted for the steel wheel on steel rail technology chosen for the Project.

No comparative magnetic levitation project has ever been built within the U.S. Therefore, no data is available to support a cost estimate. Some of the savings recognized in other countries for beam-track vehicles would not apply in the U.S. because of requirements to include an emergency egress walkway. Also, the smaller structures proposed in the comment result in shorter span-lengths, which increases the number of columns required and the cost to construct both the additional foundations and columns.

The HSST system operators have declined to make operating expenses available. Thus, with no comparative data available to support an operating cost estimate, there is no means to verify this statement regarding maglev's operating and maintenance costs compared to steel wheel.

There is no plan to implement express service, but if future operations indicate that it would be beneficial, the system could operate in skip-stop service. With the Project, trains will operate every 3 minutes in each direction during peak periods. Once on the system, it will take 42 minutes to travel from East Kapolei to Ala Moana Center. Skip-stop service could decrease travel time by a few minutes. The system will be capable of fully automated operation.

The following paragraphs address your Specific Comments on the Draft EIS:

7 Purpose of the Draft EIS: DTS and FTA requested information during scoping that would inform the technology selection process. No new meaningful information was received. As discussed previously, an open technology selection process was conducted during development of the Draft EIS in February 2008 and multiple panel meetings were held that were open for public comment as part of the review. The Final EIS documented the selection in Section 2.2.3.

8 Purpose of the Draft EIS: The Final EIS has been revised to address the identification of the Airport Alternative as the preferred alternative, in particular see Section 2.4, Preferred Alternative Identification Process.

S-4 Alternatives Considered: The City Council never enacted a technology selection bill resulting in the City accepting the findings of the panel. The suggested text edit in this comment has not been deleted from the Final EIS.

S-7 Noise and Vibration: Noise impacts and mitigation are evaluated for the steel wheel on steel rail technology. Parapet walls, wheels skirts, and sound absorptive materials are included in the project costs in Chapter 6 of the Final EIS. The suggested text edit in this comment has not been incorporated into the Final EIS.

2-3 2.1.1 Screening: Fixed guideway is not an emerging rail concept. The proposed language was not added because it does not provide any additional clarity regarding the guideway as a rail concept.

2-7 Table 2-2 Alternatives: As stated previously, proprietary technologies, meaning that selecting one of those technologies would require all future purchases of vehicles or equipment to be from a single manufacturer, were eliminated for good cause. These were eliminated because none of the proprietary technologies offered proven performance, cost, and reliability benefits compared to steel wheel on steel rail. The text has not been revised in the Final EIS.

2-8 2.1.3 Alternatives Consideration: The single operating urban magnetic levitation system has a maximum speed of 100 kilometers per hour (62 miles per hour) which is similar to the maximum operating speeds of 50 to 60 miles per hour for steel wheel on steel rail systems. While the system is quieter, other systems may be designed to match the noise level of magnetic levitation when in operation. There is no safety improvement from the traction design. The assumed visual and cost savings benefits for beam-track vehicles would not apply in the U.S. because of requirements to include an emergency egress walkway. Also, the smaller structures result in shorter span-lengths, which increases the number of columns required and the percentage of views blocked by support structure. In addition, the greater number of columns required increases the cost to construct both the additional foundations and columns. No comparative project has ever been built within the U.S. Therefore, no data is available to support a cost estimate. With no comparative data available to support an operating cost estimate, there is no means to verify this statement. The HSST system operators have declined to make operating expenses available. Thus, with no comparative data available to support an operating cost estimate, there is no means to verify this statement.

2-9 2.2 Alternatives Evaluated in the EIS: The Final EIS has been revised to reflect the identification of the Airport Alternative as the Preferred Alternative.

2-9 2.2 Build Alternatives: The system will use steel wheel on steel rail technology. Therefore, the EIS will not be revised as requested.

2-9 2.2.2 Build Alternatives: The Leeward Community College Station will be at-grade independent of where the maintenance and storage facility site constructed.

2-19 End of second paragraph on left: The correction has been made in Chapter 2 of the Final EIS and the sentence now reads "...assumed to be in place...".

2-19 Transit Technology: The suggested wording was not changed because the steel wheel on steel rail is the technology analyzed in the Final EIS.

2-20 Figure 2-9: The suggested changes were not made because the steel wheel on steel rail is the technology analyzed in the Final EIS.

2-38 Vehicle Maintenance and Storage Facility: Earthwork is included in the project cost estimate that is in the basis for Chapter 6 of the Draft and Final EISs.

3-27 Figure 3-9: This figure has been revised and now appears as Figure 3-7, A.M. Peak-Period Transit Travel Times by Travel Market—Existing Conditions, No Build Alternative, and the Project, in this Final EIS. This figure shows that the fixed guideway system will provide travel time benefits during the a.m. two-hour peak period. This figure represents travel times from origin to destination. Station-to-station travel time is provided in Table 3-16, Fixed Guideway Station-to-Station Travel Times, in this Final EIS. Trains will operate every 3 minutes in each direction during peak periods. Once on the system, it will take 42 minutes to travel from East Kapolei to Ala Moana Center. All trains are anticipated to stop at all stations. Skip-stop service would not provide substantially improved travel times for most users and could be a source of confusion for some riders; however, skip-stop service could be implemented if warranted.

3-39 Table 3-21: The suggested changes for Table 3-21, Column Placement Effects on Streets and Highways, were not made because the steel wheel on steel rail is the technology analyzed in this Final EIS.

3-42 Table 3-23: The suggested changes for Table 3-23, Effects on Traffic near Park-and-Ride Facilities and Bus Transit Centers—Existing Conditions, No Build Alternative, and the Project (without and with mitigation), were not made because the steel wheel on steel rail is the technology analyzed in this Final EIS.

3-50 Construction Phasing: Section 3.5.7, Mitigation of Construction-Related Effects, was revised in the Final EIS to reflect the identification of the Airport Alternative as the Preferred Alternative.

4-5 Table 4-1: The suggested changes for acquisitions, displacements, and relocations (Table 4-1, Summary of Direct Environmental Effects and Mitigation Measures to Avoid, Minimize, or Reduce Impacts) were not made because the steel wheel on steel rail is the technology analyzed in this Final EIS.

4-5 Table 4-1: The impacts to community services and facilities were only analyzed for the technology of steel on steel rail. The suggested changes were not made to Table 4-1, Summary of Direct Environmental Effects and Mitigation Measures to Avoid, Minimize, or Reduce Impacts.

4-8 Table 4-1: The noise and vibration analysis conducted for this project only applies to steel on steel rail and were not conducted, nor will be conducted for other types of rail. The

suggested changes were not made to Table 4-1, Summary of Direct Environmental Effects and Mitigation Measures to Avoid, Minimize, or Reduce Impacts.

4-9 Table 4-1: Steel on steel technology is the chosen technology for this project. Impacts to street trees were only analyzed regarding the impacts from this technology. The suggested changes were not made to Table 4-1, Summary of Direct Environmental Effects and Mitigation Measures to Avoid, Minimize, or Reduce Impacts.

4-33 Cemeteries: The sentence under the Cemeteries heading in Section 4.5.2, Affected Environment [Community Services and Facilities] has been revised in this Final EIS to correctly state, "One cemetery near Aloha Stadium and one near Waimano Home Road are adjacent to the project alignment."

4-36 Airport Alternative: The correction for Hickam Air Force Base has been made in Section 4.5.3, Environmental Consequences and Mitigation [Community Services and Facilities] of this Final EIS.

4-39 4.5.2: The term "White" is used in the Final EIS, which is consistent with usage by the U.S. Department of Transportation's Order 5610.2 and the U.S. Census Bureau.

4-42 Table 4-8: The terms used in this Final EIS are consistent with usage by the U.S. Department of Transportation's Order 5610.2 and the U.S. Census Bureau.

4-45 Ala Moana-Kakaako: The sentence under Ala Moana-Kakaako heading in Section 4.6.3, Environmental Consequences and Mitigation [Neighborhoods], of this Final EIS has been revised to state, "Kakaako has been designated a redevelopment area, which may result in a change in character along the Project alignment. However, substantial development has recently occurred in the neighborhood; several high-rise condominium developments have been built, and additional residential and commercial developments are planned. The elevated transit structure will not create a barrier to pedestrian or other modes of travel."

4-47 Regulatory Context: In Section 4.7.1, Background and Methodology [Environmental Justice] of this Final EIS, under the heading Regulatory Context, the sentence has been revised to state, "Additional laws, statutes, guidelines, and regulations that relate to EJ issues include the following..."

4-47 Defining Environmental Justice Areas: The term "Black" is used, which is consistent with usage by the U.S. Department of Transportation's Order 5610.2 and the U.S. Census Bureau.

4-51 Table 4-9: The terms used in Chapter 4 of this Final EIS are consistent with those defined by the U.S. Department of Transportation's Order 5610.2 and the U.S. Census Bureau.

As stated in Section 4.8, Visual and Aesthetic Conditions, of this Final EIS, the simulations are intended to represent the scale and spatial relationships of project elements to other objects. These simulations serve several purposes: they were used to evaluate visual

and aesthetic consequences, demonstrate the potential for mitigation, and provide a means of communicating the findings of the analysis. The simulations generally depict that the guideway (technology) would have a comparatively greater visual effect on the visual environment. The stations that were simulated for the visual assessment generally depict those that are expected to have a comparatively greater visual effect (see Figure 4-31 for the Chinatown Station and Figure 4-34 for the Downtown Station). Figure 2.12, Example Vehicle on Elevated Guideway (Cross-section) in this Final EIS, Section 2.5.2, Transit Technology, is a cross-section view that is intended to more accurately show the guideway dimensions. DTS has considered your request for additional station simulations. However, it was determined that the existing simulations presented in the Final EIS adequately represent the Project.

4-91 Salt Lake Alternative: The text related to views along Moanalua Stream does not require a change in the Final EIS since the Salt Lake Boulevard Alternative is not discussed in the Final EIS.

4-95 4.8.2: In regards to Section 4.9.2, Affected Environment [Air Quality], in the Final EIS, "Transportation Improvement Plan" is appropriate because it is in reference to the plan and the text will not be revised to "Program" in the Final EIS.

4-97 Figure 4-37: Noise impacts and mitigation were evaluated for the technology of steel wheel on steel rail. Because this is the transit technology analyzed in the document, it is appropriate to use the term "Rail" in Figure 4-51 Typical Sound Levels in the Final EIS.

4-100 and 4-101 Tables 4-15 and 4-16: The other three rail technologies are not being studied in the Draft or Final EIS. Related tables and figures have not been revised.

4-108 Electric and Magnetic Fields: Because magnetic levitation technology is not being considered as part of the Draft or Final EISs, the suggested changes have not been incorporated into the document.

4-137 Table 4-29: Magnetic levitation and monorail require a different guideway design that would have different impacts from a steel wheel on steel rail system. The guideway design and the impact analysis are being completed only for the steel wheel on steel rail technology that will be used for the project.

4-149 and 4-150 Table 4-32: Property names in this table refer to the names of historic properties listed in or determined eligible for listing in the National Register of Historic Places as identified in the Honolulu High-Capacity Transit Corridor Project Historic Resources Technical Report (RTD 2008o). Names used to identify historic properties in the National Register or in Section 106 documentation may not correlate with current names. Names may reflect previous uses and/or owners, or may relate to the property's historic significance, such as the CINCPAC Headquarters building. Accordingly, neither edit has been made to this Final EIS.

4-166 4.18.2: The Final EIS has been updated to include the recent changes in the TOD ordinance. The TOD ordinance is discussed in Section 4.19.2, Indirect Effects, of this Final EIS.

4-166 4.18.2: Hunt Development Group was deleted from Section 4.19.2, Indirect Effects, of this Final EIS.

4-171 Table 4-36: Upon verification, Table 4-39, Planned and Foreseeable Actions in the Study Corridor, in the Final EIS has been updated and the reference DeBartolo has been deleted.

5-3 5.2: Section 2.1.3 of the Draft EIS explains that steel wheel on steel rail was the technology chosen for analysis. No other forms of rail are being analyzed in the Draft or Final EISs.

5-3 5.3: "Affects" has been changed to "effects" in the Final EIS, Section 5.4. The sentence now states, "...presents effects to these 81 historic resources, as established by current consultation."

5-8 and 5-9 Table 5-2: As discussed above, property names in this table refer to the names of historic properties listed in or determined eligible for listing in the National Register of Historic Places. "CINPACFLT" refers to the historic landmark. While the Commander may no longer be called, "Commander in Chief", the National Historic Landmark is listed as "CINCPAC".

5-24 Measures to Minimize Harm: The smaller structures proposed in the comment result in shorter span-lengths, which increases the number of columns required and the cost to construct both the additional foundations and columns. The proposed 120 to 150 foot span lengths would require a larger structure, similar to the steel wheel on steel rail system.

6-3 Table 6-1: Other technologies are not being studied in the Draft or Final EISs. Chapter 6 has not been revised to reflect other technologies.

6-4 General Excise and Use Surcharge: The amount of County General Excise and Use Tax (GET) Surcharge revenues withheld by the State has not been included in the revenue estimates. The surcharge collections are not being re-directed by the State. The Final EIS presents only information on funding that will go towards the Project.

6-7 Fare Revenues: The HSST technology was evaluated and rejected as expensive to build and costly to operate by a technical panel of experts in transit systems, as noted in Chapter 2 of the Draft EIS. The claims in the comment have not been substantiated by any revenue service operation. There are still too many elements of HSST technology that are not sufficiently developed or understood for the Honolulu community to adopt it as a primary transportation system. By contrast, steel wheel on steel rail technology is proven and cost-effective in today's transit industry.

6-11 System Operation: Comment noted. All operating costs include a driver, though the system will be designed to allow for automation. The decision to use an operator or not will be made at a later date.

7-11 Important Trade-offs: The chapter has been revised to reflect selection of the Airport Alternative as the preferred alternative.

541 Appendix C: *The suggested changes were not made to Draft EIS Appendix C, Construction Approach (Final EIS Appendix E Construction Approach) because steel wheel on steel rail is the selected technology that is being analyzed in the Draft and Final EIS.*

596 Comment Sheet: *The comment from the Hawaii State Department of Transportation (HDOT) was in reference to phrasing in an early administrative draft of the EIS, which was changed in the Draft EIS. HDOT did not comment on the selection of a technology. As discussed in Section 2.2.3 of the Final EIS, a five-member panel appointed by the City Council and Mayor considered the performance, cost, and reliability of the proposed technologies. By a four-to-one vote, the panel selected steel wheel operating on steel rail as the technology for the Project because it is mature, proven, safe, reliable, economical, and non-proprietary. Technologies other than steel wheel on steel rail were eliminated for because they are proprietary technologies, meaning that selection of one of those technologies would require all future purchases of vehicles or equipment to be from a single manufacturer. These were eliminated because none of the proprietary technologies offered substantial proven performance, cost, and reliability benefits compared to steel wheel on steel rail.*

1045 D.R. Horton Schuler: *There is a single operating urban magnetic levitation system in the world, in Japan, and having opened for operation in 2004, has only five years of operating record. The technology is unproven.*

1160 Frank Genadio: *The energy mix for electricity generation of the system will depend on HECO's power production. As stated in Chapter 4, Section 4.11.3, Environmental Consequences and Mitigation [Energy and Electric and Magnetic Fields], the Project will consume approximately 1 to 2 percent of the total projected electricity generated on Oahu in 2030. The planned electricity generation capacity on Oahu will be sufficient to support the transit system, but the electricity distribution system will require various updates to support the system. Integration of photo-voltaic cells into project features could reduce net project electricity demand.*

1494 Fixed Guideway Alternatives: *DTS and FTA requested information during scoping that would inform the technology selection process. The information submitted was reviewed and incorporated into the selection process.*

1502 Project Alternatives Analysis Report: *Comments regarding the technology selection history are noted.*

1571 Transit Advisory Task Force: *The smaller structures proposed result in shorter span-lengths, which increases the number of columns required and the cost to construct both the additional foundations and columns. To match the Project's 120 to 150 foot span lengths and other requirements, such as an emergency walkway, the structure would be of similar size to the Project's.*

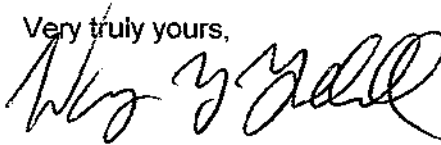

1571 Transit Advisory Task Force: *Comments regarding magnetic levitation are noted.*

Mr. Frank Genadio
Page 9

1715 Transit Scoping Meeting Comments: Surface park-and-ride lots could include covers that could be used for photovoltaic cells. This will be considered during final design of the Project.

Appendix E City Correspondence: Scoping for the Draft EIS in March of 2007 requested comments on technologies. Selection of technology occurred during the Draft EIS process; the selection was conducted as an open process with multiple panel meetings open to the public during February 2008, and the Draft EIS documented the selection.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Issuance of the Record of Decision under NEPA and acceptance of the Final EIS by the Governor of the State of Hawaii are the next anticipated actions and will conclude the environmental review process for this Project.

Very truly yours,

WAYNE Y. YOSHIOKA

Mr. Wayne Y. Yoshioka, Director
Department of Transportation Services
City and County of Honolulu
650 South King Street, 3rd Floor
Honolulu, HI 96813

Dear Mr. Matley and Mr. Yoshioka,

General Growth Properties (GGP) has begun its review of the Honolulu High-Capacity Transit Corridor Project Draft Environmental Impact Statement/Section 4(f) Evaluation and is aware of the request for comments by January 7, 2009.

GGP's properties at Ward Centers and Ala Moana Center will both be impacted by the transit project. We request an extension of the comment deadline to allow us to fully study the impacts. An extension is needed to allow sufficient time to review all of the documents and secure the assistance of any necessary consultants. The current timeframe for review runs through a very busy holiday period, which will make it difficult for affected businesses and residents to provide meaningful input.

We respectfully request that the deadline for comments be extended by an additional 75 days to March 23, 2009. Thank you for your consideration of this request.

Sincerely,

Jan Yokota
Vice President-Development, Hawaii Region

Dear Ms. Yokota:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The comment period duration was extended by 30 days to a total duration of 75 days. The regulations at 23 CFR 771.123(i) mandate a comment period of not less than 45 days. The 75-day period was longer than the 45- to 60-day periods typical for U.S. DOT Draft EIS documents and mandated regulations.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka", is written over the typed name.

Re: Honolulu High-Capacity Transit Corridor Project Draft Environmental Impact Statement

Ladies and Gentlemen:

Thank you for the opportunity to submit comments on the above Draft Environmental Impact Statement ("EIS"). These comments are being submitted to you by General Growth Properties, Inc., on behalf of its affiliates with an ownership interest in property proposed to be included in or affected by the Honolulu High-Capacity Transit Corridor Project. These properties include Ala Moana Center, Ala Moana Plaza, Ala Moana Building, Ala Moana Pacific Center and the Ward properties.

First, we would appreciate copies of the following documents and reserve the right to submit further comments based upon these materials:

- The Real Estate Acquisition Management Plan described on page S-6 of the Executive Summary of the EIS; and
- More detailed plans relating to the proposed Kaka'ako (Ward) and Ala Moana Stations.

We have the following comments with respect to the plans labeled as follows:

- Appendix A - Conceptual Alignment Plans and Profiles, Plan and Profile, Sta 1340+00 to Sta 1370+00 (Sheet 25 of 32)
- Appendix A - Conceptual Alignment Plans and Profiles, Plan and Profile, Sta 1370+00 to Sta 1401+26 (Sheet 26 of 32)
- Appendix B - Conceptual Right-of-Way Plans, Right-of Way Plan & Property Tabulation, Sta 1338+00 to Sta 1362+00 (Sheet 45 of 59)

Limited Partnership
1585 Kapiolani Blvd. Ste 800

Development Design
& Construction
Hawaii Region
Phone 808 - 946-2811
Fax 808 - 946-2216
www.ggp.com

- Appendix B -- Conceptual Right-of-Way Plans, Right-of-Way Plan & Property Tabulation, Sta 1362+00 to Sta 1386+00 (Sheet 46 of 59)
- Appendix B -- Conceptual Right-of-Way Plans, Right-of-Way Plan & Property Tabulation, Sta 1386+00 to Sta 1401+26 (Sheet 47 of 59)

Based upon our review of the above plans, we believe that there will be significant impacts to our properties. These include, but are not limited to:

- the loss of a material number of parking stalls, which would affect the parking requirements in the real estate agreements with a number of tenants and could result in lease terminations and/or significant expenditures to replace this parking, if it can be replaced;
- complete or partial loss of the use of several buildings and parking structures, with the attendant loss in gross leasable area and net operating income;
- the loss of several driveways leading to Queen Street;
- the loss of the mechanical room that services the building that houses Ross Dress for Less, The Sports Authority, Marukai 99 Cent Store and Pictures Plus; and
- impacts to the future development potential of our properties.

In addition, it appears that a vertical circulation system may be needed through several levels of the Ala Moana Center parking deck for access to the transit line. Please confirm if this is the case. If so, there may be additional costs to GGP for security, custodial, maintenance and other expenses associated with the operation of the Ala Moana station.

It also appears that columns required to support the transit line are proposed to be built through a number of buildings on our Ward properties, at Ala Moana Center and the recently built expansion area, the Ala Moana Center parking deck, and the Ala Moana Building parking deck.

As a general observation, as previously discussed with the City, our traffic consultants have proposed other alternative routes in the area that would better serve the totality of Kaka'ako and reduce the economic impact to our properties, as well as reduce the number of businesses affected. We would be pleased to share these plans with you and discuss them at your convenience.

The EIS indicates that plans are conceptual and subject to change. Accordingly, our comments are also of a general nature and subject to amendment as the plans are finalized. In addition, we would appreciate the opportunity to work with you with respect to the methods of construction, the construction timeline, staging areas, utility relocation and related matters so that the impact upon our properties and the business conducted thereon is minimized to the greatest extent possible.

We also have the following specific comments.

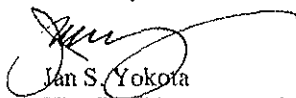

- Table 4-20 on page 4-114 of Chapter 04 of the EIS indicates that there is an unidentified above ground storage tank (AST) at 404 Ward Avenue (TMK no. 21050062), which is slated for full acquisition. Please note that the tank is a grease receptor for the restaurant, which is regularly emptied and maintained. Therefore, this site should not be considered a hazardous materials site. Please amend this table in the EIS accordingly.
- Table 4-31 on page 4-145 of Chapter 04 of the EIS titled "Potential Long-term Adverse Effects on Cultural Resources Related to Act 50" indicates that practices at Tio's (which is now Kanpai Bar and Grill) and California Rock-N-Sushi restaurants will be displaced. Please explain the type of practices that you anticipate will be displaced.
- Table 4-32 on page 4-149 of Chapter 04 of the EIS and Table 5-2 on page 5-8 of Chapter 05 of the EIS indicate that the Ala Moana Building (TMK no. 23039001) is a historic building. All references to this historic designation should be deleted unless you can provide verification that this designation has been properly granted.
- Sheet 45 of 59 of Exhibit B lists the TMK for 534 Ko'ula Street as 2-1-52:16. Our records indicate that the correct number is 2-1-53:16.
- Sheet 46 of 59 of Exhibit B lists the TMK for 335, 345 Kamake'e Street as 2-3-5:23. Our records indicate that the correct number is 2-3-005:13.
- Sheet 46 of 59 of Exhibit B lists the uses for 1020, 1030, 1044 and 1060 Kamake'e Street as commercial. There is a mix of commercial and industrial uses.

Please note that the tenants and other occupants of our properties may have comments as well and we do not purport to speak on their behalf.

Finally, the purpose of this letter is to comment upon the EIS in general terms. We have not attempted to outline all of the effects that the proposed project will or may have upon our properties, both current and future uses, such as those envisioned in the recently approved Master Plan for the Ward properties. We also note that the EIS does not adequately detail the measures, if any, proposed to minimize adverse impacts of the project on the properties and businesses affected. We reserve all of our rights and remedies, at law and in equity, in connection with the project and its effect upon our properties and the businesses conducted therein.

Thank you for the opportunity to comment on the Draft Environmental Impact Statement for the Honolulu High-Capacity Transit Corridor Project. We look forward to meeting with you to discuss our comments in greater detail.

Sincerely,

Jan S. Yokota

Dear Ms. Yokota:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal:

Ward Avenue

It is acknowledged that General Growth has significant plans for redevelopment of properties in the Ward Properties area. The City has discussed the Project with General Growth and will continue to work with General Growth as the Project moves forward. To a substantial degree, coordination of the General Growth plans with the Project on affected properties could help mitigate parking and access concerns in the vicinity of the Kakaako Station. Mitigation measures related to acquisitions, displacements, and relocations are presented in Section 4.4.3 of the Final EIS and for parking in Section 3.4.7. For partial acquisitions, defined in Section 4.4.1 of the Final EIS, "For commercial properties, including situations where the commercial property could lose its function, full acquisition will be considered." The City's right-of-way managers will work with individual property owners to provide relocation services, "...to all affected business and residential property owners and tenants without discrimination; persons, businesses, or organizations that are displaced as a result of the Project will be treated fairly and equitably" in accordance with the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970 (Section 4.4.3).

Regarding development potential of General Growth properties, the implementation of the Project is likely to have a positive effect by coordinating the General Growth plans and the rail project. The likely effect of the Project on economic activity near the stations is positive based on the experience in other cities. Table 4-38 in the Final EIS shows the effect of rail on property values in various U.S. cities related to rail. The key to success is to coordinate the plans for both the development and the Project so they work together.

Ala Moana Center

Vertical circulation elements will be needed for a station entrance through the parking deck of the Ala Moana Center, as shown on Drawing No. RP024 of Appendix B of the Final EIS. The station will be at about 35 feet above Kona Street. As indicated in Section 4.6.3 of the Final EIS, ongoing coordination efforts with the public will help develop design measures that will enhance the interface between the transit system and the surrounding community. The City will meet with property owners to discuss concerns that arise from the process.

It is possible that columns could affect existing buildings in the Ward properties area. Given the changes General Growth has proposed for that area, the Project team will work closely with General Growth to ensure the best possible coordination of design of the guideway and future Ward Neighborhood Master Plan development.

Construction planning and phasing will be coordinated with nearby property owners and businesses. The Project will continue its public involvement and education programs throughout construction. Project representatives will work with businesses that will be affected during design and construction, as well as ensure that businesses and the general public are fully informed of current and upcoming activities.

Storage Tank

Thank you for providing this information. Site No. 7, Tio's Mexican Restaurant, has been removed from Table 4-22 in the Final EIS.

Cultural/Historic Resources

The properties referenced in your letter (Tio's and California Rock-and-Sushi) are no longer identified in the Final EIS as traditional cultural practices.

Under Section 106 of the National Historic Preservation Act (as amended), the effects of Federal undertakings to historic properties must be considered by the lead Federal agency. Historic properties are properties listed in or determined eligible for listing in the National Register of Historic Places. The Ala Moana Building was determined eligible for listing in the National Register during consultation with the State Historic Preservation Division (SHPD) and was documented as such in revised material for the Honolulu High-Capacity Transit Corridor Project Historic Resources Technical Report. It is worth noting that eligibility does not mean the resource will be listed. (Please see regulation 36 CFR 60 which authorizes the NHRP and regulation 36 CFR 63 which discusses determination of historic places.) Potential project impacts to the Ala Moana Building were re-evaluated in the Honolulu High-Capacity Transit Corridor Project Historic Effects Report (April 2009). In this report, no adverse effects to the Ala Moana Building were identified. Following consultation, the SHPD concurred with this finding. These determinations of effect and the SHPD's concurrence are documented in Section 4.15 of the Final EIS.

Rights-of-Way

According to the City and County of Honolulu's property tax records, the TMK for Koula Street (2-1-52:16) is correct as shown in the Draft EIS. There was no record of 2-1-53:16 in the City's records as of February 24, 2010.

The parcel number for 335, 345 Kamakee Street has been corrected to 2-3-005:13 in Appendix C of the Final EIS on Sheet 48 of 48.

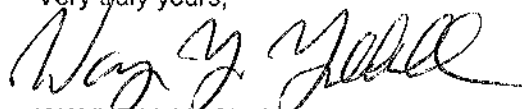

The use of 1023, 1030, 1044, and 1060 Auahi Street has been updated to state "commercial/industrial" use in Appendix C of the Final EIS.

The existing land uses were determined through a windshield survey of the project corridor and verification of the City and County of Honolulu's property tax records in February 2010. The right-of-way plans were revised and included in the Final EIS.

Mitigation measures related to acquisitions, displacements, and relocations are presented in Section 4.4.3 of the Final EIS. As stated previously in this response, the City's right-of-way managers will work with individual property owners to provide relocation services to all affected business and residential property owners and tenants. Specific mitigation measures for individual properties and businesses will be developed on a case-by-case basis as the design progresses and the number of partial and full acquisitions is refined. All acquisitions will follow the requirements of the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970 and the USDOT's implementing regulations of 49 CFR Part 24.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Submission Content/Notes : COMMENTS OF MELISSA GOO
REPRESENTING THE MOANALUA HIGH SCHOOL
SCHOOL COMMUNITY COUNCIL
ON THE DRAFT ENVIRONMENTAL IMPACT STATEMENT
FOR THE HONOLULU RAIL TRANSIT PROJECT
January 13, 2008

Thank you for the opportunity to submit comments on the Draft Environmental Impact Statement (DEIS) for the Honolulu Rail Transit Project.

My name is Melissa Goo. I chair and am speaking on behalf of the Moanalua High School (MoHS) School Community Council (SCC). MoHS is located in the Salt Lake neighborhood of urban Honolulu at 2825 Ala Ilima Street, Honolulu, HI 96818. The school was established in 1972 and serves approximately 2,000 students in grades 9 through 12.

The MoHS SCC was established pursuant to Act 51, Session Laws of the State of Hawaii 2004, also known as the Reinventing Education Act of 2004. The MoHS SCC enables Moanalua High School administrators, teachers, parents, students and representatives of the surrounding neighborhood to participate in the decision-making processes of the school. It is comprised of individuals elected by their peers to represent the school community in the interest of improving student achievement. The roles and responsibilities of the SCC include defining the school's vision and mission, reviewing and evaluating the school's Academic and Financial Plans (AFP), requesting waivers as appropriate from policies of the Hawaii State Board of Education (BOE) and Department of Education (DOE), participating in the selection and evaluation of principals, and playing a role in the development and revision of school policies. Finally, the SCC reports to the community and gathers feedback at forums held twice during the school year.

With respect to the DEIS for the transit project, the SCC has identified several benefits to the Moanalua High School community of building the transit system along the proposed Salt Lake Boulevard alignment. In conjunction with its responsibility to report to the community, the SCC is communicating these benefits to the Department of Transportation Services for potential inclusion in the final Environmental Impact Statement. The benefits are as follows:

- Students with geographic exemptions, who comprise approximately 20% of the student body, could ride transit to school and back home each day.
- Teachers and administrators who reside close to a transit station could ride transit back and forth to work each day.
- Transit could provide a cost-effective means of transporting students on field trips to locations of educational interest, e.g. museums and historical sites downtown.
- Students qualified to take college-level courses could use transit to travel to Leeward Community College, Honolulu Community College, Hawaii Pacific University, UH West Oahu, and eventually UH Manoa.

Thank you again for the opportunity to comment.

Honolulu, Hawaii 96818

Dear Ms. Goo:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the

Ms. Melissa Goo
Page 2

Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Dear Ms. Sataraka:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final

Ms. Elizabeth Sataraka

Mr. Ted Matley
FTA Region IX
201 Mission Street, Suite 1650
San Francisco, CA 94105

Mr. Yoshioka and Mr. Matley,

I am writing this letter out of concern regarding the proposed Honolulu rail transit system and the related Draft Environmental Impact Statement (DEIS).

Throughout 2008, the City and County of Honolulu made a number of claims, many of which are included in the DEIS, which cannot be substantiated by existing data. Our policy report, *Debunking Myths of Honolulu Rail Transit*, refutes many of these claims in detail. Below are just a few of these claims, along with brief explanations of the facts.

Claim: *Public transit ridership will increase with the addition of rail transit.*

Truth: Since 1960, Denver is the only city that has held onto a slight percentage increase in transit ridership after building rail. In metropolitan areas with high public transportation usage (Boston, Chicago, New York, and San Francisco), percentage of public transportation usage has decreased in all the cities following the implementation of rail systems. The same pattern is occurring for metropolitan areas with second tier public transportation usage (Detroit, Houston, Los Angeles, Phoenix, Portland, Sacramento, San Juan, San Diego), contrary to what the city's radio and TV ads would have one believe. (Decennial Census 1960-2000 and American Community Survey for 2007. US Census Bureau. http://factfinder.census.gov/servlet/DataSetMainPageServlet?_lang=en&_ts=240267317805&_ds_name=ACS_2006_EST_G00...&_program)

Claim: *Rail systems in cities such as Vancouver, Salt Lake City, Portland, and Washington, DC have been vital in reducing traffic.*

Truth: According to the Texas Transportation Institute's 2007 Urban Mobility Report, none of these cities have experienced a reduction in traffic, and traveling times for

commuters have increased even in spite of rail.
(http://mobility.tamu.edu/ums/congestion_data/tables/national/table_4.pdf)

Claim: Rail uses less energy than automobiles or other commute options.

Truth: According to the US Department of Energy, energy use per passenger mile (Btu) is 3,512 for cars, 4,235 for buses, and 2,784 for rail. Motorcycles clock in much lower at 1,855, while the Toyota Prius clocks in at only 1,659 (Transportation Data Book, Chapter 2, Table 2.12 Passenger Travel and Energy Use. 2006. US Department of Energy. [www-cta.ornl.gov/data/chapter2.shtml](http://www.cta.ornl.gov/data/chapter2.shtml); Greenhouse Gas Emissions per Passenger Mile, Public Transport & Personal Mobility in USA in 2005. www.demographia.com/db-ghg-carstr.pdf). Given rail transit's declining ridership and permanent dependence on fuel, the increasing popularity of fuel-efficient cars such as the Prius and newer models mean that energy efficiency is increasing for cars while it decreases for rail. Furthermore, the energy necessary to build a rail system offsets any estimated energy savings. Portland's environmental impact statements estimates the system would need 172 years of savings—moving commuters from cars to rail—in order to make up for construction.

Claim: Rail reduces carbon emissions.

Truth: The CO₂ output of the light and heavy rail, buses and the average car are presently very nearly the same. With the advent of hybrid and other more efficient cars and the high turnover of cars, the average car will soon surpass all other commute options, including heavy rail. This argues for transit systems that allow for large numbers of increasingly energy efficient cars—not fixed rail systems that will soon become a thing of the past.

Claim: A \$6.5 billion train is cost-effective.

Truth: According to the DEIS, the proposed rail system with both Airport and Salt Lake routes will cost \$6.5 billion in capital costs alone, or more than \$6,000 per Oahu resident. These numbers are excessively large, especially when more cost-effective traffic solutions exist. For example, the construction of HOT Lanes would cost just \$0.9 billion, while shaving 40 minutes off of the commute time from Kapolei to Downtown as compared to rail. ("Transportation Alternatives Analysis for Mitigating Traffic Congestions between Leeward Oahu and Honolulu" directed by Professor Panos D. Prevedouras, of the University of Hawaii at Manoa.)

Thank you so much for taking the time to understand these concerns as expressed by the Grassroot Institute of Hawaii. Please don't hesitate to contact me if you need any further information.

Sincerely,

Jamie Story

Dear Ms. Story:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal:

Public transit ridership

Table 3-18 of the Final EIS details the total 2030 weekday transit boardings for the Project at over 450,000 (bus and rail). This will be an increase of 80 percent over the 2007 reported weekday transit boardings for the 23-year period. This is a reasonable expectation given the substantially higher level of service to be provided with the Project. It is also on track with other locations that have implemented rail in critical travel corridors. Portland, OR, for example, experienced an increase in transit ridership of over 90 percent between 1987 and 2007 after the rail line was built. Overall transit boardings have increased 33 percent between 1999 and 2009 (TriMet Service and Ridership Information). Valley Metro ridership in Phoenix

increased 15 percent in one year following the opening of the rail line (Valley Metro press release, July 2009)

In addition, national trends show increasing transit ridership. 2008 recorded the highest demand for public transportation in 52 years (APTA 2008 Ridership Report). It is anticipated this demand for public transportation will increase in Honolulu. It is misleading to use "metro area" public transportation usage data over a time span of many decades since "metro area" has been redefined and enlarged in each census period to include low-density outer areas not served by rail, or even bus transit in some cases.

As noted above, in the 20-year period between 1987 and 2007, ridership grew 95.5 percent for the Tri-Met system in Portland, Oregon, as measured by annual unlinked passenger trips. In that same 20-year period, the transit system in Phoenix experienced 189.4 percent growth in passenger trips; Sacramento experienced 131.9 percent growth and San Diego's growth was 119.6 percent in unlinked passenger trips. Other systems, including those serving Houston, Los Angeles, Boston, New York, and San Francisco, have all experienced varying rates of growth as measured by unlinked passenger trips (APTA 2008 Ridership Report).

Traffic

In analyzing future traffic congestion and the impact of the Project, the key is to understand how bad traffic would be without rail. If all the people using the rail lines in those cities drove, conditions would be dramatically worse. A travel forecasting model was used to determine transit ridership and roadway conditions in 2030 with and without the Project. This model is used by the Oahu Metropolitan Transportation Organization (OahuMPO) for the Oahu Regional Transportation Plan 2030. The model is updated approximately every five years to reflect changes in land use, socio-economic conditions, and transportation network improvements. The model is approved by the OahuMPO Technical Advisory Committee. The OahuMPO model is based on "best practices" for urban travel models in the U.S. The model is consistent with consultation with FTA and required to meet FTA standards to qualify the Project for federal funding under the New Starts program. As stated in Table 3-14 of Chapter 3 of the Final EIS, the travel forecasting model predicts that Honolulu traffic in 2030 will be 18 percent better (in terms of delay) with the Project, compared to the No Build Alternative. Rail also provides a reliable, consistent alternative to the uncertainty of highway congestion.

Energy

Your comment correctly identifies the energy consumption use for the various modes of transportation, with rail being the most efficient of the major modes listed, as calculated for data collected for the year 2006. The same report referenced shows that between 1970 and 2006, highway transportation energy consumption has been growing at a rate of 1.8 percent per year. The assertion that highway transportation energy consumption will stop growing on an annual basis is not supported by data collected over the past 36 years.

Carbon emissions

Future analysis can only consider what is currently regulated. This includes future vehicle mix and available technologies. The analysis does not assume that future technologies will only affect private automobiles and not affect mass transit vehicles.

In addition, the direct comparison of carbon dioxide emissions between automobiles and transit rail cannot be made without knowing the energy sources providing the electricity. The utility (HECO) that will provide electricity for the Project primarily uses fuel oil to generate electricity, but the HECO grid is supplemented with independent power producers that generate electricity through renewable resources. As the percentage of energy produced from renewable resources increases over time, the electrically powered rail system will allow less of the island's transportation system to rely on oil. As noted in Section 4.9.3 of the Final EIS, the Project will result in a daily reduction of 171 metric tons of carbon dioxide when compared to the No Build Alternative. For an at-capacity system, approximately 25 grams of carbon dioxide are emitted per passenger mile. Approximately 150 grams of carbon dioxide are produced per 1/50th of a gallon of gasoline consumed.

As noted in Section 4.11.1 of the Final EIS, an average rail vehicle consumes 62,700 BTUs per vehicle mile of service. A single vehicle has a capacity of approximately 160 passengers. Therefore, approximately 390 BTUs are consumed per passenger mile at capacity. Consumption of 1/50th of a gallon of gasoline consumes 2,500 BTUs.

Cost-effectiveness

The cost of the Project is \$5.5 billion in year of expenditure dollars. The cost-effectiveness index (CEI) calculation defined by FTA under the New Starts program requires that a project show that the CEI is less than a \$24.99 per new rider threshold to qualify for federal funding. The Project CEI is \$16.24 per rider, well below the threshold. Comments about the costs and effectiveness of HOT lanes are not consistent with the findings in the Alternatives Analysis. The Alternatives Analysis showed that the cost of the Managed Lane facility would have been at least \$2.6 billion in 2006 dollars and the benefits in terms of reducing congestion would have been only slightly better than the No Build Alternative and substantially worse than the Fixed Guideway alternative.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Dear Ms. Groothuis:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final

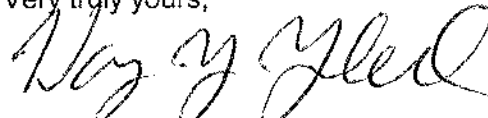

Ms. Krista Groothuis
Page 2

EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The proposed future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of this Final EIS. The future extensions are not part of this Project, thus they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in this Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time. Bus service between Ala Moana Center and UH Manoa and Waikiki will be enhanced until those extensions are built.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Dear Mr. Hackney:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

First, your opposition to the Project is noted.

With the Project, transportation benefits are expected to occur that will affect traffic conditions on Oahu. A Travel Demand Forecasting Model, based on guidelines established by the Federal Transit Administration, was used to determine traffic volumes in 2030 with and without the Project. With the fixed guideway system, total islandwide congestion (as measured by vehicle hours of delay) would decrease by 18 percent, compared to the No Build Alternative (Table 3-14 of the Final EIS). In addition, traffic volumes were studied at various screenlines in the study corridor, as shown in Tables 3-9 and 3-10 in the Final EIS. Analysis revealed that traffic volumes at these screenlines would decrease with the Project.

Section 6.3 of the Final EIS describes the funding sources anticipated to be used to pay for the capital cost of the Project and the City's overall public transportation system. Capital

Mr. John Hackney
Page 2

costs of the Project, including finance charges, are expected to be fully paid for by a combination of FTA Section 5307 and FTA Section 5309 New Starts Funds from the Federal government and the revenues from the General Excise and Use Tax Surcharge revenues levied from 2007 through 2022. Section 6.4 of the Final EIS describes the funding sources to pay for ongoing operations and maintenance costs associated with maintaining the resulting transit system in state of good repair. Operating and maintenance costs will be paid for from the same sources currently used for TheBus: Federal funding, fare revenues, and subsidies from the City's General and Highway Funds.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

UH Manoa and Waikiki will be served by enhanced bus service. Future bus routes, including frequencies, are shown in Appendix D of the Final EIS. The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The proposed future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of this Final EIS. Other extensions, such as Central Oahu, have been considered and may be undertaken at some point after the current Project. The future extensions are not part of this Project, thus they are not required to be evaluated under Chapter 343 of the Hawai'i Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in this Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Subject: Rail

Government by the People, for the

People?

"Our government should work for us, not against us, help us, not hurt us." These words spoken by Barack Obama at the Democratic National Convention ring with truth. Unfortunately, though, in Honolulu they do not reflect the reality of city government. Our city officials, under the leadership of Mayor Mufi Hannemann, are refusing to stop a train that will carry us head on into economic and environmental disaster.

Trade unions and businesses which stand to benefit from the steel on steel rail support it, as do many city bureaucrats dependent on Mufi for their jobs. But there are 35,000 or 45,000 or 49,000 voters, depending on how one defines voter, who want alternatives. Their concerns should not be dismissed. Only after a protracted struggle by citizen groups did the city agree to a City and County of Honolulu question on the November 4th ballot asking, "Should the city build a steel wheel on steel rail transit system?" Nearly half of the citizens of Hawaii fully understood the dire consequences of such a system, and voted "No!"

The proposed steel on steel rail will be an elevated 20 to 40 foot high cement structure climbing to 70 feet at U.H. Manoa and 125 feet at Ala Moana Center, stretching from Kapolei to Ala Moana and U.H. Manoa with spurs to the airport and along the Ala Wai. On Nimitz Avenue between Ka'ai Street, Bishop Street, and Halekauwila, the 20 foot elevation will run along the water. Stations will be strategically placed at 32 sites, one 5 stories high across from Aloha Tower and one 12 stories tall at Ala Moana Center. No one along this route will be able to escape the racket of steel on steel trains roaring by. No one will be able to escape the blight on the aina.

The costs to the taxpayer are staggering. Some states have no sales tax; others have no property tax; some have no tax on food or medications; still other states have no income tax. But in Hawaii we have them all, except in place of a sales tax we have a more insidious tax, a 4% excise tax, a tax on business transactions at every level which is passed on to the consumer. Hannemann added a "county

surcharge" of .5% to the excise tax to help finance the rail, giving us a rate of 4.5%. If businesses choose to pass on their excise tax liability to the consumer, this tax can be as high as 4.712%.

Add this to our high cost of living, and the financial burden becomes untenable. The cost of the steel on steel rail, with inflation and cost overruns, is now projected to be about 7 billion dollars. With the burden of maintaining a corrosion prone steel on steel system, an impractical choice for an island surrounded by ocean, the costs go even higher. We will pay, our children will pay, and our grandchildren will pay for a system that with rapidly advancing technology will become obsolete as fast as it is built.

By not presenting alternatives to steel on steel rail technology, the mayor leads many voters to think the choice is rail or nothing. Yet there are alternatives to steel on steel rail, well integrated and carefully thought out systems that would ease the traffic nightmare at a fraction of the cost and environmental destruction. The coordination of ferries, high occupancy toll lanes, fleets of mini buses, traffic lights, contra flow lanes, bicycle routes, and the use of new underpasses while encouraging telecommunication and staggered work hours would be less invasive, less costly, and more flexible than a steel on steel rail system. There may even be another less invasive, less costly, and more flexible rapid transit system that would work for Oahu commuters.

Honolulu needs a mayor who works for all the people, not just those who contribute to his campaign or who will profit from the steel on steel rail system. An honest reappraisal of the rail issue would help citizens feel their government is working for them. An honest and effective mayor would look at the current economic recession and have the integrity to scrap a rail system that will bankrupt the future, become obsolete before it is finished, and wreak havoc on Oahu's fragile ecosystem.

Dear Ms. Hall:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your comments have been noted. As discussed in Chapter 2 of the Final EIS, the fixed guideway system will travel from East Kapolei to Ala Moana Center via the Airport. The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The planned extensions are included in the Oahu Regional Transportation Plan as illustrative projects and are anticipated to be completed at some time prior to 2030. The future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS. However, the future extensions are not part of this Project; thus, they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because

they are not part of the proposed action to be taken by the City and FTA. If the extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time.

As stated in Section 4.10.3 of the Final EIS, the Project will cause no severe noise impacts. Moderate impacts will occur at upper floors of a few high-rise buildings (as shown in Table 4-18 in the Final EIS). With the recommended mitigation in place (parapet wall, sound absorbing material and wheel skirts), the noise analysis indicates that the new noise generated by the Project will be lower than the existing noise levels in most places.

The project design includes an integrated noise-blocking parapet wall at the edge of the guideway structure that extends 3 feet above the top of the rail. The parapet wall will substantially reduce ground-level noise.

The use of sound-absorptive materials below the tracks in the areas that will experience moderate noise impacts will reduce the Project noise levels from the upper floors to below the impact level. Wheel skirts will increase the benefit from the parapet wall at locations above the elevation of the track. Once the Project is operating, noise levels will be re-measured to confirm that there are no noise impacts from the Project.

The assessment of visual effect due to the Project as described in Section 4.8.3 of the Final EIS considers changes to the visual landscape and viewer responses to those changes. This includes the existing development along the Project alignment. Within the Project corridor the environment changes from rural at the Wai'anae end of the corridor to dense high-rise development at the Koko Head end.

As part of the design process, the City has developed design principles, which are identified in the Honolulu High-Capacity Transit Corridor Project Compendium of Design Criteria (RTD 2009m) that will be implemented in final design to minimize visual effects of the Project. For example, guideway materials and surface textures will be selected in accordance with generally accepted architectural principles to achieve effective integration between the guideway and its surrounding environment. Landscape and streetscape improvements will mitigate potential visual impacts, primarily for street-level views.

Other measures to address visual impacts of the Project are being developed through the station design and planning process. The initial station area plans and design guidelines were first developed with coordination between DTS and the Department of Planning and Permitting (DPP). The next level of transit station design focuses on integrating individual neighborhood characteristics of the communities served by the stations.

The following mitigation framework will be included in the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

- Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
- Coordinate the project design with City TOD planning and DPP.*
- Consult with the communities surrounding each station for input on station design elements.*

- Consider specific sites for landscaping and trees during the final design phase when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will serve to mitigate potential visual impacts.

Section 4.8.3 of the Final EIS, Design Principles and Mitigation includes information related to the mitigation framework described above. Specifically architecture and landscape design criteria include guidelines regarding site design, materials and finishes, and lighting, which apply to stations, station areas, and the guideway.

Chapter 6 of the Final EIS describes the financial resources anticipated to be needed to pay for the capital cost of the Project and for ongoing operating and maintenance costs. Capital costs, including finance charges, are expected to be fully paid for by a combination of FTA Section 5307 and FTA Section 5309 New Starts funds from the Federal government and the County General Excise and Use Tax (GET) surcharge levied from 2007 through 2022 on Oahu. Operating and maintenance costs include costs associated with maintaining the transit system in a state of good repair and will be paid for from the same sources currently used for TheBus: Federal funding, fare revenues, and subsidies from the City's General and Highway Funds.

The Mayor did not add a "county surcharge." The decision to add the GET surcharge of 0.5 percent was made by the City Council after authorization by the State legislature. The cost of the Project, with inflation, is forecast to be \$5.5 billion, including finance charges. The steel used in rail systems is not prone to corrosion. With minimal maintenance, steel rails can last for decades.

Lastly, to address your comments regarding the alternatives evaluated for the Project, the Alternatives Analysis fairly addressed the types of alternatives presented in the comment. They did not perform at the level of the fixed guideway and were eliminated from further consideration, as noted in Chapter 2 of the Final EIS. As stated in Section 2.2.3 of this Final EIS, the NEPA Notice of Intent requested input on five transit technologies. A technical review process included the opportunity for public comment and was used in parallel with the alternatives analysis to select a transit technology. The process included a broad request for information that was publicized to the transit industry. Transit vehicle manufacturers submitted 12 responses covering all of the technologies listed in the Notice of Intent. An independent five-member technology panel composed of four transit experts and a transportation academic appointed by the City Council evaluated guided rubber-tire-on-concrete systems (e.g., Phileas bus system and VAL-type systems), monorail (which is a variation on rubber-tired technology), steel-wheel-on-steel-rail systems, (e.g., light rail and rapid rail), and magnetic levitation (MAGLEV). The panel considered the performance, cost, and reliability of the proposed technologies.

Proprietary technologies, meaning those technologies that would have required all future purchases of vehicles or equipment to be from a single manufacturer, were eliminated because none of the proprietary technologies offered substantial proven performance, cost, and reliability benefits compared to steel wheel operating on steel rail.

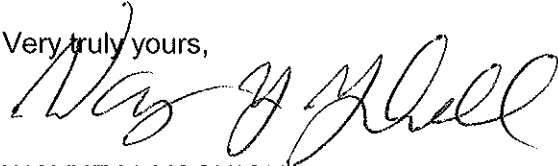

The panel accepted public comment twice as part of its review. By a four-to-one vote, the panel chose a steel wheel vehicle operating on steel rail system because it was considered safe, reliable, economical, and non-proprietary. Those results are documented in the panel's

Ms. Sally Hall
Page 4

report to the City Council dated February 22, 2008 entitled "Independent Technology Selection Panel Report".

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Subject: Honolulu Rail System

January 6, 2009

Dear Mr. Matley,

Phoenix just opened a new 20 mile light-rail train built for \$1.4 billion.

Why does our Honolulu government project \$5.3 billion for our 20 mile system? Are the Phoenicians that much smarter than us to elect a government that provides them with the same length system for almost \$4 billion (Four Billion Dollars) less? Wow!

What could we taxpayers do with \$4 billion in our own pockets? Think about it, seriously. Perhaps for the billion-dollar EPA-required sewage upgrade, and still have a few billions left?

Sincerely,

Dear Mr. Hamm:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 C.F.R. § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal:

The conditions between Phoenix and Honolulu are different. The systems are both 20 miles long, but the Phoenix line is estimated to carry less than half the riders of the Honolulu system and take more than twice as long to travel the 20 miles. Moreover, the Phoenix line removes two lanes of traffic along most of the route. There are numerous alternative routes available for motorists in the Phoenix metro area. The Honolulu Project will not remove any travel lanes. It will add to the capacity of the overall transportation system without reducing the existing, limited roadway supply. Phoenix did not need to preserve highway capacity; Honolulu must. To accomplish that, the system must be elevated (underground is more expensive). The cost of an elevated system is higher than an at-grade line such as the recently opened system in Phoenix, but the Honolulu service will have a much higher capacity and will be more reliable.

Mr. Gerhard C. Hamm
Page 2
February 16, 2010

Lastly, the proposed capital funding sources for the Project cannot be used for non-public transportation projects such as a secondary wastewater treatment plant. Enabling legislation for the County General Excise and Use Tax surcharge and Ordinance 07-001 preclude the use of the collected funds for purposes other than a fixed-guideway transit system.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Issuance of the Record of Decision under NEPA and acceptance of the Final EIS by the Governor of the State of Hawaii are the next anticipated actions and will conclude the environmental review process for this Project.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Submission Date : 11/20/2008
Submission Content/Notes : I have a few questions the first being,

What kind of security will be provided at the parking lots at the rail stops?

If current "road work" creates congestion now, how much more would a full scale project affect traffic? And what hours would the labor be done?

I have seen State "projects" and generally they take 2-3 more years than originally planned and fail to meet the budget consistently. Are there any guarantees that this project timeline would be met?

All of this is built on the assumption that the train would be full? Again are there any guarantees, or incentives to use the train, otherwise I say this, oh someone else is going to take it I can drive. The idea that other people will say will someone else will do it similar to the philosophy of recycling...if I dont do it someone else will.

Dear Mr. Hamp:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Regarding your question about how security will be provided at parking lots and stations, DTS, with assistance from the Honolulu Police Department, is developing a security plan for transit facilities, including park-and-ride lots. As discussed in the Final EIS Section 2.5.4 Safety and Security Measures, a project-specific Safety and Security Management Plan has been developed in accordance with FTA requirements to define the safety and security activities and methods for identifying, evaluating, and resolving potential safety hazards and security vulnerabilities of the system. It establishes responsibility and accountability for safety and security during the Preliminary Engineering, Final Design, construction, testing, and start-up phases of the Project. The Honolulu Police Department, the Honolulu Fire Department, the Honolulu Department of Emergency Management, and the Honolulu Emergency Services Department have been involved in preparing and will be part of implementing the plan. The plan addresses public safety and security concerns, including threats and hazards associated with

the Project, specific issues that were identified through community outreach efforts, and design and architectural details to enhance safety.

In response to your comments regarding construction effects on traffic, as discussed in Section 3.5 of the Final EIS, there will be some construction-related effects on traffic, such as lane closures, which may occur throughout the day, including peak travel periods. The extent and duration of lane closures will vary depending on location. A Maintenance of Traffic (MOT) Plan will be developed prior to construction and will describe construction methods, times, and resulting road closures. A Transit Mitigation Program will mitigate effects on transit service operating during project construction. As stated in Section 3.5.7 of the Final EIS, an extensive public information program will be implemented to provide motorists with a thorough understanding of the location and duration of construction activities, as well as anticipated traffic conditions.

Regarding your comments on the timeframe of construction activities, the anticipated project schedule is shown in Figure 2-42 of the Final EIS. The best incentive for a contractor to stay on schedule is that completing a project ahead of time generally results in a higher profit. Because of the tight timeline for completion, however, the City will impose penalties for late completion as part of the Project construction contracts. Construction of the Project will take approximately nine years to complete.

Regarding your comment on ridership, the primary quantitative method for evaluating the alternatives is a travel demand forecasting model used by the Oahu Metropolitan Planning Organization (OahuMPO) for the Oahu Regional Transportation Plan 2030 (ORTP) (OahuMPO 2007). The OahuMPO model is based on "best practices" for urban travel models in the U.S. and is consistent with consultation with the FTA. The model is updated approximately every five years to reflect changes in land use, socio-economic conditions, and transportation network improvements. The model is approved by the OahuMPO Technical Advisory Committee. This modeling approach has proven effective in estimating ridership levels in other areas such as Los Angeles County, Salt Lake City, Denver, and Phoenix in the last 10 years.

Ridership projections for the forecast year of 2030 have been developed using the travel demand model, which was calibrated against collected traffic and transit ridership information and then validated against recent counts to be sure it properly represents travel activity in the transportation system (Section 3.2.1 of the Final EIS). An on-board transit survey was completed in December 2005 and January 2006, and the latest socioeconomic information available as of October 2008 was incorporated. Traffic counts were collected in 2005, 2007, and 2008. The model is based upon a set of realistic input assumptions regarding land use and demographic changes between now and 2030 and expected transportation levels-of-service on both the highway and public transit system. Based upon the model and these key input assumptions, approximately 116,000 trips per day are expected to use the rapid transit system on an average weekday in 2030. Since the Draft EIS was published, the travel demand model has been refined by adding an updated air passenger model (which forecasts travel in the corridor related to passengers arriving or departing at Honolulu International Airport), defining more realistic drive access modes (driving alone or car pooling) to project stations and recognizing a more robust off-peak non-home-based direct demand element (trips that do not originate at home) based on travel surveys in Honolulu.

The Project is one of the first in the country to design and undertake an uncertainty analysis of this type of travel forecast. The uncertainty analysis evaluates the variability of the forecast by establishing likely upper and lower limits of ridership projections. FTA has worked closely with the City during this work effort. A variety of factors were considered in the uncertainty analysis, ranging from variations in assumptions regarding the magnitude and distribution patterns of future growth in the Ewa end of the corridor, to the impact of various levels of investment in highway infrastructure, to the expected frequency of service provided by the rapid transit system, to park-and-ride behavior with the new system in place, and to such things as the implications on ridership of vehicle and passenger amenities provided by the new guideway vehicles. Given all the factors considered, the anticipated limits for guideway ridership in 2030 is expected to be between 105,000 to 130,000 trips per day, bracketing the official forecast of 116,000 riders a day used for all calculations.

Chapter 3 of the Final EIS shows that the best incentive for use of the rail system is the fact that it will take less time than any alternative, including driving, for a large number of people. In addition, the policy to keep fares low with easy, free transfers will make it more cost-effective to use the rail system than driving a car, parking it, and paying for all other incidental costs of daily commuting by private vehicle. The travel forecasting work that forecasts the demand for the Project's services follows FTA requirements and is based on approved transportation and land use plans for the City. The guideway connects many of the major activities within the corridor and many of its neighborhoods and business/retail centers. Many cities in the U.S. and around the world have used this kind of planning approach, and experience shows that it provides a good basis for planning and designing the system and understanding its impacts.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Dear Mr. Handy:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your comments have been noted; however, the Project has been designed to serve the areas of greatest population and employment on the island most efficiently. A future project could connect to the Windward side, but no such connection is proposed at this time.

To answer your other question, bicycles will be allowed on the system and will be regulated by a bicycle policy. More information on bicycle allowances will be published in the future.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this

Mr. Earl Handy
Page 2

letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is written in a cursive, flowing style with a long horizontal tail stroke.

January 27, 2009

Mr. Wayne Yoshioka
Director, Dept. of Transportation Services
City and County of Honolulu
650 South King Street, 3rd Floor
Honolulu HI 96813

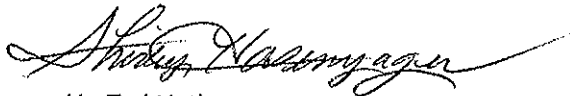

Dear Mr. Yoshioka:

I have numerous concerns about the DEIS for the Honolulu City and County's proposed heavy rail transit system. A few of them are:

1. I do not feel the issue of property acquisition and adequate reimbursement has been fully addressed. What about loss of business during relocation and construction and decreased value already occurring due to anticipation of acquisition and/or lengthy disruption ?
2. The immense adverse visual impact to Honolulu has been minimized and not adequately described. We need to have good, easily understood descriptions of the many stations planned as they will impact a large area that includes schools, homes and businesses. The size of these stations needs to be explained in detail.....the footprint of the station, height and amount of land surrounding each one needed for parking, bus accommodation, etc. How are they to be protected from vandalism, graffiti, and criminal activity?
3. What happens when we have a power outage like the one during a recent storm. This is not something speculative. **This will happen.** How do you propose getting people off of the trains and out of the stations?
4. What accommodation is there for luggage (assuming an airport route) and other large items people will need to be able to carry on a train, either to a place of work or back to their cars after shopping.

There simply has not been an **honest** presentation of the impact of the proposed rail system on businesses and residences on the route, nor the disruption of traffic during a very lengthy construction period. What recourse does a resident of an apartment have when he finds he has a noisy train running in front of his lanai every few minutes, blocking his view, ruining his life and making his apartment worth zero? Is the city prepared to deal with the many law suits that are inevitable?

Yours truly,

Dear Ms. Hasenyager:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 C.F.R. § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following addresses comments regarding the above-referenced submittal:

Your letter will be answered in the same manner as it was submitted.

- 1. Section 4.4.3 of the Final EIS presents the mitigation associated with acquisitions, displacements, and relocations for full and partial property acquisitions. Section 4.18.1 of the Final EIS lists the proposed mitigation measures to reduce adverse economic hardships for existing businesses (including small businesses) along the project alignment during construction. The City has a right-of-way team that has contacted each potentially affected parcel owner to discuss potential project impacts on their respective property. All property acquisitions and relocations are subject to the Uniform Relocation Assistance and Real Property Acquisition Policies Act, and the City will follow those procedures. Where relocations will occur, compensation will be provided to affected property owners, businesses, or residents in compliance with all applicable Federal and State laws and will follow the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act.*

2. *Chapter 2 of the Final EIS shows the location and extent of all project stations in Figures 2-17 through 2-37. In addition, visual effects of the system are addressed in Section 4.8 of the Final EIS. As discussed in Section 8.4 of the Final EIS, the City is conducting workshops with communities that will have rail stations. The purpose of the workshops is to engage the public about rail stations and provide opportunities for residents to contribute ideas about the appearance of station entryways in their areas. Ideas generated at the workshops will be incorporated into the station planning process. For more information and to get involved in this process, please visit the project website at www.honolulutransit.org.*

Stations will be patrolled and will be closed between midnight and 4:00 a.m. Materials and textures will be graffiti-resistant. Physical deterrents, such as plantings, will be used where appropriate. Graffiti removal is an anticipated maintenance activity.

3. *Since trains and rail stations will be electrically powered, the system's infrastructure is being designed to handle service disruptions. For example, trains will draw power from many points along the route, so an outage in a few areas should not disrupt service to the remainder of the system. If electrical power is lost system-wide, then train brakes are designed to stop the rail cars even without power. Lights will stay on in trains and stations; backup batteries will provide lighting for several hours. The train operations center will communicate with passengers via the public address system and intercom to provide guidance. If power is restored within a short time, service will resume. With a prolonged outage, the operations center will direct passengers to exit the trains and walk along a lighted emergency walkway on the guideway to the nearest station. For those unable to exit rail cars, help will be provided by emergency responders and transit staff. Passengers will be met at the train station by a coordinated response from emergency responders and City transportation workers.*
4. *The luggage policy for the system is not final, but the concept of the policy will be to allow luggage that does not interfere with the safety or comfort of other passengers.*

The exact impact of construction activity on traffic is not yet known. As discussed in Section 3.5.6 of the Final EIS, a Maintenance of Traffic (MOT) Plan will be developed in advance by the contractor with approval from the City and the Hawaii Department of Transportation. The MOT Plan will identify measures to mitigate temporary construction-related effects on transportation and will address roadway closures for streets identified in Table 3-27 of the Final EIS. As stated in Section 4.18.1 of the Final EIS, several public involvement strategies will be used to inform businesses and the public about construction activities, including roadway detours.

Ms. Shirley Hasenyager
Page 3
February 16, 2010

As stated in Section 4.10.3 of the Final EIS, the Project will cause no severe noise impacts. Moderate impacts will occur at upper floors of a few high-rise buildings (as shown in Table 4-18 in the Final EIS). With the recommended mitigation in place (sound absorbing material and wheel skirts), the noise analysis indicates that the new noise generated by the Project will be lower than the existing noise levels in most places.

The project design includes an integrated noise-blocking parapet wall at the edge of the guideway structure that extends 3 feet above the top of the rail. The parapet wall will substantially reduce ground-level noise.

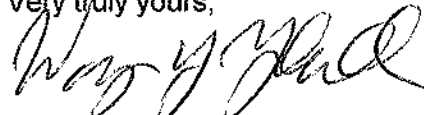

Wheel skirts will increase the benefit from the parapet wall at locations above the elevation of the track. The use of sound-absorptive materials below the tracks in the areas that will experience moderate noise impacts will reduce the Project noise levels from the upper floors to below the impact level. Once the Project is operating, noise levels will be re-measured to confirm that there are no noise impacts from the Project.

Section 4.8.3 of the Final EIS discusses the general consequence of the changes to visual conditions due to the presence of the elevated guideway and states that, "residents living in high-rise buildings adjacent to the project alignment will experience visual changes as a result of the Project."

The Economic Activity section of the Draft EIS (Section 4.2) did not evaluate the impact of the Project on property values because those values are subject to economic forces outside the direct control of the Project. However, as experienced in other cities, the value of properties with access to transit stations is substantially higher than for properties that are distant from the system. In addition, other development, including retail, businesses, schools, etc., could occur near transit stations.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Issuance of the Record of Decision under NEPA and acceptance of the Final EIS by the Governor of the State of Hawaii are the next anticipated actions and will conclude the environmental review process for this Project.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

**Re: Honolulu High-Capacity Transit Corridor Project
City & County of Honolulu, Oahu**

Thank you for the opportunity to comment on the draft environmental impact statement prepared for the above-referenced project. The following comments were received from the our Engineering and Power Supply Departments:

- (1) Engineering/Project Management (Earlynne Oshiro, 543-7825). Numerous existing and planned HECO overhead and underground facilities will be affected by the project location and route. HECO will need continued access to our facilities for operation and maintenance purposes.
- (2) Engineering/Substation, Protection & Telecommunications (David Arakaki, 543-7593). Transit facilities in the area of HECO's Iwilei 138 kV Substation may conflict with possible expansion plans for the substation.
- (3) Power Supply/Power Plant Engineering (Michael Yuen, 543-7998).
 - (a) **Honolulu Power Plant**. The transit project proposes to use the Nimitz-Bishop corner of the Honolulu Power Plant for part of the transit station. This corner of the Honolulu Power Plant currently has a storage tank that provides propane for power plant operations. Area is limited at the Honolulu Power Plant, especially during major maintenance periods, so relocation of this tank and loss of the usable area would negatively impact HECO's operation and maintenance activities. HECO requests revision of the station design to avoid the use of the Honolulu Power Plant property.
 - (b) **Waiau Power Plant**. The proposed transit guideway is routed on Kamehameha Highway in front of the Waiau Power Plant. The plans presented to HECO last year proposed to eliminate the left turn into Kamehameha Highway coming out of the power plant because of guideway column placements. This turn is utilized by large Transmission and Distribution vehicles heading in the Ewa direction. These vehicles can not easily make U-turns so they would have to take a very circuitous route to head back toward the Ewa direction. HECO requests that the guideway column placement be relocated to avoid elimination of this turn.

Dept. of Transportation Services
February 6, 2009
Page Two

- (4) Engineering/Project Management (Rouen Liu, 543-7245). Please note that HECO's work and associated costs related to the transit project may be subject to approval by the Public Utilities Commission, State of Hawaii. For this and other planning reasons, HECO would prefer to coordinate and plan for electrical needs or relocations as soon as practical.

We appreciate your efforts to keep us apprised of the planning process. As the project progresses, please continue to keep us informed. We will be better able to evaluate any effects on our system facilities further along in the project's development. We request that development plans show all affected HECO facilities, and address any conflicts between the proposed plans and HECO's existing facilities. Please forward the pre-final development plans to HECO for review.

Should it become necessary to relocate HECO's facilities, please immediately submit a request in writing and we will work with you so that construction of the project may proceed as smoothly as possible. Please note that there may be costs associated with any relocation work, and that such costs may be borne by the requestor. Because any redesign or relocation of HECO's facilities may cause lengthy delays, upon determination that HECO facilities will need to be relocated, HECO should be notified immediately in order to minimize any delays in or impacts on the project schedule.

To coordinate HECO's continuing input in this project, I suggest dealing directly with the points of contact noted above. Thank you again for the opportunity to comment.

Sincerely,

Kirk S. Tomita

Dear Mr. Tomita:

**Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement**

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 C.F.R. § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal:

(1) Engineering/Project Management: As presented in Section 4.18.2, Communities and Neighborhoods, of this Final EIS, "Design criteria will govern all new utility construction outside of buildings, as well as the support, maintenance, relocation, and restoration of utilities encountered or affected by project construction."

In addition, coordination will occur with property owners and will include, but not be limited to: underground utility service connections, access or driveway reconstruction, utility disruption, water service, grounding work, demolition, landscape protection, landscape restoration, fencing, mail delivery, and garbage collection. The vertical and lateral clearances of overhead and underground utility lines shall comply with the rules and regulations of the

appropriate utility agency and Hawaii Administrative Rules during final design and approved by the utility agencies. This coordination will include notifying and working with HECO regarding non-State roadways and roadway rights -of-way. Design refinements with all affected HECO facilities will be developed in close coordination with HECO and the design team as final design progresses. Access will be maintained to all HECO facilities, though it may be modified in some locations.

(2) Engineering/Substation, Protection & Telecommunications: Preliminary Engineering (PE) drawings for the Iwilei segment will be submitted to HECO for review and coordination by January 2010. Design coordination will continue through the final design of the Project.

(3) Power Supply/Power Plant Engineering:

(a) Honolulu Power Plant: Locating the Downtown Station at a different site would avoid use of the Honolulu Power Plant Property, and accordingly, alternative sites have been investigated, as was described in the HECO Downtown Plant and Leslie A. Hicks Building Avoidance Alternatives subsection in Section 5.5.2 Historic Sites of the Final EIS. Avoidance alternatives are limited by Honolulu Harbor and by the geometry of Nimitz Highway. Several alternative alignments were considered during the Alternatives Analysis phase, one of which included Queen Street. While this alternative would avoid the HECO property, it would have impacts on historic resources within the Hawaii Capital Historic District. Other small shifts of the station entrance were considered and are not feasible because they would require the demolition of one of the high-rise office buildings or impact Irwin Park. In addition to considering small shifts of the station entrance, two other practical avoidance alternatives were evaluated to relocate the Downtown Station to avoid this property. None of these were feasible design options. Therefore, the Project will use approximately .2 acres of the HECO property in the Ewa corner of the property near Bishop Street. PE drawings for the Downtown Station will be submitted to HECO for review and coordination by January 2010 and design coordination will continue through the final design of the Project.

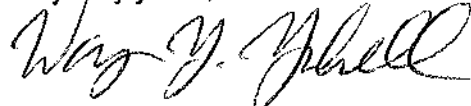

(b) Waiau Power Plant: Column design along Kamehameha Highway has been revised and the left turn onto Kamehameha Highway from the Waiau Power Plant will be preserved.

(4) Engineering/Project Management: Coordination with HECO will be ongoing throughout the design and construction process. PE design drawings have been submitted to HECO for the First Construction Phase, East Kapolei to Pearl Highlands. The drawings included information showing the location of existing HECO facilities and identified relocation requirements. PE drawings for the Second, Third, and Final Construction Phases will be submitted to HECO in the schedule shown in Figure 2-43 of the Final EIS. DTS has also provided HECO with proposed electrical utility relocation plans and comments and suggestions provided by HECO have been incorporated. Design coordination will continue through the final design of the Project.

Mr. Kirk S. Tomita

Regarding: Honolulu High-Capacity Transit Corridor Project Draft Environmental
Impact Statement/Section 4(f) Evaluation

The DEIS preface states, "The purpose of this Draft Environmental Impact Statement (DEIS) is to provide... information necessary to make an informed decision, based on a full and open analysis of costs, benefits, and environmental impacts of alternatives considered."

Unfortunately, the DEIS does not provide a full and open analysis of the short and long-term direct, indirect and cumulative social and environmental impacts from the various aspects of the fixed guideway system.

Chapter 1 Background, Purpose and Need

- When the Second City concept was introduced it was billed as a place where people would live and work thus avoiding the long commute into Downtown. Neither businesses nor jobs nor infrastructure have kept pace with housing development thus causing traffic congestion within Kapolei and Ewa and forcing people to still travel long distances to work.
- With more businesses including government offices relocating to Kapolei and a new large shopping center planned how would ridership on the fixed guideway rider ship be affected?
- Figure 1.8 Daily 2007 Transit Trips between Transportation Analysis Areas is totally useless. If this diagram is supposed to show all transit trips – car, bicycle, and bus it missed the point and is nothing but a bewildering maze of blue.

1.6 Potential Transit Markets

- “Despite the large growth of employment opportunities in the Kapolei area, population is projected to outpace and exceed the available employment in the area.”
“Additionally, there will be a bidirectional flow of traffic throughout the day as more City and State administrative offices move their daily operations to Kapolei and as other employment grows in the area.”
- What are the direct and indirect impacts on residents who must travel further from Hawai‘i Kai, Aina Haina and the Windward side to get to government operations that have moved from Downtown to Kapolei?
- What are the direct and impacts on the environment and air quality from the additional vehicle traffic traveling longer distances to Kapolei for government services?
- What are the time and cost impacts to residents who ride the bus from East Honolulu and Windward to government offices relocated from Downtown to Kapolei?
- Makakilo is expected to grow by 125%, which is 25% more than Ewa between 2000 and 2030 yet there is no transit system projected to connect to Makakilo. Why?

Chapter 2 Alternatives Considered

Operating Parameters

- This section states, “It is envisioned that bicycles would be allowed on trains.”
 - At what point in process will the decision be made on whether to permit bicycles on each train?
 - Will the public have opportunities to comment on what types of bicycle facilities are needed?

Table 2-5 Fixed Guideway Operating Assumptions

- What is the “branch-line headway?”
- How many times along the entire fixed guideway route will trains reach 50 miles per hour or greater?
- At what points along the route will trains reach 50 miles per hour?
- At 50 miles an hour what is the distance needed for a train to stop?
- How many trains will be running to meet the 3 to 10 minute time schedule at each stop?
- What is the purpose of having both elevators and escalators at each station?
- What are the maintenance costs per year for all the proposed elevators and escalators?
- What is the yearly maintenance schedule for all elevators and escalators?
- Will bicycle parking be permitted at each station, train platform and train stop?
How many spaces will be allotted for bicycle parking at each station?
- What measures will be used to prevent Hawaii’s homeless from sleeping under the stations, platforms and overhead guideway?
- What measures will be used to prevent graffiti on the columns, stations, platforms and *
- What maintenance procedures will be to get ride of graffiti and stay on top of it so that the fixed guideway system does not become a glaring mess of spray paint?

Figure 2-19.

- What are the height, width and length of the Transit Center Bridge? Will there be 20 hour lighting and security?

Figure 2-20 Pearl Highlands Station

- What are the dimensions of the station - height, width?
- How many cars will the parking garage hold?
- Will the garage be enclosed and have security and lighting?
- What hours will the garage be open?
- Will the parking garage be a shared use with Pearl Highlands Shopping Center? If so, will the Center contribute to the construction and maintenance costs?

Figure 2-22. Aloha Stadium Station

- What are the height, width and length of the Elevated Connecting Bridge? Will it be covered and have security and lighting?

Chapter 3 Transportation

3.2.1 Existing Travel Patterns

- What is the expected percentage of total daily trips of air passengers that now use ground transportation that will use the transit system to and from the airport?
- What percentage of those traveling in the corridor, and not originating or ending at work, will use the fixed guideway system?
- The DEIS is silent on what the public land under the fixed guideway system in between columns will be used for. Without information on specific uses at specific sites it is impossible to envision or assess direct or impacts of the proposed uses. The FEIS must provide information on the types of uses proposed for each column-to-column segment under the fixed guideway.

3.4. Future Conditions and Effects; Build Alternatives

Reverse Commute Markets

- The DEIS states that “Almost four-fold increase in employment is estimated by 2030 for Kapolei, the quick and direct access provided by the fixed guideway system from PUC Development Plan area locations would help address the demand of future reverse commute markets.”
- How many new jobs does “four-fold” represent?
- What data was used to determine that there would be a “four-fold” employment increase in Kapolei by 2030?
- What is the estimated percentage of students and faculty living in Kapolei, Ewa, Waianae, Makakilo and North Shore that now attend UH Manoa are anticipated to attend the UH West Oahu campus?
- What is the estimated percentage of UH Manoa students and faculty that will travel to UH West Oahu for classes?
- What other government offices are planned for relocation to Kapolei or Ewa?
- What is “the sum of the travel times in between” East Kapolei and the Pearlridge Station?

Changes in Transit and Private Vehicle Demand

- What data was used to determine that the commute-to-work transit share of the Ewa to Downtown travel would increase from 23 % to between 54 and 56 percent?

Access to Fixed Guideway Stations

- Identify the ways that the 2030 No Build conditions would effect the “gradual

deterioration of service reliability” of bus service to parts of the island outside of the study corridor?

- What data was used to determine that access to stations by bus or walking would be 85% of “total trips in the a.m. two-hour peak period?” If this is the case then why are large parking facilities and park-and-ride lots planned for only 15% of the projected ridership?

3.4.3 Effects on Streets and Highways

Table 3-21 Column Placement Effects on Streets and Highways

- What are the direct and indirect impacts on travel time by drivers at the sites where median strips will be expanded and travel lanes reduced?
- What are the direct and indirect impacts on pedestrians at locations where sidewalks will be eliminated??

3.4.4 Effects on Parking, Bicycle and Pedestrian Facilities and Freight

Effects on Parking Supply

- The DEIS states that an “Estimated 820 to 960 off-street and 230 to 250 on-street parking spaces would be removed as result of Build Alternatives...”
- The DEIS further states that, “Future development around station areas-new land uses near stations could change the demand for and supply of parking. These factors could influence how people choose to access the stations and where they would park.”
- While acknowledging the loss of parking and spill over parking into neighborhoods there is no information on short and long term effects on residents and neighborhoods impacted by spill over and construction parking or businesses that depend on street parking.
- What are the direct and indirect impacts to neighborhoods and businesses near and adjacent to the fixed guideway from spill over and construction?
- Identify the areas that will loose off-street parking and how many parking spaces will be lost at each location?
- Identify the areas that will lose on-street parking and how many spaces will be lost at each location?
- Will any of the removed off-street and on-street parking spaces be replaced? If so how many and where?
- What are the direct, indirect and cumulative impacts of removing on and off street on people attending community events and facilities such as parks, libraries, and schools?

Table 3-24

- What is the safety risks to bike riders when shared roadways are reduced from 16 to 14 feet and from 14 feet to 13 feet?
- If the city wants to encourage bicycle riding as a mode of transportation throughout the island and to and from transit then bike riding should be made safer and not more dangerous as the proposed lane reductions seem to be doing.

3.4.5 Mitigation of Long-term Transportation Effects

- Stating that “there is available parking on nearby side streets to accommodate people currently using parking spaces that be lost to guideway construction” only increases

crowding of neighborhoods and is not an acceptable mitigation measure. Neighborhood overcrowding from parking is a serious safety and aesthetic problem so the issue should not be casually brushed aside but must be resolved through community involvement.

- Information from the “detailed surveys for the affected areas” regarding necessary parking placement should have been included in this DEIS so that the direct, indirect and cumulative impacts from loss of parking, construction and spill over parking could have been evaluated.

3.5 Construction-related Effects on Transportation

3.5.1 Construction Staging Plans

- Construction staging areas and plans should have been identified and the locations included in this DEIS. Without information on staging sites it is impossible to assess the direct, indirect and cumulative social and environmental impacts of each site.
- It is unacceptable to state that “Staging areas are not expected to cause a substantial effect” when locations are not known and environmental, social and cultural impacts have not been evaluated.
- Will there be a public involvement component within each affected community in the selection of construction staging site?
- In Kailua unbeknown to the community, a contractor contracted with a private landowner to use a parcel of land, adjacent to a wetland, for a construction staging. While using the site the contractor placed fill in a portion of the wetland. Vigilant residents spent several years documenting the infraction, which resulted in fines to the landowner and contractor, and partial restoration of the wetland. Play this scenario out over the length of the 20-mile fixed guideway system and years of delay and trashed environmental resources could be the result of not identifying and evaluating construction sites in this disclosure document.

3.5.2 Construction-related Effects on Transit Service

- The DEIS fails to evaluate the direct, indirect and cumulative impacts on Handi-Van services and residents when bus stops are relocated and bus routes are changed during construction at all segments of the 20-mile fixed guideway system.

3.5.4 Construction-related Effects on Parking

- It is unsatisfactory that the “precise effects on parking during construction” will be left to the individual contractors to handle. Data on construction site selection, construction and community parking needs and mitigation measures should have been included in this DEIS so that social, environmental and cumulative impacts could be evaluated in a comprehensive manner.

3.5.7 Mitigation of Construction-related Effects

Maintenance of Traffic Plan

- Will the proposed “extensive public information program” include a public involvement component or will it just consist of information distribution?

Chapter 4 Environmental Analysis, Consequences, and Mitigation

4.1 Land Use

- This section touts all the proposed and anticipated development projects but fails to mention that not all permits for development have been sought or received.
- This is the built it and they will come scenario. As pointed out the fixed guideway system begins and ends in an empty field.
- Why the fixed guideway didn't begin in Downtown and work outwards is a mystery. One key reason, we believe, is that it would have been much harder sell but would have provided a meaningful transportation option in traffic congested areas. Beginning in an open field surrounded with compliant and willing landowners is a much easier sell.
- The undeveloped field where the fixed guideway system begins is far from most residential areas in Kapolei so people wanting to use the rail system will need to use their cars to reach the station. The DEIS is silent on whether new bus routes will be added to accommodate people who want to take the train or where the bus stops will be located.
- Because the Kapolei station is far away from the Kapolei business district people traveling to work in Kapolei will need to use buses to get to work once in Kapolei. We assume that new bus routes will be created so that people can get to their jobs but the DEIS does not provide information on bus routes or the time it will take to get to the Kapolei business district in the traffic congested Kapolei from the Kapolei station. If the bus travel time combined with the rail travel time is too long or comparable to travel by car people could opt to drive from other destinations instead of using the rail system thus negating the purpose(s) of building the rail.
- The FEIS must provide car and bus travel route and time information to and from the Kapolei station for residents living in Kapolei and information on travel time from various locations along the fixed guideway route for people traveling to the business district for work.
- What is meant by the statement "An assessment of potential changes in land use that could result from the improved mobility that would be provided by the long-term operation of the Project?"
- The DEIS states that the "Waianae end of the project that would serve the area where both population and employment are forecasted to grow by approx 400% area includes West Oahu campus, Salvation Army Kroc Center and a master-planned development Ho'opili. All are planned to open between 2009 and 2012. With commercial space envisioned to grow to 7.1 million sq ft compared to 8.4 million sq ft in Honolulu today."
- What are the direct, indirect and cumulative impacts of all the above increased population on the rail system and traffic congestion within Kapolei?
- What percentage of the 7.1 million sq ft of commercial space will be new space, what percentage exists and what percentage is proposed developments that have received permits to build? What are the direct and indirect impacts on commercial businesses in Honolulu from the projected commercial growth in Ewa and Kapolei?
- With the West Oahu campus projected to have 7,600 students and 800 staff and faculty by 2020 what are the impacts on UH Manoa student enrollment?
- The DEIS failed to identify when each of the proposed developments - West Oahu campus, Kroc Center, Ho'opili and new shopping center on Hawaiian Home lands, is projected to be developed in relation to construction of the Kapolei transit station. Without this information it is impossible to evaluate that direct, indirect and cumulative impacts on the environment, water resources, public facilities and traffic. This information must be in

the FEIS.

- It is contradictory to say that TOD special districts within Ewa and Kapolei “would restrict development in agriculture and open space areas” when the Kapolei station, West Hawaii Oahu Campus, Kroc Center and Ho’opili development are all projected to be built on land current designated agriculture.
- If TOD “could occur before the fixed guideway stations are constructed” how does the creation of TOD special districts prevent the conversion of agricultural land to urban uses?
- The DEIS states that approximately 80 acres of prime farmland and 8 acres of statewide important farmlands would be acquired but does not identify where these lands are located and present uses. What is the county zoning for the 88 acres of agricultural land? This information must be provided in the FEIS.
- The DEIS identifies the highly successful Aloun Farm as the largest property facing displacement through acquisition for the 45 acre maintenance facility. How much of the Aloun Farm is prime and/or statewide important agricultural land?
- What is the City zoning for the Aloun farm?
- The DEIS states “Considering that the amount of affected farmland is such a small proportion of all agricultural land on Oahu, the effect would not be significant and no mitigation would be required.” What an insensitive statement. The farm is significant to the operators, workers and general public who enjoy the fresh produce and picking pumpkins in the pumpkin patch, the only place on Oahu where that is possible.
- Does the statement that no mitigation is required mean that the Aloun Farm operators, who we assume lease the land although that information is not in the DEIS, will not be compensated for financial losses once the land is no longer available for farming?
- While the DEIS states that land will be acquired for transportation use the DEIS is silent on whether changes in zoning and land use designations and what types of zoning and designation changes will be sought. This information must be provided in the FEIS.
- What is the present zoning for each parcel that will be acquired?
- How many zoning changes and land use designation changes are anticipated for the entire 20-mile fixed guideway system?
- At what point(s) in the process will zoning and land use designations be sought?
- While the Ewa Development Plan is cited as promoting “higher-density residential and commercial uses along a major rapid transit corridor linking Kapolei with the PUC” this disclosure document does not provide data on what that would look like. Nor does this disclosure document analyze the direct, indirect and cumulative impacts on public facilities, utilities, communities and neighborhoods, population shift, traffic and businesses along the corridor from higher and more concentrated development. The FEIS must provide that information.

Mitigation

- The DEIS states that, “Based on the relatively small number of parcels affected by full acquisitions, the effects on different types of land uses in the study corridor would be minimal.”
- We would not know if the “effects” “would be minimal” because precise information on each parcel that will be partially or totally acquired was not given in this disclosure document. Thus, making it impossible to comment on any impact, direct, indirect or

cumulative, on neighborhoods, communities, businesses, environmental and natural resources and land use patterns.

4.3 Acquisitions, Displacement, and Relocation

The DEIS provides no information on public facility sites land acquisitions. The exact location is not identified nor is information provided on the present use of the land. It is hard to imagine that there will not be impacts by the land acquisition yet without information it is impossible to evaluate the direct, indirect and cumulative impacts.

- Honolulu Community College (0.18 acres)
 - What are the direct and indirect impacts to the College from removing 0.18 acres?
 - Will buildings and students be affected?
 - What purpose is the land being acquired for and how will that use impact the college?
- Waipahu High
 - The DEIS states that acquisition of 0.16 acres effects a “small number of temporary or permanent buildings may be displaced or may require minor modification.”
 - What are the direct and indirect impacts from either displacement or modifications to the school, students and faculty?
 - How many temporary and/or permanent buildings will be displaced or modified?
 - Are there sufficient classrooms or other buildings to accommodate the students, uses or faultily that will be displaced by the land acquisition?
 - What will the acquired land be used for and how will that use impact classrooms, students or other school facilities?
- Leeward Community College (3.94 acres)
 - What are the direct and indirect impacts to the college, students and faculty from the acquisition of 3.94 acres?
 - What will the acquired land be used for? How will that use impact surrounding buildings, classrooms and open space?
 - Does the acquisition leave the area unusable?
- UH Manoa Urban Garden Center (.16 acre)
 - What are the direct and indirect impacts of acquiring 0.16 acres of the Urban Garden Center?
 - Will the Center still be viable, will programs and opportunities be lost or will the garden have to be relocated because of the acquisition?
 - What will the acquired land be used for and how will that use impact the garden?

Affected Community facilities

- Bethesda Temple Apostolic Church (.05 partial acquisition of land)
- Alpha Omega Christian Fellowship (displaced as part of full acquisition of commercial building where church is located)
- Nimitz Field (.58 acres)
- Richardson Field (.05)
- Ke`ehi Lagoon (2.88 acres)
- Aloha Stadium (.08 acres)
- Pearl City Post Office (.06 acres)

- Federal Building 300 Ala Moana (.34 acres)
- Oahu Correctional Facility (.21 acres)
- City office building (not identified)
- Fort Shafter Army Reservation (acreage and location not given)
 - "Military properties include lands used for military operations as well as residential accommodations for enlisted personnel and their families"
- Makalapa Naval Housing (acreage and location not given)
- Pearl Harbor Complex (acreage and location not given)
- Naval reservation (acreage and location not given)
- The DEIS states that "measures to reduce adverse effects on community facilities would be evaluated during future design. Mitigation efforts would involve coordination with individual property owners as necessary."
 - Will there be opportunities for community discussions on the impacts of public land acquisition? If so, identify the opportunities for public involvement.
- While land acquisition may be within the law residents, businesses and public institutions should be given greater respect than to just be identified and mediated. After all these are people, lively hoods, and places where are children learn and play. In some cases, as with the Banana Patch, a whole community will be displaced. Will they ever get back the lifestyle they have now - don't know and we don't think anyone will ever know because mediation will happen behind closed doors.
- If the parcels slated for parcel or full acquisition were only identified "based on conceptual engineering drawings" when will the actual acquisitions be known? Without accurate acquisition data it is impossible to analyze the direct, indirect and cumulative impacts on public facilities, traffic, communities, neighborhoods and environmental and natural resources.
- Where will property owners, public and private, be officially notified that their property will be partially or fully acquired? How much time notice will they be given?
- What policies and procedures are in place to ensure that people and businesses that are displaced will have "comparable housing that is decent, safe and sanitary...and affordable" and that businesses will have equivalent commercial spaces?
- The DEIS states that "Once it was determined that a parcel would be acquired, the displacement and relocation of residences, businesses and uses were analyzed." What are the results the investigation? Why weren't the results put into this disclosure document so that the direct, indirect and cumulative impacts from full and partial acquisition could be evaluated? That information must be provided in the FEIS.

4.4 Community Services and facilities

Public and community services within ½ mile of project alignment

- The DEIS states that "Countless community facilities, schools, churches, parks and utilities, listed below, have been identified as being within ½ a mile of the fixed guideway."
- Other than a list of affected facilities no information is provided on how properties and/or services will be directly or indirectly impacted.
- How was the use of a ½ mile as a measurement determined?
- At what point(s) within the 26-foot wide fixed guideway system is the ½ mile measured from?

- Without information on where the ½ mile begins and ends at each point in the 20-mile and without showing exact location of properties within the ½ mile it is impossible to evaluate direct impacts on buildings, residents, businesses and communities. That information must be provided in the DEIS.
- The DEIS does not provide any information on how many school within a ½ mile of the fixed guideway will be impacted by noise and at what level. This is critical because if the noise is severe then classrooms and other school facilities might require air conditioning, which will be a huge purchase and installation cost as well as yearly maintenance and electrical costs. This information must be presented in the FEIS.
- How many schools will be impacted by noise from the fixed guideway system and what will that impact be to each school?
- Since school facilities are owned by the state but will be impacted by a city project which arm of government will pay for the costs associated with air conditioning?
- What are the noise impacts from the fixed guideway system on outside events held at schools and other public facilities along the 20-mile fixed guideway route?
- The DEIS identified 58 schools within ½ mile of project alignment
- The following schools are adjacent to alignment and directly impacted
 - Honolulu Community College (0.18 acres all alternatives)
 - Kalakaua Middle School
 - Kalihi Kai Elementary School
 - Makalapa Elementary
 - Moanalua High
 - Pearl City elementary
 - St. Joseph Elementary (private)
 - Waipahu High (.16 acres a small # of temporary or permanent buildings may be displaced or may require minor modification in addition to the required purchase of narrow strip of land all alternatives)
 - Waipahu Intermediate
 - Leeward Community College (3.94 acres all)
 - Maoanlua/Aiea community School
 - UH Manoa Urban Garden Center (.16 acre All)
 - Holy Family Catholic Academy (private)
 - Joy of Christ Preschool (private)

The DEIS identified the following community facilities as being directly affected

- Bethesda Temple Apostolic Church (partial acquisition of land (.05)
- Alpha Omega Christian Fellowship (displacement)
- Nimitz Field (.58 acres)
- Richardson Field (.05)
- Ke'ehi Lagoon (2.88 acres)
- Aloha Stadium (.08)
- Pearl City Post Office (.06 acres)
- Federal Building 300 Ala Moana (.34 acres)
- Oahu Correctional Facility (.21 acres)
- City office building (not identified)
- Fort Shafter Army Reservation (location not given)
 - "Military properties include lands used for military operations as well as

residential accommodations for enlisted personnel and their families”

- Makalapa Naval Housing (acreage and location not given)
- Pearl Harbor Complex (acreage and location not given)
- Naval reservation (acreage location not given)

The DEIS identified 93 religious institutions and being within ½ mile with 19 being adjacent

The DEIS identified 5 cemeteries within ½ mile, with 2 adjacent

The DEIS identified 6 libraries, 5 police stations, 3 fire stations and 6 medical facilities within ½ mile of project the alignment.

The DEIS identified 64 parklands and recreation facilities with ½ mile

- Irwin Memorial Park (public)
- Mother Waldron Park (public)

The Hawai'i Community Development Authority's Master Plan identifies this park as a major community amenity that is crucial open park space as Kaka'ako redevelops into a dense residential area. Since the fixed guideway skirts the mauka boundary of the park what are the direct and indirect impacts on the park and people visiting the park from having an elevated rail system so close?

- Aiea Bay State Recreational Area which received Water and Land Funding are Sec 6(f) resources
- Aloha Stadium
- Navy Housing Community Park (private)
- Navy-Marine Golf Course (military)
- Richardson Field (military)
- Neal S. Blaisdell Park (public) *Received Water and Land Funding are Sec 6(f)
- West Loch Golf Course (public)
- Walker Park (public)
- Future Queen Street park (public)
- Ke'ehi Lagoon Park

- The above lists show that a lot of properties, both public and private, will be impacted by the 20-mile fixed guideway system. This is a huge unprecedented undertaking for our island with unknown implications and ramifications all along the route. Yet, neither data on each property nor a cumulative effects analysis was provided in this disclosure document. Thus, making it impossible to understand or asses direct, indirect or cumulative impacts to the direct properties, public facilities, utilities, communities, neighborhoods and environmental or natural resources.
- While identification of social, recreational, and public facilities is critical lists by themselves are meaningless. There is absolutely no way to evaluate direct, indirect and cumulative impacts to a particular site or collectively when information is not provided.
- The DEIS does not provide information on why the office building that houses the Alpha Church will be purchased. That information must be provided in the FEIS.
- What are the direct and indirect impacts to the vendors at the Aloha Stadium swap meet from the fixed guideway system and station planned for the stadium?
- It is unacceptable to state in this disclosure document that, “Measures to reduce the adverse effects on individual community facilities would be evaluated during preliminary and final engineering design.” The time to “evaluate effects” is during the disclosure phase not after.

- What measures that will be used “to reduce the adverse effects on individual community facilities” must be provided in the FEIS.
- Since this avoidance to detail path has been chosen we predict that there will be countless delays when residents become aware of the threats to their schools, community facilities and neighborhoods.

4.4.3 Environmental Consequences and Mitigation

- While the DEIS states that properties that meet the Federal criteria under Section 4(f) resource have been evaluated that evaluation information is not in this disclosure document.
- Why weren’t the evaluation findings published in this disclosure document so that reviewers could comment on possible direct, indirect and cumulative impacts on the resource and surrounding environment?
- That information must be provided in the FEIS.

Public Services Common to all Build Alternatives

- The DEIS mentions that a Maintenance Traffic Plan will be developed during final design to manage traffic and emergency services during construction.
- Since traffic and availability of emergency services will be major problems during all phases of construction and after completion of the 20-mile fixed guideway system why wasn’t a Maintenance Traffic Plan developed and included in this disclosure document? That information must be provided in the FEIS.

4.5 Neighborhoods

- The DEIS states that the “Project transects 9 city-designated neighborhoods.” “How is a “designated neighborhood” defined and where are the nine neighborhoods located?”
- What approvals will the City need from the Hawai’i Community Development Authority (HCDA) before construction of the fixed guideway can begin in Kaka’ako?
- What is the meaning of “projects life cycle?”
- The DEIS states that “The transit agency could experience 3 types of crimes; crimes against persons, crimes involving transit property and other crimes committed on transit property.” What are the other crimes that are anticipated to occur on transit property?
- How many security guards will be hired? How many will be stationed at each station? Will there be security personnel at each station and platform the 20 hours of operation? Will there be security personnel on each train?
- Will there be surveillance cameras at each station and platform?
- Transit Oriented Development is being encouraged around transit stations yet there is no information about the types of zoning changes that will be sought at each location to allow for higher density development. Without location and zoning information it is impossible to evaluate the indirect and cumulative impacts of higher density on infrastructure, traffic, businesses, public and community facilities and adjacent communities. Information on zoning and stations identified for TOD must be provided in the FEIS.
- The DEIS states that “There is a public perception that community cohesion would be adversely affected by the Project. Because the Project would be constructed primarily

- The more important question is why are these critical decisions being put off until the design phase and not brought forward in this disclosure document for comprehensive evaluation of direct, indirect, cumulative and secondary impacts on neighborhoods, residents and businesses?

4.6 Environmental Justice

4.6.2 Affected Environment

- The list below identifies some of the social and community resources in OMPO EJ area but no information is provided on each facility or how it will be impacted by the fixed guideway system.
 - Goodwill
 - Pu`u wai Momi
 - Pu`uwai Momi Housing Complex Teen Center
 - Salt Lake Apartments
 - Institute for Human Services.
- It is interesting that the most impacted minority community – the Banana Patch was not identified when the OMPO method was used to identify Environmental Justice communities. The Banana Patch was only identified as a 100% minority EJ community after public outreach identified the community as an EJ area of concern.
- What mitigation measures will be used to move families living in the Banana Patch to comparable multi-generational living spaces and conditions, which is an agricultural subsistence lifestyle within an urban setting?
- Because of the broader communities involvement a community meeting, including the participation of a FTA Civil Rights Officer, will be held in the Banana Patch
- What other EJ communities did the OMPO EJ technique miss?
- Generally, environmental justice has to do with the disproportionately negative and heavy impact of activities involving the environment on the health and living conditions of communities of color and low-income communities. Environmental justice revolves around not only who is disproportionately affected by an environmental activity, but also WHO DECIDES? Typically the decision-makers do not reflect the groups who will be affected by their decisions.
- Usually residents in the underserved and poorer communities are unaware of issues and do not participate in government actions. This could be for many reasons: financial, non-English speaking. What efforts will be made to inform residents from EJ communities of pending changes and impacts on their community from the fixed guideway?
- The DEIS did not give any consideration to the higher occupancy density in home residences that's common in the identified communities and the anticipated and unanticipated impacts of the guideway transit system affect on environmental and social health. This information and analysis must be done before the DEIS is accepted.
- To elevate undue strain on identified EJ low-income and minority communities residents must provided information and included in decision-making. Translated information informing affected communities about impacts from construction and a whole host of other changes must be distributed in a way that will encourage and attract participation.
- From the conclusion made in the DEIS "That ...it has been determined that here are equal effects on the OMPO EJ areas and non-EJ areas" and "there are no disproportionately high or adverse effects on OMPO EJ areas" it seems that EJ

- communities will be left out of the decision making process once again. Is that what is meant by this statement?
- The DEIS states that there will be impacts, as shown below, but does not identify the direct, indirect or cumulative effect of each of the impacts on the community or neighborhood. Such information must be provided in the FEIS.
 - Impacts from right-of-way acquisition
 - Impacts to community cohesion
 - Impacts to social and cultural resources
 - Visual quality impacts
 - Noise and air quality impacts
 - Traffic and transportation impacts
 - Short-term construction impacts
 - There is no information in the DEIS about the Section 8 low-income housing that will be displaced in Waipahu by the fixed guideway system. This too, like the Banana Patch, seems to have escaped OMPOs EJ guidelines?
 - What are the direct, indirect and cumulative impacts of displacing people living in Section 8 housing? Will the city assist residents in finding comparable housing?

4.6.4 Public Outreach

- While “Important project notifications” were placed in various ethnic and cultural newspapers it is unclear if information was translated into the languages of people reading those publications? If not, will future notifications be translated into the languages of the people in the effected communities?
- Were public reading materials placed on the website and handed out at community events translated into common languages within the identified communities?
- How much community participation was there from the various EJ communities and how many comments were received from non-English speaking community members?
- It is disconcerting to read at this stage in the process that, “Efforts will be made to identify and coordinate with EJ populations to actively solicit their input.” This statement tells the reader that so far the outreach does not seem to have been garnered much participation by the most vulnerable and less active members in a community and who do not attend Neighborhood Board meetings, call a hotline or post comments on the website.

4.7. Visual and Aesthetic Conditions

4.7.2 Affected Environment

- Visual resources in the project corridor include landmarks, significant and majestic mauka and makai vistas, historic and cultural sites, parks, open spaces and trees and there is no way to mitigate the visual impact of the 30 to 40 foot high elevated 26 feet wide concrete fixed guideway system.
- No amount of designing, paint color or pretending that it won't be as obtrusive as we all know it will be there is no way to mitigate the impact of the elevated fixed guideway, elevated stations with lights that will cast off glare into the nigh sky and will forever mar our visual horizons.
- The only thing that *might* disrupt the intrusion of the fixed guideway system in some places are tall very tall trees, 30 to 40 feet tall trees. But whether planting trees of that

height to block the bleak starkness of the 26-foot wide guideway has been considered is not known because that information has not been provided in this disclosure document.

- What are the “policy documents” that identified significant views and vistas and will govern the project corridor? Why weren’t these documents included in the DEIS?
- What are the mitigation measures that would alleviate the obvious intrusion, loss of property values and views when the 30-40 foot guideway comes “within 10 feet of some facades along Dillingham Boulevard?”
- The fixed guideway system and Chinatown Station 30 feet above Nimitz will be a dominant visual element and bifurcate historical Chinatown from its historical connection to the Honolulu waterfront. Some things can’t be mitigated and this is one of them.
- In downtown views from the 4th and 5th floors would be blocked and trains would create light and glare and stations would increase this effect. The guideway and columns would change the visual character of the streetscape and the historical disconnection between downtown and the waterfront. There are no mitigation measures that can mitigate these impacts.
- On Halekauwila Street the guideway and columns would also block views from the 4th and 5th floors and increase light and glare on upper stories. Visual effects would be high and property values would be low. Can’t have an elevated train whizzing by outside your window and expect peace and quiet, fresh air and breezes and reasonable value for your property should it need to be sold.
- What changes are proposed for historic Halawa Bridge that will substantially change its appearance?

4.9 Noise and Vibrations

- The DEIS identified the properties, listed below, as being affected by noise.
- Over a 26-mile route it cannot be that just these properties will be affected by noise. The FEIS must identify all other properties that will be impacted by noise.
 - 94-340 Pupumomi St – moderate impact to 5th floor and above
 - 1000 Kamehameha at Kauhale St: 14 buildings with moderate impact at ground level
 - 860 Halekauwila: moderate impacts to 6th floor and above
 - 113 Waimanu: moderate impacts to 7th through 9th floors
- One direct impact will be the loss of property value due to noise from the fixed guideway system traveling 30-40 feet past residential and business windows.
- What are the direct, indirect and cumulative impacts from loss of property value for properties affected by noise from the fixed guideway system?
- One direct effect on individual effect will be the loss of breezes and fresh air as residents adjacent to the fixed guideway system will be forced to close their windows and air condition their home. In this age of reducing energy use to eliminate green house gases it is ironic that more people will be resorting to air conditioning due to the fixed guideway system and this can only be expected to get worse as Transient Oriented Developments are build along the 26-mile fixed guideway system.
- It is interesting that the DEIS points out that “Severe noise impacts are considered significant within the context of NEPA and HRS 343.” Yet, the DEIS does not consider noise to be significant since it states that “It is not practical to avoid severe impacts by

changing the location of the project, mitigation measures must be considered and incorporated into the project unless there are truly extenuating circumstances that prevent it.” Without moving the alignment away from buildings the only remedies that come to mind to block out noise from a steel-on-steel train whizzing by 30-40 feet in the air is to close the windows and air condition your home. What a shame.

- Identify the locations where “project noise level would be equal to or above the severe impact level” and “a severe impact would occur.”
- What constitutes a “severe impact” and what, if any, mitigation measures would be used to moderate noise levels?

4.12 Ecosystems

Migratory Waterbirds

- The DEIS states that “the only protected waterbird that nests in Hawaii is the black-crowned night heron.” That is incorrect.
- There are many species of waterbirds in Hawai‘i, including the endangered Hawaiian duck, endangered Hawaiian stilt, endangered Hawaiian coot, and endangered Hawaiian gallinule. All are endemic to Hawai‘i. The ‘auku‘u, or heron, is indigenous. All of them nest in Hawai‘i, although not all on all islands. There are also a number of migratory waterfowl, and ducks, such as the mallards, and shorebirds.
- The statement that “Over time, the waterbirds would adjust to new structures built for the Project...and avoid the structures” is probably true but Hawaii’s water and migratory birds have never had to compete with a fast moving unyielding object 30 to 40 feet in the air before.
- Unfortunately, the Ecosystems and Natural Resources Technical Report didn’t discuss what will happen when water and migratory birds encounter a train high traveling 30 to 40 feet through the night sky other than to say “over the long term these birds are expected to adapt to the new elevated guideway structure and the presence of the trains, as they have adapted to the presence of highway traffic.” A train traveling high in the sky is different from many lanes of cars. The potential impacts on water and migratory birds should not be so summarily dismissed but data should have been provided and direct, indirect and cumulative impacts on water and migratory birds should have been analyzed. Until all impacts are analyzed and understood this DEIS should not be approved.
- The Technical Report also did not address the effects a constant stream of lights in the cars and on the trains traveling up to 50 miles an hour 20 hours a day would have on water and migratory birds. Information on the impacts must also be analyzed and understood before this DEIS is accepted.
- While the Technical Report acknowledged that, “Construction activities adjacent to the springs and other water bodies where the waterbirds were observed may temporarily affect their feeding habitats” the short and long-term impacts on individual water and migratory birds and cumulative impacts on the species was not analyzed.
- During the observation for the Report several federally listed endangered stilts were present along the alignment and inhabit Waiau and Kalauao Springs (Sumida Watercress Farm). The federally listed endangered common moorhen has been recorded at the Sumida Watercress Farm. The federally protected migratory native black-crowned night heron have been seen at Moanalua Stream, Kalauao Spring and at

a drainage canal near the Honolulu Airport near Ke'ehi Lagoon.

- Hawaii's federally listed endangered birds are present along the rail alignment and before this DEIS is accepted the direct, indirect short and long-term and cumulative effects of construction activities, lights on the trains and at the stations, train speed, hours of travel, and height of the rail system on Hawaii's water and migratory birds must be investigated, reviewed, evaluated and incorporated into a technical document.
- The Technical Report stated without providing any substantiating data or analysis that, "The Project would not affect wetland sites such as spring-fed wetlands along the route because with few exceptions, the proposed corridor would use existing roadways." The report did acknowledge that "There may be temporary disturbance of endangered and protected waterbirds when construction activities are in proximity to some of the spring-fed wetland sites, in particular the Sumida Watercress Farm (Kalauao Spring) and Waiiau Spring" but then the Report proceeded to say "However, construction is anticipated to be no more than a minor distraction to these birds because they continue to inhabit these wetlands even though they are adjacent to highways that are heavily traveled by vehicles, trucks, and buses, and even though the general area has gradually become more densely developed. Over time, the waterbirds are expected to adjust to new structures built for the Project." While waterbirds may exist at Sumida Watercress Farm and Waiiau Spring they are currently not being disturbed by daily noise and other disturbances from construction activities.
- The above conclusions reveal another reason why this DEIS cannot be approved until in-depth analysis of construction activities on water and migratory birds within the corridor is reviewed, understood and measures in place to ensure that the fragile bird population does not collapse from the urbanization of their habitat.
- In addition the Report states that "Construction activities over Moanalua Stream may temporarily affect the availability of foraging sites for black-crowned night herons, but this species is highly adaptable to altered environments and would adapt to new structures built over the stream." It appears that this conclusion was reached without analyzing the direct, indirect and cumulative impacts of the loss of foraging sites would have on black-crowned night herons. Black-crowned night herons may be adaptable but loss of foraging sites may force them to abandon this foraging area and no data or analysis was provided in this DEIS to indicate that they would ever return.

4.13 Water

Wetlands and Streams

- While the DEIS and Technical Report state that no direct impact to Waiiau and Kalauao Springs, such as placing piers in either spring, is anticipated neither report analyzed short and long-term direct, indirect impacts and cumulative affects to both springs that might occur during construction such as dewatering.
- Neither report analyzed direct or indirect impacts to the Sumida Watercress Farm operations from construction and the completed guideway system other than to note that the shadow from the elevated guideway system might affect water quality. Even that impact was not evaluated or analyzed.
- The DEIS states that, "Some stream crossings would be required along the alignment. In some instances, the discharge of stormwater from the guideway may increase stormwater inflow to some of these waters. However, because stormwater quality is not

expected to be adversely affected, no streams or downstream marine waters are expected to experience negative effects.” The DEIS does not provide any data or analysis to back up that statement. The DEIS also does not provide data or analysis on the cumulative impacts from roadway runoff and rail runoff on streams.

- The Technical Report noted that the endemic listed ‘o‘opu nakea while uncommon was present in Waikele and Waimalu Streams. This is good news. The bad news is that the ‘o‘opu nakea inhabit streams that are within the fixed guideway alignment and so far data and analysis on direct, indirect and cumulative short and long-term impacts to native species within the alignment is not in the DEIS or Technical Report.
- The Technical Report states “Bridge support piers that are 6 to 10 feet in diameter would not inhibit ‘o‘opu nakea from traversing to the ocean during the twice-a-year spawning period.” This leads us to believe that piers will be placed in both streams. Is that true? If so, how many piers will be placed in each stream?
- Unfortunately, the Technical Report does not identify what the impacts to the ‘o‘opu nakea would be during construction or the length of construction activities in and around the streams. That information is crucial to understanding what is needed to protect the ‘o‘opu nakea as it migrates to and from the ocean.
- A positive mitigation measure would be to avoid any construction activities in and around Waikele and Waimalu Streams during ‘o‘opu nakea spawning periods.
- Does the alignment go over Pu‘o‘hala Marsh that has been identified as of critical importance to Hawaii’s endangered waterbirds? If so, will any structures be placed in the marsh? What are the short and long-term impacts of construction activities to the marsh, waterbird habitat and the water and migratory birds that forage in the marsh?
- All temporary and permanent proposed and potential stream diversions for bridges, park-and-ride lots, parking structures and garages, rail stations and platforms were not identified in the DEIS. The locations must be documented in the FEIS.
- It is unsatisfactory to state that, “Detailed delineation would therefore be a future task to be coordinated during the Project’s design phase.” While some aspects of the fixed guideway can be put off to the design phase evaluating temporary and permanent impacts to Hawaii’s streams and wetlands is one of them. This fixed guideway system is not a surprise. It is not something that was sprung on people a few months ago. To not be prepared to provide data and analysis of impacts, direct and indirect of construction and other activities in and around streams and wetlands within the alignment because “insufficient design information at the planning stage (e.g., the exact location of bridge crossings)” was not known or available is unacceptable. This is another good example of why this DEIS cannot be accepted.
- What is meant by the statement in the Technical Report that “Inspection of streams was limited to the location of specific crossings?” Does it mean that not all streams were evaluated?
- The Technical Report provides a litany of information on the Sumida Watercress Farm including that for approximately 530 feet the proposed guideway would be adjacent to the watercress farm. What the report doesn’t say is how close the guideway will be to the farm and what short and long-term impacts a noisy train roaring overhead would have on water and migratory birds who forage and inhabit the farm.
- The Technical Report states that “One major spring-fed wetland system in Kalauao (Sumida Watercress Farm) and an unutilized spring-fed wetland at Waiiau” located

adjacent to the guideway structure “would not cause a direct impact to these wetlands, but shadows cast by the elevated structure may slightly affect water temperatures and affect watercress growth” because the guideway system is within the median of Kamehameha Highway. The Report goes on to say that, “These consequences are anticipated to be very slight to non-existent, based on the proposed guideway’s distance from open water and watercress farming areas. Shade would only reach open water and watercress in the late afternoon.” What is an “unutilized spring-fed wetland?” Where are the data and analysis of direct and indirect and cumulative impacts to the Sumida Watercress Farm from the daily shadow? Where is the data and analysis of direct, indirect and cumulative impacts to the underutilized spring-fed wetland at Waiiau?

- The Technical Report mentions that the alignment would cross Moanalua Stream but doesn’t provide any data on how the alignment will or will not temporarily or permanently impact the stream. Later in the Report it is noted that “Construction activities over Moanalua Stream may temporarily affect the availability of foraging sites for black-crowned night herons, but this species is highly adaptable to altered environments and would adapt to new structures built over the stream.” Where is the data and analysis that identify the temporary and permanent impacts to the stream and evaluates impacts to the foraging site and direct and indirect impacts to the black-crowned night heron? Black-crowned night herons may be adaptable but they cannot afford to keep losing their foraging grounds.
- It is unsatisfactory to state that, “Only some sites proposed for maintenance, storage, and other facilities provide this type of habitat, which would be disturbed and eliminated by the facilities required for the Project” without identifying the sites and providing data and analysis on the temporary and/or permanent direct, indirect and cumulative impacts from disturbing or eliminating these sites. The sites must be identified and information and analysis provided in the FEIS.
- The Technical Report states that the “The Project would not affect wetland sites such as spring-fed wetlands along the route because with few exceptions, the proposed corridor would use existing roadways.” What are the “few exceptions” located and where is the data and analysis to back up this statement?
- It is unacceptable to state in the Technical Report that “There may be temporary disturbance of endangered and protected waterbirds when construction activities are in proximity to some of the spring-fed wetland sites, in particular the Sumida Watercress Farm (Kalauao Spring) and Waiiau Spring. However, construction is anticipated to be no more than a minor distraction to these birds because they continue to inhabit these wetlands even though they are adjacent to highways that are heavily traveled by vehicles, trucks, and buses, and even though the general area has gradually become more densely developed.” Where is the data and analysis to substantiate the claim that construction will only be “a minor distraction” and will cause no harm to the waterbirds or their habitat?
- The Technical Report notes that, “Streams that are over 150 feet wide may require in-water piers to support the guideway. These include Waimalu Stream (140 feet), Halawa Stream (225 feet), Moanalua Stream at Nimitz Highway (270 feet), and Ala Wai Canal (160 feet). An in-water supporting pier with a diameter of 6 to 10 feet maybe required to-span these streams.” Why isn’t data available on whether in-water

piers **will** be required for Waimalu Stream, Halawa Stream, Moanalua Stream and Ala Wai Canal? When will the data and analysis be available? Once again it is unacceptable for information to be missing from this environmental impact disclosure document.

- Is construction activity in the Ala Wai Canal associated with the first 26-miles of the fixed guideway system or with the Waikiki extension? What type of “Accommodations” will be made for paddlers in the Ala Way Canal during construction?
- And finally the Technical Report states that, “Because the Project would avoid all wetlands in the study corridor, no effects on wetlands are anticipated and no mitigation would be necessary.” We guess that all that stuff about shadows over Sumida Watercress farm, possible alignment over or near Pu`o`hala Marsh or disturbing waterbirds “when construction activities are in proximity to some of the spring-fed wetland sites” doesn’t mean anything.
- In summary, the DEIS lacks sufficient data and analysis needed to make informed evaluations on direct, indirect and cumulative short and long-term impacts from construction projects in or near streams, wetlands, and underground springs and not to mention the perpetual impacts once the fixed guideway is completed. Until data and analysis is provided, reviewed and incorporated into technical documents this DEIS should not be accepted.

Groundwater

- While the DEIS notes that drilled shafts will break through the basalt aquifer in several locations information on how severe the breaks will be or analysis of direct, indirect and cumulative impacts at each site on the aquifer is not provided. This information must be provided reviewed, evaluated, analyzed and incorporated into a technical document before this DEIS can be accepted.
- Has data been collected and analyzed for long and short-term and cumulative impacts on the aquifer from the proposed redirecting of current water runoff patterns at several locations along the alignment? If so, what does the data show?
- The DEIS notes that at each diversion site “There would be no long-term changes to groundwater levels, including artesian conditions, as a result of the fixed guideway system.” What data and analysis supports that statement?
- The Technical report states that, “Runoff from the guideway would not likely contaminate groundwater.” What data and analysis substantiates this statement?
- Interestingly in another section of the Technical Report it is stated that, “Groundwater encountered by excavations for pile caps that need to be removed is likely to be contaminated with petroleum products at several locations where excavations are required.” This is where information and analysis would come in handy.
- The Technical Report acknowledges that “places along the Airport alignment where depths to groundwater would be approximately 10 feet below the surface” and for “the remainder of the First Project alignment, groundwater may be encountered at about 10 feet below the surface.” So while it is known that Oahu’s sole source aquifer will be breached a cumulative effects analysis has not been conducted. Until relevant quantitative information is provided and analyzed this DEIS cannot be accepted.
- The Technical Report states that, “Dewatering may be required where groundwater is at levels above the base of the pile caps” but there is no data or analysis of impacts of

- dewatering at each site or how will dewatering impact the aquifer?
- Working over Oahu's sole source of drinking water for 26-miles is serious business and cannot be easily dismissed with comments like "No long-term impacts on the SOBA are anticipated." Until **all** short and long-term direct, indirect and cumulative impacts are known, evaluated, analyzed and incorporated into a technical document this DEIS should not be approved.

VIOLATION OF CHAPTER 6E, HAWAII REVISED STATUTES

The Draft Environmental Impact Statement ("DEIS") contains a copy of a letter dated January 10, 2008, from Donna Wong, Executive Director of Hawaii's Thousand Friends ("HTF"), to Wayne Yoshioka. DEIS, App. D, pp. 325-326. In that letter, HTF requested that, with regard to the compliance of the proposed Honolulu Mass Transit Project with the provisions of Chapter 6E, Hawaii Revised Statutes, "it be regarded as an "Interested person" as that term is defined in Section 13-275-2, Hawaii Administrative Rules (HAR) and be accorded all the rights of such persons under Chapter 6E, applicable administrative rules, and all other provisions of law." The letter then described the rights of "Interested persons" and the obligations of the City and County Department of Transportation Services under HAR Chapter 13-275. These provisions afford Interested persons, including HTF, various rights to be consulted during the historic preservation review process conducted by the Department of Land and Natural Resources, State Historic Preservation Division ("SHPD"), that in general parallel the rights of "consulted parties" under Section 106 of the National Historic Preservation Act ("NHPA"). Specific rights include the right to receive SHPD written comments on the proposal and to have HTF's comments on any submittal be considered by SHPD in its review of the Project. Furthermore, SHPD must publish notice of its determinations, and interested persons may appeal SHPD's determinations to the Hawaii Historic Places Review Board.

The DEIS shows that various entities were treated as "consulted parties" under the NHPA and, in September 2008, were sent "one (1) DVD copy of the documents that have been sent to the SHPD as part of our coordination under the National Environmental Policy Act of 1966, as amended and Section 106 of the National Historic Preservation Act. The DVD includes the Purpose and Need and Alternatives chapters of the Draft Environmental Impact Statement (EIS), along with electronic copies of the Archaeological Resources, Cultural Resources, and Historical Resources Technical Reports." See, e.g., Letter Dated September 29, 2008, from Wayne Y. Yoshioka to Ms. Elizabeth S. Merritt, Deputy General Counsel, Law Department, National Trust for Historic Preservation, DEIS App. D, p. 330.

HTF never received a response to its January 10, 2008, letter, and HTF never received the documents sent to "consulted parties" such as the National Trust for Historic Preservation. Accordingly, **HTF has been deprived of its legal rights as an interested person under Chapter 6E.**

The City and County of Honolulu is bound by Chapter 6E, and compliance with the consultation requirements of the NHPA (if such exists) does not obviate the need to comply with the

applicable provisions of Chapter 6E, including the granting to HTF of all of the rights of “interested persons.”

A review of SHPD’s webpage and its “on-line posting of current compliance reviews” shows that, as of February 4, 2009, no postings have been made since July 25, 2008. SHPD’s “archive of past reports” shows no postings for determinations and reviews after 2005. **It thus appears that SHPD has failed to comply with its statutory duty to give public notice of its determinations. Because notice was never given, the 30-day clock for the deadline to appeal SHPD’s determinations has not begun to run.**

HTF requests that it now be sent copies of the same documents made available to “consulted parties” (but NOT to HTF) in September 2008 (i.e., the DVD and copies of the Archaeological Resources, Cultural Resources, and Historical Resources Technical Reports) so that it may exercise its rights as an interested party under Chapter 6E. Because Chapter 6E and its rules allows HTF a period of 30 days to review documents submitted to SHPD for its review, HTF requests that it be afforded a period of 30 days from its receipt of such documentation to submit comments and, further, requests that the comment period for the DEIS be extended as necessary to allow HTF’s comments to be incorporated into and addressed in the Final EIS.

PROBABLE VIOLATION OF SECTION 4(F) OF THE U.S. DEPARTMENT OF TRANSPORTATION ACT RE: KE’EHI LAGOON BEACH PARK

The DEIS, pp. 5-12 to 5-15, discusses the application of Section 4(f) of the Department of Transportation Act (“Section 4(f)”) to Ke’ehi Lagoon Beach Park (“the Park”). The DEIS states that the project alignment for the Airport Alternative and the Airport & Salt Lake Alternative passes directly through the Park and will make direct use of 2.8 acres of this 72 acre park. It is clear from the map provided (Fig. 5-4) will have a significant effect on existing uses of the park and will permanently constrain future park use of the land occupied by the alignment, as well as of that portion of the park located to the north of the alignment.

The DEIS analyzes an alternative routing (illustrated in Fig. 5-5) that would reduce adverse impacts to the Park, while increasing impacts to nearby commercial properties. The FDEIS ultimately rejects this alternative, stating:

To connect the Airport Station and Lagoon Drive Station, the guideway would pass over several additional commercial properties, resulting in at least nine additional full acquisitions and nine business displacements than the proposed alignment. Further, the Lagoon Drive Station would have to be double-stacked (one platform above the other), and the guideway would have to be double-stacked from approximately Peltier Avenue to Ahua Street, a distance of about 600 meters. This, and the right-of-way requirements, would result in an

additional \$75 million (2007 USD) in construction costs. For these reasons, this alternative is not considered prudent.

Under Section 4(f), use of parklands may not be authorized for the Project unless the FTA determines that “[t]here is no prudent and feasible alternative, as defined in Section 774.17, to the use of land from the property; and [t]he program or project includes all possible planning, as defined in Section 774.17, to minimize harm to the property resulting from such use.” DEIS at 5-1.

The DEIS fails to justify its conclusion that no “reasonable and prudent” alternative exists to this use of park land. First of all, the explanation for the claimed necessity of “double-stacking” is wholly conclusory and fails to provide any reasoned explanation of why this method of construction could not be avoided. Furthermore, the DEIS fails to acknowledge that use of the **Salt Lake Alternative**, rather than the preferred **Airport or Airport and Salt Lake Alternatives** would appear to provide a “reasonable and prudent” alternative that would avoid any adverse impacts to the Park. **The FEIS should fully address these issues.**

Although this issue is not discussed in Chapter 5 of the DEIS, the DEIS contains a letter dated September 25, 2008, from Wayne Y. Yoshioka of the Department of Transportation, City and County of Honolulu, to Lester K. C. Chang, Director, Department of Parks and Recreation, in which Mr. Yoshioka advises Mr. Chang of “the U.S. Department of Transportation Federal Transit Administration’s (FTA’s) intent to render a Section 4(f) *de minimis* determination” with regard to the Project’s proposed use of Ke’ehi Lagoon Beach Park and obtains Mr. Chang’s acknowledgement of this determination. DEIS, Appendix D, at 318-321. **HTF asks that the FTA reconsider this determination and that all documentation setting forth FTA’s determination and its justification be included in the FEIS.** Furthermore, the quoted letter contains no justification for this determination beyond the purely conclusory statement that “[t]he park’s recreational features and attributes will be fully restored or replaced prior to project completion.” **Chapter 5 of any FEIS should fully discuss and explain the justification for this determination, including an explanation of how the loss of 2.8 acres of park land can be regarded as a “*de minimis*” impact.**

Dear Sir:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Comments on Chapter 1 Background, Purpose and Need

The comment provides background information on the Second City concept. As presented in Chapter 1, Purpose and Need, of the Final EIS, a Project goal is to improve access to planned development to support City policy to develop a second urban center.

Growth in the Kapolei area was considered in the analysis. As stated in Section 3.4.1, Future Travel Patterns, of the Final EIS, "With an almost four-fold increase in employment estimated by 2030 for Kapolei, the quick and direct access provided by the fixed guideway system from PUC Development Plan area locations (e.g., Downtown and Kakaako) will help address the demand of future reverse commute markets. These markets include existing and

planned local government offices and the future UH West Oahu campus. Based on transit travel forecasts, about 15 percent of fixed guideway ridership during the a.m. two-hour peak period would be in the Ewa-bound direction, which demonstrates that the Project supports the goal of improving access to planned development and a second urban center."

Figure 1-8, Daily 2007 Transit Trips between Transportation Analysis Areas, in this Final EIS, illustrates the relative numbers of transit trips between each area. The purpose of this figure is to illustrate that a substantial majority of trips made by transit on the island occur within the study corridor. The figure does not include car or bicycle trips, as car and bicycles are not transit modes as that term is defined for the purposes of the Figure.

The comment is directed at government operations that have moved from Downtown to Kapolei. Moving government offices is not part of the Project. The Project is consistent with City policies relative to directing growth in certain areas and increasing travel options within the study corridor. As explained in detail in Chapter 1, Background, Purpose and Need, the majority of population and employment is now, and will continue to be, concentrated in the study corridor. The City's long-term development plans which were defined long before the Project. These plans included increased employment in Kapolei and are described in the Ewa Development Plan. The Project used them as a basis for understanding and supporting future conditions. Indirect effects regarding future development trends are presented in Section 4.19.2, Indirect Effects, of the Final EIS. It is anticipated that travelers who have government offices as their destination will continue to use current methods of travel.

The comment is regarding moving government services to Kapolei, which is a prior City decision. The Draft EIS does not provide environmental clearance for the City's long-term development plans which were defined and analyzed before the Project. But certain of the future development projects (those which are reasonably likely to occur) are considered in the analysis of cumulative impacts of the Project. However, Table 4-15, 2030 Mobile Source Regional Transportation Pollutant Burdens (kg/day), in this Final EIS presents future air quality impacts that take into account predicted changes in travel patterns due to the Project.

The Project would not relocate any government offices. Bus commuters from East Honolulu and Windward locations to Kapolei will experience improved travel times by transferring to the fixed guideway for the majority of their trip.

The Project will serve Makakilo with feeder bus service. The Ewa plain provides an opportune location to concentrate feeder bus service from Ewa, Kapolei, Makakilo, and points further Waianae. Bus routes and frequencies with the fixed guideway system are shown in Appendix D, Bus Transit Routes, of the Final EIS.

Comments on Chapter 2 Alternatives Considered

As described in Section 2.5.5, Pedestrian and Bicycle Access, of the Final EIS, stations will be designed to encourage and accommodate pedestrian and bicycle access. Bicycles will be accommodated on the trains. In addition to providing bicycle racks or lockers at fixed guideway stations, non-motorized access will be supported by features included in the Design

Criteria that guide the Preliminary Engineering and Final Design of the Project. The Design Criteria provide specific direction for pedestrian and bicycle access features at stations.

Opportunities for public involvement will continue throughout the development of the Project. The station area planning process includes conducting workshops with communities that will have rail stations. For more information and to get involved in this process, please visit the Project website at www.honolulustransit.org.

The Project no longer includes a branch line (a second route between two points) as was previously analyzed. For the Airport & Salt Lake Alternative evaluated in the Draft EIS, the branch-line headway (the time between train arrivals) would have been twice the headway on the combined line, which would have ranged between 6 and 20 minutes.

Trains will reach 50 miles per hour at distantly spaced stations, such as those in Ewa and following Farrington and Kamehameha Highways. The system will not reach 50 miles per hour Koko Head of Moanalua Stream.

Under normal service braking conditions, the train is designed to stop within 900 feet when traveling at 50 miles per hour.

Between 25 and 30 trains will be in operation to meet 3-minute headways. Fewer than 10 trains will be in operation to meet 10-minute headways. Details are presented in Section 2.5.1, Operating Parameters, of the Final EIS.

As stated in Section 2.5, The Project: Fixed Guideway Alternative from East Kapolei to Ala Moana Center via the Airport, of the Final EIS, all buildings, facilities, and vehicles will conform to the applicable Federal, State, and County accessibility guidelines and standards. HRS 100-50 requires that all State or County government buildings, facilities, and sites be designed and constructed to the Architectural Barriers Act/Americans with Disabilities Act Accessibility Guidelines (36 CFR Parts 1190 and 1191). Elevators will provide wheelchair access. Escalators provide necessary passenger capacity to move people through the station.

The system operation and maintenance costs shown in Section 6.4.1 of the Final EIS of \$110 million dollars per year in 2030 (Year of Expenditure) dollars include maintenance of elevators and escalators associated with the stations.

The maintenance schedule for elevators and escalators will be developed to provide reliable service. The specific maintenance schedule has not been finalized.

As detailed in 2.5.5, Pedestrian and Bicycle Access, of the Final EIS stations will be designed to encourage and accommodate pedestrian and bicycle access. Bicycles will be accommodated on the trains. In addition to providing bicycle racks or lockers at fixed guideway stations, non-motorized access will be supported by features included in the Design Criteria that guide the Preliminary Engineering and Final Design of the Project. The Design Criteria provide specific direction for pedestrian and bicycle access features at stations.

The majority of the system will travel in roadway medians, which is not conducive to being used as a shelter. Stations will be patrolled and are closed at night when the system is not operating.

Materials and textures will be graffiti resistant. Physical deterrents, such as plantings, will be used where appropriate. Graffiti removal is an anticipated maintenance activity that is included in the projected maintenance and operations costs.

A transit center is not proposed at Leeward Community College Station. Security and lighting will be provided at the station. Figure 2-22, Leeward Community College Station, in this Final EIS shows the proposed layout of the station. Security details are provided in Section 2.5.4, Safety and Security Measures, of the Final EIS. A security plan will be developed and the City will continue to work with the Honolulu Police Department to ensure safety and security at the stations.

Regarding the Pearl Highlands Station:

- All stations are designed to be 240 feet long and be a minimum of 12 to 30 feet wide at the platform. As shown in Appendix A, Conceptual Plans and Profiles, of the Draft EIS, the platform would be approximately 60 feet above the existing ramp from Farrington Highway to Kamehameha Highway.*
- As noted in Figure 2-23, Pearl Highlands Station, in this Final EIS, the park-and-ride is designed for 1,600 spaces.*
- The parking structure will be semi-enclosed (multiple floors, with sides open for natural ventilation) and will have security and lighting.*
- The garage will be open while the system is operating.*
- There is no intent for shared use with other facilities at this location.*

The Aloha Stadium Station location shown in Figure 2-22, Aloha Stadium Station (Salt Lake Alternative and Airport & Salt Lake Alternative), of the Draft EIS is no longer proposed as part of the Project. As seen in Figure 2-25 of the Final EIS, an elevated connecting bridge will not be constructed as part of the Aloha Stadium Station.

Comments on Section 3.2.1 Existing Travel Patterns of the Draft EIS

Air passengers are expected to be a very small percentage of overall travel on the fixed guideway. The primary use of the system is expected to provide access to a large employment base in the Airport vicinity and at or near Pearl Harbor. The travel forecasting model includes an Air Passenger Model to forecast air passenger use of the transit system. As shown in Table 3-13 of the Final EIS, in 2030 there will be about 3,500 air passenger trips a day to and from the Airport using transit (bus and fixed guideway) compared to only 1,200 transit trips without the Project.

As shown in Tables 3-4, *Daily Transit Trips by Trip Purpose—2007* in this Final EIS, currently, 51 percent of all transit trips either originate or end at work. As shown in Table 3-13, this percentage is projected to stay the same under 2030 No Build Conditions; however, work-related trips will increase to 54 percent of all transit trips in 2030 with the Project. This number includes trips on both the fixed guideway and the bus. The remaining 46 percent of trips are expected to be to and from school, to and from shopping, trips that do not originate or end at work or home, ground access trips by air passengers, or visitor trips.

The majority of the guideway is in existing roadways with columns placed within the roadway median. In most cases, the median below the guideway will be planted with low-maintenance plantings.

Comments on Section 3.4 Future Conditions and Effects; Build Alternatives of the Draft EIS

As shown in Figure 1-6, *Employment Distribution for Oahu*, in this Final EIS, there were 11,200 jobs in Kapolei in 2000 and there are 53,000 jobs projected for Kapolei by 2030. These numbers reflect the four-fold increase. This information is from the City and County of Honolulu Department of Planning and Permitting, (DPP) 2008.

The specific answers to the details of these comments would be best obtained from the University of Hawaii, which is undertaking the planning for the new campus. The travel demand model is an aggregate model that does not break down individual facilities beyond identifying the general trends for the types of users associated with them. The model will reallocate trips from one campus to another related to the placement of the campus with respect to the potential users in the corridor. College trips are allocated based on student/faculty populations at each facility. The model distributes them based on time of day, not courses offered. More detailed information regarding this issue may be obtained from the University of Hawaii, although more detailed information is not necessary for development of the figures based on the Traffic Demand Forecasting Model utilized for the Project.

DTS is not aware of any specific government office relocations at this time that will be required.

In Section 3.4.2, *Effects on Transit*, of the Final EIS, the "sum of the travel times in between" the East Kapolei Station and Pearlridge Station is 18 minutes, which reflects the time it would take to travel via fixed guideway from East Kapolei to Pearlridge. This time is calculated by adding the travel times between all the stations from East Kapolei to Pearlridge.

The Travel Demand Forecasting Model forecasts the number of trips by trip purpose (in this case, home-based work trips) and mode of travel by origin and destination (Ewa to Downtown in this case). The number of trips by transit was compared to the number of trips by automobile to determine the transit mode share. The growth in population and employment and the associated increase in congestion on the highway system will force more people to consider the efficient option offered by the rail system. Population and employment data are obtained from the City and County of Honolulu Department of Planning and Permitting, 2008, and are consistent with the ORTP forecast assumptions.

As of June 2009, TheBus operates 108 bus routes. Of those routes, only 13 operate completely outside the study corridor, which accounts for less than 4 percent of the total weekday bus service in terms of revenue hours of service. The balance of service outside of the study area is provided by 35 routes that have a substantial portion of their operation within the study corridor. Consequently, the reliability of service outside of the study corridor is directly related to the impacts of traffic congestion and other factors occurring inside the Project area. For example, Routes 52 and 55 (Circle Island) take over 4 hours to complete a bus trip. About 1/3 of the Circle Island trip is spent within the Project area. Any delay occurring in the Project corridor affects people waiting for that bus to arrive in Kaneohe, Haleiwa, Wahiawa, Mililani or neighborhoods in-between. Even routes operating totally outside of the study corridor can be impacted by conditions inside the corridor. For example, the last scheduled departure of Route 76 from Haleiwa to Waiialua is 6:45 p.m. Passengers arriving on Route 52 from Downtown connect to Route 76 to continue their trip home. If Route 52 is operating off schedule, then passengers potentially miss their last connecting bus home. In some cases, Route 76 may be held if the connecting route is not too far off schedule, thus impacting the service of a route operating totally outside the corridor.

The Travel Demand Forecasting Model has been refined since the Draft EIS to account for non-home based direct demand trips (trips that do not begin or end at home) during off peak periods. In addition, the air passenger model (which forecasts travel in the corridor related to passengers arriving or departing at Honolulu International Airport) was updated to reflect current conditions. The Final EIS reflects updated ridership numbers resulting from model refinement. Walk, bike, and bus access now accounts for 90 percent of trips to fixed guideway stations. Mode of access information for each station is presented in Table 3-20 in this Final EIS. As seen in this table, mode of access varies by station location. Park-and-ride facilities are located at stations where placement of such facilities is feasible and appropriate based on demand for drive-to-transit access.

Comments on Section 3.4.3 Effects on Streets and Highways, of the Draft EIS

As shown in Table 3-21, Column Placement Effects on Streets and Highways, in this Final EIS, no travel lanes will be lost as a result of the construction of the Project and, while in some cases lanes will be narrowed, all travel lanes will remain within standard design requirements. As a result, no significant change is anticipated to in-street travel times as a result of lost lanes.

As shown in Table 3-25, Summary of Potential Effects on Bicycle and Pedestrian Systems due to Fixed Guideway Column Placement, in this Final EIS, sidewalks will not be eliminated at any location along the fixed guideway Project.

Comments on Section 3.4.4, Effects on Parking, Bicycle and Pedestrian Facilities and Freight, of the Draft EIS

The estimated number of existing parking spaces to be affected by the Project has been refined since the Draft EIS. The updated number of parking spaces effected by the project and a summary of locations where parking will be removed by the Project, including effects, is

provided in Table 3-24, Potential Effects on Parking and Loading Zones due to Fixed Guideway Column Placement of this Final EIS.

As stated in Section 3.6, Indirect and Cumulative Transportation System Effects, of Final EIS, the cumulative and indirect effect of removing parking spaces to make room for the Project will be that some people who parked in those spaces will either park in another space nearby, will choose another mode to reach their destination, or will not make the trip. The indirect effect of spillover parking around stations will result in an increased demand for existing parking spaces.

Regarding temporary effects on parking from construction, as stated in Section 3.5.7, Mitigation of Construction-related Effects, of the Final EIS, where existing parking is disrupted by construction, signs will be posted directing people to nearby locations with available parking. The public will be kept aware of upcoming work locations, and information will be available on the Project website about parking disruptions and alternatives. On-street parking by construction workers will not be permitted near work sites. During the actual hours of work, only those vehicles absolutely necessary to construction shall be allowed within the safety zone or allowed to stop or park on the shoulder of the roadway with the approval of the City.

Regarding potential spillover parking near stations, as stated in Section 3.4.7, Mitigation of Long-Term Transportation Effects, in this Final EIS, the approach to mitigating the effects of spillover parking will be unique to each station area. The City will conduct surveys prior to starting construction of a station and again within six months after opening of the station to determine the extent of spillover parking near stations and implement one or more mitigation strategies as needed. Strategies to be used include, but are not limited to: parking restrictions (where parking causes safety or congestion problems), parking regulations (meters, time limits), and shared parking arrangements (at locations where parking is available, but dedicated to another purpose such as retail centers, office uses or places of worship). The specific mitigation strategies and the schedule for implementation will be determined as the stations are opened. Implemented strategies will be monitored, and necessary adjustments will be made as needed.

Off-street and on-street parking losses are shown in Table 3-23, Potential Effects on Parking due to Fixed Guideway Column Placement, of the Draft EIS. This table has been revised based on further design of the Project. Updated results are shown in Table 3-24 in this Final EIS.

As stated in Section 3.6.1, Indirect Effects, of the Final EIS, the indirect and cumulative effect of removing parking spaces to make room for the Project will be that some people who parked in those spaces will either park in another space nearby, will choose another mode to reach their destination or will not make the trip. The indirect effect of spillover parking around stations will mean an increased demand for existing parking spaces. As stated in Section 3.4.7, Mitigation of Long-Term Transportation Effects, of the Final EIS, in locations where parking will be removed by the Project, other parking capacity generally exists nearby to accommodate the demand. Approaches to mitigating the effects of lost or spillover parking will be unique to each station area.

Off-street parking will be removed at Leeward Community College to make room for a rail station that will serve the campus. Spaces will be relocated at an alternate location on campus. On-street parking near Mother Waldron Neighborhood Park will be removed; however, additional on- and off-street parking is available nearby.

As stated in Section 3.6.1 of Final EIS, the indirect and cumulative effect of removing parking spaces to make room for the Project will be that some people who parked in those spaces will either park in another space nearby, will choose another mode to reach their destination, or will not make the trip. The indirect effect of spillover parking around stations will result in an increased demand for existing parking spaces.

In a few cases where the right-of-way is limited, it was decided that reducing the roadway width would be preferable to acquiring additional property. With regard to potential safety-related effects of reduced lane widths, a USDOT study found slightly higher accident rates associated with narrower travel lanes and shoulders¹. However, all roadway widths will meet the design standards of the American Association of State Highway and Transportation Officials (AASHTO A Policy on Geometric Design on Highways and Streets, 2004), the Hawaii Department of Transportation (HDOT), and the City.

The comment regarding bicycle riding as a mode of transportation has been noted.

Comments on Section 3.4.5 Mitigation of Long-term Transportation Effects of the Draft EIS

As stated in Section 3.6.1 of the Final EIS, the cumulative and indirect effect of removing parking spaces to make room for the Project will be that some people who parked in those spaces will either park in another space nearby, will choose another mode to reach their destination, or will not make the trip. The indirect effect of spillover parking around stations will mean an increased demand for existing parking spaces. Additional information about the April 2009 study is available in Addendum 02 to the Honolulu High-Capacity Transit Corridor Transportation Technical Report (DTS 2009).

Comments on Section 3.5 Construction-related Effects on Transportation of the Draft EIS

As stated in Section 4.18, Construction Phase Effects, of the Final EIS, the maintenance and storage facility, park-and-ride lots, and stations could be temporarily used for construction staging areas. Additional areas would be identified by the contractor as needed and the location would be reviewed and finalized during final design. The contractor will be responsible for obtaining any necessary permits and approvals. The contractor will also be required to mitigate any temporary effects from the construction staging area. As stated in Section 3.5.1, Construction Staging Plans, of the Final EIS, construction staging areas will be determined by the contractor with approval from the City. The contractor is responsible for identifying any necessary permits or approvals. However, as stated in Section 3.5.7, "An extensive public information program will be implemented to provide motorists with a thorough understanding of

¹ U.S. Department of Transportation, December 2000, Prediction of the expected safety performance of rural two-lane highways.

the location and duration of construction activities, as well as anticipated traffic conditions." This applies to construction staging areas as it would to any other aspect of the Project.

There are no effects on wetlands. In selecting sites for construction staging, no wetlands will be used.

Comments on Section 3.5.2, Construction-related Effects on Transit Service of the Draft EIS

TheHandi-Van is a curb-to-curb operation and does not require posted bus stops to board and alight passengers. TheHandi-Van vehicles are able to access businesses, medical facilities, and other destinations using driveways and parking lots since TheHandi-Van has flexibility in selecting a route to a destination. TheHandi-Van services may experience some delays in service during construction in certain areas due to general traffic conditions; however, this will be considered in scheduling.

Comments on Section 3.5.4, Construction-related Effects on Parking of the Draft EIS

As stated in Section 4.18, Construction Phase Effects, of the Final EIS, the maintenance and storage facility, park-and-ride lots, and stations could be used as construction staging sites. Table 3-28, Potential Effect on On-Street Parking During Construction, in this Final EIS shows on-street construction-related parking reductions. The location and duration of parking restrictions will not be determined solely by the contractors. The contractors will be given flexibility to coordinate the Project as efficiently as possible within certain parameters as imposed by the City. In some cases, on-street parking could be unavailable for several months at a time during construction.

Comments on Section 3.5.7, Mitigation of Construction-related Effects of the Draft EIS

There will be a public information program implemented to keep the public informed of construction areas and plans. This program will involve information dissemination and education through the various techniques discussed in Section 8.7, Public Involvement during Construction, of this Final EIS.

Comments on Section 4.1, Land Use of the Draft EIS

Each planned development disclosed in this Final EIS is an independent action of the Project. However, the City takes into consideration current planned development to better understand changing land uses to determine transportation needs for the design year 2030. Individual developers would apply for their development permits and perform any necessary environmental evaluations at the time for their development to the appropriate municipality.

As detailed in Chapter 1 of the Final EIS, the Project supports the planned development of Kapolei and the Ewa area. Section 4.2.2, Affected Environment, of the Final EIS indicates, the Ewa region is a rural and agricultural area that is undergoing urbanization and includes

Kapolei, which is developing as Oahu's 'second city'. The west terminal end of the Project is at East Kapolei. The west end of the Project would serve the area where both population and employment are forecasted to grow by approximately 400 percent. This growth is anticipated to occur either with or without the Project. The Koko Head terminal is at Ala Moana Center.

The potential of the Project to support growth and the environmental impacts of future growth are evaluated in Section 4.19, Indirect and Cumulative Effects, of the Final EIS and in the Honolulu High-Capacity Transit Corridor Land Use Technical Report (DTS 2008b). The impacts of growth in the Project area are also analyzed in local and state environmental analyses of proposed land use and infrastructure projects in the Project area that are summarized in this Final EIS.

Large infrastructure projects, such as the Project, play an important role in determining the amount, density, and pace of land use development. But many other factors determine the amount and type of additional growth in the Project area including market demand, local planning policies, land availability, and the availability of other infrastructure (roads, wastewater treatment, schools, etc.). Future development in the Project area will be greatly influenced by factors outside the control of the Project sponsor or any of the other planned projects. U.S. and Asian economic trends can affect the economy of Hawaii, as well as how, when, and to what degree land is developed on Oahu.

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- Reduce the time that each area will experience traffic and community disturbances.*
- Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*
- Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

Station figures in Chapter 2 in this Final EIS illustrate the bus connections to the stations in the Ewa area. The individual future routes that accommodate the rail system are shown in Appendix D, Bus Transit Routes, of the Final EIS.

The travel times shown in Figure 3-7, A.M. Peak-Period Transit Travel Times, in this Final EIS, represent the time required to complete a trip from origin to destination, including walking and time spent on a bus. Kapolei is shown as an origin or destination for several travel pairs in this figure. In addition, existing and future bus routes, including route numbers and frequencies, are provided in Appendix D in this Final EIS.

Section 3.4.2, Effects on Transit, of the Final EIS identified transit travel times for selected market pairs. For travel between East Kapolei and Downtown, estimated travel will be approximately 55 minutes. This represents travel from origin to destination assuming at least part of the trip is made via fixed guideway. Auto travel times for this market were not identified, but are already comparable to rail times during peak periods projected for 2030.

The long-term land use effects of the Project are discussed in Section 4.19, Indirect and Cumulative Effects, of the Final EIS. Section 4.19.2, Indirect Effects, of the Final EIS indicates that the increased mobility and accessibility that the Project may provide will also increase the desirability and value of land near the stations, thereby attracting new real estate investment nearby. See response to Comment above that begins: "As detailed in Chapter 1 of the Draft EIS, the Project supports the planned development of Kapolei and the Ewa area."

This comment quotes a statement in the Draft EIS and, therefore, no response needed.

The bulk of future regional land use changes are expected in the study corridor. Most undeveloped land within the study corridor is likely to become urban or suburban. Many already developed lands within the study corridor also are likely to be redeveloped to higher-density uses. Expansion of public services and facilities would be associated with future growth. Such growth would be consistent with community plans. The planned Kapolei extension would result in conversion of approximately 20 additional acres of farmland to transportation use, none of which is actively cultivated.

Regarding impacts of already planned growth in West Oahu on the Project and traffic congestion, it is reasonable to expect that this increased population and employment will generate ridership for the rail system and will tend to reduce traffic congestion generally because of the diversion of vehicular trips to transit trips.

The 7.1 million commercial square feet referenced in Section 4.2.2, Background and Methodology, of the Final EIS, is planned space in West Oahu at the time the Final EIS was written. Neither existing commercial space nor the permitted space was calculated at that time. It is reasonable to assume that the amount of existing and permitted space is a small fraction of the planned total.

The Project supports the projected enrollment by providing additional transportation options. It is reasonable to assume that the West Oahu campus of the University of Hawaii (UH) is intended to serve students in West Oahu as it does now with negligible impact on UH Manoa.

Section 4.19.2 in this Final EIS states that UH West Oahu developments are planned for the campus. In addition, there is the potential for residential and commercial development around the campus. When each development is planned, the potential for transit-oriented development (TOD) in this area is likely and discussed further in this section as a possible indirect effect of a nearby transit station. TOD is discussed in Sections 4.2, Land Use and 4.19, Indirect and Cumulative Effects, in this Final EIS.

The UH West Oahu campus, the Kroc Center, and the Hoopili development were all planned, independent of the Project and will proceed without it, per Section 4.19.2 in this Final EIS. The Project will use some agricultural land and will cause some of the agricultural land to be developed especially near stations. However, in the No Build Alternative (i.e., without the Project) the amount of agricultural land likely to be converted to suburban development will be substantially more because of already planned developments and the continued growth pressures on West Oahu.

Planning for the TOD special districts is the responsibility of the City and County of Honolulu, Department of Planning and Permitting, under a process covered by the City's new TOD Ordinance 09-4 and is not part of this Project. TOD is discussed in Sections 4.2, Land Use and 4.19, Indirect and Cumulative Effects, in this Final EIS.

As discussed in Section 4.2.3 of the Final EIS, the only farmlands that will be acquired for the Project are in the Ewa Plain. Because the properties are relatively large, only a small portion of each agricultural parcel will be acquired. Some of the designated lands are not currently in active cultivation. Approximately 80 acres of prime farmland and 8 acres of statewide-importance will be acquired by the Project, of which 70 acres are actively cultivated. This acreage is designated for agriculture by County zoning. All of the affected properties designated as prime, unique, or of statewide importance and/or actively being farmed are owned by individuals, corporations, or agencies that plan to develop them in conformance with the Ewa Development Plan (DPP 2000).

Figures 4-7 and 4-8, Designated Agricultural Lands, in this Final EIS indicates that all of the agricultural land at Aloun Farms that would be displaced by this maintenance and storage facility is prime agricultural land. It should be noted that this is not the preferred location of the maintenance facility. While only one site will be selected, two sites are currently under consideration: a 44-acre vacant site near Leeward Community College, which is the preferred location for the maintenance and storage facility, and a 41-acre area currently in agricultural use (Aloun Farms) adjacent to an electrical substation in Hoopili (shown on Figures 2-38, Leeward Community College Maintenance and Storage Facility Location and Conceptual Layout, and 2-39, Maintenance and Storage Facility in Hoopili Location and Conceptual Layout, in this Final EIS).

Much of the farmland acreage that could be acquired for the Project is located at one of the two alternatives for a maintenance and storage facility. The preferred alternative is a former

Navy fuel storage and delivery facility near Leeward Community College. If it is acquired, agricultural land used for the project will be about 47 acres. The Final EIS identifies the existing land use, and where information is available, planned future use of land that would be affected by the Project.

The agricultural land in question is planned to be developed, independently of the proposed Project. The land is not planned to remain in agriculture and the impacts of loss of agricultural land have been or are being addressed in the entitlement process for the planned development. There are no legal or regulatory requirements to replace agricultural land as there are regarding impacts to wetlands. The Project has been designed in compliance with the Ewa Development Plan.

Aloun Farms has 1,115 acres of prime land and 75 acres of agricultural land of Statewide Importance. Total farm acreage is approximately 1300 acres.

The Aloun Farms property is currently zoned as "AG-1, Restricted Agriculture District."

The term 'significant' as used in Section 4.1.3, Environmental Consequences and Mitigation, of the Draft EIS is in reference to the impact on the property, rather than the significance of Aloun Farms. To clarify the discussion of impact, 'significant' has been replaced by 'substantial' in Section 4.2.3, Environmental Consequences and Mitigation, in this Final EIS to clarify the discussion of impact.

Aloun Farms leases land from D.R. Horton. In the event of relocation, tenants who own buildings, structures, or other improvements to be acquired will be paid fair market value of the real property to be acquired. As discussed in Section 4.4, Acquisitions, Displacements, and Relocations in this Final EIS, compensation will be provided to affected property owners, businesses, or residents in compliance with all applicable Federal and State laws and would follow the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act.

The Project creates little new impervious surface and, therefore, there is minimal new stormwater. As the design moves forward, the expected amounts of stormwater are being calculated. For example, the first portions of the guideway to be constructed will increase stormwater runoff from 0.17- 1.31 cfs (cubic feet per second) per 1,000 feet of guideway according to preliminary calculations. This is for the drier part of the island, but this is where the first construction will occur. In wetter areas, the amount of stormwater runoff will be higher, but as there is little new impervious surface being created by the Project, the amount of additional stormwater will remain small in this areas as well.

The vehicles do not require lubricants like automobiles or buses which would contaminate runoff from the guideway. The pollutants from the guideway track would include brake dust and track flange (soy-based) lubricant. Fugitive dust from wind erosion in undeveloped areas of the Project may also collect on the guideway and be carried in the stormwater. These pollutants will be removed from the stormwater as necessary to meet the required water quality standards. Transit vehicles will have closed passenger windows to help control litter that could generate solid waste.

Appendix C of the Final EIS includes the tax map key number and general land use type for each parcel that will be acquired.

Rezoning and redesignation of land uses are municipal and State government functions and, therefore, not within the purview of this Project. In March 2009, the City Council approved and the Mayor of Honolulu signed Bill 10 (2008) (Ordinance 09-4), which defines the City's approach to TOD around fixed guideway stations. Here, zoning regulations will address parking standards, new density provisions, open space, and affordable housing. While the Project is coordinating with City and State agencies with regard to land use designations near the stations, the actual zoning changes and the timeframe of these changes are beyond the scope of the Project.

While the Project is coordinating with City and State agencies to encourage land use changes near the stations, the actual zoning changes and the timeframe of these changes are beyond the scope of the Project.

It is outside the purview of the EIS to analyze what the future impacts of the Ewa Development Plan may be. This Plan is a product of the City and County of Honolulu's Department of Planning and Permitting and is not a part of this Project.

As stated in Section 4.2.3, Environmental Consequences and Mitigation, of the Final EIS: "Property that would be acquired for the Project represents approximately 1 percent of the total acreage within the study corridor." Compensation will be provided to affected property owners, businesses, or residents in compliance with all applicable Federal and State laws and would follow the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act. Indirect and cumulative effects on land use are discussed in Section 4.19 of the Final EIS. As noted in Section 4.19.2, Indirect Effects, of the Final EIS, the Project "...will influence the distribution of development." At a regional level, the bulk of future land use changes would occur as already expected under the respective development plans.

EIS

Comments on Section 4.3, Acquisitions, Displacement, and Relocation of the Draft

The acquisition of 0.3 acre of land from Honolulu Community College would have no substantial direct or indirect impacts on the College. Seven light posts will be removed and there will be some impacts to a lawn area. The mitigation is to replace light posts. The property use agreement will be negotiated with the University of Hawaii system.

The acquisition of 0.16 acres of land from Waipahu High School would have no substantial direct or indirect impacts on the high school. There would be three temporary buildings that would be relocated to another part of the school's campus. The acquired land will be used as part of the alignment and is not expected to impact classrooms, students, or other school facilities.

The acquisition of 3.94 acres of land from Leeward Community College would have no substantial direct or indirect impacts on the college. The acquired land would be used for a

station and power substation and would not impact surrounding buildings, classrooms, and open space.

The acquisition of 0.16 acre of land from UH Manoa Urban Garden Research Center would have no substantial direct or indirect impacts on the urban garden center. The center would continue to operate as usual. The acquired land, along the perimeter frontage but not on the active part of the urban garden, would be used to widen the Kamehameha Highway and would not impact the garden center.

As described in Section 4.4, Acquisitions, Displacements, and Relocations in this Final EIS, a partial acquisition typically is either a narrow strip of land or a more substantial portion of a large parcel. It is assumed that for the properties that would be partially acquired, existing land uses would not change. In addition, where landscaping, sidewalks, and driveway access would be affected by the Project, coordination would occur with the land owner, and these property features would be replaced and/or the property owner would be compensated.

All of the Projects impacts to the natural and built environment were disclosed including impacts to public lands. The public was invited to review the Draft EIS document and provide written or verbal comments. The Draft EIS was available for public review beginning November 21, 2008 and comment was accepted through February 6, 2009. The community had the opportunity to give testimony at a series of Draft EIS hearings held on December 6, 8, 9, 10, and 11, 2008. A summary of the comments received and responses are included in Section 8.6, Draft EIS Comments, in this Final EIS. All responses to comments are presented in Appendix A of the Final EIS.

Opportunities for public involvement will continue through the design and construction phases of the Project. The City is conducting workshops with communities that will have rail stations. The purpose of the workshops is to engage the public about rail stations and give opportunities to residents and businesses to contribute ideas about the appearance of the station in their area. Ideas generated at the workshops will be incorporated into the station planning and design process. For more information and to get involved in this process, please visit the Project website at www.honolulultransit.org.

Public involvement activities will continue throughout the construction period as described in Section 8.7, Public Involvement during Construction, of the Final EIS.

Acquisitions, displacements, and relocations will be addressed on a case-by-case basis as discussed in Section 4.4 of the Final EIS, and property that would be directly affected by the Project will be purchased at market rates. As stated in Section 4.4.3, Environmental Consequences and Mitigation in this Final EIS "...compensation would be provided to affected property owners, businesses, or residents in compliance with all applicable Federal and State laws and would follow the Federal Uniform Relocation Assistance and Real Property Acquisition Policy Act. Specific mitigation measures are listed in Section 4.4.3 in this Final EIS.

There is no reasonable alternative to avoid impact to the Banana Patch community. An avoidance alternative was evaluated in the Draft EIS to avoid the Solmirin House, which at that time was thought to be a historic property eligible for the National Register of Historic Places (NRHP). Since the release of the Draft EIS the SHPD determined that this property was not

eligible. Based on the analysis in Chapter 5, Section 4(f) Evaluation, of the Draft EIS there is no feasible alternative for the location of the Pearl Highlands Station.

DTS has been coordinating with residents of the Banana Patch community since October 2008. Every household has been visited by DTS staff, Right-of-Way staff, and Engineering staff to discuss the Project, special needs, and relocation assistance.

A special community meeting was held at the Alpha Omega Christian Fellowship Church. Invitations were sent to each Banana Patch community household. At this meeting, a brief presentation was given on the Project and public testimony was recorded by a court reporter. A complete transcript is included in Appendix A, Comments Received on the Draft EIS and Responses in this Final EIS.

DTS will continue to work with individual property owners to provide relocation services. As stated in this Final EIS, in Section 4.4.3, "...to all affected business and residential property owners and tenants without discrimination; and persons, businesses, or organizations that are displaced as part of the Project would be treated fairly and equitably."

The acquisitions for the Project will be finalized during the final design process. The parcels identified in this Final EIS present the anticipated right-of-way needs for the Project.

As stated in Section 4.4, Acquisitions, Displacements, and Relocations, of the Final EIS, the Project would follow procedures outlined in the Uniform Relocation Act and Regulation 49 CFR Part 24 for relocation assistance. Under this plan, a minimum 90-day written notice would be provided before any business or resident would be required to move.

Acquisitions, displacements, and relocations will be addressed on a case-by-case basis as discussed in Section 4.4 of the Final EIS and property that would be directly affected by the Project will be purchased at market rates. As stated in Section 4.4.3, Environmental Consequences and Mitigation [Acquisitions, Displacements, and Relocations], of the Final EIS "...compensation will be provided to affected property owners, businesses, or residents in compliance with all applicable Federal and State laws and would follow the Federal Uniform Relocation Assistance and Real Property Acquisition Policy Act (49 CFR 24)." Specific mitigation measures are listed in this Section of the Final EIS.

Table 4-4, Acquisitions and Displacements Summary, in this Final EIS presents a summary of the acquisitions and displacements associated with the Project.

Comments on Section 4.4, Community Services and Facilities, of the Draft EIS

Community facilities that will be impacted by the Project are listed in Table 4-6, Affected Community Facilities and Services, in this Final EIS. Table 4-6 has been updated since the release of the Draft EIS to reflect additional information for community facilities impacted by the Project. Indirect and Cumulative Effects are discussed in 4.19 in this Final EIS.

A distance of ½ mile is a typical measurement to capture the general community facilities within the Project corridor. The Project study area looked beyond the properties and uses immediately adjacent to the guideway alignment.

In the Draft EIS, 1/2 mile was measured from the centerline of the Project alignment. In the Final EIS, the community facilities within 1/2 mile of the alignment were identified from Geographic Information System data, Internet sources, field verification, and plans to provide an overview of facilities near the Project alignment. The analyst used this information to determine the direct impacts as discussed in Section 4.5, Community Services and Facilities, of the Final EIS.

As stated in Section 4.10.3 of the Final EIS, the Project will cause no severe noise impacts. Moderate impacts will occur at upper floors of a few high-rise buildings (as shown in Table 4-18 in the Final EIS). With the recommended mitigation in place (noise blocking parapet wall, sound absorbing material and wheel skirts), the noise analysis indicates that the new noise generated by the Project will be lower than the existing noise levels in most places.

The project design includes an integrated noise-blocking parapet wall at the edge of the guideway structure that extends three feet above the top of the rail. The parapet wall will substantially reduce ground-level noise.

Wheel skirts will increase the benefit from the parapet wall at locations above the elevation of the track. The use of sound-absorptive materials below the tracks in the areas that will experience moderate noise impacts will reduce the Project noise levels from the upper floors to below the impact level. Once the Project is operating, noise levels will be re-measured to confirm that there are no noise impacts from the Project.

Appendix B of the Draft EIS and Appendix C of the Final EIS illustrate the right-of-way acquisitions of the Project in greater detail. Section 4.19 in this Final EIS discusses the Indirect and Cumulative Effects of the Project.

Appendix B of the Draft EIS and Appendix C of the Final EIS illustrate the right-of-way acquisitions of the Project in greater detail. Section 4.18 of the Draft EIS discussed the indirect and cumulative impacts of the Project. Five of the resources you listed are considered in the Section 4(f) evaluation: Neal S. Blaisdell Park, Walker Park, Aloha Stadium, Keehi Lagoon Beach Park, and (Future) Queen Street Park. The Project impacts on these resources are discussed in more detail in Sections 5.5 and 5.6 in this Final EIS.

The building that houses the Alpha Omega Fellowship Church will be acquired for the Pearl Highlands Park-and-Ride lot.

As stated in 5.4.1 of the Draft EIS with regard to Aloha Stadium, "The operation of the Project would not interfere with the features, attributes, or activities of this property." Therefore, the vendors at the swap meet would not be impaired.

Section 4.4.3 of the Draft EIS states, "Mitigation efforts would involve coordination with individual property owners as necessary to appropriately address effects to community facilities.

In addition, all property would be acquired following the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act and applicable State regulations."

DTS has contacted and met with all affected property owners.

Comments on Section 4.4.3, Environmental Consequences and Mitigation of the Draft EIS

The Draft Section 4(f) Evaluation is presented in the Draft EIS in Chapter 5. The Final EIS presents an expanded discussion in the Final Section 4(f) Evaluation in Chapter 5.

As stated in Section 3.5.7 of the Draft EIS, the Maintenance of Traffic (MOT) Plan will be developed by the contractor for each phase of construction coordinated and subject to approval by Hawaii Department of Transportation and the City. The Project is committed to such a plan; however, the MOT Plan cannot be developed until final design for the Project is completed to account for all facets of the design.

Comments on Section 4.5, Neighborhoods, of the Draft EIS

As discussed in Section 4.5.2 of the Draft EIS, "Neighborhood Board boundaries were used to define neighborhood divisions." Figure 4-13, Corridor Neighborhoods, of the Draft EIS shows the nine neighborhoods and their boundaries relative to the Project corridor.

A Development Permit will be needed from HCDA before construction can begin in Kakaako. Development permits from HCDA have been added to the table, List of Anticipated Permits, Approvals and Agreements, in Section 4.21 of this Final EIS.

The Project life-cycle includes construction, operation, and eventual re-commissioning or de-commissioning of the Project.

Theft from cars in park-and-ride lots is an example of crime to private property.

As discussed in the Final EIS Section 2.5.4 Safety and Security Measures, a project-specific Safety and Security Management Plan has been developed in accordance with FTA requirements to define the safety and security activities and methods for identifying, evaluating, and resolving potential safety hazards and security vulnerabilities of the system. It establishes responsibility and accountability for safety and security during the Preliminary Engineering, Final Design, construction, testing, and start-up phases of the Project. The Honolulu Police Department, the Honolulu Fire Department, the Honolulu Department of Emergency Management, and the Honolulu Emergency Services Department have been involved in preparing and will be part of implementing the plan. The plan addresses public safety and security concerns, including threats and hazards associated with the Project, specific issues that were identified through community outreach efforts, and design and architectural details to enhance safety.

The Project is focused exclusively on the construction and implementation of rail transit service, which is analyzed in the EIS. Planning and zoning around station areas will be

conducted and established by the City's Department of Planning and Permitting under a process covered by the City's new TOD Ordinance 09-4. Planning for the TOD special districts is the responsibility of the City and County of Honolulu, Department of Planning and Permitting, under a process covered by the City's new TOD Ordinance 09-4 and is not part of this Project. TOD is discussed in Sections 4.2, Land Use and 4.19, Indirect and Cumulative Effects, in this Final EIS.

As mentioned in Section 4.19.2, Indirect Effects, in this Final EIS, TOD is expected to occur in Project station areas as an indirect effect of the Project. For expanded discussion on this topic see the sub-section, Station Area Development, in Section 4.19.2 in this Final EIS.

The text you have cited from Section 4.6.2 of the Draft EIS is correct. The Project would not divide or bisect any existing communities.

Comments on Section 4.5.3, Environmental Consequences and Mitigation of the Draft EIS

The guideway and stations would noticeably contrast with smaller size buildings and change the character of some areas. Currently, most of the residential housing is more prevalent within the mauka areas, and commercial and industrial businesses are primarily within makai areas. The Project will not substantially change this development pattern. Since the transit system would be elevated, it will not create a physical barrier to pedestrian or other forms of travel within the study corridor. It also would not pose a barrier to the social network of the community since it would be located within an existing transportation corridor or in the Ewa area, along a planned future transportation system.

The methodology for addressing effects on neighborhoods can be found in the Honolulu High-Capacity Transit Corridor Neighborhoods and Communities Technical Report (DTS 2008d). As discussed in Section 4.6 in this Final EIS, the Project will not substantially affect community character within the surrounding neighborhoods. The increased mobility for neighborhood residents would generally improve the quality of life, especially for those with limited financial resources and those who may be transit dependent.

The community had the opportunity to give testimony at a series of public hearings that took place in December 2008. See response to Comment that begins: "All of the Projects impacts to the natural and built environment were disclosed..." Project information efforts have been ongoing and potential impacts have been disclosed for public comment. While it is true that there will be temporary construction related impacts like you mentioned, the City is drafting specific design criteria to limit potential impacts to residents, businesses, and communities during construction. More information is provided in Section 8.7 Public Involvement during Construction, in this Final EIS.

Sections 4.3, Economic Activity 4.5, Community Services and Facilities, and 4.9, Air Quality, in this Final EIS provide information on these topics along the study corridor.

In Section 4.5.3 of the Draft EIS, it was concluded that there would be no adverse effects to neighborhoods. Therefore, no mitigation is required with respect to impacts on existing communities.

As discussed in Section 8.4 of the Final EIS, the City and County of Honolulu is conducting station workshops with communities that will have rail stations. The purpose of the workshops is to engage the public about rail stations and give opportunities to residents and businesses to contribute ideas about the appearance of the stations in their area. Ideas generated at the workshops will be incorporated into the station planning and design process. For more information and to get involved in this process, please visit the Project website at www.honolulustransit.org.

DTS will oversee community relations activities performed by contractors for the construction of the Project. As part of this program, the contractors will provide construction information to affected communities, including businesses and residents. The information will advise the community of the potential for impacts, measures to minimize those impacts and the construction schedule. The public information program will identify public meetings, construction advisories, newsletters, and other community outreach plans (to be determined by DTS and implemented by the contractors) to effectively communicate the activities of construction.

DTS has developed Design Criteria to address the City and County of Honolulu's requirements for the Project. Guideway column materials and surface textures will be selected in accordance with generally accepted architectural principals to achieve effected integration between the guideway and its surrounding environment. Landscaping and streetscape improvements will serve to mitigate potential visual impacts.

As stated in Section 4.10.3 of the Final EIS, the Project will cause no severe noise impacts. Moderate impacts will occur at upper floors of a few high-rise buildings (as shown in Table 4-18 in the Final EIS). With the recommended mitigation in place (noise-blocking parapet wall, sound absorbing material and wheel skirts), the noise analysis indicates that the new noise generated by the Project will be lower than the existing noise levels in most places.

The project design includes an integrated noise-blocking parapet wall at the edge of the guideway structure that extends three feet above the top of the rail. The parapet wall will substantially reduce ground-level noise.

Wheel skirts will increase the benefit from the parapet wall at locations above the elevation of the track. The use of sound-absorptive materials below the tracks in the areas that will experience moderate noise impacts will reduce the Project noise levels from the upper floors to below the impact level. Once the Project is operating, noise levels will be re-measured to confirm that there are no noise impacts from the Project.

The Honolulu High-Capacity Transit Corridor Noise and Vibration Technical Report (DTS 2008f) includes the methodology for the noise analysis including the types of noise meters used for all measurements and the times of the measurement. The technical report can be obtained from the City and County of Honolulu, Department of Transportation Services. The exact site locations are not relevant to the overall impact analysis because per FTA methodology, all measurements were taken in representative locations that are typical of noise sensitive uses in the vicinity of the measurements. Noise impact criteria at each site along the Project alignment is shown in Figures 4-53 through 4-56 in this Final EIS. Additional analyses

completed following release of the Draft EIS is summarized in Section 4.1, Changes to this Chapter since the Draft Environmental Impact Statement, in this Final EIS.

Construction phase noise effects and mitigation are presented in Section 4.18.5, Noise and Vibration [Construction Phase Effects], in this Final EIS. Measures that may be incorporated where appropriate include:

- Develop a monitoring plan with noise limits.*
- Construct temporary noise barriers or curtains.*
- Equip construction equipment engines with adequate mufflers and intake silencers.*
- Strategically place stationary equipment, such as compressors and generators.*

Regarding temporary effects on parking from construction, as stated in Section 3.5.7 in this Final EIS, where existing parking is disrupted by construction, signs will be posted directing people to nearby locations with available parking. The public will be kept aware of upcoming work locations, and information will be available on the Project website about parking disruptions and alternatives. On-street parking by construction workers will not be permitted near work sites. During the actual hours of work, only those vehicles absolutely necessary for construction activity will be allowed within the safety zone or allowed to stop or park on the shoulder of the roadway with the approval of the City.

Regarding potential spillover parking near stations, as stated in Section 3.4.7, Mitigation of Long-Term Transportation Effects, the approach to mitigating the effects of spillover parking will be unique to each station area. The City will conduct surveys prior to starting construction of a station and again within 6 months after opening of the station to determine the extent of spillover parking near stations and implement one or more mitigation strategies as needed. Strategies to be used include, but are not limited to: parking restrictions (where parking causes safety or congestion problems), parking regulations (meters, time limits), and shared parking arrangements (at locations where parking is available, but dedicated to another purpose such as retail centers, office uses, or places of worship). The specific mitigation strategies and the schedule for implementation will be determined as the stations are opened. Implemented strategies will be monitored, and necessary adjustments will be made as needed.

As indicated in Section 3.4.3 of the Draft EIS, the guideway placements would not affect traffic operations. Also, sidewalks would not be removed as a result of the Project. Sidewalks will continue to meet Americans with Disabilities Act (ADA) standards. As indicated in Chapter 2 of the Draft EIS, bus service would be enhanced with the Build Alternatives and the bus network would be modified to coordinate with the fixed guideway system; therefore, mitigation relating to bus service would not be necessary. In addition, as stated in Section 2.5, The Project: Fixed Guideway Alternative from East Kapolei to Ala Moana Center via the Airport, in this Final EIS, all buildings, facilities, and vehicles will conform to the applicable Federal, State, and County accessibility guidelines and standards. HRS 100-50 requires that all State or County government buildings, facilities, and sites be designed and constructed to the Architectural

Barriers Act/Americans with Disabilities Act Accessibility Guidelines (36 CFR Parts 1190 and 1191).

As indicated in this Final EIS (Section 3.5.7), a Maintenance of Traffic (MOT) Plan and Transit Mitigation Program would identify measures to mitigate temporary construction-related effects on transportation, including bus service. The Plans will be developed by the contractor for each phase and coordinated by and subject to approval by the City or HDOT (HDOT approval would relate to highways only). As stated in this section, pedestrian and bicycle access would be maintained during construction as much as possible while emphasizing safety. A public information program will be initiated to inform transit riders of service changes during construction.

DTS has developed specifications and Design Criteria to address the City and County of Honolulu's requirements for the Project. Guideway materials and surface textures will be selected in accordance with generally accepted architectural principals to achieve effective integration between the guideway and its surrounding environment. Landscaping and streetscape improvements will serve to mitigate potential visual impacts. In addition, the ongoing station area planning process involves the most fundamental aspects of transit system design.

The City and County of Honolulu is conducting workshops with communities that will have rail stations. The purpose of the workshops is to engage the public about rail stations and give opportunities to residents to contribute ideas about the appearance of the station in their area. Ideas generated at the workshops will be incorporated into the station planning and design process. For more information and to get involved in this process, please visit the Project website at www.honolulutransit.org.

Comments on Section 4.6, Environmental Justice of the Draft EIS

As described in this Final EIS, the Airport Alternative has been selected as the preferred alternative and is considered the Project. As a result, the Salt Lake Apartments will not be affected as they are not adjacent to the Project. The impacts sustained to the Goodwill located near Hekaha Street on Kamehameha Highway are limited to partial strip takes to the property adjacent to Kamehameha Highway. The impacts to other Goodwill locations are not foreseen as other locations are not adjacent to the Project. The Institute for Human Services is on a parcel that is not directly adjacent to the Project and it will not be impacted. However, the adjacent parcel mauka has a partial strip take on Dillingham Boulevard. The Puuwai Momi and Puuwai Momi Complex Teen Center are on the same parcel and a partial strip take is planned for that property adjacent to Kamehameha Highway. Right-of-Way professionals have been working with property owners regarding impacts to property and that will be ongoing throughout design and construction of the Project.

DTS will oversee community relations activities performed by contractors for the construction of the Project. As part of this program, the contractors will provide construction information to affected communities, including businesses and residents. The information will advise the community of the potential for impacts, measures to minimize those impacts, and the construction schedule. The public information program will identify public meetings, construction

advisories, newsletters, and other community outreach plans (to be determined by DTS and implemented by the contractors) to effectively communicate the activities of construction.

No other communities with Environmental Justice populations have been identified by community outreach efforts.

Because of the racial and ethnic diversity, the OahuMPO developed a method to define OahuMPO Environmental Justice Areas that would be more meaningful than the demographics of the island. OahuMPO Environmental Justice Areas are defined as areas where the minority or low-income population concentration was meaningfully greater than the surrounding population.

This method of identification was agreed upon by the City and County of Honolulu's Department of Transportation Services and Department of Planning and Permitting, the State of Hawaii Department of Transportation, the FTA, and the U.S. Environmental Protection Agency.

There will not be any disproportionately high and adverse effects to resources of special importance to environmental justice populations within OahuMPO areas to which the list refers from Section 4.6.3, Environmental Consequences of the Draft EIS. Environmental Justice populations have been engaged through the Project's public outreach efforts, described in Section 8.5 of the Draft EIS. Additional discussion is presented in Section 4.7, Environmental Justice, in this Final EIS.

Section 4.7. of the Final EIS discussed the potential effects on Environmental Justice populations and states, "Because the Project would be constructed primarily within an existing transportation corridor in developed areas, it would not divide or bisect communities beyond existing conditions or the No Build Alternative. Therefore, there would be no adverse effect on community cohesion in OahuMPO Environmental Justice Areas."

No matter what the density of an individual household is, the City will continue to work with individual property owners to provide relocation services if property is to be purchased for the Project. As stated in the Draft in Section 4.3.3, "...to all affected business and residential property owners and tenants without discrimination; and persons, businesses, or organizations that are displaced as part of the Project would be treated fairly and equitably."

Those from whom property is to be acquired will be treated according to the requirements of the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act. It provides for purchase at fair market value and includes relocation assistance to those affected. The Uniform Relocation Act provides that those in need of relocation must be placed in comparable quarters.

Section 4.6.5, Banana Patch Community, of the Draft EIS describes that DTS has coordinated with this community. Updates on this continued coordination are presented in Section 4.7.5, Banana Patch Community, in this Final EIS.

Section 4.7.4, Public Outreach in this Final EIS describes the public outreach to environmental justice populations. "...particular attention has been paid to identifying and reaching low-income and minority populations that are traditionally underserved and

underrepresented in the public involvement process. This is in accordance with Executive Order 12898 (USEO 1994) and OahuMPO regulations. Materials have been prepared in the major languages of Oahu, and translators have been available upon request at meetings. Information has been distributed through cultural organizations, ethnic associations, housing associations, community development groups and similar organizations."

Public involvement outreach with Environmental Justice populations will continue through design and construction.

The Draft EIS Section 4.6.6 states, "The Project would not result in disproportionately high and adverse impacts within OahuMPO EJ Areas...The Project has and will continue to actively solicit input regarding Project alternatives and design." The Final EIS Section 4.7.3 has been revised to say, "Public involvement efforts to work with environmental justice populations, the elderly, and communities of concern will continue throughout the design and construction of the Project."

Indirect and cumulative impacts are discussed in Section 4.19 in this Final EIS.

There will be no public housing displaced due to the Project in Waipahu or any other neighborhood. Section 8 housing can include private homes or apartments; however, the specifics of Section 8 properties is confidential. The City will work with the occupants of all properties that need to be acquired for the Project. Those from whom property is to be acquired will be treated according to the requirements of the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act. It provides for purchase at fair market value and includes relocation assistance to those affected. The Uniform Relocation Act provides that those in need of relocation must be placed in comparable quarters; this includes people living in a rented house or apartment who will be displaced because that property is being purchased for the Project.

Where relocations would occur, compensation would be provided to affected property owners in compliance with all applicable Federal and State laws and would follow the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act. Those from whom property is to be acquired will be treated according to the requirements of the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act. It provides for purchase at fair market value and includes relocation assistance to those affected. The Uniform Relocation Act provides that those in need of relocation must be placed in comparable quarters. The City would assist all affected persons in locating suitable replacement housing within an individual's financial means.

Comments on Section 4.6.4, Public Outreach of the Draft EIS

"Important Project notifications" including information about scoping meetings and public hearings were placed into ethnic and cultural newspapers islandwide. In addition, translated materials were translated into the 11 major languages (other than English) spoken on the island. Project factsheets have been translated as well. Translated materials have been placed within affected communities and Project representatives have been working with ethnic and cultural communities throughout the process. As the Project continues, representatives will

continue informing and educating affected communities about the Project and will use translated materials as appropriate.

Materials provided on the website and handed out at public meetings have not all been translated into languages other than English. However, the Project team will translate materials as needed and as requested. Project factsheets have been translated into the 10 most common languages spoken (other than English) and can be found on the Project's website.

Project representatives have been engaging members of OahuMPO Environmental Justice populations throughout the Project's process through the Project's Speakers Bureau and through contact with Project representatives. We have not received any comments in a language other than English.

Coordination with OahuMPO Environmental Justice populations has been ongoing throughout the Project. The Final EIS in Section 4.7.4 has been revised to clarify our outreach to these communities. Further information is provided in Chapter 8 of the Final EIS.

Comments on Section 4.7, Visual and Aesthetic Conditions of the Draft EIS

The assessment of visual effect due to the Project as described in Section 4.8.3 of the Final EIS considers changes to the visual landscape and viewer responses to those changes. This includes the existing development along the Project alignment. Within the Project corridor the environment changes from rural at the Wai'anae end of the corridor to dense high-rise development at the Koko Head end.

As part of the design process, the City has developed design principles, which are identified in the Honolulu High-Capacity Transit Corridor Project Compendium of Design Criteria (DTS 2009m) that will be implemented in final design to minimize visual effects of the Project. For example, guideway materials and surface textures will be selected in accordance with generally accepted architectural principles to achieve effective integration between the guideway and its surrounding environment. Landscape and streetscape improvements will mitigate potential visual impacts, primarily for street-level views.

Other measures to address visual impacts of the Project are being developed through the station design and planning process. The initial station area plans and design guidelines were first developed with coordination between DTS and the Department of Planning and Permitting (DPP). The next level of transit station design focuses on integrating individual neighborhood characteristics of the communities served by the stations.

The policy documents that identify significant views and vistas include the Ewa Development Plan (DPP 2002), Central Oahu Sustainable Communities Plan (DPP 2002), and Primary Urban Center Development Plan. These documents are referenced through the visual analysis in Section 4.7 of the Draft EIS. The visual effects on Honolulu's Downtown, including the Dillingham Transportation Building are discussed under the Kalihi to Ala Moana Center Landscape Unit heading starting in Section 4.7.3 of the Draft EIS. In addition, please refer to Section 4.15 of the Draft EIS for a discussion of the historic resources qualities of this building and Chapter 5 (Section 4(f) Evaluation) for further discussions of the Project's visual effects.

The Project's visual effects along Dillingham Boulevard are discussed in under the Kalihi to Ala Moana Center Landscape Unit heading starting in Section 4.8.3, Environmental Consequences and Mitigation [Visual and Aesthetic Conditions], in this Final EIS.

The following mitigation framework will be included in the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

- Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
- Coordinate the project design with City TOD planning and DPP.*
- Consult with the communities surrounding each station for input on station design elements.*
- Consider specific sites for landscaping and trees during the final design phase when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will serve to mitigate potential visual impacts.*

Section 4.8.3 of the Final EIS, Design Principles and Mitigation includes information related to the mitigation framework described above. Specifically architecture and landscape design criteria include guidelines regarding site design, materials and finishes, and lighting, which apply to stations, station areas, and the guideway.

The visual effects of the Chinatown Station are discussed under the Kalihi to Ala Moana Center Landscape Unit heading starting in Section 4.7.3 of the Draft EIS. The discussion notes the station and guideway would be the dominant features in views along the Nimitz Highway and that distant views over the Nuuanu Stream and Honolulu Harbor would be partially blocked. The overall objectives and design guidelines for the Chinatown District will be addressed during the ongoing station areas planning process. This process involves fundamental aspects of transit system design with focus on characteristics and preferences of the communities adjacent to stations. Coordination with SHPD has included the Chinatown District.

The comment refers to the description in Section 4.7.3 under the Kalihi to Ala Moana Center Landscape Unit heading of the Draft EIS, which describes effects along Halekauwila Street. The discussion mentions that overall visual effects in this area would be high. Although exterior lighting would be shielded, blocked views from some fourth- and fifth-story windows and increased levels of light and glare would be considered unavoidable adverse impacts. The EIS also acknowledges that the Project would reduce the open character of the streetscape along the Nimitz Highway, which already presents a physical and visual barrier between Downtown and the waterfront.

Your comment on visual and property value effects is noted.

The guideway would be constructed about 40 feet above the Halawa Bridge, changing the character of its visual setting. This change would be substantial as stated in Section 4.8.3, Environmental Consequences and Mitigation, in this Final EIS.

Comments on Section 4.9, Noise and Vibrations of the Draft EIS

As stated in Section 4.10.3 of the Final EIS, the Project will cause no severe noise impacts. Moderate impacts will occur at upper floors of a few high-rise buildings (as shown in Table 4-18 in the Final EIS). With the recommended mitigation in place (noise-blocking parapet wall, sound absorbing material and wheel skirts), the noise analysis indicates that the new noise generated by the Project will be lower than the existing noise levels in most places.

The project design includes an integrated noise-blocking parapet wall at the edge of the guideway structure that extends three feet above the top of the rail. The parapet wall will substantially reduce ground-level noise.

Wheel skirts will increase the benefit from the parapet wall at locations above the elevation of the track. The use of sound-absorptive materials below the tracks in the areas that will experience moderate noise impacts will reduce the Project noise levels from the upper floors to below the impact level. Once the Project is operating, noise levels will be re-measured to confirm that there are no noise impacts from the Project.

Cumulative impacts related to noise were addressed in Section 4.18 of the Draft EIS.

Section 4.8 discusses in detail visual and aesthetic analysis. Section 4.3 discusses Economic Activity including has property value discussion.

Comments on Section 4.12, Ecosystems of the Draft EIS

Correct. Black-crowned night herons are one of several protected waterbirds that nest in Hawaii. This has been corrected in Section 4.13.3, Environmental Consequences and Mitigation, in this Final EIS.

Hawaii's waterbirds and migratory birds have adapted to multi-lane elevated freeways with thousands of automobiles, buses, tractor trailers, traveling at random intervals, at a rate that is 10 to 20 mph faster than the single track train, see Section 4.13.3, Environmental Consequences and Mitigation, in this Final EIS.

As Hawaii's waterbirds and migratory birds have adapted in the past as discussed above, it is therefore reasonable to state that the birds would adapt over time to a fixed rail train that travels at a slower rate of speed (50 mph).

The statement that there would be a constant stream of lights 20 hours a day is incorrect since lights would not be required for daylight periods which in Hawaii can be as long as 10 to 12 hours. As in the previous response, waterbirds and migratory birds would adapt to the night-time transit, similarly as they have to the lights on the elevated portions of the H-1 Freeway [cite]. The Honolulu High-Capacity Transit Corridor Ecosystem and Natural Resources Technical

Report (DTS 2008j) provides that shielding of exterior lighting will be part of the Project to minimize visual effects and impacts to wildlife as indicated in Section 4.8.3, Environmental Consequences and Mitigation, in this Final EIS.

Sections of the guideway that may be built above existing structures in the area may interfere with flights of Newell's shearwater. These seabirds could be disoriented by lights and fly into such structures." Newell's shearwater is discussed in Section 4.13, Ecosystems, in this Final EIS.

Hawaii's waterbirds and shorebirds are highly adaptable and will adjust to noise and construction activity that does not directly occur within the wetlands. If there is some disturbance caused by this activity, it will be temporary. Waterbirds and shorebirds are discussed in Section 4.13, Ecosystems, and Section 4.18.8, Natural Resources, in this Final EIS.

The effects of construction and operation of the rail system on water and migratory birds are adequately analyzed in the Honolulu High-Capacity Transit Corridor Ecosystem and Natural Resources Technical Report (DTS 2008j) and summarized in this Final EIS. The Project will not have any impact on water and migratory birds because wetlands will remain intact and such birds will adjust to the new structures. This is expected because the waterbirds have continued to occupy the wetlands after construction of nearby buildings and overhead utilities, and the construction of widening of adjacent roads and highways.

As discussed in Section 4.12.2 of the Draft EIS, endangered birds are found in streams and wetlands along the alignment. These birds would adapt to the rail structure and trains as they have other urban construction. Wetland sites for nesting, rearing young, resting, and foraging will not be affected by the Project.

Hawaii's waterbird populations are highly adaptable to an urbanized environment. What is critical to their survival is the preservation of wetlands that are necessary for nesting, rearing young, resting, and foraging. The Project will not impact wetlands adjacent to the Project.

As long as wetland habitat that provides all the components necessary for a waterbird species survival is preserved, urbanization, per se, will not cause the species' population collapse.

There are limited foraging sites for black crowned night herons where the alignment crosses Moanalua Stream because the embankments are overgrown with mangrove and the water is too deep for the herons to wade in order to forage. Through a study completed since the Draft EIS, it was determined that the bridge will be positioned above this deep water where the birds are not likely to go. As stated in Section 4.13.3, Environmental Consequences and Mitigation, in this Final EIS, the Project will not result in the taking of any protected migratory waterbirds (i.e., the black-crowned night heron and their known nesting areas are remote from the study corridor.)

Comments on Section 4.13, Water of the Draft EIS

The Kalauao and Waiau Spring sources are located mauka (to the north) and upslope of the Project. The distance from the construction areas is approximately 4 miles from Waiau Spring and 1.4 miles from Kalauao Spring. Thus, the short-term construction activities are not expected to affect either spring source.

There should be no impacts to operations at Sumida Watercress Farms. Ingress and egress to the farm will be maintained throughout construction. Construction-related mitigation measures for maintaining water quality are discussed in Section 4.17.7 of the Draft EIS. The shadowing will not affect water quality or watercress cultivation at the farm. The Kamehameha Highway is oriented approximately southeast-northwest and the sun tracks through the sky rising in the east and setting in the west. If any shadows are created on the farm by the Project, they would be in the late afternoon when the sun is beginning to set and the shadowing would be transitory.

There will be no in-water work in Waikele or Waimalu Streams, see Section 4.14.3, Environmental Consequences and Mitigation [Water], in this Final EIS.

The current design does not include placing piers in Waikele and Waimalu Streams. This has been clarified in the text in Section 4.14.3, Environmental Consequences and Mitigation, in this Final EIS.

Fish passage will be maintained during construction.

There will be no in-water work in Waikele or Waimalu Streams; therefore, passage will not be impeded, as stated in Section 4.14.3, Environmental Consequences and Mitigation, in this Final EIS.

Puohala Marsh is approximately 0.25 mile from the railway alignment and will not be affected by the rail structure.

Additional stream delineation work has been conducted since the Draft EIS was released. The locations of all potential and temporary stream diversions are identified in Section 4.14, Water, in this Final EIS.

Preliminary wetland evaluations were made at the Draft EIS stage and no potential impacts were identified. Pier locations, pier spacing, and other design considerations were not known when the Draft EIS was produced. There are no affects to wetlands from the Project. The Project will affect four stream crossings that will require work below the ordinary high water mark as described in Section 4.14.3, Environmental Consequences and Mitigation, in this Final EIS.

The stream was evaluated. Studies generally covered 200 feet in each direction where the alignment crossed the stream.

The guideway is in the median of Kamehameha Highway approximately 100 feet from the farm. As a result of the Project, there would be no effect on water and migratory birds that forage and inhabit the farm, as it is already a noisy urban corridor with tall buildings. Noise impacts to locations along the alignment are presented on Project mapping in Section 4.10, Noise and Vibration, in this Final EIS.

The Honolulu High-Capacity Transit Corridor Project Noise and Vibration Technical Report (DTS 2008f) includes the methodology for the noise analysis including the types of noise meters used for all measurements and the times of the measurement. The technical report can be obtained from the City and County of Honolulu, Department of Transportation Services. The exact site locations are not relevant to the overall impact analysis because per FTA methodology, all measurements were taken in representative locations that are typical of noise sensitive uses in the vicinity of the measurements. This location does not qualify as noise sensitive. Noise impact criteria at each site along the Project alignment is shown in Section 4.10, Noise and Vibration, in this Final EIS.

An unutilized spring-fed wetland refers to a spring-fed wetland not being used for farming or other agricultural or industrial pursuits. The shadowing will not affect water quality or growing at the farm. The highway is oriented approximately east-west and the sun tracks through the sky rising in the east and setting in the west. The shadows created on the farm by the guideway would be in the very early morning and late afternoon when the sun is low in the sky. Any temperature or growing changes would be extremely minimal and localized. Cumulative effects on wetlands are discussed in Section 4.18.3 in the Draft EIS (and Section 4.19.3 in this Final EIS).

An unutilized spring-fed wetland refers to a spring-fed wetland not being used for farming or other agricultural or industrial pursuits. The shadowing should not affect water quality or growing at the farm. The highway is oriented approximately east-west and the sun tracks through the sky rising in the east and setting in the west. The shadows created on the farm by the guideway would be in the very early morning and late afternoon when the sun is low in the sky. Any temperature or growing changes would be extremely minimal and localized. Cumulative effects on wetlands are discussed in section 4.18.3 in the Draft EIS (and Section 4.19.3 in this Final EIS).

During construction, there will be temporary disturbance at the construction location. Over the long-term, the foraging area at the subject location will not be reduced. Currently, along Moanalua Stream, there are limited foraging sites for black-crowned night herons because the embankments are overgrown with mangrove and the water is too deep to wade in order to forage.

The habitats in the footprint of the Project have been identified in the Draft EIS in Section 4.13, Ecosystems. A portion of the Project's right-of-way includes undeveloped land that could be used for the construction and operation of a maintenance and storage facility. Two site options for this facility are being considered. Agricultural sites and farmland, including the Hoopili maintenance and storage facility site, support a broader diversity of wildlife than urban sites. The preferred alternative site near Leeward Community College lacks the diversity of agriculture sites and farmlands with its dense stands of Guinea grass.

Within much of the corridor, the Project follows existing rights-of-way. The sites where the alignment isn't following existing roadways are in Ewa, and no wetlands are in the vicinity of the alignment in that area.

Here, the construction will be in the median of the highway, not in the wetland located nearby. Further, such construction impacts are temporary, not permanent. Birds in this area have adapted to the surrounding urbanized environment.

The data regarding which streams will need piers was not available for the Draft EIS because this document was based on conceptual design. During the early design phase, we assumed that numerous streams might need to have piers placed in them and the piers would be approximately 150 feet apart. The design will continue into the next phase of project development. As the environmental analysis has been ongoing since the Draft EIS, many design refinements were made to avoid and minimize impacts to streams. Streams affected by structural elements of the Project that will have permanent impacts to Waters of the U.S. are located in a table (of the same name) and discussed in detail in Section 4.14.3. Effects during construction are discussed in Section 4.18, Permits, needed for this in-water work are included in Section 4.21, Anticipated Permits, Approvals, and Agreements, in this Final EIS.

Construction in the Ala Wai Canal, if necessary, would be a part of future extensions and, therefore, is not evaluated as part of this Project (East Kapolei to Ala Moana Center).

Responses to comments on the direct, indirect, and cumulative analysis have been reflected in the additional information included in this Final EIS or clarified in the response to the specific comment made by various commenters. Substantive changes made between the Draft EIS and Final EIS are summarized at the beginning of each chapter in this Final EIS in order to provide a better understanding of the issues of concern. In addition, Chapter 8.1, Public and Community Outreach, in this Final EIS also summarize changes made in this Final EIS and include additional information and explanation on various common topics of concern.

As discussed in previous replies, the shadowing should not affect watercress growth at the farm. The shadows created on the farm by the guideway would be in the very early morning and late afternoon when the sun is low in the sky. Puhala Marsh is approximately 0.25 mile from the railway alignment and will not be affected by the rail structure. Hawaii's waterbirds and shorebirds are highly adaptable and will adjust to noise and construction activity that does not directly occur within the wetlands. If there is some disturbance caused by this activity, it will be temporary. For these reasons, no mitigation is required.

The exact depth of penetration cannot be determined until the structural requirements for the guideway have been met for the subsurface conditions at each site. The impacts on the basalt aquifer have been considered in the Groundwater Impact Assessment completed for the Environmental Protection Agency (EPA), Honolulu High-Capacity Transit Corridor Water Resources Technical Report (DTS 2008k) available at City and County of Honolulu DTS. The EPA has concurred that the Project should have no significant impacts on groundwater, either during long-term operation of the system or during its construction. The EPA's letter of concurrence is available in Appendix F, Record of Agency Correspondence and Coordination, in this Final EIS. Section 4.18.3, Water Resources, Groundwater, describes the construction

impacts and best management practices associated with the different methods for drilling the foundations for the Project.

Little new impervious surface is being created by the Project, and therefore, it is unlikely that there will be much new stormwater runoff. As described in Section 4.14.3, Environmental Consequences [Water], in this Final EIS:

Permanent best management practices (BMPs) will be installed as part of the Project to address stormwater quality before the water is discharged to streams or existing storm drain systems. The BMPs will promote a natural, low-maintenance, sustainable approach to managing and increasing stormwater quality.

Permanent BMPs, such as bioretention areas, vegetated buffer strips, dry swales, water quality basin, and structural BMPs with oil/water separators will be considered, as needed, during the park-and-ride site and the maintenance and storage facility design process. Selection of permanent BMPs will be site-specific and may be modified as a result of geotechnical data collection during final design.

Stormwater runoff will be redirected back to recharge ground water in the water table aquifer so there would be no net loss. Any shafts penetrating the basalt aquifer will be resealed with concrete. Please refer to the Groundwater Impact Assessment included with the Honolulu High-Capacity Transit Corridor Water Resources Technical Report (DTS 2008k) for the more detailed analysis.

Unlike automobiles or buses, the Project vehicles do not require lubricants, which are often the source of contaminate runoff.

The Honolulu High-Capacity Transit Corridor Hazardous Materials Technical Report (DTS 2008i) contains additional information on likely pre-existing contamination in the study corridor. In addition, Section 4.12, Hazardous Waste and Material, in this Final EIS summarizes the findings of this Report.

The foundations of the Project have the potential to impact one or both of the groundwater systems on Oahu. Most of the foundations and drilled shafts will be in contact with the water table aquifer which is generally non-potable and used for irrigation water or industrial uses. This is the groundwater referred to when the depth of 10 feet below ground surface is referenced in the Draft EIS.

Analysis has been completed on the effects on to the Southern Oahu Basal Aquifer, designated as a Sole Source Aquifer by the Environmental Protection Agency. In order for a federally-funded project to be built above a designated Sole Source Aquifer, a Ground Water Impact Assessment must be prepared to meet the coordination requirements of Section 1424(e) of the Safe Drinking Water Act. After evaluating the Ground Water Impact Assessment completed for the Project, the EPA has concurred that the Project will have no significant impacts on groundwater, either during long-term operation of the system or during its construction.

Dewatering during construction is discussed in Section 4.18.8, Natural Resources [Construction Phase Effects]. If dewatering is necessary, an NPDES dewatering permit will be required, and each individual site will be permitted pursuant to applicable NPDES requirements. At all sites where dewatering is necessary, the work will be employed to keep as little water from entering the excavation. Disposing of the water can prove difficult and with the potential subsidence issues, as discussed in Section 4.18.10, thus, the amount of water removed from the ground will be kept to a minimum. Dewatering is not expected to have any effect on the aquifers. Anticipated permits, including potential permits for construction dewatering, are included in Section 4.21, Anticipated Permits, Approvals and Agreements and Approvals, in this Final EIS.

In order for a federally-funded project to be built above a designated Sole Source Aquifer, a Ground Water Impact Assessment must be prepared to meet the coordination requirements of Section 1424(e) of the Safe Drinking Water Act. After evaluating the Ground Water Impact Assessment completed for the Project, the EPA has concurred that the Project should have no significant impacts on groundwater, either during long-term operation of the system or during its construction. The vast majority of the drilled shafts will not penetrate the aquifer and those that do will penetrate less than 20 feet. There may be instances where the shafts need to go deeper to reach durable bedrock due to the variability of lava flow composition and strength necessary to support the pier column foundations. The shafts will be quickly filled with concrete to seal the route for contaminants to enter the aquifer. The Ground Water Impact Assessment is available for review by the public as part of the Honolulu High-Capacity Transit Corridor Water Resources Technical Report (DTS 2008k).

Comments on Hawaii Revised Statutes Chapter 6E.

Under Hawaii Administrative Rules (HAR) Chapter 13-275, which you cite in your comment letter, "interested persons" are participants in the historic preservation review process. Under HAR § 13-275-3, SHPD sends its written comments "to any interested persons who have expressed concerns with the project by that point in the process." Interested persons' comments must be submitted in writing to the SHPD. Interested persons are required to contact the SHPD to obtain copies of notices, or to find locations of documents, should they wish to review them. Under these provisions, the burden is on interested parties to communicate with SHPD regarding the State's historic preservation review process. The SHPD, not the City, has the authority under these rules to convey "interested person" status.

Section 4.16 of the Final EIS provides the regulatory context that governs archaeological, cultural, and historic resources and identifies the historic properties eligible for the National Register of Historic Places. The City will comply with Federal and State archaeological, cultural, and historic preservation laws and regulations. There are 33 adverse effects on historic properties. A Programmatic Agreement was prepared in coordination with the State Historic Preservation Officer (through the SHPD) and the Section 106 consulting parties to outline measures to minimize and mitigate Project effects on these resources.

Comments on Section 4(f) De Minimis Use of Ke'ehi Lagoon Beach Park.

Following the public comment period on the Draft EIS, FTA subsequently determined that the use of Ke'ehi Lagoon Beach Park, along with the City's commitment to measures to minimize harm and mitigation of impacts as discussed in Section 5.5.1 of the Final EIS, will have a de minimis impact to the park. The City Department of Parks and Recreation (DPR), the agency with jurisdiction over this property, has been informed of FTA's intent to make a de minimis impact finding. DPR concurs that after mitigation, the Project will not adversely affect the activities, features, or attributes that make the property eligible for Section 4(f) protection.

All of the recreational features, attributes, and activities of the park, other than the four lighted mauka tennis courts, are located makai and away from the Project. The Project will traverse the park near its mauka property line, generally following the alignment of the park's access road until it leaves the park, where it continues on an elevated guideway within the right-of-way of Nimitz Highway. In the park, the Project guideway will be approximately 30 feet wide, between 30 to 35 feet high, and will be elevated above approximately 1 acre of land within the park, primarily in the parking lot and the park access road. Within the park, the guideway will be constructed on approximately 10 columns that will be about 6 feet in diameter, which will result in the use of approximately 280 square feet of park land for the placement of columns.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Dear Ms. Hawkins:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final

Ms. Emily Hawkins
Page 2

EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Subject: Comments to Honolulu High-Capacity Transit Corridor Project, Draft Environmental Impact Statement/Section 4(f) Evaluation

General comments

UH route is critical. Students are poor, rent around the University is extravagant. Many students work extra jobs to pay for their car (or high rent around UH). As a former Teaching Assistant at the University, it was very obvious that many of the students did not take the necessary time to study at home, possibly in part due to the requirements for working extra time to pay high transportation/rent costs.

A well-lit bicycle hub with showers and theft-deterrents was described as part of the UH Campus Master Bike Plan (2003). Although this plan has not been implemented due to lack of funding, coordination between the city and UH can capitalize on existing schemes to build of a joint bicycle hub at the potential rail transit station planned for UH.

Specific Comments

Page 2-20, "Operation Parameters". I wholeheartedly agree that bikes should be allowed on the trains. Bikes can extend the sphere of ridership by providing crucial options for users to get to and from transit stations. For instance, bicycles can be used to get an individual from home to a transit station, and once at the station, the individual would have the option of parking the bike at the transit station (if the bike is not required post transit ride) or bringing the bike onto the train (if the bike is to be used post transit ride). Concerns with safety can be alleviated by only allowing bikes on designated cars or in designated sections of cars.

Page 2-24, Column 1, 1st paragraph, lines 3-4. I wholeheartedly agree that bike parking should be provided at every transit stop. Bike parking should be well-lit, secure, and preferably covered from the rain. One of the biggest impediments to bike usage in Honolulu is the high bicycle theft rate. I would recommend installing safety/security personnel at the transit stops, and include in their duty bicycle theft protection.

Page 3-23, Table 3-13 and related text. I would venture that this is a minimum projected benefit, since it doesn't take into account rising gas prices, which will undoubtedly occur again when the global economy picks up.

Page 3-34, Table 3-18 and related text. Was any survey conducted to estimate the importance of bikes as a mode of transportation to access transit stations? And what would be the maximum distance at which an average transit rider would be willing to access stations via walking or via biking? In other words, a non-transit dependent person may be more willing to ride transit if a station can be accessed within 5 minutes of his/her house and also his/her destination. The sphere of accessibility within 5 minutes using a bicycle is much larger than that for walking. I would anticipate seeing hidden benefits not unveiled in this EIS if bicycle ridership is highly encouraged.

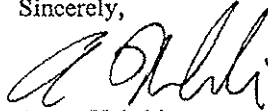

Page 3-43, Table 3-24 and related text regarding removal of bicycle lane on Salt Lake Blvd and replacing with shared use lane. The bicycle community has varied opinions on the relative utility of bike lanes vs. shared use lanes. Less experienced/comfortable riders find that bike lanes provide them more confidence and sense of security, and are more willing to use the facility than a shared use lane. More experienced riders are comfortable with either type of facility.

Page 3-43, Table 3-24 and related text. Was any engineering scheme explored whereby the elevated portions of the guideway could have a bike path system travelling underneath it? The city/state should take advantage of any opportunity to increase the miles of bicycle travel facilities.

Page 3-48 and 3-50, section 3.5.5. I appreciate your efforts to mitigate for construction-related effects on pedestrians and bicycles.

Please direct any questions to my address above.

Sincerely,

Aaron Hebshi

Dear Dr. Hebshi:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 C.F.R. § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal:

General Comments

Your comments regarding an extension to the University of Hawaii at Manoa and also comments regarding bicycles have been noted. As detailed in Section 1.1.2 of the Draft EIS, and as approved by the City Council with Resolution 07-039, the Project extends from East Kapolei to Ala Moana Center. The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The proposed future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are

discussed in the cumulative impacts sections of Chapters 3 and 4 of this Final EIS. The future extensions are not part of this Project, thus they are not required to be evaluated under Chapter 343 of the Hawai'i Revised Statutes and the National Environmental Policy Act (NEPA). Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in this Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time. UH Manoa will be connected by enhanced bus service until the future extension is built. The Project would coordinate with the University of Hawaii regarding future extensions.

Specific Comments

Page 2-20: Bicycles will also be allowed on trains, as regulated by a bicycle policy. This policy will be determined at a later time prior to the opening of the fixed guideway system.

Page 2-24: Bicycle racks will be available at each transit rail station. There will also be security at stations and in the areas around stations.

Page 3-23: Your comment is noted. The mode shares shown in Table 3-13 are islandwide. Mode share changes will be different in the corridor and during peak travel periods. As shown in Figure 3-11 in the Final EIS, transit mode share will be much higher during the a.m. two-hour peak period with the Project compared to No Build conditions.

Page 3-34: No studies related to your question have been undertaken. However, the usual thresholds for walking to rail transit stations like the ones proposed for Honolulu is ½ mile in distance or 10 minutes in time. For bicycles, the distance thresholds would be longer.

Page 3-43: The Airport Alternative has been selected for the Project instead of the Salt Lake Alternative. As a result, the bicycle lanes along Salt Lake Boulevard will not be affected by the Project.

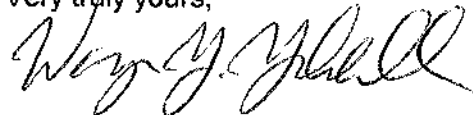

Regarding your other question on Page 3-43, the guideway generally runs along a median in the center of roadways such as Dillingham Boulevard, Kamehameha Highway or Farrington Highway. Where a median does not already exist, the Project will create a median just wide enough to accommodate the guideway columns by relocating travel lanes slightly. There is generally insufficient room beneath the guideway for a continuous bikeway at street level. Also, the guideway structure itself is designed to minimize visual impact and overall cost by being as short and compact as possible. As a result, there are no plans to provide a bike path within the structure of the guideway.

Page 3-48 and 3-50: Your appreciation of our mitigation efforts has been noted.

Dr. Aaron Hebshi
Page 3
February 16, 2010

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Issuance of the Record of Decision under NEPA and acceptance of the Final EIS by the Governor of the State of Hawaii are the next anticipated actions and will conclude the environmental review process for this Project.

Very truly yours,

TO Director Yoshioka, Ted Matley, Governor Lingle, and Members of the City Council

RE Opposition to Honolulu Rail Project Due to Challenges Unresolved by EIS

This communication is submitted in response to the EIS and offers commentary on the adverse effects the proposed rail system will have on Oahu and particularly downtown Honolulu and the City's shoreline.

There are so many factors that deserve comment, factors that justify returning to the drawing board and advancing a traffic plan that can succeed rather than one that is doomed to fail. I have gone to countless public meetings and hearings on this project. I have studied the impacts of rail and the relative advantages/disadvantages to cost of these various cities. I am not impressed that we can justify the extensive negatives and high costs by any benefits that might result for a small portion of the population who would ride the train. I am a social science researcher with a Ph.D. and am a faculty member and the leader of planning in a local university. My investigation into this problem, the proposed solution, and the inadequacy of the draft EIS make me conclude that this is still a project that should not be carried forward. We should, at the very least, get more answers than we have now -- before any further steps are taken. I will cite 3 concerns as major problem areas not resolved by the EIS.

1. Deception, Misinformation and Misuse of Taxpayer Funds Create Adverse Economic and Social Consequences – One set of severe adverse consequence of this doomed project is the loss of public trust in government, the questionable investment in the front-loading of publicity for the project, and the long term economic losses we will experience when the project goes into overruns of time and resources. A large portion of the public has lost faith in the ability of the government to engage in an objective analysis of a problem and solution. We have seen way too much money spent on the initial consultation. We have seen our tax money spent on biased and nasty advertising and public relations. And we have seen a commitment carried forward even now in a time of recession, as if there was no economic crisis in our land and we should still seek *the most expensive transit system for the shortest distance and the smallest number of people*.

The EIS has not properly addressed the social and economic impacts of the proposal and project to date, nor does it explain why this huge report came out only 4 days before the election and the vote that supposedly showed "support" for the project. People have been frightened into thinking there are no choices and they had *inadequate time to consult the draft EIS to form their own opinions*.

2. Creation of a True "Blight" on the Oahu Landscape and Shoreline Viewplanes Without an Equivalently Powerful Public Benefit – There has been little consideration given to the disastrous effect of this proposed project on the viewplanes of Oahu and the especially adverse effects on the Downtown to Ala Moana areas and the shoreline views. The EIS does not properly address this in the sense of defining advantages that would outweigh the drastic disadvantages. Add to that the lack of answers to many questions about details of the project. For example, how do we assess the impact at Ala Moana Center if we don't have elevations and instead of hearsay and stories. We are told that even if it is ten stories the 100 feet will be at the top not the bottom, so not to worry. I was told this by a city official at a public hearing.

RECEIVED
09 FEB 6 PM
DIRECTOR OF
DEPT. OF
TRANSPORTATION

Letter re Honolulu Transit EIS -- From Nancy Hedlund, Honolulu

This is merely an example. There are countless unanswered questions about claims for benefits, costs, impacts on existing transportation (The Bus) and so on. The EIS has not resolved questions about false claims, such as presenting statistics claiming benefit but still falling far short of the problem. There is inadequate exploration of the arguments that have emphasized advantages and positives without explaining the larger negatives within which only relative small benefits may be created --- at massive costs to a State now in very serious decline economically. *No one would urge an average person whose income was reduced by the recession to go ahead anyway and buy an expensive yacht because it might offer an alternative way to travel from Ewa to Pier 1!*

3. Unresolved Questions about the Proposed Technology – Given the inadequacy, deceptive communications, and unanswered questions about the choice of fixed rail, it is hard to believe that the rail advocates are continuing to press forward. Many alternatives were essentially dismissed, even though they were listed to give the (false) appearance that they were given serious consideration. The EIS does not resolve the many questions that many citizens still raise about the need for elevated rail, for steel on steel, and equipment not made in the US. Add to that the problems with construction here in Hawai'i and lack of people experienced in the methods to be used. In the meantime, ground-level alternatives that would have the advantage of being "on the ground" have not been given sufficient attention and consideration.

In summary, the EIS fails to answer many important questions, fails to sufficiently well address the adverse social and economic impacts on Hawai'i and fails to provide a basis for resolving the enormously adverse effects on the "look" of Hawai'i and the view planes of so many who live here every day and will have to look at those dreadful elevated tracks and cars moving right through a person's attempt to look out at the horizon as they did in years past. No more horizon. No more skyline.

This is a deeply disappointing and disturbing move by a few people who have been exposed as intending to benefit certain businesses and developers. Shame shame on the government officials who have advanced a plan that so clearly means disadvantages that vastly outweigh very small supposed gains.

Respectfully Submitted,

Nancy Hedlund, Ph.D.

Dear Ms. Hedlund:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your comments will be answered in the same manner as submitted.

1. *Guidelines set forth by NEPA, and Chapter 343 of the Hawaii Revised Statutes stipulate that public involvement be carried out on large-scale projects such as the rail project. As one of the largest infrastructure projects ever to be constructed on Oahu, the City believed that it was important to disseminate information to as many people as possible. Thus, a broad range of print and visual media was employed to reach multiple population segments. Project funds paid for the public involvement activities listed in Chapter 8 of the Final EIS.*

As discussed in Chapter 7 of the Final EIS, the cost-effectiveness analysis considers whether the Project's benefit will justify its capital and operating costs. Cost-effectiveness is one of the key criteria that FTA uses to evaluate projects proposed for Section 5309 New Starts funding. The cost-effectiveness indices for the Project are within the "medium" range established by FTA for its New Starts ratings which, along with other considerations, is currently required to qualify for New Starts funding.

The primary sources of capital for the Project are the General Excise and Use Tax (GET) surcharge revenues. These sources will fund more than 70 percent of the cost of the Project. The remainder of project funding will be from Federal transit sources, primarily from the Section 5309 New Starts program, supplemented as necessary by formula Section 5307 funds.

The fixed guideway system is designed to serve major destinations in the most heavily travelled corridor on Oahu, plus the area with the greatest expected growth. In 2000, 63 percent of Oahu's population and 80 percent of its jobs were located within the study corridor. By 2030, these distributions will increase to 69 percent of the population and 83 percent of the employment.

Social and economic impacts of the Project are discussed in Chapter 4 of the Final EIS. The NEPA process, including publication of the Draft EIS, was started in 2007. When in the summer of 2008, the City Council decided to place the measure on the ballot, the schedule for the Draft EIS had been long established. Various design, agency coordination, and approval steps were required prior to publication of the Draft EIS. For this project, the normal distribution schedule was accelerated by FTA and the City to ensure availability of the information prior to the general election.

2. *The assessment of visual effect due to the Project as described in Section 4.8.3 of the Final EIS considers changes to the visual landscape and viewer responses to those changes. This includes the existing development along the Project alignment. Within the Project corridor the environment changes from rural at the Wai'anae end of the corridor to dense high-rise development at the Koko Head end.*

As part of the design process, the City has developed design principles, which are identified in the Honolulu High-Capacity Transit Corridor Project Compendium of Design Criteria (RTD 2009m) that will be implemented in final design to minimize visual effects of the Project. For example, guideway materials and surface textures will be selected in accordance with generally accepted architectural principles to achieve effective integration between the guideway and its surrounding environment. Landscape and streetscape improvements will mitigate potential visual impacts, primarily for street-level views.

Other measures to address visual impacts of the Project are being developed through the station design and planning process. The initial station area plans and design guidelines were first developed with coordination between DTS and the Department of Planning and Permitting (DPP). The next level of transit station design focuses on integrating individual neighborhood characteristics of the communities served by the

stations.

The following mitigation framework will be included in the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

- *Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
- *Coordinate the project design with City TOD planning and DPP.*
- *Consult with the communities surrounding each station for input on station design elements.*
- *Consider specific sites for landscaping and trees during the final design phase when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will serve to mitigate potential visual impacts.*

Section 4.8.3 of the Final EIS, Design Principles and Mitigation includes information related to the mitigation framework described above. Specifically architecture and landscape design criteria include guidelines regarding site design, materials and finishes, and lighting, which apply to stations, station areas, and the guideway.

The Ala Moana Center Station, at the end of the project, will be located at about the 40-foot level just Koko Head of Kona Iki Street. The station and the guideway will be between Ala Moana Center and mid- to high-rise buildings and will not substantially change the view from adjacent offices and residences.

3. *The Alternatives Analysis phase evaluated a range of transit mode and general alignment alternatives in terms of their costs, benefits, and impacts. An initial screening process considered alternatives identified through previous transit studies, a field review of the study corridor, an analysis of current population and employment data for the study corridor, a literature review of technology modes, work completed for the Oahu Regional Transportation Plan 2030 (ORTP) prepared by the Oahu Metropolitan Planning Organization (OahuMPO) (OahuMPO 2007), and public and agency comments received during the formal Alternatives Analysis scoping process.*

During the fall of 2005 and winter of 2006, the City and County of Honolulu completed the alternatives screening process that is documented in the Honolulu High-Capacity Transit Corridor Project Alternatives Screening Memorandum (DTS 2006a). Scoping meetings were held, which included a presentation of alternatives to the public and interested agencies and officials to receive comments on the Purpose and Need, alternatives, and scope of the analysis for the Alternatives Analysis. Refinements were made to the alternatives. In total, 75 fixed guideway alignment options were screened.

The following alternatives were studied in the Alternatives Analysis: No Build Alternative, Transportation System Management (TSM) Alternative, Managed Lane Alternative, and the Fixed Guideway Alternative. After review of the Alternatives Analysis Report and consideration of public comments, the City Council selected a fixed guideway transit system extending from Kapolei to UH Manoa with a connection to Waikiki as the

Locally Preferred Alternative. The selection, which eliminated the TSM and Managed Lane Alternatives, became Ordinance 07-001 on January 6, 2007.

The Purpose and Need of the Project is discussed in Sections 1.7 and 1.8 of the Final EIS. The purpose of the Project is to provide high-capacity rapid transit in the highly congested east-west transportation corridor between Kapolei and UH Manoa, as specified in the ORTP. The Project is intended to provide faster, more reliable public transportation service in the study corridor than can be achieved with buses operating in congested mixed-flow traffic, to provide reliable mobility in areas of the study corridor where people of limited income and an aging population live, and to serve rapidly developing areas of the study corridor. The Project also will provide additional transit capacity, an alternative to private automobile travel, and improve transit links within the study corridor.

As stated in Section 2.2.3 of this Final EIS, the NEPA Notice of Intent requested input on five transit technologies. A technical review process included the opportunity for public comment and was used in parallel with the alternatives analysis to select a transit technology. The process included a broad request for information that was publicized to the transit industry. Transit vehicle manufacturers submitted 12 responses covering all of the technologies listed in the Notice of Intent. An independent five-member technology panel composed of four transit experts and a transportation academic appointed by the City Council evaluated guided rubber-tire-on-concrete systems (e.g., Phileas bus system and VAL-type systems), monorail (which is a variation on rubber-tyred technology), steel-wheel-on-steel-rail systems, (e.g., light rail and rapid rail), and magnetic levitation (MAGLEV). The panel considered the performance, cost, and reliability of the proposed technologies.

Proprietary technologies, meaning those technologies that would have required all future purchases of vehicles or equipment to be from a single manufacturer, were eliminated because none of the proprietary technologies offered substantial proven performance, cost, and reliability benefits compared to steel wheel operating on steel rail.

The panel accepted public comment twice as part of its review. By a four-to-one vote, the panel chose a steel wheel vehicle operating on steel rail system because it was considered safe, reliable, economical, and non-proprietary. Those results are documented in the panel's report to the City Council dated February 22, 2008 entitled "Independent Technology Selection Panel Report".

Construction activities for the majority of the transit system are similar to roadway and building construction. Appendix E of the Final EIS details construction methods that are widely used for both rail transit and elevated highway construction and were employed on the H-3 Freeway. Experienced labor is locally available. A limited number of specialists will be needed to work with locally available labor in certain areas, such as transit power and signaling specialists working with local electricians to install system equipment.

The Alternatives Screening Memorandum (DTS 2006a) recognized the visually sensitive areas in Kakaako and Downtown Honolulu, including the Chinatown, Hawaii Capital, and Thomas Square/Honolulu Academy of Arts Special District. To minimize impacts on historic resources, visual aesthetics, and surface traffic, the screening process considered 15 combinations of tunnel, at-grade, or elevated alignments between Iwilei and Ward Avenue. Five different alignments through Downtown Honolulu were advanced for further analysis in the Alternatives Analysis, including an at-grade portion along Hotel Street, a tunnel under King Street, and elevated guideways along Nimitz Highway and Queen Street (Figure 2-4).

The Alternatives Analysis Report (DTS 2006b) evaluated the alignment alternatives based on transportation and overall benefits, environmental and social impacts, and cost considerations. The report found that an at-grade alignment along Hotel Street would require the acquisition of more parcels and could potentially affect more burial sites than any of the other alternatives considered. The alignment with at-grade operation Downtown and a tunnel under King Street, was not selected because of the environmental effects, such as impacts to cultural resources, reduction of street capacity, and property acquisition requirements of the at-grade and tunnel sections, which would cost an additional \$300 million.

The Project's purpose is "to provide high-capacity rapid transit" in the congested east-west travel corridor (see Section 1.7 of the Final EIS). The need for the Project includes improving corridor transit mobility and reliability. The at-grade alignment would not meet the Project's Purpose and Need because it could not satisfy the mobility and reliability objectives of the Project (see bullets below). Some of the technical considerations associated with an at-grade versus elevated alignment through Downtown Honolulu include the following:

- **System Capacity, Speed, and Reliability**—*The short, 200-foot (or less) blocks in Downtown Honolulu would permanently limit the system to two-car trains to prevent stopped trains from blocking vehicular traffic on cross-streets. Under ideal operational circumstances, the capacity of an at-grade system could reach 4,000 passengers per hour per direction, assuming optimistic five minute headways. Based on travel forecasts, the Project should support approximately 8,000 passengers in the peak hour by 2030. Moreover, the Project can be readily expanded to carry over 25,000 in each direction by reducing the interval between trains (headway) to 90 seconds during the peak period. To reach a comparable system capacity, speed, and reliability, an at-grade alignment would require a fenced, segregated right-of-way that would eliminate all obstacles to the train's passage, such as vehicular, pedestrian, or bicycle crossings. Even with transit signal priority, the at-grade speeds would be slower and less reliable than an elevated guideway. An at-grade system would travel at slower speeds due to the shorter blocks, tight and short radius curves in places within the constrained and congested Downtown street network, the need to obey traffic regulations (e.g., traffic signals), and potential conflicts with other at-grade activity, including cars, bicyclists, and pedestrians. These effects mean longer travel times and far less reliability than a fully grade-separated system. None of these factors affects an*

elevated rail system. The elevated rail can travel at its own speed any time of the day regardless of weather, traffic, or the need to let cross traffic proceed at intersections.

- **Mixed-Traffic Conflicts**— *The Project will run at three minute headways. However, three-minute headways with an at-grade system would prevent effective coordination of traffic signals in the delicately balanced signal network in downtown Honolulu. A disruption of traffic signal cycle coordination every three minutes would severely affect traffic flow and capacity of cross-streets. Furthermore, there would be no option to increase the capacity of the at-grade rail system by reducing the headway to 90 seconds, which would only exacerbate the signalization problem. An at-grade system would require removal of two or more existing traffic lanes on affected streets. This effect is significant and would exacerbate congestion. Congestion would not be isolated to the streets that cross the at-grade alignment but, instead, would spread throughout Downtown. The Final EIS shows that the Project's impact on traffic will be isolated and minimal with the elevated rail, and, in fact will reduce system-wide traffic delay by 18 percent compared to the No Build Alternative (Table 3-14 in the Final EIS). The elevated guideway will require no removal of existing through travel lanes, while providing a reliable travel alternative. When traffic slows, or even stops due to congestion or incidents, the elevated rail transit will continue to operate without delay or interruption.*

An at-grade light rail system with continuous tracks in-street would create major impediments to turning movements, many of which would have to be closed to eliminate a crash hazard. Even where turning movements are designed to be accommodated, at-grade systems experience potential collision problems. In addition, mixing at-grade fixed guideway vehicles with cars, bicyclists, and pedestrians presents a much higher potential for conflicts compared to grade-separated conditions. Where pedestrian and automobiles cross the tracks in the street network, particularly in areas of high activity (e.g., station areas or intersections), there is a risk of collisions involving trains that does not exist with an elevated system. There is evidence of crashes between trains and cars and trains and pedestrians on other at-grade systems throughout the country (e.g., Phoenix, Houston, LA). This potential would be high in the Chinatown and Downtown neighborhoods, where the number of pedestrians is high and the aging population presents a particular risk.

- **Construction Impacts**—*Constructing an at-grade rail system could have more effects than an elevated system in a number of ways. The wider and continuous footprint of an at-grade rail system compared to an elevated rail system (which touches the ground only at discrete column foundations, power substations, and station accessways) increases the potential of utility conflicts and impacts to sensitive cultural resources. In addition, the extra roadway lanes utilized by an at-grade system would result in increased congestion or require that additional businesses or homes be taken to widen the roadway through Downtown. Additionally, the duration of short-term construction impacts to the community and*

Ms. Nancy Hedlund
Page 7

environment with an at-grade system would be considerably greater than with an elevated system. Because of differing construction techniques, more lanes would need to be continuously closed for at-grade construction and the closures would last longer than with elevated construction. This would result in a greater disruption to business and residential access, prolonged exposure to construction noise, and traffic impacts.

Because it is not feasible for an at-grade system through Downtown to move passengers rapidly and reliably without significant detrimental effects on other transportation system elements (e.g., the highway and pedestrian systems, safety, reliability, etc.), an at-grade system would have a negative system-wide impact that would reduce ridership throughout the system. The at-grade system would not meet the Project's Purpose and Need and, therefore, does not require further analysis.

As discussed previously, the island's unique visual character and scenic beauty were considered in the visual and aesthetic analysis presented in Section 4.8 of the Final EIS. Social and economic impacts are discussed in Chapter 4 of the Final EIS.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

RE: IN SUPPORT OF DRAFT EIS
HONOLULU HIGH-CAPACITY CORRIDOR PROJECT
Public Hearings: December 9th – 11th, 2009

Dear Department of Transportation Services:

For the record my name is Buzz Hong, the Executive Director for the Hawaii Building & Construction Trades Council, AFL-CIO. Our Council is comprised of 16-construction unions and a membership of 26,000 statewide.

The Council supports the Draft EIS for the Honolulu High-Capacity Corridor Project, which as part of an integrated mass transit system, is an investment in Oahu's future – growing our economy, protecting our environment, strengthening our communities, and providing reliable and affordable transportation for generations to come.

Thank you for the consideration of our request.

Sincerely,

William "Buzz" Hong

Dear Mr. Hong:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 C.F.R. § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses comments regarding the above-referenced submittal:

Your preference for a Fixed Guideway Transit Alternative has been noted. While each of the alternatives includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana Center has been selected as the Preferred Alternative. The identification of the Airport Alternative as the Preferred Alternative was made by the City to comply with FTA's NEPA regulations that state that the Final EIS should focus on the Preferred Alternative (23 C.F.R. § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative, public input on the Draft EIS, and City Council Resolution 08-261 identifying the

Mr. Buzz Hong
Page 2
February 16, 2010

Airport Alternative as the Project. The selection of the Airport Alternative is described in Chapter 2 of this Final EIS. The discussion of the alternatives considered is included in Chapter 2 of this Final EIS and the Alternatives Analysis.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Issuance of the Record of Decision under NEPA and acceptance of the Final EIS by the Governor of the State of Hawaii are the next anticipated actions and will conclude the environmental review process for this Project.

Very truly yours,

Dear Mr. Higashide:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

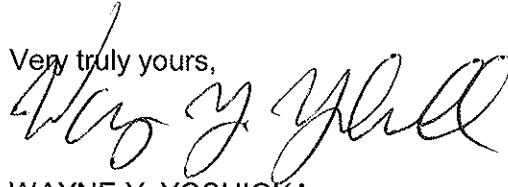

Much of the California earthquake repair work was completed under emergency provisions and exempt from the standard project development process. The Project on Oahu is regulated by both State and Federal laws that govern its development.

As discussed in the Final EIS Section 2.5.4 Safety and Security Measures, a project-specific Safety and Security Management Plan has been developed in accordance with FTA requirements to define the safety and security activities and methods for identifying, evaluating, and resolving potential safety hazards and security vulnerabilities of the system. It establishes responsibility and accountability for safety and security during the Preliminary Engineering, Final Design, construction, testing, and start-up phases of the Project. The Honolulu Police Department, the Honolulu Fire Department, the Honolulu Department of Emergency Management, and the Honolulu Emergency Services Department have been involved in

Mr. Roy Higashide
Page 2

preparing and will be part of implementing the plan. The plan addresses public safety and security concerns, including threats and hazards associated with the Project, specific issues that were identified through community outreach efforts, and design and architectural details to enhance safety.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Honolulu High-Capacity Transit Corridor Project

Welcome to the Honolulu High-Capacity Transit Corridor Project's Public Hearing for the Draft Environmental Impact Statement/Section 4(f) Evaluation.

This public meeting and hearing has been designed to inform the public about the transit project, explain materials contained in the Draft EIS, answer questions from the public, and collect public input on project issues related to the Draft EIS, Section 106 of the National Historic Preservation Act, Section 4(f) of the U.S. Department of Transportation Act, and floodplains affected by the project.

Please review the project information and ask project staff any questions about the project that you might have. The Draft EIS is available on the project website at www.honolulustransit.org.

You may provide official comments in several ways. Here at this Public Hearing you may provide oral comments to a court reporter who will record them for the record or use this form to provide written comments. After the meeting, you may provide an on-line comment at www.honolulustransit.org or use this form to send a written comment to the Department of Transportation Services. All comments must be postmarked or received by January 7, 2009 in order for them to be included in the Final EIS.

Dear Ms. Hinton:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

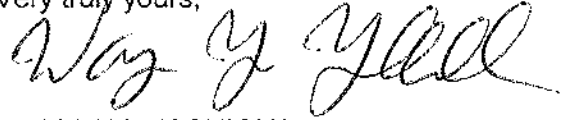

Your opposition to the station located on Halekauwila Street is noted. A broad range of alignments through Downtown and Kakaako were evaluated in the Alternatives Analysis. Physical limitations prevent the use of many streets, such as the Federal Building blocking Pohukaina Street. Other streets, such as King Street, are farther from where people live and want to travel to, resulting in fewer users of the system. While there will be adverse effects from the Halekauwila Street alignment, overall they are less than would be experienced with other possible alignments.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this

Ms. Lennette Hinton

Mr. Wayne Yoshioka, Director
Department of Transportation Services
City and County of Honolulu
650 South King Street
Honolulu, Hawaii 96813

**RE: Honolulu High-Capacity Transit Corridor Project,
Review of Draft Environmental Impact Statement (EIS)/Section 4(f) evaluation**

Dear Mr. Yoshioka:

Thank you for referring the above-mentioned project to Historic Hawaii Foundation (HHF) for review and comment under the National Environmental Policy Act (NEPA) and Section 4(f) of the Department of Transportation Act, 49 USC §303. HHF previously reviewed and provided comments on the Historic Resources Technical Report (September 15, 2008) as a consulting party to the review process under Section 106 of the National Historic Preservation Act (NHPA), pursuant to 36 CFS §800.2.(c)(5) and 800.3(f)(3).

HHF also notes that the Department of Transportation Services has provided notice that it intends to use the process and documentation prepared under NEPA in order to comply with its NHPA Section 106 obligations. HHF shares the concerns raised by the National Trust for Historic Preservation in its letter of Oct. 3, 2008 about combining the two processes. We look forward to the response from the federal agencies and Advisory Council on Historic Preservation to address the propriety of this proposal and the circumstances under which it would be appropriate.

The proposed Honolulu Transit Corridor project will have a dramatic impact on the landscape of the island of O'ahu; this includes not only the direct impact to specific parcels, but primarily the visual effect on the landscape and historic resources. HHF is concerned that the Draft EIS does not accurately take into account these larger impacts, but rather focuses on those adverse effects caused by the direct taking of land.

As indicated in 36 CFR 800.16(i), effect means "alteration to the characteristics of a historic property qualifying it for inclusion in or eligibility for the National Register." The following activities constitute an adverse effect: physical destruction of or damage to all or part of the resource; alteration of a resource, including restoration, rehabilitation, repair, maintenance, stabilization, hazardous material remediation, and provision of handicapped access, that is not consistent with the Secretary of Interior's standards for the treatment of historic properties; removal of the resource from its historic location; change of the character of the resources' use or of physical features within the setting that contribute to its historic significance; introduction of visual, atmospheric, or audible elements that diminish the integrity of the property's significant historic feature; or neglect of a property that causes its deterioration, except where such neglect and

680 Iwilei Road, Suite 690 / Honolulu, Hawaii 96817 / Tel (808) 523-2900 / Fax (808) 523-0800
Email preservation@historichawaii.org / Web www.historichawaii.org

HISTORIC HAWAII FOUNDATION

deterioration are recognized qualities of a property of religious and cultural significance (emphasis added).

Table 4-32 of the draft EIS lists properties preliminarily determined eligible for listing on the National Register of Historic Places. Of these, only seven individual structures were determined to be adversely effected by the proposed project. This assessment is unacceptable, as in a large number of cases the "introduction of visual, atmospheric, or audible elements that diminish the integrity of the property's significant historic features" will occur. It is crucial that these impacts are recognized and properly mitigated.

For many of those properties for which it was determined that there will be "no effect" or "no adverse effect," Table 4-32 indicates the description of the effect as "no property acquisition." This determination is in error. The mere fact that either no property acquisition or only a minor acquisition occurs does not mean that there is "no effect" or "no adverse effect." The dramatic visual change and impact to view sheds caused by the presence of the guideway and rail stations does in fact constitute an adverse effect.

It is vital that direct, indirect and cumulative impacts to districts, bridges, view planes, and individual structures as a result of the presence of the guideway and rail stations are acknowledged and properly identified as adverse effects. Table 4-10 acknowledges that visual impacts exist; it needs to be further acknowledged that, where historic resources are present, these impacts likely constitute an adverse effect.

HHF also has serious concerns regarding the evaluation of Pearl Harbor as historic resource. Page 4-59 discusses visually sensitive resources. The paragraph discussing landmarks should differentiate designated National Historic Landmarks (NHL)—which are of extreme importance to our nation's history—from visual landmarks such as parks and open space. The draft EIS does not do so, thus downplaying the significance of the Pearl Harbor NHL. The sentence of greatest concern reads, "Pearl Harbor is considered a historical landmark because of the part it played in the island's history." This is an egregious understatement regarding Pearl Harbor, the bombing of which brought the United States into World War II. It has great significance both to the Nation and to the world for its extreme importance that reaches far beyond its history at a state level. The fact that Pearl Harbor is a designated NHL of great importance to the nation should be clearly stated in the draft EIS.

The visual effects to each area that the transit line will pass through are evaluated in Table 4-10. For the Pearl Harbor segment, the Draft EIS indicates that the visual impact will be moderate, but states that "the guideway would dominate the linear view corridor above the highway. However, Kamehameha Highway is a major transportation corridor and visual effects would not be substantial." While Kamehameha Highway is a substantial roadway, its impact is nowhere near that of a 60-foot high guideway. Thus, the impact to historic view planes and the character of the National Historic Landmark (NHL) will be high.

We have additional concerns about the assessment of some of the other visual impacts of the project, especially in the Chinatown areas, where in some cases the impact is only listed as moderate. For the view from Maunakea Street looking ma kai, for example, the draft EIS indicates that the

680 Iwilei Road, Suite 690 / Honolulu, Hawaii 96817 / Tel (808) 523-2900 / Fax (808) 523-0800
Email preservation@historichawaii.org / Web www.historichawaii.org

HISTORIC HAWAII FOUNDATION

existing visual quality is high and that the impact would be moderate, even though the assessment of the impact reads: "the guideway and columns would be prominent features in the ma kai views of Honolulu Harbor, partially blocking views of the sky." The EIS should acknowledge the high level of impact, especially given the fact that Chinatown is both listed on the National Register of Historic Places and is designated by the City and County of Honolulu as a Special Design District.

The Honolulu special design district guidelines indicate that there are certain view planes from Chinatown to Honolulu Harbor that are significant and should be preserved. One of the objectives of the district is "to retain ma kai view corridors as a means of retaining the historic link between Chinatown and the harbor." In addition to the visual impact that the transit line will have on the district, it will also impact this historic visual link. For both of these reasons, the project constitutes an adverse effect on the Chinatown District.

In regards to former Naval Air Station Barber's Point, previous documentation in the Historic Resources Technical Report indicated that resources at this site were determined eligible for listing on the National Register. However, these resources have not been included in Table 4-32 listing the historic properties within the Area of Potential Effect (APE). HHF deferred to the State Historic Preservation Division (SHPD) on determinations of eligibility. Please provide an explanation for the changed circumstances that led to a different determination of eligibility for these resources.

The State Historic Preservation Division's letter of September 26, 2008 stated that additional consideration should be given to resources at former Marine Corps Air Station 'Ewa Field. This was not done in this draft EIS. Five sites at Pearl Harbor were recently designated by President Bush as part of the Valor in the Pacific National Monument. Though not officially part of the monument, Barber's Point (Kalaeloa), which was also attacked on December 7, 1941, was one of twelve sites nationwide that received official recognition for its importance of telling the story of World War II in the Pacific. Given its extreme importance and proximity to the transit line, it should be further evaluated.

In previous correspondence, HHF suggested potential measures to mitigate impacts to historic resources from this undertaking. A commitment to providing the mitigation measures, including timelines and responsible parties, needs to be complete as part of the final EIS and made part of the Record of Decision, in addition to any Section 106 documentation.

Since 1974, Historic Hawaii Foundation has been a statewide leader for historic preservation. A non-profit, membership-based organization, HHF's mission is to preserve and encourage the preservation of Hawaii's historic buildings, sites, objects and communities.

Thank you for the opportunity to comment. We look forward to the opportunity to discuss the proposed project, the impacts to historic resources and appropriate mitigation efforts.

Very truly yours,

Kiersten Faulkner, AICP

Dear Ms. Faulkner:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal:

The City appreciates the continued interest and participation of the Historic Hawaii Foundation throughout the Section 106 process, including previous input to the eligibility and effects determinations and consultation throughout the development of the Section 106 Programmatic Agreement. The Programmatic Agreement is included as Appendix H to the Final EIS. Previous comments by the Historic Hawaii Foundation and other consulting parties regarding combining Section 106 with the NEPA process as permitted in 36 CFR Chapter 800.8(c) were considered and addressed at the time. No party provided a substantive reason why the project should not be merged. Per the notification to the State Historic Preservation Division of the use of 36 CFR Chapter 800.8(c), comments received on the Draft EIS were also considered as comments on the Section 106 process. This is an accepted process to provide

better integration of historic preservation and environmental policy review and reduce redundancy of public involvement activities.

Based on concerns raised by Section 106 consulting parties, including Historic Hawaii Foundation, preliminary effects determinations as shown in the Draft EIS were reevaluated as part of intensive-level assessments and documented in the Honolulu High-Capacity Transit Corridor Project Historic Effects Report (April 2009) issued by FTA on April 14, 2009. Both direct and indirect effects to historic properties were reconsidered in this report. These include, as appropriate under effects criteria, the visual effects on historic properties and landscapes. Following consultation, which included participation of Historic Hawaii Foundation, the State Historic Preservation Division (SHPD) concurred with all 22 adverse effect determinations and also provided comment that project impacts be considered as adverse effect to 11 additional resources. The Project accepted these recommendations. These determinations of effect are documented in Section 4.16 and Appendix H of the Final EIS. Chinatown and U.S. Naval Base, Pearl Harbor National Historic Landmark are among the resources to receive an adverse effect determination. The Historic Effects Report is available on the project website (www.honolulutransit.org) and from the Department of Transportation Services.

Table 4-32 in the Draft EIS corresponds with Table 4-34, Historic Properties within Project's Area of Potential Effect, in the Final EIS. In the Final EIS, this table presents the determination of effect and a brief description of the effect. The determination of effect was made with consideration of input from the consulting parties and concurrence by SHPD. More detailed descriptions of the properties and the effects determination is presented in the Honolulu High-Capacity Transit Corridor Project Historic Effects Report (April 2009).

After a collaborative re-evaluation of historic properties and potential impacts presented in the Draft EIS, consulting parties, including historic, Native Hawaiian and federal interests participated in 11 meetings as part of the development of the Programmatic Agreement that describes measures taken to avoid, minimize, and mitigate historic properties. Historic Hawaii Foundation was involved in the development of this agreement. The Programmatic Agreement is included in Appendix H, and a summary of these measures has been included in Section 4.16.3 in this Final EIS.

As currently conceived, the Project will not extend to Ewa Field or Barber's Point, therefore those sites do not require further analysis. In the case that a future extension would be located within proximity to these historic resources, a full evaluation would be completed at that time.

The final Project alignment, as configured in the Final EIS has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. Potential future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS. However, the future extensions are not part of this Project; thus, they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in the Final EIS. It would be premature to undertake an

environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are eventually proposed for implementation, full environmental analysis and appropriate alternatives will be undertaken at that time. The potential future Kapolei Extension, including areas Ewa of the proposed East Kapolei Station, Marine Corps Air Station Ewa Field, and Naval Air Station Barbers Point, is not part of this Project. Therefore, no further analysis of the Kapolei Extension will be conducted at this time. If the Kapolei Extension is considered and studied in the future, potential project impacts to historic resources identified in this area will be addressed at that time.

The island's unique visual character and scenic beauty was considered in the visual and aesthetic analysis presented in the Final EIS. The Project is intended to protect the overall visual character and scenic beauty of Oahu in the longer term by enabling future development to be more densely concentrated in existing urbanized areas and on land adjacent to urbanized areas, rather than replicating auto-centric sprawl that plagues many Mainland communities.

The Project will be set in an urban context where visual change is expected and differences in scales of structures are typical. In addition, viewers in upper stories of some buildings would be affected by light and glare from trains traveling on the guideway.

The overall objectives and design guidelines for the neighborhoods with planned stations will be addressed during the ongoing station areas planning process. This process involves numerous aspects of transit system design with focus on characteristics and preferences of the communities adjacent to stations. In addition, the Final makes the commitment that the following measures will be included with the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that the Project creates:

- Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
- Coordinate the project design with the City transit-oriented development program within the Department of Planning and Permitting.*
- Consult with the communities surrounding each station for input on station design elements.*
- Consider specific sites for landscaping and trees during the final design phase when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will serve to mitigate potential visual impacts.*

The policy documents that identify significant views and vistas include the Ewa Development Plan (DPP 2002), Central Oahu Sustainable Communities Plan (DPP 2002), and Primary Urban Center Development Plan. These documents are referenced in the visual analysis in Section 4.8 of the Final EIS. The visual effects on Honolulu's Downtown, including the Dillingham Transportation Building are discussed under the Kalihi to Ala Moana Center

Ms. Kiersten Faulkner
Page 4

Landscape Unit heading starting in Section 4.8.3 of the Final EIS. In addition, please refer to Section 4.16 of the Final EIS for a discussion of the historic resources qualities of this building.

In addition to the information about visual effects in Section 4.8 of the Final EIS, the Historic Effects Reports discusses effects by resource in greater detail.

Pearl Harbor National Historic Landmark

As referenced above, the Pearl Harbor National Historic Landmark is among resources to receive an adverse effect determination. The Historic Effects Report is available on the project website (www.honolulutransit.org) and from the Department of Transportation Services.

The Pearl Harbor National Historic Landmark is discussed in Section 4.8.3 and in Section 4.16.3. The Final EIS documents the SHPD's opinion that the Project would have an adverse effect to the landmark.

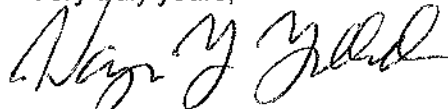

The assessment of the visual effect (in Section 4.8.3 of the Final EIS) notes that the existing viewshed includes transportation infrastructure, namely the Kamehameha Highway.

Chinatown Station

The visual effects of the Chinatown Station are discussed under the Kalihi to Ala Moana Center Landscape Unit heading starting in Section 4.8.3 in this Final EIS. The discussion notes the station and guideway will be the dominant features in views along the Nimitz Highway and that distant views over the Nuuanu Stream and Honolulu Harbor will be partially blocked. The overall objectives and design for the Chinatown District will be addressed during the ongoing station areas planning process. This process involves numerous aspects of transit system design with focus on characteristics and preferences of the communities adjacent to stations. Coordination with SHPD has included the Chinatown District. Following consultation, SHPD concurred with the effect determinations on the Chinatown Historic District and the Hawaii Capital Historic District. These determinations of effect and the SHPD's concurrence are documented in Section 4.16 and Appendix H of the Final EIS.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Submission Content/Notes : What would be the hours of operations for the rail. How many trains will we be initially start with. Is it a two-way rail or one rail. How many minutes interval during peak hours. What is the speed of the train, how many minutes does it take to go from end to the other? How much is the fare? Will a transit pass good for bus, boat, and rail? Will there be convenient shops planned at each station? Sorry, no time to navigate your site.

These questions are some that are crucial to the sucess of the rail and I haven't heard anybody talking about them.

I am in favor of rail but how it is the managed and run makes or breaks it.

Thanks,

Mr. Tony Ho
tho227@yahoo.com

Dear Mr. Ho:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been

Mr. Tony Ho
Page 2

completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

To answer your questions regarding operation of the Project, as described in Section 2.5.1 of the Final EIS, the system will operate between 4:00 a.m. and midnight in both directions. The train will arrive every three minutes during peak periods and will travel at an average speed 30 mph or greater. A trip from one end of the Project to the other will take about 42 minutes. The fleet will include up to 85 vehicles.

The fare to use the system will be the same as for TheBus. Therefore, if it were operating today, it would be \$2.25 one way or a rider could use the same monthly pass used for TheBus. As described in Chapter 2, Section 2.5.1 of the Final EIS, the bus and rail systems will have a unified fare structure, including monthly passes that work for both modes. You will be able to use a free transfer to change from one mode to another. If TheBoat is restored in the future, the cost will be the same as well.

Commercial enterprises are not planned within the stations; however, private commercial enterprises are expected to develop around most stations.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Submission Content/Notes : I have traveled to numerous cities in the world and ridden dozens of transit systems with proven ridership histories in their respective communities. There is no doubt in my mind that I have a much more comprehensive understanding of rail systems than most people that live in Hawaii and this is why I not only wish to have my say, but to qualify my opinion as much broader than someone that believes this pie in the sky system is the answer to traffic on the island of Oahu. I feel Honolulu's rail program is flawed in many ways of which I will discuss only the most important.

Ridership is dependent upon many factors most importantly density and convenience. Honolulu, Ewa, Kapolei or where ever there are planned stops has no density. Hong Kong has density, New York has density, the Bay Area to a lesser extent has density. Without it people will have to some how travel to the train in order to get on it. In your EIS there is limited park and ride lots, without ample parking there will never be enough ridership to justify this project.

We are not a mass transit community and will never be one. Not only do most residents commute to and from work, but we all make stops to schools, shopping or run errands in our daily lives. Because we have no public school bus system and the density to make these other daily chores convenient people need to have their personal vehicles and a train, like the bus, is not an option. It is a major flaw to believe you will change the attitudes and behavior of a society simply by building a train that is not accessible to most.

Efficiency is key to providing a realized difference in commute times. Aside from possible economic gains commuters ride mass transit in large urban cities because it makes a marked difference in commute times. With 19 stops over 20 miles of rail the proposed train is not much faster than a present express bus and definitely not any faster than the alternate HOT lanes with dedicated expressed busses. Compare for instance Hong Kong's express train to/from the airport to Hong Kong, there are a total of 3 stops prior to reaching the IFC center in under 30 minutes. Distance is approximately 14 miles. This train is complimented by an underground subway system and other trains than run throughout China. It's purpose is fairly singular as the goal is getting people to and from one of the best airports in the world.

Similarly, stops per mile along BART's routes are far less than the 1 per mile proposed for Honolulu. Secondly, the noise that emanates from steel on steel rail is very loud as anyone that has stood in a New York, Chicago or San Francisco tube can attest to. It is not quite and quite frankly that is why these systems are for the most part buried beneath ground. Your EIS fails to adequately address this problem and sugar coats the end result. What transit system in the world sends trains through the air in it's densest metropolitan area? None, they are all beneath ground because of noise and because they can more efficiently address ingress/egress issues. Why isn't this a must for Honolulu? It's like the city is attempting to ramrod a third class system down our throats because it does not want to adequately address the real issues. Do it right or don't do it at all would be a good motto to

follow.

Historically, city public works projects have a proven track records of inadequacy, cost overruns and blunders. From sewer work to road maintenance the city has proved time and again that it is not up to task in any facet of public works. It is pitiful to me to compare our achievement and results compared to other cities in the United States and abroad. The fact that it takes 2 years to replace 1.0 mile of sewer under Kapiolani Blvd., all the while leaving the surface road nearly undrivable to anything but a 4WD truck, is inexcusable. I won't go into the same type of project along Kalaheo Ave., but will say that there are few major cities in America that would put up with that type of government foolishness. My assessment of the city being able to bring a 3 rate rail system on line, on budget and on time are just about as optimistic as getting these sewer projects completed. We will be \$6B into it before we realize that it is taking twice as long and twice as much as originally estimated.

Lastly and on a more personal I am deeply troubled by trade unions endorsing rail over other alternatives, when they should be neutral. If there are any public works projects, rail, bus, HOT lane or other, they will all require building trades to do, which option is chosen should not be influenced by the ultimate beneficiary of tax payer monies. By using endorsing rail the unions have tainted the project as nothing but political pay back and that wrong. It is so wrong that it should be investigated more thoroughly by Federal authorities, since a small portion of the project's funds are supposed to be coming from that source.

Because I am working and cannot attend tonight's public hearing I would like this to be presented verbally or in writing to those that are in attendance and for the record. Mahalo.

Ms. Wailani Ho
P.O. Box 11012
Honolulu, Hawaii 96828

Dear Ms. Ho:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal.

A travel demand forecasting model was used to forecast daily mode of access to the project stations. As shown in Table 3-20 of the Final EIS, 60 percent of riders will access the fixed guideway via bus and 30 percent will access the system by walking or biking. The Bus system will be altered to provide improved connections and/or to reduce duplication of services. Certain local routes will be rerouted to provide frequent and reliable connections to the nearest fixed guideway station. Existing and future bus routes, including route numbers and frequencies, are included in Appendix D of the Final EIS. Because of the high frequency of the fixed guideway service (every three minutes during peak periods and every six minutes during mid-day periods), riders transferring from buses to the fixed guideway will experience minimal wait times. Riders transferring from the guideway service to buses will benefit from improved frequencies on existing bus routes serving stations. Also, several new routes with high

frequencies will be provided as feeders to the guideway system. Since these routes will primarily operate in residential areas, they will provide greater reliability versus routes operating along congested arterials. Accordingly, access to the fixed guideway system will be convenient. Park-and-ride facilities are located at stations with the highest demand for drive-to-transit access.

Your comments concerning the fact that Honolulu is not a mass transit community are noted. However, per data from the U.S. Department of Transportation National Transit Database, in 2006 Honolulu had the fourth highest per capita transit ridership among urbanized areas in the United States, trailing only New York, San Francisco, and Washington, D.C. As a result, Honolulu can be considered a mass transit community. Please see http://www.ntdprogram.gov/ntdprogram/pubs/other_data_products/Top_Transit_Cities.xls.

Regarding transit efficiency and placement of fixed guideway stations, as stated in Section 3.3.2 of the Final EIS, TheBus operates in mixed traffic, without signal priority; therefore, buses are caught in the same congestion as general-purpose traffic. With increasing traffic congestion over the last 20 years, scheduled trip times for bus routes have been lengthened to reflect the additional time each bus trip takes. As a result of longer bus travel times, 128,600 additional revenue hours of bus service were needed in 2007 to deliver the same amount of service TheBus provided in 1984. This inefficiency consumed about \$13.5 million in additional annual operating budget expenses in 2007.

The location of fixed guideway stations was based on land use development plans, bus access, room for the station, and expected modes of access to the station. Many fixed guideway stations are located within a mile of each other. Typically, an individual will walk one-half mile to reach a high-capacity transit station. Accordingly, fixed guideway stations are close enough to each other to promote walking and biking access. The average travel speed of the rail line would be reduced if stations were located closer together.

Transit riders will experience substantially reduced travel times with the fixed guideway system. Presently, bus speeds are declining as a result of growth in traffic congestion and the lack of exclusive right-of-way for transit vehicles. Figure 3-6 in the Final EIS compares system-level transit speeds, both with and without the Project. As a result of the increased transit speeds, major reductions in transit travel times will occur for several major markets, such as between Ewa and Downtown Honolulu, as shown in Figure 3-7 of the Final EIS. Trips to and from Mililani and Waikiki, which are not along the alignment, will also benefit from reduced travel times when using the guideway.

Urban sections of many systems, including BART in the San Francisco Bay Area, MARTA in Atlanta, and the Metro in Los Angeles, are elevated. Worldwide, Tokyo, Singapore, and Vancouver, are among many which have elevated systems.

As stated in Section 4.10.3 of the Final EIS, the Project will cause no severe noise impacts. Moderate impacts will occur at upper floors of a few high-rise buildings (as shown in Table 4-18 in the Final EIS). With the recommended mitigation in place (sound absorbing material and wheel skirts), the noise analysis indicates that the new noise generated by the Project will be lower than the existing noise levels in most places.

The project design includes an integrated noise-blocking parapet wall at the edge of the guideway structure that extends 3 feet above the top of the rail. The parapet wall will substantially reduce ground-level noise.

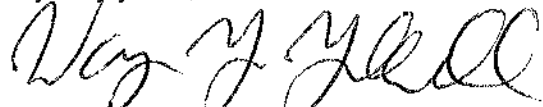

Wheel skirts will increase the benefit from the parapet wall at locations above the elevation of the track. The use of sound-absorptive materials below the tracks in the areas that will experience moderate noise impacts will reduce the Project noise levels from the upper floors to below the impact level. Once the Project is operating, noise levels will be remeasured to confirm that there are no noise impacts from the Project.

FTA has reviewed the Project's cost estimates and determined that the City has the capabilities to implement the Project. We have not received any indication from the FTA that we will not receive Federal funding. Chapter 6 of the Final EIS provides more information regarding the Project's cost estimates and implementation capabilities.

Endorsements of the Project by independent groups are not relevant to the environmental review process. All public comments in support of and in opposition to the Project have been considered in the environmental process. In addition, all comments submitted on the Draft EIS are included in the Final EIS.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Submission Content/Notes : Many of us living on the Neighbor Islands would visit Oahu much more frequently if the new rail system served the Honolulu Airport. Eliminating the headache of fighting traffic congestion just to get into town would mean more "return business" for Oahu, and I'm sure this applies equally well to tourists from the mainland and overseas. If other factors on the two competing routes are roughly equal, please choose the HNL option. Mahalo.

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the

Mr. Daniel Hodel
Page 2

Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

RE: IN SUPPORT OF DRAFT EIS
HONOLULU HIGH-CAPACITY CORRIDOR PROJECT
Public Hearings: December 9th – 11th, 2009

Dear Department of Transportation Services:

For the record my name is Buzz Hong, the Executive Director for the Hawaii Building & Construction Trades Council, AFL-CIO. Our Council is comprised of 16-construction unions and a membership of 26,000 statewide.

The Council supports the Draft EIS for the Honolulu High-Capacity Corridor Project, which as part of an integrated mass transit system, is an investment in Oahu's future – growing our economy, protecting our environment, strengthening our communities, and providing reliable and affordable transportation for generations to come.

Thank you for the consideration of our request.

Sincerely,

William "Buzz" Hong

Email: w Yoshioka@honolulu.gov

Dear Mr. Yoshioka:

Comments on the Honolulu Draft Environmental Impact Statement (Draft EIS)

Our comments on the Draft EIS are attached in seven parts:

- Part I All reasonable alternatives were not studied.
- Part II insufficient consideration of elevated rail impacts.
- Part III The Locally Preferred Alternative must be studied in the EIS.
- Part IV First Project, Phase I, is an illegal segmentation.
- Part V Unjustifiable forecasts.
- Part VI Strategic misrepresentation in the Draft EIS.
- Part VII Strategic misrepresentation outside of the Draft EIS.

We find the Draft EIS continues, as did its forerunners, the Oahu Regional Transportation Plan and the Alternatives Analysis, to mislead the public with unclear language, misrepresentations, and omissions of important material so as to position this document as less of an analytical and informative document and more of a selling tool.

Hopefully you will produce a Supplementary Draft EIS that will remedy these misrepresentations, omissions, and unclear language so that it will be clear to the public that,

- You are forecasting traffic congestion to be worse in the future with rail than it is today.
- An elevated rail line traversing the core of our city will have a deleterious effect on our environment.
- There exists a high risk of property taxes being greatly increased to fund the increased operating subsidies and the missed construction cost forecasts.
- The project places undue risks on an already fragile economy.

We find that the City has taken an insufficiently "hard look" at the alternatives that were rejected, at those issues we have discussed herein as misrepresentations in the Draft EIS, and the ridership forecasts, as examples. They are supposed to be dealt with in detail. As one court held,

... assumptions must be spelled out, inconsistencies explained, methodologies disclosed, contradictory evidence rebutted, record references solidly grounded, guesswork eliminated and conclusions supported in a manner capable of judicial understanding.¹

We find that the City and Parsons Brinckerhoff have not produced a document that has handled these important environmental issues with the objectivity and scientific rigor that is both needed by the public and is a NEPA requirement.

¹ E. I. DuPont de Nemours & Co. v. Train, 541 F.2d 1018, 1038 (4th Cir. 1976).

In summary, we believe the alternatives analysis is legally insufficient since the Managed Lanes Alternative analysis is so lacking in factual substance that it must fail to give the reader the true meaning of the alternative. Failing to provide accurate and complete information, especially for one of the most important socioeconomic factors — the incredibly high cost to Hawaii's citizens — makes this a faulty document that must be redone.

When the analysis fails to describe the incredibly low cost of the Tampa project when compared to the projected Hawaii costs, one cannot help to wonder why this fact was left out. Socioeconomics has been given very little if any attention in this document and failure to point out the Tampa project was approximately seven times cheaper than this proposed action is problematic and thus the underlying analysis fails.

The people of Hawaii were not given this information and if they were given this information, perhaps the vote may have gone differently. If they had been given this information in this NEPA document, perhaps they would have had more meaningful comments on the proposed action. We will not know unless a new Draft EIS is produced.

The Draft EIS is also simply not readable and thus doesn't give the opportunity for the reader to make meaningful comments. It incorporates by reference 20 studies and the Draft EIS fails to weave a narrative that accurately describes in the NEPA document, as required by NEPA, the true potential impacts that will be caused by the proposed action.

In a less complicated project, perhaps this would be acceptable; but in a proposed \$5 billion project that will displace hundreds of people, condemn homes and businesses, disrupt traffic and Oahu's quality of life, disturb cultural resources, potentially uncover sacred *iwi*, cause financial hardship to hundreds of thousands of people, while disregarding reasonable alternatives, or leaving out key components of other alternatives, is completely unacceptable.

The City and County and the FTA must be held to the standard required by the 9th Circuit, NEPA, and Hawaii State law, and the information presented fails to meet these standards. We request that a Supplemental Draft EIS be undertaken.

Sincerely,
HONOLULUTRAFFIC.COM

February 6, 2009

Part I — “All reasonable alternatives” were not studied.

“There’s small choice in rotten apples.”

This line from Shakespeare’s *The Taming of the Shrew* is, appropriately, the opening line in the FTA’s introduction to *Evaluation of the Alternatives*.¹

We believe that insufficient alternatives were considered during the Alternatives Analysis. Each prior rail transit effort in Honolulu from the 1970s on has suffered from the same problem; the range of alternatives studied was inadequate and disinterested experts have all commented on it.

Finally, the most serious deficiency of analyses done to date is the failure to devise and evaluate meaningful alternatives to HART [Honolulu Area Rapid Transit]. The so-called “alternatives analysis” is seriously deficient and the bus alternative considered in them can only be considered as “straw men.”

Dr. John Kain, Chair, Economics Department, Harvard. 1978.²

In particular, what is lacking is a serious investigation of several viable dedicated busway options.

Dr. Robert Cervero, Professor of Urban and Regional Planning, UC-Berkeley. 1991.³

Many more examples in a similar vein are available from experts’ critiques of the 1990 Alternatives Analysis.¹

The National Environmental Policy Act (NEPA) process requires that the City & County of Honolulu (City),

Rigorously explore and objectively evaluate all reasonable alternatives ... Devote substantial treatment to each alternative considered in detail including the proposed action so that reviewers may evaluate their comparative merits ... Include reasonable alternatives not within the jurisdiction of the [City].⁵

The Council on Environmental Quality’s (CEQ) comments on 1502.14 is as follows:

Section 1502.14 requires the EIS to examine all reasonable alternatives to the proposal. In determining the scope of alternatives to be considered, the emphasis is on what is “reasonable” rather than on whether the proponent or applicant likes or is itself capable of carrying out a particular alternative. Reasonable alternatives include those that are practical or feasible from the technical and economic standpoint and using common sense, rather than simply desirable from the standpoint of the applicant.⁶ (emphasis added)

⁶ Question 2A in CEQs 40 Q&As. <http://www.nmru.gov/meetings/2005impacts/pdfs/40Questions.pdf>

In addition to rail transit and No-Build, there are at least three other alternatives that should have been considered in the Draft EIS:

1. The Reversible Managed Lane Alternative
2. The 2003 Bus/Rapid Transit Project
3. The EZway plan.

1. The Reversible Managed Lane Alternative.

The draft EIS shall evaluate all reasonable alternatives to the action and discuss the reasons why other alternatives, which may have been considered, were eliminated from detailed study. (23CFR771.123)

The reasons given for the elimination of the Managed Lane Alternative from the Draft EIS are insufficient since little supporting data is given for the conclusions reached and no reference is given to any other publication that might have it. It is not surprising since there was little in the Alternatives Analysis or in the documents regarding the second Scoping when we first found that the Managed Lane Alternative had been eliminated.

For example, the Draft EIS tells us *"that the Managed Lane Alternative would provide slightly more benefit [than TSM] at a substantial cost."* We can only guess at what that means.

A Bus/Rapid Transit (BRT) bus would travel at 55mph while on the Managed Lanes and, say, 15 mph when on city streets. If the distance traveled on city streets is one-half of that traveled on the Managed Lanes the average speed would be 29 mph — faster than trains. But the benefit to users of trains is supposedly three times that of the Bus/Rapid Transit on Managed Lanes?

Also two, or possibly three, additional lanes managed through dynamic pricing would each have a vehicle throughput close to twice that of each of the nearby congested freeway lanes according to the Federal Highways Administration (FHWA).⁷ Such lanes would add the equivalent of four to six lanes to the current (and projected through 2030) five regular freeway lanes. And we are supposed to believe that traffic congestion⁸ will be far worse with Managed Lanes? There is no support for this in the Draft EIS nor any reference to other documents.

We made the original proposal for a reversible dynamically-tolled highway which led to its inclusion in the First Scoping authorized in the federal Notice of Intent of December 5, 2005.

The concept that we proposed to the City was what Reason Foundation's Robert Poole, termed a *Virtual Exclusive Busway* where buses and vanpools have priority and go free of toll charges and all others pay a dynamically-priced toll. It has all the virtues of an exclusive busway, while also having a significant impact on automobile traffic congestion in the Corridor.

The City's Chief Transportation Planner said that he used the map of our proposed route from our website and that, *"This is what HONOLULUTRAFFIC.COM requested us to study and this is exactly what we studied."*⁹

However, our original proposal was only a conceptual one; at the time we did not have the technical expertise to do anything else and we certainly did not have the resources to submit a comprehensive design. Far from being a design, a cursory look at our original map shows a freehand line drawn none too steadily along the route with a black marker pen. It never crossed our minds that Parsons Brinckerhoff would not apply its expertise to provide the best possible alternative.

⁷ FHWA's *Congestion Pricing — A Primer*. At: <http://www.honolulutraffic.com/congestionpricing.pdf> p. 3.

⁸ See Vehicle Hours of Delay in Table 2-1, Draft EIS.

⁹ League of Women Voters Forum video, <http://www.brightcove.tv/title.jsp?title=1301088S50&channel=293897125> 5:00 minute mark of 10 minute video.

We had forecast a cost of \$900 million for a 10-mile two-lane version. This estimate of cost came from a one-day conference that Governor Lingle asked us to conduct in December 2002 to evaluate whether the reversible tolled transitway concept was worth pursuing. Some of Hawaii's and the nation's leading experts¹⁰ on this issue were represented at the conference. The concept and cost estimates met with the general approval of the attendees and accordingly we recommended to the Governor that the project be further developed to a higher level of detail.

In December 2005, the FTA issued the first Notice of Intent and it stated,

Alternatives proposed to be considered in the AA [Alternatives Analysis] and draft EIS include No Build, Transportation System Management, Managed Lanes, and Fixed Guideway Transit.

After the first Scoping, the Scoping Report of April 6, 2006¹¹ issued and confirmed that the Managed Lane Alternative would be studied in both the Alternatives Analysis and the Draft EIS.

Subsequently, the Alternatives Analysis was produced in November 2006 and recommended that the Fixed Guideway Alternative be adopted as the Locally Preferred Alternative and shortly thereafter the City Council chose the Fixed Guideway Alternative with termini at West Kapolei, University of Hawaii at Manoa and Waikiki.

However, the Managed Lane Alternative was not objectively studied in the Alternatives Analysis. Rather, the Managed Lane Alternative was setup as a classic "straw man," contrived to make it look ineffective in comparison to rail transit.

Professor John Kain, co-author of the classic *The Urban Transportation Problem*, who wrote extensively about such tactics, wrote in his *The Use of Straw Men in the Economic Evaluation of Rail Transport Projects*,¹²

Nearly all, if not all, assessments of rail transit systems have used costly and poorly designed all-bus alternatives to make the proposed rail systems appear better than they are.

Out of the blue, on March 15, 2007, the FTA issued a second Notice of Intent¹³ but this time excluded the Managed Lane Alternative. This was the first intimation we had of its rejection. Both the first Notice of Intent¹⁴ and the first Scoping Report¹⁵ had stated that the Managed Lane Alternative would be studied in the Draft EIS.

Mr. David Glater, then the recently retired Chief Counsel of the US DOT's Volpe Center, who had been appointed to be the Transportation Analyst for the City Council's Transit Advisory Task Force, and who wrote the Task Force Report, must have also been surprised since his Appendix 3, attached hereto as Appendix B, is titled, "*Suggestions for further development of the Managed Lane Alternative.*"

¹⁴ www.honolulutraffic.com/NOI051205.pdf

¹⁵ <http://www.honolulutraffic.com/ScopingReport.pdf>

The second Notice of Intent did not even want comments on alternatives that were “*previously studied and eliminated for good cause.*” While not named, one can reasonably assume it referred to the Managed Lane Alternative.

On March 18, 2007, we wrote to the FTA protesting that the process used by the City for assessing the Managed Lane Alternative in the Alternatives Analysis was flawed.¹⁶ We also protested the issuance of two Notices of Intent to perform the same Draft EIS. We received no response to these communications.

Honolulu found itself in the strange position of beginning Scoping while having already selected its Locally Preferred Alternative.

The second Scoping Report that issued May 30, 2007¹⁷ implies that the Managed Lane Alternative was rejected at least in part because,

The Honolulu High-Capacity Transit Corridor Project analysis is meant to evaluate project alternatives that may be constructed within the authorization of Act 247, enacted by the Hawai‘i State Legislature in 2005. The act prohibits the construction of a non-transit project with the authorized excise-tax surcharge. Projects with the purpose of providing roadway mobility for automobiles and commercial vehicles are not fundable by Act 247; therefore, they will not be added to the purpose of the Honolulu High-Capacity Transit Corridor Project¹⁸.

However, this is the first mention of Act 247 through two Notices of Intent and two SIPs and the first Scoping Report. In any case, is this reason for rejection not in conflict with the following?

An alternative that is outside the legal jurisdiction of the lead agency must still be analyzed in the EIS if it is reasonable. A potential conflict with local or federal law does not necessarily render an alternative unreasonable, although such conflicts must be considered. Section 1506.2(d). Alternatives that are outside the scope of what Congress has approved or funded must still be evaluated in the EIS if they are reasonable, because the EIS may serve as the basis for modifying the Congressional approval or funding in light of NEPA’s goals and policies.¹⁹

The second Scoping Information Package describes the Fixed Guideway Alternative as follows:

The fixed guideway system is planned to operate between 4 a.m. and midnight, with a train arriving in each direction at each station between every three and ten minutes ... The system is planned to operate with multitar trains approximately 175 to 200 feet in length, with each train capable of carrying a minimum of 300 passengers. This would provide a peak capacity of at least 6,000 passengers per hour per direction.²⁰

Since at this point the *de facto* decision to select trains as the preferred mode alternative had already been made, does not the issuance of a new Notice of Intent circumvent the requirement that NEPA *not be used to rationalize or justify decisions already made?*²¹

The second Scoping Report states,

As stated in the Notice of Intent issued on March 15, 2007, that Notice of Intent superceded [sic] the one published on December 5, 2005.²²

¹⁶ www.honolulutraffic.com/AAALcomments5.pdf

¹⁷ <http://www.honolulutraffic.com/NEPAScopingReport.pdf>

¹⁸ The second Scoping Report, p. 5-1. Act 247 is at

¹⁹ <http://www.nepa.gov/neparegs/40/C-10.HTM#2>

²⁰ Scoping Information Package, 4-1&2. <http://www.honolulutraffic.com/ScopingInformationPackage.pdf>

²¹ “Environmental impact statements shall serve as the means of assessing the environmental impact of proposed agency actions, rather than justifying decisions already made.” 40CFR1502.2[g]

This is not true; the second Notice of Intent states no such thing.

The second Scoping Report also states that,

*City Council Resolution 07-039 defined the First Project as extending from East Kapolei to Ala Moana Center.*²³

Resolution 07-039 uses the term “Minimum Operable Segment” to describe the shortened project and never mentions “First Project”; the term in the second Scoping Report only serves to confuse the issue.

Also federal regulations require that, “*Draft environmental impact statements shall be prepared in accordance with the scope decided upon in the scoping process.*”²⁴

The first Notice of Intent was not superseded and the Alternative Analysis states that its alternatives were developed “*during a formal project scoping process held that would satisfy the requirements of the National Environmental Policy Act (NEPA) ...*”²⁵

The second Scoping Information Package and the second Scoping Report suggest that the first Notice of Intent was to merely satisfy Hawaii Revised Statutes 343, even though there is no mention of that in either of the two federal Notices of Intent or the subsequent Scoping Report. In any case, that does not wash since, if satisfying Hawaii Revised Statutes 343 was the only intent of the first Notice of Intent, would not the FTA’s issuance of it have been unnecessary?

In addition, this action by FTA would appear to violate 40CFR1506 which requires agencies

... to the fullest extent possible to reduce duplication between NEPA and state and local requirements.

And NEPA §1500.6 makes it clear that,

The phrase “to the fullest extent possible” in section 102 means that each agency of the Federal Government shall comply with that section unless existing law applicable to the agency’s operations expressly prohibits or makes compliance impossible.

This requirement is, in part, to avoid the kind of time consuming and confusing situation we now have.

Neither the FTA nor the City has made any attempt to clarify why FTA issued the second Notice of Intent. While the first Notice of Intent initiated the NEPA review process, the second Notice of Intent informed us that the NEPA review was “*initiated through this scoping notice.*” Have we not been in the NEPA process since December 2005? Why was a second scoping necessary?

The City did not make the case in the second scoping documents that re-scoping was being conducted because the first was inadequate or unsatisfactory. And if it had been inadequate would not the second scoping merely have been to supplement the first scoping and not to replace it?

There has obviously been insufficient “*public involvement,*” as required by SAFETEA-LU, if we cannot even find out whether the NEPA review process started on December 5, 2005, or March 15, 2007. Why cannot the public be told why the second scoping was authorized and if it invalidated the findings of the first Scoping?

We believe that the City and Parsons Brinckerhoff had the second Notice of Intent issued in an attempt to evade the more stringent investigative requirements of the NEPA process for the Managed Lane Alternative and possibly also for the purpose and needs statement.

²³ Second Scoping Report, p. 5-1, at <http://www.honolulutraffic.com/NEPAScopingReport.pdf>

²⁴ Resolution 07-039. <http://www4.honolulu.gov/docshare/dsweb/Get/Document-59472/23mk1lib.pdf>

²⁴ 40CFR1502.9.

²⁵ www.honolulutraffic.com/AAD.pdf p. 2-2.

Six specific ways in which the Managed Lane Alternative was contrived to fail are listed below.

- a) Zipper lane inexplicably removed:
- b) Excessive Managed Lane Alternative capital costs:
- c) Inflated operating costs:
- d) Effects on vanpools not considered.
- e) Inefficient ingress/egress ramps:
- f) Avoidance of due diligence:

a) Zipper lane inexplicably removed

In November 2006, the City Council convened a Transit Advisory Task Force (Task Force) to advise it on the technical aspects of the Alternatives Analysis. Mr. David Glater, retired Chief Counsel of the U.S. Department of Transportation's Volpe Center, and Transportation Analyst for the Task Force, wrote in his Final Report to the City Council,

The description of the Managed Lane Alternative in Chapter 2 of the Alternatives Analysis states that, 'The H-1 zipper lane would be maintained in the Two-direction Option but discontinued in the Reversible Option.' (p. 2-4). However, no explanation is provided as to why the zipper lane would not be continued in the Reversible Option. The Managed Lane Reversible Option's addition of two Koko Head-bound elevated lanes for the morning commute appears to result in a net increase of only one lane if the inbound zipper lane were removed.²⁶

Why was the zipper lane taken out? When it remains in, it alone negates the conclusions of the Alternatives Analysis that the Managed Lane Alternative was inferior to rail in traffic congestion reduction as can be seen from the table below. With the zipper lane reinstated traffic on the H-1 freeway regular lanes would be less with the Managed Lane Alternative than the Fixed Guideway Alternative.

Congestion relief together with energy consumption, both of which are required to be analyzed by statute,²⁷ would be significantly improved with the Managed Lane Alternative. The following table is identical to the data in Table 3-12 in the Alternatives Analysis with the exception of the center column showing the zipper lane reinstated and a new line at the bottom of the page to total all traffic.

The only changes made to original column, which is to its left, are those in the grayed out cells. These reflect the same zipper lane traffic as in the Rail column and reduction of that same amount of traffic in the H-1 Freeway traffic. It shows that with the zipper lane reinstated the H-1 traffic is less than the traffic in the Rail Alternative.

For example, the single major freeway into downtown Honolulu from the far end of the study Corridor is H-1. It has seven lanes inbound during the morning peak hours, of which one is a zipper lane, one is an HOV lane, and five lanes are regular freeway lanes.

With the zipper lane reinstated the Managed Lane Alternative would provide two, or possibly three, additional lanes managed through dynamic pricing. Each lane would have a vehicle throughput close to twice that of each of the nearby congested freeway lanes.²⁸ Such lanes would add the equivalent of four to six lanes to the current (and projected through 2030) five regular freeway lanes (this is not provided for in the table that follows).

Total Managed Lane Traffic	3,457	0.79	C2	3,457	0.79	C2	NA	NA	NA
Total All Traffic	28,733			28,702			25,948		

The grayed cells are the only ones changed from the Alternatives Analysis, Table 3-12.
 The Total All Traffic was not provided in the original. Others may wish to check our addition.
 Changes made were to reinstate the zipper lane using vehicle data from the fully built out rail option.
 Then reduce the H-1 Fwy forecast by a like amount. Other changes are merely recalculation of totals.

The congestion mitigation effects of these additional lanes to the seven-lane H-1 freeway are too obvious for the effect not to have been noticed during the Alternatives Analysis process.

b) Excessive Managed Lane Alternative capital costs

Parsons Brinckerhoff and the City grossly inflated the capital costs of the Managed Lane Alternative with the result that, if correct, it would result in it having twice the cost per lane-mile of any highway ever built in the U.S.

Parsons Brinckerhoff and the City also added unnecessary costs to the project by only using a 16-mile facility while not testing the viability of shorter 10 to 12-mile versions.

The City's projected cost of \$2.6 billion in 2006 dollars for the Managed Lane Alternative was excessive. It was twice as expensive as the H-3 freeway per lane mile, almost as much per mile as the rail transit line, and seven times as much as the Tampa Expressway, a similar but even larger facility. And the City made it 50 percent longer than necessary. Further, the normal due diligence expected for a project of this magnitude was not undertaken.

Had the Managed Lane Alternative been projected at 11 miles long and priced to be the same as H-3 per lane mile (allowing for inflation), the projected cost would have been only \$915 million (still twice as much as the Tampa Expressway). Of this amount half could have been paid for with toll revenue bonds and the other half with less than three years of the 1/2 percent GE tax revenues (assuming the unlikely scenario of Senator Inouye being unable to obtain any federal funds).

And the city did not study the effects of the Managed Lane Alternative having three lanes. Tampa added the third lane after finding that this 50 percent increase in lane space would cost only 20 percent more than two lanes.

Anyone who has ever travelled the H-3 will find it absurd that the City's cost estimate of the Managed Lane Alternative could be the same as the H-3 (inflation-adjusted). The City's projected costs for the Managed Lane Alternative were calculated without any attempt to justify this high cost by comparing it to similar facilities in Hawaii or on the Mainland.

As discussed earlier, our cost projection was \$900 million for a 10-mile two-lane elevated highway, or \$90 million per mile in 2002. This cost when inflated using the *Price Trends for Federal-aid Highway Construction Index*,²⁹ results in \$134.7 million per mile in 2006 dollars.

However, this estimate was made before we were aware of the astonishing cost savings offered by the new construction method devised by Figg Bridge Company and used to construct the Tampa Expressway.

Tampa Expressway:

The actual contract price for the 17.5 lane miles of bridge structure was just over \$100 million. At approximately \$120 million, the deck cost for the segmental bridge portion of the project was approximately \$65 per square foot, far below the average cost for structures in Florida during the past 20 years. The average cost per lane mile for the reversible bridge is approximately \$7 million and is among the lowest for bridges constructed in the U.S.³⁰

The Figg Bridge Company tells us they "have experienced savings of approximately 40 percent to 50 percent when using precast segmental span-by-span construction in urban settings when compared to segmental balanced cantilever construction."³¹

Using 45 percent as the average of these savings reduces our \$134.7 million per mile projection to \$74.1 million per mile in 2006 dollars, or \$37.0 million per lane-mile.

Recently Figg Bridge, which is familiar with Hawaii conditions, told us they believe there is no reason why the Managed Lane Alternative should not be built for the same cost per mile that they are experiencing in Florida for 2008 given the addition of a further 32 percent for the construction cost differential between Hawaii and Florida.

The 14-mile Expressway cost \$320 million in 2006 (net of an impending award of \$100 million for a sub-contractor's error). Using the same *Price Trends for Federal-Aid Highway Construction Index* that the City uses, and allowing the mid-point of costs to be 2004, we calculate that the cost to build it in 2006 would have been \$458.7 million.

The cost comparison index used to inflate Florida construction costs to Hawaii's level is an additional 32 percent, that being the rate given in the current *Civil Works Construction Cost Index*.³² Applying this factor to the inflation adjusted cost, results in \$605 million as the cost of constructing the facility in Honolulu. Dividing this by its 14-mile length results in \$43.2 million per mile.

While Tampa has three lanes, the Expressway Authority tells us that the third lane only added 20 percent more to their costs than if they had only built two lanes. We have, therefore, divided the Tampa cost per mile by only 2.4 instead of three to arrive at a cost for a two-lane facility. It

²⁹ <http://www.flhwa.dot.gov/programadmin/pt2006q1.cfm>

³¹ Personal Communication, CEO, Figg Bridge Company.

³² <http://www.usace.army.mil/publications/eng-manuals/em1110-2-1304/entire.pdf> p. A-34.

results in a cost of \$18.0 million per lane-mile as a comparable cost for building such a facility in Honolulu.

Hawaii's H-3 Freeway:

The 16.1-mile H-3 freeway is a divided highway with two lanes in each direction and its construction required boring two miles of tunnels through the solid rock of the Koolau Mountains. The total cost was \$1.3 billion at completion in 1997 making it the most expensive highway per mile ever built in the U.S.

Lacking a distribution of costs by year, we have allowed the mid-point of construction cost as occurring in 1991. Inflating the \$1.3 billion to 2006 dollars using the *Price Trends for Federal-Aid Highway Construction Index*³³, results in \$2.7 billion.

This amount divided by the 16.1 mile length equals \$166.2 million per mile and dividing that by the four lanes results in \$41.6 million per lane-mile.

Capital costs summary:

We show below an adjusted cost per lane-mile comparison with two highway facilities, one from Tampa, Florida and the other, the H-3 freeway in Honolulu together with both the City and our Managed Lane Alternative cost projections.

The table below summarizes our calculations of all four facility costs per lane-mile after being adjusted for construction inflation costs and location cost differentials. This enables us to directly compare one with the other. The full calculation is given in detail in Appendix A.

Adjusted cost per lane-mile in 2006 dollars³⁴	
Facility	\$millions
Tampa Expressway actual, adjusted to Honolulu costs	\$18.0
H-3 Freeway actual, adjusted	\$41.6
Our Managed Lane Alternative estimate, adjusted	\$37.0
City's Managed Lane Alternative estimate	\$80.5

Note that our Managed Lane Alternative estimate is within ten percent of the adjusted H-3 freeway cost. In consideration of the extensive trans-Koolau tunneling required for H-3 one would anticipate that our Managed Lane Alternative estimate should be somewhat less.

Even allowing for inflation and location cost differences, the adjusted Tampa Expressway cost is still less than half of either the H-3 or our Managed Lane Alternative estimate.

However, the most striking comparison is that the City Managed Lane Alternative estimate is twice that of the H-3 freeway and over four times that of the Tampa Expressway — after all adjustments. We do not believe that this projected cost would ever pass scrutiny by any members of the professional engineering community.

Our cost calculations for the Managed Lane Alternative, while compelling, need more work at a level of detail requiring resources that are not available to us. Our concern is that the City and Parsons Brinckerhoff did not make any serious effort to investigate it at any level of detail, as the section of lack of due diligence demonstrates.

At the behest of FTA, Booz Allen investigated the Fixed Guideway Alternative and the Managed Lanes Alternative construction costs. They produced a preliminary 8-page draft in April 2007 and later followed that in May 2007 with a 38-page full report.³⁵

³³ <http://www.thwa.dot.gov/programadmin/pl2006q1.cfm>

³⁴ See Appendix A for details of cost adjustments for construction inflation and location differences.

³⁵ FTA PROJECT MANAGEMENT OVERSIGHT PROGRAM, Contract No. DTF60-04-D-00013 Project No. DC-27-5041 Task Order No. 10

The 8-page draft does mention the Tampa Expressway and also Dr. Stone's comments,

Dr. Marty Stone [PhD AICP], planning director for the Tampa-Hillsborough County Expressway Authority, wrote a lengthy defense of the construction of his agency's reversible, elevated toll lanes in Tampa for HawaiiReporter.com on November 21, 2006. Dr. Stone criticized rail proponents in Honolulu for what he perceived as misrepresentation of the Tampa project in order to discredit the managed-lanes alternative in Honolulu.

However, neither Tampa nor Dr. Stone appear in the subsequent full report. This is a shame because it would have been interesting to know why an award-winning public planning official would go out on a limb to criticize fellow public officials.

The full report begins by telling us that the primary objective was to, "confirm absence of bias in cost estimation between the Fixed Guideway and Managed Lanes alternatives." Not to determine whether there was any bias, but rather to confirm that there was none.

Booz Allen's 38-page report covers a wide variety of cost estimating material but evades a very important and most awkward fact, and that is the cost of the Tampa Expressway was \$300 million.

The investigator does not grapple with this fact; the word Tampa cannot be found in this document. The group that put together the expressway, the Tampa-Hillsborough Expressway Authority and Figg Bridge have won just about every national award possible³⁶ and built it at a remarkably low cost.

The Tampa cost is a stubborn and intractable fact, one that will never go away until rail proponents confront it instead of evading it as the City has, as the Transit Advisory Task Force did and as Booz Allen does in this case.

To be credible an assessment of the Managed Lane Alternative costs must be performed with "scientific accuracy" and has to reconcile the \$300 million for the Tampa Expressway (even to include the \$120 million error) with a similar project in Honolulu for \$2.6 billion. Allowance can be made for construction costs inflation, location differences, and other smaller issues but an honest appraisal is unlikely to be able to bridge this widest of chasms.

A credible assessment could start by talking to Figg Bridge to ask them how they did it and whether it could be done in Hawaii. No one involved in the pricing, and the validation of the pricing, of the Managed Lane Alternative — the City, the Council Task Force, or Booz Allen — has ever contacted Figg Bridge.

c) Inflated Managed Lane Alternative operating costs

Parsons Brinckerhoff and the City also inflated Managed Lane Alternative operating costs to make the project appear uncompetitive with the Fixed Guideway Alternative.

The Alternatives Analysis had forecast that operating costs for the Managed Lane Alternative would be greater than the FGA. These high operating costs occur because,

Transit operating costs for the Managed Lane Alternative would range between approximately \$251 and \$261 million as a result of additional buses that would be put in service under that alternative.³⁷

The Alternatives Analysis projects that the Managed Lane Alternative will need a fleet of 906 buses versus the No-Build Alternative requiring 614 buses.³⁸ This would result in the Managed

³⁶ <http://www.tampa-exway.com/documents/Awards/REI,%20Awards.pdf>

³⁷ Alternatives Analysis, page S-4, at: <http://www.honolulutraffic.com/AAAD.pdf>

Lane Alternative having 50 percent more buses than the No-Build Alternative yet the City projects only 5 percent greater ridership for it.³⁹ This small increase is projected despite the Managed Lane Alternative offering bus users the advantage of a congestion free bus ride from the H-1/H-2 merge to Downtown. It begs the question, why would the Managed Lanes Alternative offering much faster bus service than the No-Build not generate many more riders?

Fundamentally, the Managed Lane Alternative provides the existing bus system with a faster method of transiting the Corridor. Buses would be able to travel Koko Head bound in the AM peak on the Managed Lane Alternative at three times the current 20 mph operating speed of buses on the H-1 freeway. Buses can then return to their original departure point via the H-1 freeway in the Ewa Bound direction in relatively uncongested traffic.

This will allow some express buses to make two round trips in the time it presently takes to make one. One might anticipate that such efficiency would allow a considerable increase in ridership to be achieved at about the same operating costs as is experienced *currently*, allowing for inflation.

Instead, the Alternatives Analysis forecasts that the Managed Lane Alternative would require the operation of 48 percent more buses⁴⁰ than the No-Build Alternative while carrying only five percent more trips⁴¹ and that this would cost 36 percent more in operating costs than the No-Build and even more than the FGA.

In addition, the Alternatives Analysis projected a totally unnecessary 5,200 parking stalls for the Managed Lane Alternative, only slightly less than the 5,700 stalls projected for the entire rail line other than a pro-rata increase in the 529 stalls presently available, nor is there any need for bus stations on Managed Lane Alternative.⁴²

The City's and Parsons Brinckerhoff's plan has been to simply drive up operating costs to project that the Managed Lane Alternative is uneconomical in comparison with rail transit.

d) Effects on vanpools not considered.

The same benefits accruing to buses, including and freedom from toll charges, will also apply to vanpools. Such travel time savings can increase bus and van ridership and decrease both the amount of traffic and the share of low occupancy vehicles.

Vanpools have by far the lowest use of energy of any form of mechanized transportation using only 1,322 BTUs per passenger mile.⁴³ That is less than one-third of that used by the unweighted average of rail transit lines and so offers a significant opportunity to reduce energy use, reduce emissions, reduce traffic congestion, and since vanpools require no operating subsidy, an opportunity to reduce TheBus operating losses.

e) Ingress/egress insufficiently studied

Parsons Brinckerhoff and the City engineered the ingress and egress ramps in a way that could only result in heavy traffic congestion at the Koko Head end of the Managed Lane Alternative.

³⁸ Alternatives Analysis, Table 2-1, at: <http://www.honolulutraffic.com/AAD.pdf>

³⁹ The bus fleet data is taken from the Alternatives Analysis, Table 2-1, and the daily trips data from the Alternatives Analysis, Table 3-7. The percentages shown are calculated from these data. At: <http://www.honolulutraffic.com/AAD.pdf>

⁴⁰ Alternatives Analysis, Table 2-1.

⁴¹ The bus fleet data is taken from the Alternatives Analysis, Table 2-1, and the daily trips data from the Alternatives Analysis, Table 3-7. The percentages shown are calculated from these data.

⁴² Alternatives Analysis, pp. 3-7/8 and 3-10, at: <http://www.honolulutraffic.com/AAD.pdf>

⁴³ U.S. Dept. of Energy Data Book, table 2.12, at: http://www.eia.doe.gov/data/edb27/Edition27_Chapter02.pdf

The Task Force Report, Appendix 3,⁴⁴ contains the following statement,

In its discussion of travel time benefits of the Managed Lane options, the Alternatives Analysis projects that traffic congestion at both the H-1 Freeway access to the Managed Lane facility and at the Nimitz Highway exit at Pacific Street will negate travel time benefits gained from travel on the Managed Lane facility itself. The Analysis should explore how traffic congestion at these points could be alleviated (at least for mass transit vehicles) in order to enhance the overall performance of this Alternative as a transit guideway.

Parsons Brinckerhoff made no discernible effort to apply its engineering competence and ingenuity to the question of ingress and egress for the Managed Lane Alternative in the Alternatives Analysis.

In his letter to the City, copied to the Federal Transit Administration (FTA), Dr. Panos Prevedouros, Professor of Traffic Engineering at the University of Hawaii, Chair of the Transportation Research Board's Highway Micro-simulations Committee and himself a member of the Task Force, commented,

"... the most egregious violation of FTA's rules on alternative specification and analysis was the deliberate under-engineering of the Managed Lanes Alternative to a degree that brings ridicule to prevailing planning and engineering principles."⁴⁵

Dr. Prevedouros in his micro-simulation studies of differently designed entry and exit ramps for the Managed Lane Alternative shows that with properly designed ramps⁴⁶ traffic congestion can be reduced and excessive traffic congestion would not occur even during peak-hour traffic.

f) The City's lack of due diligence

The Task Force consisted of seven individuals to advise it on the Alternatives Analysis. Kazu Hayashida, a former Director of the Hawaii Department of Transportation (HDOT), was appointed Chairman.

In turn, the Chairman appointed two members to be a Technical Review Subcommittee to review construction costs. One had been a long time senior employee of the Hawaii State Department of Transportation (HDOT) and the other was the recently retired Director of Honolulu's City Department of Transportation Services and a former HDOT Director. Neither one had the expertise to judge construction costs in detail especially for a project of this magnitude and complexity.

After the Subcommittee's first report to the Task Force that they believed the projected Managed Lane Alternative costs in the Alternatives Analysis to be reasonable, we asked the subcommittee members for a list of the companies they had contacted. We believed there needed to be a detailed reconciliation between the Tampa Expressway cost (less the design error) of \$320 million and the Parsons Brinckerhoff estimate of \$2.6 billion for the Managed Lane Alternative. They told us they had only talked to the local office of Parsons Brinckerhoff, which had produced the projections, and had been assured that the cost estimates were reasonable.

They talked subsequently to engineers at the Hawaii Department of Transportation who told them that the 36-foot wide Managed Lane Alternative would need eight-foot supporting piers, totally ignoring the fact that the 59-foot wide Tampa Expressway has only six-foot piers. They mention that most agencies on the Mainland use \$100 to \$200 per square foot to price elevated highways but since they had not talked to Figg Bridge they would not know that they quote slightly less

⁴⁴ Attached as Appendix B.

⁴⁵ www.honolulutraffic.com/NEPAScopingReport.pdf p. A-180

⁴⁶ http://www.honolulutraffic.com/UCS_Report11.pdf p. 39.

than \$100. Meanwhile they say that the State DOT uses \$400-\$500 per square foot but gives no sensible explanation of why that should be.

A project involving billions of dollars should be expected to receive reasonable due diligence on the part of the City Council's Task Force. To the contrary, there was little, if any, performed.

Accordingly, we suggested a consultation with the Tampa Expressway Authority and with PCL Construction Services, Inc., which had built both the Tampa Expressway and the Hawaii Convention Center, and maintained offices in both Tampa and Honolulu and would be familiar with the costs and construction difficulties in both cities.

We also suggested they contact the Figg Bridge Company who had designed the Tampa Expressway incorporating its new low-cost construction methodology. One of the subcommittee members made a single, short phone call to the Tampa Expressway Authority; no one contacted PCL or Figg Bridge.

Dr. Martin Stone, AICP, Director of Planning, Tampa-Hillsborough Expressway Authority, whose project won the International Bridge, Tunnel and Turnpike Association's 2007 Award for the Best Toll Operations Project in the World, told them that the City's cost estimate was too high but they obviously did not follow up with that.

When one considers that Parsons Brinckerhoff maintains its national bridge practice in Tampa and actually designed a part of the Tampa Reversible Express Lanes project one would think that they should have been contacted also but it is our understanding that they were not. The Subcommittee report was made part of the Task Force Final Report.⁴⁷

The Task Force Final Report makes it clear that there was inadequate study of the Managed Lane Alternative.

"... the Alternatives Analysis should have presented variations on the Managed Lane Alternative that could make this alternative more attractive. Appendix 3 contains suggestions for fleshing out possible variants of the Managed Lane Alternative."⁴⁸

The Report's Appendix 3, "*Suggestions for further development of the Managed Lane Alternative,*" written by the former Chief Counsel of the USDOT's Volpe Center, David Glater, acting as the Transportation Analyst for the Task Force, concurs in finding an under-engineering of the Managed Lane Alternative by producing the list of suggested modifications attached as our Appendix B.⁴⁹ From this it is obvious that Mr. Glater anticipated these modifications to be adopted in the Draft EIS process.

The City and Parsons Brinckerhoff ignored these and all other the recommendations of the Task Force regarding the Managed Lane Alternative and omitted from the Draft EIS any mention of the Task Force, or its Final Report, or the highly relevant questions it posed.

We believe this cavalier attitude on the part of the City regarding due diligence violates the rule that,

The Council on Environmental Quality (CEQ) requires the data and analyses in an EIS are commensurate with the importance of the impact.⁵⁰

⁴⁷ www.honolulutraffic.com/TaskForceReport.pdf

⁴⁸ Task Force Final Report, p. 4/7

⁴⁹ www.honolulutraffic.com/TaskForceReport.pdf pp. A-32 to A-33. Appendix 3 also attached as our Appendix B

⁵⁰ 40CFR1502.15

Subsequent to the Alternatives Analysis process, a micro-simulation study undertaken by Dr. Prevedouros and his students concluded that,

*[The Managed Lane Alternative] would reduce H-1 congestion by 35%, reducing drive times from 4 to 22 minutes. An express bus commuter would make the same trip in 12.7 minutes. The greatest benefit of HOT lanes would accrue to those who never use them; they would pay no added taxes or tolls yet would experience dramatically reduced congestion.*⁵¹

g) Summary of the case for reinstating the Managed Lane Alternative in the EIS:

*Methodology and scientific accuracy. Agencies shall insure the professional integrity, including scientific integrity, of the discussions and analyses in environmental impact statements. They shall identify any methodologies used and shall make explicit reference by footnote to the scientific and other sources relied upon for conclusions in the statement. An agency may place discussion of methodology in an appendix. (40CFR1502.24)*⁵²

The Draft EIS and its accompanying technical memoranda offer no evidence that the City and Parsons Brinckerhoff ever undertook to “rigorously explore and objectively evaluate”⁵³ the Managed Lane Alternative as required by NEPA.

*Environmental impact statements shall be concise, clear, and to the point, and shall be supported by evidence that agencies have made the necessary environmental analyses.*⁵⁴ (emphasis added)

We ask that the FTA require the City re-assess the Managed Lane Alternative in a Supplementary Draft EIS using a less “client focused” and more independent consultant. Such an independent re-evaluation should perform the following:

1. The requisite due diligence a project of this magnitude warrants.
2. Have qualified cost estimators reconcile and document in detail the difference between the City’s Managed Lane Alternative cost projections and the actual costs of similar facilities in Florida and determine the reasons for the differences between them.
3. Project the outcome of using three-lanes rather than two for all or part of the facility.
4. Project the outcome of distributing Koko-Head bound traffic by way of egress ramps in a manner similar to that shown in Professor Prevedouros’ UHCS study.
5. Project the outcome of following the suggestions made in Appendix 3 of the Task Force Report.

If this is done the EIS will meet the requirements of this particular directive:

*During the draft EIS stage all reasonable alternatives, or the reasonable range of alternatives, should be considered and discussed at a comparable level of detail to avoid any indication of a bias towards a particular alternative(s).*⁵⁵

⁵¹ *Transportation Alternatives Analysis for Mitigating Traffic Congestion between Leeward Oahu and Honolulu: A Detailed Microsimulation Study (UHCS Study)* Directed by Professor Panos D. Prevedouros with the Participation of Undergraduate and Graduate Students Specializing in Transportation Studies. University of Hawaii. 2008.

⁵² http://edocket.access.gpo.gov/cfr_2008/julapr/pdf/40cfr1502.24.pdf

⁵³ 40CFR1502.14

⁵⁴ 40CFR1500.2(b)

⁵⁵ <http://www.environment.flhwa.dot.gov/projdev/tdmalt.asp>

In addition the U.S. Secretary of Transportation has responsibilities under 49USC5309(d)(3),

... for a major capital investment grant, the Secretary shall analyze, evaluate, and consider

(A) the results of the alternatives analysis and preliminary engineering for the proposed project;

(B) the reliability of the forecasting methods used to estimate costs and utilization made by the recipient and the contractors to the recipient;

The Alternatives Analysis was legally insufficient and without a reinstatement of the Managed Lanes Alternative and a more rigorous and scientific assessment of its benefits in a Supplementary Draft EIS, how can the Secretary possibly make a reasoned judgment?

The importance to the people of Honolulu of thoroughly evaluating all reasonable alternatives as required by NEPA is that one or more of the alternatives may offer an opportunity at reasonable cost to provide mobility without needing to construct an elevated rail line along the Honolulu waterfront and through the center of town.

(e) Use the NEPA process to identify and assess the reasonable alternatives to proposed actions that will avoid or minimize adverse effects of these actions upon the quality of the human environment.⁵⁶

Virtually all of Hawaii's environmental organizations are opposed to elevated rail running through the core of the city of Honolulu with all the concomitant visual blight and noise disturbances that it brings. We need to avoid such an environmental disaster if at all possible.

2. Use of the 2003 BRT Project

With some fairly minor modifications the 2003 Bus/Rapid Transit Project, as fully described in the July 2003 Final Environmental Impact Statement,⁵⁷ is a "reasonable alternative" that should have been considered in the current Draft EIS since with its projection of 313,000 daily linked trips, it was forecasting higher ridership than the current rail project for less than \$1 billion in capital costs.⁵⁸

The State's objection at that time to the Regional segment of the Project appears to have evaporated since they have been recently considering changes to H-1 similar to those contemplated in the 2003 FEIS.

Objections to the In-Town segment could easily be mitigated by adoption of the King/Berctania transit couplet described in Dr. Prevedourous' UHCS study. The In-town segment's time savings for the Downtown to Waikiki trip projected in the 2003 FEIS were inconsequential and should not affect the project's overall cost-effectiveness.

3. The EZway Plan

The basic goals of the EZWay plan are to provide:

- a) Substantial congestion relief largely caused at the H-1/H-2 and H-1/Moanalua freeway merges by adding critical high occupancy capacity,
- b) Express bus mass transit primarily in the west Oahu to downtown corridor,
- c) Traffic relief at other major congestion spots in Honolulu; and,
- d) Express transit connections to the University of Hawaii at Manoa.

⁵⁶ <http://www.nepa.gov/nepa/regs/ceq/1500.htm> §1500.2(e)

⁵⁷ http://www.honolulutraffic.com/feis_all_files.pdf

⁵⁸ http://www.honolulutraffic.com/feis_all_files.pdf p. 34.

The EZWay plan extends the transit service requirement of rail by providing a wider coverage, combines strong elements of managed lanes without the use of tolls, and takes advantage of the extensive experience of running bus public transit on Oahu and the Regional BRT plan of 2001-2003. The basic elements of the plan are outlined below and discussed in brief.

The EZWay consists of:

1. three elevated reversible lanes from the H-1/H-2 merge to Iwilei, with a priority BRT from downtown to the UH,
2. express buses having exclusive use of freeway shoulders in order to travel at near free flow speeds from/to the EZWay,
3. a downtown underpass for efficient downtown traffic distribution, and
4. a new Auahi Street transit center for west Oahu bus passenger distribution to Kakaako, Ala Moana and Waikiki.

- (1) The EZWay structure is a fully managed expressway facility that can be described as three reversible elevated zipper lanes starting at the H-1/H-2 merge and terminating at Pier 16 with off-ramps at Aloha Stadium/Pearl Harbor, Lagoon Drive and Waiakamilo Street. The right lane is an exclusive bus lane throughout the length of the facility. At Iwilei, one elevated lane goes to Hotel St. to connect with King/Beretania BRT (University spur BRT). University BRT runs on priority lanes and with priority signaling along King and Beretania Streets.

The EZWay will open with a minimum occupancy requirement of three people per vehicle. This requirement may be increased in the future to avoid congestion. No tolls will be collected. Automated steep fines applied to low occupancy violators. No trucks allowed at any time. Open to all emergency vehicles at all times. Open to green vehicles with greater than 35 mpg EPA highway fuel consumption. This threshold is also subject to change in order to maintain at least 50 mph speeds in peak periods. Therefore, usage on the EZWay is controlled macroscopically, by occupancy and fuel efficiency requirement, rather than microscopically by electronically incrementing tolls.

- (2) Kapolei and Ewa Beach Bus Rapid Transit (BRT) connectors to Waipahu: Hybrid or fuel cell buses will be allowed to use shoulders on on-ramps and a few elevated passages or priority lanes at intersections (queue jumpers) which allow them to get by chronically congested spots. Includes a Waipahu (Farrington Hwy.) on-ramp to/from the EZWay.

Express buses from Waianae and Makakilo may use upgraded H-1 freeway shoulders to get to the EZWay quicker. The same priority treatment applies to express buses from Mililani and Wahiawa.

- (3) Ala Moana Blvd. Downtown Underpass (mini-tunnel) starting east of River Street and ending both at Alakca Street and Halekauwila Street. Same tunnel reverses in the PM period from Halekauwila Street and Bishop Street to Nimitz Hwy. contraflow lane onto the elevated zipper lanes. The underpass may continue to large new parking lot(s) east of Punchbowl Street. As a result, a large portion of vehicular traffic may "disappear" from downtown by going from the EZWay, through the mini-tunnel directly into a parking structure, one block east of Punchbowl Street.

- (4) New Ward Centers bus terminal on Auahi Street. Express buses that arrive from the EZWay stop at this terminal and either return to origin, or continue as regular bus to Ala Moana Center. Contracted tour buses may be deployed at this terminal for direct worker distribution to Waikiki hotels.

Appendix A

Ours and the City's projected costs for the Managed Lanes Alternative versus the Tampa Expressway and the H-3 Freeway — in millions of dollars.

Tampa Expressway			
Cost index			
2001	144.8	\$320.0	original cost
2006	221.3	\$489.1	inflated using construction cost index
+32%		\$645.6	to allow for Florida/Hawaii cost change

TRANSIT ADVISORY TASK FORCE

c/o Honolulu City Council
530 S. King Street, Room 202
Honolulu, HI 96819
Phone: (808)523-4139

Appendix 3

Suggestions for further development of the Managed Lane Alternative.

- The Alternatives Analysis' description of the characteristics of the Managed Lane Alternative should provide more complete information as to mass transit operations utilizing this facility. The Alternatives Analysis States that new express and other bus transit routes would be developed for operation on the Managed Lane facility. (p. 2-4) A fuller development and presentation of the transit services that would accompany the Managed Lane Alternative would be helpful (e.g., routes, new/existing stations). There is no description in the Alternatives Analysis of any proposed supportive operational practices off of the Managed Lane facility that would complement the facility's use as a transit guideway, e.g., transit stations connected to park-and-ride facilities, reserved lanes for transit vehicles on existing streets, traffic signal priority for transit vehicles.
- In its discussion of travel time benefits of the Managed Lane options, the Alternatives Analysis projects that traffic congestion at both the H-1 Freeway access to the Managed Lane facility and at the Nimitz Highway exit at Pacific Street will negate travel time benefits gained from travel on the Managed Lane facility itself. The Analysis should explore how traffic congestion at these points could be alleviated (at least for mass transit vehicles) in order to enhance the overall performance of this Alternative as a transit guideway.
- The description of the Managed Lane Alternative in Chapter 2 of the Alternatives Analysis states "The H-1 zipper lane would be maintained in the Two-direction Option but discontinued in the Reversible Option." (p. 2-4). However, no explanation is provided as to why the zipper lane would not be continued in the Reversible Option. The Managed Lane Reversible Option's addition of two Koko Head-bound elevated lanes for the morning commute appears to result in a net increase of only one lane if the inbound zipper lane were removed.
- The foldout photographic plans presenting the Managed Lane Alternative (Alternatives Analysis, Figures 2 - 1 and 2 - 2) do not clearly depict the ramp lanes necessary to access the Managed Lane facility from Interstate Highways I-1 and

H-2 in both the Two-direction Option and the Reversible Option, or the ramp lanes necessary to exit from the facility to these Interstate Highways.

- These plans show an approximately one-mile long “facility” in the vicinity of Kaonohi Street (Figure 2 - 1), and another in the vicinity of Radford Drive (Figure 2 - 2), however no description of these facilities is provided. In discussions with DTS Administration staff, these facilities have been identified as transit stations with attendant deceleration and acceleration lanes. Assuming this to be the case, it would be helpful to see the proposed location(s) of park-and-ride facilities planned near these stations, comparable to the information presented in Table 3 - 5, with respect to the Fixed Guideway Alternative. It is not apparent whether the stations would operate in both the Two-direction Option and the Reversible Option. What are the cost implications of adding access/exit ramps for transit vehicles instead of building elevated transit stations?
- Figure 2 - 2 shows a small section of the Managed Lane facility approximately 2000 feet Koko Head of the end of the facility at Nimitz Highway/Pacific Street. This component of the Managed Lane facility is not explained. Is it an elevated structure or at-grade? Which Managed Lane users would be allowed to access it?
- Figure 2 - 1 shows two ramps in the vicinity of Aloha Stadium. It is not clear whether these ramps would be available in both the Two-direction Option and the Reversible Option, or whether these ramps would be available to other than transit vehicles (e.g., to vans, three-person and two-person automobiles, and/or single-occupant automobiles paying tolls).

See also Financing Committee’s report discussing changes in permitted access to the Managed Lane facility that might make the facility eligible for New Starts and/or GET ½% surcharge funds.

February 6, 2009

Part II — Insufficient consideration of elevated rail impacts

Use all practicable means, consistent with the requirements of the Act and other essential considerations of national policy, to restore and enhance the quality of the human environment and avoid or minimize any possible adverse effects of their actions upon the quality of the human environment. 40CFR1500.2.¹

At the heart of this issue is that of the environmental harm of an elevated rail transit line thirty feet wide at an average of 35 feet elevation accommodating trains every 1½ minutes (three minute intervals in both directions) during the peak commuting time and three minutes at other times traversing the entire center of urban Honolulu including the waterfront.

The effect of elevated rail on the built environment has not been adequately addressed in the Draft EIS. The following requirement that there be discussions about the built environment is not fully addressed.

Urban quality ... and the design of the built environment including the reuse and conservation potential of various alternatives and mitigation measures.²

Many environmental organizations have gone on record as being opposed to such an elevated structure. The following are some quotes from their recent statements on elevated rail:

Outdoor Circle: *The lack of specific descriptions of how to overcome the visual misery that will be heaped upon the O'ahu landscape leaves our organization with little confidence that damages to the visual environment can or will be mitigated as the project moves forward ... Of equal concern to The Outdoor Circle is the pending fate of literally hundreds of street trees. Honolulu has fostered a worldwide image of being a city full of beautiful trees. It's an important part of Honolulu's appeal to both residents and visitors ... The Outdoor Circle believes the City has deceived the public about the visual impacts the project will have on our communities and our quality of life.*

Historic Hawaii Foundation: *The proposed Honolulu Transit Corridor project will have a dramatic impact on the landscape of the island of O'ahu; this includes not only the direct impact to specific parcels, but primarily the visual effect on the landscape and historic resources. HHF is concerned that the Draft EIS does not accurately take into account these larger impacts, but rather focuses on those adverse effects caused by the direct taking of land.*

Hawaii's Thousand Friends: *Elevated fixed rail routes will negatively impact the established landscape of Honolulu and significant view planes makai to mauka ... The rail line will be the ugly and block views with concrete rail beds 30-feet wide supported by pillars that are 35-40 feet high and six feet in diameter spaced at 150 feet intervals.*

Hawaii Architects position: *... the proposed elevated rail structure will block mauka and makai view corridors particularly along Nimitz Highway through historic Chinatown and Downtown ... Elevated rail stations and structures along the waterfront will make a poor situation worse by introducing an additional physical and visual barrier ... We are concerned that the areas below elevated rail structures and stations will become*

¹ <http://www.nepa.gov/nepa/regs/cen/1500.htm> §1500.2(f) See also 49 USC 5301(e) and 42 USC § 4321

² 40CFR1502.16(g)

blighted, "nuisance" environments and that the lack of natural public sightlines into stations will diminish safety and security for passengers waiting on platforms. The proposed elevated platforms and concourses will also impede convenient access for both able-bodied and disabled users.

We believe that elevated rail violates the Oahu General Plan, which states, in part, we must,

Protect Oahu's scenic views, especially those seen from highly developed and heavily traveled areas & Locate roads, highways, and other public facilities and utilities in areas where they will least obstruct important views of the mountains and the sea.³

We believe there has been inadequate consideration of the detrimental effects of elevated rail. What has happened in other communities that once had an EI, such as New York's 3rd Avenue EI? What are the detrimental impacts of the elevated sections of Miami's Metrorail and San Juan's Tren Urbano? What happened in San Francisco when they removed the Embarcadero Freeway segment?⁴

It should be noted that the Managed Lanes Alternative and the other suggestions for alternatives, the 2003 Bus/Rapid Transit proposal, and the EZWay plan, do not propose any elevated structures through the urban core or in residential areas or along the waterfront. We believe that had these other alternatives been objectively studied as required by NEPA that one of them would have been the "environmentally preferable alternative."

The environmentally preferable alternative is the alternative that will promote the national environmental policy as expressed in NEPA's Section 101. Ordinarily, this means the alternative that causes the least damage to the biological and physical environment; it also means the alternative which best protects, preserves, and enhances historic, cultural, and natural resources.⁵

As was also commented on by the Corps of Engineers:

... the overall project purpose is used for evaluating practicable alternatives under the Guidelines, which require that if the overall purpose of a project is practicably met through several alternatives, the Corps can only authorize the least environmentally damaging practicable alternative.

City renderings misrepresent reality

We asked a professional commercial artist with experience in streetscape renderings to comment on those renderings shown in the Draft EIS on pages 4-65 through 4-84. Following are their comments:

In nearly every rendering, the cast shadows have been deemphasized, making the project appear much less impactful. They show shadows, but do not show the correct size and extension to match the existing shadow reach (shown by other objects in the photo), or especially darkness. This has a significant psychological effect, and they use it to the extreme.

The shadows on the structures themselves have also been deemphasized to give the appearance of blending into the scene, which is also a distortion. They make extensive

³ Oahu General Plan, III, Objective B, policies 2 & 3. <http://honolulu.gov/planning/GeneralPlan/GP3.pdf>

⁴ NEPA implementing regulations provide that "[e]nvironmental impact statements shall be concise, clear, and to the point, and shall be supported by evidence that agencies have made the necessary environmental analyses" (40 C.F.R. § 1500.2(b)) [emphasis supplied].

⁵ Council on Environmental Quality's 40 Questions and Answers. <http://ceq.hss.doe.gov/neparegs/40/1-10.HTM> 6(a)

use of a 'white' concrete appearance. Is that a correct material they will use? Even if so, the shadows will be significantly more prominent.

Their choice of view locations/angles is carefully done, of course.

The width of the guideway and its vertical thickness are smaller than what the actual plans call for. Many of the support columns are quite obviously slimmer than they should be.

They are showing support columns on thin grassy strips of median with virtually no 'buffer' between the median curb and the pillar itself. That is not legal.

One of the Dillingham shots (DEIS, fig 4-27) shows a pillar resting directly in the right turn lane. I'm thinking that may be a no-no.

These also do not properly indicate the foliage that will be removed.

The Dillingham shot similar to our rendering talks about trees 'softening' the visual impact, but they don't mention the trees that will be removed on the Mauka side of the street. The angle they use disguises it. The Fort Street Mall shot is a joke. They positioned the shot to put as many trees as possible in the view line.

The photos and renderings on the following pages illustrate our concern with the impacts of elevated rail along the waterfront and through the center of Honolulu:

Our artist carefully calculated the appropriate support column and rail bed widths and added the barriers necessary to protect the support piers. The City's version is below and the differences are obvious; the dimensions are smaller and the structure appears less intrusive. On all City renderings (Draft EIS pp. 4-65 to 4-84), the environmental impacts are deliberately minimized.

February 6, 2009

Part III — The Locally Preferred Alternative must be studied in the EIS

Proposals or parts of proposals which are related to each other closely enough to be, in effect, a single course of action shall be evaluated in a single impact statement.¹

A problem of "segmentation" may also occur where a transportation need extends throughout an entire corridor but environmental issues and transportation need are inappropriately discussed for only a segment of the corridor.²

As stated in Bill 79 (2006)³ and Ordinance 07-001:

The locally preferred alternative for the Honolulu High-Capacity Transit Corridor Project shall be a fixed guideway system between Kapolei and the University of Hawaii at Manoa ... with the Waikiki branch ... The city administration is authorized to proceed with preparation of an environmental impact statement for the locally preferred alternative (LPA)

Resolution 07-039 defines a shortened minimum operable segment between East Kapolei at the University of Hawaii-West Oahu, near the future Kroc Center, and Ala Moana Center.

The second and last Scoping Report, p. 5-3, states clearly that:

Both UH Mānoa and Waikīkī service are included in all fixed guideway alternatives that will be evaluated in the EIS.

However in the Draft EIS, the detailed environmental analysis and documentation applies only to the core 20-mile alignment between East Kapolei and Ala Moana Center. The additions from East Kapolei to West Kapolei and from Ala Moana Center to UH Mānoa and to Waikīkī are described as "future planned extensions."

The Locally Preferred Alternative should be examined in the EIS in its entirety as was intended by both Notices of Intent and authorized by the City Council. The three "planned extensions" should not have been segmented from the Locally Preferred Alternative in this Draft EIS.

As the Corps of Engineers commented for the second Scoping Report, A-10,

The Corps believes the environmental consequences resulting from construction of the "Minimal Operable Segment" and all planned extensions must be considered in the project-level EIS, particularly if the Project [meaning the LPA] benefits, wholly or partially, are derived from one or more of these future extensions and station locations.⁴

We believe that segmentation of what was formerly the Locally Preferred Alternative into a newly designated "Project" (formerly the Minimum Operable Segment and later the First Project) and "planned extensions" was surreptitiously undertaken to avoid the following FTA policy.

... the Federal 'undertaking' in a Fully Funded Grant Agreement (FFGA) will no longer be segmented into Project and Local Activities. All activities related to a Federal undertaking will be identified as the Federal Project. The Federal funds will be distributed among all the activities in the project at a level funding ratio equal to the

¹ 40CFR1502.4[a]

² <http://www.hawaii.gov/environment/ults.htm>

³ <http://www.honolulutraffic.com/Bill79Final.pdf>

⁴ Corps of Engineers comments, Second Scoping, App. A-1, p. A-6, at: www.honolulutraffic.com/NEPASCopingReport.pdf

percentage of Federal financial participation in the entire project. Thus, all the elements and activities of the project, as described in the FFGA will be funded, in part, with Federal funds; and, the requirements attached to the use of Federal funds will apply to each such task, unless otherwise exempted as provided in the applicable laws, regulations and policies.⁵

Not segmenting the original Locally Preferred Alternative would mean that the City would get far less federal funds for the Minimum Operable Segment and make the MOS even more financially untenable than it is already (see Discussion of Finances).

The lack of any credible rationale in the Draft EIS for the City's segmentation of the "planned extensions" from the LPA intimates that the segmentation was done to facilitate funding and acceptance of the Draft EIS since cost and environment issues for the extensions to UH Manoa and Waikiki are proportionally greater than for the Minimum Operable Segment.

These combined segments of the project are intended to provide approximately 30 miles of unified rail transit line. The cost and environmental impacts of the integrated project will be significantly greater than the isolated Minimum Operable Segment or "Project" that is specified.

The UH Manoa and Waikiki extensions will traverse the core urban center of Honolulu creating significant cumulative environmental impacts including prolonged lifestyle disruption due to construction difficulties, excavation of culturally sensitive areas, severe noise impacts through close-quartered residential neighborhoods resulting in great emotional distress, impossible to mitigate visual impacts, and negative impacts on property values within close proximity to the rail line.

When several foreseeable similar projects in a geographic region have a cumulative impact, they should be evaluated in a single EIS.⁶

Like the two sections of the Winston-Salem beltline at issue in North Carolina Alliance, the three remaining sections of the Locally Preferred Alternative,

... constitute cumulative actions, and therefore should [be] considered in the same environmental impact statement.⁷

The *de minimus* discussion of cumulative impacts of the planned extensions in the Draft EIS do not justify segmentation of the Locally Preferred Alternative under NEPA. This segmentation has occurred because of funding considerations and the arguments found in the Draft EIS are merely post-hoc rationalizations for this funding-driven violation of the law.

The Draft EIS violates both NEPA and the FTA regulations because it fails to consider the fully detailed cumulative actions of the Minimum Operable Segment and the "planned extensions" in a single Environmental Impact Statement, because these sections were segmented due to funding considerations rather than the NEPA criteria.

The Draft EIS, p. 2-41, states that,

The Ala Moana Center and Convention Center Stations would be transfer points between the UH Mānoa and Waikīkī branch lines.

This raises innumerable question about how this would all work and what would be the impacts. For example, the engineering drawings⁸ show that the planned extension to UH would entail

⁵ http://www.fta.dot.gov/funding/thirdpartyprocurement/bppin/grants_financing_6105.html

⁶ Resources, Ltd. v. Robertson, 35 F.3d 1300, 1306 (9th Cir. 1993), quoted in North Carolina Alliance for Transportation Reform v. U.S. Dept. of Transportation, 151 F. Supp. 2d 661, 685 (M.D.N.C. 2001).

⁷ 151 F.Supp. 2d at 684.

⁸ Draft EIS, Appendix A, Sheet RP024.

adding a branch line in the vicinity of the junction of Queen and Waimanu Streets. This would likely near double the width of the rail bed. The drawings also show that these two rail lines cross over one another at Piikoi and Kona Streets with one line continuing at the 35 feet level and the one above at 65 feet. This may be an even greater eyesore than was in the original plan.

How are the two Ala Moana stations going to work? And how are the promised three minute headways to be maintained with these future extensions.

Further, if Ala Moana Center and the Convention Center are transfer points to Waikiki and UH Manoa, how will that work environmentally? If UH Manoa and Waikiki are also to have service every three minutes, how is that going to work with three separate lines — Ala Moana only line, UH Manoa line and Waikiki line — in operation?

Is the lower Ala Moana Station to be torn down and replaced by the originally contemplated higher one? Or is it that the structures at Ala Moana Center present insurmountable engineering difficulties and that the City has no plan to ever build beyond Ala Moana Center?

Or is it that the “planned extensions” could not possibly pass the FTA’s cost-effectiveness test? It is obvious that the “planned extensions,” which would require a separate EIS,⁹ would not come close to meeting the cost-effectiveness requirements.

In another significant omission, the Draft EIS does not give total transit boarding or trip data for the various rail alternatives, only Fixed Guideway Boardings.¹⁰ However, according to the Alternatives Analysis the greatest transit ridership generated of all the rail alternatives is 294,100 versus 281,900 for the 20.7 mile MOS. That is a mere 4.5 percent increase in ridership requiring a 25 percent increase in capital costs, again according to the Alternatives Analysis.

Frankly, failing a coherent plan that addresses these issues, we are presently inclined to believe that Ala Moana Center is the final terminus and there may well be no real intent to build the “planned extensions.”

Had the City Council and the public been aware of this segmentation at the time of the Alternatives Analysis and Scoping, the public responses may well have been very different. For example, the Managed Lane Alternative would have been considered more useful if there was to be no direct rail connection to UH Manoa.

In addition, the Minimum Operable Segment will have almost no impact on residential property in the dense urban areas whereas the planned extensions to UH Manoa and Waikiki will have significant adverse impacts on high rise condominiums, hotels, and family dwellings.

For all these reasons the Locally Preferred Alternative should be examined in the EIS in its entirety as was intended by both Notices of Intent and authorized by the City Council and as required by law.

⁹ Draft EIS, 2-41.

¹⁰ Draft EIS, Table 3-28.

February 6, 2009

Part IV — First Project, Phase I, is an illegal segmentation.

Agencies shall not commit resources prejudicing selection of alternatives before making a final decision. 40CFR1502.2[f].

The Locally Preferred Alternative is a major federal action. To have the First Project, Phase I, East Kapolei to Pearl Highlands, under construction before such time as the City is granted a Full Funding Grant Agreement, or even a Record of Decision, or being given a Letter of No Prejudice¹ clearly violates federal regulations on evaluating environmental impacts (23 CFR 771.111(f)), which require that:

In order to ensure meaningful evaluation of alternatives and to avoid commitments to transportation improvements before they are fully evaluated, the action evaluated in each environmental impact statement (EIS) or finding of no significant impact (FONSI) shall:

Connect logical termini and be of sufficient length to address environmental matters on a broad scope;

Have independent utility or independent significance, i.e., be usable and be a reasonable expenditure even if no additional transportation improvements in the area are made; and

Not restrict consideration of alternatives for other reasonably foreseeable transportation improvements.

To build Phase I prior to receipt of a Letter of No Prejudice would violate the regulations. Connecting East Kapolei to Pearl Highlands where the first three of the six stations are in open fields² is not exactly connecting "logical termini" especially as the Kapolei terminus and the next two stations are in open fields, and where for the last half of its six-mile length is in an area of low population density.³

While the Phase I costs, ridership and cost-effectiveness are not detailed in the Draft EIS, it is obvious that it cannot possibly have "independent utility or independent significance."

For these reasons, the construction of Phase I would be an illegal segmentation.

¹ Spot Report #2, PE Entry Readiness Report, on HHCTCP by Booz Allen, October 2008.

² See video <http://www.honoluluanisil.com/video?id=14>

Part V — Unjustifiable forecasts:

1. Ridership forecasts

The No-Build forecast is irrational and it stems from the fact that proponents refuse to recognize that transit continues to lose market share to the automobile and has been doing so for as long as the Census has been collecting commuting data.

We can also measure the decline by using total urban transit boardings and divide it by urban populations — a number that used to be known as the *riding habit*.

Transit boardings per capita of urban population peaked in 1917 at 289 boardings annually. It declined slowly to 276 by 1926 then dropped precipitously during the Depression to 176 by 1940.

It increased during World War II and then dropped back down to the earlier level at the end of the war and then declined steadily to 49 in 1970. Since then it has dropped to today's level of 42.

While the decline continues on it is at a much slower rate. And that is because of the subsidies.

In 1960 transit companies were, for the most part, profitable tax-paying privately-operated businesses. In the 1970's began the massive subsidies for transit from local, state and federal governments — some \$260 billion just in the last ten years. It has slowed the decline in transit's market share but it has not stopped it.

Honolulu has followed the national trend. Our ridership is slowly declining over time as can be seen from the chart below using the City's ridership data.¹ But while the ridership is declining despite

increased population and providing higher service levels to the public, the City and Parsons Brinckerhoff continue to forecast increases for the No-Build alternative, which is what happens if we do little more than we are doing now and have done for the last thirty years.

The chart shows the last three forecasts made by Parsons Brinckerhoff for the No-Build option for the 1992 rail project, the 2003 forecast of No-Build for the BRT program and now the No-Build forecast for this Draft EIS.

The importance of the No-Build forecast is that the rail transit forecast uses the same computer forecasting model. Thus, if the No-Build is optimistic, so are all the forecasts that use the same model, such as the rail transit forecast.

¹ http://hawaii.gov/dbedt/info/economic/databook/Data_Book_time_series/ Table 18.25

Take a hard look at the above chart. Remember that during this period Oahu has had two periods of incredible fuel cost spikes and declines. We have had periods of great prosperity in the 1980s and late 1990s to 2007 and economic hardship in the early 1990s. We have had population growth and a period of slight population decline. And while we had a general slight decline in bus ridership it was a considerable decline relative to population growth.

The historical data strongly suggests that we will get more of the same unless major changes were to occur.

Since the last two forecasting models have been drastically wrong on Honolulu ridership and since there have been dramatic shortfalls in ridership projections for virtually all new U.S. rail transit systems,² the public should be wary of the ridership forecasts for the Project and consider the impacts of lower (and higher) ridership on their future taxes.

The last rapid transit line to open in the U.S. was Puerto Rico's Tren Urbano line which only achieves 40 percent of its FTA approved ridership projections.

2. Projected energy savings have not been carefully examined.

The U.S. Dept. of Energy has measured the energy use of rail by system and finds the following:

*"Because of the inherent differences in the nature of services, routes available, and many additional factors, the energy intensity of transit rail systems can vary substantially among systems. The charts [see here and Appendix C] show that for 2000, light rail systems varied from 1,600 Btu per passenger-mile to over 8,000 Btu per passenger-mile; energy intensity for heavy rail systems ranged from 2,200 to 6,200 Btu per passenger-mile."*³

The average energy use of automobiles is 3,400 Btus per passenger mile according to the U.S. Dept. of Energy.⁴ Thus,

many rail lines consume more energy per passenger mile than does the average automobile with a typical 1.1 occupants.⁵

Undoubtedly, a full train uses less energy per passenger than a single-occupant vehicle; however, trains are rarely full in both directions except in extremely highly populated metropolitan cities.

¹ See page 5.

² Fact #221: June 17, 2002, Transit Rail Energy Intensity Varies By System

³ Source: 2007 DOE Energy Data Book, Table 2.13. At: http://eia.doe.gov/data/cdb/27/Edition27_Chapter02.pdf

⁴ Load factor used was 1.1 occupants for automobiles and 1.72 occupants for light trucks and SUVs.

⁵ Source: http://eia.doe.gov/data/cdb/27/Edition27_Appendix_A.pdf

Where the confusion arises is that rail proponents unjustly tout the *weighted* average of rail transit energy use. This average is dominated by the energy efficient New York subways, which carry 57 percent of the nation's rail transit traffic and masks the relative energy inefficiency of most other rail lines.

But Honolulu is not going to use the ultra heavy rail equipment, such as New York's, because it does not have the population size to support such equipment.

In addition, autos travel directly from their point of origin to their destination, and therefore, the total miles travelled are much less than by transit – and thus more energy efficient.

With the continued growth of hybrid cars and buses we may expect their energy efficiency to continue to significantly improve up to the horizon year of 2030 while rail transit projections are not forecasting savings.

Construction energy use:

Another form of energy use is that used for its construction. The following is an excerpt from the Congressional Budget Office testimony given by its Director, Alice Rivlin, before the Subcommittee on Transportation, Committee on the Environment and Public Works, United States Senate on October 5, 1977.

"In particular, new heavy rail systems appear much less energy-efficient than new bus services, when the energy needed to build roadways and track, the energy needed to manufacture and maintain vehicles, the energy used to heat and light stations, the energy required to drive to stations, and the directness of alternative modes of travel are taken into consideration. The principal reason for this is that the limited route mileage of rail systems necessitates a high degree of auto travel to and from stations, resulting in overall, door-to-door travel patterns that are less energy-efficient than rail travel by itself."

In short, we believe it will be very difficult for the City to show scientifically and "in an accurate, clear, complete, and unbiased manner"⁶ that the proposed rail line is more energy efficient than the average automobile.

The Draft EIS shows:

Daily operating energy for Airport Alternative:	1,224 million btu/day
Construction energy for Airport Alternative:	7,480,000 million btu

This means construction energy would be 20 years worth of daily energy usage. If we allow a 50 year life for the train and spread the construction energy use over its life then we need to increase the daily usage by 40 percent to get a better picture of energy use.

The construction energy issue together with the shorter distance covered by the automobile makes it almost impossible for even a highly energy-efficient rail line to be more energy efficient than the regular automobile and this should be made clear to the public.

3. The Draft EIS financial plan is unduly optimistic

The City's recently released financial plan shows us that rail is to be funded primarily by the ½ percent General Excise Tax surcharge amounting to \$4.1 billion and the federal government with \$1.4 billion for a total of \$5.5 billion.

The Airport Alternative capital plan shows federal New Starts funding of \$1.4 billion and this is much higher than what has been discussed heretofore.

⁶ OMB Guidelines for ensuring the integrity of information. <http://www.whitehouse.gov/omb/fedreg/reproducible2.pdf>

What is not discussed is that the additional operating subsidy for rail is not accounted for in the cash flow plan but will be paid for with the General and Highway Funds, which is to say, by property taxes. This subsidy grows 34 percent over inflation through 2030 and the total operating subsidy amounts to \$5.4 billion during this time.

In addition, even if this highly optimistic financial plan is met, not only would we have \$5.4 billion to meet out of property taxes (either increases or foregone reductions) but we will also have over \$500 million more in General Obligation bonds than at present.

The City plan shows the GE tax surcharge revenues growing at 5.4 percent compounded annually for 2008-2022 even though that is much faster than the 4.5 percent that it grew during 1992-2005.

The table below consists of the city's forecast taken directly from their Cash Flow Tables associated with the Draft EIS. Calculations of City collections of the ½% GE tax increase					
Fiscal year	Our calculation		City forecast		\$ diff.
	Mills. \$'s	% change	Mills. \$'s	% change	
2007	\$48	Actual	\$13	N/A	\$35
2008	\$169	Actual	\$161	N/A	\$8
2009	\$173	2.5%	\$188	16.8%	-\$15
2010	\$167	-3.5%	\$198	5.3%	-\$31
2011	\$169	1.3%	\$207	4.5%	-\$38
2012	\$174	3.0%	\$214	3.4%	-\$40
2013	\$180	3.1%	\$228	6.5%	-\$48
2014	\$190	5.9%	\$242	6.1%	-\$52
2015	\$203	6.6%	\$253	4.5%	-\$50
2016	\$215	5.7%	\$265	4.7%	-\$50
2017	\$222	3.4%	\$274	3.4%	-\$52

2020	\$250	3.0%	\$309	3.0%	-\$59
2021	\$260	3.9%	\$321	3.9%	-\$61
2022	\$273	5.0%	\$337	5.0%	-\$64
2023	\$143	5.0%	\$261	N/A	-\$118
Total	\$3,312		\$4,056		-\$744

Our calculation uses actual collections given by the City's Department of Budget and Fiscal Services for fiscal years 2007 and 2008⁷, the projection of percentage increases and decreases in GE tax collections by the State Council on Revenues 2009-2015⁸, and the City's projection of annual percentage increases in GE tax revenues for 2016 through 2023 as calculated from their Cash Flow Tables.⁹

The net result is a \$744 million shortfall from what the City is projecting. It shows that the City is going currently into deficit and when the economy turns positive the City never catches up.

⁷ <http://hawaii.gov/tax/monthly/2008fyr1.pdf> The gross revenues are shown before the State takes its ten percent share.

⁹ http://www.honolulutraffic.com/Cash_Flow_Table.xls

4. Risk assessment understated

The risks that Honolulu taxpayers are taking that are possible, and more likely probable, from inaccurate forecasting are poorly and insufficiently addressed.

The federal government has published two formal studies comparing predicted with actual impacts of New Starts projects. In another omission these are not so much as mentioned or referenced in the Draft EIS.

The financial risk assessment is superficial in that it describes events that could affect the financial performance of the Project, but does not address the consequences. For example, the Draft EIS discusses factors that could affect Project capital costs and funding, and Project operating costs and revenues, but it does not elaborate (or even mention) the consequences of any shortfall in capital or operating cash flow.

A significant capital shortfall could result in stoppage of the Project at an intermediate stage, and/or delay in completion of any or all of the extensions or be made up by incurring further debt.

A significant shortfall in cash flow could result in deferral of other City projects or programs, or would have to be made up by City subsidies, which are primarily funding by property taxes.

At a minimum, the risk assessment should include such items as:

- How any additional borrowing will be paid for.
- A sensitivity analysis of Project negative cash flows (capital or operations) on property taxes.
- A detailed analysis of projects that would have to be delayed (including this one) based on insufficient capital.
- Identification of environmental projects that would be affected (sewage plant upgrades, collection system upgrades, sewer maintenance).
- Identification of quality-of-life issues (road maintenance and repairs, park maintenance and other city services).

The EIS needs to explain “in plain language” the financial risks taxpayers will be taking with the City’s rail transit proposal.

This is particularly important for Honolulu since, on a per capita basis, the \$4.5 billion in 2008 dollars (or \$5.4 billion in year of expenditure dollars) projected cost would make it by far the

Rail transit costs per capita of population ¹⁰			
MSA	Cost in millions 2006\$’s	Metro area population (thous.)	Cost per capita
Dallas	\$1,067	5,222	\$204
Denver	\$358	2,582	\$139
Portland	\$1,643	2,265	\$725
Sacramento	\$307	1,797	\$171
Salt Lake City	\$376	1,334	\$282
St. Louis	\$464	2,604	\$178
Pittsburgh	\$1,051	2,571	\$409
Honolulu	\$4,200	920	\$4,565

most expensive rail lines on a per capita basis ever built in the U.S, even allowing for inflation and without cost overruns.

To make a sensible assessment of the financial risks of the project, policy makers need to review the experiences of other metro areas that have built rail lines with actual versus projected capital and operating costs and ridership. The use of comparable projects is widespread in business planning and certainly in real estate. It should be an FTA requirement that transit agencies include comparable data in their EISs.

¹⁰ The data in the table is not completely reliable but does approximate the relative per capita costs.

Until recently the only official U.S. Department of Transportation (USDOT) comparisons of other metro areas capital cost projections and ridership versus actual outcomes, was the 1990 *Pickrell Report*¹¹ which focused “upon the accuracy of projections that were available to local decision-makers at the time the choice among alternative transit improvement projects was actually made” (original emphasis). This is usually the time when the Locally Preferred Alternative is selected.

This report showed cost overruns for the eight rail projects studied as averaging 42.8 percent. Importantly, they revealed a wide error range from the best, the original Pittsburgh light rail line, at 11 percent under projection, to the worst, at 83 percent over.

The second study, FTA’s *Predicted and Actual Impacts of New Starts Projects*¹² was released last year and also compares projected costs at the Alternatives Analysis/Draft EIS and FEIS stages with actual costs. The average cost overrun in this study was 40.2 percent.

Many agencies use cost forecasts that were made much later in the process, some just before the opening of the line, long after the primary decisions had been made. These tend to show much higher projected costs and therefore show a greater likelihood of coming in “under budget.”

Furthermore, in reviewing the two studies we find little consistency in the percentage overruns. While the averages are around 40 percent over, they vary from 28 percent under projection to 186 percent over so we can take little comfort from the averages.

The following table shows the range of errors and also the average error for both cost and ridership projections in each of the two reports.

More important than averages is the distribution of the various error rates. For example, if the resulting costs of the 21 projects were between ± 10 percent of the original projections it would be a reasonable indication to the public of the accuracy of the projections.

Projections versus Actual — Ridership and Costs				
	costs vs. projections		Ridership vs. Projection	
	Cost range	Average	Range	Average
Pickrell Report	-11% to +83%	+43%	-28% to -85%	-62%
FTA CPAR Report	0% to +186%	+40%	-84% to +39%	-39%

But when faced with actual results that range from on budget to nearly triple the projection, what is the public to make of it? Based on the wide range of uncertainty, what is the public to believe?

Even if we were to use just the average it would increase the Honolulu Project cost from \$4.5 billion to \$6.3 billion — a nearly \$2 billion increase. And ridership would be 39 percent lower than projected,¹³ which would mean fare revenues of \$800 million less than the City is planning on through 2030.

The City Administration will undoubtedly paint this as ridiculously improbable and wildly pessimistic.

However, each of these recent 21 capital cost projections was thought at the time to be reasonable by both the transit agency and its consultant who produced them. Just as our City Transportation Department and its consultants, Parsons Brinckerhoff and InfraConsult, also believe their current cost projections are reasonable.

¹¹ Pickrell, Don H. *Urban Rail Transit Projects: Forecast Versus Actual Ridership and Costs*. U.S. Dept. of Transportation. October 1990. Informally known as the Pickrell Report.

¹² Federal Transit Administration. *The Predicted and Actual Impacts of New Starts Projects -- 2007: Capital Cost and Ridership*. April 2008. We used the Alternatives Analysis/Draft EIS forecasts for comparison as did the Pickrell Report.

¹³ [http://www.fta.dot.gov/documents/NSPA2007_Final\(1\).pdf](http://www.fta.dot.gov/documents/NSPA2007_Final(1).pdf) Table 7.

In addition, the FTA's in-house analysts and outside consultants also examined each of these 21 capital cost projections in great detail and thought them all reasonable.

And so here we have innumerable transit planners, engineers and accountants, all well educated and experienced and all believing that, as a the result of their hard work, the cost projections are, dare we say it, reasonable. Yet each new project seems to ignore past experience, and in most cases, the project comes in significantly over budget.

The FTA believes that projects that are within ± 20 percent range are reliable.¹⁴ On this basis, Honolulu's forecast could have nearly a billion dollar cost overrun and still be considered "reliable." But, in this latest FTA report, more than half of the projects exceeded the 20 percent deviation limit.

The public needs to understand the financial risk and implications of various levels of cost overruns, and then consider how, or even if, they, as taxpayers, can cope with the resulting financial impact. After all, Hawaii's senior Senator, Daniel Inouye, said that if the City had to spend one billion dollars fixing the sewage treatment facility, it would bankrupt us. The rail project could cost as much as \$9 billion, before accounting for operating losses and bond interest. What would be the financial impact of that?

The Draft EIS shows us clearly that traffic congestion, with rail, is going to be far worse than it is today.¹⁵ Is it reasonable to expect that Honolulu taxpayers to afford to risk this many billions of dollars on a project that will not reduce traffic congestion below today's unbearable levels?

The issue here is that the public needs to be provided in the EIS with sufficient quantified information about the financial risks and uncertainties in the project for them to understand what could be the impact on their future property taxes.

The Draft EIS states that transit operating subsidies will increase from the current less than 10 percent of the City Budget to 14 percent by 2030.¹⁶ Since the subsidies will continue to be funded from the City's Highway and General Funds,¹⁷ what will be the effect on property taxes given a range of errors for both capital costs and ridership?

5. Operating subsidies are understated:

The City projects operating subsidies to be 70 percent of operating costs, which has been a long-term City Council policy. Thus the higher the operating costs, the higher the subsidies.

Operating costs for the mid-priced Airport Alternative are projected to be \$68 million¹⁸ annually to carry unlinked trips (boardings) of 29.9 million¹⁹, or \$2.27 per unlinked trip.

However, nowhere in the Draft EIS is there any indication of what is being used as the basis for calculating operating costs.

Since we are planning to build an elevated steel-on-steel rapid transit system we should compare our projected operating costs with those of other U.S. cities with elevated rapid transit lines.

There are just two elevated lines that seem appropriate, the Miami Metrorail and San Juan's Tren Urbano. Their actual operating costs per trip in 2007 were \$4.61²⁰ and \$6.83²¹ respectively. This would lead us to believe that Honolulu's projected \$2.27 may be understated.

¹⁴ CPAR p. 9.

¹⁵ Kalaauo Screenline AM Peak Koko Head bound traffic volumes are forecast in the Draft EIS to increase by nearly 10 percent from today's levels with no additional highway capacity planned.

¹⁷ Draft EIS, Section 6.4.4.

¹⁸ Draft EIS, Table 6-3.

¹⁹ Draft EIS, Table 3-16 shows 95,000 average weekday boardings, which multiplied by 315 results in 29.9 million.

²⁰ http://204.68.195.57/mdprogram/pubs/profiles/2007/agency_profiles/034.pdf

If we examine actual versus projected operating costs and ridership of other rail lines we can get a handle on the risks being taken in this cost category.

The FTA's latest assessment of ridership published last year showed average shortfalls from the projected ridership were 39 percent while the earlier *Pickrell Report* showed an average shortfall of 61 percent.

Another FTA Report released last year dealt with cost overruns for operating costs.²² This showed an average cost overrun was 87 percent. This was remarkably close to the only other assessment of operating cost overruns, which was the *Pickrell Report* averaging 83 percent.

If we apply the 87 percent overrun to Honolulu's projected \$68 million operating costs it results in \$127 million. And if we reduce ridership by 39 percent to 58 million and then divide that into the \$127 million it results in operating costs of \$6.81 per unlinked trip, or three times the amount currently projected.

Since the aggregate operating costs for bus and rail combined through 2030 is currently projected at over \$7 billion²³ the public should be made aware of the significant risk being taken in this area.

There is also a danger that we may have made insufficient allowance in the calculation for transit police, which is usually a major expense and transit agencies often omit it from their forecasts by accounting for it in other parts of their budgets.

Los Angeles pays in excess of \$50 million annually for their Transit Police with about three times the rail ridership projected for Honolulu. We note that is no mention of such costs in the Draft EIS.

6. Replacement and Refurbishing

The city does not explicitly warn the public in the Draft EIS that virtually all of the rail cars, rail lines and other equipment will have to be replaced, or rehabilitated, also known as R&R, within 35 years from the start of operations.

Other than to project that the City will expend \$62 million²⁴ on R & R through 2030, the following two paragraphs is all that is said.

The estimates include ongoing costs for replacing, rehabilitating, and maintaining capital assets in a state of good repair throughout the forecast period (2007 to 2030). Rail rehabilitation and replacement costs are expected to begin 16 years after initial construction activities are completed. Draft EIS, 6-3.

6.4.3 Ongoing Capital Expenditure Cash Flow: Systemwide ongoing capital expenditures include all necessary replacement, rehabilitation, and improvements to the existing system (TheBus and TheHandi-Van) as well as the Project. Funding sources used to pay for these capital expenses consist of discretionary and formula-based Federal funding programs (see Section 6.2.3, Funding Sources for Ongoing Capital Expenditures, for descriptions of these programs). Any resulting funding gap is assumed to be bridged on an annual basis with City General Obligation Bonds, as is currently the case with transit-related budgets. Therefore, the resulting ongoing capital sources and uses would balance in any given year. Draft EIS, 6-10.

²² http://www.fta.dot.gov/documents/CPAR_Final_Report_-_2007.pdf

²³ Draft EIS Cash Flow Tables, Airport Alternative, total YOES.

²⁴ Draft EIS Cash Flow Tables. In 2008 dollars, or \$116 million in YOES.

Failing to provide for R&R results in this Washington DC headline that “Metro needs \$11.3 billion” which goes on to explain that,

*\$7 billion alone is needed just to maintain service and keep the system running safely and reliably from 2010 to 2020. That includes repairs to leaking tunnels and crumbling platforms, as well as replacements for aging rail cars.*²⁵

The following are some of the provisions made for R&R by other rail transit lines such as San Francisco’s BART, the Chicago Transit Authority’s rail transit, and Atlanta’s MARTA, as follows:

Chicago Transit Authority capital expenditure plan spells out that:

*“All rail cars rehabilitated at mid-life (12-13 years), overhauled at their quarter-life points (6 and 18 years), and either rehabilitated or replaced at the end of their useful life (25 years).”*²⁶

Similarly, the Atlanta Transit Authority concurs:

*“MARTA started work last year to rebuild and upgrade all 48 miles of track. It is an extensive project that will not be complete until mid-2007. Our trains have run every day for over 25 years – this work is necessary to keep the system strong for the next 25 years and beyond. The Track Renovation is part of a major capital program that also includes the overhaul of over 200 of MARTA’s rail cars.”*²⁷

Los Angeles plans for R&R using the Peskin model:

“Projected rehabilitation and replacement costs are based on a methodology developed by Robert Peskin of KMPG Peat Marwick (commonly called Peskin Model). This methodology was developed based on actual costs experienced by the Washington Metropolitan Area Transit Authority (WMATA). Actual WMATA rehabilitation and replacement costs were compared to their original installation capital costs. The MTA rail rehabilitation and replacement costs were calculated in the same manner based on the Metro Blue, Red, Gold and Green Lines original installation capital costs. The rehabilitation and replacement costs are estimated to begin five years after a rail line begins revenue operations. Some limited repair is assumed in the forecasting model for the first few years as reflected in the five-year MTA Capital Improvement Program (CIP) and annual budget.”

Based on the MTA Office of Management and Budget near term forecast and Peskin Model in the later years the rail rehabilitation and replacement costs through 2025 are \$4.7 billion.²⁸

BART began its first major repair and rehabilitation plan in 1994 at a cost of \$1.2 billion within only 20 years of opening. At the time, their balance sheet showed “Facilities, property and equipment” was \$2.4 billion, net of \$0.7 billion in depreciation.²⁹ Thus, the total invested in this category through 1994 had been \$3.1 billion.

The Bay Area’s Transportation and Land Use Coalition³⁰ tells us that the BART Planning Department reported to the Board of Directors meeting on November 9, 2000, that total repair and refurbishing requirements for BART during 2001 to 2030 would be \$6.8 billion spread across the entire 30-year period.

²⁵ <http://www.washingtontimes.com/news/2008/sep/23/metro-needs-11.3-billion/>

²⁸ [Short Range Transportation Plan for Los Angeles County, Technical Document 2003](#)

²⁹ Bay Area Rapid Transit, 1972 through 1994 Annual Reports.

³⁰ <http://www.transcoalition.org/reports/overext/overextended.html>

The San Francisco Bay Area voters were unaware at the time of the BART decision that BART would need to refurbish or replace “facilities, property and equipment” in amounts far exceeding BART’s original cost; they had been sold on the concept that once you have built rail it is there forever.³¹

Honolulu’s rail line financial plan should make provision for potential refurbishing liabilities using the Peskin model (or similar) to provide decision-makers with the appropriate financial information detailing likely future financial obligations for replacement, refurbishing and system enhancement. The Peskin Model³² is used by the Washington Metro and Los Angeles among other. A useful discussion of the subject is in the 2004 Status of the Nation’s Highways, Bridges, and Transit, Chapter 7c.

The Federal Transit Administration (FTA) requires that,

“Agencies planning major capital investments need to incorporate the [repair and refurbishing] (R&R) of those assets in the later years of the capital plan in addition to the ongoing R&R of the existing asset base.”³³

It would be helpful to think in terms of the Aloha Stadium which has cost far more to maintain than it ever cost to build. As the Honolulu Advertiser explained last year,

The estimated \$185 million renovation of Aloha Stadium is expected to transform the rusting, 33-year-old facility into a “new stadium.” ... Since opening in 1975 at a cost of \$32 million, the state’s largest facility has been dogged by costly repairs and lawsuits. From 1985 to 1995, rust treatment cost \$80 million..³⁴

The City needs to establish a detailed schedule of R&R obligations that the rail line is likely to face in future years so that the public is fully aware of what they are getting themselves into.

The impacts of forecasting errors

A major concern is that the City’s Cost-Effectiveness Rating of “Medium” hovers near the “Medium-Low” rating, which would make the project ineligible for federal New Starts funds.

The FTA rating is calculated by dividing projected new riders into the total of projected annualized capital costs and projected annual operating costs. At present the FTA rates a new trip as cost-effective if it costs \$22 or less. That amounts to a subsidy of over \$10,000 per new rider annually.

³¹ Excerpt from a speech by Todd Litman at the Mayor’s Transit Symposium.

³² Peskin, Robert L. 1988. “Methodology for Projecting Rail Transit Rehabilitation and Replacement Capital Financing Needs.” In: Transportation Research Record 1165. Washington, DC: Transportation Research Board, National Research Council.

³³ Source: http://www.fta.dot.gov/printer_friendly/planning_environment_2423.html

8.3.1.1 Rehabilitation and Replacement. The rehabilitation and replacement (R&R) of capital resources is needed for several reasons. First, capital resources wear out. Stations, maintenance facilities, track-way, signal systems, propulsion systems, and vehicles all have distinct useful lives. These assets must be re-capitalized before deterioration leads to service disruptions. Second, technological obsolescence due to the availability of parts or technological advances may spur the replacement of various systems. Old rail cars may become increasingly difficult to maintain and require replacement or agencies may wish to implement communications based train control, automatic train stop, or passenger information systems to improve system reliability and safety. Third, changes in operating or safety policies may require new capital investment. One example is station or vehicle enhancements to assure compliance with the American’s with Disabilities Act (ADA).

Prudent capital planning requires an inventory of the agency’s assets and an evaluation of the expected useful life of each major component. An R&R cycle is assumed for each of the major assets and annual costs are projected at least 20 years into the future. Agencies planning major capital investments need to incorporate the R&R of those assets in the later years of the capital plan in addition to the ongoing R&R of the existing asset base.

In most cases, the capital costs for R&R will vary markedly from one year to the next due to different cycles and widely varying costs for the numerous components. Agencies typically establish reserve accounts, sometimes called sinking funds, to provide the funds for sudden increases in capital spending. Occasionally, agencies smooth out the R&R cost swings by using a multi-year rolling average as the annual cost estimate.

³⁴ <http://the.honoluluadvertiser.com/article/2008/Jun/27/hn.hawaii806270385.html>

However, if the projections are not achieved and recent FTA assessments of cost overruns for capital costs, cost overruns for operating costs and shortfalls in ridership occur then the cost effectiveness calculation changes dramatically.

We are also concerned that the fact that at this late stage the Project does not yet have an FTA rating yet there is no explanation of why that should be, as is required by NEPA:

... (Draft EISs) must present -- for all alternatives — the information used by FTA to assign New or Small Starts ratings if that information has been vetted by FTA. If the information has not been vetted with FTA, then the absence of the information must be highlighted in the document.

The intent of this policy is to comply with FTA requirements for AAs and the Council on Environmental Quality for DEISs by identifying information relevant and important to a decision on a locally preferred alternative. If this requirement cannot be met, publication of the AA or AA/DEIS would not be delayed; rather, the absence of the information and its relevance must be explained in the AA or AA/DEIS. (emphasis added)³⁵

Instead, in the Draft EIS, the City slides by the issue rather than highlighting and explaining why the Project is not rated. This is the City's explanation:

The cost-effectiveness indices for the Build Alternatives compared to the baseline fall within the "medium" range established by FTA for its New Starts ratings, which, along with other considerations, is currently required to qualify for New Starts funding. FTA is currently reviewing the estimates made for ridership and user benefits, operating and maintenance costs, and capital costs for the Build Alternatives. If these results hold up through subsequent phases of project development, along with other FTA considerations, the Project would be in the competitive range for funding consideration. Funding recommendations are made each year from among the projects that have completed the planning and project development process, including the National Environmental Policy Act process. These recommendations reflect the merits of the projects competing for available Federal funds at the time, as well as the availability of New Starts funding authorization. DEIS, p. 7-9.

The fact that the Project is not yet rated is not made clear. It is certainly not highlighted since the subject is not even mentioned in the Executive Summary. This is important as without a rating the Project cannot enter Preliminary Engineering.

Part VI — “Strategic misrepresentation” in the Draft EIS

The University of Aalborg, Denmark, conducted the most extensive international study ever of actual versus estimated costs in transportation infrastructure development.¹ A summary of the study was published in the American Planning Association Journal. The study concluded:

“Based on a sample of 258 transportation infrastructure projects worth US\$90 billion and representing different project types, geographical regions, and historical periods, it is found with overwhelming statistical significance that the cost estimates used to decide whether such projects should be built are highly and systematically misleading. Underestimation cannot be explained by error and is best explained by strategic misrepresentation, that is, lying. The policy implications are clear: legislators, administrators, investors, media representatives, and members of the public who value honest numbers should not trust cost estimates and cost-benefit analyses produced by project promoters and their analysts.”

Other distinguished and authoritative transportation experts have warned about cost misrepresentations in rail projects. Dr. John Kain, Chair Emeritus of Harvard’s Economics Department, wrote *Deception in Dallas*, Dr. Don Pickrell, Chief Economist of the U.S. Department of Transportation’s Volpe Center, wrote what is known as the *Pickrell Report*, Dr. Martin Wachs, Head of Rand Corporation’s Transportation practice and Chair Emeritus, Department of Urban Planning, UC-Berkeley, wrote *When planners lie with numbers*,² and there have been many, many others.

The Draft EIS needs to make clear the amount of scholarly literature produced by academic transportation experts² detailing the misrepresentations by promoters of rail transit and the virtual

complete lack of such literature defending them. The public needs to be so sufficiently informed about it that no one will be able to complain in the future that they were not warned.

*NEPA procedures must insure that environmental information is available to public officials and citizens before decisions are made and before actions are taken. The information must be of high quality. Accurate scientific analysis, expert agency comments, and public scrutiny are essential to implementing NEPA.*³

There are many misleading elements of the Draft EIS. There are both errors of commission and omission and are dealt with below under the following headings:

1. Omissions of relevant material.
 - a) OMPO surveys
 - b) Future traffic conditions vs. today omitted.
 - c) The Draft EIS omits relevant information about highways.
 - d) Change of observed volumes without discussion
 - e) Does not discuss the differences between Draft EIS and Alternatives Analysis
2. Misleading purpose and need statement.
3. Renderings that do not match reality

1. Omissions of relevant material

a) OMPO surveys:

In its entirety, this is how the Draft EIS describes the 2004 Oahu MPO Survey⁴:

As part of its work to update the Regional Transportation Plan, the O'ahu Metropolitan Planning Organization (O'ahuMPO) surveyed O'ahu residents about transportation issues in 2004. The survey results identified traffic congestion during the commute period in the study corridor extending from Ewa and Central O'ahu to Downtown Honolulu as the biggest concern. Nearly twice as many residents responded that improving transit was more important than building more roadways. Seventy percent of the respondents believed that rail rapid transit should be constructed as a long-term transportation solution, and 55 percent supported raising taxes to provide local funding for the system. (Draft EIS p. 1-3).

From this one would not gather that the same Oahu MPO Survey Summary said in its entirety:

"Based on the survey, most residents appear to accept the necessity of tax increases to fund specific capital projects, such as new road-building, road widening and extensions. Between a Rapid Rail system and the BRT, residents do not indicate a strong preference for one over the other. There is broad support for either system, generally, with strongest support for the Rapid Rail system coming from the Ewa/Kapolei and Leeward areas of Oahu."

Or that in a later page it would summarize question responses as follows:

- 60% would reportedly support a tax hike for road widening or extensions.
- 59% would support a tax hike for new road-building.
- 57% would back a tax hike for a rail rapid transit system.

² Edwards, Chris. *Government Just Can't Contain Itself*. Cato Institute, September 23, 2003

³ <http://edocket.access.gpo.gov/cfr/2002/julapr/40cfr1500.1.htm>

⁴ www.honolulutraffic.com/issuessurvey.pdf

- 54% would back tax increases to improve the bus system.

Adding to these errors of omission is that the City avoided altogether discussing a subsequent 2006 OMPO Survey⁵. Here is one excerpt from this Survey's Summary:

Oahu traffic and, in particular, congestion in Ewa/Kapolei, remains a key concern of residents. The key priorities are: (1) road-widening of the H-1 in the Honolulu corridor; and (2) widening Farrington Highway in Kapolei and Waianae.

Relative to Rail Rapid Transit, over one-third of Oahu residents indicated that they would use the system on a regular basis.

There is also majority support for the concepts of HOT lanes from Ewa to downtown and for a Pearl Harbor bridge or tunnel, but not for funding construction via higher taxes.

b) Future traffic conditions versus today's traffic omitted

From the beginning the City and Parsons Brinckerhoff have misled the public into believing that rail transit will relieve congestion.

Far from "supporting proactive public involvement"⁶ our elected officials and their appointees and consultants have continually alluded to the idea that rail transit will result in traffic congestion relief even though the Alternatives Analysis and the Draft EIS both show that traffic congestion will get significantly worse with the rail transit alternative than it is today.

A significant omission in the Draft EIS is that nowhere does it discuss future highway conditions with rail. In fact, it deliberately goes out of its way to avoid doing so. For example, the discussion of traffic conditions in section 3 assesses future traffic conditions for No-Build but not with the Build alternative. Nor does the Summary of Findings on page 3-53, which is shown below.

Existing Conditions: Increasing traffic congestion and constrained transit operating conditions have reduced system reliability and mobility for all travelers.

Effects of the No Build Alternative: Traffic congestion would worsen, even with \$3 billion in other planned roadway improvements, affecting mobility and reliability for all travelers.

Effects of the Build Alternatives: [No mention of traffic congestion].

The omission of future traffic congestion with the Build Alternative compared to the congestion that exists today in both the body and the summary shows that it was deliberate.

In addition, the Draft EIS has avoided any discussion of the new 2006 *National Strategy to Reduce Congestion on America's Transportation Network*⁷. Its preamble reads,

Congestion is one of the single largest threats to our economic prosperity and way of life. Whether it takes the form of trucks stalled in traffic, cargo stuck at overwhelmed seaports, or airplanes circling over crowded airports, congestion is costing America an estimated \$200 billion a year.

Each year, Americans lose 3.7 billion hours and 2.3 billion gallons of fuel sitting in traffic jams and waste \$9.4 billion as a result of airline delays. Worse, congestion is affecting the quality of Americans lives by robbing them of time that could be spent with families and friends.

⁵ http://www.honolulutraffic.com/Trans_Proj_Surv_Results_2006.pdf

⁶ It is the policy of the ... Federal Transit Administration (FTA) to aggressively support proactive public involvement at all stages of planning and project development. http://www.fhwa.dot.gov/environment/pi_pol.htm

⁷ <http://isdcdot.gov/OLPFiles/QST/012988.pdf>

Congestion is not a fact of life. It is not a scientific mystery, nor is it an uncontrollable force. Congestion results from poor policy choices and a failure to separate solutions that are effective from those that are not.

Given the current traffic conditions in Honolulu, and also the following NEPA requirement, one would think the new policy worthy of mention, if not analysis:

An agency shall identify and discuss all such factors including any essential considerations of national policy which were balanced by the agency in making its decision and state how those considerations entered into its decision. 40CFR1505.2(b)

c) Highway capacity data omitted

In the Alternatives Analysis, Table 3-12, highway capacity data was given for each of the corridor's highway components. This has been omitted and makes it difficult to understand what caused the dramatic reductions in the Draft EIS from the Alternatives Analysis in forecast traffic volumes at the various screenlines.

For example, the Kalauao screenline in the Alternatives Analysis shows that the observed traffic volume for 2003 during the peak hour slightly in excess of the highway capacity shown, which motorists in the corridor would find accords with experience. However, the Draft EIS observed volume for 2005 shows an eight percent reduction in traffic from 18,870 to 17,300, and less than the highway capacity shown in the Alternatives Analysis, which certainly does not accord with experience.

Kalauao Screenline AM Peak Head bound volumes AA= Alternatives Analysis			Koko
AA Highway Capacity 18,450	AA 2003 Actual 18,870	AA 2030 No-Build 28,023	AA 2030 Build 26,101
Draft EIS Highway Capacity N/A	Draft EIS 2005 Actual 17,300	Draft EIS 2030 No-Build 20,800	Draft EIS 2030 Build 18,910

Source: Alternatives Analysis, Table 3-12, Draft EIS, Tables 3-12 & 3-20

Further, there is a 28 percent reduction in projected traffic volume for the Draft EIS 2030 Build Alternative compared with that of the Alternatives Analysis from 26,101 down to 18,910. No explanation is given for this.

We know that with no planned widening of H-1 the freeway cannot accommodate either the 18,910 given in the Draft EIS, let alone the 26,101 vehicles per hour projected by the Alternatives Analysis. Are we to assume that the City and Parsons Brinckerhoff recognize that the highways will be excessively congested and that the excess traffic will be accommodated in extended shoulder periods?

In other words, those who currently leave home at 5:00 AM to miss the worst of the

traffic will, in the future, with rail have to leave home at 4:00 AM — or earlier?

If this is the case, why does the City not say so? Or is it once again to avoid any discussion of traffic congestion relative to today's unbearable levels?

2. Misleading purpose and need statement:

*Congestion is not a scientific mystery, nor is it an uncontrollable force. Congestion results from poor policy choices and a failure to separate solutions that are effective from those that are not.*⁸

⁸ <http://isldc.dot.gov/01.PPfiles/OST/012988.pdf>

The relevant federal requirements regarding the “purpose and need statement” are as follows:

... the lead agency shall provide an opportunity for involvement by ... the public in defining the purpose and need for a project ... The statement of purpose and need shall include a clear statement of the objectives that the proposed action is intended to achieve ... (SAFETEA-LU Sec. 6002).

“FHWA and FTA review would include making sure that objectives or choices derived from the transportation plan were: based on transportation planning factors established by Federal law; reflect a credible and articulated planning rationale; founded on reliable data; and developed through transportation planning processes meeting FHWA and FTA statutory and regulatory requirements. In addition, the basis for the goals and choices must be documented and included in the NEPA document.”⁹ (emphasis added)

Consistent with NEPA, the purpose and need statement should be a statement of a transportation problem, not a specific solution ... A purpose and need statement that yields only one alternative may indicate a purpose and need that is too narrowly defined.¹⁰

The NEPA regulations require that,

Environmental impact statements “shall be written in plain language ... so that ... the public can understand them.”¹¹

The purpose statement in the Draft EIS is presented here in its entirety while the need statement that follows is truncated in the interests of space:

1.7 Purpose of the Project

The purpose of the Honolulu High-Capacity Transit Corridor Project is to provide high-capacity rapid transit in the highly congested east-west transportation corridor between Kapolei and UH Manoa, as specified in the O’ahu Regional Transportation Plan 2030 (ORTP) (O’ahu MPO 2007). The project is intended to provide faster, more reliable public transportation service in the study corridor than can be achieved with buses operating in congested mixed-flow traffic, to provide reliable mobility in areas of the study corridor where people of limited income and an aging population live and to serve rapidly developing areas of the study corridor. The project also would provide additional transit capacity, an alternative to private automobile travel, and improve transit links within the study corridor.

Implementation of the project, in conjunction with other improvements included in the ORTP, would moderate anticipated traffic congestion in the study corridor. (Draft EIS p. 1-19.)

⁹ <http://www.fhwa.dot.gov/tep/plannepa030222.pdf>

¹⁰ <http://edocket.access.gpo.gov/2007/pdf/07-493.pdf> Federal Register / Vol. 72, No. 30 / p. 7282.

¹¹ 40 C.F.R. § 1502.8

1.8 Need for Transit Improvements

There are several needs for transit improvements in the study corridor. These needs are the basis for the following goals:

Improve corridor mobility

Improve corridor travel reliability

Improve access to planned development to support City policy to develop a second urban center

Improve transportation equity (Draft EIS, p. 1-20/21)

The main misrepresentation in this purpose and needs statement is that it is in total conflict with what the public understands. The Draft EIS says that the “purpose and need” is a need for “transit improvements” and the purpose is to build “rapid transit.”

Aside from the misrepresentation the statement is at variance with FTA/FHWA guidance,

Consistent with NEPA, the purpose and need statement should be a statement of a transportation problem, not a specific solution.¹²

The public believes that the purpose of the project is to reduce traffic congestion. This is reinforced in the Draft EIS by the following:

Total congestion would be reduced by 21 to 23 percent with the Build Alternatives. "S-5

"Implementation of the project, in conjunction with other improvements included in the ORTP, would moderate anticipated traffic congestion in the study corridor." (p.1-19)

The general understanding of the public is that the purpose of the Project is to reduce traffic congestion in the Corridor so it less than today's unbearable levels and also, *incidentally*, provide improved public transportation.

"The statement of purpose and need shall include a clear statement of the objectives that the proposed action is intended to achieve ... " SAFETEA-LU Sec. 6002.

When does one hear the ordinary citizen use phrases like “Improve corridor mobility,” “Improve corridor travel reliability,” and “moderate anticipated traffic congestion”?

This is jargon for those working in the transportation industry; it is not understood by the average resident unless they habitually parse sentences in City documents. To the average citizen, to moderate or reduce traffic congestion means relative to what they experience today — and not some projected condition in the future unless explicitly told so.

A “clear statement” would say instead that, “It is not the Purpose of the Project to reduce traffic congestion below today's levels, it is to provide an alternative to automobile travel.” That the language is not *a clear statement* understandable to ordinary citizens proves that the process lacks *public involvement*. To *involve* is totally different than to *inform*.

The intent of the statute is for the public to be *involved* and to this end it is essential that the language be clear. Instead, this jargon lulls the average citizen into believing that the primary purpose of the Honolulu High-Capacity Transit Corridor Project is to reduce traffic congestion from current levels.

¹² <http://www.environment.fhwa.dot.gov/stm/ing/linkingtrans.asp>

Lacking an FTA definition of *involvement* we have to fall back on the dictionary definition, which tells us that to *involve* is,

- “To engage as a participant; embroil: *involved the bystanders in his dispute with the police.*
- “To connect closely and often incriminatingly; implicate: *evidence that involved the governor in the scandal.*
- “To influence or affect: *The matter is serious because it involves your reputation.*
- “To occupy or engage the interest of: *a story that completely involved me for the rest of the evening.*”¹³

To make clear the distinction: If you are *involved* in a murder, you may be hanged. If you are only *informed* of a murder you will not be.

It is derelict to omit any discussion of traffic relief relative to today’s congestion in the Draft EIS especially since there has been a constant refrain from City officials implying that the purpose and need is for traffic relief.

To be a “clear statement,” the purpose and need statement requires it to say that, “It is not the Purpose of the Project to reduce traffic congestion below today’s levels; it is to provide an alternative to automobile travel” and, “After the rail transit line opens, traffic congestion will be worse than it is today, though somewhat less than what it might be otherwise.”

The NEPA regulations require that, “*Environmental impact statements shall be concise, clear, and to the point ...*”¹⁴ and the purpose and need statement is the complete antithesis of this.

3. Renderings misrepresent reality

See this issue covered under Part II, Insufficient consideration of elevated rail impacts, Pages 2:7

¹³ Excerpted from the American Heritage® Dictionary.
¹⁴ 40CFR1500.2 (b)

February 6, 2009

Part VII — Misrepresentations outside of the Draft EIS

We understand that federal officials do not wish, and are possibly not even empowered, to involve themselves in local politics. However, the current situation concerning the City administration misleading the public is more serious than is usually the case.

When public support for a project has occurred only because of the voluminous amount of lies and misrepresentations made by the local agency, then it is incumbent upon the federal agency to not approve such a project until the situation has been mitigated. Certainly this would accord with the spirit and purpose of the environmental statutes and the responsibility of the lead agency.

For example, the federal government directs the Office of Management and Budget (OMB) to:

*provide policy and procedural guidance to Federal agencies for ensuring and maximizing the quality, objectivity, utility, and integrity of information (including statistical information) disseminated by Federal agencies.*¹

The NEPA statute and associated laws and regulations are replete with language about “objectivity,” “scientific evaluation,” and “integrity.”

What is the point of the lead agency meticulously ensuring that the integrity of information in the Draft EIS (and the thousands of pages of appendices and technical memoranda) which most of the public will never read, if the lead agency then knowingly evades dealing with the fact that the public has been totally misled about the benefits and disbenefits of the project?

Does the agency want an environmentally destructive alternative chosen over an equally effective, but less costly, and less environmentally intrusive one?

Citizens of the City and County of Honolulu have been consistently misled not only by how the Project will reduce traffic congestion, but also the other purported benefits of the rail transit project, such as the presumption of energy savings, the merits of alternatives, the “success” of Mainland public transportation agencies and the dislike of Oahu residents for new highways.

This has not occurred through the occasional “slip of the tongue” statement but by a deliberate coordinated and continuous barrage of half-truths and deception in public meetings, through millions of dollars of media purchases² in TV, radio, newspapers, and in public “bully pulpit” pronouncements by the Mayor, our Congressional delegation, city employees, city transit consultants and their sub-consultants.³

City taxpayers and have spent \$2.4 million promoting transit through June 30 last year and we expect that when the final report comes in on their spending before the November 4 election, it will add another million dollars to the City total. In addition, the Mayor spent a great deal of his campaign money promoting his rail idea. Others rail supporters, Go Rail Go, Support Rail Transit, and the Carpenters Union between them spent a total of \$1.1 million promoting rail in the November 4 referendum.

¹ Public Law 106-554; H.R. 5658). Section 515. See <http://www.whitehouse.gov/omb/fedreg/reproducible2.pdf>

² Mayor, rail supporters outspent opponents. Honolulu Advertiser. December 9, 2008.

<http://www.honoluluadvertiser.com/article/20081209/NEWS05/8120903557-1/NEWS05>

³ “Proponents and opponents of Honolulu’s planned \$3.7 billion commuter rail system have saturated Hawai’i airwaves with advertising.” <http://the.honoluluadvertiser.com/article/2008/Jul/29/hawaii807290361.html>

A major financial support for Go Rail Go was Parsons Brinckerhoff.⁴ We do not know their total contribution since half of Go Rail Go's contributions were made before the ballot issue was certified and before that time contributions did not have to be enumerated. Countering the over \$5 million spent promoting rail was the puny \$100,000 spent by the Stop Rail Now organization.

Examples of these misleading statements are detailed in Appendix D.

The most important of the misstatements are those relating to traffic congestion. The public believes that the "purpose and need" of the Project is to reduce traffic congestion in the Corridor to less than today's unbearable levels and also, *incidentally*, provide improved public transportation.

As evidence of this, 73 percent of residents in a Honolulu Advertiser poll of July 27, 2008, said they agreed with the statement,

*"We need a light rail system in order to reduce traffic congestion and commute times along H-1"*⁵

Their misunderstanding has been encouraged by our elected officials, their employees and contractors. Their public statements to gain support for rail transit constantly imply, or state outright, that the need is for traffic congestion relief. In his 2008 State of the City speech, the Mayor said, "traffic congestion is the most significant challenge to our quality of life."⁶ And in a policy statement, "Our residents ... are crying for relief from traffic congestion."⁷

Our elected officials (and the public) know precisely what is needed for "improving transportation conditions."

City accuses us of lies and misrepresentations:

The City Administration's Transportation Director Wayne Yoshioka⁸ took the position that the opposition (Stop Rail Now and Honolulutraffic.com) was putting out so many "lies and misrepresentations" that the city had to respond to this 'misleading and false information' with the truth." He added that "most of their statements are not true."

This was the most outrageous action by the City yet. On September 3, 2008, the City Council's Executive Matters Committee discussed a bill that would restrict the use of taxpayer funds for advocacy of rail transit by the Administration.

We responded that all Honolulutraffic.com's information was footnoted and sourced and if anyone is lying it is the city.

Yoshioka was unwilling to specify what our lies and misinformation were but the Committee Chair eventually persuaded him to agree to supply a list of 20 such "lies and misrepresentations" within five working days. Fortunately, all of this is on video. Three weeks later he produced them.

There is nothing in the list he produced that could reasonably be called a lie or misrepresentation. For example, he states that our comment, "The city admits future traffic congestion will be worse

⁴ <http://www.honoluluadvertiser.com/article/20081209/NEWS05/SI2090355/L/NEWS05>

⁷ <http://www.honolulu.gov/cfs/esd/publiccom/honnews06/mayorofferscompromiseontransitaximasse.htm>

⁸ Since it is a two hour tape we have provided a time line in hours and minutes below:

0:24 --- DTS Director Yoshioka begins testimony on bill 01-189 regarding rail transit advocacy.

1:08 --- Corporation counsel begins testimony.

1:32 --- Cliff Slater begins testimony.

1:40 --- Council begins discussion and with legal counsel.

2:08 --- End of proceedings.

with rail than it is today" was, "... a cleverly crafted statement that knowingly uses only part of the information available. The Alternatives Analysis shows that a fixed guideway will reduce future traffic congestion between Kapolei and Honolulu by 11 percent."

This is pure spin. He is not denying that traffic congestion will be worse in the future with rail than it is today, only that it will be 11 percent better than it would be without rail. In fact, he and Mike Schneider of InfraConsult finally admitted we were right during a debate on KHVI radio some weeks later. The crucial [four minute clip](#) of this admission is available. We have detailed [our responses](#) to this and all his other charges in Appendix D.

The issue regarding spin, lies and misrepresentation is that it has been used to garner support for rail. The culmination was that after all this the City could only get 50.4 percent of the voters to approve the rail referendum. It begs the question of what would have been the support if the City had told the truth.

While strictly speaking these misrepresentations are not part of the NEPA EIS process, these misleading activities by Hawaii government officials are of great import. It is one matter to attempt to ensure accuracy and objectivity in the Draft EIS, but can a federal agency evade evidence of local government actions that seek to undermine the EIS process?

What is the point of following the NEPA process to the letter and spirit of the law when local political authorities and their campaign contributors, consultants and all their employees are conspiring to undermine the NEPA process by spending literally millions of dollars lying about traffic congestion relief, among other matters? When Parsons Brinckerhoff is giving \$25,000 to fund Go Rail Go efforts to persuade voters to vote for rail with gross misrepresentations of the facts?

It is one thing that the FTA not involve itself in local political matters but it is quite another when their own federal environmental process is being undermined. It is not being ignored --- because FTA is fully aware of what has transpired. Rather, the undermining of the process is being evaded.

Appendix D

Following are a few examples of the many claims of prospective traffic relief offered by the City administration.

Mayor Hannemann, KGMB interview, 10/30/2008, "People are tired of being stuck in traffic and they want solutions."

Bill Brennan op/ed in Hawaii Reporter 6/26/08. "Cities with large, well-established rail systems have significantly . . . less traffic congestion ... A comprehensive rail transit system can reduce per capita congestion delays by half, and even greater reductions probably occur on specific corridors." <http://www.hawaiireporter.com/story.aspx?6847fd0b-ddec-41c1-82e9-3dcd7335de50>

Mayor Hannemann's 2008 State of the City Address, "I've said time and time again that traffic congestion is the most significant challenge to our quality of life ... the fixed guideway presented the most effective means of relieving traffic congestion and accommodating the anticipated growth in West and Central Oahu.

Mayor Hannemann said, "Our residents, particularly those in Leeward and Central Oahu, are crying for relief from traffic congestion. A mass transit system represents our best near- and long-term solution to this worsening problem and I'd hate to see our efforts derailed because of

disagreements over who-does-what any delays in implementing the tax and completing our planning will delay relief for tens of thousands of commuters who are squandering hours of precious time in traffic." City Hall press release: Mayor offers compromise on transit tax impasse. June 21, 2006.

<http://www.honolulu.gov/refs/csd/publiccom/honnews06/mayorofferscompromiseontransitaximpasse.htm>

This video of Mayor Hannemann and Rep. Neil Abercrombie's city hall "Traffic sucks!" rally held on December 5th, 2005, typifies the grossly misleading statements emanating from our elected officials.

<http://mfile.akamai.com/12891/wmv/vod.ibsys.com/2005/0707/4695365.200k.asx>

"[Hannemann] said the [rail] system will help all parts of the island, easing traffic overall because 'there'll be less cars on the road. '"

<http://the.honoluluadvertiser.com/article/2005/May/12/In/In02p.html>

Mayor's Press Secretary: "Slater misrepresents just about everything Mayor Mufi Hannemann, Transportation Services Director Ed Hirata and other supporters of transit have said, from the timing of federal requirements to tax calculations, highway capacity and a rail system's potential to ease traffic congestion."

<http://the.honoluluadvertiser.com/article/2005/Aug/10/op/508100321.html>

"We're poised to break ground for a long-awaited fixed guideway system that will reduce the time commuters spend in their cars and away from their families ... " Mayor Hannemann, editorial, Honolulu Advertiser, June 29, 2008, Living Green section.

"Mayor Mufi Hannemann chided Lingle at the rally and said the city needs a rail system to alleviate increasing traffic congestion. U.S. Rep. Neil Abercrombie, D-Hawaii, also blasted a possible veto and said that he and the rest of Hawaii have had enough of the traffic problems. He said commuters are fed up and don't need any more "Lingle lanes" filled with traffic congestion."

<http://www.bizjournals.com/pacific/stories/2005/07/04/daily18.html?t=printable>

"How does rail transit help reduce traffic congestion? ... Building rail transit now is the most cost-effective way to avoid even more congestion in the future ... This brochure is provided by the City & County of Honolulu as part of the public information program required by the Federal Transportation (sic) Administration." City's 8-page 11" x 12" full color glossy brochure inserted in the Honolulu Advertiser, Honolulu Star-Bulletin and the weekly, Mid-Week, circa. October 19, 2008. Combined circulation was about 500,000. To add insult to injury the brochure was marked, "Paid for by City taxpayers."

"The [rail] project shrinks future traffic congestion by more than 20 percent." Mayor Hannemann quoted in the Honolulu Advertiser on November 2, 2008, under a bold above the fold headline, "Study predicts rail to ease traffic 23%". Honolulu Advertiser, November 2, 2008. p. A1

"Rail transit can improve the quality of life for residents across O'ahu by reducing traffic congestion ... and will shrink traffic congestion by at least 21 percent as it matures ... my hope is that this is an action we collectively take for the future -- for the generations of children to come who deserve an island home where they can live, work and raise their families free from the grind of constant traffic gridlock." Senator Daniel K. Inouye. *Draft EIS bodes well for transit*. Honolulu Advertiser, November 2, 2008. p. B1.

"What's more, today's rail technology is already proven and successful, like Vancouver's SkyTrain, the Trax system in Salt Lake City, Portland's MAX Train, and the Washington, D.C. Metro. When each of these systems was first proposed, there were questions and concerns raised. But today, they are vital parts of their cities' overall transportation solutions: reducing traffic ... "

Radio commercials repeated this endlessly in the weeks leading up to the November 4 rail referendum. Of course, the facts are that traffic congestion in these cities since they built rail is as bad as other cities – if not worse, according to the Texas Transportation Institute.

The Mayor's behavior during the 2008 mayoral candidates' debates exemplified the refusal of city officials and their contractors to admit that traffic congestion will get worse with rail. During the September 9 debate, Dr. Panos Prevedouros asked the Mayor, "Your own city studies show that traffic congestion in the future, with rail, will be far worse than it is today. Is that true? Yes or No?" The Mayor totally dodged this because he knows full well that the answer is "Yes" but the viewers did not know that traffic congestion will indeed get worse with rail. Watch him duck and dive during this video.

Other aspects of misrepresentations by the city during the rail transit debate follow:

The following transcript is of a one-minute City radio commercial that ran incessantly on many Honolulu radio stations in the months leading up to the referendum vote:

TRANSCRIPT: "Will mass transit attract riders in Honolulu? Actually, we already know the answer. Honolulu has the fourth highest transit ridership per capita in the nation. People here already know that mass transit, like the bus, is a great way to deal with traffic, parking and save money. So, how about rail transit, which will be even faster and more efficient? Again, we don't have to guess. Look at how people in cities nationwide are responding to fuel costs and traffic hassles. In Portland, San Francisco, New York and Washington, D.C., rail ridership has increased more than five percent in the last year. In Los Angeles, a city that loves its cars, rail ridership is up over fifteen percent. In Seattle, it's up twenty-eight percent. In Charlotte, thirty-four percent. And in Sacramento, rail ridership has increased forty-three percent in just a year. It's too bad we don't already have rail transit. The next best thing we can do is start building it now. To learn more, visit Honolulu Transit.org."

The above statistics were repeated in the City's newspaper advertising. For example, the Honolulu Star-Bulletin, October 14, 2008.

The following paragraphs show the city's statement numbered and in quotes followed by our comments. Our data is drawn from the American Public Transportation Association (APTA) website. For comparison calendar years 2007 vs. 2006, the file is found at <http://www.apta.com/research/stats/ridership/riderep/documents/07q4rep.pdf> The latest available data is that of the 1st quarter of 2008 and the file comparing it with the same quarter of 2007 is at: <http://www.apta.com/research/stats/ridership/riderep/documents/08q1rep.pdf>

#1: "In Los Angeles, a city that loves its cars, rail ridership is up over fifteen percent."

For 2007 versus 2006, total public transportation in Los Angeles was down 1.78 percent, heavy rail was up 2.03 percent, light rail was up 0.81 percent and buses were down 2.53 percent. For the first quarter 2008, heavy rail was up 5.37 percent, light rail was up 1.77 percent and bus ridership was down about 7 percent (two categories). Los Angeles total public transportation was down 4.57 percent.

#2: "In Seattle, [rail ridership] it's up twenty-eight percent."

This is a statement that is accurate but misleading. For 2007, Seattle's light rail was up 3.8 percent and commuter rail commuter rail (*real trains, long distance between stops*) is up 27 percent, but it is a minor issue since it carries just 1.5 percent of all public transportation in Seattle. The primary reason for the great increase in this minor commuter rail line is that there have been extensive increases in commuter rail service during the past two years. See: http://en.wikipedia.org/wiki/Sounder_commuter_rail

#3: "In Charlotte, [rail ridership is up] thirty-four percent."

Charlotte's rail line did not open until November 2007 and so there is nothing to compare it to. The supposed 34 percent increase is a pure figment of someone's imagination.

#4: "And in Sacramento, rail ridership has increased forty-three percent in just a year."

For the year 2007, Sacramento's rail was up 1.41 percent over the prior year. For the first quarter of 2008 rail was up 3.12 percent.

The above statements are not only inaccurate but they mislead citizens into believing that recent increases in gasoline prices have driven motorists to public transportation far more than they actually have. The national experience is that the first quarter of 2008 shows a 3.3 percent increase in boardings over the year earlier quarter. Some cities were up slightly more, while others experienced declines.

Source: http://www.apta.com/media/releases/080602_ridership_report.cfm

The City repeated these data in ads placed in local newspapers in 2008, for example, in the Honolulu Advertiser, October 13, 2008, p. A9. And since our local newspapers will print the City's official line without any research whatsoever this gets repeated, as for example, in the main editorial of May 15, 2008.

InfraConsult LLC is a consultant to the city whose management is comprised of former Parsons Brinckerhoff employees. They run the "Public Outreach Program" for which they hired Elisa Yadao for \$500,000 as its program manager.

Dr Prevedouros had written a paper on 20 reasons why we should choose bus technology. That was criticized by InfraConsult's Managing Director, Michael Schneider, and below we comment on his criticism. The more egregious of his misleading comments are shown below as EXCERPT followed by OUR COMMENT.

EXCERPT: "*Virtually every city in the U.S. with a population over 750,000 people has both buses and some form of rail technology in operation, construction, or in the advanced planning stage... Every major city in the world, whether a "capital city" or not, has some form of rail system. The size of the rail system planned for Honolulu is appropriate for the community's size.*"

OUR COMMENT: The spin here is to use the term "city" whereas all normal discussions of rail systems use "metro area" or "urban area," which are contiguous urban areas almost regardless of political division. Thus, the San Francisco Bay Area contains all of the contiguous urban areas within the Bay Area. Portland's urban area consists of Portland and the surrounding counties.

When we review Honolulu's size relative to other metro areas we find that we are the 56th largest in the U.S. and that if we were to build any kind of rail line we would be the smallest in population size. In fact, most of the metro areas larger than Honolulu do not have rail lines.⁹

The next largest city that has a totally grade-separated rail line powered from a third rail, usually termed 'heavy rail,' is Miami whose population is more than four times that of Honolulu.

The other issue of appropriateness is that of cost. The cost of the proposed Honolulu rail line is out of all proportion to the population and tax base. The table on page 24 shows the relative local tax burden falling on Oahu taxpayers as compared to other communities. Honolulu will likely receive only about 18 percent of capital costs from federal funding.

⁹ [List of the 60 largest U.S. Metropolitan Areas from the 2000 Census](#). Some three more metro areas have added rail since the chart was prepared but that does not change the statement.

As the primary consultants, Parsons Brinckerhoff has been active in spreading misinformation about rail on various radio programs.

For example, on this radio program, Parsons Brinckerhoff's Steve Hogan discussed transit with Dr. Prevedouros, UH Professor of Traffic Engineering, on the Rick Hamada Show on KHVH 830 AM for an hour on May 12, 2008. The full discussion may be heard on [the podcast made of it](#).

During the radio program Hogan said that it took six lanes of freeway to have the same carrying capacity as rail transit.

Our comment: A single lane of busway on the New Jersey I-495 carries 32,000 passengers on buses per hour during the peak hours.¹⁰ This lane carries more passengers per hour than any rail line in the U.S. with the sole exception of one line of the New York City subway. So it is nonsense to talk about rail having more capacity than Bus/Rapid Transit.

Further, Parson's Brinckerhoff's own *HOV Manual* says:

"(This) comparison of person moving capacities for various U.S. rail and HOV projects...appears to cut through the myth that HOV facilities (e.g. busways) do not have the person carrying equivalent of rail lines. Both modes can serve the person carrying capacity needs of about any corridor in North America."¹¹

Hogan then argued that there was no space to put the HOT lanes in Honolulu.

Our comment: Parsons Brinckerhoff designed the Managed Lane Alternative and included it in the Alternatives Analysis with maps and engineering drawings showing that it fit.

Hogan later tried to belittle the multiple on/off ramps Dr. Prevedouros has proposed for the HOT BRT alternative by saying that on the Tampa Expressway there's no stopping after you get on, until you get off at the other end.

Our comment: The fact is that the Tampa Expressway has multiple on/off ramps and a map of them may be seen on [the on/off ramps page](#). The Expressway's Director of Planning sees no difficulty with having even more on/off ramps.

Then Steve Hogan argued that rail is more fuel efficient than autos on HOT lanes.

Our comment: Only when New York City subways are included using weighted averages do rail transit lines show as more energy-efficient than cars. See the arguments on this issue on page xxx

The efficient systems, such as New York, have a great deal of traffic going in both directions in their core areas in the off-peak while the energy-inefficient systems, such as Miami, tend to be those that are highly directional during the peak hours — full going from suburbs into town in the morning and empty going back out, with the opposite being true in the afternoon while there is little traffic during the middle of the day.

For a meaningful assessment of what Honolulu is likely to experience we must look at the experience of those modern systems built since 1970.

The average rail line is less energy efficient than the automobile (3,496 for cars and 4,329 for light trucks and SUVs) according to the U.S Department of Energy as shown and described in the chart to the left¹² and in other DOE publications.¹³

¹⁰ Transportation Research Board's Highway Capacity Manual, Table 1-13.

¹¹ Charles A. Fuhs. *High Occupancy Vehicle Facilities*. Parsons, Brinckerhoff, December 1990.

¹² http://www1.eere.energy.gov/vehiclesandfuels/facts/favorites/fevt_totw221.html

http://www.carkeys.co.uk/road_test/hyundai/14074.asp

¹³ http://cta.ornl.gov/data/cedb27/Edition27_Chapter02.pdf Tables 2.12 & 2.13

While it is still possible that Honolulu's prospective rail line could be more efficient than an automobile this is not likely. It is especially unlikely when the target year for discussion is 2030 and automobiles are getting far more fuel efficient every year and trains are not.

Then Hogan said that even in Tampa the Expressway would today cost 3.5 times what it originally cost to build.

Our comment: There are multiple construction cost indices, such as the Corps of Engineers Civil Works Index for Roads and Bridges, covering Florida from 2003-2008 and none of them show anything higher than a 50 percent increase. In addition, the Figg Bridge Corporation has been recently estimating new facilities in Florida similar to the Tampa Expressway and their current projected costs are less than a 50 percent increase from what the Expressway actually cost. A 350 percent increase is nonsense; it is simply Parsons Brinckerhoff's attempt to justify the preposterously high projected cost of \$2.6 billion that Parsons Brinckerhoff used for the MLA.

Anyone believing that Parson's Brinckerhoff's employees are reasonable and objective in informing the public about rail transit and the Managed Lane Alternative should hear the PODCAST of this Rick Hamada Show.

City brochure misleads

The city's widely distributed May 2008 Transit brochure is grossly misleading. The city prints thousands of these transportation brochures and distributes them to a city wide mailing list in addition to placing it on their website www.honolulutrainsit.com. Following are our comments on the City's May transportation brochure (takes time to download).

Front page: Top reasons for rail:

EXCERPT: Good for MOBILITY -- One train can move 300 people which equals 6 buses or 300 cars! That means one rail line equals 6 lanes of cars.

OUR RESPONSE: We dealt with this canard in earlier pages.

EXCERPT: Good for the ENVIRONMENT -- It's sustainable - rail can be powered by alternative energy like solar, wind or H-power. This means less air and water pollution and fewer green house gas emissions.

This is a typical environmental appeal which has no substance in fact. As proof of that, there is no mention of these potential power sources in either the Draft EIS or its supporting technical documents. It is another case of spin being good enough for local consumption but not valid enough for submission to the FTA.

EXCERPT: Good for the ECONOMY -- The rail project will create 90,000 person years of employment or 11,000 direct and indirect jobs annually. And, building a reliable, dependable, efficient transportation system encourages healthy economic growth.

OUR RESPONSE: 82 percent of the capital cost and 100 percent of the operating losses will be funded with local dollars. No mention is made of the downside of incurring higher taxes and higher City debt to justify a make-work project.

EXCERPT: Good for COMMUNITIES -- Rail encourages managed, orderly growth along the route. Planning where and how communities expand means we can keep the country country.

OUR RESPONSE: It really means Transit Oriented Development, or heavy subsidies for developers, which has been the case in every other TOD; the subsidies are needed to entice people to live in so-called "vibrant" communities. No mention is made about the subsidies needed and their effect on local taxes.

EXCERPT: "[Houston] Metro says ridership on its light rail system has doubled in 20 months."

OUR RESPONSE – The American Public Transportation Association shows ridership on Houston's light rail was up 6.29 percent 2007 over 2006 and up just 3.08 percent for the 1st Quarter 2008 over the same quarter in 2007. Some doubling.

"The Dallas DART is up 9%. In Los Angeles - a city that loves its cars - rail ridership is up over 15%. In Seattle it's up 28%, in Charlotte 34%, and in Sacramento, rail ridership is up 43% in just a year. Across the country rail ridership is up 11.2%." City advertisement, "Paid for by City Taxpayers," in the Honolulu Advertiser, October 13, 2008. p. 49.

Since our local newspapers will print the City's official line verbatim without any research whatsoever, these untruths are repeated, for example, in the Advertiser main editorial of May 15, 2008.

Stop Rail Now's so-called "Lies and Misrepresentations"

This refers to the discussion on page 38 when the City accused Stop Rail Now and Honolulutraffic.com on statewide television of disseminating "lies and misrepresentations." When they finally presented the list to the City Council they called it "Inaccuracies."

The City's listing of our sister operation Stop Rail Now's supposed "lies and misrepresentations" are in larger type bold-faced and flush left. The City's response to our comments is shown underneath each of them. Our responses are shown underneath each of the items but are in small type and indented. We have listed here only those "lies and misrepresentations" attributed to Stop Rail Now.

This exchange took place before the Draft EIS had issued and so our comments related to that time and the Alternatives Analysis.

The following retains the City's original format:

Inaccuracies

Stop Rail Now Ad

Sunday, September 14, 2008 • Honolulu Advertiser • Page A25

1. "The recent GET Tax increase and federal funds will be insufficient to fund rail."

Through the financial plan in the Alternatives Analysis, adequate funding sources have been identified for the approved Kapolei to Honolulu route. The financial plan also includes almost \$1 billion in contingencies. The financial plan was thoroughly reviewed by transportation experts with the Federal Transportation Administration (FTA) prior to its release.

There are five reasons for believing the funds will be insufficient:

First, the projected revenues from the GE tax hike will most probably fall short over the 15-year life of the tax given the current state of our economy. They will certainly be no more than that shown as the lower of the three growth scenarios, the "Trend Forecast," in the AA, table 5-4 & 5-7.

Second, the Alternatives Analysis (AA) financial plan, Table 5-8 and the Financial Feasibility Report (FFR) p. 4-4, calls for \$1.2 billion in federal funds for the 20-mile option using the Trend Forecast for GE tax revenues.

The fed docs not deal in inflation adjusted dollars only nominal dollars. There is no likelihood of us receiving \$1.2 billion. In fact, the only FTA assurance that we have in writing is the minutes of an OMPO Policy Committee Meeting (see <http://oahumpo.org/PC/pc2004/pc04mm0323.html>) where Mr. Rogers, head of FTA's Region IX told the Committee that, "The FTA program office is looking to limit any New Starts funding to no more than \$500 million per project." The minutes were accepted as true by the Committee members. This is the only written assurance from the FTA of us getting anything.

An email of 10-7-2008, from the FTA's Paul Griffo to us, reads as follows: "It is far too early to tell whether Honolulu's proposed rail project will receive New Starts funding. The project hasn't yet been accepted into the New Starts Program. "

Third, the plan does not call for operating losses to begin until 2019 (www.honolulutraffic.com/FFR.pdf, p. B-4.). However, according to city officials, plans call for operations to start in 2012. If operations do begin earlier it will increase the subsidies shown in the financial plan.

Fourth, the capital cost estimate for the 20-mile line is about one billion understated and the 28-mile by \$2 billion. See www.honolulutraffic.com/costunderstate4.pdf for a discussion of the 1992 rail project, the Miami Metrorail and the San Juan Tren Urbano all adjusted for construction inflation and location.

Fifth, there will likely be change orders and other cost overruns. The average of the most recent FTA evaluation of New Starts Actual versus Projections and Costs showed average cost overruns of 40 percent.

That the "financial plan was thoroughly reviewed by transportation experts with the FTA prior to its release" is no assurance to anyone who has the slightest acquaintance with the FTA's record. The last two rail lines to open, Charlotte and San Juan, both went over 100 percent over projected costs.

2. "For the beginning 20-mile line we are unlikely to get all of the supposed \$900 million in federal funds."

The Federal Transit Administration would not have allowed the City to continue with the project if it were not a reasonable estimate. In fact, in the Alternatives Analysis, it was assumed that federal funds would total \$700 million. If we receive more, it will be a bonus.

Congressman James Oberstar, chair of the U.S. House Transportation and Infrastructure Committee has twice told the local media he strongly supports this project and mentioned \$900 million as a reasonable figure.

2. Dealt with above.

3. "This amount together with the operating subsidy will take at least a 40 percent hike in property taxes."

This is a scare tactic. The subsidy for rail could be funded without any increase in taxes, property or otherwise.

Our statement related to the full Locally Preferred Alternative (LPA) and included operating losses. We estimate that the City's projected cost of the Full Corridor Alignment at \$5.1 billion in 2006 dollars (AA, table 5-1) is \$2 billion understated (see www.honolulutraffic.com/costunderstate4.pdf) and to that must be added the airport spur bringing the total to \$7.5 billion. This will take more than a 40 percent hike in property taxes. See <http://www.honolulutraffic.com/railfunding13.pdf> which is a spreadsheet using an earlier estimate of \$6.4 billion that resulted in a 40 percent hike in property taxes. If the City wishes to disagree, they should be specific.

4. "Automobiles are on average more energy efficient than modern rail lines."

According to the U.S. Department of Energy's 2007 Data Book, rail uses 36 percent less energy per passenger-mile than cars and trucks.

This attempt to confuse the average of rail lines with the *weighted* average of all rail lines, which includes New York, is quite deliberate. They know that New York City's energy efficient subways provide 57 percent of the nation's rail transit ridership and dominate the *weighted* average. We should be comparing ourselves to rail technologies similar to what we would be getting. In fact, whether you take just modern rail lines, or all rail lines including New York City, but use a straight average instead of a weighted average the automobile still comes out ahead with Btu's per passenger mile of 3,445 versus rail's 4,337. They know we are right on this. See this web page: <http://www.stoprailnow.com/nwsubenergyuse.pdf>.

5. "The city admits future traffic congestion will be worse with rail than it is today."

This is a cleverly crafted statement that knowingly uses only part of the information available. The Alternatives Analysis shows that a fixed guideway will reduce future traffic congestion between Kapolei and Honolulu by 11 percent.

This is pure spin. He is not denying that traffic congestion will be worse than today only that rail will reduce congestion by 11 percent from what it would be without rail.

6. "The city's own Parsons Brinckerhoff studies forecast that with rail, rush hour traffic will be 37% greater than it is today."

This is another cleverly crafted statement that uses only part of the information available. With the expected increases in population and employment in the future, rail transit promises the greatest reduction of this increased congestion.

More spin; he is still not denying that congestion will be worse with rail than it is today.

7. "Bus Rapid Transit and autos on High Occupancy Toll 'HOT LANES' is [sic] the most cost-effective way to reduce congestion and thus reduce pollution and energy use."

This statement has no basis in fact. The Alternatives Analysis compared the costs per users of Managed Lanes and the 20-mile fixed guideway and found that the Managed Lane is between \$63 and \$50 per user, while the fixed guideway is about \$21 per user.

In addition, Managed Lanes would provide approximately 2 million hours of user benefits per year. The 20-mile fixed guideway would provide approximately 12

million hours of user benefits per year. Page 6-6 of the Alternatives Analysis states, "The Fixed Guideway alternative is approximately four times as effective at providing transit user benefits per annualized incremental dollar cost as the Managed Lane alternative."

Our statement refers to the detailed findings of the UHCS Study, which the city has made no attempt to refute. All they have done is personally attack Dr. Prevedouros who led the study. Failing any significant analysis of the UHCS Study by the City we will continue to quote it.

GETTING IT RIGHT

Misinformation about rail

Below are inaccurate statements about rail transit and HOT lanes taken from their source websites. The statements are grouped by category: traffic congestion, financial plan-costs, Managed Lanes-HOT lanes, ridership, travel times, Environmental Impact Statement, population, train speed, route, environment, downtown and Phileas buses.

TRAFFIC CONGESTION

"You may be even more outraged to find that it has never been our elected officials intention to improve traffic congestion." (stoprailnow.com)

One of the goals from the beginning has been to reduce traffic congestion and improve **corridor mobility, which includes reducing travel times and improving travel time reliability.**

Nowhere in the AA is there any sign of intent to reduce traffic congestion below current levels, only to "increase urban mobility" by which they mean by public transportation.

These excerpts from a letter sent by DTS Director Melvin Kaku to Cliff Slater on June 20, 2006, show that the City did not have congestion reduction as a main requirement:

"Projects with the purpose of providing roadway mobility for automobiles and commercial vehicles are outside of the authorization of Act 247; therefore, they will not be considered for the Honolulu High-Capacity Transit Corridor Project ...

"While the transit system will reduce the number of drivers on congested roadways within the corridor, the corridor is expected to continue experiencing growth in travel demand. The transportation corridor between Kāhala and the University of Hawaii at Manoa will continue to experience substantial traffic congestion; however, congestion in the corridor is expected to decrease somewhat after the system opens, and grow at a reduced rate after that time because of automobile trips diverted to transit."

All the City hopes to do is to use rail to reduce congestion to levels below what they would be if we did nothing. The AA table 3-12 shows that present peak hour levels on the regular H-1 freeway lanes are 10,960 vehicles. If we build rail the city forecasts 17,414. That will mean a considerable increase in traffic congestion relative to today's levels. If we do nothing (No-Build Alternative), the demand will only increase to 18,049.

FINANCIAL PLAN-COSTS

"Even if Honolulu receives \$900 million in federal aid, all of it will be spent in foreign countries or on the mainland. No federal funds will ever reach Oahu." (stoprailnow.com)

This statement is absurd. The largest cost elements of the project are the construction of the guideway, stations and maintenance facility and associated costs for utility relocations and street repaving. All of this work, of course, will be done on-site in Honolulu, as will most of the professional service activities.

Stop Rail Now finds no record of us saying this. However, it may well be true it is just that we have not researched this issue.

The City cannot afford rail because it will cost \$150 million a year to operate and maintain." (stoprailnow.com)

The estimated annual operating and maintenance costs for a fixed guideway are approximately \$60 million. The cost of operating and maintaining a bus and rail system will be less than the cost of carrying the same number of riders on a bus only system.

We can find no record of us having said this. However, it may well be true; we have yet to research it.

MANAGED LANES-HOT LANES

"Engineers for the Tampa elevated toll lanes say an elevated toll road can be built in Honolulu for less than \$1 billion." (stoprailnow.com)

According to an e-mail from Linda Figg, whose firm designed the Tampa project, "We (Figg Engineering) have not done any "detailed engineering studies" of what estimates of probable construction costs would be for the elevated structure."

"We simply took those actual cost figures (from Tampa) and escalated the costs to today's time and included the escalations that might be anticipated for construction in Hawaii. The values that Cliff Slater is referencing look like the ball park figures that we determined from that back of the napkin review."

What they precisely said was that they could not believe that it would cost as much as one billion dollars. Figg Bridge does other work in Hawaii and is familiar with geotechnical and labor conditions. They are also familiar with the proposed route of the HOT lanes proposal. Given that they are not going to perform "detailed engineering studies" for the city for free, their comments are valid and we think reasonable.

"In the 2006 AA, 10-mile Hot Lane performed only a little worse than 20 miles of rail line." (stoprailnow.com)

The fixed guideway is projected to reduce traffic congestion by about 11 percent in the study corridor. The Managed Lane-HOT lane option reduces future traffic congestion by about 4 percent. The fixed guideway is a more cost-effective solution per user benefit than Managed Lanes-HOT lanes (AA, table 6-1).

We can find no record of this poorly written sentence coming from us.

**HOT lanes pay for themselves with toll revenues and federal funds."
(various)**

Toll revenues would fund only about 20 to 25 percent of the cost of HOT lanes. No other funding sources have been identified.

We see no reason why toll revenues cannot provide half of the \$900 million capital costs and FHWA the other half. Even if FHWA did not fund it, the local taxpayer load \$450 million is so incomparably small relative to rail transit that the city could have the state legislature amend Act 247 to allow its use for HOT lanes and still be able to terminate the tax in about four years.

POPULATION

**"The rail project is totally out of line for the size of our community."
(stoprailnow)**

Honolulu is fifth densest among cities with populations of 500,000 or more. We are the only one without a rail system.

More spin. No one compares "cities" but rather metro areas — contiguous urban areas with logical linkage for sharing urban transportation. Rather than San Francisco the federal government reviews the whole Bay Area. The USDOT's listing of metro areas has Honolulu as the 56th largest and most of the 55 that are larger than us have no rail.

In addition, rail transit's cost per capita for Honolulu is at least seven times the next highest cost per capita among all metro areas and ten times the average.

TRAIN SPEED

"Train is not rapid." (stoprailnow.com)

Rail will achieve a top speed of 55 mph or greater between many stations.

More spin. We, of course, only deal with average speeds from origin to destination. The city claims they will average 30 mph but that will be a reach and be, more likely, 25-28 mph. In any case, 30 mph is not rapid in comparison to uncongested highway speeds of 60 mph such as the HOT lanes would provide.

ROUTE

**"Virtually everyone will have to use buses to get to rail stations.
(stoprailnow.com)"**

Rail stations will [be] accessible by automobile, bus, bicycle paths and walkways. In the transit corridor, 23 percent of the population and 38 percent of the employment will be within a 10-minute walk of a rail station.

We do not find it credible that 23 percent of the corridor population will be within a ten minute walk from a station. We will ignore for a moment that a quarter mile is considered by the feds to be the maximum that people will walk to station or bus.

However, we have not made a detailed study of this and if the city has, we will be happy to review it with them and concede that they are right should that turn out to be the case.

**"They are delaying the theoretical opening until 2019."
(stoprailnow.com)**

The projected opening is 2018.

The City's AA Financial Feasibility Report, Table B-4, shows that operating and maintenance costs for the 20-mile project begins in 2019, while the full length system begins in 2020 (Table B-5).

ENVIRONMENT

**"The noise from steel on steel is an environmental blight."
(stoprailnow.com)**

Rail decibel levels are about the same sound as a city bus.

Yes buses are noisy. However, rail has a particularly annoying sound that at 79 decibels @ 50 feet coming by every 1½ minutes, in addition to buses and other ambient noise, makes the situation far worse.

Mr. Cliff Slater
Honolulutraffic.com, Stop Rail Now
3105 Pacific Heights Road
Honolulu, Hawaii 96813

Dear Mr. Slater:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Cover Letter

As described in Chapter 2 of the Final EIS, the Airport Alternative is defined as the Project, and is one of the alternatives studied in the document. The identification of the Airport Alternative as the Preferred Alternative was made by the City to comply with FTA's NEPA regulations (23 CFR § 771.125 (a)(1)). Further, FTA's NEPA regulations for projects proposed to be funded with major capital investment funds, the level of detail necessarily increases between the Draft EIS and the Final EIS through preliminary engineering work (23 CFR § 771.123(j)). The Final EIS addresses each of the points of concern noted in your letter. Specifically, Tables 3-9 and 3-10 of the Final EIS compares existing congestion levels to future levels both with the Project and without to provide a point of reference to the reader for future conditions. These tables include traffic volumes, level-of-service, and maximum volume thresholds for individual roadways in the project corridor. Table 3-14 of the Final EIS provides a

comparison of the No Build Alternative and the Project in 2030 and shows that the Project will result in an 18 percent reduction in congestion, as measured by daily vehicle hours of delay (VHD). The environmental benefits and impacts of the Project are detailed in Chapter 4 of the Final EIS. Table 4-1 provides a summary of those impacts and proposed mitigation.

An analysis of the financing of the Project is set forth in Chapter 6 of the Final EIS. Figure 6-3 illustrates forecast transit operating needs from the Highway and General Fund, which includes property tax revenues. As stated in Section 6.4.2 of the Final EIS, overall transit operating and maintenance costs (i.e., the Project, TheBus, and TheHandi-Van) are expected to increase from approximately 11 percent to 14 percent of the City's operating budget. This small increase is typically accounted for in the normal budgeting of available funds and will not by itself result in an increase in property taxes. Financial risks associated with the Project are discussed in Section 6.6 of the Final EIS. The travel forecasting model has been refined since the Draft EIS to add an up-to-date air passenger model (which forecasts travel in the corridor related to passengers arriving or departing at Honolulu International Airport), improved drive access (driving alone or carpooling) module and a better presentation of non-home based direct demand trips (trips that do not originate or end at home). The results are not substantially different than those in the Draft EIS. As stated above, VHD will decrease by 18 percent with the Project versus the No Build Alternative.

The summary section of Chapter 4 in the Final EIS provides a list of technical reports that were prepared for the Project. In addition, various technical reports were used as the basis of the transportation and modeling analysis conducted for Chapter 3 of the Draft and Final EISs. These reports are available from the Department of Transportation Services and on the project website at www.honolulutransit.org.

Chapter 2 of the Final EIS also summarizes the screening and Alternatives Analysis processes that were used to identify and develop the alternatives evaluated in the Draft EIS. The detail requested is provided in the supporting reports listed as references to the Draft EIS. To quote from the FTA "Keys to Efficient Development of Useful Environmental Documents" (US DOT, 2007): The NEPA implementing regulations provide that "[e]nvironmental impact statements shall be concise, clear, and to the point, and shall be supported by evidence that agencies have made the necessary environmental analyses" (40 CFR § 1500.2(b)). This means that the impact statement itself should not contain elaborate and extensive analyses of different types of impacts, but rather, relatively brief descriptions in plain language of the results of those analyses; the brief descriptions are meant to discuss impacts associated with alternatives that were analyzed and presented in comparative form. The Final EIS explains the analysis of the various alternatives considered and environmental impacts of the proposed Project in compliance with NEPA.

According to 23 CFR § 771.130, a Supplemental EIS is prepared when the Administration determines that:

- (1) Changes to the proposed action would result in significant environmental impacts that were not evaluated in the EIS; or

(2) New information or circumstances relevant to environmental concerns and bearing on the proposed action or its impacts would result in significant environmental impacts not evaluated in the EIS.

Neither of these instances is applicable to the Honolulu High-Capacity Transit Corridor Project or demonstrated in the comment letter.

Part I – Alternatives Studied

Project scoping was conducted in two phases, as allowed for in FTA SAFETEA-LU guidance. Early scoping was completed during the Alternatives Analysis phase and NEPA scoping was completed after selection of the Locally Preferred Alternative. The process is detailed as follows. The Alternatives Analysis phase, as documented in Chapter 2 of the Final EIS, evaluated a range of modal and general alignment alternatives, including managed lanes, in terms of their costs, benefits, and impacts. The scoping process for the Alternatives Analysis involved a presentation of the viable alternatives to the public and interested public agencies and officials to receive comments on the Purpose and Need, alternatives, and scope of the analysis for the Alternatives Analysis. Scoping followed the FTA process that provides for a culling of alternatives studied in the EIS through an Alternatives Analysis. The following scoping meetings were held as part of the Alternatives Analysis phase of the Project:

- December 13, 2005: Neal S. Blaisdell Center Pikake Room at 777 Ward Avenue in Downtown Honolulu from 2:00 to 4:00 p.m. (agency scoping meeting)*
- December 13, 2005: Neal S. Blaisdell Center Pikake Room at 777 Ward Avenue in Downtown Honolulu from 5:00 to 8:00 p.m. (open to the public)*
- December 14, 2005: Kapolei Middle School Cafeteria at 91-5335 Kapolei Parkway in Kapolei from 7:00 to 9:00 p.m. (open to the public)*

The scoping process initiated for the Alternatives Analysis included a variety of highway, bus and fixed guideway options for consideration. As a result of this scoping effort, the proposed Managed Lane Alternative was expanded. It was revised again during the Alternatives Analysis to improve its performance. Despite the improvements, the managed lane alternative was not able to meet the performance of the fixed guideway.

A second scoping opportunity was initiated in support of the Draft EIS in March of 2007. All meetings held were open to the public:

- March 28, 2007: Kapolei Hale at 1000 Uluohia Street from 6:00 to 9:00 p.m.*
- March 29, 2007: McKinley High School at 1039 South King Street from 5:00 to 8:00 p.m.*
- April 3, 2007 at Salt Lake Elementary School at 1131 Ala Liliko'i Street from 5:00 to 8:00 p.m.*

In this later scoping effort, the public was requested to propose alternatives that would satisfy the purpose and need at less cost or with greater effectiveness, less environmental or community impact and alternatives that were not previously studied and eliminated for good cause. The only alternative that emerged that met these criteria was a fixed-guideway

alternative following an alternative alignment. All reasonable alternatives that emerged from these processes were ultimately evaluated in the Draft and Final EISs. Your letter suggests that a second scoping process was held because the first scoping process was "inadequate or unsatisfactory"; that is not the case. In 2006, FTA issued guidance that stated a scoping process could be held before the Alternatives Analysis with a second scoping process held after the Notice of Intent to prepare an EIS:

According to SAFETEA-LU Environmental Review Process Final Guidance issued jointly by the Federal Highway Administration and FTA: "Certain New Starts project sponsors have advocated publishing a Federal Register notice of intent to prepare an EIS, more accurately called an "early scoping notice," and then conducting the New Starts planning Alternatives Analysis as a super-extended scoping process (so called "Option 1.5"). This option may provide an opportunity to identify and engage participating agencies...earlier, i.e., during the New Starts planning Alternatives Analysis, through the early scoping notice... Under this option, project initiation [scoping process] would occur after the New Starts planning Alternatives Analysis at the start of the environmental review process."

The FTA issued a Notice of Intent to prepare this EIS in the Federal Register on March 15, 2007. All interested individuals and organizations, as well as Federal, State, and Local agencies, were invited to comment on the Purpose and Need to be addressed by a fixed guideway transit system; the alternatives including modes, technologies and alignments to be evaluated; and environmental, social, and economic impacts to be analyzed. The alternatives evaluated in the Draft EIS are the result of the alternatives screening process and reflect comments received during the scoping process, as summarized in the Honolulu High-Capacity Transit Corridor Project National Environmental Policy Act Scoping Report (DTS 2007). Several scoping comments were received requesting reconsideration of the Managed Lane Alternative that was considered and fully evaluated during the Alternatives Analysis phase and found to perform substantially less effectively than the fixed guideway alternative that was selected for further development in the Locally Preferred Alternative. Because no new information was provided that would have changed the findings of the Alternatives Analysis regarding the Managed Lane Alternative, it was not included in the Draft EIS for further consideration. Had information been provided that demonstrated greater effectiveness, the managed lane alternative would have been reconsidered in the Draft EIS.

Regarding alternatives studied, the Alternatives Analysis fully evaluated a reversible Managed Lane Alternative and documented that it performed poorly compared to the Fixed Guideway Alternative on a broad range of metrics. Based on public comments received on the Draft EIS, additional information, as summarized from the Alternatives Analysis Report and Honolulu High-Capacity Transit Corridor Project Alternatives Screening Memorandum, has been added to Chapters 2 and 8 of the Final EIS to explain why this alternative was rejected. Both the Alternatives Analysis Report and Screening Memorandum were available to the public. The following is a quote from Chapter 8, Section 8.6.12, of the Final EIS:

"A number of commenters stated that the alternatives studied did not properly address other options for the corridor. In particular, there was a concern that the Managed Lane Alternative was not included in the Draft EIS as an alternative."

The process of alternatives screening and selection is discussed in Chapter 2 and in Section 8.6.1 of the Final EIS. As discussed, alternatives were developed through three general phases: (1) the FTA Alternatives Analysis process; (2) the selection of a Locally Preferred Alternative; and (3) the NEPA scoping and Draft EIS process. The initial screening of alternatives is documented in the Honolulu High-Capacity Transit Corridor Project Alternatives Screening Memorandum (DTS, 2006a) (Screening Memorandum). The subsequent FTA Alternatives Analysis process is provided in the Honolulu High-Capacity Transit Corridor Project Alternatives Analysis Report (DTS 2006b) (Alternatives Analysis).

The initial screening process considered a wide range of alternatives, including "construction of a 'managed' two-lane elevated structure for transit vehicles and potentially carpools, as well as single occupant vehicles willing to pay a congestion-based toll," as described on page S-2 of the Screening Memorandum. The screening results for the Managed Lane Alternative are discussed on pages C-4 through C-5 of this report. The analysis found that the transit mode share under the Managed Lane Alternative would hold constant with the No Build Alternative; the automobile mode share would increase; and the bike and walk mode share would decrease. Vehicle hours traveled would decrease, while vehicle miles traveled would increase slightly.

This initial screening process identified four alternatives that were presented at scoping meetings held to obtain public input. As described on page 5-2 of the Screening Memorandum, one of the alternatives recommended for further evaluation was the Managed Lane Alternative. The Managed Lane Alternative originally was described as follows:

"The Managed Lane Alternative would include construction of a two-lane grade-separated facility between Waiawa Interchange and Iwilei for use by buses, paratransit vehicles and vanpool vehicles (see Figure 5-1). The lanes would be managed to maintain free-flow speeds for buses, while simultaneously allowing High-Occupancy Vehicles (HOVs) and variable pricing for toll-paying single-occupant vehicles. Intermediate bus access points would be provided in the vicinity of Aloha Stadium and Middle Street. Bus operations utilizing the managed lanes would be restructured to use the Managed Lane and enhanced to provide additional service between Kapolei and other points Ewa of Downtown, through to the University of Hawai'i at Manoa."

The scoping process resulted in the revision of this proposed alternative. As discussed on page 6-1 of the Screening Memorandum:

"Based on scoping comments, a second operational option was included under the Managed Lane Alternative. The initial option proposed a two-lane grade-separated facility between Waiawa Interchange and Iwilei which would operate as one lane in each direction at all times of the day. The second option proposes similar infrastructure, but it would operate as a reversible facility with two lanes traveling Koko Head during the morning peak period, and then reversing to travel Ewa in the PM peak period. Both operational options would include restructured and enhanced bus operations by utilizing the managed lanes to provide additional service between Kapolei and other points Ewa of Downtown, and both would be managed to maintain free-flow speeds for buses. Providing that enough capacity existed, High-Occupancy Vehicles (HOVs) and toll-paying single-occupant vehicles would also be allowed to use the facility under either

scenario; however, it is possible that under the initial option (one lane in each direction), there would not be enough excess capacity to allow toll-paying single occupant vehicles and still maintain reasonable speeds. Intermediate access points would be provided in the vicinity of Aloha Stadium and the Keehi Interchange."

This alternative was further developed in the Alternatives Analysis Report, with additional features added to maximize the performance of the alternative, as discussed on page 2-4:

"The Two-direction Option would serve express buses operating in both directions during the entire day. The Reversible Option would serve peak-direction bus service, while reverse-direction service would use H-1. Twenty-nine bus routes, with approximately 93 buses per hour, would use the managed lane facility during peak hours for either option. One limited-stop route and one local route would continually operate in the managed lane. A total of 27 peak-period express routes would operate in the peak direction using the managed lane facility. Of these, three would be new express routes serving developing areas and nine would be new routes developed for exclusive use of the managed lane. The nine new managed lane express bus system routes would originate from Kalaeloa, Kapolei, or Central Oahu and terminate at the Alapai Transit Center, Waikiki, or UH Manoa. Other peak-period, local and limited-stop routes would follow a route similar to the current structure but would use the managed lane for the line-haul portion of the route.

"A toll structure has been developed that ensures that the managed lane facility would operate to maintain free-flow speeds for buses. To maintain free-flow speeds in the Two-direction Option, it may be necessary to charge tolls to manage the number of HOVs using the facility. For the Reversible Option, three-person HOVs would be allowed to use the facility for free, while single-occupant and two-person HOVs would have to pay a toll."

As discussed on page 3-8 of the Alternatives Analysis Report, the enhanced bus system would include an increased fleet size, estimated at 321 buses beyond the existing fleet for the two-direction managed lane facility and 381 buses for the reversible managed lane facility, to provide a sufficient fleet to ensure that the alternative would function as planned.

1. Reversible Managed Lane Alternative

The Alternatives Analysis Report estimated total capital and operating costs for the Managed Lane Alternative. As discussed on page 2-16, capital costs for the Managed Lane Alternative were estimated to range between \$3.6 and \$4.7 billion, of which \$2.6 to \$3.8 billion would be for construction of the managed lanes. Transit operating costs for the Managed Lane Alternative would range between approximately \$251 and \$261 million as a result of additional buses that would be put in service under that alternative. These costs do not include the cost of maintaining the managed lane facility. Capital costs for the Fixed Guideway Alternative, including bus system costs, would range between \$5.2 and \$6.1 billion for the Full-corridor Alignments, of which \$4.6 to \$5.5 billion would be for the fixed guideway system. The costs would be \$4.2 billion for the 20-mile Alignment, of which \$3.6 billion would be for the fixed guideway system. Operating costs for the Fixed Guideway Alternative in 2030, in 2006 dollars, would be approximately \$192 million. The total operating costs for the Fixed Guideway

Alternative, including the bus and fixed guideway, would range between approximately \$248 and \$256 million.

The capital cost of the Managed Lane Alternative thus is potentially somewhat lower than the 20-mile Fixed Guideway Alternative and significantly lower than the Full-corridor Alternative. Operating costs would be slightly higher. These cost factors were considered in conjunction with other project goals in evaluating the alternatives.

With respect to transit travel time benefit, the Managed Lane Alternative options would improve some trips that were particularly well-served by the managed lanes. In general, the Managed Lane Alternative would increase transit travel times by increasing traffic on the overall roadway system and creating more delay for buses. The H-1 Freeway leading up to the managed lanes would become more congested because cars accessing the managed lanes would increase traffic volumes. Significant congestion would occur where the managed lanes connect to Nimitz Highway at Pacific Street near Downtown. Much of the time saved in the managed lane itself would be negated by the time spent in congestion leading up to the managed lane, as well as exiting the lanes at their downtown terminus. Furthermore, areas that are not directly served by the managed lane would not experience much positive change from the No Build Alternative. As discussed on page 3-14, the Alternatives Analysis Report found that, "although the Managed Lane Alternative would provide some travel-time improvement for certain areas, it has significant limitations with regard to improving travel times or transit service for a broader customer base.

As discussed on page 3-17, transit ridership would increase only 5.3 to 6.4 percent over the No Build Alternative, a small increase compared both to the cost of the Managed Lane Alternative and the increase that would result from the Fixed Guideway Alternative, which would increase transit ridership by 21 percent for the 20-mile alignment.

The volume of peak-hour vehicles in key areas would actually increase under the Managed Lane Alternative compared to the No Build Alternative. As discussed on page 3-27, the Fixed Guideway Alternative would reduce the number of vehicles by 3 to 12 percent.

With respect to the goal of providing equitable transportation solutions that meet the needs of lower-income transit-dependent communities, the Alternatives Analysis Report noted that the Managed Lane Alternative, "would not substantially improve service or access to transit for transit-dependent communities, as buses that use existing HOV facilities would be routed to the managed lane facility but would continue to be affected by congestion in other parts of their routes. Arterial congestion would increase in the study corridor with the Managed Lane Alternative, making bus access to the managed lanes less reliable" (page 6-8).

The Alternatives Analysis Report also considered consistency with existing land use planning and regional transportation planning. On page 6-13, the report concluded that the Fixed Guideway Alternative, "best serves the areas of Oahu that are designated for future growth and development. It is also the only alternative that is consistent with regional transportation system planning defined in the 2030 Oahu Regional Transportation Plan (OMPO 2006a)."

The evaluation of alternatives inevitably involves trade-offs. As stated on page 6-13 of the Alternatives Analysis Report, the "greatest trade-off among the alternatives is between the transportation benefit provided and the cost to implement alternatives....The Managed Lane Alternative provides slightly more benefit [than the Transportation System Management (TSM) alternative, which had little effect on traffic], but at a substantial cost. While the Fixed Guideway Alternative would have the highest cost, it is also the only alternative that would provide a substantial transportation benefit, measured both by the benefit to transit users and in the reduction in congestion compared to the No Build Alternative."

The November 2006 Alternatives Analysis Report provided information about all alternatives considered, including the Managed Lane Alternative. As stated in the Summary of the Alternatives Analysis Report, "the Managed Lane Alternative would provide some travel time improvements between selected origins and destinations that are well served by the facility, but in many cases the travel time savings experienced is offset by the increased congestion experienced before entering and upon exiting the facility." The summary also states that the Managed Lane Alternative would "generate the greatest amount of air pollution, require the greatest amount of energy for transportation use, and would result in the largest number of transportation noise impacts. It would provide little community benefit, as it would not provide substantially improved transit access to the corridor." Additionally, Table 6-3 in Chapter 6 of the Alternatives Analysis compares each of the alternatives studied in the Alternatives Analysis, including the Managed Lane Alternative, in relation to project goals and objectives. This table shows that the Fixed Guideway Alternative performs the best when considering all the objectives related to the goals of improving corridor mobility and improving transportation equity.

The Alternatives Analysis findings are also summarized in Table 2-2 in Chapter 2 of the Final EIS. The Managed Lane Alternative is discussed in Section 2.2.2 of this Final EIS. As stated in the Final EIS and supported by the lengthy analysis that preceded the preparation of the Draft EIS, the Managed Lane Alternative was not pursued because the Managed Lane Alternative would not have achieved project goals and objectives, would not result in substantially fewer environmental impacts, and would not be financially feasible. For all of these reasons, it was not advanced to consideration in the EIS. The City Council eliminated the Managed Lane Alternative from consideration when it selected the Locally Preferred Alternative on December 22, 2006. The Council's selection was signed into law as Ordinance 07-001.

Comments received about the Managed Lane Alternative referenced in the Draft EIS suggested there were significant differences between the alternative studied in the Alternatives Analysis and an ideal managed lane option. However, there was no substantial difference between the alternatives proposed in comments and those studied in the Alternatives Analysis that would have resulted in a different outcome. The primary concern raised about the Alternatives Analysis alternatives was that they did not allow access other than at the beginning and end of the facility. That is a misunderstanding of the Alternatives Analysis alternatives. Both provided access at Aloha Stadium and Middle Street to allow connections to intermediate points along the corridor. Any additional access points would substantially increase the cost of the facility because of right-of-way and structure costs and would affect the level-of-service provided by the investment.

Also questioned in the comments was the provision of a congestion pricing system that would make the facility available to single occupant vehicles or those with two occupants at a

cost that would rise during periods of high demand. In both cases, the Managed Lane Alternative evaluated a pricing option, and the two-lane reversible alternative description stated that, "A toll structure has been developed that ensures that the managed lane facility would operate to maintain free-flow speeds for buses" (Alternatives Analysis Report, page 2-4). While there may be some minor details of the proposed alternatives that differ from the Alternatives Analysis alternatives, the evaluation assesses the concept fairly in the context of the Project's Purpose and Need.

In addition, the statement in Chapter 2 of the Draft EIS that "the Managed Lane Alternative would provide slightly more benefit [than the TSM] at a substantial cost" is supported by information provided in Table 2-1 of the Draft EIS. As shown in this table, the cost per hour of transit-user benefit compared to No Build is \$13.54 for the TSM Alternative and \$50.34 to \$63.42 for the Managed Lane Alternative whereas the reduction in vehicle hours of delay and daily islandwide transit trips are comparable between the two alternatives. This supports the statement that the Managed Lane Alternative provides benefits at a "substantial cost." As further shown in Table 2-1 of the Draft EIS, the cost per hour of transit-user benefit for the fixed guideway project compared to the No Build Alternative is \$21.32 to \$27.05.

The Transit Task Force was created to assist the City Council in selecting the locally preferred alternative. Page 2 of 7 of the Task Force Report states: "The Task Force finds that the Alternatives Analysis' presentation and assessment of [the Managed Lane] alternative were fair and accurate, however it may well be that operational variations of this alternative could make it more attractive and/or feasible than the specific version considered." The operational variations discussed by the Task Force were focused on improving bus operations on the managed lane. The Alternatives Analysis Report (p. 3-13) indicated that the bus would operate very well while on the managed lane system, but would not be able to maintain performance once it transitioned to the local street network. Since the primary issue with buses was the performance on local streets, the suggestions of the Task Force were not substantive in improving the managed lane alternative performance overall and would not have resulted in a change in the relative merits of the alternatives evaluated. Furthermore, "The Task Force did not identify any additional information that the Council must obtain before proceeding [to select a Locally Preferred Alternative]."

a) Zipper lane: As discussed in the Chapter 5, Alternative 3b of the Detailed Definition of Alternatives Report (2006), the reversible lane Managed Lane Alternative provides three managed/HOV lanes in the peak direction, which is sufficient to satisfy the demand for restricted lanes. Eliminating the zipper lane frees up two off-peak direction lanes – one HOV and one general purpose lane. In other words, it was not needed to accommodate the demand in the eastbound direction. Additionally, Table 3-11 of the Alternatives Analysis Report showed that westbound demand during the a.m. peak hour at the Kalauao Screenline would increase from approximately 7,600 vehicles per hour (vph) in 2003 to approximately 10,600 vph in 2030 with the Managed Lane. While the demand in the reverse direction would increase by approximately 40 percent, the peak-direction demand would increase by only 30 percent. Eliminating the zipper lane while evaluating the reversible managed lane alternative provided the greatest benefit to freeway users by increasing capacity in both directions. Access ramps were provided at several locations. Park-and-ride facilities and bus stops were included to maximize transit use, providing the alternative the greatest opportunity to generate transit user

benefits while reducing traffic congestion. However, as stated in the Alternatives Analysis and Draft and Final EISs, the Managed Lane Alternative was less effective at reducing congestion than the Fixed Guideway Alternative.

b) Managed Lane Alternative capital costs: The engineering cost estimate for a two-lane reversible managed lane facility, which was calculated following the same rigorous cost estimating process used for the Fixed Guideway Alternatives, was \$2.6 billion in 2006 dollars. The City Council's Transit Advisory Task Force reviewed the Alternatives Analysis and concluded in their report of December 14, 2006 that the assessment of each alternative was "fair and accurate" and that capital cost estimates were compiled using the same methodology and unit cost and that the construction cost estimates were fairly and consistently prepared. Shortening of the Managed Lane Alternative, whether to 14 miles, or 10 to 12 miles, would not have increased the benefits to the traveling public compared to the alternative evaluated.

Regarding the costs of the H-3 Freeway, according to construction cost indices prepared by the Washington State Department of Transportation, construction costs doubled between 1997 (the year construction ended on the H-3 Freeway) and 2006 (the year of the Alternatives Analysis). If construction of the H-3 Freeway had begun in 2006, that project would have cost approximately \$2.6 billion. In addition, both the H-3 Freeway and the Managed Lane Alternative face unique situations that affect cost estimates. Construction of the Managed Lane Alternative would have occurred in a heavily developed corridor. As a result, there would be substantial disruptions to traffic and utilities, both of which add to the time, and thus cost, of a project. The H-3 Freeway was built in an undeveloped part of the island and while it had its own challenges, expensive traffic and utility disruptions were minimal.

Regarding the Tampa Expressway, the Task Force compared the Managed Lane Alternative to the Tampa Expressway. The designer of the Tampa Bay facility herself admitted that to apply such an estimate without detailed consideration of the many differences between the two locations is not reasonable. For clarification, the Tampa Bay elevated toll lanes extend only 5.8 miles within the 10-mile expressway. The costs quoted are from 2002, long before the costs of materials and construction rose dramatically after 2004. Furthermore, the corridor within which the Tampa Bay lanes are built required no right-of-way, had no significant utility conflicts, no major structures or crossings, and was built in much more favorable geotechnical conditions than exist on Oahu. In addition, real estate costs between the two locations are different, with costs being substantially higher in Honolulu. As stated in the Transit Task Force Report (dated December 14, 2006) Paul Santo, HDOT Highways Division, stated that there are substantial differences in cost for bridge construction between Hawaii and the mainland US. At that time, the State DOT Bridge Section used \$400 to \$500 per square foot for planning purposes whereas "most highway agencies on the mainland use \$100 to \$200 per square foot with some even below \$100. He believes the high cost in Hawaii is due to its location and the lack of competition." The Transit Task Force Report stated that "the committee concluded that the projects are sufficiently different (actual costs versus projected costs with contingencies; available, accessible ROW vs. construction in actively used highways; no utilities relocation vs. extensive relocations) as to make the comparison unreasonable."

An increase in the number of lanes on the facility would not have substantially changed the findings of the analysis. It would have increased the cost and marginally increased freeway capacity, but the arterial system would still have experienced increased congestion, resulting in total systemwide congestion similar to or worse than the No Build Alternative and substantially worse than the Fixed Guideway Alternative.

Any increase in the number of access points to the facility would result in significant additional right-of-way requirements and additional costs beyond the \$2.6 billion cost estimate (2006 dollars). The geometric implications of building additional ramps and the structures that are needed to support them are significant. The elevated structure would need to be widened beyond the two full travel lanes to accommodate a deceleration lane approaching the ramp and an acceleration lane rising to it. These will be carried at a full lane width at the full height of the facility for between 600 and 1000 feet before the ramp descends from the facility or after the ramp rises to join it. These improvements add substantial additional cost to the project, make it more difficult to build and increase its impact on the nearby communities.

c) Managed lane Alternative operating costs: The approach used to develop the costs of the managed lane was the same as for all other alternatives.

d) Effects on vanpools: According to the data in the 2008 Transportation Energy Data Book, vanpools provided less than 2 percent as many passenger-miles of service as transit vehicles. As such, they do not provide a significant alternative to transit service. The benefits of reduced congestion that will be provided by the Project also will benefit any vanpool operations in the corridor.

e) Ingress/egress: As shown in Figures 2-1 and 2-2 of the Alternatives Analysis Report, there were four access locations in the managed lane alternative. The primary issue with access is that too much access may reduce the performance of the facility as a result of weaving and merging traffic and too little access makes the facility unavailable to many potential users. The access locations identified in the alternative were designed to serve the primary population centers in the corridor at the most desirable locations for access. The other side of the access question is that it introduces additional costs to the facility and creates right-of-way, relocation and general disruption of the communities where they are located. To clarify, each access location requires acceleration and deceleration roadways. Each requires an additional lane approaching an exit ramp and a lane following the on-ramp leading to a merge with the mainline lanes. Deceleration and acceleration require about 1,000 feet each, including transitions if high speeds are to be maintained through the diverging and merging maneuvers. That means each access location requires about 2,000 feet of an additional lane on the elevated structure (i.e., a wider structure by about 12 feet than needed for the mainline only) in addition to the property impacts on the ground and the necessary roadway features where the ramping system joins the surface roadways.

The Purpose and Need of the Project in Chapter 1 states that the selected alternative must improve transportation mobility, reliability and equity. The necessarily limited number of access points, even if strategically placed as in the Alternatives Analysis, provides convenient access to only a select population. The Managed Lane Alternative

cannot guarantee high performance once the vehicle leaves the managed lane itself, offering no improvement to reliability under congested conditions. Limiting access through the high tolls (up to \$6.40 during peak periods as noted on page 5-11 of the Alternatives Analysis) required to maintain free-flow speeds is also not consistent with an equitable solution given most people's inability to pay.

f) Due diligence: Development of costs for the Managed Lane Alternative followed the same approach used in establishing the costs of the Fixed Guideway Alternative. The City did complete due diligence both in Hawaii and through its consultant Parsons Brinckerhoff (PB) regarding the use of appropriate costs of the managed lane alternative and the comparison of construction costs between Tampa Bay and Honolulu. Costs of bridge construction were verified and corroborated through PB contrary to the comment letter indication of an "understanding that they were not". The findings of the Transit Task Force Report cited above are one example of such corroboration. Further corroboration is available from FTA's Project Management Oversight Contractor (PMOC), Booz Allen Hamilton, which prepared a Cost Validation Analysis and Report, May 2007. In response to concerns regarding the estimate procedures for the Managed Lanes vs. the proposed Fixed Guideway, cost estimates for both alternatives were compared to identify any potential cases of analysis bias in favor of one model alternatives over the other. Two comparison activities were completed, a comparison of detailed unit costs, and a comparison of the cost build-up process for the Managed Lanes and Fixed Guideway alternatives. The PMOC determined both the unit costs and the cost build-up process were exactly the same for the Managed Lanes and Fixed Guideway alternatives. No evidence was found indicating a bias in favor of one modal alternative over the other.

g) Managed Lane Alternative in the EIS: The Alternatives Analysis fully evaluated the Managed Lane Alternative and documented that it performed poorly compared to the Fixed Guideway Alternative on a broad range of metrics, for reasons stated previously in this response letter. The analysis is summarized in Chapters 2 and 8 of the Final EIS. As explained previously and shown in Table 6-3 of the Alternatives Analysis Report, the Managed Lane Alternative would perform poorly at addressing the purpose and need for the Project. These findings are further summarized in Chapter 2 of the Final EIS.

As stated previously, the requirements for the preparation of a Supplemental EIS are not applicable to the Honolulu High-Capacity Transit Corridor Project.

2. 2003 BRT Project

Your letter references the 2003 Bus Rapid Transit Project. This proposal was a variation on the Transportation System Management (TSM) Alternative that was evaluated in the Alternatives Analysis. While the alternative was cost effective, its overall system benefit was very low. Dynamic pricing was included in the analysis of the Managed Lane Alternative, which found that a very high toll would have to be paid that would limit access for many users.

3. The EZway Plan

Regarding the EzWay Plan referenced in your letter, which included a 15-mile, 3-lane viaduct was developed as a hybrid of a plan for elevated lanes and some form of rubber-tire-on-

concrete transit system. This concept was similar to the Managed Lane Alternative, as described in Chapter 2 of the Alternatives Analysis, which accommodated both single occupant and transit vehicles, and which was thoroughly evaluated in the Alternatives Analysis. The main difference with the reversible Managed Lane Alternative was that it eliminated the toll element for single occupant vehicles. The EzWay concept was proposed by a mayoral candidate for consideration just prior to the release of the Draft EIS and the mayoral City of Honolulu election. It represented a subtle variation on the Managed Lane Alternative (i.e., no tolls would be allowed) of the Alternatives Analysis, but did not provide a substantive departure from the work completed previously. There may be many other versions of this type of system with minor adaptations to suit one or another special concern. In the end, however, they all face similar challenges as a primary solution to Honolulu's transportation problems. Specifically, they do not address the Purpose and Need of the Project, which aims to reduce congestion, increase the reliability of the transportation system, serve future land use plans, and improve transportation equity in terms of the fairness of and access to the transportation system. The other alternatives also would not offer an alternative to private automobile travel, an element of the purpose of the Project.

Part II – Consideration of elevated rail impacts

The Draft and Final EISs present the potential environmental impacts of the proposed action. These are presented in Chapters 3 and 4 of the Draft and Final EISs and summarized in the Executive Summary of the Final EIS.

The Draft and Final EISs present the environmental impacts of the Project on the built environment. The following resources of the affected built environment were analyzed in the following sections of the Draft EIS: transportation system (Chapter 3); land use (Section 4.1); economic activity (Section 4.2); acquisitions, displacements, and relocations (Section 4.3); community services and facilities (Section 4.4); neighborhoods (Section 4.5); environmental justice (Section 4.6); visual and aesthetic conditions (Section 4.7); noise and vibration (section 4.9); energy and electric and magnetic fields (section 4.10); and hazardous waste and materials (Section 4.11). In fact, the majority of the environmental analysis presented in the Draft EIS pertains to impacts on the built environment versus the natural environment. The potential impacts of the Project on the built environment have been thoroughly analyzed in the environmental process, and those results are presented in the Draft and Final EISs.

The Project is located in Honolulu; therefore, none of the listed locations have direct applicability. The New York system is now an obsolete construction technology. Neither the Miami nor San Juan systems have generated additional significant adverse impacts that were not addressed in the environmental review documents for those systems. The Embarcadero was an elevated highway, more akin to the elevated traffic lanes preferred in the comment. One of the reasons it performs poorly is that it does not serve segments of the corridor where congestion is worst. Furthermore, these examples do not suggest there would be additional significant impacts that have not already been disclosed in the Draft or Final EISs.

Visual renderings

Figure 4-27 in the Draft EIS has been revised for the Final EIS. This figure (now Figure 4-28) shows the column located within a raised median and is a correct rendering of the Project

based on current design drawings. The Project will not be as large as depicted in the drawing you provided nor will it include barriers between lanes as shown in your letter

The Project will not construct any structures in the vicinity of University Avenue. The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future, including a possible extension to the vicinity of University Avenue. The future extensions will not be constructed as part of this Project, thus they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA as part of the Project (Please note that the potential future extensions are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS). Thus, the graphic of Varsity Station included in the letter does not represent the Project.

The next graphic included in the letter does not adequately represent the Project. Figure 4-28 of the Draft EIS illustrates the Project on Dillingham Boulevard near Honolulu Community College and Kapalama Station Area. A 3-foot parapet wall is included in project design along the entire alignment. As such, the effects of the parapet wall are shown in each of the simulations provided in Section 4.8 of the Final EIS.

Visual and aesthetic conditions are discussed in Section 4.8 of the Final EIS. The Project will be set in a primarily open urban context where visual change, including shade and shadow, is expected and differences in scales of structures are typical (e.g., new high rise buildings). The Final EIS acknowledges that the fixed guideway and stations will be elevated structures, and thus will result in noticeable changes to existing views and in the foreground of these views. This change will also affect the location and extent of shadows.

The analysis acknowledges that shadow impacts along the alignment will vary with orientation, height of the stations and guideway, and the height of surrounding trees and local development (see Section 4.8.3 from the Final EIS). Shade and shadow effects are correctly illustrated in the simulated views included in Section 4.7 of the Draft EIS and Section 4.8 of the Final EIS.

The intent of the comment about the "ugliness" of straddle bents is unclear as there is no noticeable difference between the two pictures shown in the comment. Recognizing the visual concerns about the Project, however, the following measures will be included with the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

- Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
- Retain existing trees where practical and provide new vegetation.*
- Replant trees close to their original locations.*
- Shield exterior artificial lighting.*
- Coordinate the Project design with City transit-oriented development planning and Department of Planning and Permitting.*

Part III – The Locally Preferred Alternative

The Project is defined in the Final EIS as a 20-mile fixed guideway from East Kapolei to Ala Moana Center. In February 2007, the City Council passed Resolution 07-039, which directed the first construction project to be fiscally constrained by anticipated funding sources and to extend from East Kapolei to Ala Moana Center. The Project has logical termini and independent utility from any extensions that may be constructed in the future. The potential future extensions are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS. The potential future extensions are not part of the Project, thus they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a federal agency.

Here, because the potential future extensions are not proposed for implementation at this time, they are not part of the Project studied in the Final EIS. While a statement may have been made about a broader project concept, scoping is an early and open process for determining the scope of issues to be addressed and for identifying the significant issues related to a proposed action. Among other things, the scoping process determines the scope and the significant issues to be analyzed in depth in the environmental impact statement. The scoping process is part of the environmental review process that led to the identification of the Project. The broader project concept, which includes extensions to Waikiki and the University of Hawaii at Manoa, are not part of the Project; and therefore, must be the subject future environmental study if it is ever built. The extensions are addressed in Sections 3.6.2 and 4.19.3 of the Final EIS under Cumulative Effects, because while they are not part of the Project, they may be considered a reasonably foreseeable future action. It would be premature to undertake an environmental analysis of the extensions (beyond the analysis conducted as part of the Alternatives Analysis and in the cumulative effects sections of Chapters 3 and 4) because they are not part of the proposed action to be taken by the City and FTA. The City has not requested funding from FTA or any New Starts approvals for the future extensions of the elevated rail system. If and when local funding becomes available and future extensions are proposed for implementation, environmental analysis of the extensions and appropriate alternatives analyses will be undertaken at that time.

The Final EIS describes the total extent of the proposed Federal action of construction and operation of a fixed guideway transit system between logical termini in East Kapolei and Ala Moana Center, a project included in the Oahu Regional Transportation Plan 2030. There is no segmentation between a Federal and local undertaking. Possible future extensions from East Kapolei to West Kapolei, Salt Lake Boulevard, and from Ala Moana Center to UH Manoa and Waikiki are addressed in the Final EIS as cumulative effects in Chapters 3 and 4. The extensions represent elements of the long-range plan that are not part of the Project or proposed action. The commenter suggests presenting an evaluation of an action that is not proposed for implementation, which would be a violation of both Chapter 343 of the Hawaii Revised Statutes and NEPA.

Chapter 4 of the Final EIS includes an evaluation of the cumulative effects of the Project with other past, present, and reasonably foreseeable actions, including the future extensions. When the planned extensions are evaluated in the future, a range of alternatives and complete analysis of potential impacts will be conducted.

Future extensions are not precluded by the Project identified in the Draft and Final EISs. The 35-foot-high station at Ala Moana Center is a logical terminus for the Project, which will serve the shopping center and area properties. In the future, when funding is available, the extension would be designed to best accommodate the possibilities available at that time. The high level option over the shopping center is still available and does not obviate the need for the 35-foot option built now. There are operating plans for the system that will continue to rely on the 35-foot station even after an extension is built. If a future extension is constructed beyond the Ala Moana Center, it is preliminarily proposed that the branch lines would have longer headways than the core system, and service that terminates at Ala Moana Center would use the lower platform, while through service would use the upper platform. Riders traveling towards UH or Waikiki would use the upper platform, while those traveling to Ewa could use either platform.

The Draft EIS provided estimates of cost-effectiveness for those build alternatives addressed in the document, namely three fixed guideway alternatives from East Kapolei to Ala Moana Center. The cost-effectiveness discussion in the Final EIS has been revised since the Draft EIS to reflect updated modeling and financial information. In addition, cost-effectiveness is only presented for the Airport Alternative. Future extensions from East Kapolei to West Kapolei, Salt Lake Boulevard, and from Ala Moana Center to UH Manoa and to Waikiki are addressed in the Final EIS as cumulative effects in Sections 3 and 4.

Table 3-16 of the Draft EIS provides total transit boardings and linked trips in 2030 for each of the "First Project" Build Alternatives (East Kapolei to Ala Moana Center). Table 3-28 of the Draft EIS shows fixed guideway boardings for each of the "First Projects" and the "First Projects plus extensions" (East Kapolei to Ala Moana Center with the West Kapolei, UH Manoa, and Waikiki extensions). These tables have been revised in the Final EIS to show boardings for the Airport Alternative and the Airport Alternative plus future extensions (Tables 3-18 and 3-29 respectively).

As documented in the Alternatives Analysis and summarized in Chapter 2 of the Final EIS, the Managed Lane Alternative performed poorly in comparison to both the 20-mile and full-corridor Fixed Guideway Alternative alignments evaluated in the Alternatives Analysis. Chapter 2 in the Final EIS includes a discussion of why the Managed Lane Alternative is no longer being considered. Despite any prior comments, the Project in the EIS was defined to be the 20-mile fixed guideway that is the subject of the EIS by City Council action in adopting a financially constrained alternative. Because of available funding, the Project was, of necessity, limited in scope and, as a consequence, so was the content of the supporting EIS. Please note that the planned extensions are addressed generally in the Cumulative Impacts sections in Chapters 3 and 4 of the Final EIS. This Project has been consistent in its presentation to the public since the beginning of the EIS/Preliminary Engineering project began in mid 2007.

Part IV –Project Termini

The Record of Decision, acceptance of the Hawaii Revised Statutes Chapter 343 EIS, and applicable permits are required prior to construction. Pearl Highlands is not a project terminus, rather, it is a construction phasing point. The questions of logical termini, independent utility, and not restricting other foreseeable transportation improvements apply to project limits of East Kapolei and Ala Moana Center. First, the Project still connects logical termini and is of sufficient length to address environmental matters on a broad scope as required by 23 CFR

771.111(f). As discussed in Chapter 2 of the Final EIS, the open fields alluded to in the letter are slated for major residential and commercial development including a significant new campus of the University of Hawaii (University of Hawaii West Oahu) as well as the Kroc Center, a major destination community center complex. In addition, Ala Moana Center is a logical Koko Head terminus because it is a major activity center as well as a major transit hub with more than 2,000 weekday bus trips. The Project can operate independent of any future transportation improvements. Lastly, the 20-mile alignment will not preclude any reasonably foreseeable transportation improvements since it is proposed almost entirely within the median of existing roadways where no transportation improvements would occur. The Project enhances the existing transportation system by adding substantial new person-carrying capacity to the corridor by making more efficient use of the roadways. Construction phasing points such as Pearl Highlands are not relevant to the completion of the EIS as long as the entire Project is covered in the document.

Second, the Project has independent utility, because it will be usable and be a reasonable expenditure even if no additional transportation improvements in the area are made. As discussed in Chapter 2 of the Final EIS, the Project will connect multiple activity centers, provide cost-effective transit-user benefits, and meet the Purpose and Need whether or not the planned extensions are built.

Third, the Project will not restrict consideration of alternatives for other reasonably foreseeable transportation improvements. Construction of the Project will not preclude future development of the planned extensions, nor will it preclude development of other projects on the Oahu Regional Transportation Plan (ORTP).

Because of its length, the Project will be constructed in phases to accomplish the following:

- Match the anticipated schedule for right-of-way acquisition and utility relocations.
- Reduce the time that each area will experience traffic and community disruptions.
- Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.
- Match the rate of construction to what can be maintained with local workforce and available financial resources.
- Balance expenditure of funds to minimize borrowing.

The construction phases are not project segments and are considered in total in the Final EIS to meet the requirements of 23 CFR 771.111(f).

Part V – Forecasts

1. Ridership forecasts

National trends show substantial ridership increases. Last year (2008) recorded the highest demand for public transportation in 52 years (APTA 2008 Ridership Report). National transit ridership has grown 18 percent over the past ten years (2007 National Transit Summaries

and Trends, National Transit Database). Honolulu transit ridership has grown over the past several years recovering from three fare increases (July 1, 2001, July 1, 2003, October 1, 2003) and a month-long strike (FY 2004). As identified in the Final EIS (Chapter 3, Section 3.2), transit ridership forecasts, for rail and bus service, are based on a travel demand forecasting model used by the Oahu Metropolitan Transportation Organization (OahuMPO) for the Oahu Regional Transportation Plan. This model is based on guidelines established by FTA and is required to qualify for federal grant funding under the New Starts program. FTA forecasting guidelines have been revised periodically to take advantage of experiences on other projects to ensure projections are realistic and reproducible. The ridership figures presented in the Final EIS have been developed using the latest and best practices put forth by the FTA.

In addition, the Project is one of the first in the country to design and undertake an uncertainty analysis of this type of travel forecast. The uncertainty analysis evaluates the variability of the forecast by establishing probabilistic upper and lower limits of ridership projections. FTA has worked closely with the City during this work effort. A variety of factors were considered in the uncertainty analysis, including the following:

- Variations in assumptions regarding the magnitude and distribution patterns of future growth in the Ewa end of the corridor.
- The impact of various levels of investment in highway infrastructure.
- The expected frequency of service provided by the rapid transit system.
- Park-and-ride behavior with the new system in place.
- The implications on ridership of vehicle and passenger amenities provided by the new guideway vehicles.

Given all the factors considered, the anticipated limits for guideway ridership in 2030 is expected to be between 105,000 to 130,000 trips per day, bracketing the official forecast of 116,000 riders a day used for all calculations.

2. Projected energy savings

According to the U.S. Department of Energy, Transportation Energy Data Book, for the year 2006, passenger cars require 3,512 BTUs per passenger mile while transit trains require 2,784 BTUs per passenger mile and transit buses require 4,235 BTUs per passenger mile. While New York City carries more transit trips than any other city, it represents only 22 percent of the rail passenger-miles traveled, not 57 percent, according to the Bureau of Transportation Statistics (BTS). Furthermore, the commenter applies the most convenient interpretation of the Department of Energy information to make his point about energy utilization. If we use 1600 BTU/mile instead of 8000 BTUs/mile, it can be argued, using the same statistics presented in the comment, that many transit riders use less than half the 3400 BTUs/mile consumed by people who drive. The analysis presented in both the Draft and Final EISs applies more reasonable numbers for energy use. As the Department of Energy advises, great care should be taken when comparing modal energy intensity data among modes. Because of the inherent differences among the transportation modes in the nature of services, routes available, and many additional factors, it is not possible to obtain truly comparable national energy intensities among modes. These values are averages, and there is a great deal of variability even within a

mode, as the commenter has demonstrated. The same Department of Energy report referenced by the commenter shows that between 1970 and 2006, highway transportation energy consumption has been growing at a rate of 1.8 percent per year. The commenter's assertion that highway transportation energy consumption will stop growing on an annual basis is not supported by data collected over the past 36 years.

With regard to construction energy usage, a construction project will obviously require the use of energy. If no construction is done, less energy will be used. Under any alternative evaluated to this point, with the exception of the ineffective No Build and TSM Alternatives in the Alternatives Analysis, avoiding construction is not possible and affords no possible way to meet the Project's Purpose and Need to improve mobility and reliability, access to planned growth areas, and improvement in the equity of the transportation system. Recognizing the demand for energy during construction, measures are being taken to reduce energy use during construction as noted in Chapter 4.18.6 of the Final EIS.

3. The Draft EIS financial plan

The financial plan for the Project is discussed in detail in Chapter 6 of the Final EIS. The commenter's statement that "the additional operating subsidy for rail is not accounted for in the cash flow" is incorrect. The referenced cash flow table anticipates a City subsidy of \$4.726 billion will be spent to support all public transit operations and maintenance during the 2009-2030 period. This is approximately 14 percent of anticipated revenues from the City's General Fund and Highway Fund during this period of which the Project will represent less than 25 percent. Approximately 60 percent of General Fund and Highway Fund revenues come from property taxes with the remainder coming from a variety of other taxes and fees.

The commenter is correct in noting that over \$500 million (\$571 million) in General Obligation Bond proceeds are anticipated to be used for ongoing capital expenditures during the 2009-2030 period. This is a continuation of the City's long-standing practice of using General Obligation Bond proceeds to pay for ongoing capital expenditures for the transit system. As shown in the cash flow table for the Project, about 9 percent of ongoing capital expenditures during the 2009-2030 period are anticipated to be related to the rail line, with the remainder going to the purchase of vehicles and other capital projects for TheBus and TheHandi-Van. It is likely that many of these expenditures, utilizing General Obligation Bond proceeds, would occur even if the Project were not implemented. In reference to General Excise and Use Tax (GET) collections, the Final EIS financial analysis recognizes the reduction in GET surcharge collections, forecasting total revenues of \$3,524 million from the GET surcharge, almost the same as presented in the commenter's letter.

The financial plan is a dynamic document that will be regularly updated to reflect changing conditions. The City will continue to refine revenue forecast and cost estimates as the Project proceeds through FTA's New Starts process. The financial analysis presented in Chapter 6 shows the overall Project financial plan to be balanced using federal and GET surcharge revenues. The primary change has been the amount of federal funding to be requested from New Starts has been increased. This revision has been presented to the FTA.

4. Risk Assessment

Chapter 6, Section 6.6 of the Final EIS provides a detailed discussion of the risks associated with Project funding ranging from project construction risks to market uncertainty to inflation. It also presents other possible revenue options should conditions warrant their consideration.

The operating cost model was developed using information from Washington Metro, Los Angeles and Miami as noted in Chapter 6 of the Final EIS. The procedure used was in accordance with the guidance of the FTA and has been reviewed by the FTA. All transit projects have a variety of different characteristics and thus do not provide an "apples to apples" comparison. While cost comparisons may be somewhat helpful in evaluating projects, they cannot form the primary basis for such an evaluation because of the unique physical conditions, engineering and other characteristics of each geographic area and system.

The "Pickrell Report" is widely accepted as being out of date as it reviewed a small sampling of systems that were built over 20 years ago and which were not exposed to the current more rigorous requirements of the FTA's New Starts process. The 2007 FTA report shows real costs to be much closer to estimates, in general. Sixty percent of the percentage discrepancy presented by the commenter is recognized in the report by the FTA to be attributable to one project, the Tren Urbano in Puerto Rico. Comparing the final estimate before construction of the same list of projects without the Tren Urbano shows the comparison of actual cost and estimate to be within a reasonable range. These kinds of discrepancies are now the subject of careful review by the FTA using third party financial specialists to supplement their own reviews. The New Starts process is designed to refine estimates as the engineering and design elements are advanced. In the end, the analyses in these reports serve to aid FTA in improving the way estimates are done.

Cost estimates and ridership projections for the Project have been developed in accordance with the latest guidance issued by FTA. FTA and the Project have the benefit of experience from other systems built in the U.S. FTA continuously adjusts the requirements to improve practices where necessary. As mentioned above, there are many checkpoints within the development of the Project subject to FTA scrutiny, review and, ultimately, approval. The Financial Plan and ridership analysis prepared for the Project and documented in the Final EIS contains the best available data, and their development adheres to FTA requirements. The Final EIS also discloses the potential risks and uncertainty associated with funding for the Project (Section 6.6).

The fixed guideway alternative was shown in the Alternatives Analysis Report to provide the best improvement in travel conditions over the No Build Alternative compared to the Managed Lane and the TSM alternatives. This analysis is discussed in Chapter 2 of the Final EIS. The fixed guideway will reduce VHD on the highways by 18 percent compared to the No Build Alternative. Other alternatives studied offer negligible improvement compared to the No Build Alternative.

The fixed guideway component of public transit operating costs is projected to be 25 percent of the systemwide total. Increasing operating costs are a consideration for the entire transit program. Operating costs for the transit system as a whole (i.e., TheBus and TheHandi-

Van and, eventually, the Project) are funded from the City's General and Highway Fund which is made up of a variety of sources, including property taxes, vehicle license fees and other items. The operating budget is set each year by the City Council during the budget process. The additional costs of the transit system will not by themselves cause a need to increase property taxes (and the contribution from the Project is even less likely to do so), but the City Council will review all competing needs and the available resources and make that decision each year as they do now with all City operating programs.

5. Operating subsidies

Chapter 6.4 of the Final EIS describes the basis for the operating costs used in the financial calculations. The primary public transit properties used for comparison were Washington D.C., Los Angeles, and Miami. These systems were selected because they had detailed information available as required by FTA. Other apparently comparable operations did not maintain the appropriate types of data needed for the detailed analysis required by FTA. The methodology to develop operating and maintenance cost estimates for the fixed guideway project was reviewed by the FTA. All properties used for comparison were steel-on-steel grade-separated systems. Your comment that Miami's operating cost per trip of \$4.61 compared to Honolulu's projected \$2.27 cost per trip suggests that Honolulu's operating cost may be understated. However, cost per trip is a poor metric for comparisons of operating costs because the measure also depends on ridership response to the service. Cost per vehicle revenue hour is a much better metric because vehicle-hours are a direct quantification of the amount of service provided. Miami's cost of \$9.65/vehicle-hour is only slightly higher than Honolulu's projected cost of \$9.20/vehicle hour.

Regarding the long term cumulative operations cost, the fixed guideway portion of the overall transit systemwide cost is less than 25 percent. Chapter 6.6 of the Final EIS discloses the risks and uncertainties associated with the financial analysis of the Project.

The cost of security is included in the operating costs estimated for the Project as part of the development of the overall operating costs for the system. Security costs are reflected in "professional services" element of the operating costs for all the systems used in developing Project. The security cost for the Los Angeles system cited in the comment is for all transit services not just fixed guideway service, which is significantly more extensive than Honolulu's proposed Project.

You also reference FTA's Contractor Performance Assessment Report (CPAR), September 2007. The findings of the CPAR with respect to operations and maintenance (O&M) costs are inconsistent with your assertion. Quoting from page 26 of the CPAR Appendix "Figure 8 shows that actual O&M costs tend to be less than the estimate prepared for the AA/DEIS – a finding consistent with the level of service offered." Quoting from page 27 "For the projects reported here the as-operated O&M costs are on average 92 percent of the estimate." Quoting from page 28 "It is rare for New Starts project O&M costs to exceed the planning estimates."

6. Replacement and Refurbishing

Information regarding replacement and refurbishing has been included in the Final EIS and is shown graphically in Figure 6-1. Similar replacement and refurbishing practices will apply

to the fixed guideway as they do to TheBus. Although railcar equipment is more costly, it has a much longer lifespan than buses and associated equipment and facilities. The funding for refurbishing and replacement will come primarily from discretionary and formula federal funding such as FTA Urbanized Area Program and the Fixed Guideway Modernization Program. The City will receive a higher share of formula funding because of the Project.

Replacement and refurbishment costs are minimal for the Project as a new system. Costs are expected to be very small with no full replacement needed until 16 years after the opening of the first segment (2028 at the earliest) and only minor repair costs about five or six years after opening. This places the demands for replacement and refurbishing outside the planning horizon for the Project. However, recognizing the need to provide for this cost over time, the Peskin approach has been used effectively for estimating these needs.

The need for refurbishing and replacement of capital assets is addressed in the Financial Plan and discussed in Chapter 6 of the Final EIS, including funds available for that purpose. There will be ongoing costs to maintain the fixed guideway system as there are with any capital investment over time. A possible method of calculation of such costs is mentioned above.

Forecasting and Cost Effectiveness

At a \$16.24/hour cost-effectiveness index (CEI) as indicated in Chapter 7 of the Final EIS, the Project is well under the \$23.99/hour level the FTA requires to find a project to be cost-effective. Ridership and costs are based on the best information available and have been developed consistent with FTA guidance and under FTA scrutiny. Even at lower levels of ridership or higher costs, the Project would still qualify under the FTA's CEI criterion.

FTA approved the Project's entry into Preliminary Engineering on October 16, 2009, giving the Project an overall rating of "Medium." This rating is sufficient for the Project to be advanced in the Federal project development process and for the Project to be recommended for Federal funding. The information related to the New Starts evaluation of the Project is discussed in Chapter 7, Section 7.6.

Part VI – Information in the Draft EIS

Numerous transportation reports were prepared for the Draft and Final EISs, including the Transportation Technical Report; Addendum 01 Addendum 02, and Addendum 03 to the Transportation Technical Report; Model Development, Calibration, and Validation Report; Travel Forecasting Results and Uncertainties Report; Travel Demand Forecasting Results Report; and Addendum 01 to the Travel Demand Forecasting Results Report. These reports are available on the Project website and listed in the References section of the Final EIS.

1. Other material

a) OMPO surveys:

The statements quoted from the 2004 Oahu MPO Survey indicate that there is broad public support for an improved transit system and a willingness to fund the improvements with local tax revenue.

The 2006 survey provided little new information about the public's opinion about the fixed-guideway project. The indication that one-third of Oahu residents plan to use the Project on a regular basis would indicate a substantial desire of current drivers to change mode to reliable transit.

b) Future traffic conditions versus today's traffic:

The Draft EIS provided existing traffic conditions in Table 3-7 and 2030 conditions with and without the Project in Table 3-20. The information is provided for the public to compare current conditions to those projected for the future both with and without the Project. Tables 3-9 and 3-10 in the Final EIS present traffic volume information for existing conditions and for 2030, with and without the Project, during the a.m. and p.m. peak hours. These tables have been revised in the Final EIS to show the component roadway facilities of each screenline, level-of-service, and maximum volume thresholds. As shown in these tables, traffic decreases with the introduction of the Project. The Final EIS includes a statement in the Summary of Findings (now appearing as Table 3-1) stating that roadway conditions in 2030 will be better with the Project than the No Build Alternative. Table 3-14 compares the 2030 No Build Alternative with the Project and clearly shows the benefits of building rail to vehicle miles traveled (VMT), vehicle hours traveled (VHT) and VHD. All measures decrease significantly with the implementation of the fixed guideway compared to the No Build Alternative.

c) Highway capacity data

In response to comments and additional analysis, the travel forecasting model has been refined since the Draft EIS to account for non home based direct demand trips during off peak periods. In addition, the air passenger model was updated to reflect current conditions. The Final EIS reflects updated ridership numbers resulting from model refinement. Screenline information for existing conditions, 2030 No Build, and the Project are shown in Tables 3-9 and 3-10. Updated VMT, VHT, and VHD for all time frames are shown in Table 3-14.

Under the No Build and Build alternatives, travel forecasting has assumed several transportation projects, including congestion relief projects in the Oahu Regional Transportation Plan 2030 (as shown in Table 2-4 in the Final EIS). As identified in Chapter 3 of the Final EIS (Table 3-14), the fixed guideway alternatives will result in reduced islandwide vehicle delay of 18 percent as compared to the No Build Alternative.

The screenline volumes in the Alternatives Analysis report were incorrect and have since been corrected. Numbers have been updated for the Final EIS based on the Airport Alternative and refinements to the travel demand forecasting model. The updated results continue to show that traffic will decrease with the addition of the Project. Tables 3-9 and 3-10 in the Final EIS contain updated screenline information including level-of-service, maximum capacity thresholds, and the component roadway facilities of each screenline.

2. Purpose and Need statement:

Section 1.7 of the Draft EIS specifically states the Project's purpose: The purpose of the Honolulu High-Capacity Transit Corridor Project is to provide high-capacity rapid transit in the

highly congested east-west transportation corridor between Kapolei and UH Manoa, as specified in the Oahu Regional Transportation Plan 2030 (OahuMPO 2006). This Purpose and Need in the Draft EIS reflects the work completed during the Alternatives Analysis and the findings resulting from that effort that led to a City Council decision to pursue a fixed guideway system for Honolulu. The Project is intended to provide faster, more reliable public transportation service in the study corridor than can be achieved with buses operating in congested mixed-flow traffic, to provide reliable mobility in areas of the study corridor where people of limited income and an aging population live, and to serve rapidly developing areas of the study corridor. The Project also will provide an alternative to private automobile travel and improve transit links within the study corridor. Implementation of the Project, in conjunction with other improvements included in the ORTP, will moderate anticipated traffic congestion in the study corridor. The Honolulu High-Capacity Transit Corridor Project also supports the goals of the Honolulu General Plan and the ORTP by serving areas designated for urban growth.

The need for transit improvements are discussed in Section 1.8 of the Draft EIS, and are addressed by the Project goals as discussed in Section 1.9 of the Draft EIS. They include: improve corridor mobility, improve corridor travel reliability, improve access to planned development to support City policy to develop a second urban center, and to improve transportation equity.

The purpose and need statement complies with the requirements of NEPA and applicable FTA guidance.

3. Visual renderings

Please see our response to this topic above, under Part II.

Part VII – Information outside of the Draft EIS

The Draft and Final EISs include a clear and objective evaluation of project alternatives and impacts.

Project funds have been expended to inform the public and solicit public input about the status and details of the Project.

The comment related to political contributions is not related to the environmental analysis of the Project.

The purpose of the Project, as stated in Section 1.7 of the Final EIS, includes moderation of anticipated traffic congestion (“Implementation of the project, in conjunction with other improvements included in the ORTP, will moderate anticipated traffic congestion in the study corridor.”). As shown in Table 3-14 in the Final EIS, in comparison to the No Build Alternative, in 2030 the Project will result in an 18 percent reduction in islandwide congestion, as measured by daily vehicle hours of delay. Thus, the Project meets the purpose of moderating anticipated traffic congestion.

You are correct in pointing out that traffic congestion will be worse in the future with rail than what it is today without rail, and that is supported by the data included in the Final EIS. In

Mr. Cliff Slater
Page 25

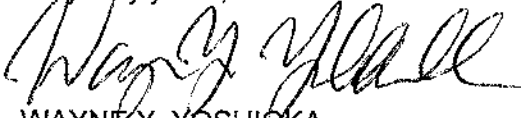

fact, projections suggest that traffic conditions will be worse in 2030 under any circumstances. The Alternative Analysis supports this statement as does the analysis of transportation impacts in the Final EIS. The comparison that is key to the Project is that rail will improve conditions compared to what they would be if the Project is not built. With the fixed guideway system, total islandwide congestion (as measured by VHD) will decrease by 18 percent (as shown in Table 3-14 in the Final EIS), compared to the No Build Alternative. In addition, traffic volumes were studied at various screenlines in the study corridor. The travel demand forecasting model was used to forecast traffic volumes at these screenlines in 2030, both with and without the Project (as shown in Tables 3-9 and 3-10 in the Final EIS). Analysis revealed that traffic volumes at these screenlines will decrease up to 11 percent with the Project. Accordingly, traffic conditions will be significantly better with the fixed guideway compared to the No Build Alternative.

The comment regarding inaccuracy in statements made by politicians is not related to the NEPA environmental analysis of the Project. FTA is the federal lead agency and will continue to ensure compliance with NEPA as part of their responsibilities under NEPA and federal law.

The NEPA process is unrelated to any electoral processes. Further, this comment regarding the electoral process is not related to the environmental analysis of the Project.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Submission Content/Notes : We are concerned about the impact construction will have on our
Kapalama Branch located at 1535 Dillingham Blvd.

1. How will the construction impact traffic along Dillingham Blvd.? Will construction be phased to close one lane at a time thus creating traffic bottle necks?
2. During construction, we are concerned egress into our facility will be compromised.
3. We are concerned about the construction noise, dust and heavy equipment vibrations during business hours. We understand the street will be a construction site, however we need to conduct business in a business like fashion and not have to raise our voices to be heard by our customers.
4. Will there be road closures during normal business hours?
5. Is night work a consideration?
6. Will portions of the property need to be condemned or encroached upon to allow the rail structure?
7. How will the project phasing be communicated to affected businesses? Will we receive prior notification of critical work that will impact our foot and vehicular traffic?
8. After completion of the project will visibility to our facility be compromised? We rely on street visibility of signage and placements of vertical support structures may block visibility.

Dear Ms. Hookano:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following addresses your comments regarding the above-referenced submittal:

This letter will address your comments in the same manner as your letter.

- 1. The exact impact of construction activity on traffic is not yet known. As discussed in Section 3.5.7 of the Final EIS, a Maintenance of Traffic (MOT) Plan will be developed in advance by the contractor with approval from the City Department of Transportation Services and Hawaii Department of Transportation. The MOT Plan will identify measures to mitigate temporary construction-related effects on transportation and will address roadway closures for streets identified in Table 3-27 of the Final EIS. As stated in Section 4.18.1 of the Final EIS, several public involvement strategies will be used to inform businesses and the public about construction activities, including roadway detours. These include a public involvement*

plan developed prior to construction to inform business owners of the construction schedule and activities, as well as public information campaigns to reassure people that businesses are open during construction and to encourage their continued patronage. Public information regarding construction activities will be provided in print and on television and radio. The Project will provide advance notice if utilities are to be disrupted and will schedule major utility shut-offs during non-business hours.

- 2. As stated in Section 4.18.1 of the Final EIS, access to businesses near construction activities could temporarily be affected. Drivers may be required to change their approach in order to enter businesses. The MOT Plan will address temporary effects on access to businesses during construction. Mitigation measures will include maintaining access to businesses during construction and providing business owners prior notification regarding construction activities and schedule.*
- 3. As discussed in Section 4.18.5 of the Final EIS, prior to construction, the contractor will be required to obtain an approved Community Noise Variance from the Hawaii Department of Health. The permit will regulate construction times and activities and include mitigation commitments. Mitigation measures will include monitoring plans, temporary noise barriers or curtains, and placement of construction machinery. Noise impacts from construction will not be constant, and business disruptions will be kept to a minimum. The contractor will be required to provide mitigation for pile driving activities that are closer than 75 feet to buildings. As discussed in Section 4.18.4 of the Final EIS, dust will be controlled by using watering trucks, covering truckloads of dirt, using windbreaks, washing and cleaning construction equipment, and minimizing construction-related traffic on and off work sights.*
- 4. As shown in Table 3-27 of the Final EIS, temporary peak-period lane closures will be necessary along that section of Dillingham Boulevard. An MOT Plan will address the duration of lane closures and provide mitigation strategies. As discussed previously, several public involvement strategies will be used to inform businesses and the public about construction activities, including roadway detours.*
- 5. Yes, nighttime work is a possibility.*
- 6. Dillingham Boulevard in this vicinity will require widening to the makai side of the roadway. Additional right-of-way will be required to relocate the sidewalk farther makai and allow for widening. Owners of properties where an acquisition is required have all been individually contacted to discuss right-of-way impacts to their property. As design progresses, there will be a refinement of property requirements. Specific right-of-way needs are shown in Appendix C of the Final EIS.*

7. *As discussed previously, Section 4.18.1 of the Final EIS discuss the effects that construction will have on businesses. Communication and coordination with businesses will occur throughout the process. Access to businesses near construction activities could be temporarily affected. DTS will coordinate with affected businesses prior to construction. A public involvement plan will be developed prior to each construction phase, which will detail outreach tailored to the construction phase. DTS will maintain the project website (www.honolulustransit.org), which will also provide information to the community regarding construction phasing.*

8. *Building the Project will have short-term effects on the environment, including the business community, as discussed in Section 4.18.1 of the Final EIS. During that period of time, every effort will be made to inform the surrounding affected community about upcoming and ongoing construction activities. Access may temporarily change during this phase, but there will be access to your place of business during construction. The guideway will be about 30 feet above the center of Dillingham Boulevard as it passes by the Kapalama Branch and McNeill Street. The visibility for motorists along Dillingham Boulevard is illustrated on Figure 4-29 (Viewpoint 10) of the Final EIS. The simulated view shows that the guideway columns would not block views of businesses or signage as the guideway will be constructed overhead and the columns will be constructed in the median and spaced at substantial intervals of between 120 and 1,550 feet. In addition, the signage for the bank will be visible under the guideway to travelers on Dillingham Boulevard.*

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Submission Content/Notes : Having been loosely associated with rail transit matters since the time of the initial Fasi proposal, I am a strong supporter. Major cities simply cannot function well over the long term without some version of off-grade rail transit. However, I also believe the present proposal should be modified in several ways. First, in light of the immense cost involved, it should be made clear that no ground will be broken until there is iron-clad assurance that all possible Federal support (including new prospects presently under discussion) will be available. Second, construction of the system should follow the classic pattern and be built from the city core outward rather than as currently planned. There are several reasons this makes good sense. Particularly if some future event--economic or other--were to cause a halt in the project, it would be far preferable to have a segment serving the urban core instead of one starting in Ewa and stopping in Waipahu or Pearl City. The project definitely should be moved ahead but not so rapidly that overly hasty decisions are made.

Dear Mr. Hooper:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The current plan is to begin construction as soon as possible, using local funds, prior to the execution of a Full Funding Grant Agreement with the FTA in order to ameliorate the effects of cost escalation that would occur if the project start is delayed. The environmental process must be completed before Federal funding can be committed to construct a project. No contracts for construction will start before the Record of Decision for the Environmental Impact Statement is issued by FTA. Once that occurs, although action by Congress is still required, there is an expectation of approval of a Full Funding Grant Agreement based on the experience with other projects throughout the country.

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase

Mr. Paul Hooper
Page 2

must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- Match the anticipated schedule for right-of-way acquisition and utility relocations.
- Reduce the time that each area will experience traffic and community disturbances.
- Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.
- Match the rate of construction to what can be maintained with local workforce and available financial resources.
- Balance expenditure of funds to minimize borrowing.

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Dear Mr. Huyler:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Per your first comment, The Honolulu Advertiser published an article on November 10, 2008, which evaluated the voting patterns in the results for the Project.

Regarding your second comment as to the cost of the Project, as noted in Section 6.5 of the Final EIS, the Honolulu High-Capacity Transit Corridor Project Summary Cash Flow Tables (RTD 2009g) present the year-by-year cash flow tables for the Project. They are available as support documents to the Final EIS along with other technical reports.

To answer your third comment, both the Airport and Salt Lake Alternatives were carried forward in the Draft EIS. No alignment had been selected at that time. The City has since identified the Airport Alternative as the Project. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As

compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The proposed future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of this Final EIS. However, future extensions are not part of this Project, thus they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and the National Environmental Policy Act (NEPA). Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in this Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time.

Lastly, business proponents consist of the Hawaii Business Roundtable and several other business groups that have voiced support for the Project. Information on campaign contributions may be obtained from the State of Hawaii Campaign Spending Commission. Questions regarding plans for future development by private groups should be directed to the groups in question. Aside from the secondary and cumulative effects described in the Final EIS, such development is not part of the Project proposed in this EIS.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

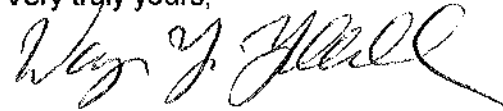

WAYNE Y. YOSHIOKA
Director

Mr. Harry Huyler

Submission Content/Notes : Aloha to whom ever this may concern,
I really think that this transit system isnt great for Hawaii, espescially at times like this. Last night was one of Hawaii's biggest black out since the earth quake and we wouldnt have problems if we had back power plants to the ones we already have. If one goes down we have another. Look we have comments in the advertiser from people in Okinawa and they have yet to have a blackout like the one in Oahu. That tells you something, use our tax paying money to something we need not to something we want. Im one of the people that voted for the transit not to be build, but seriously if the government gets there heads out of their asses an really look over everything they could see what exactly were going through. thanks for your time for reading my response.

Dear Ms. Iaea:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

Since trains and rail stations will be electrically powered, the system's infrastructure is being designed to handle service disruptions. For example, trains will draw power from many points along the route, so an outage in a few areas should not disrupt service. If electrical power is lost systemwide, then train brakes are designed to stop the rail cars even without power. Lights will stay on in trains and stations; backup batteries will provide lighting for several hours. The train operations center will communicate with passengers via the public address system and intercom and provide guidance. If power is restored within a short time, service will resume. With a prolonged outage, the operations center will direct passengers to exit the trains and walk along a lighted emergency walkway on the guideway to the nearest station. For those unable to exit rail cars, help will be provided by emergency responders and transit staff. Passengers will be met at the train station by a coordinated response from emergency responders and City transportation workers.

Ms. Sheree-Victoria laea
Page 2

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Submission Content/Notes : A couple of questions...your Q&A section estimates 25,000 cars off the road each day due to rail. But the reason the highways are crowded is because everyone has to be in the same area around the same time. So if you can carry 300 people, or 6000 per hour (again from your Q&A section) what about the rest of the people who need to be at work at the same time as those other 6000 people? Don't they still have to drive? so how can you estimate 25,000 cars off the road if only 4000 cars are off the road during the time people need to be travelling to work?

Second question...is it legal to have people vote on a rail system if the eis is provided only a few days before the ballot? If not, then the legal challenge will end up costing more and the vote will need to happen again.

Third (and final for now) question...will the ballot issue be on neighbor island ballots? While the GET increase may have been on Oahu, if you assume that it does not flow to other counties, that is somewhat short-sighted (I hope that is not the extent of the reasoning abilities applied to the rail project). Is the tax increase charged to businesses on the other islands that purchase goods from Oahu? If so then it would seem to be a constitutional issue that could be challenged and again delay the project and or the vote.

(for the record I support the effort to have a rail system although I feel the current model is not feasible. I wonder if anyone in office would like to wager or bet their reputation on whether or not it will actually help by the time it is built?)

thanks...ken

Dear Mr. Ikeda:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Chapter 3 of the Draft EIS showed that peak direction volume during the morning (a.m.) two-hour peak period will be below the fixed guideway system's currently planned minimum capacity. Should higher volumes be realized, the system is expandable to accommodate longer trains and to reduce the headways between trains from 3 minutes to 90 seconds resulting in an increase in capacity of more than 100 percent.

Ridership projections for the forecast year of 2030 have been developed using the travel demand model, which was calibrated against collected traffic and transit ridership information and then validated against recent counts to be sure it properly represents travel activity in the transportation system (Section 3.2.1 of the Final EIS). An on-board transit survey was completed in December 2005 and January 2006, and the latest socioeconomic information available as of October 2008 was incorporated. Traffic counts were collected in 2005, 2007, and 2008. The model is based upon a set of realistic input assumptions regarding land use and demographic changes between now and 2030 and expected transportation levels of service on both the highway and public transit system. Since

the Draft EIS was published, the travel demand model has been refined by adding an updated air passenger model (which forecasts travel in the corridor related to passengers arriving or departing at Honolulu International Airport), defining more realistic drive access modes (driving alone or car pooling) to project stations and recognizing a more robust off-peak non-home-based direct demand element (trips that do not originate at home) based on travel surveys in Honolulu. Based upon the model and these key input assumptions, approximately 116,000 trips per day are expected to use rapid transit system on an average weekday in 2030. Chapter 3, Section 3.4.2 of the Final EIS states that the maximum peak direction volume during the a.m. two-hour peak period will be about 14,700 passengers. The operating plan for the fixed guideway system has been revised and the system will have a minimum capacity exceeding 17,300 passengers per direction during the two-hour peak period. The Final EIS reflects the updated modeling results. Table 3-18 in the Final EIS shows that the fixed guideway system will have more than 116,000 daily boardings. Approximately 40,000 automobiles will be removed from roadways daily as a result of the Project, compared to the No Build conditions. Based on the results from the travel demand forecasting model, most riders will travel during the peak periods. The Project will not accommodate all commuters that will continue to drive on the highways, which will continue to carry high traffic volumes. The Project, however, does, offer commuters a choice that will have a relatively high speed regardless of conditions on the highways.

As discussed above, the planned capacity of the system is greater than the passenger volume predicted by the travel demand forecasting model. Further, the travel demand model forecasts that more than 51,000 fewer vehicle trips will occur daily with the Project (as shown in Table 3-12 in the Final EIS).

In regards to your second question, the NEPA process is unrelated to any local electoral process. The ballot initiative was independent of the Draft EIS which is part of the NEPA process.

Per your last question, the transit ballot measure was specific to Oahu. Per the State of Hawai'i Department of Taxation Oahu County Surcharge Frequently Asked Questions (FAQs) (http://www.state.hi.us/tax/a2_b2_7csurchg_faq.htm) updated January 23, 2009:

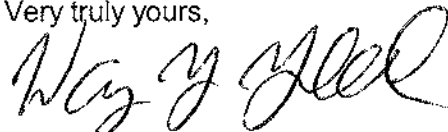

- All businesses on Oahu are required to pay the 0.5 percent County surcharge tax on all Oahu transactions in addition to the 4 percent General Excise and Use Tax (GET) surcharge.*
- Neighbor island businesses (and out-of-state businesses) that do not deliver any goods or services to Oahu are not subject to the new 0.5 percent County surcharge tax.*
- Neighbor island businesses (and out-of-state businesses) that deliver goods or services to Oahu, and have a "physical presence" on Oahu, must pay the new 0.5 percent County surcharge tax on their Oahu transactions. ("Physical presence" means, for example, having an office on Oahu, an employee or agent on Oahu, or sales representatives traveling to Oahu to do business.)*
- In general, any income earned from any transaction related to an Oahu customer is subject to the 0.5 percent County surcharge tax.*

Mr. Ken Ikeda
Page 3

Business activities that are subject to the 4 percent GET surcharge rate, such as retailing of goods and services, contracting, renting real property or tangible personal property, and interest income, are also subject to the 0.5 percent County surcharge.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulustransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is fluid and cursive, with the first name "Wayne" being the most prominent.

Submission Content/Notes : I believe that rail would work best, that is get the most usage, by going near the airport not through Salt Lake. I also believe the ridership on the first segment would be higher if the rail is built nearer to town. It makes no sense to build it out west first. Lack of use with that train that "goes nowhere" could cause large financial issues and would increase taxpayer burden.

Mr. Sean Ishii
930 Kaheka Street, Apt. 3202
Honolulu, Hawaii 96814

Dear Mr. Ishii:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your preference for the Airport Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been identified as the Preferred Alternative as described above. Compared to the other alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly lower impacts to the natural and built environment. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative.

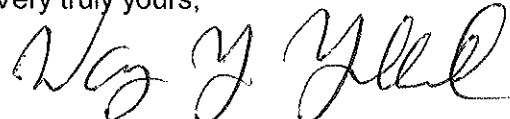

As described in Section 2.5.10 of the Final EIS, to support phased opening of the system, the first construction phase must be connected to a maintenance and storage facility, which requires considerable land. The first phase of the Project must be connected to the maintenance and storage facility because, in addition to maintenance of equipment and ongoing operations, the maintenance and storage facility houses the main control center for the entire Project and the required testing and operation of the system could not be completed without access to it. No location has been identified closer to Downtown with sufficient available land to construct a maintenance and storage facility. The Project will be constructed in phases to accomplish the following:

- Match the anticipated schedule for right-of-way acquisition and utility relocations*
- Reduce the time that each area will experience traffic and community disturbances*
- Allow for multiple construction contracts with smaller contract size to promote more competitive bidding*
- Match the rate of construction to what can be maintained with local workforce and resources*
- Balance expenditure of funds to minimize borrowing*

The portion of the corridor Ewa of Pearl Highlands is less developed than the areas Koko Head. Right-of-way can be obtained more quickly; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted Koko Head from Pearl Highlands to Aloha Stadium, then Kalihi, and finally to Ala Moana Center.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Submission Date : 01/18/2009

Submission Content/Notes : According to DOE:
Trains use 2,996 BTU's per passenger-mile.
Cars use 3,512 BTU's per passenger-mile.

Cars and trains are nearly equally wasteful and harmful to the climate.

Personal Rapid Transit (PRT) sets an efficient paradigm shift. Read Congressional Office of Technology Assessment study PB-244854 for background. There are numerous additional studies.

Morgantown's PRT network has delivered 110 million injury-free, oil-free passenger miles.

Our version of PRT, JPods use 433 BTU's per passenger-mile, efficient enough that solar collectors 6-foot wide mounted over the rails gather 5,000 to 12,000 vehicle-miles of power per mile of rail per typical day.

We can build a demonstration unit in Hawaii within 5 months if you will grant rights of way. We will build this unit with private capital.

In 6 years we can displace 70% of oil-based transportation in Honolulu. Here is link to our response to San Jose's request to build such networks:

Dear Mr. James:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

Your comments have been noted. As described in Section 2.2.1 of the Final EIS, Personal Rapid Transit Technology was evaluated and determined to have insufficient capacity and unproven reliability for a 20-mile or greater system. In addition, DTS does not control right-of-way beyond that which is required to construct the transit project.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

More of Mufi's Rail Deceptions

Well, Romy, welcome to the club.

Mayor Mufi Hannemann shook the hands of Cachola and Salt Lake representatives in promising the rail route would run along Salt Lake Boulevard. He needed Cachola's vote; and the rail re-route from the airport to his district raised allegations of political gladhanding. It clearly was a political maneuver that became the calling card of the entire project.

Just as the decision to award the route to Salt Lake was a little smelly, the ballots weren't even dry when the mayor, and a select group of councilmembers, flipped Romy and Salt Lake the bird and re-routed the rail back to the airport.

I mean, really, is anybody surprised?

Romy made a backdoor deal and got hit in the coils when it was slammed shut by the mayor. As they say, if you are going to play in the mud, you're going to get dirty. Cachola put the mayor on the line with threats of pulling his vote, and Mufi Cachola think that he would honor his agreement.

I don't think there was one fleeting moment when the mayor knew if rail got the vote that he would honor his agreement.

Councilman Cachola is just one in a long line of those who feel betrayed by the rail process. First and foremost, the whole propagandistic indoctrination of the people with ad nauseum pro-rail commercials ranks as one of the most blatant and outrageous voter-manipulation episodes ever seen in Hawaii. The combination of taxpayer money and special interest money was a staggering amount. There was a paucity of fair-

ness to begin with regarding this project, but the heavy-handed promotion of the project paid for with your tax dollars remains a bad taste in the mouth of many. Imagine a scoop of Limburger cheese with kim chee on a multi-course of bread. That combination would be more disgusting.

I find it interesting that some of the more vocal critics of the rail project have thrown their support behind the rail project. The rationale is, "The voters have spoken." Yes, vote for rail passed, but it was less than fair, and using taxpayer money on marketing remains outrageous.

There is a 45-day period to analyze and debate the contents of the draft environmental impact statement. This is the time to demand an equitable assessment of the details. There should be a petition to the Federal Transit Authority for precise oversight of the public process to ensure

City Councilman Romy Cachola is upset that he was deceived about the rail project.

fairness and equality. Save the federal involvement. I am not confident that the discussion of the DEIS will be above reproach.

All the reasons for opposing this project exist. The route, the cost, the impact and the alleviation of congested roadways still remain salient and relevant issues.

I believe this multi-billion dollar project is a wonderful vehicle to enrich a few at the expense of the many. This is a make-work project to keep a select group of

residents employed while being subsidized by their neighbor. This is not an economic stimulus project. It is a government redistribution of wealth project.

I understand the polls have spoken. I respect the process. But I don't think the process was respectful to us. The DEIS process provides for additional public input. The modification of this project demand precise public discussion without a grant favoritism from either side. The public deserves the opportunity to participate in the ongoing process and reserves the right to act accordingly if relations about the project oppels them back to the poll. Remember, there are tens of thousands of signatures on the Stop Rail Now ballot that can be expanded, thereby placing the question of rail on the 2010 ballot.

The rail project is not a done deal.

Submission Content/Notes : I believe that the Rail Transit route should go to the airport and not through Salt Lake. Our economy depends on Tourism and this would help tourists adjust better to our big city atmosphere as they make their way to their Waikiki hotels. Sure taxi drivers and others in the transportation business won't like this. But our government has to look "at the big picture" here and do the right thing. I also feel that the beginning construction and operation of transit should start in a more heavily populated area. Such as Aiea to downtown. And NOT starting from Kapolei with construction and operation heading Eastward. "Biggest bang for the buck" and not catering to political special interests! Please! No more talk and studies. Just do it! Mahalo

Dear Mr. Jansen:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your preference for the Airport Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been identified as the Preferred Alternative as described above. Compared to the other alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly lower impacts to the natural and built environment. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative.

With the Airport Alternative, visitors and residents will benefit by having more transportation options. Table 3-13 in the Final EIS shows daily person transit trips by person, broken down for residents and visitors. As seen in this table, transit trips for both groups increase with the addition of the Project compared to the No Build Alternative. Daily resident person trips by transit increase 24 percent with the Project compared to without, while daily visitor person trips by transit increase 19 percent with the Project

compared to without the Project in 2030. As stated in Section 3.4.2, approximately 9,900 visitors will use the fixed guideway daily, of which about 1,800 will be traveling to or from the Airport.

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- Match the anticipated schedule for right-of-way acquisition and utility relocations.
- Reduce the time that each area will experience traffic and community disturbances.
- Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.
- Match the rate of construction to what can be maintained with local workforce and available financial resources.
- Balance expenditure of funds to minimize borrowing.

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Submission Content/Notes : It is much more akamai to have the train route go to the airport. You need a relaxed less stressful way of getting tourists to Waikiki. This will help. Also it makes more sense to start building the train in the more populated or higher potential use area. Starting to build the train in Ewa will not generate much ticket sales and what if the project is put on hold due to lack of funds, etc. Then you have a train only benefiting a few. Start building it at the airport, Waikiki or near UH. And build out from there. I know my ideas will generate extra costs but lets do this the right akamai way!

Dear Ms. Jansen:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your preference for the Airport Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been identified as the Preferred Alternative as described above. Compared to the other alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly lower impacts to the natural and built environment. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative.

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space.

Ms. Sue Jansen
Page 2

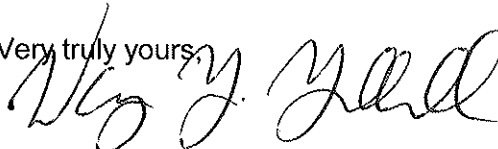

No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- *Reduce the time that each area will experience traffic and community disturbances.*
- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*
- *Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- *Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Honolulu High-Capacity Transit Corridor Project

Welcome to the Honolulu High-Capacity Transit Corridor Project's Public Hearing for the Draft Environmental Impact Statement/Section 4(f) Evaluation.

This public meeting and hearing has been designed to inform the public about the transit project, explain materials contained in the Draft EIS, answer questions from the public, and collect public input on project issues related to the Draft EIS, Section 106 of the National Historic Preservation Act, Section 4(f) of the U.S. Department of Transportation Act, and floodplains affected by the project.

Please review the project information and ask project staff any questions about the project that you might have. The Draft EIS is available on the project website at www.honolulutransit.org.

You may provide official comments in several ways. Here at this Public Hearing you may provide oral comments to a court reporter who will record them for the record or use this form to provide written comments. After the meeting, you may provide an on-line comment at www.honolulutransit.org or use this form to send a written comment to the Department of Transportation Services. All comments must be postmarked or received by January 7, 2009 in order for them to be included in the Final EIS.

E-mail: _____

Comment(s):

We need a second road from Wai'anae to Kapele to provide access to the train/rail project. I back the rail thru Pearl area and airport into town, eventually to Manoa Univ. of HI. Please start in Kapele area so you can start earlier as there is plenty of area to work on the construction.

Dear Ms. Jarvis:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your request for an additional roadway from Waianae to Kapolei has been noted. Creation of this roadway is outside the scope of this Project. However, this Project does not preclude such a roadway from being constructed in the future.

Your support to begin phasing in Kapolei has been noted. As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*

Ms. Zoe Jarvis

RE: Draft Environmental Impact Statement [DEIS]

Dear Sir or Madam:

As CPA's, we support viable and affordable traffic solutions for the City and County of Honolulu. We find several flaws regarding funding for the proposed rail project currently estimated to cost \$5.5 billion for the airport route adopted on January 28, 2009 and summarized in Section 6 of the Draft Environmental Impact Statement [DEIS]. We believe these flaws are of such magnitudes that not only will this project be neither viable nor affordable; this project will jeopardize our City and County's financial health and sustainability.

How realistic are the funding assumptions?

The basis for funding the proposed rail system is a 1/2% excise surcharge assessed on county transactions from January 1, 2007 to December 31, 2021. Using the City's figures provided in Section 6 of the DEIS, this surcharge needs to generate a minimum of \$4.1 billion. The cash flow statement of the DEIS includes surcharge tax collections through 2023, two years past the 2021 collection expiration date provided by law. When the taxes for the additional two years are deleted from the City's projection, the required collections are short by \$473.5 million [Exhibit A].

The collections from January 2007 to December 2008, total \$294 million, substantially below the City's projections. It would require a minimum tax growth rate of 9.46% every year for thirteen [13] years [Exhibit B]. Based on the Honolulu's economic history and the current global economy, this growth rate is unattainable.

What do the economists say?

The Council on Revenues [the economic board that provide forecasts of tax revenues to the Governor and State Legislators] issued new tax collection forecasts on January 12, 2009 [Exhibit C.] The forecast for growth in Hawaii tax revenues for 2009 through 2015 are -3.1%, 1%, 3.5%, 5.3%, 6%, 6.5%, and 6.5%. Using these forecasts, it would require an increase, compounded annually; in collections of 25.29% from 2016 to 2021 [Exhibit D]. These forecasts do not include the additional cost for borrowing funds due to the shortfall in surcharge tax collections. This rate of required growth in tax collections is unattainable based on our economic history.

The funding should be based on the economic realities and reasonable factors:

1. 2007 and 2008: The actual surcharge collections
2. 2009 through 2015: The Council on Revenues forecasts
3. 2016 through 2021: Using a 6.5% growth rate of collections

Based on the above assumptions, the City will experience a **\$1.26 billion shortfall** by the year 2021 [Exhibit E].

How much will the federal government contribute?

The DEIS estimates this rail project will cost approximately \$5.5 billion, with \$ 1.4 billion to be provided by the U.S. Department of Transportation. The federal funds are to be paid through their "New Starts" grants in the amount \$200 million per year for seven [7] consecutive years. The 2009 budget for "new starts" is \$1.475 billion for 30 grants that were selected from mass transit program applications from municipalities nationwide. The average grant is \$47 million with two-thirds [2/3] of the grants going to cities with populations averaging 5.4 times the size of Honolulu. The average grant for smaller cities such as Honolulu is \$23.5 million. There is great competition for these grants. The DEIS assumption that Honolulu will successfully obtain 1/7 of the country's mass transit budget for seven consecutive years is unrealistic and not viable.

What are the risks?

- Honolulu could have a rail system that is never completed. With no monies available to complete the project, the useless concrete pillars will be a monument to an irresponsible act that will mar our landscape for years to come.
- Honolulu's credit rating could plummet resulting in higher unbudgeted costs for interest on borrowed funds.
- Residents could face tax increases to pay for the shortage that will put undue economic pressure on them and future generations.
- Honolulu could be bankrupt due to all the debt that even future generations cannot service.

The City and County of Honolulu has a duty to its residents and taxpayers to act appropriately and prudently when committing our resources to traffic solutions. **The solutions must be viable and affordable.** We await your response to our concerns.

Dear Ms. Jensen:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The Final EIS includes General Excise and Use Tax (GET) surcharge collections through December 31, 2022, in accordance with City Ordinance 05-027 which established the 0.5 percent County surcharge on the GET through this date. As shown in Table 6-4 in the Final EIS, the net GET surcharge revenue will equal \$3,524 million (YOE \$). The analysis in Chapter 6 of the Final EIS takes the current economic downturn into account.

Section 6.6 of the Final EIS discusses risks and uncertainties associated with the funding assumptions for the Project. A subsection under Section 6.6.3 has been added since the Draft EIS was published to address the Council on Revenues' forecasts. As stated in this section, in the short-term, GET surcharge revenues are subject to uncertainties related to the magnitude and timing of the economic recovery on Oahu. Over the long-term, GET surcharge revenues on Oahu depend on a variety of underlying economic factors outside of the City's control that may result in a higher or lower projection than the one used in this EIS.

Ms. Janet I. Jensen
Page 2

While GET surcharge collections have gone down, so too have the costs of the Project. However, if GET surcharge revenues and/or Federal funding are not sufficient to meet the cash-flow requirement to cover capital expenditures, other potential revenue sources will be developed to close the funding gap.

The financial plan is balanced for the entire Project so there will not be a situation in which only a portion of the system will be built. If there is a shortfall, additional revenue sources will be identified. As noted above, Section 6.6 of the Final EIS discusses risks and uncertainties, as well as the potential sources to cover shortfalls.

The magnitude and timing of Federal funding is one source of risk that is discussed in Chapter 6 of the Final EIS. Density and transit use in the corridor are among the highest in the nation and higher than most areas that have qualified for New Starts funding in recent years. This Project has been developed in coordination with FTA since its inception. There is no indication to suggest that the Project will not qualify for the Federal funding requested.

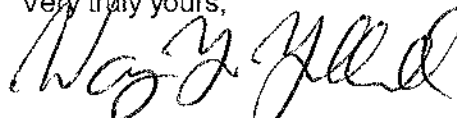

The financial plan was developed in consideration of safeguarding the City's credit rating in light of the likelihood of General Obligation bond sales required to bridge any year-by-year funding shortfalls, with all debt service costs paid with GET surcharge revenues, because FTA Section 5309 will pay for some financing costs. The New Starts funds are also proposed for a significant increase in the latest Federal budget proposal. Further, there has been no indication from the FTA that the requested amount is unreasonable or unrealistic.

As discussed in Section 6.4.2 of the Final EIS, the City's contribution to transit operation and maintenance is currently funded through Federal funding, fare revenues, and the City's General and Highway Funds. This funding will be used to fund operating and maintenance costs of the Project. The General Fund includes property tax revenues and other taxes and fees. Beyond collection of property taxes that fund City operations, for which the City develops rates on an annual basis and part of which will fund transit services, there is no anticipated impact to property taxes. Fixed guideway operation costs will represent between 2 and 3 percent of the City's annual operating budget. Property tax revenues are not expected to be used to fund construction of the Project.

The financial plan is structured to ensure Honolulu will not go bankrupt. The debt amount is a minor part of the Project at less than 10 percent.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Subject: Rail DEIS

I think that the Honolulu High Capacity Transit Corridor Project DEIS is quite inadequate. A supplemental DEIS must be produced to address many unanswered questions:

1. Will any stations have restrooms?
2. How can the streets over which rail will run not lose lanes when such large columns will be placed in the middle?
3. What will be done to counteract the darkness resulting from train bed over narrow streets such as Kona and Halekauwila Sts? Has the cost been factored into the maintenance cost?
4. Why does the train start in Kapolei? The stated reason of starting at the maintenance facility is inadequate. Every other new system was started in the city, where the riders are. How did other systems cope with the distance from maintenance?
5. How high will the Ala Moana station be?
6. Why are whole communities of poor people, such as the Banana Patch, being displaced when the DEIS plainly states that they will be unable to find comparable homes with the compensation to be offered? Elsewhere in the document re-alignments are suggested to save historic buildings. But no such measures are considered necessary when it is only poor people that are in the way of the train or a parking lot.
7. The unsightliness of elevated rail's impact on tourism, the city's main industry, is not addressed. Why would anyone want to come here when it will be as ugly and noisy as Brooklyn or Chicago?

The supplemental DEIS should be available at no cost to those who request it, so please do not make it fancy and expensive.

Dear Ms. Johnson:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following addresses your comments regarding the above-referenced submittal:

Your comments will be addressed in this letter in the same format as submitted.

- 1. Each station will have a secured public restroom. Patrons will ask the station attendant for access to the restroom.*
- 2. As stated in Chapter 3 of the Final EIS, columns to support the fixed guideway will be placed to minimize effects on traffic patterns. Table 3-21 in the Final EIS presents information on how column placement will affect streets and highways. In some cases, widening the median to accommodate columns will require a slight reduction in lane widths. Right-of-way will also be acquired in a few locations. As shown in the table, travel lanes will not be taken away.*

3. *The guideway will provide shade, but its typical width of 30 feet will not block light from reaching the street. Shade and shadow effects are described in Section 4.8 of the Final EIS. Project design is considered in the maintenance cost estimate.*
4. *As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:*

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- *Reduce the time that each area will experience traffic and community disturbances.*
- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*
- *Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- *Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

5. *Appendix B of the Final EIS includes detailed project plans, including a system profile. The Ala Moana Station platform will have an elevation of approximately 40 feet, which is approximately 35 feet above the existing ground.*
6. *There is no reasonable alternative to affecting The Banana Patch community. DTS has been coordinating with residents of the Banana Patch community since October 2008. Every household has been visited by City staff, right-of-way staff, and engineering staff to discuss the Project, as well as special needs and relocation assistance for residents who will be displaced. Strategic outreach was conducted for this neighborhood and it was found the residents were mostly interested in learning more about the right-of-way acquisition process. Residents*

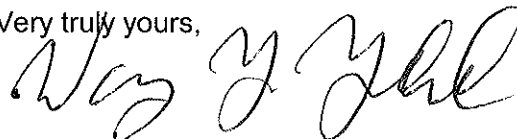

asked when acquisition might occur, how their property would be appraised, and how soon they might receive compensation. Residents of the community did not object to being relocated to decent, safe, and sanitary housing in compliance with the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act. Nor was there concern expressed about keeping the community intact for relocation purposes. As stated in Section 4.4.3 of the Final EIS, "relocation services will be provided to all affected business and residential property owners and tenants without discrimination; and persons, businesses, or organizations that are displaced as part of the Project will be treated fairly and equitably."

7. *Aesthetic effects of the system are described in Section 4.8 of the Final EIS. The Project is substantially different from systems in New York and Chicago, as it will have a different structural design. There is no evidence that the Project will have a negative impact on the tourism industry. Section 4.19 of the Final EIS states that the economic forecast is for continued steady growth. Planned projects are intended to continue to encourage and enable economic growth in the region. Continued focus on tourism is anticipated.*

The Project will offer tourists a transportation alternative that links them directly with many key destinations and reduces the need for a car. Table 3-13 of the Final EIS shows daily person transit trips by purpose, broken down for residents and visitors. As seen in this table, transit trips for both groups increase with the addition of the Project compared to the No Build Alternative. Daily resident person trips by transit increase 24 percent with the Project compared to without, while daily visitor person trips by transit increase 19 percent with the Project compared to without the Project in 2030. As stated in Section 3.4.2 of the Final EIS, approximately 9,900 visitors are expected to use the system daily, of which 1,800 are to or from the airport.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Honolulu, Hawaii 96813

Dear Mr. Johnston:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

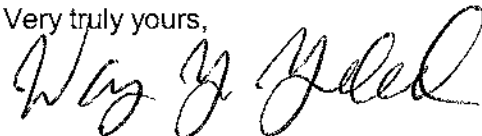

While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final

Mr. John Johnston
Page 2

EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is fluid and cursive, with the first name "Wayne" being the most prominent.

Submission Content/Notes : The sequence of construction and operability should begin at the highest congestion point and where the short commutes will help at first - whether it be downtown or somewhere near it. Construction should continue to head out in both directions towards UH and especially out west. It should DEFINITELY have a stop at the airport. The stops should also be integrated with bus stops that have short circulations through the general area of the stop.

See other successful systems such as BART that have built in stages - they follow the same sequence of starting construction and operability at the heart of the traffic and not out on the edges.

Dear Ms. Judd:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been identified as the Preferred Alternative as described above. Compared to the other alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly lower impacts to the natural and built environment. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative.

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a

maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- *Reduce the time that each area will experience traffic and community disturbances.*
- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*
- *Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- *Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

As discussed in Section 2.5.6 of the Final EIS, bus service will be enhanced and the bus network will be modified to coordinate with the fixed guideway system. Some existing bus routes, including peak-period express buses, will be altered or eliminated to reduce duplication of services provided by the fixed guideway system. Certain local routes will be rerouted or reclassified as feeder buses to provide frequent and reliable connections to the nearest fixed guideway station. Existing and future bus routes, including frequencies, are shown in Appendix D of the Final EIS.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Dear Mr. Kagawa:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Security, which will be coordinated with the Honolulu Police Department, will be provided during all operating hours. Security systems will be incorporated into all stations and vehicles. As discussed in Section 2.5.4 of the Final EIS, all stations, park-and-ride facilities, and vehicles will include security cameras that are monitored at all times of operation, will have audible and visual messaging systems, and an intercom link to the system operations center. Security personnel will also patrol the system; however, security personnel may not be physically located at all stations and on all trains at all times. Interior and safety lighting will be provided at all stations and park-and-ride facilities. As shown in Table 2-7 of the Final EIS, the system will operate between 4:00 a.m. and midnight.

As discussed in Section 3.4.3 of the Final EIS, park-and-ride facilities will be provided at East Kapolei, UH West Oahu, Pearl Highlands, and Aloha Stadium. As stated above, there will

Mr. Brent Kagawa
Page 2

be security provided at park-and-ride facilities, including security cameras, security personnel, and safety lighting.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Re: Request to extend the January 7, 2009 deadline for comments on the Honolulu High-Capacity Transit Corridor Project Draft EIS/Section 4(f) Evaluation

Dear Messrs. Matley and Yoshioka,

Kaka'ako Business and Landowners Association is a group of small businesses and landowners in Central Kaka'ako. We are requesting that the deadline for the comment period be extended two months beyond the January 7, 2009 deadline.

We will all be greatly impacted by the transit route through and stations in Kaka'ako. Some of us will be impacted more than others because of partial and full property condemnation. So it is important for us to try to understand the details of the draft EIS in order to submit comments. We do not have the expertise in this field nor do we have the staff to study the draft EIS. It will take us time to absorb all that is in the EIS. But because we are small businesses owners, we spend all of our time on our businesses and in these difficult economic times, it is all the more important that we keep an eye on our business. Compounding the issue is that December is the busiest time of the year for us and in January, many of us are closing our books for the fiscal year. We cannot afford to neglect our businesses.

By extending the comment period two months beyond January 7, 2009, it will get us past the holidays and our year end closing and also give us the time to learn about the EIS process and to make sensible comments.

Your consideration will be greatly appreciated.

Sincerely

Dexter Okada

Re: Comments on the Honolulu High-Capacity Transit Corridor Project Draft Environmental Impact Statement/Section 4(f) Evaluation

Dear Messrs. Matley and Yoshioka,

The Honolulu High-Capacity Transit Corridor Project(HHCTCP), the accompanying construction, and the Transit Oriented Development(TOD) will have a detrimental impact on the small businesses and small property owners in Kaka'ako. What makes it more tragic is that the purpose of the HHCTCP as stated in the Draft Environmental Impact Statement(DEIS) preface to connect Kapolei to University of Hawaii at Manoa will not be fulfilled. The DEIS trivializes the problems that the HHCTCP will cause. The DEIS also minimizes and pushes the mitigating steps into sometime in the future.

Kaka'ako Mauka is a mixed use(residential, commercial, service and light industrial) district under the jurisdiction of the State of Hawaii. In 2006, there were 1,479 businesses with 16,931 employees(3.7% of Honolulu's workforce). The 2006 annual sales of businesses was \$2.02 billion. On Oahu, it is the farthest east industrial area that serves all of East Honolulu, much of the Windward area, and the urban core. Any disruption of the businesses in Kaka'ako will have a ripple effect through Honolulu's economy.

In the DEIS, it states:

1. P. i "... the Council of the City and County of Honolulu selected the Locally Preferred Alternative to be a fixed guideway project from Kapolei to the University of Hawai'i at Manoa(UH Manoa) with a connection to Waikiki."
2. P.1-19 "The continued operation of UH Moana as a commuter school along with the opening of UH West Oahu will generate a strong student transportation market in the study corridor."

With this in mind, the voters of the City and County of Honolulu voted on the rail transit issue, 53% for and 47% against. The initial segment will go from Kapolei to Ala Moana Shopping Center. On page 33 of the DEIS Appendix A, the station at the end of the initial segment at Ala

Moana Shopping Center will be 35-40 feet above the street level, nowhere close to clearing the newly built Nordstrom extension of Ala Moana Shopping Center. So how will the transit reach UH Manoa or Waikiki? Page 33 of the DEIS Appendix A also shows a separate "future extension" that starts climbing from 40 feet at Pensacola Street to 90 feet to clear the Nordstrom extension. But the DEIS does not discuss this extension. What about the problems that will arise because of this "future extension"? How will these problems be mitigated?

1. Visual Impact
2. 90 feet columns to support the rail and the station
3. How will it come down on the Waikiki side of the Nordstrom extension
4. How will it fit the narrow canyon of Kona street between the big buildings.

Without clarifying information in the DEIS, it can only be assumed that the "future extension" is either an impractical task or a cost prohibitive task because if the "future extension" is viable, then why build the station at 40 feet in the initial segment. This means that the Locally Preferred Alternative will not be achieved.

1. The traffic caused by students going to UH Manoa will not be relieved
2. The traffic caused by workers going to Waikiki will not be relieved
3. Businesses have suffered or closed down for nothing
4. Property owners have lost all or part of their property for nothing
5. Would the vote have been 53% to 47% if this information had been out before the election

Since the LPA goes to UH Manoa and Waikiki, the DEIS must validate how the route is going to get to UH Manoa and Waikiki from Ala Moana Shopping Center. If the problems are too great to mitigate, then alternative routes must be studied, Kapiolani Boulevard or King Street.

Far too often, when there is a construction project, there is too much hoopla that goes on about how much job the construction project creates. What is overlooked or trivialized is the cost of the damage or outright destruction of small businesses and properties in the construction area. The Honolulu High-Capacity Transit Corridor Project DEIS is no exception. There is no analysis of the economic damage that the project will have on the small businesses both in regards to revenue and cost.

1. P.S-6 "Displaced businesses would need to purchase or lease new commercial/industrial space, and the location where employees would work would change.... Where relocations would occur, affected property owners, businesses, or residents would receive compensation ..."
2. P.4-20 "Based on the *relatively small numbers* of parcels affected by full acquisitions ..."
3. P.4-153 "Construction work details will be developed *during preliminary and final design*. Effects could include dust, noise, and traffic disruption congestion, and diversion, as well as *limited or temporarily* lost access and parking to residences and businesses. ... The maintenance and storage facility, park-and-ride lots, and stations *could* be used for construction staging areas. Additional area would be identified by

contractor *as needed*. ... Access to businesses near construction activities could be *temporarily* affected."

4. P.4-154 "Segments of Halekauwila and Queen Streets *may* be made temporarily one-way or have parking eliminated during construction."
5. P.4-155 "*During development of the Construction Safety and Security Plans*, measures would be identified to *minimize* effects on communities and their resources that address specific consequences anticipated at each location within the various communities, as well as ensure the safety of the public and the environment."

These are only sample excerpts from the DEIS. Instead of a detailed study of the impacts, many of the problems are trivialized by using terms such as "relatively small", "limited or temporarily" or "minimize" and solutions are pushed into the future, "during preliminary and final design", "as needed" or "may".

In Kaka'ako, there are many small businesses and properties around the current transit route. Some of the challenges that currently exist are:

1. Limited parking
2. Narrow street
3. Congestion
4. Building settling problems due to loose compaction of soil in the past
5. Water table close to ground level
6. Underground streams
7. Lack of area for dewatering
8. Old and fragile infrastructure

These challenges will be exacerbated by the construction. The DEIS does not come even close to addressing these challenges. The result will be the damaging or destruction of these small businesses.

In regards to TOD, the DEIS states:

P 4-166 "...the Project's primary indirect effect would be to alter development near the stations, bringing higher densities than presently planned...".

The rule of thumb often mentioned is that the TOD applies to areas within a quarter mile radius of the transit station. With the two stations in Kaka'ako, all of Kaka'ako becomes a TOD. With higher density comes higher property valuations thus higher property taxes. Higher property taxes will make it difficult for small businesses to remain in Kaka'ako. What impact will the TOD and accompany rules have on the character of the Kaka'ako community and the support it provides to the rest of Honolulu? The DEIS does not address this issue.

The DEIS must be expanded to include:

1. A detailed analysis of whether the LPA can be achieved. What are the impacts of extending the initial segment from Ala Moana Center to UH Manoa?

2. The LPA was approved going through Salt Lake; yet the Airport alternative was included in the DEIS. Under the same logic, the DEIS should be expanded to include an analysis of alternative routes that will go from Iwilei to King Street or Kapiolani Boulevard.
3. A more detailed analysis of the impacts on construction on the communities.
4. A more detailed analysis of the impacts of TODs on communities.
5. More meaningful mitigating steps.

The HHCTCP should serve the communities of Honolulu. The communities should not serve the HHCTCP.

Thank you,

A handwritten signature in black ink, appearing to read "Dexter Okada", with a long horizontal flourish extending to the right.

Dear Mr. Okada:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS. However, the future extensions are not part of this Project; thus, they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation in the future,

environmental analysis of the extensions and appropriate alternatives will be undertaken at that time.

Future extensions are not precluded nor made impractical or cost-prohibitive by the Project evaluated in the Final EIS. The 35-foot station at Ala Moana Center is a practical solution for the first construction project to serve the shopping center and area properties. In the future, when funding is available, the extension would be designed to best accommodate the extension. The high level option over the shopping center will still be an available option, if needed, in the future and does not obviate the need for the 35-foot option that is part of the Project and subject of this EIS. There are operating plans for the system that will continue to rely on the 35-foot station even after an extension is built. The five numbered conclusions in the comment are not accurate representations of the long-term intent of the City or the Project.

The Draft and Final EISs describe the entire proposed action of construction and operation of a fixed guideway transit system between logical termini in East Kapolei and Ala Moana Center. The Locally Preferred Alternative selected by the City Council includes both the Project and planned extensions that are included in the long-range plan for the system, but are not part of the Project. When the planned extensions are evaluated in the future, a range of alternatives will be evaluated for each of them. However, based on conceptual information, the planned extensions are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS.

Economic impacts, including impact to businesses during construction, are presented in the Final EIS. The Final EIS does not distinguish between sizes of businesses in terms of analyzing construction impacts. Section 4.18.1 of the Final EIS lists mitigation measures to reduce adverse economic hardships for existing businesses (including small businesses) along the project alignment during construction.

Regarding Item 1 on the list, as stated in Section 3.5.4 of the Final EIS, on-street parking by construction workers will not be permitted near work sites. Because of the limited amount of parking available to residents and businesses in and around construction sites, construction workers will not be allowed to park their personal vehicles in the public right-of-way. Construction workers also will not use commercial parking facilities if doing so reduces available parking for customers or employees of that business. Contractors would need approval from business owners before private lots can be used for parking. Regarding Items 2 and 3, as stated in Section 3.5.7 of the Final EIS, a Maintenance of Traffic (MOT) Plan will be created by the construction contractor with approval from the City and State Transportation Departments. The MOT Plan will mitigate construction-related effects on transportation, including temporary lane closures as identified in Table 3-27 in the Final EIS.

Items 4 through 8 are related primarily to dewatering and construction methods. The primary guideway construction method (drilled shaft foundations) was chosen to reduce the level of potential impact related to these concerns. Section 4.18.5 of the Final EIS indicates that contractors will be required to provide mitigation for vibration levels during possible pile driving activities (where drilled shafts cannot be used) within 75 feet of buildings. The section also indicates that utilities within 25 feet of pile driving may need to be further evaluated during project design to establish whether mitigation is needed. Similarly, Section 4.18.10 of the Final

Mr. Dexter Okada
Page 3

EIS indicates that dewatering will be performed per Hawaii Department of Health permit requirements. Where settlement due to dewatering is a concern, ground-stabilization methods will be conducted to protect existing conditions. The section also indicates that induced settlement or movement of nearby facilities will not be permitted and that pre- and post-construction monitoring may be performed to ensure settlement does not occur.

As mentioned above, future extensions are not part of this Project; and thus, they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. The Locally Preferred Alternative included both an Airport and Salt Lake Alignment. The language of the City Council's Ordinance 07-001 left discretion to the City on which portions of the Locally Preferred Alternative were to be built initially. Under City Council Resolution 08-261, the Project includes a single alignment via the Airport between East Kapolei and Ala Moana Center. Construction impacts are addressed in Sections 3.5 and 4.18 of the Final EIS. The Final EIS includes mitigation commitments for permanent and construction related effects.

As discussed in Section 4.19.2 of the Final EIS, transit-oriented development (TOD) is expected to occur in station areas as an indirect effect of the Project. The increased mobility and accessibility that the Project provides will also increase the desirability and value of land near the stations, thereby attracting new real estate investment nearby (in the form of TOD). Planning and zoning around station areas will be conducted by the City's Department of Planning and Permitting under a process covered by the City's new TOD ordinance.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Re: Comments on the Draft Environmental Impact Statement/Section 4(f) Evaluation
("DEIS") for the Honolulu High-Capacity Transit Corridor Project ("Project")

Dear Messrs. Matley and Yoshioka:

Thank you for the opportunity to comment on the DEIS for the Project.

As a brief background, Kamehameha Schools ("KS") is a charitable educational trust, founded in 1887 through the Will and Estate of Princess Bernice Pauahi Bishop, whose mission is to provide educational opportunities to improve the capability and well-being of Native Hawaiians. KS currently offers a wide range of educational programs and services, including K-12 campus programs, preschools, financial aid, outreach programs, community education and collaborations with schools and community organizations. This past year, KS' programs and services reached more than 38,000 Native Hawaiian children and families.

In addition to providing educational programs and services, KS owns and maintains, as an important part of its ancestral and cultural legacy, over 365,000 acres of privately-held lands in Hawai'i. These lands are part of an endowment that provides the financial resources necessary to support these educational services and programs. As a Native Hawaiian educational organization, landowner and community member, KS has worked and continues to strive to work collaboratively with government, businesses, community organizations and others on solutions to the difficult challenges facing our families and communities, such as education, employment, housing, energy, food supply, sustainability, transportation and quality of life.

KS supports a rail transit system on Oahu as a long-term transportation solution. A rail transit system can provide a tremendous benefit to our communities by alleviating traffic congestion, reducing the use of fossil fuels, curbing urban sprawl, spurring development of communities and revitalizing our economy. We commend the City and County of Honolulu and the Federal Transit Administration for their hard work in initiating and carrying forward this important transit project and are appreciative of the extensive effort of our City leaders and their staff to study and publicize the impacts of this project.

Letter to Messrs. Matley and Yoshioka
February 6, 2009
Page 2 of 2

We received a copy of the DEIS for the Project and understand that our role or kuleana in this prescribed process is to review the DEIS and provide productive comments to help best assure the Project's successful completion. We have taken this responsibility seriously. We met with tenants and other business owners and operators on KS lands who occupy properties potentially affected by the Project to become familiar with their concerns and interests. We also retained consultants to provide us with an independent review of specific aspects of the Project. The review of the thousands of pages of highly technical materials of the DEIS has taken time, and we appreciate your efforts in providing an extension of time for responses. It has made a meaningful difference in the quality of our review.

From this review, we have found many positive aspects to the DEIS and the proposed system. We have also identified, which is understandable in a document of this complexity, some items that we believe require additional study and work. In preparing our comments on those items, we have considered the potential impacts to our lands and our ability to continue to fulfill our educational mission with the returns generated from our lands; the potential impacts on the hundreds of small-and large business tenants and individuals on our lands; the potential impacts on communities where KS is diligently planning redevelopment and revitalization measures; and as appropriate, the broader potential impacts on our communities and families. In addition, we have tried to make our comments specific, productive and solution-oriented so that you may more easily address concerns with the appropriate particulars and move ahead with a successful project.

Our comments to the DEIS are set forth in full in Attachment A to this letter.

We thank you again for the opportunity to participate in this process and look forward to continuing to work collaboratively with the City to help assure the timely success of this important project, which will benefit our families and communities for many generations.

Mahalo.

Very truly yours,

Kirk Belsby
Vice President, Endowment
Kamehameha Schools

ATTACHMENT A

Kamehameha Schools ("KS") appreciates the opportunity to comment on the Draft Environmental Impact Statement/Section 4(f) Evaluation ("DEIS") for the Honolulu High-Capacity Transit Corridor Project ("Project") prepared by the City and County of Honolulu (the "City") Department of Transportation Services ("DTS") and the Federal Transit Administration ("FTA"). In order to provide comments that are helpful toward the success of the Project, KS retained consultants to conduct in-depth assessments of specific aspects of the Project. UltraSystems Environmental ("UltraSystems") was retained to provide a technical review of the Project and CBRE Consulting, Inc. ("CBRE") was retained to analyze the economic impact of the proposed Project. This process has enabled KS to offer the following comments on the Project and the DEIS.

I. IMPACTS OF CONSTRUCTION ON BUSINESSES

KS estimates that construction of the Project could affect over one hundred of its properties and approximately one thousand of its tenants and sub-tenants, and their businesses.¹ Research by CBRE indicates that businesses along the construction routes of major rail systems experience significant losses. While some disruption during construction is unavoidable, losses can be minimized if positive mitigation measures are taken.

A. Physical Impacts

Comment #1: Construction activities could have substantial economic impacts on businesses and more specific discussion of the construction impacts and proposed mitigation measures is requested.

1. **Information.** Although section 4.17 of the DEIS contains a discussion of construction phasing effects, a more detailed discussion of anticipated construction impacts and the scheduling of construction activity would help businesses understand the full extent of construction-related impacts. Information such as the following is requested: (a) the number of businesses directly affected by construction activity (i.e., businesses located adjacent to a construction site and on property to be acquired by the City) and indirectly affected (i.e., within one mile of a construction site), (b) for various segments of the line, a more detailed estimate of the length of the construction period from commencement to conclusion of construction, including any time needed to relocate utilities prior to the commencement of construction on the actual rail system, and (c) the proposed location of construction barriers, the amount of time that barriers will be in place, specific land and street closings, and rerouted traffic patterns during construction.

2. **Concerns about Construction Activity.** KS shares in the concern noted in the DEIS that construction will disrupt traffic and limit access to and from businesses in various ways. See DEIS section 3.5.3 at 3-46 and section 4.17.1 at 4-153 to -154. In some cases, direct access to businesses will be lost or curtailed. Construction will also result in loss of available parking.² The erection of fences around construction sites will diminish the visibility of certain businesses, thus reducing customer traffic: Even if a business maintains visibility during construction, there is a general tendency for people to avoid aesthetically unappealing construction sites, or avoid construction areas where traffic flow will be seriously compromised. KS is also concerned that construction will disrupt utility service during the length of the construction period, which KS understands could last from one to five years. More detail of these impacts by neighborhood is requested.

3. **Mitigation Measures.** The DEIS proposes a mitigation plan that touches upon some of the physical impacts of construction. The DEIS states that a Maintenance of Traffic ("MOT") Plan and

Transit Mitigation Plan ("TMP") will be developed to identify measures to mitigate temporary construction-related effects on transportation. See DEIS section 3.5.7 at 3-48. The DEIS discusses the goals that the MOT Plan and TMP should achieve. Building upon that discussion, the objectives of the MOT Plan and TMP could be advanced by inclusion of the following:

(a) Agreements by project construction contractors that they will (i) ensure by necessary means (including phasing of the work) that access to businesses in the project area be maintained during project construction activities, (ii) coordinate the timing of temporary facility closures to minimize impacts to business activities in the project area -- especially those with seasonal or high sales periods, (iii) minimize, as practical, the duration of modified or lost access to businesses in the project area, (iv) provide advance notice when utilities are to be disrupted especially if disruptions will be during regular business hours, and schedule major utility shut-offs during non-business hours; (v) keep roadways as clean as possible by using street sweepers and wheel washers to minimize off-site tracking; (vi) during dry periods, apply water to exposed soils to minimize airborne sediment; (vii) properly maintain construction equipment to minimize unnecessary exhaust; (viii) locate stockpile areas in less visibly-sensitive areas and, wherever possible, place them in areas that are not visible from the road, or by residents and businesses; (ix) remove visibly obtrusive erosion-control devices (e.g., silt fences, plastic ground cover, and straw bales) as soon as an area has been stabilized; (x) replace street trees and other vegetation that must be removed with appropriately sized vegetation; (xi) to the extent feasible, have the concrete decking along the cut-and-cover segments installed flush with the existing street or sidewalk levels; (xii) wherever feasible, maintain sidewalks at their current width during construction and where a sidewalk must be temporarily narrowed during construction (e.g., deck installation), restore to its current width during the balance of the construction period; (xiii) construct site fencing of good quality, capable of supporting the accidental application of the weight of an adult without collapse or major deformation; (xiv) where major boulevards must be fenced, offer the business owners the opportunity to request covered walkways in lieu of chain-link fencing; (xv) where covered walkways or solid surface fences are installed, implement a program to allow for art work (e.g., by local students) on the surface; and (xvi) where used, maintain in clean repair chain link fences.

(b) Provisions for public information campaigns to inform the community that businesses are open during project construction activities to encourage their continued patronage, including advertising of businesses.

(c) Provision for a public involvement plan prior to the beginning of project construction to inform business owners of the project construction schedule and activities and to understand their needs, and to appropriately address them, including (i) interviews of individual businesses potentially affected by construction activities to understand how these businesses carry out their work, and (ii) identifying business usage, delivery, and shipping patterns and critical times of the day and year for business activities, as well as alternate access routes to maintain critical business activities.

(d) Provisions for a program to (i) convey construction information to the community, (ii) provide public information (e.g., press releases or newsletters) regarding construction activities and ongoing business activities, (iii) enable the community to "speak" to the appropriate persons at the FTA and the Rapid Transit Division of DTS ("RTD") during construction with a specific process for responding to community concerns in a timely manner, and (iv) install appropriate signage and lighting, and display other information to indicate that businesses in the construction area are open, and to direct both pedestrian and vehicular traffic to businesses via alternate routes.

(e) Provisions for a Business Disruption Mitigation Plan ("BDMP") whereby the FTA and RTD will work with community residents, elected officials, local businesses, and community

organizations to tailor the mitigation program to meet community needs prior to the commencement of construction activities. KS requests that the BDMP (i) include remedies for business owners if the measures in the BDMP are not observed, (ii) be readily available for public review, (iii) have a process to inform the public of its progress in implementing the measures identified through a quarterly program of auditing, monitoring, and reporting, (iv) identify a staff person to work directly with the public to resolve construction-related problems, (v) provide for a field office during construction of the Project to address the matters described above, (vi) provide for an information and voice mail telephone line for community members and businesses to express their views regarding construction, with calls received reviewed by FTA and RTD staff and, as appropriate, forwarded to the necessary party for action (e.g., utility company, fire department, resident engineer in charge of construction operations), and (v) provide for traffic management plans as described above.

B. Economic Impacts

Comment #2: KS requests that the discussion of economic impacts in the DEIS be expanded through an independent study and recommends certain mitigation measures.

1. **Impact on Businesses.** KS requests expansion of the economics impact analysis in the DEIS.³ Presently, the DEIS provides discussion on (a) the effect of the Project on regional economics in the study corridor, including employment trends, growth, and real property tax; (b) the effect of construction on land use and economic activity; and (c) indirect effects of the Project on economic development, particularly focused on opportunities for transit-supportive development ("TSD") and transit-oriented development ("TOD"). KS suggests supplementing the discussion with an analysis of the economic impacts of the Project (both during and after construction) from the perspective of businesses and property owners along the rail line. For example, the impact of business closures or revenue losses should be added to the economic impacts analysis. As discussed further below, research conducted by KS' consultants regarding other transit projects indicates that construction of the Project could lead to the demise of a significant number of businesses.

Case studies of other major rail systems indicate that businesses situated along and surrounding the construction route can experience significant losses such as declines in customer numbers, sales, and in some cases, the closure of businesses. One of the most dramatic cases of this type of negative impact was in Salt Lake City, where an estimated 30 percent of local businesses closed during the construction of the TRAX system, and there were no mitigation strategies planned beforehand to reduce the impact on the businesses.

A similar situation occurred during the construction of SkyTrain's Canada Line in Vancouver. No public subsidies were provided to retailers and some businesses claimed that revenues dropped by 70 percent. On average, 40 to 60 percent losses in revenue have been reported. As of 2007, less than a year into construction, it was reported that between 40 and 60 businesses along the line had closed, with more likely to follow, as completion of the project is not expected until 2009.

If the Project will have similar economic impacts as the case studies discussed above, the economic loss to KS, its tenants, and their businesses will be significant. Negative impacts of construction could be further exacerbated due to the current economic climate that is already challenging the viability of many businesses.

2. **Independent Study.** In light of the physical and economic impacts referenced above, KS requests that the City retain an independent urban economist to conduct a study of the economic impacts of the Project both during and after construction. The geographic scope of the study should extend beyond the areas immediately adjacent to construction because the impacts can have a blighting

effect on the surrounding community as well. The independent analysis should be based on case studies and empirical data taken from other communities with particular emphasis given to elevated transit systems similar to that proposed for Honolulu. It would also be helpful to study alternative systems (e.g., at-grade) and routes to determine if these alternatives mitigate the expected pre- and post-construction impacts.⁴ KS requests that the public, which has not had the opportunity to review the items, be given the opportunity to review and comment on the study before it is incorporated into the Final EIS.

3. Public Assistance Programs and Other Mitigation Measures. Case studies indicate that public assistance is essential to keeping businesses viable during construction. During the construction of Interstate MAX-Yellow, an extension to Portland's light rail network, the transit agency Tri-Met and Cascadia Revolving Fund came together to provide assistance to affected businesses. The businesses who received assistance had to demonstrate that the construction had negatively impacted their business revenues. The success of this program is illustrated by the fact that during construction, *only one business of the 106 businesses located along the length of the light rail route closed as a direct result of construction, and only two businesses moved to another location.* For the development of another extension of the light rail line, Tri-Met started the Business Support program for ground-floor retail businesses along the light rail construction route that may be disrupted due to their reliance on established pedestrian and transit traffic.

Salt Lake City is an example of a city that has learned from its experience of not investing in a public assistance program. When Salt Lake City built its first light rail line in 1999, nearly 30% of the businesses along the rail line closed. No mitigation strategies were planned beforehand to reduce the impact on the businesses. When the University Line extension was built in 2001, however, Salt Lake City sponsored a low interest loan program available to impacted businesses, which materially reduced business closures and economic impacts.

The case studies above highlight that well-conceived mitigation and public assistance can be effective in keeping businesses intact. Programs that we respectfully request for consideration include:

- Outright assistance
- Relocation assistance
- Rent subsidies
- Property owner compensation for lost rents
- Publicly funded business advertising and promotions
- Temporary real property tax relief

II. POTENTIAL PARKING IMPACTS OF COMPLETED SYSTEM

Availability of parking is important to the success or failure of the Project. Transit users who drive to stations will require parking or else be deterred from using the rail system. Thus, KS recommends that the City study and estimate the amount of parking that will be available to rail users and motorists in areas near transit stations after the Project is built.

A. Potential Parking Impacts

Comment #3: Inadequate parking for the Project will have economic consequences on surrounding businesses and properties.

U.S. transit systems often encounter problems with providing enough off-street parking and park-and-ride lots. This results in various adverse impacts to owners with businesses and properties located near transit stations.

First, transit riders may be forced to find on-street parking, thus increasing traffic congestion in the area surrounding a transit station and/or park-and-ride lots, disrupting traffic flow, and reducing the number of street parking spaces available for non-transit users. Scarcity of parking can also be a deterrent to use of the rail system.

Second, transit users might park illegally in private retail and business parking areas, thus limiting further actual customer parking and/or increasing the cost of parking enforcement for business and property owners. An overall reduction in the amount of available parking spaces either on the street or in dedicated customer parking will discourage customers from patronizing businesses in the area.

Third, the uncertainty of the supply of parking negatively affects property owner redevelopment plans due to (i) concerns that additional lands may be condemned to provide for parking if ridership forecasts are achieved (or if ridership forecasts are not achieved and the agency determines a lack of parking availability to be the cause), or (ii) concerns that private property owners will be forced to mitigate the parking shortfall without public assistance. As acknowledged in the *Land Use Technical Report Honolulu High-Capacity Transit Corridor Project* (RTD 2008b) dated August 15, 2008 ("*Land Use Technical Report*"), KS owns many properties near the proposed Pearlridge, Kapalama, Kaka'ako, and Mo'ili'ili stations and intends to engage in redevelopment of those properties when the current leases expire. See *Land Use Technical Report* at 5-2 to 5-11. Therefore, these are important concerns to KS.

KS offers the following comments to assist the City in the refinement of its parking plans:

1. **Quantify parking needs at each transit station in the Final EIS:** Planning for parking needs begins with quantifying the number of parking stalls required for each rail station.
2. **Kapalama Station:** It appears that the City does not plan to build additional parking spaces for users of the Kapalama Station. See DEIS at 2-31. It is unclear where users who drive to this station can park. KS requests that the Final EIS discuss the impact on commercial tenants adjacent to this station if no off-street parking is provided to station users and the empirical basis for the determination that no station parking facilities are required.
3. **Dillingham Boulevard from Kohou Street to the rear parking lot of Costco:** On the mauka side of the roadway, the DEIS provides that all through and left-turn lanes would be preserved by acquiring 10 feet of additional right-of-way on the makai side of the roadway. What traffic impact will the acquisition of an additional right-of-way have on parking for existing land uses where ROW is acquired and what mitigation is proposed? See *Transportation Technical Report Honolulu High-Capacity Transit Corridor Project* (2008a) dated August 15, 2008 ("*Transportation Technical Report*"), Table 5-32, at 5-85.
4. **Halekauwila Street from Nimitz Highway to Ward Avenue:** Most of the existing on-street parking would be removed. What impact would this have on existing off-street parking spaces for the commercial uses located along Halekauwila Street and what mitigation is proposed? See *Transportation Technical Report*, Table 5-33, at 5-86.
5. **Dillingham Boulevard from McNeill Street to Kohou Street:** Twenty-six off-street parking spaces would be lost on Dillingham Boulevard between McNeill Street to Waiakamilo Road due to fixed guideway column placement in the median. Ten off-street parking spaces would be lost on Dillingham Boulevard between Waiakamilo Road to Kohou Street due to fixed guideway column placement on the side. See *Transportation Technical Report*, Table 5-54, at 5-114. The loss of off-street parking could impact customer and employee parking at Waiakamilo Shopping Center and buildings on both sides of Dillingham. KS requests that the Final EIS discuss the impact of the loss of these off-street

parking spaces on the commercial uses located on KS lands along Dillingham Boulevard and any proposed mitigation.

6. **Halekauwila Street from Keawe Street to Coral Street:** Sixteen on-street mauka and 22 on-street makai parking spaces would be lost on Halekauwila Street between Keawe Street to Coral Street due to fixed guideway column placement on the side. See *Transportation Technical Report*, Table 5-54, at 5-114. KS requests that the Final EIS discuss the impact of the loss of these on-street parking spaces on businesses located on KS owned properties and any mitigation proposed.

B. Mitigation Measures For Parking

Comment #4: The City is requested to develop more specific mitigation measures for parking.

KS notes that mitigation measures were included in the DEIS to address this issue, including the establishment of a neighborhood parking plan, but KS suggests the following additional measures:

1. **Early planning.** The DEIS appears to contemplate developing mitigation strategies for parking after significant commitments of resources have been made for the design and construction of each transit station. This is indicated by the fact that section 3.4.5 of the DEIS states that mitigation strategies for parking would be determined by surveying stakeholders within six months before implementation of fixed guideway service. See DEIS at 3-44. KS requests that specific parking strategies be devised and studied as part of this environmental review process.

2. **Parking study.** To ensure that parking impacts are fully addressed in the Final EIS, KS recommends a detailed parking study be performed for each transit stop that is predicated on the level of transit use occurring at each station and validating through more rigorous analysis how these users will access the site (e.g., pedestrian access, transit access or vehicular access). Once the study is concluded, specific mitigation measures should be developed based on the results of the study and incorporated into the Final EIS.

3. **District parking solution.** District parking garages could be developed near rail stops and paid for through transit system funding. Such systems should be located with a view toward improving transit use and facilitating redevelopment within TOD corridors.

4. **Public assistance for building parking structures.** A program of subsidies, grants, or other assistance for the construction of parking structures could be provided. For example, Portland recently approved a \$6.6 million subsidy for a parking garage for a TOD.

5. **Signage and parking permit program.** Adequate signage could be installed during and after construction for transit-parking areas and alternate business parking areas. A parking permit program could be created for on-street parking to limit impacts on local businesses by transit users monopolizing on-street parking.

**III. IMPACTS OF COMPLETED SYSTEM ON BUSINESSES ALONG
RAIL LINE AND AT TRANSIT STATIONS**

KS owns properties containing approximately 229 acres in communities that would be directly affected by the rail system along Farrington Highway, Kamehameha Highway, Dillingham Boulevard, and Halekauwila Street in Kaka'ako. KS is concerned that the Project will affect visibility of and access to the businesses on KS' properties; limit the redevelopment options available to KS and other landowners; and narrow streets, among other impacts.

A. Physical Impacts

I. Traffic, Visibility, and Access to Businesses

Comment #5: A more detailed assessment of the reduction in visibility and access to businesses and potential mitigation measures is requested.

a. **Visibility.** Presently, a significant percentage of KS' land holdings along the Project route are used for retail. Retail properties require good visibility to be successful. As the DEIS acknowledges on page 4-59, "[b]usiness owners have a vested interest in the visual environment surrounding their operations." KS is concerned that the elevated guideway will substantially reduce the visibility of businesses from the street level. As such, the discussion of visual impacts in the DEIS⁵ should be expanded beyond impacts on views of "landmarks, significant views and vistas, historical and cultural sites, and Exceptional Trees." DEIS at 4-59. Impacts to visibility of businesses located along the rail line also should be considered.

b. **Access.** Businesses also depend on convenient access to and from their properties. The erection of the elevated guideway and its supporting columns, however, will eliminate left turn lanes, thus cutting off direct access to many businesses, requiring potential customers to take a circuitous route. Traffic patterns and the level of service in affected areas might change as a result. Added congestion would further discourage customers from visiting businesses along the guideway. As a related matter, to the extent the Project permanently eliminates existing street parking due to placement of the transit guideway, all of the parking-related impacts noted in **Comment #3** above become issues. Again, the number of parking spaces needed for each transit station needs to be determined carefully to prevent loss of business due to customer parking being occupied by transit users.

c. **Narrower Lanes.** The DEIS notes that in certain places, the widening of existing street medians to accommodate the columns would require reducing lane widths. See DEIS, Table 3-21, at 3-39; *Transportation Technical Report*, Table 5-29, at 5-30. Narrowing of lanes could increase the risk of traffic accidents. KS suggests that the Final EIS study such risk. KS specifically requests more information on the impact of reduction in lane widths to traffic on the following roadways that are aligned next to its properties, including (a) Farrington Highway and Waipahu Depot Road; (b) Kamehameha Highway and Kuleana Road; (c) Kamehameha Highway and Ka'ahumanu Road; (d) Kamehameha Highway and Kaonohi Street; (e) Kamehameha Highway and Lipoa Place; and (f) Kamehameha Highway and Pali Momi Street. A discussion of the impacts of lane narrowing on industrial uses (travel of large vehicles such as semi-trucks) in the Final EIS is particularly needed given the industrial uses in many of the impacted communities.

d. **Mitigation.** KS requests adoption of a mitigation plan that will (a) ensure there is adequate parking near transit stations; (b) maintain access to and from businesses; (c) maintain traffic circulation; (d) prevent traffic accidents; and (e) minimize loss of visibility due to the elevated system. To achieve these objectives, a detailed mitigation plan incorporating specific initiatives should be developed and incorporated as part of the Final EIS. Examples of the types of elements that might be incorporated into the mitigation plan include: (i) traffic signals with protected left turns at busy intersections; (ii) elongated left turning lanes off of the main roadways to accommodate the increase in motorists utilizing left turn lanes at busy intersections, and to alleviate backup along the main roadways; (iii) district parking near rail stops paid for through transit system funding; and (iv) update and supplement the traffic study contained in the *Transportation Technical Report* to address the comments stated above.

2. Noise and Vibrations

Comment #6: Disclosure of noise and vibrations and their impact according to time of day.

It is our understanding that the noise analysis contained in the DEIS is based upon average hourly noise impacts rather than noise impacts at different times of the day. However, noise impacts can vary in significance depending on the time of day. For example, the impacts relative to background conditions may be more significant between 4:00 a.m. and 6:00 a.m. than during mid-day periods. Because these time-of-day differences may impact current and future uses differently, more complete disclosure of noise impacts by time of day is needed.

Assuming the DEIS used the noise impact criteria in the FTA's *Transit Noise and Vibration Impact Assessment* manual as the standard against which to evaluate noise exposures due to the Project, the impacts of noise on commercial should be studied further.

The noise sampling methodology utilized in the DEIS appears to be specific to ground level impacts. Because sound rises, there will be greater impacts on buildings (either existing or to be constructed in the future) that are constructed at heights above the proposed rail line. KS could not find discussion of these conditions in the DEIS and how the noise impacts of an elevated system might affect the viability of future TOD proximate to the rail line, particularly for uses that are noise sensitive such as residential.

3. Security, Transients, and Crime

Comment #7: Additional disclosures on security, transients, and crime are requested with more specific mitigation measures.

The Final EIS should disclose that in urban areas with hot and wet climates, such as Miami and Honolulu, elevated lines can provide shelter for the homeless, increasing crime and litter and thereby detract from commercial activity and result in lower property values. Transit stations also tend to attract graffiti.

The availability of parking and safety are interrelated issues. If parking is not available near transit stations, riders will need to find off-street parking within the district or travel to stations by walking. Without addressing the issue of security patrolling and providing ample parking in safe areas, riders will not want to park multiple blocks away and walk, especially at night, in order to get to and from the rail station and their vehicles.

The DEIS does not detail mitigation options to reduce concerns raised about area crime, property vandalism and an increase in transient persons using the elevated system as temporary shelter. KS requests the Final EIS provide specific mitigation actions to be undertaken. The mitigation measures could include: (a) use of landscaping and/or security fencing to minimize the ability of transients to assemble underneath the elevated rail lines; (b) adequate security on staff (dedicated security and/or Honolulu police) to patrol the stations and surrounding areas; (c) installation of surveillance cameras and equipment, emergency call boxes, and closed-circuit television monitoring; (d) locating police neighborhood substations at transit stations; (e) conducting regular maintenance and cleaning of areas under the rail line, transit stations, and surrounding areas; and (f) designing and installing structures underneath elevated rail lines that would discourage or prevent loitering by transients.

4. Visual and Aesthetic Impacts

Comment #8: The elevated system will cause visual blight and additional details on visual and aesthetic impacts for evaluation by viewer groups would allow a more complete analysis.

a. **Visual Blight.** An elevated system with platforms will cause visual blight. The elevated guideway will also cast shadows on adjacent buildings, reducing visibility. Glare and excessive lights from the rail line could adversely impact certain businesses during the day. Visual blight will also occur from deterioration of the system over time. These visual and aesthetic impacts may reduce tenant or customer interest in the area, increase turnover, and decrease property values. Thus, KS requests that the Final EIS include discussion of the estimated economic loss that visual impacts will cause, specific measures for mitigating such impacts, and the mechanisms for soliciting public input on mitigation measures.

b. Expanding Study.

i. The *Visual and Aesthetics Resources Technical Report Honolulu High-Capacity Transit Corridor Project* (2008e) dated August 15, 2008 (the "*Visual and Aesthetics Resources Technical Report*") utilized the methodology of the Visual Impact Assessment for Highway Projects⁶ of the Federal Highway Administration ("FHWA") for the Project since it is a linear transportation facility comparable to a highway, has a similar range of issues, and because the FTA has not issued comparable guidance. The *Visual and Aesthetics Resources Technical Report* discusses how viewer groups have been categorized (i.e., residents, commuter, etc.) and indicates that viewer response to change is impacted by viewer exposure and viewer sensitivity. See *Visual and Aesthetics Resources Technical Report* at 3-2. However, the analysis provided in section 5.0 (Consequences) of the technical report contains few to no details regarding user group exposure to project alternatives for different user groups, including such factors as location, duration, and distance. KS suggests that the Final EIS provide additional clarification regarding viewer exposure and viewer sensitivity for the selected view points. We recommend that the viewer exposure response include focus groups and outreach that encompasses a broad range of stakeholders. Property owners are not included among the five user groups asked to comment on visual impacts, but should be.

ii. The expanded study should also provide 360-degree visuals for multiple cross-sections of the rail line with particular emphasis given to transit stops. To provide representative visual imagery of the Project, such 360-degree studies should include areas within the urban core and areas within the suburban landscape. We would also recommend showing these images at multiple levels for each representative cross-section, including at street grade and at elevations of 2 to 3 stories.

c. **Utility Relocation.** The DEIS notes that the Project would involve relocation and modification of existing utilities. See DEIS at 4-38. KS is concerned about the impacts that relocating above ground power and telephone lines will have on existing commercial properties that are located on KS owned land in the Dillingham Plaza area and the area to the north and south of this property. Since ten feet of land in front of these commercial uses will be acquired to allow for widening of the median in this street, it is assumed that existing above-ground poles and power/telephone lines along this street will be moved back ten feet, bringing them even closer to these commercial uses, which include the Boulevard Saimin restaurant,⁷ Sizzler restaurant, Burger King fast food restaurant, Popeye's Chicken fast food restaurant, and other uses along this street. Bringing utility lines even closer to existing commercial uses will detract from the appearance of these uses and limit access to the properties and the ability to maintain the properties in good repair.

Mr. Kirk Belsby
Kamehameha Schools
567 South King Street
Honolulu, Hawaii 96813-3036

Dear Mr. Belsby:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal:

I. *Effects of Construction on Business*

A. *Physical Effects*

Response to Comment #1 regarding construction effects on businesses

- Economic impacts during construction are presented in the Final EIS. Section 4.18.1 of the Final EIS lists mitigation measures to reduce adverse economic hardships for existing businesses (including small businesses) along the project alignment during construction. Access to businesses near construction activities could be temporarily affected but will be maintained. In several locations, left-*

turn lanes will be closed during construction, some streets may be made temporarily one-way or have parking eliminated during construction.

2. *The City will mitigate temporary impacts associated with construction. To reduce adverse economic hardships for existing businesses along the project alignment during construction the City will coordinate construction planning and phasing with nearby property owners and businesses; initiate public information campaigns, including signs and lighting, to reassure people that businesses are open during construction and to encourage their continued patronage; minimize the extent and number of businesses, jobs, and access affected during construction; to the extent practicable, coordinate the timing of temporary facility closures to minimize impacts to business activities—especially those related to seasonal or high sales periods; minimize, as practical, the duration of modified or lost access to businesses; phase construction in each area so as to maintain access to individual businesses for pedestrians, bicyclists, passenger vehicles, and trucks during business hours and important business seasons; and provide advance notice if utilities will be disrupted and scheduling major utility shutoffs during non-business hour.*

Properties that are anticipated to be acquired by the Project, including businesses, are identified in Appendix C: Preliminary Right-of-Way Plans of this Final EIS.

As discussed in Sections 4.18.1 and 4.18.2, the City will coordinate with property owners regarding both temporary impacts during construction and long term impacts. The City will notify and coordinate with adjacent property owners adjacent to the Project that will be temporarily impacted during construction and when the Project will require acquisition of property. Coordination will be ongoing during both design and construction.

3. *Your suggestions regarding the Maintenance of Traffic (MOT) Plan and Transit Mitigation Program have been noted. Many of the suggestions are already discussed in the Final EIS, Section 4.18.1.*
 - a. *Section 4.18.1 of the Final EIS states that, "access to businesses near construction activities could be temporarily affected but will be maintained." In addition Section 4.18.1 states, "to the extent practicable, [the Project will] coordinate the timing of temporary facility closures to minimize impacts to business activities—especially those related to seasonal or high sales periods" and "minimize, as practical, the duration of modified or lost access to businesses." As part of the City's coordination with businesses, advanced notice will be provided if utilities will be disrupted and shut-offs will be scheduled during non-business hours. Many of the other suggested elements in your letter will be incorporated into the construction contract documents as performance specifications or as design criteria that will be used by designers and contactors. Regarding the request for covered walkways in lieu of chain-*

link fencing, the contractor will be required to provide a covering if the Project affects an adjacent awning or where there is a potential for falling debris. Covering provided in other situations could be considered on a case-by-case basis, subject to City approval. In addition, allowing artwork on fences could also be considered on a case-by-case basis subject to City approval.

- b. Sections 3.5.7, 4.18.1, and 8.7 of the Final EIS discuss public involvement activities that will occur during construction. For instance, Section 4.18.1 states that public involvement activities will include signage and lighting to reassure people that businesses are open during construction.*
- c. As discussed in Section 4.18 of the Final EIS the City will coordinate with affected residents and businesses prior to construction. A public involvement plan will be developed prior to each construction phase that will detail outreach tailored to the construction phase. The City will maintain the Project website (www.honolulutransit.org) and telephone hotline, which will also provide information to the community regarding construction phasing.*
- d. The Final EIS discusses several approaches that will be taken to inform the public about construction activities. Section 8.7 of the Final EIS states that "the City will continue the use of the Speakers Bureau, the project website (www.honolulutransit.org), and a telephone hotline to inform the public about construction activities. Section 3.5.7 states that newsletters, local newspapers, radio and/or television spots, news releases, instant messaging lists, and fliers may also be used to provide information to the public. The hotline will provide the means for members of the public to talk to those working on the Project and ensure their specific questions are addressed. Lighting and signage will be used to reassure the public that businesses are open during construction. Signage will also be used to direct pedestrians and bicyclists to the safest and most efficient route through construction zones (Section 3.5.7) and to direct motorists of parking disruptions and alternatives.*
- e. Some elements suggested for the Business Disruption Mitigation Plan, such as having a staff person work directly with the public and property owners to resolve construction-related problems, will be part of the MOT Plan or public information program. The DTS will work with all adjacent property owners and their tenants during construction to minimize disruption to local businesses.*

B. Economic Effects

Response to Comment #2 regarding economic effects and mitigation

- 1. An analysis of the impacts to businesses during construction is provided in both the Final EIS and the Honolulu High-Capacity Transit Corridor Project Economics Technical Report (RTD 2008c). An analysis of construction impacts is shown on Page 5-6 of the Economics Technical Report, which can be found on the project*

website at www.honolulutransit.org. The primary impacts are anticipated to result from inconveniences and disruptions to adjacent residents, businesses, and business customers that are inherent in any major construction project, which include the following:

- Presence of construction activities and material.
- Temporary road closures and traffic diversions.
- Temporary reductions in parking availability.
- Airborne dust, noise, and vibrations.
- Businesses' loss of visibility to their customers.

As discussed in Section 4.18 of the Final EIS, the City will mitigate these temporary effects to protect residents' and businesses' comfort and daily life, as well as to prevent inconveniences and disruptions to the flow of customers, employees, materials, and supplies to and from area businesses based on successful efforts on other projects.

The City will employ the following measures during construction:

- Maintain access to businesses during construction.
- Develop a public involvement plan prior to construction to inform business owners of the construction schedule and activities.
- Initiate public information campaigns to reassure people that businesses are open during construction and to encourage their continued patronage.
- Minimize the extent and number of businesses, jobs, and access affected during construction.
- Coordinate the timing of temporary facility closures to minimize impacts to business activities—especially those related to seasonal or high sales periods—to the extent practicable.
- Minimize the duration of modified or lost access to businesses—as practicable.
- Provide signage, lighting, or other information to indicate that businesses are open.
- Phase construction in each area so as to maintain access to individual businesses for pedestrians, bicyclists, passenger vehicles, and trucks during business hours and important business seasons.
- Provide advance notice if utilities will be disrupted.
- Schedule major utility shut-offs during non-business hours.

As discussed in Section 4.3.2 of the Final EIS, the Project will require the acquisition of some commercial and industrial properties. This will displace the businesses using the properties as well as their employees. However, it is anticipated that these businesses will be relocated to new sites. Once constructed, the Project will employ workers for maintenance and operation of the system. It is anticipated that workers will be hired from the existing local labor force and trained to meet job requirements. The number of new workers will be small compared to the total labor force on Oahu and is included in the operating and maintenance costs for the Project. Workforce costs are included in the operating and maintenance cost estimates discussed in Section 6.4.1. The Project is not expected to result in long-term adverse effects on the economy or property tax revenues. No mitigation measures will be needed.

2. *No independent evaluation study is planned.*
3. *The City will not provide direct financial assistance to mitigate temporary impacts during construction to businesses. Where acquisition of property will occur, compensation will be provided to affected property owners, businesses, or residents in compliance with all applicable Federal and State laws and will follow the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act.*

II. Potential Parking Effects of Completed System

A. Potential Parking Effects

Response to Comment #3 regarding parking

The comment involves three types of potential parking-related effects: lost on-street parking, spillover parking in station areas (referred to as "illegal parking" in original letter), and lost off-street parking, which may affect redevelopment. The number and location of on-street and off-street parking spaces to be removed by the Project are listed in Table 3-24 in the Final EIS. The estimated demand for spillover parking at each station is shown in Table 3-22 in the Final EIS.

Regarding the loss of on-street parking, a survey of parking usage conducted in June 2008, April 2009, and March 2010 found that, in locations where on-street parking will be removed by the Project, other parking capacity exists nearby to accommodate demand. Therefore, these on-street parking spaces will generally not be replaced by the City. However, some new on-street parking spaces will be created by the Project in the approximate locations of lost spaces as the streets are rebuilt after construction. New parking spaces could be short-term, long-term, or loading zones, depending on the need, as determined by the City.

Analysis conducted for the Project also examined potential effects from spillover parking. One possible effect of spillover parking would be an increase in demand for existing parking spaces near stations. As stated in Section 3.4.7 of Final EIS, the City will conduct a before-and-after parking study that will identify impacts of spillover parking both on-street and off-street, and will implement one or more of the following mitigation strategies as needed:

- *Parking restrictions;*
- *Parking regulation;*
- *Permit parking; and/or*
- *Shared parking arrangements.*

Follow-up surveys will be conducted by the City to determine if the mitigation strategy(ies) is effective, and additional measures will be implemented by the City as needed. Regarding transit riders parking illegally in private retail and business parking areas, that issue will also be included in the City's parking study and will be covered by one or more of the strategies listed above. Additionally, analysis was completed to determine if spillover parking will affect traffic and parking supply near stations. The traffic analysis was conducted for the a.m. and p.m. peak hours. The intersection level-of-service analysis determined that additional traffic from spillover parking will not affect local traffic conditions. Please see Addendum 02 to the Transportation Technical Report (RTD 2009i) for more detail.

The City will provide parking facilities at four stations (East Kapolei, UH West Oahu, Pearl Highlands, and Aloha Stadium). These stations were selected based on results from the travel demand forecasting model which showed these stations had high drive to transit demand. The City has identified the land that will be acquired for the Project as part of the right-of-way needed along the length of the corridor, including the land needed for the four park and ride facilities. Compensation will be in accordance with the requirements of the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970. The City does not anticipate acquiring any additional land for parking near any of the other stations. Additionally, regarding the limited supply of parking near stations affecting property owners' potential redevelopment plans, the City will develop parking regulations and strategies over time that respond to the specific needs of each station area.

The following text is in response to sub-comments 1-6 within Comment #3 of your letter:

- 1. Parking needs at each transit station has been added to the Final EIS as Table 3-22.*
- 2. Table 3-22 in the Final EIS shows an estimated demand of five parking spaces at the Kapalama Station. Rather than providing five parking spaces, the City intends to provide bus service, bicycle parking and improved sidewalks to encourage riders to access this station by modes other than the private automobile. The spillover parking surveys mentioned previously will assess spillover demand once the stations are opened and parking mitigation would be implemented as needed.*
- 3. Along Dillingham Boulevard near Honolulu Community College, the City will purchase right-of-way to preserve the existing number of through- and turn-lanes. As shown in Table 3-24 of the Final EIS, this acquisition will result in the removal of approximately 30 off-street parking spaces that will be purchased in*

accordance with the requirements of the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970. The City does not plan to generally replace all of the private, off-street parking purchased and removed for construction of the Project; however, the Project will help reduce the need for such parking. Where landscaping, sidewalks, and driveway access will be affected by the Project, coordination will occur with the landowner, and these property features will be replaced and/or the property owner will be compensated in accordance with the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act.

4. Regarding the loss of on-street parking on Halekauwila Street, as stated in Final EIS section 3.4.4, a parking usage survey was conducted in April 2009 along Halekauwila Street. This survey examined current usage of on-street parking in this location. The results of this study, which are summarized in Table 3-24 of the Final EIS, revealed that most on-street spaces between Punchbowl Street and Cooke Street were lightly to moderately used during the week day (approximately 25 to 75 percent of spaces were full) while over 75 percent of spaces were full between Cooke Street and Kamani Street.. This survey also found that alternative parking was generally available within one block of the parking spaces to be removed, and as a result, it is not expected that transit riders would park in the commercial parking lots in this area. As a result, these on-street spaces will generally not be replaced.
5. Regarding the loss of off-street parking along Dillingham Boulevard, as stated in Section 3.4.7 of the Final EIS, properties related to effected private, off-street parking spaces will be acquired for the Project as part of right-of-way needed along the length of the corridor. Compensation will be in accordance with the requirements of the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970. The City does not plan to generally replace all of the private, off-street parking purchased and removed for construction of the Project; however as stated above, the Project will help reduce the need for such parking. Where landscaping, sidewalks, and driveway access will be affected by the Project, coordination will occur with the landowner, and these property features will be replaced and/or the property owner will be compensated in accordance with the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act.
6. The project design has been revised since the Draft EIS and as a result, there will not be a loss of parking on Halekauwila Street between Keawe Street and Coral Street.

B. Mitigation Measures for Parking

Response to Comment #4 regarding parking mitigation

1. Based on comments received on the Draft EIS, additional parking surveys have been conducted since the Draft EIS was released. As stated in the response to

Comment #3 (above), these parking surveys revealed that there is parking available within one block of the parking spaces to be removed. As a result, on-street parking spaces will generally not be replaced. The City is committed to conducting spillover parking surveys before construction of the station and again after the station is opened. Results of the surveys will be used to determine the appropriate mitigation strategies.

- 2. The Final EIS includes a table showing mode of access (walk/bike, bus, kiss-and-ride, and parking) to each transit station (Table 3-20). Additionally, Table 3-22 in the Final EIS shows parking demand at each station. Table 3-20 shows that 90 percent of transit riders will access fixed guideway stations by walking, biking, and the bus. Parking demand is expected to be minimal overall. Spillover parking surveys will be conducted at each station before construction begins and again after the station is opened to determine actual spillover effects. As stated in Chapter 3, Section 3.4.4, the actual extent of spillover parking near stations will be influenced by a variety of factors, including changing conditions between now and the time the station is opened as well as future development. As a result, parking surveys conducted before and after station opening is the most appropriate way to gauge actual effects directly attributable to the station.*
- 3. The travel demand forecasting model identified stations with high drive to transit access. Park and ride facilities are being built at four stations (East Kapolei, UH West Oahu, Pearl Highlands, and Aloha Stadium) based on these modeling results. The City does not plan to construct any parking facilities at the other fixed guideway stations.*
- 4. Thank you for your suggestion regarding public assistance toward building parking structures. The City recognizes that good parking management is important to the success of the Project and to station areas in particular. As part of the Project, the City will provide a total of 4,100 parking spaces at four stations, including structured parking for 1,600 cars at the Pearl Highlands station. In addition, as part of a different project, the City is planning to build a 1,000 space parking garage near the Middle Street Transit Center station. At this time, the City does not plan to participate in the construction of other parking structures near stations.*
- 5. Regarding your suggestion for a signage and parking permit program, the City understands that providing proper signage and real-time information is crucial for the construction phase and during operation of the system. As stated in Section 3.5.7 of the Final EIS, where existing parking is disrupted by construction, signs will be posted directing people to nearby locations with available parking. The public will be kept aware of upcoming work locations and information will be available on the project website about parking disruptions and alternatives. The City will coordinate with property and business owners regarding the timing of construction and other issues to minimize disruptions to off-street parking. A permit parking program will be considered among other strategies by the City to mitigate the effects of spillover parking near transit stations.*

III. Effects of Completed System on Businesses along Rail line and at Transit Stations

A. Physical Effects

1. Traffic, Visibility, and Access to Businesses

Response to Comment #5 regarding visibility and access to businesses

a. Visibility

The assessment of visual effects discussed in Section 4.8 of the Final EIS considers businesses, which include owners, customers, and employees, as important viewer groups. Each viewer group's characteristics were considered in the visual quality assessment for the viewpoints analyzed in Section 4.8 of the Final EIS. For example, the visibility for motorists along Dillingham Boulevard is illustrated on Figure 4-29 (Viewpoint 10) in the Final EIS. The simulated view shows that the overhead guideway will not block views of businesses or signage. The guideway support columns will be spaced at about 150 foot intervals, and views of businesses will not be greatly reduced. The overall visual effect in this area, as noted in Table 4-9, will be moderate.

More detail on the consideration of viewer response in this analysis can be found in the Honolulu High-Capacity Transit Corridor Project Visual and Aesthetic Resources Technical Report (RTD 2008e). Please refer to the following tables in that report:

- *Table 4-1: Landscape Unit 1 Viewpoints – Existing Visual Quality and Viewer Groups (this Landscape Unit corresponds to the East Kapolei to Fort Weaver Road Landscape Unit in the Draft EIS).*
- *Table 4-2: Landscape Unit 2 Viewpoints – Existing Visual Quality and Viewer Groups (this Landscape Unit corresponds to the Fort Weaver Road to Aloha Stadium Landscape Unit in the Draft EIS).*
- *Table 4-3: Landscape Unit 3 Viewpoints – Existing Visual Quality and Viewer Groups (this Landscape Unit corresponds to the Aloha Stadium to Kalihi Landscape Unit in the Draft EIS).*
- *Table 4-4: Landscape Unit 4 Viewpoints – Existing Visual Quality and Viewer Groups (this Landscape Unit corresponds to the Kalihi to Ala Moana Landscape Unit in the Draft EIS).*

b. Access

Access to all businesses located near the Project will be maintained. Traffic conditions will operate at acceptable levels-of-service except for four station areas: East Kapolei, UH West Oahu, Pearl Highlands, and Ala Moana Center. As shown in Table 3-23 of the Final EIS, park-and-ride, passenger drop-offs, and feeder buses will affect traffic at six intersections near these stations; however, measures included with the Project will mitigate these effects. These measures include traffic signalization and adding roadway lanes. Mitigation measures are discussed in Section 3.4.7 of the Final EIS. As stated in response to Comment #3 (above) parking is generally available within one block of the parking spaces that will be lost due to construction of the Project. As a result, the City does not generally plan to replace lost on-street parking.

c. Narrower Lanes

As indicated in Section 3.4.3 of the Final EIS, the guideway placements will not affect overall traffic operations in terms of the number of travel lanes available to motorists. Although the width of some lanes will be narrowed by the Project, they will comply with the American Association of State Highway and Transportation Officials (AASHTO) recommended minimum standards for urban roadways. During Final Design, the relationship of travel lanes, shoulders, sidewalks, and horizontal clearances to obstructions such as columns will be considered together in determining the final widths of each item. Some lane widths could be increased from what is shown in Table 3-21. Permits for construction will not be approved unless a roadway is safe and acceptable to the responsible transportation agency. Lane widths along all roadways, including those roadways referenced in your comment, will meet AASHTO and the Hawaii Department of Transportation (HDOT) standards and will not be a hazard for larger trucks. In addition, no sidewalks will be permanently closed as a result of the Project, as shown in Table 3-25 of the Final EIS.

d. Mitigation

The City commits to the following measures to mitigate effects from the Project:

- (a) With regard to parking-related mitigation, as noted in Section 3.4.7 of the Final EIS, station areas with the highest estimated demands for spillover parking are at West Loch, Pearlridge, Iwilei, and Ala Moana Center. Spillover parking surveys will be conducted around each station before and after construction to determine any effects from spillover parking and mitigate as appropriate. Mitigation could range from parking restrictions or regulation, permit parking or shared*

parking, or other measures as noted in Section 3.4.7 of the Final EIS. Section 3.4.4 of the Final EIS states that in locations where parking will be removed by the Project, other parking capacity generally exists nearby to accommodate demand. The cumulative and indirect effect of removing parking spaces to accommodate the Project will be that some people who parked in those spaces will either use another space nearby, will choose another mode to reach their destination, or may not make the trip at all. The indirect effect of spillover parking around stations will increase demand for existing parking spaces.

- (b) With regard to access to and from businesses, Section 4.18.1 of the Final EIS states that, "access to businesses near construction activities could be temporarily affected but will be maintained." In addition Section 4.18.1 states, "to the extent practicable, [the Project will] coordinate the timing of temporary facility closures to minimize impacts to business activities—especially those related to seasonal or high sales periods" and "minimize, as practical, the duration of modified or lost access to businesses."*
- (c) With regard to traffic circulation, Section 3.4.7 of the Final EIS identifies strategies that will mitigate potential effects associated with the Project. With mitigation strategies, traffic conditions in the East Kapolei, UH West Oahu, Pearl Highlands, and Ala Moana Center station areas will operate in a satisfactory manner.*
- (d) As stated previously, lane widths along all roadways will meet AASHTO and the HDOT standards. As a result, it is not anticipated that there will be an increase in traffic accidents. Further, as stated in Section 3.6.1, the Project will result in a reduction in vehicle miles traveled, which could reduce traffic accidents. Additionally, as stated in Section 2.5.4 of the Final EIS, operation in exclusive right-of-way eliminates the potential for accidents between automobiles and fixed-guideway transit vehicles. Because pedestrians will not be allowed to cross the tracks, the potential for pedestrian accidents is virtually eliminated.*
- (e) The Project will be elevated over roadway. For motorists, passengers and pedestrians traveling on the roadways where the guideway will be overhead, views of businesses will not be affected.*

Regarding your suggestions for traffic signals and elongated turning lanes mentioned under part d. mitigation, as detailed in Section 3.4.7 of the Final EIS, mitigation measures at the six intersections effected by the Project include widening of intersections to provide turn lanes and installing of new traffic signals and coordinating these signals with adjacent signals. Additionally, the City will restripe the section of H-2 Freeway near Kamehameha Highway to provide a parallel merge lane. Addendum 2 provides information on the additional traffic studies that have been conducted for the Project.

2. Noise and Vibration

Response to Comment #6 regarding noise and vibrations

The Project's noise analysis was prepared in accordance with FTA's Transit Noise and Vibration Impact Assessment Manual (2006). The analysis accounts for additional nighttime noise sensitivity by evaluating Ldn noise levels, which include a penalty for noise generated at night. Noise impacts to noise sensitive uses, including commercial areas, were evaluated according to FTA policy. Section 4.10.1 of the Final EIS describes the various noise measurement locations, including the lanais of upper floors of residential buildings. Noise levels at higher-level floors were measured and analyzed as a result of comments received on the Draft EIS and are shown in Section 4.10.3 of the Final EIS. The results show only moderate noise impacts to one residential building between the proposed Civic Center and Kakaako Stations. With mitigation that has been committed to in the Final EIS (wheel skirts and use of sound absorptive materials), there are no noise impacts along the corridor as a result of the Project. For the building at 860 Halekauwila Street, sound absorptive material will be required from 200 feet Ewa of Kamani Street to 100 feet Koko Head of Kamani Street—a total of 300 feet. Future buildings above the guideway at similar distances from the guideway can be expected to be exposed to comparable moderate noise levels.

3. Security

Response to Comment #7 regarding security

The majority of the system will be located in existing roadway medians, which is not conducive to being used as a shelter. Stations will be patrolled by police, transit staff, and/or private security and will be closed at night when the system is not in operation (between midnight and 4:00 a.m.). Additionally, as stated in Section 2.5.4, of the Final EIS, security cameras that are monitored at all times of operation, audible and visual messaging systems, and an intercom link to the system operations center will also be included at all stations, park-and-ride facilities, and vehicles. The system will also include park-and-ride facilities with security and lighting. The City is working with the Honolulu Police Department to develop the system's safety and security program. As discussed

in this section, security measures will include Crime Prevention through Environmental Design (CPTED) principles, which is a theory that proper design and effective use of the built and natural environments can reduce the fear and incidence of crime as well as improve the quality of life. CPTED measures ensures that spaces are visible, open, well-lit and observable to minimize crime and will be incorporated at all stations. The City will provide maintenance to the guideway and transit facilities.

In addition, the City is conducting workshops with communities that will have rail stations. The purpose of the workshops is to engage the public about rail stations and provide opportunities to residents and businesses to contribute ideas about the appearance of station entryways in the surrounding areas. Ideas generated at the workshops will be incorporated into the station design process. Please plan to attend the workshops and advance the measures listed in your comment during this process. For more information and to get involved in this process, please visit the project website at www.honolulustransit.org.

4. Visual and Aesthetic Effects

Response to Comment #8 regarding visual and aesthetic effects

The following comments are in response to Comment #8 in your letter, Letters A-D.

Throughout the Draft EIS review and comment period, many commented that visual changes associated with the project's elements will result in substantial visual effects. Many comments received expressed concern that the elevated fixed guideway transit system will adversely affect Oahu's unique visual character by creating blight and degrading views. In addition, commenters, including Kamehameha Schools, requested more information on how the project elements will be integrated with their communities, especially in the areas around stations.

These comments on view effects are representative of the various viewer groups (including businesses) that have been considered in the visual and aesthetic conditions analysis presented in the Draft EIS and the Final EIS. The definition and description of viewer groups is provided in Section 3.1.4 of the Honolulu High-capacity Transit Corridor Project Visual and Aesthetic Resources Technical Report (RTD 2008). The following is an explanation of the terms "viewer exposure" and "sensitivity." Viewer exposure refers to the view groups' physical location, the relative number of people exposed to the view, and the duration of their view. This includes transit and highway users and people in the surrounding area. Viewer sensitivity refers to a group's expectations relative to a particular visual setting in a particular area. It is also the extent to which visual elements are important to the viewer group. Viewer sensitivity is affected by a variety of factors, including the activities a viewer is engaged in; the visual context; and their values, expectations, and interests. The assessment of visual

effects in Section 4.8 of the Final EIS has considered that each viewer group, including business owners, customers, and employees, are important (see "Viewer Groups," in Section 4.8.2 of the Final EIS). The methodology for the visual assessment is detailed in Section 4.8.1 of the Final EIS. In addition, each viewer group's characteristics were considered in the assessment of visual effects for each of the viewpoints described in Table 4-9 in Section 4.8 of the Final EIS. The effects, which are noted as low, moderate, or significant, also consider each viewer group's location, duration, and distance.

In response to the viewer groups' responses, received during the Draft EIS comment period, several key views have been reevaluated and the Final EIS has been refined (see section 4.8 of the Final EIS). The overall conclusions of the Draft EIS have not changed. The analysis of protected views and vistas was provided in earlier technical documents; however, the Final EIS more clearly describes the visual effects on these resources.

The island's unique visual character and scenic beauty were considered in the visual and aesthetic analysis presented in the Draft and Final EISs. As discussed in Section 4.8 of the Final EIS, the Project will be set in an urban context where visual change is expected and differences in scales of structures are typical. The Final EIS acknowledges that the Project will have shadow, light, and glare effects Mitigation is listed in 4.8.3. Effects on property values are discussed in Section 4.19.2 of the Final EIS. Property values in the vicinity of rail systems tend to increase, including in the vicinity of rapid rail systems with elevated sections (see Table 4-38 and Section 4.19.2 of Final EIS).

As discussed in Section 4.8.2 of the Final EIS major viewer groups within the project corridor include residents, commuters, business owners, recreationists, and visitors. Residents are people who observe the visual environment daily and for extended periods. Commuters are those who frequently travel through an area and, therefore, are familiar with the existing visual environment. However, this group may not have the same sense of ownership as residential viewer groups because they do not reside within that environment but only pass through it. Business owners have a vested interest in the visual environment surrounding their operations. Most business owners are familiar with their surrounding environment and may have a sense of ownership. Recreationists include people who frequent local parks, hiking trails, bikeways, and watercourses. They have definite expectations about the visual environment's condition. Visitors consist of both first-time and repeat visitors to the area. Visitors may consist of tourists, delivery or service personnel, or business employees and customers. This viewer group is less familiar with the existing visual environment's specific details, but they tend to have some sensitivity to and expectation of the surrounding environment. DPP and other interested groups (e.g. the Outdoor Circle, Scenic Hawaii Inc., the Honolulu Chapter of the American Institute of Architects) also provided data or input regarding the visual impact assessment for the Project. The major components of the visual impact assessment are described in 4.8.1 of the Final EIS. The U.S.

Department of Transportation methodology does not prescribe the development of 360-degree visuals for multiple cross sections of the rail line. The methodology as described in the Final EIS provides the information required to determine visual impact of the Project.

The Honolulu High-Capacity Transit Corridor Project Visual and Aesthetics Resources Technical Report discusses the methodology for the visual impact assessment. This assessment includes views from representative viewpoints. Selection of these viewpoints was limited to readily accessible public areas such as parks, sidewalks, streets, and parking lots. A greater emphasis was placed on identifying views toward the Project, because this best represents most viewers and the greater variety of views that would be experienced.

The visual simulations are intended to accurately represent the structure's scale in relation to other objects. However, they do not reproduce the entire field of view that individuals would perceive. Photographs typically produce a static field of view, but an individual's eyes constantly scan and selectively focus on a scene for content. As a result, photographs often do not show scenic features as prominently as they might appear to individual observers.

The visual simulations are intended to represent the scale and spatial relationships of project elements to other objects. Some of the simulations are also intended to represent view corridors identified as protected resources in pertinent policy documents. These simulations serve several purposes: they were used to evaluate visual and aesthetic consequences, demonstrate the potential for mitigation, and provide a means of communicating the findings of the analysis.

In addition, the Project will provide users, including tourists, with expansive views from several portions of the corridor by elevating riders above highway traffic, street trees, and low structures adjacent to the alignment. Section 4.8.3 of the Final EIS contains specific environmental, architectural, and landscape design criteria that will help minimize visual effects of the Project. Design criteria will govern all new utility construction outside of buildings, as well as the maintenance, relocation, and restoration of utilities encountered or affected by construction of the fixed guideway.

The assessment of visual effect from the Project as described in Section 4.8.3 of the Final EIS considers the existing development along the project alignment. Within the Project corridor the environment changes from rural in the Waianae end of the corridor to dense high-rise development at the Koko Head end.

As part of the design process, DTS has developed specifications and design criteria to address the City's requirements for the Project that will be implemented as mitigation measures to minimize visual effects. Guideway materials and surface textures will be selected in accordance with generally accepted architectural principles to achieve effected integration between the

mobility and accessibility afforded by the Project that will increase the desirability and value of land near stations and attract new real estate investment nearby (in the form of TOD). Planning and zoning around station areas will be established and conducted by the DPP under a process covered by the City's new TOD Ordinance 09-4. For properties outside the boundaries of TOD station locations, these requested studies are beyond the scope of the Project and the EIS.

As noted earlier, an additional independent study is not planned.

2. Redevelopment

Response to Comment #10 regarding redevelopment options

To accomplish the economic development objectives for Oahu's urban corridor, suitable infrastructure must be developed as described in Section 4.3 of the Final EIS. The Project is supportive of the land use and transportation elements of plans, policies, and controls within the study corridor as documented in Appendix J of the Final EIS.

Section 4.5.3 of the Final EIS discusses the potential new development and redevelopment along the project alignment, as well as the scale of the transit system itself, may affect the character of development along the alignment. This section includes a discussion of the Project's effects on individual neighborhoods along the corridor.

IV. Cost and Financial Analysis

Response to Comment #11 regarding financial feasibility

- a. *The capital plan for the Project is presented in Section 6.3 of the Final EIS, which includes a description of the amount of funding anticipated from various sources. The capital plan takes the current economic downturn into account.*
- b. *Section 6.6 discusses the risks and uncertainties associated with the financial analysis prepared for the Project, including risks related to changes in project scope. If the Project is over budget, other sources of revenue have been identified in 6.3.3 and 6.6.3 and could include private funds (i.e., contributions toward the cost of building stations) or airport funds; however, \$1.3 billion in year-of-expenditure dollars is included in the project budget as contingency for just such eventualities.*
- c. *The State's announcement of a series of projects for construction as a result of a Federal stimulus program are already included in the No Build Alternative and are shown in Table 2-4 of the Final EIS. All the major stimulus projects are identified in the OahuMPO's Regional Transportation Plan and were also part of the No Build Alternative in the Draft and Final EISs against which all the Build Alternatives were compared.*

- d. Chapter 6 of the Final EIS describes the financial resources expected to be needed to pay for the capital costs of the Project and for ongoing operating and maintenance costs. Capital costs of the Project, including finance charges, are expected to be fully paid for by a combination of FTA Section 5309 New Starts and FTA Section 5307 Funds from the Federal government and revenues from the General Excise and Use Tax (GET) surcharge levied from 2007 through 2022. Additionally, \$1.3 billion in year-of-expenditure dollars is included in the project budget as contingency in the event of cost overruns.

The financial plan will be updated periodically as conditions warrant and as the Project moves ahead. This is a requirement of the Federal New Starts process and is intended to ensure the Project continues to be financially feasible and to avoid the types of problems encountered on other projects.

V. Effects of Land Acquisitions

Response to Comment #12 regarding land acquisition and mitigation

1. Individual assessments will be performed by the Project's Right-of-Way Team as the design progresses. Right-of-way plans are shown in Appendix C of the Final EIS. These maps show full and partial acquisitions and individual properties can be identified by tax map parcel numbers. As discussed in Section 4.4.3 of the Final EIS, where relocations will occur, compensation will be provided to affected property owners, businesses, or residents in compliance with all applicable Federal and State laws and will follow the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act (49 CFR 24). The following measures will be implemented for relocations:

- The City will assist all affected persons in locating suitable replacement housing and business sites within an individual's or business's financial means. A minimum 90 day written notice will be provided before any business or resident will be required to move.
- Relocation services will be provided to all affected business and residential property owners and tenants without discrimination; persons, businesses, or organizations that are displaced as a result of the Project will be treated fairly and equitably.
- Where landscaping, sidewalks, and driveway access will be affected by the Project, coordination will occur with the landowner, and these property features will be replaced and/or the property owner will be compensated in accordance with the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act.

2. All acquisitions will follow the requirements of the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970. The City will work with land owners if non-conformities occur as a result of acquisitions.

(3. Please note, there is no #3 comment in your original letter).

4. All acquisitions will follow the requirements of the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970. The City will work with land owners if non-conformities occur as a result of acquisitions

5. If payment is delayed more than 30 days after the final judgment, additional interest at the rate of 5 percent shall be added to the final judgment (Section 100-25, Hawaii Revised Statutes). For a Federal-aid project, the cost of this interest payment is not eligible for Federal reimbursement.

6 – 8. The City recognizes property owner's specific needs and will have a Right-of-Way Team dedicated to this Project. Specific details will be worked out with individual property owners.

VI. Kelo Concerns

Response to Comment # 13 regarding private property

The Project evaluated in the Draft and Final EISs concerns the construction and implementation of rail transit service. However, as discussed in Section 4.19.2 of the Final EIS, TOD is expected to occur in station areas as an indirect effect of the Project. Planning around stations is currently underway by DPP under a process covered by the City's new TOD Ordinance 09-4. The TOD ordinance, and subsequent TOD plans, are designed to encourage private investment in the vicinity of the stations, as appropriate. DPP has encouraged community involvement in the development of those plans. As for the Project, the City will acquire only properties needed to build the Project, which includes about 200 full and partial acquisitions, mostly strip acquisitions along roadways (Section 4.4.3 of the Final EIS). All acquisitions and relocations will comply with the Federal Uniform Relocation Assistance and Real Property Acquisitions Policies Act.

VII. TODs As Potential Mitigation

Response to Comment #14 regarding TOD

The following paragraphs are in response to Comment #14, Letters A, B1 and B2A-C in your comment letter.

a. The City has adopted plans that direct future development to occur within the study corridor and away from less developed portions of Oahu. The TOD policy will focus the growth into patterns that will increase the viability of a number of travel options available to corridor residents and employees, including transit, walking, and bicycling. TOD special districts will restrict development in agricultural and open-space areas and encourage mixed-use, high-density, walkable communities around transit stations. The special districts also encourage public input into the design of TOD neighborhood plans to reflect unique community identities. TOD planning is underway and will occur before the fixed guideway stations are constructed. The City passed this TOD ordinance in March 2009 in anticipation of the Project. Development in the study corridor, whether highway-oriented or TOD, will be based on market demands. Pursuant to the policy, TOD may occur in project station areas as an indirect effect of the

Project. The increased mobility and accessibility that the Project will provide may also increase the desirability and value of land near the stations, attracting new real estate investment nearby. See Section 4.19.2 of the Final EIS for additional information regarding TOD development.

b. The NEPA and Hawai'i Revised Statutes Chapter 343 require the evaluation of potential effects of proposed government actions on the environment. Land use impacts, including potential TOD development, are critical criteria for FTA in ranking projects for Federal funding. Potential TOD development is addressed in Section 4.18 of the Draft EIS. This section was updated in the Final EIS Section 4.19 to reflect Ordinance 09-4. Evaluation of TOD projects in other cities with new rail projects is beyond the scope of this EIS.

c. DPP is working with the community to develop TOD plans. DTS, the lead agency for the Project, is not responsible for planning. However, the Project is supportive of this planning effort.

VIII. Study of the North King Street Alignment

Response to Comment #15 regarding a North King Street alignment

The North King Street alignment was evaluated in the Alternatives Analysis (November 2006). This alignment would have effected a greater number of parcels located within environmental justice/communities of concern areas (29 parcels of which 2 are residential versus 23 parcels of which 0 are residential along Dillingham Boulevard). In addition, a North King Street alignment would have moderate-high visual impacts whereas the Dillingham Boulevard alignment would have low-moderate visual impacts. The noise analysis conducted revealed moderate impacts at 52 receivers along the North King Street alignment whereas there would be moderate impacts at 17 receivers along Dillingham Boulevard.

There are 43 cultural practices and resources along the North King Street alignment that would be affected during construction and 2 that would be affected during operation. With the Dillingham Boulevard alignment, 23 cultural practices would be affected during construction and 0 would be affected during operation (cultural practices varied from one-time annual events to churches or community organizations where cultural activities are regularly held). The historic analysis identified pre-1965 tax map lots within the study corridor. Locations on this list included resources reviewed in previous studies and/or already included in the State Historic Preservation Division's State and National Register lists. The North King Street alignment is adjacent to 33 historic resources (of which 5 are on either the Hawaii Register or Eligible for the National Register) whereas the Dillingham Boulevard alignment is adjacent to 12 potentially historic resources (of which only 1 is on one of the registers).

The North King Street alignment would have required a longer and less efficient route and would have increased the system's cost by \$50 million. While the North King Street alignment would serve more residents, Table 3-3 in the Alternatives Analysis Report shows that the fixed guideway route via North King Street had fewer overall riders than the route along Dillingham Boulevard. As a result of these reasons, the North King Street alignment was rejected as an alternative and thus not studied as part of the EIS. This information is provided

in the Alternatives Analysis and technical reports prepared for the Alternatives Analysis. The North King Street alignment will not be reexamined as part of the Final EIS. The Nimitz flyover project was included in the modeling conducted for both the No Build and Build Alternatives studied in the Alternatives Analysis and EIS.

IX. Evaluation of An At-Grade or Multi-Modal System in the Urban Core

Response to Comment #16 regarding an at-grade or multimodal transit system

As stated in Section 2.2 of the Final EIS, prior to selecting an elevated fixed guideway system, a variety of high-capacity transit options were evaluated during the Primary Corridor Transportation Project (1998—2002) and Alternatives Analysis. Options evaluated and rejected included an exclusively at-grade fixed guideway system using light rail or bus rapid transit (BRT) vehicles, as well as a mix of options consisting of both at-grade and grade-separated segments. These alternatives were rejected because they did not meet the Purpose and Need of the Project. The text below explains further reasons why an at-grade system was rejected.

The Alternatives Screening Memorandum (DTS 2006a) recognized the visually sensitive areas in Kakaako and Downtown Honolulu, including the Chinatown, Hawaii Capital, and Thomas Square/Academy of Arts Special Design Districts. To minimize impacts on historic resources, visual aesthetics, and surface traffic, the screening process considered 15 combinations of tunnel, at-grade, or elevated alignments between Iwilei and Ward Avenue. Five different alignments through Downtown Honolulu were advanced for further analysis in the Alternatives Analysis, including an at-grade portion along Hotel Street, a tunnel under King Street, and elevated guideways along Nimitz Highway and Queen Street.

The Alternatives Analysis Report (DTS 2006b) evaluated the alignment alternatives based on transportation and overall benefits, environmental and social impacts, and cost considerations. The report found that an at-grade alignment along Hotel Street would require the acquisition of more parcels and could potentially affect more burial sites than any of the other alternatives considered. The alignment with at-grade operation Downtown and a tunnel under King Street, in addition to the environmental effects such as impacts to cultural resources, reduction of street capacity, and property acquisition requirements of the at-grade and tunnel sections, would cost approximately \$300 million.

The Project's purpose is "to provide high-capacity rapid transit" in the congested east-west travel corridor (see Section 1.7 of the Final EIS). The need for the Project includes improving corridor mobility and reliability. The at-grade alignment would not meet the Project's Purpose and Need because it could not satisfy the mobility and reliability objectives of the Project (see bullets below). Some of the technical considerations associated with an at-grade versus elevated alignment through Downtown Honolulu include the following:

- **System Capacity, Speed, and Reliability:** *The short, 200-foot (or less) blocks in Downtown Honolulu would permanently limit the system to two-car trains to prevent stopped trains from blocking vehicular traffic on cross-streets. Under ideal operational circumstances, the capacity of an at-grade system could reach 4,000 passengers per hour per direction, assuming optimistic five minute*

headways. Based on travel forecasts, the Project should support approximately 8,000 passengers in the peak hour by 2030. Moreover, the Project can be readily expanded to carry over 25,000 in each direction by reducing the interval between trains (headway) to 90 seconds during the peak period. To reach a comparable system capacity, speed, and reliability, an at-grade alignment would require a fenced, segregated right-of-way that would eliminate all obstacles to the train's passage, such as vehicular, pedestrian, or bicycle crossings. Even with transit signal priority, the at-grade speeds would be slower and less reliable than an elevated guideway. An at-grade system would travel at slower speeds due to the shorter blocks, tight and short radius curves in places within the constrained and congested Downtown street network, the need to obey traffic regulations (e.g., traffic signals), and potential conflicts with other at-grade activity, including cars, bicyclists, and pedestrians. These effects mean longer travel times and far less reliability than a fully grade-separated system. None of these factors affect an elevated rail system. The elevated rail can travel at its own speed any time of the day regardless of weather, traffic or the need to let cross traffic proceed at intersections.

- **Mixed-Traffic Conflicts:** The Project will run with three minute headways. However, three-minute headways on an at-grade rail system would prevent effective coordination of traffic signals in the delicately balanced signal network in Downtown Honolulu. A three minute cycle of traffic lights would affect traffic flow and capacity of cross-streets. Furthermore, there would be no option to increase the capacity of the rail system by reducing the headway to 90 seconds, which would only exacerbate the signalization problem. An at-grade system would require removal of two or more existing traffic lanes on affected streets. This effect is significant and would exacerbate congestion. Congestion would not be isolated to the streets that cross the at-grade alignment but, instead would spread throughout Downtown. The Final EIS shows that the Project's impact on traffic will be isolated and minimal with elevated rail, and in fact will reduce system-wide traffic delay by 18 percent compared to the No Build Alternative (Table 3-14 in the Final EIS). The elevated guideway will require no removal of existing travel lanes, while providing a reliable travel alternative. When traffic slows, or even stops due to congestion or incidents, the elevated rail transit will continue to operate without delay or interruption.

An at-grade light rail system with continuous tracks in-street, would create major impediments to turning movements, many of which would have to be closed to eliminate a crash hazard. Even where turning movements are designed to be accommodated, at-grade systems experience potential collision problems. In addition, mixing at-grade fixed guideway vehicles with cars, bicyclists, and pedestrians presents a much higher potential for conflicts compared to grade-separated conditions. Where pedestrians and automobiles cross the tracks in the street network, particularly in areas of high activity (e.g., station areas or intersections), there is a risk of collisions involving trains that does not exist with an elevated system. There is evidence of crashes between trains and cars and trains and pedestrians on other at-grade systems throughout the country. This

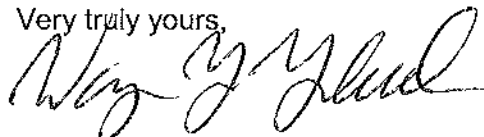

potential would be high in the Chinatown and Downtown neighborhoods, where the number of pedestrians is high and the aging population presents a particular risk.

- **Construction Impacts:** *Constructing an at-grade rail system could have more effects than an elevated system in a number of ways. The wider and continuous footprint of an at-grade rail system compared to an elevated rail system (which touches the ground only at discrete column foundations, power substations and station accessways) increases the potential of utility conflicts and discovery of sensitive cultural resources. In addition, the extra roadway lanes taken away for the system would result in increased congestion or require that additional businesses or homes be taken to widen the roadway through Downtown. Additionally, the duration of short-term construction impacts to the community and environment with an at-grade system would be greater than with an elevated system. Because of differing construction techniques, more lanes would need to be continuously closed for at-grade construction and the closures would last longer than with elevated construction. This would result in a greater disruption to business and residential access.*

Because it is not feasible for an at-grade system through Downtown to move passengers rapidly and reliably without significant detrimental effects on other transportation system elements (e.g., the highway and pedestrian systems, safety, reliability, etc.), an at-grade system would have a negative system-wide impact that would reduce ridership throughout the system. The at-grade system would not meet the Project's Purpose and Need and, therefore, does not require additional analysis. As a result of these reasons, an at-grade system was not evaluated as part of the Draft or Final EISs.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Enclosure

d. **Other Mitigation Measures.** The *Visual and Aesthetics Resources Technical Report* does identify a number of principles for minimizing, reducing, or mitigating impacts, including those related to construction. See *Visual and Aesthetics Resources Technical Report* at 6-1 to 6-2. KS generally agrees with the stated objectives, but recommends development of specific mitigation actions that will ensure substantive results. The following are the types of specific and measurable mitigation actions that could be included, although a more detailed list should be developed as these measures below would address only a limited number of the expected impacts that will arise: (a) consultation with the communities surrounding each station for input on station design elements; (b) cooperative agreements with adjacent property owners that would improve the Project's visual quality; (c) where practicable, retention of existing street trees along sidewalks and in medians, or plant new vegetation to help soften the visual appearance of project elements (e.g., stations, guideway columns, and TPSSs); and (d) use of source shielding in exterior lighting at stations and ancillary facilities such as the maintenance and storage facility and park-and-ride lots, to ensure that light sources (such as bulbs) would not be directly visible from residences, streets, and highways, and to limit spillover light and glare in residential areas.

B. Economic Impacts

1. Business Impacts

Comment #9: KS requests that the discussion in the DEIS of the economic impacts of the completed system on businesses be expanded through an independent study.

As noted in Section I above, KS requests that the Final EIS incorporate an expanded study of the economic impacts of the Project on businesses conducted by an independent urban economist. In addition to analyzing the impact of construction on businesses, the study should include an assessment of the business impacts of the completed system across a range of property types along the rail line. The analysis should result in quantifiable projections of lost revenue for current and future uses along such systems (both at transit stop locations and between transit stop locations), and business failures, and should be based on case studies of other jurisdictions where an elevated heavy rail technology is chosen rather than a light rail at-grade system. It might also be helpful to analyze the impacts of other rail systems (e.g., at-grade systems) and routes to compare the relative impacts of these alternatives. Once the impacts are identified using these empirical methodologies, the Final EIS should detail mitigation options and how these mitigation options reduce impacts on businesses.

2. Redevelopment

Comment #10: Elevated rail systems affect redevelopment options in the urban core and require additional mitigation measures

An elevated rail system will affect KS' and other landowners' redevelopment plans by limiting the kinds of projects that can be feasibly built on lands adjacent to the rail line. New buildings constructed along the rail line would have to plan around blocked viewplanes, noise emanating directly from trains, and the aesthetics of an elevated line and transit station. To compensate for the low demand for second or third level residential or office space and restricted view planes, buildings would have to be constructed at a minimum height if adjacent to the rail system. This will, of necessity, require greater verticality in future redevelopment, which will have broader community impacts and increase construction costs.

One example of the impact of buildings adjacent to elevated rail lines is the Los Angeles Green Line. A portion of the Green Line runs on an elevated line with several stations near major office buildings and hotel projects. The elevated portion is similar to the Project, except that it is no more than

25-30 feet above grade, and the concrete Y-beam is only 24-25 feet wide. There are no retail properties along the route. One office building constructed in 1993 at the intersection of Rosecrans Avenue and Aviation Boulevard was located within 40 feet of the building's curtain wall. As a result of the obstructed view and noise, the developer experienced significant difficulty in leasing the office space on the second and third floors of the building's northeast corner. This space was the last to be leased, with the space remaining vacant for three years.

If an elevated system is selected, KS expects that buildings occupied by residents, tenants, or businesses would need to be set back to attenuate the effects of the adjacent rail system. Buildings would also be constructed on platforms above the rail line to compensate for noise, visual, and aesthetic impacts. As a result, construction costs would increase due to the increased height and the use of more expensive materials to provide soundproofing, and the potentially larger building area. These constraints effectively narrow the range of redevelopment options. It could be cost prohibitive, for example, to build relatively affordable residential units on lands fronting the rail line.

KS requests that the Final EIS analyze in greater detail the impacts of an elevated system on redevelopment. Since there are multiple references in the technical reports that future TOD could mitigate some of the negative conditions created by the transit line, we recommend that the Final EIS incorporate input from urban planning professionals, including a working group(s) from the Hawaii Chapter of the American Planning Association, the American Institute of Architects, the Urban Land Institute, or similar organization(s).

In a similar vein, KS recommends that the analysis of Project impacts on property values be revised and expanded to address the points in these comments. The DEIS anticipates that the Project will lead to an increase in property values due to the desirability of access to transit and TOD opportunities. KS' consultant's research indicates that such results may not necessarily be achieved. Further, in situations where desirable value outcomes are achieved, they seemed to have occurred in systems that are not comparable to the Project, such as at-grade designs.

IV. COST AND FINANCIAL ANALYSIS

Comment #11: Further study of the financial feasibility of the DEIS is suggested.

As a member of the community, KS has an interest in seeing that the feasibility of an economic undertaking as significant as the Project is thoroughly studied and based upon reliable data. The initial financial projections for the Project reported in Chapter 6 of the DEIS may not have taken into account (a) the recent economic downturn, the duration or severity of which is unknown, (b) potential additional project costs that may be necessary to mitigate impacts of the Project, including those items identified in this letter, (c) the State's recent announcement of major highway improvement projects intended to ease traffic congestion, which may affect ridership projections, and (d) cost overruns beyond the control of the governmental agency, which were experienced by other large-scale projects. In light of, and in evaluating, these types of financial issues, KS respectfully suggests that the City consider alternatives to building an elevated system. As discussed below in Section IX, building an at-grade system through at least portions of the route could be less expensive, may achieve the same transit objectives as an elevated system, and could also eliminate many of the impacts discussed in this letter.

V. IMPACTS OF LAND ACQUISITIONS ON KS, ITS TENANTS AND THEIR BUSINESSES

Condemnation or an acquisition by the power of eminent domain of KS' legacy lands, even partial acquisitions, impact KS, its tenants, and their businesses. More information on what areas and

interests will be acquired, when they will occur, and what interests will be compensated for would be helpful to KS and its tenants.

Comment #12: KS requests more specific information on what will be acquired by the City and the impact of such acquisitions and compensation to be provided. Such information should assist KS and its tenants in evaluating how the acquisitions will affect their businesses.

1. **Additional Information.** The DEIS' recognition of the procedures for acquiring and compensating for properties taken and the disclosures to be made are helpful.⁸ The *Real Estate Acquisition Management Plan* (RTD 2008q) (the "RAMP") is detailed and provides certain procedural protections. However, more specific information on the acquisitions and impacts of such acquisitions would assist KS and its tenants in evaluating how the acquisitions will affect their businesses, such as, (a) information on the size of the area that will be acquired, the size of the remaining area not being acquired⁹, and the type of interest to be acquired¹⁰; and (b) confirmation that KS' and its lessees' buildings and other improvements will not be taken.

2. **Goodwill.** Businesses, especially small businesses operating from a location for many years, may develop valuable goodwill. "Goodwill" has been described as the benefits to a business as a result of its location, reputation for dependability, skill, or quality, and any other circumstances resulting in probable retention of old or acquisition of new patronage. The Model Eminent Domain Code and California's statute (Deering's California Codes Civil Procedure § 1263.510) provide for compensation to a business owner for the loss of goodwill. Neither the DEIS nor the RAMP discusses compensating a business owner for the loss of goodwill resulting from a full or partial acquisition (whether or not required by the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act (CFR 1989) or other applicable statutory and case law). KS wishes to know whether the City intends to compensate a business owner for the loss of goodwill if the owner has to move because of reasons such as adverse impacts from construction activities, or the operation of the rail line, near the business.

4. **Economic Unit.** On a partial taking, it would seem to make sense to have parcels of land treated as a single parcel of land if they (a) are generally contiguous, (b) are in substantially identical ownership, and (c) are being used, or are reasonably suitable and available for use in the reasonably foreseeable future, for their highest and best use as an integrated economic unit.¹¹ That way, landowners and businesses are able to receive compensation for the diminution in value of the remainder parcel (the entire parcel excluding the portion acquired by the City) as the result of the Project. Clear guidance in the Final EIS on the treatment of parcels used as an economic unit and compensation for devaluation of the property not taken would assist KS, its tenants, and their business in evaluating whether they will bear a disproportionate burden of the impacts of the Project.

5. **Consequences.** The RAMP discusses the procedures for compensating property owners and businesses affected by full and partial acquisitions, however, KS' tenants and their businesses will be adversely affected if payments are delayed. In any such event, the aggrieved business owner has limited recourse against the City.¹² Consequently, it is suggested that the City consider including in the Final EIS a timetable for the City's compliance with the real estate process outlined in Appendix W and other portions of the RAMP (including the prompt payment of compensation after an agreement is reached) and measures to mitigate such harm caused to landowners and businesses such as a schedule of delay damages payable to the affected parties, interest on the amount due until paid, and reimbursement of reasonable attorneys' and experts' fees incurred by affected parties. In addition, to ensure fair treatment to landowners and businesses when offers of just compensation are made, condemned parties in other jurisdictions are reimbursed their attorneys' and experts' fees if the final offer price by the condemning agency is less than a certain percentage of the final judgment awarded by the court.

6. **Disclosure of Impacts.** The RAMP does provide for basic negotiation procedures where the agency is to "discuss its offer to purchase the property, including the basis for the offer of just compensation and explain its acquisition policies and procedures, including it[s] payment of incidental expenses in accordance with 49 CFR 24.106." See, § 4.B of App. W of the RAMP. However, it does not expressly require the City to disclose to the property owner or business the impact of the Project on the remainder parcel, including the business thereon, or the date by which payment will be made. It is requested that the basic negotiation procedures specifically include the City's disclosure of the impact of the Project on the remainder parcel, including construction disruptions, temporary and permanent access issues, noise, vibrations, etc., and compensation offered for such adverse impacts; and the date that compensation will be paid (in a pre-established schedule) and the consequences described above if payment is not made as scheduled.

7. **Subdivision.** Although the City is vested with the authority to approve the subdivision and consolidation of parcels of land, it does not usually exercise such authority when condemning property.¹³ As such, it is requested that the RAMP (in sections describing closings) provide that on a partial taking, the City create subdivided parcels, including obtaining an order of the Land Court by the filing of the required petition and map, such that the parcel conveyed to the City and the remainder parcel are two separately subdivided parcels. Further, the City should permit the consolidation of a nonconforming (substandard) parcel with any adjoining parcel owned by or subsequently acquired by the condemnee.

8. **Non-conforming parcels.** When KS and its tenants have been left with a non-conforming parcel after acquisition by a governmental authority, they have not been able to obtain necessary building and other permits for renovation and/or redevelopment because of the non-conformity. It is requested that the City consider measures to allow reasonable development of non-conforming parcels created by the Project.

VI. KELO CONCERNS

Comment #13: KS requests assurances that the City will not take private property to give to another private party, whether in the context of a TOD or otherwise.

KS believes that its properties, including its legacy lands, should not be taken through the government's exercise of its eminent domain powers and transferred to a private party for any use. In *Kelo v. City of New London*, 545 U.S. 469, 125 S.Ct. 2655, 162 L.Ed. 2d 439 (2005), the U.S. Supreme Court narrowly held in a 5 to 4 decision that a city could exercise its eminent domain power by transferring property from one private party to another to promote economic development. However, the U.S. Supreme Court emphasized that nothing in its opinion precluded any state or county from imposing stricter restrictions on its eminent domain power. Many states have already imposed standards stricter than the federal standard by constitutional amendments and legislation.

Any use of the eminent domain power to take KS' property for private development, even if it is in the context of a TOD (transit-oriented development) or TSD (transit-supportive development) would have adverse economic and social impacts on KS. It is requested that the City declare in the Final EIS that the City shall not use its power of eminent domain to take private property and subsequently transfer, by sale or otherwise, the use, ownership, or possession of the condemned property, or any portion thereof, to any person or entity for any economic development or redevelopment or any private use or development, including but not limited to industrial, residential, agricultural, commercial, hotel, resort, office, or retail use or development, whether to raise revenue or otherwise create value to help it meet financial needs for construction or operation of the Project.¹⁴

VII. TODS AS POTENTIAL MITIGANTS

Comment #14: TOD could be a positive mitigant to the impacts described herein; however, it is premature to rely upon the benefits until a TOD ordinance is adopted and developments are integrated into the Project through planning.

A. Importance of Planning. Studies of other projects indicate that proactive planning efforts to allow high density residential and commercial development near stations are the primary cause of land value appreciation. An example cited for this is the SkyTrain system in Vancouver, where the local governments instituted long term regional planning to create new town centers around elevated transit stations. One such center is the Metrotown, a former light industrial and suburban single family neighborhood, which is reported to be home to over 6 million square feet of commercial and thousands of high rise residential units. Another example cited is the Pleasant Hill BART station area where over 2 million square feet of commercial and 2,300 residential units have been built on a 75-acre site since the mid-1980's. In both cases, rail transit was reported as the key driver behind planning and development efforts.

In contrast, where there is a lack of governmental assistance or coordination, the result may be decades of under utilized properties before any revitalization occurs. Even SkyTrain, as described above, has generated some negative impacts. Many stations have a poor reputation as magnets for crime. Development around elevated stations in the City of Vancouver has been hindered by NIMBYism and poor planning. It is reported that one year after the completion of the Expo line, the Ombudsman of British Columbia released a report addressing some negative impacts of SkyTrain, including noise, a harsh presence, loss of privacy and a depreciated enjoyment of lifestyle, all leading to reduced property values. Although in certain higher-density areas, home prices may increase near a station¹⁵, multiple studies of rail projects show that property values decrease if located near a rail line or even a station.¹⁶ In certain cases, with good planning and governmental assistance, these adverse economic impacts could be partially mitigated. Examining other projects should provide a sound basis for the City to improve upon the experiences of other cities.

B. Integrate Land Use Planning With the Project.

1. Study of other rail systems. To aid the City in identifying best practices in spurring TOD/TSD along the Project route, it is suggested that the City retain an independent urban economist to study other elevated, fixed guideway systems to evaluate and disclose both beneficial and adverse economic impacts on land values, including success stories where governmental assistance prevented or reversed decline. Public comments and input are recommended before the study is finalized.

2. TOD Ordinance. Furthermore, it is essential that the City enact a TOD ordinance. The DEIS has a limited discussion of TODs, but the *Land Use Technical Report* does contain a detailed discussion of land planning and a future TOD ordinance. It was anticipated that the City would develop and adopt a TOD ordinance by 2008. See, DEIS at 4-166. We remain hopeful that a bill will be introduced to the City Council in 2009. A TOD ordinance is appropriate before construction of the Project so that landowners can evaluate whether the ordinance will be an effective mitigant of the various impacts of an elevated system discussed elsewhere in this letter. In developing a TOD ordinance, consideration of the following is recommended:

a. Elements of successful rail projects. A study of rails systems shows that they all resulted in some negative impacts on surrounding properties, at least during construction; however, various aspects of each are also considered models for future TOD. Their success appears to be dependent upon: (i) the commitment of municipalities to employment and density; (ii) healthy real estate

market conditions; (iii) the interface and integration of rail and real estate concessions with adjoining TOD; (iv) careful phasing; and (v) public-private collaboration and the development of successful partnerships, including the establishment of the appropriate risk and revenue sharing mechanisms.

b. **Evaluation of other transit projects in other states.** Portland is often cited for having a strong planning component. It adopted policies on transit and land use that strongly encouraged TOD and is considered a model for successful development. It is reported that more than \$6 billion in development has occurred along MAX lines since the decision to build in 1978. The positive land use impacts of Portland's transit system are due to both the impact of the transit system itself as well as aggressive state, regional, and local policy. Many financial subsidies were also provided to developers to build transit oriented development. While Portland remains, in the eyes of many planners, a strong example of successful transit oriented development, there are many critiques of the city and the impacts of MAX.

c. **Implement sound planning principles.** Studies show that sound planning includes (i) giving priority to development of a TOD ordinance to encourage development along the currently planned route and future transit stations; (ii) working with consultants and landowners to ensure appropriate zoning/land uses around stations; (iii) providing tools to ensure the district receives the intended development lift¹⁷; (iv) modifying subdivision and land use ordinances to allow non-conforming lots to be consolidated and re-subdivided and to allow issuance of renovation and redevelopment permits for non-conforming lots, both as discussed above; (v) integrating parking into TOD as described above; (vi) planning for and encouraging TODs because they do not automatically occur¹⁸; including possible real property tax breaks; (vii) developing a specific timetable for the adoption of a TOD ordinance; (viii) seeking and obtaining public input on a bill for a TOD ordinance¹⁹; (ix) ensuring that the permits to construct the TOD will be issued in a timely manner; and (x) to the extent the TOD ordinance is not adopted in a timely manner, ensuring that permits will be issued for pending developments and not delayed in anticipation of the TOD ordinance.

VIII. STUDY OF NORTH KING STREET ALIGNMENT

During the alternatives analysis phase of the NEPA/HEPA review process, the City considered two alternative alignments for the portion of the fixed guideway traversing through Kalihi and Iwilei, one aligned at North King Street and another at Dillingham Boulevard. The DEIS, however, only discusses the Dillingham Boulevard alignment. It appears that the North King Street alignment may not have been adequately studied before being eliminated as an alternative, and that there are advantages to a North King Street route that warrant it being re-examined.

Comment #15: Further study of the North King Street alignment is recommended

A further evaluation of the North King Street alignment may be warranted. In the initial stages of the environmental review process for the Project, North King Street was considered for the segment of the rail system traversing through Kalihi and Iwilei. The *Alternatives Screening Memo Honolulu High-Capacity Transit Corridor Project* dated October 24, 2006, and prepared by Parsons Brinckerhoff ("*Alternatives Screening Memo*") listed five alignment options for this segment including elevated guideway alignments for North King Street and Dillingham Boulevard. See *Alternatives Screening Memo* at 4-17. By the time the City issued the *Alternatives Analysis Detailed Definition of Alternatives* ("*Detailed Definition*") and *Alternatives Analysis Report* ("*Alternatives Analysis Report*") both dated November 1, 2006, the North King Street and Dillingham Boulevard alignments remained as alternatives for the segment, but the remaining alignments were eliminated. See *Detailed Definition* at 6-16; *Alternatives Analysis Report* at 2-7.

The *Alternatives Analysis Report* ultimately decided that the Dillingham Boulevard alignment was optimal, and that the alignment was selected for discussion in the DEIS. See *Alternatives Analysis Report* at 6-4. One reason cited was that the Dillingham alignment would require acquisition of fewer residential parcels than the North King Street alignment. The table shows two residential parcels along the North King Street alignment that would be acquired compared to one along the Dillingham alignment. See *id.* Table 4-1, at 4-2. Unfortunately, neither the residential parcels nor the number of units on the parcels for each alignment is identified in the 2006 *Alternatives Analysis Report* to permit an evaluation of the number of residents who would be displaced under either alignment. However, Appendix B of the DEIS shows that all or portions of three residential parcels (not one as noted in the *Alternatives Analysis Report*) along Dillingham Boulevard are slated for acquisition by the City and the *Neighborhoods and Communities Technical Report Honolulu High-Capacity Transit Corridor Project* (RTD 2008d) dated August 15, 2008, at 5-17 states that along Dillingham “[p]roperty acquisitions would result in 11 residential displacements.” Thus, further evaluation would seem to be warranted to determine impacts on residents along both alignments.

The *Alternatives Analysis* states that the North King Street alignment would serve more residents than the Dillingham alignment, but notes that it would serve fewer jobs. As a general matter, serving more residents could lead to an increased ridership of rail because the rail system would be closer to people’s homes. Further, the North King alignment is a particularly attractive alternative if the City chooses not to make the stations along the Dillingham alignment more accessible by building parking garages near the stations.

The *Alternatives Analysis Report* also stated that a greater number of potentially historic properties are located along the North King Street alignment. See *id.* at 4-1. The number of historic properties located along each alignment is not quantified, and the definition of “historic properties” is unclear; it might be that certain properties are “old” but do not have social, cultural, or historic value.

It should also be noted that the Dillingham alignment will require acquisition of three times more the commercial/office parcels (22 parcels) than the North King Street alignment (6 parcels). See *id.* Building a rail line will exacerbate already difficult economic conditions for Dillingham businesses.

The *Alternatives Analysis Report* states that the Dillingham alignment would result in fewer noise impacts. See *id.* at 6-4. The basis for the conclusion is not available in the report yet should be for such an important consideration.

Finally, the State recently announced its plans for a “flyover,” an elevated two-lane roadway over Nimitz Highway, which “would run from the Ke’ehi interchange to Pacific Street, zipping commuters through Kalihi with no way to get off until its end.” Mary Vorsino, “Hawaii Set for Years of Roadwork in ‘Huge’ \$4B Highway Plan – 6-year effort includes Nimitz ‘flyover,’ better bike access,” *Honolulu Advertiser*, Feb. 4, 2009. The impacts of the two proposed elevated structures over the parallel traffic corridors of Nimitz Highway and Dillingham Boulevard should be considered in evaluating a North King alignment.

One of the primary reasons given for choosing the Dillingham alignment is that it is projected to experience the highest transit ridership, which includes ridership on various modes of transportation (e.g., busses). See *id.* at 3-6, 6-4. However, according to data reported in the DEIS, the North King alignment is forecasted to make 128,500 daily trips on the *fixed guideway system* as opposed to 123,700 daily trips for the Dillingham alignment. See *id.* Thus, for purposes of comparing two fixed guideway alignments, the North King Street alignment actually would attract more use. Moreover, the North King Street alignment is forecasted to experience twice the number of daily boardings than the Dillingham

alignment—i.e., 10,860 daily boardings for the three stations along the North King alignment²⁰ versus 5,370 daily boardings for the two stations along the Dillingham alignment.²¹

For these reasons, KS requests that the Final EIS include the North King Street alignment as an alternative.

IX. EVALUATION OF AN AT-GRADE OR MULTI-MODAL SYSTEM IN THE URBAN CORE

Comment #16: An at-grade or multi-modal transit system in the urban core is an alternative worth evaluating to determine whether it is a less expensive and quicker to construct than an elevated system.

KS is supportive of a fixed guideway transit system.²² The fixed guideway alternatives discussed in the DEIS utilize an elevated rail system and vary only in terms of alignment. See DEIS at S-4. None of the alternatives discussed in the DEIS appears to utilize at-grade technology for any segment of the alignment. While it is understandable why an elevated system might be utilized in rural areas of the transportation corridor, as discussed elsewhere in this comment letter, a host of adverse economic and environmental impacts are associated with an elevated guideway system, including noise, reduced visibility and access to businesses, visual blight, and increased crime. Such impacts will be greatest in the urban core where businesses and commercial land holdings are concentrated, including those of KS. For these reasons, it makes sense to consider an alternative to an elevated system at least within the urban core. KS believes that an at-grade system running from the perimeter of the urban core is a viable alternative to an elevated system based on cost, visibility impacts, urban aesthetics, construction impacts, and time to construct.

It is KS' understanding that the City did not formally reject an at-grade system as an alternative during the alternatives analysis.²³ Because the issue of whether the rail system should run on an elevated line instead of at-grade was never squarely raised during the alternatives analysis process, KS did not previously have the opportunity to comment on the relative merits of an at-grade versus elevated system.

It does not appear that the at-grade alternatives were adequately studied before being eliminated from consideration in the DEIS. Although at-grade alternatives were considered during the alternatives screening process, the reasons why they were not carried through to the DEIS is not explained. In fact, the *Alternatives Screening Memo* left open the option of constructing certain portions of a fixed guideway system at-grade. See, e.g., Screening Memo at 4-1, 4-4. For example, at-grade options were contemplated for the portion of the route from Leeward Community College to Aloha Stadium and from Aloha Stadium to Ke'ehi Interchange (Section 4). See *id.* at 4-10 to 4-17. The *Detailed Definition* did not discuss whether the fixed guideway system would be elevated, at-grade, or below-grade.

The *Alternatives Analysis Report* is largely silent on whether the fixed guideway alternative would be at-grade or grade-separated (or a combination). The "optimum alternative" identified in the *Alternatives Analysis Report*, which apparently became the alternative endorsed in the DEIS, was compared to other alternatives differing in terms of method (e.g., managed lane alternative, TSM alternative) and route, not above-grade versus at-grade. The only reference to an elevated fixed guideway in Chapter 6 is a statement that the Twenty-Mile Alignment "continues elevated following Nimitz Highway to Ala Moana Center." *Id.* at 6-5. Based on this chronology, it is KS' understanding that the discussion of what fixed guideway system is optimal for the urban core remains open. This is an opportune time to continue the discussions.

A ground-level transit system for the urban core is worth considering because it can meet performance demands, and it has been demonstrated to work in other cities. Los Angeles' Blue Line is an

example of a rail system that utilizes a combination of at-grade, elevated, and subterranean technology. In the urban core of Long Beach, however, the Blue Line is completely at-grade. Our research indicates that the system carries 56,000 passengers per day with 20 peak hour trains running during both morning and afternoon commutes and 10 off-peak trains.

Portland's Tri-Met system is an example of a mixed-grade system. The Portland Metropolitan Area Express ("MAX") Light Rail system is at-grade through downtown and runs on elevated lines to the suburbs. Other types of trains also service the downtown area.

A similar at-grade system would be a viable option for the urban core of Honolulu. KS' understanding is that the desired through-put of the Project in mixed traffic is 3-minute headways and 6,000 passengers per hour per direction ("pphpd"). Experts have noted that a light rail transit ("LRT") system running on surface streets could satisfy the criteria. Three-minute headways equate to 20 train movements per hour; thus, a capacity of 6,000 pphpd requires that each train carry 300 passengers per hour. Modern light rail vehicles ("LRV") have a capacity in the range of 232 passengers per car. When operated in two-car trains, LRVs can exceed the throughput requirement.

Examples of at-grade LRT systems that can achieve the specified through-put include the following:

Alberta, Canada. Calgary, Alberta's system provides more than 6,000 pphpd capacity on Seventh Avenue, a surface street having numerous cross streets controlled by traffic lights. Its current schedules show that Calgary Transit operates its C-Train Route 201 (Dalhousie/Bridlewell-Somerset) every 4 minutes during the weekday morning and afternoon peak periods; the C-Train Route 202 (McKnight-Westwinds/City Centre) runs along Seventh Avenue every 6 minutes during the weekday morning and afternoon peak periods. This results in a combined headway of 2 minutes, 24 seconds. With the delivery during 2007 and 2008 of 40 additional LRVs, both of the light rail lines are being operated with three trains of Siemens-built U-2 and S160 LRVs, each with a practical capacity of 162 passengers, resulting in a practical capacity along Seventh Avenue of 12,150 pphpd based on 75 LRV car movements per hour.

Portland, Oregon. Portland, Oregon's MAX is a three-line LRT that operates through its central business district in curbside lanes along Morrison and Yamhill Streets. The three LRT lines currently operate a combined 4-minute headway (15 trains per hour in each direction) through Pioneer Square, the center of Portland's central business district, during the weekday morning and afternoon peak hours. A fourth LRT line, which will run for 1.8 miles through the central business district along Fifth and Sixth Avenues and on a 6.5 miles-long branch to Clackamas Town Center is nearing completion and is scheduled to be placed into passenger-carrying service on September 10, 2009.

Denver, Colorado. Denver's Regional Transit District operates 15 LRT trains (4-minute average headways) with lengths varying between two and four cars on its D, F, and H lines along California and Stout Streets. The West Line, a third LRT now under construction, will add two additional services throughout downtown Denver.

The above examples show that an at-grade transit system for the Honolulu urban core is an option worth serious study and consideration.

Endnotes:

¹ KS is a landowner in Honolulu, and the proposed rail alignment traverses through four key communities in which KS has a combined land area of approximately 229 acres. In each community, the proposed rail line either bisects KS' land holdings or runs along the perimeter of its properties.

² See **Comment # 3** for a more specific discussion on parking impacts.

³ This request is made pursuant to 40 C.F.R. §§ 1508.8 and 1508.14. "When an environmental impact statement is prepared and economic or social and natural or physical environmental effects are interrelated, then the environmental impact statement will discuss all of these effects on the human environment." 40 C.F.R. § 1508.14. The *Economics Technical Report Honolulu High-Capacity Transit Corridor Project* (RTD 2008c) issued by DTS on August 15, 2008 was also reviewed in formulating this comment.

⁴ Mitigation measures for post-construction impacts are discussed in other sections of this letter.

⁵ Note that the *Transportation Technical Report* was also reviewed in formulating this comment.

⁶ Publication No. FHWA HI-88-054.

⁷ Boulevard Saimin is identified as a historic property in the DEIS. See DEIS at Table 5-2, page 5-7.

⁸ The DEIS provides, "Acquisition of property for the Build Alternative would be conducted in accordance with Federal and State regulations and procedures outline in the Real Estate Acquisition Management Plan (RTD 2008q). Where relocations would occur, affected property owners, businesses, or residents would receive compensation in compliance with all applicable Federal and State laws. Compensation would be in accordance with the Federal Uniform Relocation Assistance and Real Property Acquisitions Policies Act (CFR 1989)." DEIS at S-6.

⁹ By way of example, although there are references to increasing the width of Dillingham Boulevard by ten feet, it is unclear whether each right-of-way taking along Dillingham Boulevard will be ten feet wide.

¹⁰ The maps included in Appendix B of the DEIS indicate that the rights of way acquisitions "may be in the form of an aerial easement; an easement allowing joint use; subdivision of property with transfer of title; transfer of title for the entire parcel; or some other form to be documented by Land Court registration."

¹¹ By way of example, it would make sense to treat the parcels constituting Dillingham Shopping Plaza as a single parcel because they are owned and operated as an integrated economic unit.

¹² Defined consequences would also ensure that the City understands that the federal requirements are not merely guidelines (notwithstanding the label of "policies" or "plan"), but are enforceable obligations to be taken seriously with consequences for failure to comply.

¹³ For example, if the City condemns a strip of land in the middle of a parcel, the City's condemnation could create two nonconforming (substandard) parcels. The City has not allowed the consolidation of the nonconforming parcels with adjoining parcels owned by the same party. Such nonconforming (substandard) parcels adversely impact the property owner's ability to develop, sell, or lease such parcels.

¹⁴ If the City does intend to use its power to take private property for private development, including any TOD or TSD, it is requested that the Final EIS (a) describe in detail any such intended use of the City's eminent domain power, (b) evaluate and disclose the economic and social impacts of such action, and (c) propose mitigation measures.

¹⁵ The DEIS contains Table 4-35, at 4-169, entitled "Rail System Benefits on Real Estate Values." This summary appears to be incomplete and could be misunderstood as showing how the Project will increase "home" values if the home is located closer to the rail line.

¹⁶ By way of example, a 1996 study of properties within a half mile of Portland's MAX stations had higher values but those within a half mile of the rail line, but not near a station, decreased in value. A 2004 study even showed that home values near the Chicago Midway Line station decreased in value after the rail project was completed.

¹⁷ A study has shown that adjacency to transit stations is not a sufficient factor to cause development to occur. It found dozens of stations areas where no new development had occurred for 20 to 30 years. It is reported that along LA's Metro Blue Line, there has been little or no development activity along a several mile stretch of Long Beach Boulevard. Real estate professionals indicated that "the location of the transit line in the middle of the street had a significant negative impact on accessibility to retail businesses along the street.

¹⁸ Development along the rail line will not likely occur automatically; governmental assistance and coordination are needed. It is reported that Portland TODs are heavily subsidized in the form of tax breaks, infrastructure subsidies, below-market land sales, and direct grants. The City of Portland has used tax incentives (\$100 million of 10-year waivers of property taxes offered to high-density residences along the light-rail line) to help overcome redevelopment hurdles. This is excluding the \$1.2 billion in tax-increment financing that Portland is offering to developers along the rail lines or similar direct subsidies offered by Portland's suburbs, including Gresham and Beaverton.

¹⁹ It is important that KS, prospective investors, lenders, and affected businesses be given an opportunity to provide input on the bills. It should be noted that, the *Land Use Technical Report* provides that Kapalama has a "low potential for TOD," Table S-1, at S-4. KS requests further discussions with the City on the potential for TOD in Kapalama.

²⁰ This is the sum of the forecasted 3,530 boardings at the North King & Owen Street station; 2,580 boardings at the North King Street & Waiakamilo Road station; and 4,750 boardings at the North King Street at Liliha Street station. See *Alternatives Analysis Report* at Table 3-9, page 3-19.

²¹ This is the sum of the forecasted 3,030 boardings at the Dillingham Boulevard & Mokauea Street station and 2,340 boardings at the Dillingham Boulevard & Kokea Street station. See *Alternatives Analysis Report* at Table 3-9, page 3-19.

²² The term "fixed guideway" means:

(4) Fixed guideway.--The term "fixed guideway" means a public transportation facility—

(A) using and occupying a separate right-of-way or rail for the exclusive use of public transportation and other high occupancy vehicles; or

(B) using a fixed catenary system and a right-of-way usable by other forms of transportation.

49 U.S.C. § 5302(a)(4). This definition does not distinguish between elevated and at-grade systems. Furthermore, according to the *Alternatives Analysis Report* at 5-3, the FTA Section 5309 New Starts program provides funds for the construction of a "new fixed guideway" system, which "refers to any transit facility that uses exclusive or controlled rights-of-way or rails, entirely or in part. Eligible purposes for these funds include light rail line, rapid rail (heavy rail), commuter rail, automated fixed guideway system (such as a 'people mover'), a busway/HOV facility, or an extension of any of these." *Id.*

²³ If the City did make a formal determination that an at-grade system is inferior to an elevated system and thus rejected an at-grade system as a viable alternative, information on that determination should be provided.

SHARON ANN THOM
DEPUTY DIRECTOR

June 11, 2010

RT9/09-331507

Mr. Richard Kamis
kamii@hawaii.rr.com

Dear Mr. Kamis:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- *Reduce the time that each area will experience traffic and community disturbances.*

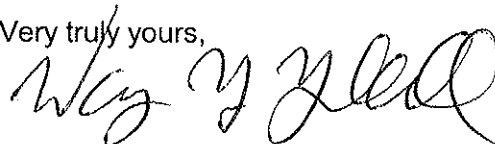

Mr. Richard Kamis
Page 2

- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*
- *Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- *Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Cc: Djou, Charles
Subject: Honolulu Transit

We respectfully request your consideration of Charles Djou's recommendation to begin construction of the transit system at the East end of the proposed route working toward the west end

If monies should fail and the project be halted, a portion at the East end should be useable whereas a portion only at the West end is not likely to be particularly useful

Additionally, we truly hope that you seriously believe that monies will be available for this project. We have serious question regarding this, considering inevitable overruns and the disastrous "Boston Big Dig" history of the company that Honolulu apparently plans to use. Reports surely indicate that Boston is in major financial trouble as a result!

Dear Mr. Kamis:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- *Reduce the time that each area will experience traffic and community disturbances.*

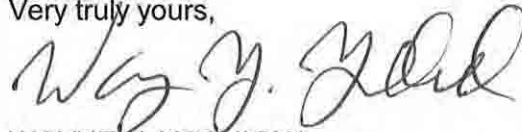

- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*
- *Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- *Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

The financial plan is balanced for the entire Project so there will not be a situation in which only a portion of the system will be built. If there is a shortfall, additional revenue sources will be considered. Section 6.6 of the Final EIS discusses risks and uncertainties, as well as potential sources to cover shortfalls.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Dear Mr. Kammerer:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal:

Chapter 6 of the Final EIS describes the financial resources anticipated to be needed to pay for the capital cost of the Project and for ongoing operating and maintenance costs. Capital costs of the Project, including finance charges, are expected to be fully paid for by a combination of FTA Section 5307 and FTA Section 5309 New Starts Funds from the Federal government and revenues from the County General Excise and Use Tax (GET) surcharge levied from 2007 through 2022 on Oahu. Operating and maintenance costs will be paid for from the same sources currently used for TheBus: Federal funding, fare revenues, and City revenues from the General and Highway Funds.

The Purpose and Need of the Project are discussed in Chapter 1 of the Final EIS. The Project will improve corridor mobility, reliability, access to planned development to support City policy to develop a second urban center, and transportation equity.

Mr. David Kammerer
Page 2

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Other Submission Method :
Submission Date : 01/25/2009

Submission Content/Notes : I am in favor of building the "Minimum Operating System" from the airport area to Ala Moana, starting from the airport, not Kapolei.

Why?

During recent testimony, the question came up, "Where are we going to get the money to build the entire project?"

Under questioning, Wayne Yoshioka said that he guarantees that we have enough money to complete the MOS (Kapolei to Waipahu). What about the rest of the project? If we run out of money, if we complete only the MOS, shouldn't it be in the town area?

Councilmember Cachola asked for an explanation of the rising cost of the project from \$3.7B to \$5.3B and the fact that the city had only received \$246M in 20 months.

\$246M is about \$60M short of what is necessary to stay on track to reach the original \$3.7B estimate, and is woefully short of the \$5.3B "2008 cost of expenditure" estimate.

Director Yoshioka says that \$5.3B is today's dollars, insists that they have a good fiscal plan and he talks about the cyclical nature of the economy.

Please, help me understand:

1. The estimate for the project has gone up \$1.6B (from \$3.7B to \$5.3B) since 2006.
2. Is \$5.3B the expected final cost in 2020, or what will it go up to ???????
3. We are in an economic slump which is projected to last several years and revenues are declining.
4. Currently, we are already short of the expected funds and it will get even worse.
5. Is it expected that the half% GET is going to pick up to a point where it makes up for the current shortage and the expected shortage?
6. Is it expected that the half% GET will increase to a point where it will cover the expected rise in project cost "2020 cost of expenditure"?
7. The state is facing a budget shortfall and there is now, a looming threat for the state to withhold the half% GET for at least a year.

Will any of the above facts affect the City's ability to complete the entire rail project within budget?

If the answer is yes, then we deserve to at least have an MOS that is complete, useable, generating revenue and ready to expand to Waikiki and UH Manoa.

Thank you,

Dear Mr. Kanemori:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- *Reduce the time that each area will experience traffic and community disturbances.*

- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*
- *Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- *Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

The following responses correspond to your numbered list of questions:

1) At the time of the Alternatives Analysis, the capital cost of the Salt Lake Alternative was estimated to be \$3.72 billion, including finance charges, expressed in year 2006 dollars. In Year-of-Expenditure dollars the same estimated cost was \$4.98 billion. As shown in Table 6-1 of the Draft EIS, the cost of the Salt Lake alternative, in Year-of-Expenditure dollars (i.e., including inflation), was estimated to be \$5.276 billion, an increase of less than \$300 million. The City selected the Airport Alternative for which the costs are estimated to be \$5.513 billion (Table 6-1 in the Final EIS) including finance charges.

2) As noted above, the \$5.513 billion estimated cost for the Airport Alternative is expressed in Year-of-Expenditure dollars. This is the anticipated final cost including finance charges. Project costs, excluding finance charges, will be expended through calendar year 2019. Finance charges will continue through calendar year 2022.

Comments 3 to 6) The capital plan that analyzes capital expenditures for the Project is presented in Section 6.3 of the Final EIS and takes the current economic downturn into account. Section 6.6 of the Final EIS describes risks and uncertainties associated with these funding assumptions. The financial planning assumes a much lower forecast of the General Excise and Use Tax (GET) surcharge revenue. If GET collections return to originally anticipated levels the Project will benefit from those funds.

7) By law, the State is required to collect the GET surcharge and to turn over the proceeds, less an administrative fee of 10 percent, to the City on a quarterly basis. Unless State law is changed this obligation remains, regardless of the State's budget condition. The law has not been changed.

Mr. Ted Kanemori
Page 3

Lastly, the capital plan that analyzes capital expenditures for the Project is presented in Section 6.3 of the Final EIS, including a description of the amount of funding anticipated from various sources. As noted above, Section 6.6 of the Final EIS describes risks and uncertainties of the funding assumptions. The finances are balanced and other funding sources are identified should there be additional need for funds.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Dear Ms. Keaton:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Luggage allowances for the rail system will be more permissive than those for TheBus because it will be easier to safely enter, exit, and ride the train with luggage. Separate luggage areas are not planned. Riders will only be allowed to bring on luggage that they can safely be managed.

To respond to your second question, corrosion control measures will be applied to the Project's fixed steel facilities and neighboring utility structures to provide proper operation over their lifetime. These measures include the following:

- *Protective coating specification for steel aerial structures*
- *Coating specification for stations*

Ms. Laura Keaton
Page 2

- *Preventive measures against stray current corrosion*
- *Corrosion control design of transit underground utilities and neighboring utilities owned by others*

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Monday, November 10, 2008

Dear Mayor Hanneman and Mr. D'Jou:

Pls accept my feelings on the rapid transit that now has been voted in. I am from Vancouver, Canada, where of course we have an outstanding system, I believe Honolulu is basing their system on Vancouver's. I am used to riding the VCR system and it is outstanding. My big fear is that Honolulu won't get it right. I ride the BUS occasionally to my job at Kaiser Hosp and find the bus to very inefficient, and so I am afraid that the train will be inefficient.

I feel the only way to get an efficient train is to make sure that the "good of the whole" is served and not just a minority group ie: Salt Lake residents. If the good of the whole population is served, then there will be links to the airport, UH, Ala Moana and Waikiki. If the city decides to go with what is good for the minority, I see a very inefficient system with low ridership and a waste of taxpayer's money and I would be resentful of my tax dollars going to fund a system that serves the minority.

Putting a link to Salt Lake and not the airport would be the height of stupidity. It would symbolize that we are NOT a progressive city. Every progressive city links rapid transit to the airport. Honolulu, especially, should have a link to the airport, as tourism is our number 1 industry. Right now you cannot take luggage on the #42 bus to the airport which is ludicrous, it does not make sense. In Vancouver, you can take luggage on the airport city bus routes and they are also building an airport link that arriving tourist can take right to downtown in 22 min.

Mr Cachola may need to understand that Honolulu must do what is best for the whole/majority of the island and that just because his constituents want a link to Ala Moana mall to spend the day is not a reason to put a SL link in before serving the airport. The majority must be served before the minority is served.

Mr. Hanneman, please get it right and do the right thing with the links, and please also allow luggage on the train. Having a train to the airport and not allowing luggage would be ludicrous. Also, luggage should be allowed on the city bus that will link to the train. Please make this a modern and efficient and user friendly to the people system.

Thank you, Anna Kerr RN at Kaiser Hospital and resident of Diamond Head area

Dear Ms. Kerr:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As documented in Chapter 1 of the Final EIS, the bus system is affected by congestion, which results in poor reliability and slower speeds. The fixed guideway system is being designed to improve transit reliability and speed. Since the fixed guideway system will operate in an exclusive right-of-way, service will not be affected by surrounding roadway conditions. Bus routes will be enhanced to create more fluid travel between TheBus and the transit system. Existing and future bus routes, including route numbers and frequencies, are presented in Appendix D of the Final EIS.

Your preference for the Airport Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the

Ms. Anna Kerr
Page 2

Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

Lastly, to address your comment about luggage on the system, the luggage policy for the system is not final, but the concept of the policy will be to allow luggage on the fixed guideway that does not interfere with the safety of comfort of other passengers. No change to policy on TheBus is proposed at this time.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Thank you for the opportunity to comment.

Along the proposed rail route, 62% of Oahu's population in 2000 according to the DEIS Table 1-5 is concentrated between Kaimuki-Waiialae and Salt Lake-Aliamanu. The route could be nearly half as long and still accommodate the majority of the current population in the project corridor.

Presumably, the second half of the proposed rail route (Pearl City-Aiea to Kapolei) is justified based on the anticipated population growth between now and year 2030. If growth predictions shown in Table 1-5 are correct, 53% of Oahu's population along the proposed rail route will be concentrated between Kaimuki-Waiialae and Salt-Lake Aliamanu. Therefore, even though the population in the Pearl City-Aiea to Kapolei area is projected to increase by about 70% over the current population in this area by 2030, the majority of people in the project corridor will still be concentrated between Kaimuki-Waiialae and Salt Lake-Aliamanu. It is therefore illogical to nearly double the rail route to accommodate less than half of the projected population in the project corridor, much of which hinges on proposed developments that do not yet currently exist.

These proposed developments are likely to exist at least partially on agricultural lands – even prime agricultural lands. Constructing this rail transit system on agricultural lands (prime, unique, or of statewide importance, or otherwise), through agricultural lands to serve developments that are built on agricultural lands is not sustainable or in the best long-term interest of Oahu's people.

Prime, unique, and statewide important lands are, by definition, of agricultural importance. Land with such classification is significant, not negligible, regardless of acreage. To trivialize the absorption of such lands on the grounds that only a small amount of it will be sacrificed is not acceptable. Conversion of land with such classification is, according to the ALISH system that defines these classifications, irreversible and therefore not a decision that should be taken lightly or trivialized because of scale. Any final EIS must provide measures to adequately mitigate the loss (88 acres of prime, unique, or statewide important lands will be acquired by the Build Alternatives) of such important lands.

According to the 2002 Census of Agriculture (USDA 2004) that the DEIS cites, only 18% of land on Oahu is farmland compared to over 30% of land on each of the main outer islands in Hawaii. Land available and suitable for farming on Oahu is dwindling. Subtracting another 88 acres will not help Oahu's food independence and is not so insignificant that it can be ignored.

Even if 88 acres represents a small percentage of agricultural land on Oahu, converting prime agricultural land to urban development further confirms that we are okay with rezoning productive land arbitrarily. Prime agricultural land should be staunchly reserved for agriculture. Zoning changes should have a scientific, not political, basis. If we continue to

indulge the perception that rezoning relatively small quantities of agricultural land for development is insignificant, eventually there will be no agricultural land left to rezone. There is nothing negligible about that in terms of loss of biodiversity and food security.

On her website, Governor Lingle states:

"Hawai'i produces only 15 percent of its own food. That's not acceptable and shouldn't be for the State. We need to take action now to increase food self-sufficiency for Hawai'i and preserve and strengthen the agriculture industry for future generations.

We must increase our efforts to protect the best agricultural lands from development and preserve them for agriculture into the future and we must strengthen our commitment to providing infrastructure and water for agriculture. Increasing our food self-sufficiency will contribute to our own communities rather than sending our dollars out of the State for imported food."

Loss of any prime, unique, or statewide important agricultural land undermines this mission.

It is unclear whether the 88 acres of agricultural land to be absorbed by this project is limited to the rail route itself and associated facilities or is extended to include agricultural lands adjacent to construction boundaries. There exists a myriad of evidence that when transit routes are created, development crops up around it. This is the basis of the popular "if you build it, they [development] will come" mentality, which is one of the arguments used to justify building a mass transit system through non-urban regions. Once the rail transit route is in place, it is expected that development will occur along the route. Therefore, any existing agricultural land along the route will also be affected by the project. In order for any final EIS for rail transit to accurately and completely examine the environmental impacts to agricultural lands, the project must include agricultural lands adjacent to project construction boundaries.

The DEIS claims that "all of the affected properties designated as prime, unique, or of statewide importance and/or actively being farmed are owned by individuals, corporations, or agencies that plan to develop them in conformance with the Ewa Development Plan (DPP 2000)". However, on the DPP's website for the Ewa Development Plan, the first sentence is "The Plan protects prime agricultural lands". Which is true?

Regardless, the land in question remains prime, unique or statewide important agricultural land. Therefore the future state of the land should be irrelevant when discussing environmental impacts to it, as the scope of this DEIS is to examine environmental impacts on the current conditions and not on future planned conditions that do not exist.

A detailed plan for mitigating all negative environmental impacts to agricultural land affected by this projects including an analysis of alternative routes to preserve prime, unique, and/or statewide important

agricultural land must be provided in any final EIS. If such land must be used for the proposed project, land equivalent in acreage and quality (as defined by equivalent ALISH soils classifications and water availability) must be provided elsewhere to replace the land consumed by this project's development.

Figure 1 at <http://equiliberate.org/fig1.jpg> plots data shown in Figure 1-1 of the DEIS as vehicle miles traveled (VMT) per registered automobile over time from 1980 to 2006. People are logging more miles today than in the last three decades.

Based on project population in 2030 shown in Figure 1-5 of the DEIS, city area, and year 2000 population density from the U.S. Census Bureau, the population density for Kapolei and Makakilo, Ewa, Waipahu and Waiawa, and Downtown Honolulu are plotted in Figure 2 (at <http://equiliberate.org/fig2.jpg>) for year 2000 and year 2030. Projected population density is plotted for year 2030. Kapolei and Makakilo, and Waipahu and Waiawa, were combined since data was given by zipcode and these regions share the same zipcode. Downtown Honolulu was included to provide a baseline population density reflecting urban development on Oahu. Figure 2 then shows population densities for Kapolei, Makakilo, Ewa, Waipahu, and Waiawa that are about 50% less than that of Downtown Honolulu. This difference can be attributed to the fact or likelihood that suburban sprawl either exists or is planned for the Waiawa through Kapolei area. Greater distances between community services increase the need for automobile use, thereby

- 1) Negatively impacting convenience of using a public mass transit system.
- 2) Creating an increased need for automobile support facilities (i.e. park-and-rides, access ramps, roadways, etc.) in order to enable the population to use a public mass transit system.
- 3) Decreasing the likelihood that the population in this area will use a public mass transit system.

The presence of a mass transit system has a proven record of encouraging development along the transit corridor, as evidenced by the increasing real estate values associated with properties closer to transit stations given in Table 4-35 of the DEIS for various existing transit systems in the United States. The environmental impacts associated with encouraging suburban sprawl, especially since the DEIS uses this projected growth as a justification for extending the Build Alternatives to the Waiawa through Kapolei area (Chapter 1, in particular), must be discussed, and measures for mitigating adverse impacts must be provided, in any final EIS.

According to the DEIS, the methodology for projecting future air quality as a result of the various project alternatives is based on anticipated vehicle miles traveled (VMT) and average network speed for each alternative. The data given in the DEIS indicates that all Build Alternatives yield better air quality than the No Build alternative. The only logical way for this to occur is if the proposed rail transit system replaces enough cars on the road such that its emissions are less than the

collective emissions of the cars it replaces. In other words, the data shown in Table 4-12 of the DEIS depends on the number of cars that the rail transit system takes off the road. There are so many variables involved in determining the number of cars that the rail system will take off the road that a number of different scenarios could result. How accurate is the data shown in Table 4-12? What assumptions were made to produce the data shown in Table 4-12?

Is it possible that the emissions generated from using electricity to operate any of the Build Alternatives would not be offset by reductions generated by any reduced VMT? That is, is it possible that emissions generated by operating any of the Build Alternatives will exceed emissions reductions resulting from reduced VMT? What assumptions were made in determining VMT?

Any final EIS must include measures for mitigation for scenarios where emissions from any of the Build Alternatives exceeds those of the No Build Alternative. The DEIS states that "Any measures to reduce automobile travel would reduce air pollutant emissions". This is not necessarily true. An attempt to reduce air pollutant emissions may not be successful. Consider the worst case scenario: the rail transit system is built and operable but is not sufficiently used. In this case, resultant emissions would actually exceed that of the No Build Alternative since additional cars would be in operation in addition to the rail system. This DEIS does not confirm that this scenario and/or other less extreme scenarios are not possible. Such a statement is therefore not justified and should be removed in any final EIS.

From the data presented in the DEIS, it is unacceptable to consider only Ldn (24-hour average, penalizing night noise) and/or Leq (average sound). The maximum noise levels must be the criteria used to determine environmental impacts of noise since a few extremely noisy events, like a train rolling by, can be balanced with no noise (no train) to produce an average sound event that is only moderately noisy. People will not likely experience the average noise depicted in Figures 4-39 to 4-42 at any given moment, rather they will experience the maximum noise levels and minimum noise levels independently. If my interpretation of this information is incorrect, the final EIS should provide clarification.

The DEIS states that once the project is operating, noise levels will be measured to determine the actual extent of project noise impacts. However, no measures for mitigating any moderate and/or severe noise impacts that may arise are provided. Any final EIS must include a methodology for noise mitigation that the project shall adhere to.

The DEIS states that the proposed Build Alternatives will have no effect on endangered and protected waterbirds despite the fact that waterbird habitats exist within the project boundaries. The justification for this claim given in the DEIS is that

"Over time, the waterbirds would adjust to new structures built for the Project since the wetlands would remain intact. This is expected

because the waterbirds have continued to occupy the wetlands after the construction of nearby buildings and overhead utilities and the construction or widening of adjacent roads or highways.”

Have any studies been conducted that investigate the environmental impacts of development on endangered waterbirds and protected waterbirds and their habitats? If so, please provide sources for each study and state whether or not the study findings support the DEIS claim that there will be no effects. Did the previous construction activities (construction of nearby buildings and overhead utilities and the construction or widening of adjacent roads or highways) result in noise intensity and duration, site disturbance, and all other environmental impacts to the endangered waterbirds' and protected waterbirds' habitat equivalent to each of the proposed Build Alternatives? If so, please provide evidence that supports this claim. Was the proximity from previous construction activity to wetlands and/or endangered waterbird and protected waterbird habitat the same as the proximity from the proposed construction activity to the wetlands and/or endangered waterbird and protected waterbird habitat? Will the noise in the areas where endangered waterbirds were observed remain the same after any of the proposed Build Alternatives are complete and operational? If not, the environmental impacts of noise on endangered waterbird and protected waterbird habitat must be investigated in any final EIS and mitigating measures must be provided.

What is the accuracy of the each field survey conducted and bird point counts? What is the margin of error? If accuracy cannot be guaranteed, a potential for environmental impacts to endangered terrestrial fauna exists. These impacts must be identified in any final EIS, and measures to mitigate these impacts must be included in any final EIS.

Are the “numerous canopy trees” in the Tern habitat enough to support the existing and future white tern population? What is the basis of the claim in the DEIS that the other large canopy trees in urban Honolulu will result in no impact to the white tern population? Please provide sources to substantiate this claim.

How were field surveys conducted? The DEIS explains the procedure for conducting point counts but not field surveys. Any final EIS must include the procedure followed for conducting field surveys.

Why was 8 minutes the duration used for point counts? Please provide a justification for the use of this time interval. One study found that on average 55% of all initial species detections occurred within the first 5 minutes, and 82% of all initial species detections occurred within the first 10 minutes, of 15-minute long point counts regardless of time of day or use of aural stimuli. If the results of this study hold true for Hawaii, only about a 75% of all species were detected over the 8-minute period. Were single or multiple visits conducted? Bartlet, et al. (1999) recommended two visits.

What time of day were point counts conducted and was any aural stimuli used?

The results of the Water Quality Impact Assessment for the EPA must be included in any final EIS and the public must have an opportunity to comment on this study.

What permanent BMPs will be implemented to ensure there is no change in the amount of infiltration? An increase in infiltration relative to existing conditions can have positive environmental impacts. Have any studies been conducted to determine if this is feasible?

The DEIS states that because the Project would rely on electric propulsion, minimal pollutants would be generated on the guideway relative to pollutants generated by roadway traffic. Has a study been conducted that confirms this assumption? If so, please provide a source.

The DEIS does not acknowledge the fact that floodplains provide ecological benefits beyond groundwater recharge and infiltration, including but not limited to maintenance of biodiversity and fish habitats. In fact, the DEIS states the contrary by saying "the only beneficial functions for the floodplains analyzed in the study corridor are the recharge of groundwater and drainage conveyance". Please provide evidence to support this claim.

The DEIS states that a 2% reduction in energy consumption would result from each of the project Build Alternatives relative to the No Build Alternative. The transportation analysis is referenced as the source for this analysis of operational energy consumption. The transportation analysis references the Oahu MPO Travel Demand Forecasting Model as the source of the daily trips per transportation type per Alternative data. This data is the basis of system-wide daily travel data (vehicle miles per day per for each alternative), which is the basis of the total energy consumption of each alternative presented in Table 4-18. The Travel Forecasting Methodology Report, which explains the details of the Travel Demand Forecasting Model, states that "The mode choice model was also updated and recalibrated to improve accuracy of the model coefficients and relationships and to calibrate the alternative-specific constants. ...The mode choice model was re-calibrated as part of the Draft EIS process; however, the details of it are not discussed in this report." Where can these details be found?

What assumptions were made in the determination of transit ridership? In Table 4-18, Total energy consumption is the sum of roadway and bus energy consumption and the fixed guideway vehicle energy consumption. The latter energy consumption is greater across all Build Alternatives relative to the No Build Alternative. Therefore, the energy savings of the Build Alternatives results solely from reduced roadway and bus energy consumption. Indeed, the No Build Alternative energy consumption in this category exceeds the energy consumption of each Build Alternative in this category. Therefore, the DEIS assumes that less automobile and bus vehicle miles will be traveled in each Build Alternative. That is, Table 4-18 assumes that operation of the fixed guideway system will result in less automobile and bus usage. What

data is this assumption based on? How was transit ridership projected? Is it possible that transit ridership will not result in less roadway and bus energy consumption (i.e. fixed guideway vehicle energy consumption exceeds roadway and bus energy savings)? Please provide a justification for any response to this question. Did the model consider that automobiles may become increasingly more efficient by 2030 and into the future?

The fact that photovoltaic cells could be integrated into project stations to reduce project electricity demand, as the project states as a measure of mitigation, provides no tangible mitigating effect. Any final EIS must provide a detailed analysis of measures that could be taken to reduce the project's net electricity demand and total energy consumption. This analysis must consider the feasibility of integrating alternative energy technologies into the project as well as an analysis of energy conservation measures that could be implemented to increase the operational efficiency of the system.

The DEIS lists a number of ways the volume of hazardous materials used and extent of worker exposure could be limited as a means for mitigation. This list of mitigating measures must be implemented in order to adequately mitigate environmental impacts of hazardous waste.

It is not acceptable to use prime agricultural land as a site for a maintenance and storage facility when a clear alternative (given in the DEIS) is present.

Why is the entire transit route (in all Build Alternatives) elevated? Kapolei is currently grossly undeveloped. The transit route should be placed at ground level where geography permits to preserve view planes and reduce construction cost and energy consumption. This would result in 150,000 MBTU energy savings per track mile during construction, based on the information provided in the DEIS. Any final EIS must consider energy conserving measures like this.

Where clearing and grubbing occurs, will these areas be revegetated to the extent possible? The DEIS is not clear on this point.

Will pruning of trees found to contain chicks be delayed until chicks fledge or not? The DEIS is not clear on this point.

Under what conditions will additional studies, such as but not limited to a complete Phase I Environmental Site Assessment, during the design or construction phase be performed? Will remediation of contaminated soil and groundwater that is discovered during the project occur? To what extent?

In addition to demolished material, will every effort be made to recycle or make available for reuse unused construction materials and other waste generated on site? What measures will be taken to minimize the amount (in weight and/or volume) of construction waste generated over the project construction phase?

Any final EIS must provide margins of error for all data and assumptions made in the DEIS.

Dear Ms. Kido:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal:

With a population of around 340,000, the Kaimuki-Waiialae to Salt Lake-Aliamanu area described in your comment contains approximately 40 percent of the island's population of 876,200 people, and contains approximately 61 percent of the population of 552,100 within the transit corridor. The remaining transit corridor area (Salt Lake-Aliamanu to Kapolei) contains the other 39 percent of the population. While the remaining corridor contains a smaller population, shortening the route will fail to serve a large population with substantial transit demand.

As stated in Chapter 4, Section 4.2.3 of the Final EIS, the farmlands that will be acquired for the Project are in the Ewa Plain. The Ewa Development Plan designates areas for dense development while preserving other areas for agriculture. A maximum of 80 acres of prime farmland and 8 acres of statewide-important farmlands will be acquired by the Project, of which 70 acres are actively cultivated. All of the affected properties designated as prime, unique, or of statewide importance and/or actively farmed are owned by individuals, corporations, or agencies

that plan to develop them in conformance with the Ewa Development Plan. The Project will be constructed on land designated for development as outlined in the Ewa Development Plan.

The 88 acres of prime, unique, and statewide-important land impact includes land that may be used for a maintenance and storage facility. One of the two alternatives for a maintenance and storage facility is in agricultural-related use (Aloun Farms). The preferred maintenance and storage facility site is located near Leeward Community College and is the site of a former Navy fuel storage and delivery facility. The Leeward Community College location is the preferred location for the maintenance and storage facility, and DTS has been working with the Navy to acquire it. If the City can acquire this site, only 47 acres of land designated as prime or of statewide importance will be acquired for the Project.

As stated in Section 4.2.3 of the Final EIS the 2002 Census of Agriculture (USDA 2004) reported that there are more than 70,000 acres of agricultural land in cultivation on Oahu, including those designated as prime, unique, or of statewide importance. The displacement of agricultural lands as a result of the Project represents less than one-tenth of one percent of available agricultural land. Considering that the amount of affected farmland is such a small proportion of all agricultural lands on Oahu, including those designated as prime, unique, or of statewide importance, the effect will not be substantial and no mitigation will be required.

As stated in Section 4.2.3 of the Final EIS, the proposed maintenance and storage facility site in Ewa is about half the amount of farmland required for the Project. If DTS can acquire the Leeward Community College site, only 47 acres of land designated as prime or of statewide importance will be used for the Project.

As stated in the Final EIS Section 4.2.3, some land uses will need to change in order to accommodate the Project; however, impacts to the natural and built environment are minimized whenever possible. Zoning changes are at the discretion of the City's Department of Planning and Permitting.

The Ewa Development Plan recognizes that agricultural land should be protected and designates areas for dense development while preserving other areas for agriculture. The displacement of agricultural lands as a result of the Project represents less than one-tenth of one percent of available agricultural land. The Project's effect will not be substantial and no mitigation will be required.

The 88 acres of prime and statewide important farmlands referenced in Table 4-1 in this Final EIS is limited to the transit project (guideway and associated facilities) and do not include the development of the adjacent properties by other parties. These adjacent properties are designated for development in the Ewa Development Plan.

As discussed in Section 4.19.2, within station areas, the Project, combined with supportive public policies and favorable real estate market conditions, could attract transit-supportive development (TSD) and transit oriented development (TOD). The Ewa Development Plan stresses development in concert with a transit system. Although the addition of transit does not directly cause development to occur, plans and policies will encourage new development to

be located near transit stations to take advantage of the transportation infrastructure and increased accessibility if a new transit line is built.

As stated previously, the Ewa Development Plan recognizes that agricultural land should be protected and designates areas for dense development while preserving other areas for agriculture. The transit system will help focus development in designated areas.

Much of the farmland acreage that could be acquired for the Project is located at one of the two alternatives for a maintenance and storage facility. The preferred alternative is a former Navy fuel storage and delivery facility near Leeward Community College. If it is acquired, agricultural land used for the project will be about 47 acres. The Final EIS identifies the existing land use, and where information is available, planned future use of land that would be affected by the Project.

The agricultural land in question is planned to be developed, independently of the proposed Project. The land is not planned to remain in agricultural use and the impacts of loss of agricultural land have been or are being addressed in the entitlement process for the planned development. The Project has been designed in compliance with the Ewa Development Plan.

Regarding convenience of mass transit, among the Project goals and objectives (Table 1-4 of this Final EIS) is to "improve access to planned development to support City policy to develop a second urban center." The Final EIS shows estimated traffic volumes for year 2030. Traffic is expected to grow with or without the Project being constructed. However, as indicated in Section 3.4.1 of the Final EIS, vehicle miles traveled (VMT), vehicle hours traveled (VHT), and vehicle hours of delay (VHD) are projected to decrease under the Project as compared to the No Build Alternative. VMT is computed by multiplying the forecast number of trips using a roadway by the facility's total length in miles. VHT is derived by multiplying the number of trips using a roadway by the travel time for each travel period. VHD is calculated by finding the difference between the congested VHT and the VHT that would be expected under free-flow conditions. Table 3-14 in the Final EIS shows an 18 percent reduction in VHD with the Project compared to the VHD for the No Build Alternative.

Regarding station access, as indicated in Table 3-20 in this Final EIS, overall access to public transit will be enhanced with the Project. Based on the results of the travel demand forecasting model (described in Section 3.2 of the Final EIS) a substantial portion of project riders will access the system by local bus and by walking and biking to the station. Bus, walk, and bike access to stations will account for approximately 90 percent of total trips in the a.m. peak period, 6 a.m. to 8 a.m.

Several stations will be located near existing or planned bicycle facilities. As stated in Chapter 3, Section 3.4.5, the Oahu Bike Plan is currently being updated and is scheduled to be adopted in 2010. The draft update of the Oahu Bike Plan includes a prioritized list of bicycle projects developed using criteria that includes access to transit. Several projects that would connect existing or future bicycle facilities to rail transit stations are included in the draft update. Additionally, the City will provide parking facilities at four stations (East Kapolei, UH West Oahu, Pearl Highlands, and Aloha Stadium). These stations were selected based on results from the travel demand forecasting model which showed these stations had high drive-to-transit demand.

Regarding the use of mass transit, as presented in Chapter 3 of the Final EIS, the Project will result in reduced VMT, fewer hours of delay, and higher shares of total travel when compared to No Build conditions. As stated in Section 3.4.2 of the Final EIS, approximately 40,000 automobiles are forecast to be removed from roadways as a result of the Project, compared to the No Build Alternative. The specifics of this forecasting model can be found in 3.2.1.

As shown in Figure 3-10 in the Final EIS, the stations on the Ewa end of the corridor will have high daily ridership. It is anticipated that the proposed fixed guideway system will allow development in the Ewa area to occur in an organized fashion around the well-defined transit system. Compact development patterns, better access, and, ultimately, use of the transit system are anticipated. In addition, bus service will be enhanced to provide connections between surrounding communities and fixed guideway stations. All stations will be accessible by bus, walking and bicycling. Future bus routes and frequencies are provided in Appendix D of the Final EIS.

Section 4.19.2 of the Final EIS addresses indirect effects of the Project on development patterns, while cumulative effects are presented in Section 4.19.3, where it is stated: "The bulk of future regional land use changes are expected in the study corridor." Indirect land development would be associated with TOD at the proposed stations, focusing rather than sprawling development. The analysis considers other planned development within the study corridor. Mitigation required to address impacts created by other proposed actions would be the responsibility of those developing the land.

The regional pollutant burdens estimated in Table 4-15 of the Final EIS are based on VMT and VHT estimates throughout the study area. These estimates are based on regional planning models adopted by the OahuMPO. Emission rates are developed through the use of EPA's MOBILE6.2 Emission Factor program which takes into account vehicle mix, speed, meteorological conditions of the study area, and vehicular registration information. The Regional VMT model is reviewed by the State agencies for accuracy. Additional detail is available in the Transportation and Air Quality Technical Reports for the Project. The reports can be reviewed at the City and County of Honolulu Department of Transportation Services (DTS) office or on the Project website (www.honolulustransit.org).

The results shown in Table 4-15 of the Final EIS reflect mobile source emission burdens. As stated in the text, additional emissions will be generated due to the power requirements of the fixed guideway system. Table 4-21 indicates that the Project would require 2 percent less overall energy as compared to the No Build Alternative. The Project is expected to result in decreased emissions generated on the roadways and increased power source emissions resulting from fixed guideway energy consumption. However, the overall emission level for the Project is expected to be lower than the No Build Alternative because of anticipated reduced traffic congestion compared to the No Build Alternative (Section 3.4.2 of the Final EIS).

As summarized in Table 4-21 in the Final EIS, operation of the Project is anticipated to reduce daily transportation energy demand by approximately 3 percent compared to the No Build Alternative. This reduction is due to the reduction in VMT that occurs as a result of people

switching from automobiles to the fixed guideway system and includes electrical energy required to operate the fixed guideway system.

VMT is the sum of the length of all highway segments multiplied by the number of vehicles that travel on them over the course of a day. The travel forecasting model performs that calculation each time the model is run. The differences in VMT between alternatives in the analyses are based on the differences in the numbers generated by the model. The same is generally true for VHT and VHD. VMT, VHT, and VHD forecasts have been developed using the travel demand model, which was calibrated against collected traffic and transit ridership information and then validated against recent counts to be sure it properly represents travel activity in the transportation system (Section 3.2.1 of the Final EIS). An on-board transit survey was completed in December 2005 and January 2006, and the latest socioeconomic information available as of October 2008 was incorporated. Traffic counts were collected in 2005, 2007, and 2008. The model is based upon a set of realistic input assumptions regarding land use and demographic changes, such as updates to population and employment patterns that reflect planned development on Oahu, between now and 2030 and expected transportation levels-of-service on both the highway and public transit system.

In response to your comment, the Final EIS (Section 4.9.3) was revised to remove the following sentence: "Any measures to reduce automobile travel would reduce air pollutant emissions."

Section 4.10 of the Final EIS addresses noise effects of the Project as related to applicable FTA noise criteria. As explained in Section 4.10.1 of the Final EIS, Ldn is an appropriate measure to assess community noise effects, because it considers both the total noise and the daily pattern of the noise experienced and reflects community reaction to environmental noise exposure. Maximum noise levels are not an appropriate measure of urban noise impact, as a single very loud event once a week would have less impact than a quieter event that occurs several times per hour. Leq is used to evaluate noise levels in areas where only the daytime use is noise sensitive. The analysis completed for the Project is consistent with FTA guidance. While Lmax does reflect the maximum noise from a single event, it does not describe either the frequency or duration of the noise event. Lmax is not used in transit noise assessment because it would not differentiate the impact of a single transit vehicle occurring once during the daytime from a constant flow of vehicles occurring over all daytime and nighttime hours.

The Final EIS includes additional information about how any severe noise impacts measured after project operation would be treated. As stated in Section 4.10.3 of the Final EIS, the Project will cause no severe noise impacts. Moderate impacts will occur at upper floors of a few high-rise buildings (as shown in Table 4-18 in the Final EIS). With the recommended mitigation in place (sound absorbing material and wheel skirts), the noise analysis indicates that the new noise generated by the Project will be lower than the existing (2009) noise levels in most locations.

The project design includes an integrated noise-blocking parapet wall at the edge of the guideway structure that extends three feet above the top of the rail. The parapet wall will substantially reduce ground-level noise.

In areas with high-rise apartments and hotels that have lanais above the elevation of and facing the rail, the parapet wall will have a limited benefit (less than a 3-dBA noise reduction) at floors above the level of the guideway. Wheel skirts will increase the benefit from the parapet wall at locations above the elevation of the track. The use of sound-absorptive materials below the tracks in the three areas that will experience moderate noise impacts will reduce the Project noise levels from the upper floors to below the impact level. Once the Project is operating, noise levels will be re-measured to confirm that there are no noise impacts from the Project. If additional noise impacts occur, then FTA will require the evaluation of measures to address the impacts.

The Project does not propose to convert waterbird habitat, including wetlands, into transportation facilities (Section 4.13.3). The Project will stay within existing roadway corridors along most of its route, except sites planned for the maintenance and storage facility and park-and ride lots. These proposed facilities are not located adjacent to any waterbird habitat, including wetlands. Consultation with U.S. Fish and Wildlife Service (USFWS) did not generate any concerns about project effects to habitat as referenced in Appendix F of the Final EIS.

Although this Project did not monitor the noise intensity and duration and other environmental impacts associated with construction of existing facilities near waterbird habitat, we anticipate that the Project will be similar and comparable to the construction effects of the existing facilities, although not equivalent in all aspects at all times. The Project proposes to use drilled-shaft foundations to reduce or eliminate the need for pile driving.

Based on the information provided to FTA by USFWS, coordination with USFWS staff, and field observations, there will be "no effect" to threatened and endangered species or designated critical habitat related to this Project. Areas along the proposed corridor that are in close proximity to waterbird habitat have previously experienced major construction of roads, utility lines, bridges, elevated freeways, buildings, and other existing structures. As summarized in Section 4.13.3 of the Final EIS, there is not expected to be any effect to waterbirds as a result of the Project because it is anticipated that over time, the waterbirds will adjust to new structures. All wetlands will remain intact, and waterbirds continued to occupy the wetlands after the construction and widening of adjacent roads and highways.

Operational noise may generate some disturbance adjacent to the guideway when trains are passing; however, the noise will not be a critical factor in endangered waterbird survival since the quality waterbird habitat will remain intact. The noise levels generated by the Project will be similar to the existing highway-noise levels in the corridor.

The standard error, not the margin of error, of the following parameters was presented in the Honolulu High-Capacity Transit Corridor Project Ecosystems and Natural Resources Technical Report (2008j): the average number of individuals of each species per station and the average number of species per station or average richness for each corridor area. By providing the standard error of the averages and the sample size, we present what is conventionally required in the presentation of averages. From these statistics, one can derive confidence limits for the estimated population parameter, if desired. Further information about methodology is available in this technical report. The report can be reviewed at the DTS office or on the Project

website (www.honolulutransit.org). The standard error ranged between 0.22 and 0.62 for bird count survey results.

The true values of the population parameters will almost always remain unknown and, therefore, it is common to estimate the reliability of the estimated parameter by setting confidence limits to it. There is no way to guarantee that the estimate, such as the average number of zebra doves at each point count station, is accurate. We can only express our degree of confidence in the average as a probability.

Field surveys were observations conducted while walking or driving around. We cannot place confidence limits on such observations since the manner in which the observations were conducted does not lend itself to statistical analyses. The presence and quantity of a species are influenced by many factors such as the time of day, season, and a host of environmental conditions, including the presence of disturbances, such as predators, aircraft, or construction noise, that can cause wildlife to temporarily move out of the area. However, these visits generally reveal what can be expected, based on previous anecdotal and scientific records of similar sites and habitats. They are, therefore, important in verifying and checking the species components and environmental characteristics that typify a site, but conclusions derived from these visits must be interpreted conservatively. Reported observations are accurate.

The design of the point counts was to determine what birds were present along the corridor and provide an index of abundance. Field surveys were designed to record the species observed.

As provided in the Honolulu High-Capacity Transit Corridor Project Ecosystems and Natural Resources Technical Report (RTD 2008j): "White terns may be directly affected by the project between Kalihi to University and Waikiki, because this species uses mature canopy trees as roosting and nesting sites almost exclusively. These trees could be affected by the construction of the fixed guideway system." This report can be found at the DTS office and on the Project website. VanderWerf (2003) indicates that while the white tern population on Oahu is still relatively small and restricted in range, it is increasing and robust. While white tern habitat is limited to large trees in southeastern Oahu, VanderWerf also indicates that if the population grows they may move inland, to other coasts of the island and to other islands. While not as comprehensive, tern sightings during our observations along the corridor show a similar geographic distribution as VanderWerf found in 2001 to 2003. The tern population on Oahu still has area to expand. (Vanderwerf, E.A. 2003. Distribution, abundance, and breeding biology of white terns on Oahu, Hawaii. *Wilson Bull.*, 115(3):258-262.) The only portion of tern habitat that will now be affected by the Project is between Kalihi and Ala Moana Center.

The procedures for all field surveys were presented in Section 3.2. of the Ecosystems and Natural Resources Technical Report (RTD 2008j). Technical Reports can be found at DTS and on the Project website.

Scott, et al. (1986), used an 8-minute count period for their variable circular plot method to estimate bird densities in Hawaiian forests. They determined that the interval was long enough to allow an observer to accurately record all birds observed. The count period was selected as a compromise between efficiency and effectiveness. Point counts by Blondel, et al.

(1981), were conducted for 20 minutes, but as the commenter points out, studies by Dettmers, et al. (1999) (not Bartlett et al.) indicate that 5- or 10-minute intervals are adequate.

Scott, J.M., S. Mountainspring, F.L. Ramsey, C.B. Cameron. 1986. "Forest bird communities of the Hawaiian Islands: their dynamics, ecology, and conservation." *Studies in Avian Biology*, No. 9.

Blondel, J., C. Ferry, and B. Frochot. 1981. "Point counts with unlimited distance." *Studies in Avian Biology*, No. 6:414-420. Cooper Ornithological Society.

Dettmers, R., D. A. Buehler, J. G. Bartlett, and N. A. Klaus. 1999. "Influence of point count length and repeated visits on habitat model performance." *JWM* 63(3):815-823.

Dettmers and Bueher (Dettmers, et al. 1999) stated that the one visit data did not perform as well in their model. "The current point count recommendations also suggest conducting only one visit/point, but we found that models developed from two visits/point consistently performed somewhat better than single visit models across all count durations and species. We concluded that conducting two visits/point will likely result in habitat models that perform better than models developed from a single visit. However, as with count duration, the potential benefits of increased model performance should be weighed against the additional costs in time and resources required to complete extra visits to each point."

During the alternative routes analyses, each route was surveyed once via the modified point count method using 8-minute count periods. After the route was selected, the preferred route was re-sampled using the same method resulting in two samples to determine the presence or absence of species and their relative abundance. Point counts were conducted from 7 a.m. to 11 a.m. All birds heard and seen were recorded, and no aural stimuli were used.

After evaluating the Ground Water Impact Assessment completed for the Project, the Environmental Protection Agency (EPA) concurred that the Project should have no significant impacts on groundwater, either during long-term operation of the system or during its construction. These findings are presented in Section 4.13.3 of the Final EIS. The complete Ground Water Impact Assessment and evaluation of other water resources is available to the public as part of the Honolulu High-Capacity Transit Corridor Project Water Resources Technical Report. This report can be found on the Project website and at the City and County of Honolulu, and the DTS office.

Permanent BMPs will include vegetated swales, retention ponds, and grit removal structures (Section 4.14.3 of the Final EIS). Where it is feasible, an increase in the amount of infiltration of clean water back into the water table aquifer is a design goal.

The Final EIS was revised to clarify the following air pollution statement: "Any measure to reduce automobile travel would reduce air pollutant emissions." Minimal pollutants are anticipated to be generated on the guideway. As shown in Table 4-15, of the Final EIS, the Project will reduce regional transportation pollutant emissions by between 3.9 to 4.6 percent compared to the No Build Alternative. If the electricity used to operate the Project is generated by combustion, this may produce additional emissions. However, these emissions will be offset

in whole or part by the reductions generated by the reduction in transportation emissions, as indicated in Table 4-15. Furthermore, power plant emissions may be more easily controlled than emissions from individual automobiles. Further, as stated in Section 4.11.3, as a result of the decrease in VMT, total transportation energy demand for transit and highway vehicles will be 3 percent lower with the Project when compared to the No Build Alternative. This decrease in energy demand is due to the reduction in VMT that occurs as a result of people switching from automobiles to the fixed guideway system and includes electrical energy required to operate the fixed guideway system. This analysis accounts for both roadway vehicle propulsion energy and power requirements. Based on this, it is expected that the total emission burden generated by the Project will be lower than the No Build Alternative.

For the purposes of the environmental analysis presented in Section 4.14.2 of the Final EIS, the description of the functions of floodplains are limited to their hydrological functions. Section 4.14.2 also acknowledges the habitat functions of the floodplain. The environmental analysis of habitat functions of aquatic resources, including floodplains, is presented in Section 4.13 of the Final EIS.

The Mode Choice Model Calibration and Validation Report includes a more thorough discussion of the model calibration and validation process. This report can be obtained from DTS or on the Project website.

Transit ridership was forecast using a travel demand forecasting model. The model inputs are based on various inputs compiled from empirical information consistent with FTA guidelines. There is no indication that the energy needed by the fixed guideway will exceed the equivalent amount needed to move the same number of people in cars. In general, the fixed guideway will use less than 30 percent per capita of the amount of energy needed to power the number of cars required to carry the same number of people.

As stated previously, ridership projections for the forecast year of 2030 were developed using the travel demand model, which was calibrated against collected traffic and transit ridership information and then validated against current counts to be sure it properly represents travel activity in the transportation system (Section 3.2.1 of the Final EIS). An on-board transit survey was completed in December 2005 and January 2006, and the latest socioeconomic information available as of October 2008 was incorporated. Traffic counts were collected in 2005, 2007, and 2008. The model is based upon a set of realistic input assumptions regarding land use and demographic changes between now and 2030 and expected transportation levels-of-service on both the highway and public transit system. Based upon the model and these key input assumptions, approximately 116,300 trips per day are expected to use the rapid transit system on an average weekday in 2030. Since the Draft EIS was published, the travel demand model has been refined by adding an updated air passenger model (which forecasts travel in the corridor related to passengers arriving or departing at Honolulu International Airport), defining more realistic drive access modes (driving alone or car pooling) to project stations and recognizing a more robust off-peak non-home-based direct demand element (trips that do not originate or end at home) based on travel surveys in Honolulu.

The Project is one of the first in the country to design and undertake an uncertainty analysis of this type of travel forecast. The uncertainty analysis evaluates the variability of the

forecast by establishing likely upper and lower limits of ridership projections. FTA has worked closely with the City during this work effort. A variety of factors were considered in the uncertainty analysis, including the following:

- Variations in assumptions regarding the magnitude and distribution patterns of future growth in the Ewa end of the corridor.
- The impact of various levels of investment in highway infrastructure.
- The expected frequency of service provided by the rapid transit system.
- Park-and-ride behavior with the new system in place.
- The implications on ridership of vehicle and passenger amenities provided by the new guideway vehicles.

Given all the factors considered, the anticipated limits for guideway ridership in 2030 are expected to be between 105,000 to 130,000 trips per day, bracketing the official forecast of 116,000 riders a day used for all calculations.

Chapter 3 of the Final EIS describes the results of the analysis, and Figures 3-9 and 3-10 show the number of passengers that will be carried by the fixed guideway during the a.m. peak period and daily. Compared to serving the same number of passengers with buses or in cars, there will be fewer vehicles on the road. As discussed in Section 2.5.6, bus service will be enhanced and the bus network will be modified to coordinate with the fixed guideway system. Some existing bus routes, including peak period express buses, will be altered or eliminated to reduce duplication of services provided by the fixed guideway system. Buses removed from service in the study corridor will be shifted to service in other parts of Oahu, resulting in improved transit service islandwide. Certain local routes will be rerouted or reclassified as feeder buses to provide frequent and reliable connections to the nearest fixed guideway station.

According to the U.S. Department of Energy, Transportation Energy Data Book, for the year 2006, passenger cars require 3,512 BTUs per passenger mile while transit trains require 2,784 BTUs per passenger mile, and transit buses require 4,235 BTUs per passenger mile. Based upon these figures, transit trains are a more energy efficient mode of transportation compared to passenger cars or transit buses. These figures are influenced by the load factor (persons per vehicle). The Honolulu system currently has the fourth highest load factor of any transit system in the United States and the highest load factor for any transit system without a rail transit system (Table 3-8 in the Final EIS).

Vehicle efficiency is factored into energy calculations based on overall fleet performance. In general, performance is assumed to improve over time consistent with fleet requirements imposed by federal law or set by individual states.

The Project will rely on Hawaiian Electric Company (HECO)'s existing grid to provide propulsion for the trains and system operations for the trains. HECO is moving toward renewable energy generation. As that happens, the fixed guideway will also benefit from such

new sources of energy. The 21 proposed stations and maintenance and storage facility will, to the extent possible, incorporate energy efficiency, alternative energy technologies, and other sustainable features into the design. This is being accomplished by including sustainability design criteria into the contract documents for the Project.

This list of methods provided in Section 4.12.3 of the Final EIS to limit the volume of hazardous materials used and the extent of worker exposure provides examples of how worker exposure will be limited. In addition, the Project will comply with applicable rules and regulations, such as Occupational Health and Safety Administration (OSHA) and Hawaii Occupational Safety and Health (HIOSH), and workers will be required to comply with material labels.

As stated previously, the preferred location for the maintenance and storage facility is located near Leeward Community College. If that location is used, the impacts to agricultural land will be significantly reduced.

The Alternatives Screening Memorandum (DTS 2006a) recognized the visually sensitive areas in Kakaako and Downtown Honolulu, including the Chinatown, Hawaii Capital, and Thomas Square/Academy of Arts Special Design Districts. To minimize impacts on historic resources, visual aesthetics, and surface traffic, the screening process considered 15 combinations of tunnel, at-grade, or elevated alignments between Iwilei and Ward Avenue. Five different alignments through Downtown Honolulu were advanced for further analysis in the Alternatives Analysis, including an at-grade portion along Hotel Street, a tunnel under King Street, and elevated guideways along Nimitz Highway and Queen Street.

The Alternatives Screening Memorandum (DTS 2006a) recognized the visually sensitive areas in Kakaako and Downtown Honolulu, including the Chinatown, Hawaii Capital, and Thomas Square/Honolulu Academy of Arts Special District. To minimize impacts on historic resources, visual aesthetics, and surface traffic, the screening process considered 15 combinations of tunnel, at-grade, or elevated alignments between Iwilei and Ward Avenue. Five different alignments through Downtown Honolulu were advanced for further analysis in the Alternatives Analysis, including an at-grade portion along Hotel Street, a tunnel under King Street, and elevated guideways along Nimitz Highway and Queen Street (Figure 2-4).

The Alternatives Analysis Report (DTS 2006b) evaluated the alignment alternatives based on transportation and overall benefits, environmental and social impacts, and cost considerations. The report found that an at-grade alignment along Hotel Street would require the acquisition of more parcels and could potentially affect more burial sites than any of the other alternatives considered. The alignment with at-grade operation Downtown and a tunnel under King Street, was not selected because of the environmental effects, such as impacts to cultural resources, reduction of street capacity, and property acquisition requirements of the at-grade and tunnel sections, which would cost an additional \$300 million.

The Project's purpose is "to provide high-capacity rapid transit" in the congested east-west travel corridor (see Section 1.7 of the Final EIS). The need for the Project includes improving corridor transit mobility and reliability. The at-grade alignment would not meet the Project's Purpose and Need because it could not satisfy the mobility and reliability objectives of

the Project (see bullets below). Some of the technical considerations associated with an at-grade versus elevated alignment through Downtown Honolulu include the following:

- **System Capacity, Speed, and Reliability**—The short, 200-foot (or less) blocks in Downtown Honolulu would permanently limit the system to two-car trains to prevent stopped trains from blocking vehicular traffic on cross-streets. Under ideal operational circumstances, the capacity of an at-grade system could reach 4,000 passengers per hour per direction, assuming optimistic five minute headways. Based on travel forecasts, the Project should support approximately 8,000 passengers in the peak hour by 2030. Moreover, the Project can be readily expanded to carry over 25,000 in each direction by reducing the interval between trains (headway) to 90 seconds during the peak period. To reach a comparable system capacity, speed, and reliability, an at-grade alignment would require a fenced, segregated right-of-way that would eliminate all obstacles to the train's passage, such as vehicular, pedestrian, or bicycle crossings. Even with transit signal priority, the at-grade speeds would be slower and less reliable than an elevated guideway. An at-grade system would travel at slower speeds due to the shorter blocks, tight and short radius curves in places within the constrained and congested Downtown street network, the need to obey traffic regulations (e.g., traffic signals), and potential conflicts with other at-grade activity, including cars, bicyclists, and pedestrians. These effects mean longer travel times and far less reliability than a fully grade-separated system. None of these factors affects an elevated rail system. The elevated rail can travel at its own speed any time of the day regardless of weather, traffic, or the need to let cross traffic proceed at intersections.
- **Mixed-Traffic Conflicts**— The Project will run at three minute headways. However, three-minute headways with an at-grade system would prevent effective coordination of traffic signals in the delicately balanced signal network in downtown Honolulu. A disruption of traffic signal cycle coordination every three minutes would severely affect traffic flow and capacity of cross-streets. Furthermore, there would be no option to increase the capacity of the at-grade rail system by reducing the headway to 90 seconds, which would only exacerbate the signalization problem. An at-grade system would require removal of two or more existing traffic lanes on affected streets. This effect is significant and would exacerbate congestion. Congestion would not be isolated to the streets that cross the at-grade alignment but, instead, would spread throughout Downtown. The Final EIS shows that the Project's impact on traffic will be isolated and minimal with the elevated rail, and, in fact will reduce system-wide traffic delay by 18 percent compared to the No Build Alternative (Table 3-14 in the Final EIS). The elevated guideway will require no removal of existing through travel lanes, while providing a reliable travel alternative. When traffic slows, or even stops due to congestion or incidents, the elevated rail transit will continue to operate without delay or interruption.

An at-grade light rail system with continuous tracks in-street would create major impediments to turning movements, many of which would have to be closed to

eliminate a crash hazard. Even where turning movements are designed to be accommodated, at-grade systems experience potential collision problems. In addition, mixing at-grade fixed guideway vehicles with cars, bicyclists, and pedestrians presents a much higher potential for conflicts compared to grade-separated conditions. Where pedestrian and automobiles cross the tracks in the street network, particularly in areas of high activity (e.g., station areas or intersections), there is a risk of collisions involving trains that does not exist with an elevated system. There is evidence of crashes between trains and cars and trains and pedestrians on other at-grade systems throughout the country (e.g., Phoenix, Houston, LA). This potential would be high in the Chinatown and Downtown neighborhoods, where the number of pedestrians is high and the aging population presents a particular risk.

- **Construction Impacts**—*Constructing an at-grade rail system could have more effects than an elevated system in a number of ways. The wider and continuous footprint of an at-grade rail system compared to an elevated rail system (which touches the ground only at discrete column foundations, power substations, and station accessways) increases the potential of utility conflicts and impacts to sensitive cultural resources. In addition, the extra roadway lanes utilized by an at-grade system would result in increased congestion or require that additional businesses or homes be taken to widen the roadway through Downtown. Additionally, the duration of short-term construction impacts to the community and environment with an at-grade system would be considerably greater than with an elevated system. Because of differing construction techniques, more lanes would need to be continuously closed for at-grade construction and the closures would last longer than with elevated construction. This would result in a greater disruption to business and residential access, prolonged exposure to construction noise, and traffic impacts.*

Because it is not feasible for an at-grade system through Downtown to move passengers rapidly and reliably without significant detrimental effects on other transportation system elements (e.g., the highway and pedestrian systems, safety, reliability, etc.), an at-grade system would have a negative system-wide impact that would reduce ridership throughout the system. The at-grade system would not meet the Project's Purpose and Need and, therefore, does not require further analysis.

As previously discussed, the Project must operate in a protected right-of-way to preserve system speed and reliability and neither automobiles nor pedestrians can be allowed to cross the tracks. For at-grade operation, this would require a fenced right-of-way with no crossings. Because the City does not intend to acquire the right-of-way through the existing farmlands and future development, and because constructing at-grade and fencing the right-of-way would preclude crossing the tracks, an at-grade system would impair the current use and future development of surrounding lands. Any future crossing of the tracks would have to include construction of a bridge over the tracks.

Areas that are cleared and grubbed will be re-vegetated to the extent possible. This is included in Section 4.18.10 of the Final EIS.

Trees will not be pruned until the young birds have fledged as stated in Section 4.18.8 of the Final EIS.

As presented in Section 4.12.3 of the Final EIS, "The City will decide whether a partial or complete Phase 1 [Environmental Site Assessment (ESA)] is necessary for each property prior to acquisition." The factors that will influence this decision-making process include:

- Whether the parcel is a full or partial acquisition.*
- Whether there is existing documentation regarding contamination investigation and/or documentation of remedial activities having occurred.*
- The degree to which subsurface construction activities will be performed at that individual parcel.*
- The type of contaminated media that is expected to be encountered.*

Also, archaeological studies will be completed as described in Section 4.16 of the Final EIS.

Sites of concern are listed in Section 4.12 of the Final EIS in Table 4- 22. Some properties that will be acquired to obtain required right-of-way for the Project received a rank of "1" or "2" during the Initial Site Assessment (Table 4-22) and, therefore, may be polluted. Either a partial or complete Phase I Environmental Site Assessment (ESA) will be performed by the City prior to acquiring portions of these properties to lessen the chance that the City will acquire a degraded piece of real estate or that workers will be exposed to contaminants during construction. ESAs will also be performed for those sites listed in Table 4-23. ESAs will be conducted per the ASTM International's Standard Practice for Environmental Site Assessments—Phase I Environmental Site Assessments Process (E1527-05) (ASTM 2005). Site assessments have already begun, are ongoing, and will continue prior to construction of the Project. Depending on the outcome of the Phase I ESAs, a Phase II assessment (including collecting and analyzing samples) may be appropriate. The City will decide whether a partial or complete Phase I ESA is necessary for each property prior to acquisition. If contaminated materials are identified, the property will be remediated in accordance with Federal, State, and Local regulations. The City will coordinate with the HDOT Hazard Evaluation and Environmental Response Office regarding work within HDOT rights-of-way. Specific pre-construction activities regarding contaminated media are discussed in Section 4.18.7 of the Final EIS.

Contractors will be required to prepare a Solid Waste Management Plan to identify procedures to reduce solid waste. Measures to minimize construction waste will be included in the plan prepared by the contractor.

As discussed in Chapter 3, Section 3.2.1, ridership projections for the forecast year of 2030 have been developed using the travel demand model, which was calibrated against collected traffic and transit ridership information and then validated against recent counts to be sure it properly represents travel activity in the transportation system (Section 3.2.1 of the Final

EIS). An on-board transit survey was completed in December 2005 and January 2006, and the latest socioeconomic information available as of October 2008 was incorporated. Traffic counts were collected in 2005, 2007, and 2008. The model is based upon a set of realistic input assumptions regarding land use and demographic changes between now and 2030 and expected transportation levels-of-service on both the highway and public transit system.

The Project is one of the first in the country to design and undertake an uncertainty analysis of this type of travel forecast. The uncertainty analysis evaluates the variability of the forecast by establishing likely upper and lower limits of ridership projections. FTA has worked closely with the City during this work effort. A variety of factors were considered in the uncertainty analysis, including the following:

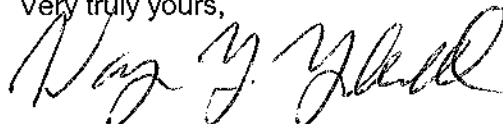

- Variations in assumptions regarding the magnitude and distribution patterns of future growth in the Ewa end of the corridor.*
- The impact of various levels of investment in highway infrastructure.*
- The expected frequency of service provided by the rapid transit system.*
- Park-and-ride behavior with the new system in place.*
- The implications on ridership of vehicle and passenger amenities provided by the new guideway vehicles.*

The FTA-approved forecasting methodology is not a probabilistic analysis and does not inherently provide margins of error.

The Final EIS includes the best available information regarding all resources and effects of the Project.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Enclosure

Honolulu High-Capacity Transit Corridor Project

Welcome to the Honolulu High-Capacity Transit Corridor Project's Public Hearing for the Draft Environmental Impact Statement/Section 4(f) Evaluation.

This public meeting and hearing has been designed to inform the public about the transit project, explain materials contained in the Draft EIS, answer questions from the public, and collect public input on project issues related to the Draft EIS, Section 106 of the National Historic Preservation Act, Section 4(f) of the U.S. Department of Transportation Act, and floodplains affected by the project.

Please review the project information and ask project staff any questions about the project that you might have. The Draft EIS is available on the project website at www.honolulutransit.org.

You may provide official comments in several ways. Here at this Public Hearing you may provide oral comments to a court reporter who will record them for the record or use this form to provide written comments. After the meeting, you may provide an on-line comment at www.honolulutransit.org or use this form to send a written comment to the Department of Transportation Services. All comments must be postmarked or received by January 7, 2009 in order for them to be included in the Final EIS.

Comment(s):

SALT LAKE BLVD IS NOT THE BEST ROUTE!
The construction period will cause traffic disruption
all along S.L. BLVD. & affect Radford HS, & Makalapa
Elementary School.
operation on the rail along S.L. BLVD will be
affected by ~~noise~~ The schools with noise.
F-V. & Aliamano Residents will NOT
have transit stops. They will have to
go to the stadium to get onboard.
Too much noise / congestion!

I wonder why no politicians showed
up for the Salt Lake Blvd meeting:
I won't be voting for my
Councilman! He should have been
at the meeting!

Honolulu, Hawaii 96818

Dear Mr. Kilthau:

**Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement**

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal:

Your preference for the Airport Alternative has been noted. While each of the alternatives includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana Center has been selected as the Preferred Alternative. The identification of the Airport Alternative as the Preferred Alternative was made by the City to comply with FTA's NEPA regulations that state that the Final EIS should focus on the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative, public input on the Draft EIS, and City Council Resolution 08-261 identifying the Airport Alternative as the Project. The selection of the Airport Alternative is described in Chapter 2 of this Final EIS. The discussion of the alternatives considered is included in Chapter 2 of this Final EIS and the Alternatives Analysis. As discussed in Section 3.4.2 of this Final EIS, the Airport Alternative will carry the most passengers with 116,000 daily passengers and 282,500 daily trips in 2030, thereby resulting in the greatest transit-user benefits. The Airport Alternative

Mr. Bob Kilthau
Page 2

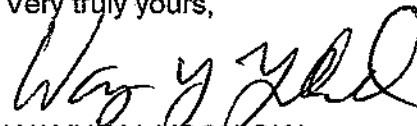

will also result in the fewest vehicle miles traveled and vehicle hours of delay, as well as provide access to major employment areas, including Honolulu International Airport, that will have substantially greater ridership than the other alternatives considered.

In addition, a Maintenance of Traffic (MOT) Plan will be developed by the construction contractor with approval from the City and the Hawaii Department of Transportation. The MOT Plan will mitigate construction-related effects on the transportation system. Table 3-27 in the Final EIS identifies roadways that will experience peak-period lane closures during construction.

For schools and other noise-sensitive locations that do not have nighttime sleep activities, the FTA Transit Noise and Vibration Impact Assessment compares the existing maximum-hour noise level to the maximum-hour noise that the transit line will produce by itself. Construction noise will be a temporary impact, and all local noise ordinances will be followed to reduce noise annoyance to residents and schools.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Issuance of the Record of Decision under NEPA and acceptance of the Final EIS by the Governor of the State of Hawaii are the next anticipated actions and will conclude the environmental review process for this Project.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

- 1) We are lessees on Kamahehaha Schools property on Dillingham and attended the meeting held at KS on 12/18/08. We occupy TMK: 1-5-28:66 and it looks as though a pillar will be right in front of our showroom window. We are wondering if this is correct and if so, can the location of that pillar be revisited? If you move 30-40ft ewa, it would be in front of our bldg wall, and if you move 50-60ft dhead it'll be in front of a parking lot. How big are the pillars?
 - 2) What will visibility be like for motorists as they travel Dillingham looking for businesses? Will they be able to see our current signage? If not, how will the city address this?
 - 3) Our business will be impacted. How much so is anyone's guess. Will we be compensated at all with relief from RPT perhaps? And has this all been figured into the budget?
 - 4) At what point will we be informed as to how much of our front parking lot will be affected? When the BRT talks were in the works, 6 - 7 ft (of our pkg lot to be condemned) was what we were hearing. Will the city be paying for the repaving of our entire parking lot?
 - 5) When the Board of Water Supply dug up Dillingham a few yrs ago, we arrived one morning during the Christmas season to find that they had closed off entry into our parking lot. We hope the city will be more sensitive to retail businesses on these kinds of issues.

Thank you!

Dear Ms. Kim:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The specific location of support columns along Dillingham Boulevard has not been determined. According to Appendix E of the Final EIS, columns will be 6- to 10-feet in diameter. The exact location for columns will be established during the final design phase of the Project, considering traffic movements, overhead and underground utilities, and other visibility and access issues, such as those expressed by the commenter.

The visibility for motorists along Dillingham Boulevard is illustrated on Figure 4-29 (Viewpoint 10) of the Final EIS. The simulated view shows that the guideway columns will not block the views of businesses or signage as the guideway will be constructed overhead, and the columns will be constructed in the median and spaced at substantial intervals.

Ms. Jayne Kim
Page 2

As design progresses, we will have a better understanding as to the exact property requirements. If there is an impact to a property, it will be handled in compliance with the requirements of the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act. If it is an affected parcel, the owner will be notified by the City of the extent of the impact to begin discussions about the appropriate next steps. There are no programs proposed that would reduce property taxes for affected businesses. The Honolulu High-Capacity Transit Corridor Project Right-of-Way team will contact and work with affected property owners and follow the requirements of the Uniform Relocation Assistance and Real Property Acquisition Policies Act.

Building the Project will have short-term effects on the environment including the business community during the construction phase as discussed in Section 4.18.1 of the Final EIS. As stated in the Final EIS Section 4.18.1, a public involvement plan will be developed prior to construction to inform business owners of the construction schedule and activities. Access may temporarily change during this phase, but access to places of business will be maintained during construction. A Maintenance of Traffic Plan will be developed by the contractor prior to construction and will address temporary effects on access to businesses during construction. Proposed mitigation to reduce adverse economic hardships for existing businesses along the Project alignment during construction activities will be included, see Section 4.18.1 of the Final EIS.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Submission Content/Notes : Aloha,

When you look at the route, consider destination rather than origin. Airport, Hickam and Pearl Harbor route has destination and origin without making route changes for buses while Salt Lake route is only the origin. So when the train pulls in to a station with standing room only, would people there ride the train? I doubt that. However, with a bus ride to the airport, they can ride the train comfortably to the destination.

Think about this. What was the primary reason for the mass transit rail? To reduce the traffic from the West side to PUC.

Even though rail was not address in Waipahu Special Area Plan of 1995, I'll support the Airport Route.

Sincerely,

Young Kim, Resident

Dear Mr. Kim:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

Project planning considers both origins and destinations of riders. The numbers of riders that would use each alternative are detailed in Chapter 3 of the Draft EIS. The purpose of the transit project is detailed in Chapter 1 of the Draft EIS. It includes improving travel time, reliability, supporting planned development, and improving travel equity. Your preference for the Airport Alternative has been noted. While each of the alternatives includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana Center has been selected as the Preferred Alternative. The identification of the Airport Alternative as the Preferred Alternative was made by the City to comply with FTA's NEPA regulations that state that the Final EIS should focus on the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative, public input on the Draft EIS, and City Council Resolution 08-261 identifying the Airport Alternative as the Project. The selection of the Airport Alternative is described in Chapter 2 of this Final EIS. The

Mr. Young Kim
Page 2

discussion of the alternatives considered is included in Chapter 2 of this Final EIS and the Alternatives Analysis. As discussed in Section 3.4.2 of this Final EIS, the Airport Alternative will carry the most passengers with 116,000 daily passengers and 282,500 daily trips in 2030, thereby resulting in the greatest transit-user benefits. The Airport Alternative will also result in the fewest vehicle miles traveled and vehicle hours of delay, as well as provide access to major employment areas, including Honolulu International Airport, that will have substantially greater ridership than the other alternatives considered.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Submission Content/Notes : Hopefully this has been considered, or is being considered as an option. To have the rail run through Salt Lake, but with a spur down through Mapunapuna to service the airport? The Salt Lake route will cost less, and service the locals. The spur will service locals and the visitors. Of course getting the visitors into Waikiki w/out them having to pick up a car at the airport will have great results in reducing the number of cars in H1.

Dear Mr. Kimball:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

The proposed option was described in the Draft EIS as a construction phasing option for the Airport and Salt Lake Alternatives. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section

Mr. David Kimball
Page 2

2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

To: Honolulu C&C Dept. of Transportation Services
For: Draft EIS Public Hearing at Blaisdell Exhibition Hall
From: Amy Y. Kimura

Mon., Dec. 8, 2008

Good evening. I testify tonight as an ordinary citizen who rides public transit wherever I've lived and traveled and who likes it for the most part. I enjoyed commuting on the subways in New York City and Japan. As a traveler I've ridden on the trains and buses in Europe, Canada, and the U.S. I list these because many people think everyone who is against the proposed Honolulu rail dislikes mass transit, rail in particular. On the contrary, rail in the places I've used them has been fast, convenient, efficient, and usually reasonably priced. But the populations served by them have been from two times to more than ten times Honolulu's population and could more easily support their operation and maintenance.

One place it was not so reasonably priced was Vancouver, Canada. The Skytrain was clean, convenient, and efficient, but way more expensive than Honolulu's bus system. A MONTHLY ADULT PASS cost \$73-136, depending on the number of zones covered. That's about two to three times the \$40 cost here. What would that do to transit-dependent riders here, people with no auto?

In Vancouver the MONTHLY PASS FOR SENIORS is \$42, more than the YEARLY cost of \$30 for seniors in Honolulu. What would that kind of cost do to seniors on limited and moderate incomes?

For students, monthly passes in Vancouver are also \$42, twice as much as the \$20/month charged by The Bus.

"Transit-dependent" adult riders, the elderly, and children will be greatly affected. Will the City be willing and able to greatly increase its subsidy of transit to keep down the prices of the transit passes for them?

If not, how will that affect the quality of life of seniors of moderate or limited means? How about families of low, moderate, and even middle incomes?

If not, how will that attract motorists out of their cars and on to the fixed guideway?

If yes, how will that affect property tax rates of everyone?

If commuter passes increase in price, the "Choice Riders" of The Bus, those who have an available vehicle to ride but choose to ride The Bus, will likely choose to abandon commuting on public transit in favor of their car, adding to congestion.

Mahalo for giving me this opportunity to comment. In the future more notice would be appreciated. I received your newsletter announcing this hearing three days ago, on Friday, Dec. 5.

Dear Ms. Kimura:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The corridor from Kapolei to UH Manoa (i.e., the study corridor) is well suited for the fixed guideway project. In 2000, 63 percent of Oahu's population of 876,200 and 80 percent of its 501,100 jobs were located within the study corridor. By 2030, these distributions will increase to 69 percent of the population and 83 percent of the employment as development continues to be concentrated into the Primary Urban Corridor and Ewa Development Plan areas. As stated in Section 1.3.1 of the Final EIS, 2,036,000 or 73 percent of the approximately 2,790,000 island-wide daily trips, and 350,000 or 64 percent of the 544,000 a.m. peak-period work-related trips, are currently generated within the study corridor. The study corridor attracts an even higher percentage of island-wide work-related trips with 446,000 or 82 percent of a.m. peak-period work-related trips having destinations within the study corridor.

Ms. Amy Kimura
Page 2

The EIS assumes that fares for all transit modes, including the fixed guideway line and TheBus will be the same, with a fare structure similar to today. Zone fares or distance-based fares are not assumed. The EIS also assumes that the City's current policy will remain in effect (i.e., that fare revenues will pay for between 27 and 33 percent of annual operating and maintenance costs).

As described in Section 6.4.2 of the Final EIS, "The fare structure for the fixed guideway is assumed to follow the current bus fare structure, with transfers between modes assumed to be free." Current users of the TheBus with its fare structure for limited income populations will be able to transfer onto or directly access the fixed guideway system with their current bus passes or one-way fare. Since the fare structure is assumed to be the same and that transit-dependent households will experience a substantial time benefit (as shown in Figure 3-7 of the Final EIS), the combination of a consistent fare structure across modes coupled with a decrease in travel time is anticipated to attract motorists out of their cars. Fares are anticipated to increase with inflation and the cost of automobile ownership, and use is anticipated to increase at or above the rate of general inflation.

Chapter 6 of the Final EIS describes the financial resources anticipated to be needed to pay for ongoing operating and maintenance costs. Operating and maintenance costs will be paid for from the same sources currently used for TheBus: Federal funding, fare revenues, and subsidies from the City's General and Highway Funds. It is anticipated that with an integrated bus and rail system in place that a slightly higher percentage of the City's operating budget will be used for transit than is currently the case.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

City and Count of Honolulu, O'ahu, Hawai'i
Draft Environmental Impact Statement/Section 4(f) Evaluation

C: ✓ Mr. Ted Matley
FTA Region IX
201 Mission Street, Suite 1650
San Francisco, CA 94105
415-744-3133

The following are my comments on the Draft EIS due February 6, 2009. I recommend a Supplemental EIS be prepared before the Final EIS to adequately answer my and others' questions and comments.

CHAPTER 1 PURPOSE AND NEED FOR RAIL PROJECT

A. REDUCE CONGESTION INTO URBAN HONOLULU At the beginning of this process the public was told the major reason for the project was to **reduce congestion**, particularly from Leeward and Central O'ahu. As a n urban Honolulu resident I was usually not affected by this daily problem. However, on those few occasions when I found myself in it, it made me very sympathetic to their plight. I believe the City and its consultants have given short shrift to investing in an improved bus system that would reduce congestion for leeward O'ahu motorists at least as much as the rail system and much sooner and at vastly less cost to O'ahu taxpayers.

B. DIRECT FUTURE GROWTH. The other major reason discussed, one espoused by many on the City Council, was as a planning tool, to **direct future growth** toward the Second City of Kapolei. This made sense to me. I recalled Stockholm, where at rail stations there was high density: high rises with commercial spaces on the low floors, residential on the upper floors, often for the elderly. Radiating from the station were first lower density town houses and low rise apartments, then farthest away, starting perhaps from one-third or one-half mile were single-family houses. Bicycle and pedestrian paths connected with the stations without crossing a street. It was safe and well-planned, with a mixture of family types and families easily accessible to elderly parents. Each station was a little neighborhood where you didn't have to drive to take care of daily activities and needs, as is common in Japan and in New York City. But this is not what I see being planned for the first few stations being built.

C. FARFETCHED STATEMENTS BY CITY IN FAVOR OF RAIL

1. "Rail transit is a way to...provide options for those who cannot easily drive to, or park at, their destinations." [Hnl rail transit insert Advertiser and Star-Bulletin Sun-10-19-08] .

Why provide an option at such a high cost for the next 20-30 years when it will do little to alleviate traffic from Leeward O'ahu (only 11% according to the City's rosy estimates) ? The City should not be

ayk

mortgaging the taxpayers' future for something with such a small benefit and so risky . At a minimum it should exhaust other, less expensive, lessrisky, and less disruptive options like greatly improved express bus service The City should act prudently, not be gambling with present and future taxpayers' funds

2. "Goal: Improved Equity" "Everyone can use the fixed guideway system and afford it." (Honolulu On The Move Newsletter, Feb. 2008, p. 1)

How is it possible that bus passes and fares will not increase with rail added? How can the rail be built and added costs of operating and maintaining the rail in addition to the bus system not require higher fares?

The current \$40/month adult bus pass is affordable for households with limited incomes and/or no car The \$30/YEAR (not month) senior pass is an outstanding bargain! Nowhere in the US or Canada have I come across such a bargain for seniors. This incredible bargain offers great mobility and a high quality of life to seniors with limited income and those unable to drive. My late mother made good use of it.

3a. Improve Corridor Mobility. (1.8.1).

Decreasing congestion into Honolulu and the Central Business District can be achieved much more economically than with a multi-billion rail by the City (and State) increasing monthly employee parking rates (e.g. \$60) in the CBD to closer to private rates downtown (\$200+). This would encourage more carpooling and bus riding [but bus service must be improved to attract "Choice Riders"]. The City and State would probably have to negotiate this with the unions, but it would be much easier on the public and not disruptive to businesses along the route than constructing the rail system.

3b. "Motorists and transit users experience substantial traffic congestion and delay at most times of the day, both on weekdays and on weekends." (1.8.1)

During peak hours I agree, but **in the off-peak hours or on weekends I haven't found this in 10-15 years** of occasional driving to Waikale/Waipahu/Pearl Ridge/Pearl City from Makiki. Nor have I found this when often driving around Kalihi and Iwilei in offpeak hours. In the 90s when I used to drive to Pearl City during the morning peak period, it usually took me 10 minutes longer than in the best off-peak times. But driving back during the am peak period took an hour longer, so I learned to delay returning because I was lucky enough to have a choice most of the time.

4. "A need exists to provide a more reliable transit system." (1.8.2)

I agree, but this can be done with an improved bus system that will cost a fraction of the rail and will not be disruptive during construction nor take away parts of people's land.

5. Improve Transportation Equity (1.8.4) "Downtown median daily parking rates are the highest among U.S. cities, further limiting this [transit-dependent and lower-income workers from Pearl City, Waipahu, and Makakilo areas] population's access to Downtown."

Why would high Downtown median daily parking rates affect the transit-dependent and those without cars?

D. ALTERNATIVES INADEQUATELY EXPLORED. Mayor Hannemann and the City's consultants have **not explored alternatives adequately.** They have given short shrift to a bus and Transportation Systems Management alternatives. What I've read and heard at public meetings and hearings indicates the Managed Lane Alternative has also not been given a fair examination. When the mayor ran for office he often said the City has Needs and Wants. He would focus on the Needs before the

ayk

Wants I believe the rail project is a Want, not a Need. Our Needs include at least one billion dollars to bring our aging sewer system up to minimum Federal standards now that repeated waivers over the past 15-20 years have run out. A Federal court has ordered the City to do so U.S. Senator Daniel Inouye is trying to use his influence to grant us an exception because he said the City cannot afford to pay for it. Yet Senator Inouye feels we can afford a much more costly five billion dollar rail system that is a Want, not a Need.

E. WHO WILL NOT BE BETTER SERVED BY THE RAIL SYSTEM?

1. **Urban Honolulu (and Central Business District) residents** are currently well served by the low-fare bus system, especially those without cars. They will not benefit from the proposed rail system. On the contrary, they will have poorer bus service because many bus routes from one part of Honolulu to another part will be diverted to feed the rail stations
2. **The elderly, people of limited income, and the disabled** are best served by buses because of the low-cost fares, nearness to origins and destinations, security due to the presence of a driver on every bus, and safety because the driver waits until the elder and handicapped are on board or safely on the ground before closing the door and moving on.
3. **UHM/Chaminade/St. Louis students** because the Minimum Operating Segment will not go to UHM/Chaminade/St. Louis. Commuters from Leeward and Central O'ahu usually remark on how much less traffic there is when UH is not in session, that there really is little congestion. This contradicts the assertion that "The Project would ...meet the Purpose and Need for the Project whether or not the planned extensions are provided." [Project Phasing, p. 2-38]
4. **O'ahu taxpayers** will be spared the traffic congestion during the ten-year construction period, the much higher property taxes and GET surcharge increase necessary to build, operate, and maintain the train, and the inability to afford both rail and core city services like sewers.
5. **Tourists** will not like the visual blight created by an elevated line (this is supposed to be "paradise") and go elsewhere, affecting the state and city economy and the revenues for the 1/2% GET surcharge as well as the Tourist Accommodation Tax.
6. **Leeward O'ahu residents**, last, but most importantly, who do need relief from peak period congestion Unfortunately, the rail will not provide that relief as I will argue in my comments. They have been misled into believing that their severe rush hour congestion affecting their quality of life will be eased when the MOS is completed in ten or so years.

CHAPTER 2 ALTERNATIVES CONSIDERED

A. NO BUILD (BUS SYSTEM), TRANSPORTATION SYSTEMS MANAGEMENT (TSM)

Express buses are tremendously more cost-effective than a multi-billion dollar fixed rail. Express buses use roadways used by cars and other buses and thus will not cause more congestion during a decade of construction as the guideway must, which can cause small and even medium-sized businesses to go under. They do not require condemnation of land for their stops.

1. **Improve express bus service from Leeward O'ahu.** It is the Leeward (and Central) O'ahu areas which are most in need of relief from rush hour congestion. I feel not enough thinking outside the

box has been done by TheBus decision makers. More express buses, especially during the morning peak period, could fill this need better and at much lower cost than a rail system. More luxurious coach-type buses should be tested to see what brand best meets commuters' needs. Most of them should be super express buses, which only pick up passengers in the originating area and only drop off in destination areas.

Example: Improve Wai'anae-Honolulu express buses. For example, Waianae super express buses should drive straight to town without stopping at Waipahu or any other place en route to the destination in, say, the CBD or Waikiki or UHM. This would minimize riding time for everyone on the bus. The bus should have upholstered seats such as tourist coaches have or long distance buses on the mainland have. I've ridden on inter-state Greyhound buses that have spacious Business Class size reclining seats like those on jet planes, with a pull-down tray-table, individual lights and air jets. The buses have a toilet on board. Riders would be able to read, use a laptop, sleep, and even eat. So even if the bus is stuck in traffic, the rider can use the time productively and in comfort.

Example: Improve Kapolei-Honolulu express buses. To minimize time spent riding and maximize space on them, express buses should stop only for pickups (no dropoffs) in Origin areas. They should allow only dropoffs (no pickups) in Destination areas. This is done elsewhere though not here. The number of Origin and Destination areas served can be determined partly by survey, partly by trial-and-error after establishing initial service. For example, whether it should include Downtown en route to UHM or Downtown and Ala Moana en route to Waikiki would depend on the number of riders to the different areas and availability of buses.

2. More than five minutes late is "Late" for express buses (1.5.3). Express buses are on average more than five minutes late 30% of the time. (p1-19) This definition of "late" is unduly strict and doesn't make sense to me. When I drive or ride the bus, I consider a 5-10 minute leeway normal, not late. Only in Switzerland or Japan with their famed punctuality would this be a reasonable definition; not in the US or elsewhere in Europe. Fifteen minutes would be "late" for the bus or when I drive.

3. TheBus serves urban residents well. Ninety-five percent of the urban population lives within one-quarter mile of a bus stop. The urban population is well served by the present bus system.

This DEIS contradicts itself when it states (p.2-9, col. 2) , "Transit service levels... would remain about the same as they are today." And then it says (p. 2-24), Some bus routes including peak period express buses would be altered or eliminated. Certain local routes would be re-routed or reclassified as feeder buses.

This is not possible if feeder buses must be diverted to transit stations to meet trains every three to six minutes and the fleet would be about the same whether the rail is built or not.

4. Apply traffic signal priority for buses now Traffic signal priority would be given to buses during the morning peak period when the rail is built. This can be done without rail to improve the express buses' times. Trial-and-error can be used to determine the intersections with bus traffic signal priority very inexpensively compared to building and operating rail.

5. Transfers to/from rail discourage "Choice Riders." The rail stations will not be within easy walking distance of most potential riders' homes. People will find, as I did, that transfers from bus to rail and vice versa are time-consuming and a deterrent to riding the rail if you have an alternative.

Example: Yokohama. My actual ride on the subway train was about 11 minutes. But I allowed 60 minutes for my trip because there was a 5-minute walk from my apartment to the bus stop; a 5-10 minute

wait for the bus; 10-15 minute bus ride; 5-minute walk from the bus to the subway platform; 1-4 minute wait for the train; 11 minutes on the train; an 8-10 minute walk from the platform to my final destination. On the days when I had no wait times, it would take 40 minutes; on other days when I barely missed the bus and subway, it would take 55-60 minutes. I had no car and no choice but to ride public transit in Yokohama. I do not ride bicycles, so that was not an alternative.

6. Buses can stop close to home and work/school. Express buses can come close to riders' homes and destinations, making transfers unnecessary. What's most important is door-to-door time, not the time on one leg of your commute. If you can settle in for 40 minutes or so on a seat, you can read, text, work on your laptop, or sleep, activities one cannot do comfortably when transferring from one transit mode to another.

7. Elderly and disabled prefer buses. The elderly and disabled generally prefer buses because stops are closer to their homes and destinations, requiring less walking. They feel safer because they know there's a live, alert person always on the bus, its operator. They know that operator will wait for them to get on and get off before moving the bus so they're less likely to fall.

8. Tourists. They generally add little to the am peak period congestion from Leeward and Central O'ahu because most of them stay in Waikiki, and the trips they take by bus or car are usually against traffic.

9. Fallacy: TSM more polluting and energy inefficient than rail. The Alternatives Analysis concluded that TSM would have required more transportation system energy and generated more air and water pollution than the fixed guideway alternative. I believe this statement does not take into account improvements in hybrid and electric vehicles occurring now. By the time the Minimum Operating Segment of the rail is completed in ten years, electric buses powered by non-polluting electricity produced sustainably by sun, wind, ocean wave, or ocean thermal will be available. It will be much cheaper and simpler to incrementally phase in these kinds of low polluting buses than replacing the third rail providing the power for 50-60 steel-on-steel railcars. The technology to replace the third rail and cars or retrofit the cars we've purchased could be 20-50 years in the future, keeping us more oil-dependent far longer than with buses.

B. BICYCLES AS ALTERNATIVE SUPPLEMENTAL TRANSPORTATION

1. Dismissed with little real consideration in public documents/meetings During the public hearings and meetings on the fixed guideway, bicycles were dismissed. This dismissive attitude keeps bicycles from being more widely used as transportation for short and medium distances. The present setup in urban Honolulu certainly discourages all but the most determined and daring from riding a bicycle because they must compete with cars and other much larger motor vehicles whose drivers often give the defenseless rider no respect. Yet in Europe they are widely used by all ages and for trips that an American would hop in the car to do.

Example: Copenhagen. In the 1970s I was at first puzzled at the double sidewalks in the area I spent as a tourist. When I saw bicycle riders on the lower sidewalk closer to the street and pedestrians on the higher sidewalk farther away from the street, I realized what they were. I recall being amazed at sights I never saw in the US: an elderly, plump, white-haired woman dressed in nice clothing and wearing a small hat and dressy shoes, was riding a bike on a Sunday morning near the centrum, the town square, apparently on her way to or from church. Then I saw a young couple ride past, the man with two small children on his bike, the woman with what looked like picnic things on her bike, apparently heading for a picnic. Wow, I thought, when riding a bicycle is made safe enough, a lot more people will do so. I hardly expect us here to do what the Danes do, but with Hawaii's mild year-round climate, we could easily

encourage more bicycle commuting and traveling

2. Year-round climate for bicycles. With our vaunted perfect weather for bicycles and the relative short distances we can travel on a small island, bicycles are a perfect vehicle for many college students who cannot afford a car, who are young and fit, and who live short distances from campus. This would allow campus parking lots to be smaller and create less air pollution on campus. Many urban residents who live and work/attend school in town would ride a bike to work/school if it were safe to do so. This could reduce local traffic, making bottlenecks near and in town clear more quickly, helping Leeward and Central commuters.

3. Bikes on TheBus, Pearl Harbor bike path. The City must be given credit for allowing two or three bikes on the front of TheBus. There is a bike/pedestrian path from Pearl Harbor to Pearl City which is completely separated from auto traffic. There should be more like it, connecting Leeward O'ahu to urban Honolulu to give an option to those most in need of relief from congestion. This would allow the fit and would-be fit to use this mode.

4. City bicycle budget miniscule. If the City were to spend three percent of its roadway budget on bike paths/bikeways/bike facilities, it would be infusing a huge increase in funds. Improved riding for bike commuters would make us less dependent on oil, reduce the size of parking lots needed by businesses and government, and improve the bike riders' weight and health. But the City has placed a much higher priority on roadways and street parking for motorists, spending a pittance on encouraging transportation by bicycling. It is very reluctant to reduce street parking for safer bike lanes. The City has generally treated bike riding as a recreational pastime. For example, around the Waikiki Zoo there is a paved path for bikes alongside the pedestrian path that does not share the road with autos. It's where I sometimes see children and parents riding on their bikes

5. Bicycles environmentally friendly. Bicycles represent a tremendous potential for quickly reducing importing our transportation fuel should there be an oil embargo or gasoline goes up to \$5-\$8 a gallon. Little unfamiliar or expensive infrastructure needs to be built. Land does not need to be taken from food production. There are no unsightly land-hogging windmills to be erected. No expensive underground cables need be built.

Together with an improved bus system and more shade trees to encouraging walking short distances, bicycles are part of an affordable, more sustainable, more energy independent future for O'ahu's commuters and residents.

PROBLEMS WITH RAIL

A. RAIL FUNDING PROBLEMS

1. By law, dedicated local funding cannot be used for buses or highways. State law does not allow the funds from the one-half percent GET surcharge to be used for other than a fixed guideway system (2-5). The Draft EIS does admit that, "Variables like tourism spending and retail sales could materially impact the net GET surcharge revenues available to fund the Project." (p. 6-11)

a. The **serious recession** the state, country and world are in is causing leading state legislators and the Governor to reconsider the fund's use or to suspend collecting it until the economy improves. Senate President Colleen Hanabusa and Governor Linda Lingle are both now considering using it for other state needs because of serious budget shortfalls

If this dedicated funding source is the "only source of funding until FY2012," what will happen if the State decides next year to either suspend its collection or allow it to be used for other more immediate needs?

b. The City's other main sources of revenue are property taxes and its share of a state Transient Accommodation Tax (tourist tax). But property values on O'ahu have plummeted in the past year, and tourism is in a deep and worsening slump. Economists are predicting tough times for the next few years

2. **City Council's weakening position on rail.** The large majority of seven favoring a fixed guideway in the early stages dropped to a bare majority of five when UHM was left out of the MOS. One of that five no longer favors the rail after last month's vote to select the Airport route instead of a Salt Lake or Salt Lake/Airport route.

B. RAIL ROUTE PROBLEMS

1. **Failure to include UHManoa in the MOS will cause minimal reduction in congestion and large reduction in potential ridership** Without including UHM in the Minimum Operating Segment, there will be no significant impact on peak am congestion. Letters to the editor of both dailies have confirmed what my relatives, friends, and acquaintances have said: how little traffic congestion there is when UHM is not in session. Even with UHM/Chaminade I have doubts that our island population is large enough to support a rail system. All the successful rail systems that I'm familiar with serve populations of at least two million, usually more. Without UHM it will become a white elephant because farebox revenues will be far too low to cover the 27-33% users' share of operating costs required. Raising fares will cause a drop in ridership and revenues. Naturally it will cost much more to operate and maintain a rail and bus system than a bus system alone.

2. **Leeward Community College station.** Is there a station at Leeward Community College? If not, what is the reason? Because community colleges have much lower tuition than UHM, Chaminade, or HPU, many cost-conscious students elect to attend a community college for the first two years before transferring elsewhere. They should be easily accessible by public transit so people without cars can attend. During the public information sessions I did not study the station locations in the areas I was not familiar with; I assumed, perhaps incorrectly, that LCC would be served. (p 2-26)

C. RESTROOMS AT STATIONS

Where are they shown or described in the DEIS? There MUST be restrooms in every station. I saw no mention in the verbal descriptions nor could I find any in the figures I looked at. If there are restrooms in every station that should have been made much clearer in this DEIS. If not every station is to have a restroom, that should be made absolutely clear in a Supplemental EIS.

Young Children need them. Any mother with a young child knows that when they say they need to go, you'd better find a restroom quickly in the station or they'll relieve themselves on the platform or against a wall in the station. When this happens on the bus, you get off at the next stop and find a bush or the gutter if no suitable place can be found in time. Odors are more quickly dissipated at a bus stop than in a train station.

Elderly. The elderly often need to relieve themselves much more frequently than younger people. Elderly men, who often have prostate conditions and cannot hold it, will do so on the platform or elsewhere in the station against a wall if there is no restroom at the station. This will create a smelly, unpleasant atmosphere for others. Maintenance costs will be much higher than if restrooms were provided to begin with.

D. RAIL REVENUE PROBLEM : FARES SEVERELY UNDERESTIMATED, REVENUES OVERESTIMATED

1. Fares severely underestimated. Rail fares have been severely underestimated. In public meetings the mayor has repeatedly said it would be the same as it is now, \$2.00 a ride. This is obviously not possible, even adjusting for inflation, when there are huge capital costs to construct the project. And of necessity operating and maintenance costs will be higher for a rail plus bus system than a bus system alone, again even adjusting for inflation. The DEIS admits that "...riders' price sensitivity could decrease ridership..."

Example: Vancouver (Canada) fares 2-4 times TheBus's. [Note: Fares are from its website in 2008. It's unclear if dollars are US or Canadian.]

Look at Vancouver, which has a steel-on-steel automated rail system plus a bus system. While the monthly adult pass on O'ahu costs \$40 and covers the whole island 24/7, in Vancouver it's \$73, \$99, and \$136 for one-, two-, or three-zones. If Honolulu used Vancouver's zone system, one zone might be urban Honolulu (from Salt Lake to Hawai'i Kai); two zones might include Ewa, Kapolei, Waipahu, Pearl City, Kailua, Kane'ohe, and Waimanalo; three zones would include the entire island. How would fares like Vancouver's impact the limited and moderate income, even the middle income working adult?

If O'ahu adults had to pay the equivalent of Vancouver's fares to commute to work, most of the Choice Riders would switch to their car because it would be cheaper, adding to congestion. Some of the Transit-Dependent riders of limited and even moderate incomes might become homeless due to the high cost of getting to work.

For **children** it's \$20 for the monthly pass. In Vancouver it's twice as much, \$42/month, the same as for seniors there. If children's fares are not reasonably priced, parents may then begin driving them, adding to congestion and defeating a major purpose of rail transit.

For **seniors**, it's a superbargain \$30/YEAR, or \$2.50/month pro-rated. Seniors may use this pass 24/7. In Vancouver, it's \$42/MONTH, more than it costs for one year on O'ahu.

Individual senior fares are \$1.00 with a Medicare card; in Vancouver a 10-ride card costs \$16.00, or \$1.60/ride.

2. Seniors' quality of life lowered with higher bus fare/pass. Their superbargain fares will be gone. The necessary higher fares due to additional costs of building the rail, operating and maintaining it in addition to the bus system will impact especially limited income households and the transit-dependent with no household car. Most of these are in urban Honolulu and are better served by the bus system. Seniors all over who use the bus will be impacted by a necessarily higher fare. Many will choose to not purchase a much more expensive pass, thereby decreasing their mobility and quality of life. Few seniors are aware how much higher their fares would be with rail.

3. "Choice Riders" will choose auto. When the rail is completed in ten years the necessary high cost rail transit passes/fares will deter transit-optional riders, whose loss will lower expected farebox revenues and whose shifting to auto will add to congestion during peak period traffic..

Choice Riders, those who ride the bus but have access to a car, are 29-35% of bus riders according to the Bus Survey. High fares, loss of direct bus routes between home and work in urban Honolulu, and

inconvenient transfers due to diverting buses in urban Honolulu to feeder lines to the rail stations will result in loss of some of these transit riders, reducing revenue.

4. Inadequate parking at stations will reduce ridership. The lots to be built at East Kapolei and several of the suburban stations allow for only one-third of the estimated morning peak period commuters to park. An optimistic estimate would be one-third will walk, ride a feeder bus, ride a bicycle, or be dropped off. What will the other one-third do? They will drive to work/school, adding to road congestion and decreasing operating revenues.

5. Unrealistic headway frequencies produce overly high rider capacity estimates. When I was a commuter in Yokohama, with a population at least three to four times Honolulu's, the rush hour headway was more like four minutes. Thus, the peak hour load trains here would carry is overestimated because there will be 12-13 trains per hour instead of 17-18 per hour in one direction. In New York City outside of Manhattan, headways during rush hours were at least five minutes.

(The six-minute and ten-minute headways at off-peak and night times are also unrealistic. In Yokohama they ran about six to ten minutes off-peak on weekdays and about 12-15 minutes on weekends. In New York City where I was a commuter many years ago and still use the subway on more recent visits, the night and weekend trains often run every 20 minutes, depending on which train you're taking. Running them less frequently should reduce operating costs a little and is not likely to have much effect on the weekend and late night ridership)

E. RAIL OPERATION PROBLEMS: SAFETY, SECURITY

1. Station parking lots at night are unsafe for women, elderly. Walking to one's car at night after working late could be unsafe for women and the elderly because they would be good places for would-be robbers/rapists to lie in wait for vulnerable victims.

2. Automatic driverless trains should not be considered.

a. Without an operator/driver like Vancouver, women and elderly will be easy prey at night

b. They encourage crime. At night empty cars will attract graffiti, vandalism, and worse crimes. This will lower ridership.

c. They can be hazardous for the disabled and elderly. Many years ago I witnessed an elderly friend's leg get caught in the subway door as she exited. She could not extricate it. Fortunately, the employee in the cab whose job it was to make sure everything was clear saw her predicament and quickly opened the door, allowing her to pull out her leg. Had he not done so, she would have been dragged along the platform floor as the train left the station.

d. They invite the homeless. They would be a dry, comfortable place to sit/lie down at night and cool and airconditioned during hot days for the homeless. If homeless people begin spending much time in the stations and on trains, urine odors could become a problem, particularly if there are no restrooms in the stations. This will discourage Choice Riders who will drive, adding to congestion.

QUESTIONS/SUGGESTIONS

I found some sections of the DEIS puzzling and would appreciate an explanation or rationale for that

particular statement, table, or figure. I am not an engineer, architect, or transit technician. I am simply a citizen who rides public transit as well as drives a car. I have some experience with public transit as a user, having been a commuter on the New York subway and Yokohama transit systems. As a traveler, I've used public transit more than the typical American tourist. I've found buses and subways are an interesting way to see the locals; they're reasonably priced and the light/heavy rail is usually fast and efficient. I have ridden on commuter and urban rail systems, light rail (usually trolleys), buses, and ferries.

1. In what situations does the Transportation Research Board define "late" as more than five minutes late for an express bus? If it does, I find it contrary to most people's thinking
- 2.a. Peak-Period Transit Work Trips (1.3.2). Why is Waipahu-Waikole lumped together with urban Honolulu for home-based origins of work trips? It should be separated to show the need for the train being built to serve their commute to urban Honolulu. (p.1-13)
- 2.b. Similarly, why are Waipahu-Waikole bus commuters lumped with others--all in urban Honolulu, where congestion is not a major problem--to account for 50% of islandwide am peak-period home-based work trips? Waipahu-Waikole needs to be separated to help support the need for the train.
3. The 60% of all am peak period bus trips destined for work in Downtown, Punchbowl, Sheridan-Date, and Waikiki do not show if the origins are primarily in urban Honolulu or Leeward or Central O'ahu. They should be broken down by Origin areas so that the percent of trips originating in Waipahu, Waikole, Kapolei AND ending in Downtown, UHM/Makiki, Ala Moana, Waikiki, and other parts of urban Honolulu can be clearly seen. Similarly, the raw numbers and percent of trips originating from the Waianae Coast in the am peak period should be connected to their destinations in urban Honolulu and shown in a table. (p.1-13)
4. Figure 2-38 Kapolei Bus Service. Bus route numbers and routes should be more clearly delineated. In my travels I've used bus maps that do this.
5. Figure 2-39 Central Oahu Bus Service. The map should have bus route numbers and routes clearly delineated. What are the Bus route numbers? (p2-35)
6. Bus System (p. 2-36). What are these "special shuttles" and whom will they serve? (p2-38 col 2)
7. The Bus Level-of-Service should be displayed like the green boxes on p.3-3.
- 8.a. Fig. 1-11. Why were Routes 52 (Wahiawa-Circle Island) and 55 (Kane'ohe-Circle Island) selected? They're both going against traffic, one to the North Shore, the other to the Windward side. They're also primarily sightseeing buses aimed at tourists going to Turtle Bay Hotel and to the Windward coast.
8. b. According to Figure 1-11, Bus 52 took about 130 minutes in 2007 to go from some place to someplace else. The 12/7/08 timetable says it's 93 minutes from Ala Moana Center to Haleiwa Beach Park in the morning rush hour. What are the starting and ending points for the 130 minutes? How was this time obtained?
- 8.c. Moreover, Figure 1-11 also shows Route 40 (Honolulu-Makaha) takes about 170 minutes in 2008, about 150 minutes from 2004-2007. But the 12/7/08 Route 40 timetable shows the 6:11 am originating from Makaha Towers arrives at Ala Moana Center at 8:37 am, 146 minutes later. The 6:41 am from Makaha Beach arrives at Ala Moana Center at 9:01 am, 140 minutes later. How do you account for this discrepancy?
8. d. Of course, all of these times are unacceptable. The Bus should look immediately into providing a

Super Express from the Wai'anāe Coast that skips all stops from Kapolei until Middle Street to reduce the time any rider from that area has to spend on the bus. The Bus should also immediately begin exploring more comfortable coach-type buses for those who must spend over one hour on the bus. Other express buses originating from Kapolei should be provided.

9. Pedestrian and Bicycle Systems (1.4.4). "...there are 98 miles of existing bicycle facilities on O'ahu."

What is included in "facilities"?

10. TRAIN SPEED. I do not understand why a speed of 55 mph is necessary when stations are going to be a mile apart. Isn't it more horsepower (?) than necessary for an urban train stopping so often? The NYC subway averaged about 30 mph yet was faster, cheaper, and more convenient than driving. Many upper middle income people commuted on the subway because parking was so costly if even available, and driving was slow and nerve wracking. Only the express trains were able to go much above 30 mph on a limited stretch, and express lines require a third track, which has never been proposed for O'ahu. The Yokohama subway averaged about that or less but was the most convenient and cost-effective way for most middle-income commuters to get to work or school because of high parking costs.

Isn't requiring a train capable of 55 mph akin to having a car capable of 100 mph when the highest legal speed on a freeway is 60 mph?

11. AIRPORT AREA EMPLOYMENT STATISTICS. What are the employment statistics for the Airport area, including and excluding airport employees, most of whom do not need to travel during peak hours? (Fig. 1-6 lumps Airport with Pearl Harbor for an impressive 38.5k. But at a public meeting a City employee/consultant said there were about 900 airport employees.)

12. FARE INSPECTORS ON TRAINS. Are turnstiles not being included in every station? Usually there are turnstiles where one inserts a card or token, obviating the need for an inspector to randomly check for payment. They could be useful at night to discourage freeloaders who sneak in, but wouldn't it be more cost effective to have them in the stations to catch people sneaking in without paying? Also if there are turnstiles, would the freeloaders caught or deterred offset the cost of having an employee to catch them?

What is the rationale, where has this been tried successfully, and for how long has it been done?

I recall it being done on light rail/trolleys in Germany, but these were **surface trolleys** where passengers could board from center or rear doors directly from the sidewalk trolley stop like one boards a bus. It was also done on long distance trains where stops were perhaps five miles apart, giving the conductor time to check an entire car between stops.

In my travels I cannot recall fare inspectors on city subway/trains randomly checking for valid tickets, passes, or transfers in New York City, Washington DC, Boston, Philadelphia, Portland, Los Angeles, San Diego, Vancouver, or Toronto in North America; nor in England, Paris, Italy, Austria, Hungary, Czech Republic, Poland, Denmark, or Sweden in Europe; nor in Japan.

13. Table 7-9. Comparison of Transit Travel Times (Minutes) among Alternatives.

Are the times Door to Door?

14. The 12/2005-1/2006 Bus Survey was a good idea. A survey done of households from Leeward and perhaps Central O'ahu could have yielded valuable data for planning transit. It certainly wouldn't be inexpensive; I can imagine it costing \$40-80,000, but that's a small investment compared to the \$10

million spent on consultants early on.

15. Additional bus service with school buses or private vehicles was rejected [Table 2.2]. Why was this not explored? Possible contracts with tourist buses for peak period express use would be much cheaper than rail. It might also help them survive during poor economic periods. It would have allowed testing the different kinds of coaches without purchasing them by the City. Purchase of other more luxurious coaches to attract motorists from their cars thereby reducing congestion during rush hours seems to have not been explored.

16. BUS ADVISORY COMMITTEE. Is there a Bus Advisory Committee comprised of regular bus riders from all over the island to advise TheBus on problems and make suggestions on improvements? Ideas and comments from the public could be presented at its monthly or bimonthly public meetings announced and held at a time convenient for commuters and in a location convenient to bus riders. If there is one, I would like information on where and when it meets. If there isn't one, I recommend it be established soon.

I appreciate your consideration of my comments.

Aloha,
Amy Y. Kimura

Ms. Amy Y. Kimura
1310 Heulu Street
Apartment 1002
Honolulu, Hawaii 96822

Dear Ms. Kimura:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your comments will be addressed in the same manner as submitted.

CHAPTER 1 Purpose and need for rail project

A. Enhanced bus service

Enhanced bus service was examined during the Alternative Analysis phase. As stated in Section 2.2.2 of the Final EIS, the enhanced bus service would have improved transit times somewhat, but roadway congestion would not have been alleviated. As stated in Chapter 3, with the Project, bus service will be enhanced and modified to coordinate with the fixed guideway system. Some existing bus routes will be altered or eliminated to reduce duplication of services provided by the fixed guideway system. Buses removed from service in the study corridor will

be shifted to service in other parts of the island. Certain local routes will be rerouted to provide frequent and reliable connections to the nearest fixed guideway station.

B. Direct future growth

Although the Project does not include any commercial or residential development, it supports the City's goal of directing future development to Kapolei by providing high quality, frequent, and reliable transit service to this area. The City's Department of Planning and Permitting (DPP) has adopted a transit-oriented development ordinance (Ordinance 09-4) that creates a comprehensive planning process for each station area. DTS is working with other City agencies and the Hawaii Department of Transportation to ensure good access to the rail transit stations for pedestrians, bicyclists, and bus riders. Many stations are near existing or future bicycle paths and routes. All stations will be designed to accommodate pedestrians, bicyclists, feeder bus riders, and TheHandi-Van users.

C. Purpose and Need

1. Table 3-14 of the Final EIS shows that in comparison to the No Build Alternative, in 2030 the Project will reduce congestion by 18 percent, as measured by daily vehicle hours of delay. Of all the alternatives evaluated during the Alternatives Analysis phase, only the Fixed Guideway Alternative provided a substantial improvement in transit travel time and had a greatly lower cost per hour of user benefit than the Managed Lane Alternatives evaluated.

2. The Honolulu City Council sets transit fares by enacting ordinances. Chapter 6 of the Final EIS shows that rail service will cost about \$77 million a year (in 2009 dollars) or about 40 percent of the present cost of TheBus (in 2009 dollars). By 2030, the cost of rail will be about 25 percent of the total transit system cost. For operating and maintenance costs, City Council policy requires that between 27 and 33 percent of the costs be recovered from fares. As system-wide transit costs rise, necessitating an increase in fares, the rail element generally will be responsible for a smaller portion of those costs than the TheBus and other elements of the system.

3a. Increasing parking fees would not have any effect on improving corridor mobility. It might slightly reduce demand in the corridor, but only if done in combination with providing a reliable alternative transportation means, such as the Project.

3b. As indicated in Section 1.8.1 of the Final EIS, average weekday travel speeds on the H-1 Freeway are currently less than 20 miles per hour in many places and will degrade even further by 2030. As delays increase, traffic demand will shift from peak to non-peak periods, thereby affecting midday and evening conditions. While most delay occurs during the weekday peak periods, mid-day weekday and all-day weekend traffic conditions are frequently congested. Even a 10-minute increase in travel times, when applied to a large number of travelers, results in a substantial loss of time to congestion.

4. As discussed in response to Comment A, enhanced bus service was studied during the Alternatives Analysis phase. A bus operating in a shared right-of-way, or even

one with lights and cross-traffic, can never provide as reliable service as a system in exclusive right-of-way.

5. High parking rates are a hindrance for low-income populations wishing to drive to their destination Downtown. Parking rates are unaffordable for some low-income populations, thus causing these individuals to find another means of reaching their destination.

D. Alternatives explored

As described in Chapter 2 of the Final EIS, the Alternatives Analysis process evaluated a broad range of alternatives and eliminated those that would have performed poorly, which included the Transportation System Management (TSM) Alternative and the Managed Lane Alternative. Section 2.2 of the Final EIS states that no alternatives have been identified that would satisfy the Purpose and Need at less cost, with greater effectiveness, or less environmental or community impact.

E. Groups served by transit

1. The future transit system will have the same fare structure for all modes. As noted in Chapter 2 of the Final EIS, bus service will be enhanced and the bus network will be modified to coordinate with the fixed guideway system. Section 2.3.9 of the Transportation Technical Report (RTD 2008a) details the guiding principles that were used when restructuring the bus network. These principles include the following:

- Local routes will be either discontinued or reclassified as a feeder service if the bus route serves the same general alignment as the fixed guideway. The exceptions are those bus routes deemed essential to provide local bus stop service along the fixed guideway alignment. Selected local routes will operate their full alignment in the late evenings when the fixed guideway is not operating. These routes will provide 24-hour service.*
- Peak-period, peak-direction express bus routes that serve the same alignment as the fixed guideway system will be discontinued only if the estimated passenger travel time is effected by no more than 15 additional minutes.*

The intent of following the guidelines was to make sure the bus and rail technologies work together to provide the best system possible for transit riders. Existing and future bus routes, including frequencies, are presented in Appendix D of the Final EIS.

2. As indicated in Section 4.7.3 of the Final EIS, the rail system will result in increased transit options and improved mobility. The rail system will not eliminate the need for TheBus or TheHandi-Van and transit users can use the best option or combination of options for their lifestyle and specific individual needs. The transit system will be Americans with Disabilities Act (ADA) accessible. Elevators and escalators will be provided at all stations. In addition, platforms will be level with trains for boardings;

therefore, stairs or lifts, as used on buses, will not be required. The system operation plan considers all ADA requirements. Regarding security, all stations, park-and-ride facilities, and vehicles will include security cameras that are monitored at all times of operation, will have audible and visual messaging systems, and an intercom link to the system' operations center. Security personnel will also patrol the system.

3. Connection to UH Manoa will be served by buses integrated with the system. The Draft and Final EISs reflects this operation. Table 3-14 of the Final EIS shows that, when compared to the No Build Alternative, the Project will reduce islandwide congestion by 18 percent in 2030, as measured by daily vehicle hours of delay.

4. Chapter 3 of the Final EIS discusses construction effects on traffic and the steps that will be taken to minimize inconveniences during construction. As discussed in Chapter 3 of the Final EIS, a Maintenance of Traffic (MOT) Plan will identify measures to mitigate temporary construction-related effects on transportation. Construction contractors will develop the MOT Plan, which must be approved by the City and/or the Hawaii Department of Transportation. As stated in Section 3.5.7 of the Final EIS, an extensive public information program will be implemented to provide motorists with a thorough understanding of the location and duration of construction activities, as well as anticipated traffic conditions.

Beyond collection of property taxes that fund City operations, for which the City develops rates on an annual basis and part of which will fund transit services, there is no anticipated impact to property taxes. Operating and maintenance costs will be paid for from the same sources currently used for TheBus, which includes Federal funding, fare revenues, and subsidies from the City's General and Highway Funds. Fixed guideway operating costs will represent between 2 and 3 percent of the City's annual operating budget. The General Excise and Use Tax (GET) surcharge that funds the capital costs of the Project is a dedicated revenue source that the City Council adopted to pay for a priority concern of the community.

5. Tourists will continue to enjoy the beauty of Oahu and, once they are here, they will have more transportation options to travel to their destinations. The fact that this will be the only island with high-capacity transit, with an efficient airport connector, may attract more tourists who value the convenience, potential cost savings, and decreased travel time between various tourist destination spots along the Project's alignment. There is no evidence to suggest that other places have lost tourism as a result of an elevated guideway.

The Project's potential visual effects are discussed in Section 4.8, of the Final EIS. Many new viewsheds were studied for the Final EIS and, in some instances, significant visual effects were found. Overall measures will be taken to address visual impacts of the Project when possible. Please see the mitigation discussion in this section.

6. Figures 3-9 and 3-10 in the Final EIS show that there will be high fixed guideway ridership levels between stations in the Leeward area of the corridor. There

will be over 8,800 riders on the Koko Head-bound train after the Waipahu Transit Center Station during the a.m. peak period. The number of riders increases even more after the Pearl Highlands Station (over 13,000 riders during the a.m. peak period in the Koko Head direction). Ridership levels near Ala Moana Center will also be high, with over 7,000 passengers getting off the fixed guideway at the Ala Moana Center Station.

As a result of transit ridership, traffic volumes will decrease throughout the entire corridor. As shown in Tables 3-9 and 3-10 in the Final EIS, there will be an 11 percent decrease in traffic volumes traveling Koko Head-bound at the Kalauao screenline during the a.m. peak hour and a 10 percent decrease in congestion during the p.m. peak hour at this screenline traveling Ewa bound.

Chapter 2 Alternatives considered

A. No Build (bus system), Transportation Systems Management (TSM)

1. The No Build Alternative shows a 46 percent increase in system-wide congestion as measured by vehicle hours of delay (Table 3-14 in the Final EIS) compared to existing conditions. Therefore, buses would be operating in the same congestion as cars. As seen in Table 2-2 in the Final EIS, vehicle hours of delay are greater with the TSM Alternative than with the Fixed Guideway Alternative. The analysis conducted during the Alternatives Analysis phase showed that the Purpose and Need for the Project could not be met through a lower-cost, bus-based alternative alone.

*2. The Draft and Final EISs compares Honolulu's bus service on-time performance with other transit systems. This information is from the Transit Cooperative Research Program (TCRP) Synthesis of Transit Practice 10. The synthesis reviewed more than 80 agencies' on-time performance standards, as they existed in 1994. Of the 80 U.S. transit agencies surveyed, 58 percent defined on time as being five minutes late or less. On-time performance measurements are particularly applicable to services operating with headways (time between buses) longer than 10 minutes, such as express buses. Canadian transit operator on-time performance standards are less lenient than those of their U.S. counterparts. Of the 17 agencies surveyed by the Canadian Urban Transit Association that define an on-time performance, 11 define "on-time" as being no more than three or four minutes late. The other six agencies define "on time" as being up to five minutes late. (Source: *The Transit Capacity and Quality of Service Manual 2nd Edition*, TCRP Report 100, Transportation Research Board. Research sponsored by the Federal Transit Administration).*

3. The statement on Page 2-9 of the Draft EIS: "However, due to increasing traffic congestion and slower travel times, transit service levels and passenger capacity would remain about the same as they are today" refers to the bus system in the No Build Alternative which does not include a rail component. The statement on page 2-24: "Some existing bus routes, including peak-period express buses, would be altered or eliminated to reduce duplication of services provided by the fixed guideway system" refers to the bus system with the Project.

4. According to Chapter 3 of the Final EIS, traffic signal priority will occur at only a few fixed guideway stations (East Kapolei, Pearl Highlands, and Ala Moana Center) as part of the Project. Implementing traffic signal priority now would require modification of signal timings and intersections to provide bus-only lanes. Currently, there is no separate funding source that can be applied to traffic signal priority.

5. As stated in Section 3.4.2 of the Final EIS, "Because of the high frequency of the fixed guideway service (three-minute headways between trains during peak periods), riders transferring from buses to the fixed guideway will experience minimal wait times. Riders transferring from the guideway service to buses will benefit from improved frequencies on existing bus routes serving stations. In addition, several new routes with high frequencies will be provided as feeders to the guideway system. Since these routes will primarily operate in residential areas, they will provide greater reliability versus routes operating along congested arterials. Riders transferring from rail to bus will also benefit from coordinated transfers between trains and buses, thereby minimizing wait times."

6. Under current conditions, travel times via bus can vary considerably due to traffic congestion and unpredictability. Longer-distance buses (such as Route C), express routes, and other local routes traveling to and from Downtown are predicted to take longer in the future due to worsening traffic conditions. Future travel times with rail will be highly reliable. The rail system will operate in its own right-of-way every three minutes during peak periods and every six minutes during mid-day.

7. There is no evidence that the elderly or disabled will not use the fixed guideway system. As discussed previously in response to Comment E2, Section 4.7.3 of the Final EIS indicates that the rail system will result in increased transit options and improved mobility. The rail system will not eliminate the need for TheBus or TheHandi-Van, and transit users can use the best option or combination of options for their lifestyle and specific individual needs.

8. With the Project, visitors and residents will benefit by having more transportation options. Table 3-13 in the Final EIS shows daily person transit trips by purpose, broken down for residents and visitors. As seen in this table, transit trips for both groups increase with the addition of the Project compared to the No Build Alternative. Daily resident person trips by transit increase 24 percent with the Project compared to without, while daily visitor person trips by transit increase 19 percent with the Project compared to without the Project in 2030.

9. Technology related to transportation continues to evolve. Improvements to all modes, including transit and single-occupant vehicles, will make those modes safer and more efficient. The changes speculated on by the commenter may make the internal combustion engine used in automobiles today obsolete; however, they would enhance the attractiveness of an electrically powered rail system, which already consumes less energy per passenger-mile carried than automobiles, as is illustrated by the reduced energy demand shown in Section 4.11 of the Final EIS.

B. Bicycles as alternative supplemental transportation

1.-5. The scope of the Project focuses on development of a fixed guideway transit system and not on programs involving the bicycle system. However, the Project will encourage use of bicycles as a way to access stations. As noted in Chapter 2 of the Final EIS, facilities in the form of bike racks and/or lockers will be provided at each guideway station. It is also envisioned that bicycles will be allowed on trains, as regulated by a bicycle policy.

Many bicycle lanes planned by the City or State could connect to fixed guideway stations. The Oahu Bike Plan is currently being updated by DTS and is scheduled to be adopted in 2010. The Draft Master Plan includes a prioritized list of bicycle projects developed using criteria that include access to transit. Several projects that would connect existing or future bicycle facilities to rail transit stations are included in the Draft Master Plan. Additional information on the Oahu Bike Plan is available at <http://www.oahubikeplan.org>.

RAIL

A. Rail funding

The comment is not related to the project alternatives or effects. Regarding revenue from the GET surcharge, the financial plan is updated periodically in recognition of changing conditions. Revenues and costs are expected to rise and fall during the time the surcharge is in effect. Section 6.6 of the Final EIS includes a discussion of risks and uncertainties associated with the funding assumptions.

B. Rail route

1. The fixed guideway system extends from East Kapolei to Ala Moana Center and points in-between. The Project has logical termini and independent utility from any extensions that may be constructed in the future. The future extensions to East Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS. The future extensions are not part of the Project; thus, they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation at some time in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time. Connection to UH Manoa and Waikiki will be served by buses integrated with the system. The Draft and Final EISs reflect this operation. According to Table 3-18 in the Final EIS, 282,500 trips will be made on transit (bus and rail) daily in 2030. Table 3-14 in the Final EIS provides the information that in comparison to the No Build Alternative, in 2030 the

Project would result in an 18 percent reduction in congestion, as measured by daily vehicle hours of delay.

Regarding population, the corridor from Kapolei to UH Manoa (i.e., the study corridor) is well suited for the fixed guideway project. In 2000, 63 percent of Oahu's population of 876,200 and 80 percent of its 501,100 jobs were located within the study corridor. By 2030, these distributions will increase to 69 percent of the population and 83 percent of the employment as development continues to be concentrated into the Primary Urban Corridor and Ewa Development Plan areas. As stated in Section 1.3.1 of the Final EIS, 2,036,000, or 73 percent, of the approximately 2,790,000 islandwide daily trips, and 350,000, or 64 percent, of the 544,000 a.m. peak-period work-related trips are currently generated within the study corridor. The study corridor attracts an even higher percentage of islandwide work-related trips with 446,000, or 82 percent, of a.m. peak-period work-related trips having destinations within the study corridor.

Regarding farebox revenue, the amount of service provided will be scaled to generally match the demand. If the service attracts fewer riders than expected, then less service may be provided by adjusting headways or train length, thereby resulting in lower than expected operating and maintenance costs.

2. As shown throughout the Draft and Final EISs, and detailed in Figure 2-22 of the Final EIS, there is a fixed guideway station at Leeward Community College.

C. Restrooms at stations

Each station will have a secured public restroom. Because of maintenance and security concerns, patrons will ask the station attendant for access to the restroom.

D. Rail revenue

1. The fare for the rail and TheBus will be the same; so if the system were operating today, a trip would cost \$2.25. Fares are anticipated to increase with inflation and the cost of automobile ownership; use also is anticipated to increase at or above the rate of general inflation. Capital costs of the Project, including finance charges, are expected to be fully paid for by a combination of FTA Section 5309 New Starts Funds from the Federal government and the GET surcharge revenues collected from 2007 through 2022 on Oahu. Farebox revenue will be used to cover between 27 and 33 percent of annual operating and maintenance costs. The fixed guideway will represent about 25 percent of the total operating and maintenance costs of the overall public transportation system. This information is detailed in Section 6.4 of the Final EIS. The EIS assumes that fares for all transit modes, including the fixed guideway line and TheBus, will be the same with a fare structure similar to today. Zone fares or distance-based fares are not assumed. Fares charged in Vancouver are unrelated to the Honolulu system.

2. Current users of the TheBus with its fare structure for seniors and those with limited income populations will be able to transfer onto or directly access the fixed

guideway system with their current TheBus passes or one-way fare. Since the fare structure is assumed to be the same and that transit-dependent households will experience a substantial time benefit (as shown in Figure 3-7 of the Final EIS), the combination of a consistent fare structure across modes coupled with a decrease in travel time is anticipated to attract motorists out of their cars. Fares are anticipated to increase with inflation and the cost of automobile ownership; use also is anticipated to increase at or above the rate of general inflation. Fixed guideway operating costs will represent between 2 and 3 percent of the City's annual operating budget.

3. As stated in response to Comment D2, the unified fare system coupled with decreased travel times with rail (as shown in Figure 3-7 of the Final EIS) is anticipated to attract motorists out of their cars. There will also be coordinated transfers between the fixed guideway system and the bus, which will minimize wait times. Forecasts indicate that riders who are predicted to use the train are those who will find it is more beneficial than another transportation alternative. Some fixed guideway riders are those who currently use TheBus, but many will be from other modes. Forecasts indicate that approximately 40,000 vehicles will be removed from roadways as a result of the Project. Most guideway systems are attractive to automobile users because of the time benefit and the lower stress levels during the ride.

4. As shown in Table 3-22 of the Final EIS, according to the travel demand forecasting model, the estimated demand for parking in 2030 totals about 1,800 cars at the East Kapolei and UH West Oahu Stations. The total capacity will be 1,900, which should satisfy the demand in this area. The overall system-wide demand for parking in 2030, as estimated by the model, is about 5,900 parking spaces, exceeding the 4,100 currently planned. However, experience with park-and-ride facilities in Honolulu to date is limited. Existing park-and-ride facilities (offering express bus service) have been generally underused. The projected mode of access shares were compared to observed data from several Mainland areas, notably San Diego. Given the history of park-and-ride use on the island, it seems prudent to evaluate any need for additional or larger facilities on the basis of empirical experience rather than commit substantial additional funding now. Any need for additional parking at the four stations with park-and-ride facilities would best be determined once experience is gained about their use. Other station access, such as feeder bus and passenger drop-off, can also be expanded offering another option to passengers. In addition, as shown in Table 3-20 in the Final EIS, 90 percent of fixed guideway riders will access the system via walking, biking, or bus. Roadway congestion will decrease by 18 percent with the Project compared to the No Build Alternative.

5. The following systems operate with 3 minute or less headways during peak periods: WMATA Red and Orange lines (3 minutes), Toronto Bloor-Danforth and Yonge-University-Spadina lines (2.4 minutes), BART through Transbay Tube and San Francisco (2.6 minutes), Vancouver SkyTrain Expo Line (2 minutes), Copenhagen Metro (2 minutes), Lille Line 1 and 2 (1.5 minutes), and Toulouse Line (1.3 minutes). Many systems that operate trains with less frequent headways use longer trains. The Honolulu system relies on frequency rather than train length. The use of 3-minute headways obviates the need to offer longer trains. This also allows for the construction of smaller

stations and reduced waiting time. However, the amount of service provided will be scaled to generally match the demand. If the service attracts fewer riders than expected, then less service may be provided by adjusting headways or train length, thereby resulting in lower than expected operating and maintenance costs.

E. Rail operation: Safety, security

1. DTS, with assistance from the Honolulu Police Department, is developing a security plan for transit facilities, including park-and-ride lots. Security, including cameras, will be provided at all stations and park-and-ride facilities.

2. None of these items are associated with automatic train operations. Fully automated vehicles are used in Vancouver, London Docklands, Copenhagen, and other systems. Staff on the train, which as described in Chapter 2 of the Final EIS will be included in the system, are able to react to incidents on the train much more quickly than a driver who must remain in the driving cab. Vehicle door-closing systems are being designed with safety systems to prevent entrapment in the doors.

QUESTIONS/SUGGESTIONS

1. The Transit Cooperative Research Program (TCRP) Synthesis of Transit Practice 10 reviewed more than 80 agencies' on-time performance standards as they existed in 1994. Of the surveyed agencies, 58 percent of the 80 U.S. transit agencies defined on time as being 5 minutes late or less. On-time performance measurements are particularly applicable to services operating with headways longer than 10 minutes (Source: *The Transit Capacity and Quality of Service Manual 2nd Edition*, TCRP Report 100, Transportation Research Board. Research sponsored by the FTA).

2a. This section lists high origin areas for peak-period work trips. Waipahu-Waialeale and urban Honolulu both fall in this category.

2b. Waipahu-Waialeale represents a significant origin for transit trips.

3. Complete production-attraction matrices are available in Addendum 01 to the Travel Demand Forecasting Results Report.

4. and 5. Information about existing and future bus routes, including route numbers and frequency, is provided in Appendix D of the Final EIS. This appendix includes a series of maps showing bus route service near each fixed guideway station.

6. Special shuttles are those operated by private companies, such as the shuttle for Hilo Hatties or the Waikiki Trolley. These shuttles can serve the general population (as in the case of the Waikiki Trolley) or individuals traveling to or from a specific destination, such as a shopping center.

7. *Transit level of service information involves a variety of factors and is not calculated in the same manner as for roads. Chapter 3 of the Final EIS includes information on level-of-service involving transit reliability.*

8a. *TheBus operates 100 bus routes. Of those routes, only 13 operate completely outside the study corridor, which accounts for less than 4 percent of the total weekday bus service in terms of revenue hours of service. The balance of service outside the study area is provided by 35 routes that have a substantial portion of their operation within the study corridor. Consequently, the reliability of service outside the study corridor is directly related to the impacts of traffic congestion and other factors occurring inside the project area. For example, Routes 52 and 55 (Circle Island) take over four hours to complete a bus trip. About one-third of the Circle Island trip is spent within the project area. Any delay occurring in the project corridor effects people waiting for that bus to arrive in Kaneohe, Haleiwa, Wahiawa, Mililani, or neighborhoods in between. In the a.m. peak period, these two routes provide essential inbound (town-bound) service for workers, students, and other trip purposes from the North Shore, Central Oahu, and Windward communities. In the p.m. peak period, they provide outbound (to Central Oahu, North Shore, and Windward) service from Downtown and Ala Moana Center. Both routes are a major connection for residents in the communities they serve.*

8b. *Bus 52 originated from Ala Moana Center and traveled to Turtle Bay Resort. This time was obtained from the March 2, 2008 public timetables and represents travel time during the p.m. peak period in the peak direction.*

8c. *Figure 1-11 in the Final EIS shows selected PM trips in the peak direction (Ala Moana Center and Downtown to outlying areas Makaha, Ewa Beach, Central, North Shore, and Windward communities). The March 2, 2008 public timetables show that Route 40 leaving from Ala Moana Center at 3:03 p.m. to Makaha takes 169 minutes. The 2:37 p.m. departure takes 167 minutes.*

8d. *Enhancements and modifications to the bus system will occur to coordinate service with the fixed guideway system. Other modifications to the existing bus service are outside the scope of this Project; however, this Project does not preclude such modifications from occurring.*

9. *As shown in Section 3.3.5 of the Final EIS, bicycle facilities on Oahu include Shared Roadways (30.1 miles), Bike Lanes (33.6 miles), and Shared-use Paths (34.3 miles). Further descriptions of these facilities are provided in Section 3.3.5 of the Final EIS.*

10. *The system will average approximately 30 miles per hour, including stops at stations. A 55 mile per hour maximum speed between stations is typical of modern steel-wheel systems. The train will reach 50 miles per hour at several locations in the system.*

11. *Approximately 9,000 people are employed at the airport and supporting facilities, as compared to approximately 17,000 at the combined Pearl Harbor and*

Hickam. Including other employment in the airport and Pearl Harbor area, total employment is approximately 38,500 jobs, as shown in Figure 1-6 of the Final EIS.

12. As described in Chapter 2, the system will be run as a proof of payment system without fare gates. The use of fare gates would require additional staff at stations. Inspectors will cite and fine passengers without tickets. This system is widely used, including for example Vancouver, B.C., and Los Angeles.

13. Yes, transit travel times in Table 7-2 in the Final EIS are door to door. They represent the length of time it will take an individual to walk from their origin to a transit station, wait for a transit vehicle, travel by transit, and walk to the final destination.

14. The information from the on-board rider survey provided important information on existing ridership characteristics. This information was used in travel forecasting efforts carried out for the EIS.

15. The concept of providing additional bus service with school buses or private vehicles was rejected only because it was not substantially different from the TSM Alternative that was separately evaluated in detail and rejected. Both alternatives were essentially the same service, but being provided either by a different party or with a different type of bus.

16. There is currently a Bus Advisory Committee that deals with issues regarding TheBus only. Information on this committee and how to join should be obtained through TheBus. The City is considering the possibility of some form of citizen rail advisory group, but no determination on the mechanics of establishing or organizing such a committee has been made at this time.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Re: Rail

1. I am against the rail - Too Expensive!
2. If it is done, it makes more sense to do the Pearl City - Downtown road bike. It is the major traffic corridor with probably the largest under ships.

I also makes the land more easily acquirable and least subject to speculation before acquisition.

Honolulu, Hawaii 96821

Dear Mr. Kishimori:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your objection to the Project has been noted. Section 6.3 of the Final EIS describes the funding sources anticipated to be used to pay for the capital costs of the Project and the City's overall public transportation system. Capital costs of the Project, including finance charges, are expected to be fully paid for by a combination of FTA Section 5309 New Starts Funds and FTA Section 5307 Funds from the Federal government and revenues from the County General Excise and Use Tax (GET) surcharge levied from 2007 through 2022. Section 6.4 of the Final EIS describes the funding sources to pay for ongoing operating and maintenance costs associated with maintaining the resulting transit system in a state of good repair. Operating and maintenance costs will be paid for from the same sources currently used for TheBus: Federal funding, fare revenues, and subsidies from the City's General and Highway Funds. Fixed guideway operation costs will represent between 2 and 3 percent of the City's annual operating budget.

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility.

Mr. Phillip T. Kishimori
Page 2

Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- *Reduce the time that each area will experience traffic and community disturbances.*
- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*
- *Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- *Balance expenditure of funds to minimize borrowing.*

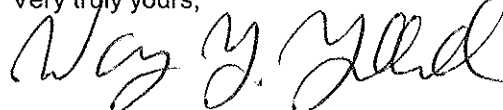

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

The Project is focused exclusively on the construction and implementation of rail transit service, and that is covered in the Draft and Final EISs. However, as discussed in Section 4.19.2 of the Final EIS, transit-oriented development (TOD) is expected to occur in project station areas as an indirect effect of the Project. The increased mobility and accessibility from the Project could increase the desirability and value of land near stations, thereby attracting new real estate investment nearby (in the form of TOD). Planning and zoning around station areas will be conducted by the City's Department of Planning and Permitting under a process covered by the City's new TOD ordinance.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Dear Mr. Kljajic:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

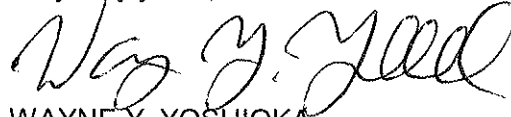

As stated in Section 2.2.3 of this Final EIS, the NEPA Notice of Intent requested input on five transit technologies. A technical review process included the opportunity for public comment and was used in parallel with the alternatives analysis to select a transit technology. The process included a broad request for information that was publicized to the transit industry. Transit vehicle manufacturers submitted 12 responses covering all of the technologies listed in the Notice of Intent. An independent five-member technology panel composed of four transit experts and a transportation academic appointed by the City Council evaluated guided rubber-tire-on-concrete systems (e.g., Phileas bus system and VAL-type systems), monorail (which is a variation on rubber-tyred technology), steel-wheel-on-steel-rail systems, (e.g., light rail and rapid rail), and magnetic levitation (MAGLEV). The panel considered the performance, cost, and reliability of the proposed technologies.

Mr. Dragan Kljajic
Page 2

Proprietary technologies, meaning those technologies that would have required all future purchases of vehicles or equipment to be from a single manufacturer, were eliminated because none of the proprietary technologies offered substantial proven performance, cost, and reliability benefits compared to steel wheel operating on steel rail. The panel accepted public comment twice as part of its review. By a four-to-one vote, the panel chose a steel wheel vehicle operating on steel rail system because it was considered safe, reliable, economical, and non-proprietary. Those results are documented in the panel's report to the City Council dated February 22, 2008 entitled "Independent Technology Selection Panel Report".

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is fluid and cursive, with the first name "Wayne" and last name "Yoshioka" clearly distinguishable.

Enclosure

2/6/09.

1.

- Where are the "five distinct transit technologies" under review in the 2008 DEIS?
The Federal Register/Vol. 72, No. 50 of March 15, 2007 shows a "Notice of Intent To Prepare the Draft EIS".
The Federal Register clearly states that: "Fixed Guideway Alternatives, which would include the construction and operation of a fixed guideway transit system in the corridor between Kapolei and UHManoa with a branch to Waikiki. The Draft EIS would consider five distinct transit technologies: Light rail, rapid rail transit, rubber-tire guided vehicles, a magnetic levitation system, and a monorail system."
- Will the Mayor and City Council of Honolulu open up the transit process to ALL technology manufacturing companies who submit thru the RFI/RFP process? As they say: "May the best man win".
- Where are the cost numbers in the 2008 DEIS for the "UHManoa with a branch to Waikiki" extensions?
- When will the current Design-Build Contract RFP-DTS-0900015 on the Department of Budget and Fiscal Services Division of Purchasing website document be available to be viewed by the general public on Oahu? -Will it be displayed on the transit site for public review the way the 2006 AA & 2008 DEIS documents are?
- What state procurement laws or codes are being violated if the original approved ordinance was authorizing the city council to review qualifications & system requirements for potential bidders prior to the administration seeking and soliciting the RFP?
"Building rail transit NOW is the most "cost-effective way" to avoid even more congestion".
- Who on earth thinks that spending \$5.767 Billion to \$7.173 Billion dollars for only a short 20 mile rail system is "the most affordable, cost-effective" solution for Oahu?
- Will this equal \$288 million per rail mile, up to \$358 million per rail mile for just the 20 mile section build?
- Where is the true per-capita spending breakdown in the DEIS for this multi-billion dollar transit project?
- Where is the Rail Transportation Spending per capita by state? -Where does Hawaii rank?
- On 2/2/09, Minnesota Congressman Jim Oberstar claimed that the CEI, or 'cost effectiveness Index' federal requirement is widely viewed as a hindrance to transit projects and it will be modified, and not just to be amended, but eliminated. Is this true?
"As soon as there is a Federal Transit Administrator I will encourage that person to, by executive order, erase it from the books. And if they don't we'll do that in legislation." says Rep. Jim Oberstar.
Today's 2/6/09 Star-Bulletin staff story reports that the RFP for the first 6.5 mile transit segment will have transit stations built and constructed later in another contract.
- How can the Mayor's aggressive first segment completion target date of 2012 be useful for local residents without the transit stations completed?
- Who will ride a system that is built in the empty fields of Kapolei with zero surrounding ridership?
- How will the current flawed transit route serve residents in high population areas that were skipped?
- Why was the first 20 mile route not placed in the high population areas of Ewa Beach/Ft Weaver rd., Salt Lake, & thru Waikiki up to UH Manoa?
"By year 2030, up to 90,000 riders per day are 'expected' to use rail".
- How can Oahu transit ridership at just 6% today islandwide, only go up 1% with the building of "rail transit", to a 7% ridership total in year 2030 as the DEIS states? (Table 3-13, page 3-23)
- Will transit ridership only increase 1% by year 2030 after spending multi-billions on "rail"?
- Now that America is going bankrupt and the economy is in the toilet, how can Oahu residents afford the added new tax burdens of building, maintaining & operating and subsidizing a massive multi-billion-dollar project that only a small minority percentage of current bus transit riders might use (6%-7% total on Oahu)?
- Oahu has become over-populated because we refuse to stop the over-development of the West side of this island.
- Is there a way to convince over 140,000 local residents who were not in favor (49%) of "steel on steel

rail" and who voted against it at the Nov.'08 ballot vote, that it was needed or voted in without pro-rail propaganda and union funding force through support of a one-sided view to push and shove the passage of this flawed rail system onto the Oahu voters?

On 4/23/2007, on Page A1 of the Honolulu Advertiser: "Sewage mandate disputed; Inouye says EPA order to upgrade plants would "bankrupt" the city".

-Is Sen. Inouye correct to claim that when the Feds force the issue of upgrading the city waste water treatment system at a cost of over \$1 billion, would that "bankrupt" Honolulu?

The 2006 transit cost was near \$3.5 billion, now @ \$6.4+ billion for the same 20 mile route.

- Why has the cost of "rail" transit gone up billions since the 2006 AA report?

The so-called 'required' 8 page Ad slick brochure, (Oahu taxpayer funded), claims that "One day, rail will extend even further to HNL, Waikiki, UHManoa, and Kalaeloa".

-How many multi-billions more will this cost and with what money and funding?

-Where is this information on future rail extensions cost in the 2008 DEIS?

-Will the electricity on Oahu come from burning fuel and barrels of oil at local HECO power plants to power "rail"?

-If "rail" will be powered by burning fuel and barrels of oil at HECO, how does this protect the environment? What are the energy costs for this new transit system per year?

-Will transit stations use and need even more power from HECO with lights, elevators, escalators, and T.O.D. shops and retail stores at each location?

-What is the amount of energy needed and used to build the new transit system?

-Where is the cost listed in the DEIS for the amount of energy required to build the new 20 mile transit?

-Is the data from the US Department of Energy correct, that suggests that on a national basis, average energy use per passenger mile is higher for transit than for automobile travel? According to the U.S. Department of Energy: Energy use per passenger mile (Btu) = 1,659 for fuel-efficient cars (Prius), 2,784 for rail transit.

This may be our final opportunity to give a public statement during this stage of the fixed-guideway process. My effort can hopefully be a useful commentary towards a question and answer seeking probe that I feel I must submit. As a full time Hawaii resident from the early 90's, I've grown to appreciate the natural beauty of Oahu and the panoramic views of a sleepy surfside mini-metropolis hugged by vintage suburban dwellings. I tried to sit down and write a comprehensive list of topics on the fixed-guideway "rail" transit issue. I didn't know where to start. The complex and twisted course the mayor and city council have begun has complicated the transit plan with political manipulation and a popularity contest involving high powered union-support coupled with large campaign contributions with a mix of mainland interests.

I hope Oahu is not evolving towards a society of socialistic reform with a loss of independence with local cattle and tamed worker bees packed & crowded into standing room only rail cars, and jokingly maybe even into a 'stinky' situation.

One of the more unusual events that unfolded was a few 4-4 tie votes, two weeks running, by the city council on Bill 80 ('06/'07) on the Transit Technology Selection. This was an interesting display of a split decision problem. An unavailable council member on the panel of 9, was unable to cast any tie-breaking vote, for or against, for two weeks of voting on the selection. 8 council members tied on 4-4 votes 5 or 6 times on different third reading versions. This should have been crafted to allow all available technologies & advanced modern innovations for fixed-guideway transit solutions submitting thru a transparent RFI/RFP process.

3.

I hope all of the questions here can be answered in a fair and open transparent "sunshine" process for the benefit of the Hawaii public. Thank you.

Honolulu High-Capacity Transit Corridor Project

Welcome to the Honolulu High-Capacity Transit Corridor Project's Public Hearing for the Draft Environmental Impact Statement/Section 4(f) Evaluation.

This public meeting and hearing has been designed to inform the public about the transit project, explain materials contained in the Draft EIS, answer questions from the public, and collect public input on project issues related to the Draft EIS, Section 106 of the National Historic Preservation Act, Section 4(f) of the U.S. Department of Transportation Act, and floodplains affected by the project.

Please review the project information and ask project staff any questions about the project that you might have. The Draft EIS is available on the project website at www.honolulustransit.org.

You may provide official comments in several ways. Here at this Public Hearing you may provide oral comments to a court reporter who will record them for the record or use this form to provide written comments. After the meeting, you may provide an on-line comment at www.honolulustransit.org or use this form to send a written comment to the Department of Transportation Services. All comments must be postmarked or received by January 7, 2009 in order for them to be included in the Final EIS.

Dear Mr. Kot:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal:

Responses to your comments will be provided in the same format as your letter.

- *As stated in Section 2.2.3 of this Final EIS, the NEPA Notice of Intent requested input on five transit technologies. A technical review process included the opportunity for public comment and was used in parallel with the alternatives analysis to select a transit technology. The process included a broad request for information that was publicized to the transit industry. Transit vehicle manufacturers submitted 12 responses covering all of the technologies listed in the Notice of Intent. An independent five-member technology panel composed of four transit experts and a transportation academic appointed by the City Council evaluated guided rubber-tire-on-concrete systems (e.g., Phileas bus system and VAL-type systems), monorail (which is a variation on rubber-tyred technology),*

steel-wheel-on-steel-rail systems, (e.g., light rail and rapid rail), and magnetic levitation (MAGLEV) . The panel considered the performance, cost, and reliability of the proposed technologies.

Proprietary technologies, meaning those technologies that would have required all future purchases of vehicles or equipment to be from a single manufacturer, were eliminated because none of the proprietary technologies offered substantial proven performance, cost, and reliability benefits compared to steel wheel operating on steel rail.

The panel accepted public comment twice as part of its review. By a four-to-one vote, the panel chose a steel wheel vehicle operating on steel rail system because it was considered safe, reliable, economical, and non-proprietary. Those results are documented in the panel's report to the City Council dated February 22, 2008 entitled "Independent Technology Selection Panel Report".

- *The Request for Proposal (RFP) provides information on the steel wheel on steel rail technology for which the City is soliciting bids.*
- *The Draft EIS only reports estimates of cost for those Build Alternatives addressed in the Final EIS document, namely three fixed guideway alternatives from East Kapolei to Ala Moana Center. The Project has logical termini and independent utility from any extensions that may be constructed in the future. The future extensions to East Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS. The future extensions are not part of the Project; thus, they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation at some time in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time.*
- *The referenced RFP can be obtained from the Department of Budget and Fiscal Services, Division of Purchasing.*
- *All procedures have followed the City's procurement requirements, and no bidder's proposal was received prior to release of the pertinent RFP.*
- *The cost-effectiveness analysis considers whether the Project's benefit would justify its capital and operating costs. Cost-effectiveness is one of the key criteria that FTA uses to evaluate projects proposed for Section 5309 New Starts funding. The cost-effectiveness indices for the Project compared to the baseline is within the "medium" range established by FTA for its New Starts ratings, which,*

along with other considerations, is currently required to qualify for New Starts funding (Table 7-8 of the Final EIS). As shown in Table 6-1 of the Final EIS, the Project will cost \$4.6 billion in 2009 dollars and \$5.5 billion in inflated dollars, including finance charges. Please refer to Chapter 6 of the Final EIS.

- *Capital costs for the Project in the Final EIS are presented in Table 6-1 of the Final EIS. The total cost, including finance charges, will be \$4.6 billion in 2009 dollars. This equates to a cost of \$230 million per mile in 2009 dollars.*
- *The per-capita spending breakdown is not a requirement of the Draft or Final EISs. If we were to assume a conservative 50-year life span for the system (this type of system typically lasts longer than 100 years), then the cost per person would be about \$100/year for a system that performs at a much higher level than any of the systems currently in place.*
- *Transportation spending in other states is not relevant to the issue at hand. The financial feasibility of this Project is discussed in Chapter 6 of the Draft and Final EISs.*
- *The cost effectiveness index has not been eliminated, but its contribution to the overall project rating has been reduced.*
- *Stations will be complete within the initial construction area at the opening of that area.*
- *As stated in Chapter 2 of the Final EIS, "the area of East Kapolei is undergoing development that will be a mixture of residential, recreational, educational, industrial, and commercial land uses.... As part of this development the immediate area is also planned for future Department of Hawaiian Home Lands housing development. Kroc Center, scheduled to open in 2010, will be a 15-acre family support, education, recreation, and cultural arts facility for the general public and will provide services for low-income children, seniors, and families. Projected year of opening (2019) ridership shows that the East Kapolei Station would have one of the highest boardings in the system." Figure 3-9 in the Final EIS also shows that the East Kapolei and UH West Oahu fixed guideway stations will have high ridership during the a.m. two-hour peak period.*
- *The fixed guideway system is designed to serve major destinations in the most heavily traveled corridor on Oahu, plus the area with the greatest expected growth. In 2000, 63 percent of Oahu's population and 80 percent of its jobs were located within the study corridor. By 2030, these distributions will increase to 69 percent of the population and 83 percent of the employment. As a result, it is anticipated that the rail transit system will be used by a wide cross section of the local population.*
- *A Fort Weaver Road alignment was evaluated and rejected in the Alternatives Analysis. It would have been the most expensive option for serving the Ewa*

area, and no space would have been available to provide park-and-ride and bus transfer facilities. Available funding is insufficient to extend to UH Manoa and Waikiki. The Project will connect to Ewa Beach via bus service from East Kapolei and to UH Manoa and Waikiki from Ala Moana Center.

Your preference for the Airport Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

- The 1 percent referenced is an islandwide figure that includes all travel during the day, including short trips in neighborhoods and trips in the North Shore, Kaneohe, or Hawaii Kai, which are not directly served by the Project. The most visible benefit of transit is within a corridor and during the peak times of the day. Table 3-12 of the Final EIS shows daily islandwide trips, while Figure 3-11 in the Final EIS shows transit shares of home-based work trips during the a.m. two-hour peak period for key travel markets. As shown in Table 3-12, on a daily, islandwide basis, transit use is not expected to increase substantially. However, as shown in Figure 3-11, there is a substantial increase in transit trips during the a.m. peak period within the study corridor as a result of the Project. As stated in Section 3.4.2 of the Final EIS, for many travel markets, the transit share for trips under the Project will double or triple the share occurring under the No Build Alternative. For example, the commute-to-work transit share of the Kapolei to Downtown Honolulu travel market would increase from 23 percent under the No Build Alternative to 60 percent under the Project. In other words, more than half of the people going from Kapolei to Downtown for work in the morning will use transit with the Project, compared to only a quarter without the Project.
- Please see the response to the comment above.

- *Chapter 6 of the Final EIS describes the financial resources anticipated to be needed to pay for the capital costs of the Project and for ongoing operating and maintenance costs. Capital costs of the Project, including finance charges, are expected to be fully paid for by a combination of FTA Section 5309 New Starts Funds from the Federal government and the General Excise and Use Tax surcharge revenues collected from 2007 through 2022 on Oahu. Operating and maintenance costs will be paid for from the same sources currently used for TheBus: Federal funding, fare revenues, and City revenues from the General and Highway Funds.*
- *The comment concerning convincing voters is not related to the project alternatives or effects.*
- *The comment concerning the waste water treatment system is not related to the project alternatives or effects.*
- *The Alternatives Analysis Report presented an estimated capital cost (including finance charges) of \$5.071 billion in year-of-expenditure dollars for the Airport Alternative. The Final EIS presents an estimated capital cost for this alternative of \$5.513 billion, including finance charges. It is inaccurate to characterize the difference between these two estimates as being "billions." The increase in cost is primarily due to design revisions.*
- *As stated previously, the Draft EIS only reports estimates of cost for those Build Alternatives addressed in the Final EIS document, namely three fixed guideway alternatives from East Kapolei to Ala Moana Center. Planned extensions to West Kapolei, Salt Lake Boulevard, UH Manoa, and Waikiki would be evaluated under a separate environmental review process when they are proposed for implementation.*
- *See response in previous bullet.*
- *The transit system will require approximately 17.9 megawatts (MW) of electrical power for operation. This represents 1 percent of the existing combined electrical-generating capacity on Oahu by the Hawaiian Electric Company (HECO) and independent power producers. HECO is currently soliciting proposals for non-firm renewable-energy generating capacity up to 100 MW that would commence operation within the 2010 to 2014 timeframe. As discussed in Section 4.11.3 of the Final EIS, the Project will consume approximately 1 to 2 percent of the total projected electricity generated on Oahu in 2030.*
- *The Project is anticipated to reduce daily transportation energy demand by approximately 3 percent compared to the No Build Alternative.*
- *The cost of operating the stations is included in the operating and maintenance cost analysis in Chapter 6 of the Final EIS. The entire transit system, including the lighting, elevators, and escalators at stations, is expected to consume*

approximately 1 to 2 percent of the total projected electricity generated on Oahu in 2030. Additional electricity required to develop and maintain transit-oriented development (TOD) and retail development is not directly related to the Project. TOD has been identified as an Indirect Effect in Section 4.19.2 of the Final EIS.

- As presented in Section 4.18.6 of the Final EIS, "Construction of at-grade high-capacity transit systems generally requires 20,000 one million British thermal units (MBTUs) of energy per track mile (Caltrans 1983), including track and power systems. Because the guideway is elevated, an additional 150,000 MBTUs of energy per track mile will be required to construct the elevated structure."*
- The energy cost for construction is built into the cost of materials, fuel, and personnel to construct the Project. For example, construction contracts typically carry escalation clauses for fuel oil, asphalt, and concrete to account for fluctuations in the cost of these materials due to changes in raw energy costs.*
- Statistics for energy consumption for rail at full capacity and specific gasoline hybrid passenger cars are not available from the Department of Energy. The Department of Energy does publish statistics for average transit rail energy consumption (2,784 BTUs per passenger mile) and cars (3,512 BTUs per passenger mile). As the Department of Energy advises, great care should be taken when comparing modal energy intensity data among modes. Because of the inherent differences among the transportation modes in the nature of services, routes available, and many additional factors, it is not possible to obtain truly comparable national energy intensities among modes. These values are averages and there is a great deal of variability even within a mode.*

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Submission Date : 12/18/2008
Submission Content/Notes : What ever happened to making Kapolei the second city and wanting to keep west side residents on the west side instead of giving them an alternative to going into town? Why cant we double deck the existing freeway system and open it up to the public for free? no hot lanes or tolls just a double decker freeway. I recently read there will be massive development around all the rail stops, why encourage development and add more people and cars to the road.

Mr. Glenn Kuhia, Jr.
(No address provided)

Dear Mr. Kuhia:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

The Project supports the development of Kapolei and the plans for development of the Ewa area and is consistent with the Regional Development Plans. Page 4-10 of the Draft EIS states, "The Ewa region is a rural and agricultural area that is undergoing urbanization and includes Kapolei, which is developing as Oahu's 'second city'. The Waianae terminal station for the Project is at East Kapolei. The Waianae end of the Project would serve the area where both population and employment are forecasted to grow by approximately 400 percent."

Regional planning, conducted by the OahuMPO, considered a wide range of transportation options in development of the Oahu Regional Transportation Plan (ORTP). A fixed guideway transit system was identified as being an effective means of improving future mobility. The ORTP also identifies several highway-system improvements, many of which are listed in Table 2-3 of the Draft EIS. The population of Oahu is projected to increase by 2030; that increase in population will need to be accommodated with additional housing and employment.

Honolulu High-Capacity Transit Corridor Project

Welcome to the Honolulu High-Capacity Transit Corridor Project's Public Hearing for the Draft Environmental Impact Statement/Section 4(f) Evaluation.

This public meeting and hearing has been designed to inform the public about the transit project, explain materials contained in the Draft EIS, answer questions from the public, and collect public input on project issues related to the Draft EIS, Section 106 of the National Historic Preservation Act, Section 4(f) of the U.S. Department of Transportation Act, and floodplains affected by the project.

Please review the project information and ask project staff any questions about the project that you might have. The Draft EIS is available on the project website at www.honolulutransit.org.

You may provide official comments in several ways. Here at this Public Hearing you may provide oral comments to a court reporter who will record them for the record or use this form to provide written comments. After the meeting, you may provide an on-line comment at www.honolulutransit.org or use this form to send a written comment to the Department of Transportation Services. All comments must be postmarked or received by January 7, 2009 in order for them to be included in the Final EIS.

Comment(s):

Kamehameha Hwy is 1 of only 2 corridors
from east to west. It is heavily used and
congested especially during peak traffic
hours. more so in the afternoons. There
is not enough lanes for the amount of
vehicles traveling. To eliminate lanes
would cause an unimaginable disaster.
The military facilities would be impacted
There is an overpass (H-1) Hawaiian Electric

and Bears Distribution. Is the train track going to be above the H-1. There are about 14 bus stops from Home Depot in Pearl City to the airport. I have caught bus #62 route. There are not hundreds of people waiting at the bus stops. Ridership is over inflated. The City is doing a great disservice to the citizens of the C + C of Honolulu by proceeding with this project. This project provides very little benefit if any and will not solve the congestion problems.

Dear Ms. Kupukaa:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

1. *Concern about travel lanes removal*

The number of traffic lanes along Kamehameha Highway in Pearl City (three lanes in each direction) will remain the same before and after construction of the fixed guideway. During construction, one lane may be temporarily closed during peak-travel periods and additional lanes may be temporarily closed during off-peak travel periods. Construction-related procedures that may require temporary road closures are described in Section 3.5.3 in the Final EIS.

Travel lanes will not be taken away along Dillingham Boulevard as a result of the Project. As shown in Tables 3-9 and 3-10, roadway conditions on Dillingham Boulevard will improve as a result of the Project.

The modeling conducted for the Draft and Final EISs considered all roadway projects listed in the Oahu Regional Transportation Plan (ORTP), including a Nimitz Flyover and mitigation measures on the H-1 Freeway. Table 2-4 in the Final EIS lists committed projects from the

ORTP that were included in all modeling results. As shown in Tables 3-9 and 3-10 in the Final EIS, roadway conditions will improve with the Project.

2. Concern about adequate demand and ridership for the Project

As shown in Table 3-18 in the Final EIS, transit ridership will be 44 percent higher with the Project compared to the No Build Alternative. This includes ridership on the guideway as well as TheBus.

As identified in the Section 3.2.1 on Analytical Tools and Data Sources of the Final EIS, transit ridership forecasts for rail and bus service are based on a travel demand forecasting model used by the Oahu Metropolitan Transportation Organization (OahuMPO) for the Oahu Regional Transportation Plan. The OahuMPO model is based on "best practices" for urban travel models in the U.S. and is consistent with consultation with FTA. As indicated in the Final EIS, this modeling approach has been effective in estimating ridership levels in other areas such as Los Angeles County, Salt Lake City, and the Denver region in the last 10 years.

The travel demand forecasting model has been refined since the Draft EIS was published by adding an updated air passenger model (which forecasts travel in the corridor related to passengers arriving or departing at Honolulu International Airport), defining more realistic drive access modes to project stations, and recognizing a more robust off-peak non-home-based direct-demand element (trips that do not originate or end at home) based on Honolulu travel surveys. The Final EIS reflects updated ridership numbers resulting from model refinement.

The Project is one of the first in the country to design and undertake an uncertainty analysis of this type of travel forecast. The uncertainty analysis evaluates the variability of the forecast by establishing likely upper and lower limits of ridership projections. FTA has worked closely with the City during this effort. A variety of factors were considered in the uncertainty analysis. Given the factors considered, the anticipated limits for guideway ridership in 2030 are expected to be between 105,000 to 130,000 trips per day, bracketing the official forecast of 116,000 riders a day used for all calculations. Currently, there are over 250,000 boardings per day on buses.

3. Concern about congestion

As shown in Table 3-14 in the Final EIS, the Project will reduce congestion (as measured by vehicle hours of delay) by 18 percent compared to the No Build Alternative. Tables 3-9 and 3-10 in the Final EIS show an improvement in vehicles per hour on Kamehameha Highway during both the a.m. and p.m. peak hour.

The Project responds to unmet demand for transit infrastructure that accommodates current residents and visitors and anticipates future demographic trends. The challenge is to reconcile the need to provide a public transportation system that is safe, accessible, and convenient while preserving aspects of the community that are integral to its character and values. This project will enable the City to concentrate growth in existing urbanized and adjacent areas on Oahu in the decades to come. By reducing the overall number of vehicle miles traveled through expanded public transportation, DTS and FTA are promoting environmental sustainability, congestion reduction, and increased mobility for a diverse population, which will improve the overall quality of life for the majority of Honolulu residents and visitors.

Ms. Katherine Kupukaa
Page 3

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Honolulu High-Capacity Transit Corridor Project

Welcome to the Honolulu High-Capacity Transit Corridor Project's Public Hearing for the Draft Environmental Impact Statement/Section 4(f) Evaluation.

This public meeting and hearing has been designed to inform the public about the transit project, explain materials contained in the Draft EIS, answer questions from the public, and collect public input on project issues related to the Draft EIS, Section 106 of the National Historic Preservation Act, Section 4(f) of the U.S. Department of Transportation Act, and floodplains affected by the project.

Please review the project information and ask project staff any questions about the project that you might have. The Draft EIS is available on the project website at www.honolulutransit.org.

You may provide official comments in several ways. Here at this Public Hearing you may provide oral comments to a court reporter who will record them for the record or use this form to provide written comments. After the meeting, you may provide an on-line comment at www.honolulutransit.org or use this form to send a written comment to the Department of Transportation Services. All comments must be postmarked or received by January 7, 2009 in order for them to be included in the Final EIS.

Comment(s):

Dillingham Blvd is 1 of 4 corridors,
in the east/west direction to Honolulu.
It is heavily congested throughout the
day because there is not enough lanes.
To eliminate lanes for the train
tracks is unthinkable. The businesses
would also be impacted not only with
loss of business but loss of property
space. There are about 12 bus stops

from Middle St to King and Dillingham
Blvd. There are not hundreds of people
waiting at these bus stops. People are
not going to give up driving their
cars and catching the train. This
project should be stopped immediately.
The State is coming up with projects
to reduce traffic congestion with more
lanes on H-1 and Nimitz Hwy.

Submission Date : 01/04/2009
Submission Content/Notes : Does the rail transit system include plans for expansion and growth? I like and support the rail system a great deal but I believe that it should be available to many more people than the original plans include, especially if we all need to pay for it. I agree that west Oahu needs it the most but I would like to see it include the airport, Waikiki, UH Manoa, Hawaii Kai and possibly Kaneohe/Kaitua as well. Also, I hope that the Bus system ties into the schedule of the Rail system. Making things more efficient will bring greater success to all parties. Thank you for listening and good luck.

Dear Mr. Kuranishi:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your preference for the Airport Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more

information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS; however the future extensions are not part of this Project, thus they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time. Other extensions, such as Central Oahu, have been considered and may be undertaken at some point after the current Project.

The Bus system will be altered to provide improved connections with the rail system. Bus routes or portions of bus routes will be altered or eliminated to reduce duplication of services with the rail system. Certain local bus routes will be rerouted to provide frequent and reliable connections to the nearest rail station. Because of the high frequency of rail service (every three minutes during peak periods and every ten minutes during off-peak periods), riders transferring from buses to trains will experience minimal wait times. Riders transferring from trains to buses will benefit from improved frequencies on existing bus routes serving stations. In addition, several new bus routes with high frequencies will be provided as feeders to the rail system. Since these routes will primarily operate in residential areas, they will provide greater reliability versus routes operating along congested arterials. Additional information regarding existing and future bus routes, including frequency, is included in Appendix D of the Final EIS.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Reference: Rail Draft EIS

Dear Mr. Yoshioka,

I am a concerned tax payer and I am also against the rail. I feel that I was misled and misinformed. The fact that the EIS draft was made public a few days before the election concerns me because of the many people who cast their vote via absentee/early ballot. The vote for and against rail was too close and I feel that if the public was given this information sooner, the vote could have possibly turned out different.

I am very angry and would like to know in writing how the City and County can let this kind of thing happen?

Please respond to me in writing.

Sincerely,

Jaime Kurosawa

The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

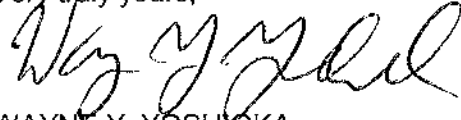

The NEPA process, including publication of the Draft EIS, was started in 2007. When in the summer of 2008 the City Council decided to place the measure on the ballot, the schedule for the Draft EIS had already long been established. Various design, agency coordination, and approval steps were required prior to publication of the Draft EIS. In the end, the normal distribution schedule was accelerated by FTA and the City to ensure availability of the information prior to the general election. The NEPA process is independent of the electoral process.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this

Dear Community Leaders,

I am a Honolulu resident and I am very concerned the following questions have not been properly addressed. I know you folks have your minds set on implementing this expensive project in the face of the deteriorating economy. Please know that many of us do not want you to proceed with the project until all these issues are thoroughly addressed.

1. The bus routes will change. What happens to your route? What happens to express buses? 2. Lanes will be taken away, some temporarily for construction and some permanently. Where are those lane closures and what is their duration? Are there traffic rerouting plans? 3. Will there be bike racks on the train and where will they be located? Will bikes be allowed on the train? Will there be a place for surfboards? What about luggage? What about construction workers' tools? Will there be a place for people to put large items they purchase at a big box retailer? What's the size limitation? 4. Will there be washrooms at the stations? How about convenience stores, vending machines? Will the platforms have seats? How many? 5. Under land use, Aloun farms needs to relocate. Is that possible? Where will they go? 6. A relatively simple job of sewer upgrades in Kailua and Kapiolani lead to the loss of businesses and jobs. Are details provided about similar effects during the construction of the rail? 7. Is there a detailed plan for the effect of rail construction on water, sewer, gas and electric utilities? Will there be disruptions of service? Who pays for all these? 8. About \$107 million will be spent on the soft costs of this project. This "paperwork" cost is rather exorbitant for a single 20 mile rail line. How did \$107 million get spent? 9. The DEIS list of preparers for technical content shows that it was done almost exclusively with out-of-Hawaii engineers, planners and specialists. H-3 freeway was designed mostly with Hawaii based engineers. If Hawaii engineers are not able to design rail, who will supervise and build this unfamiliar-to-Oahu infrastructure? 10. Rail construction involves unique skills and certifications that Hawaii construction workers do not have. How will this be addressed? 11. The city has declared that in many cases only a portion of a parcel needs to be condemned and taken away. Can the business survive with the remaining portion? Are they forced to mandatory downsizing and some loss of employment? 12. There are 16 schools that are adjacent to the alignment. Will the overhead structure, the continuous high current exposure and the intermittent noise and vibration affect the learning environment? Is it prudent to relocate the schools? 13. Does rail fit our Hawaiian Sense of Place? How was the impact to tourism and local quality of life by a large elevated structure through town been assessed? 14. Does the DEIS address the impacted vistas and scenery? Are the aesthetics of the structure and each station explained and presented adequately? 15. What will happen in the event of a hurricane? Will the train operate? The train in Houston was shut down for 10 days due to hurricane Ike. 16. BART in the Bay Area uses rail cars made of aluminum to combat corrosion. Is the city's position that corrosion is not an issue? 17. It appears that General Excise Tax surcharge proceeds for rail will be much lower than expected for at least four years in a row. How is this deficit going to be made up? 18. If ridership turns out to be lower than forecast, then what? If the city is forced to provide free train rides like in Puerto Rico, how is the shortfall going to be covered? 19. I heard that the Ala Moana station will now be at a lower elevation, at the west end of Kona Street and not above Nordstrom's. What is the exact plan for the Ala Moana Center station and how is the train going to Waikiki and UH afterwards? 20. Starting construction in Kapolei makes little sense. It may be expeditious and convenient but it is not smart. Why can't a temporary rail yard be established near the airport or Aloha Stadium and build rail east into the city and west out to Kapolei simultaneously?

Sincerely,

Dear Mr. Lam:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

This letter will address your comments in the same format as submitted.

- 1) *As indicated in Chapter 3 of the Final EIS, bus service will be enhanced with the Project and the bus network will be modified to coordinate with the fixed guideway system. Some existing routes, including peak-period express buses, will be altered or eliminated to reduce duplication of services provided by the fixed guideway system. Buses removed from service in the study corridor will be shifted to service in other parts of Oahu. Existing and future bus routes, including frequencies, are presented in Appendix D of the Final EIS.*
- 2) *Travel lanes on roadways will only be closed temporarily during construction. Table 3-27 in the Final EIS presents information on construction-related lane closures during peak periods. Additional lane closures may be necessary during off-peak periods. The specific duration of construction closures will be defined by the contractor working at the location, but the City will impose parameters to minimize impacts on local residents and businesses. Detours will also be specified for times when roadway capacity is temporarily impaired by construction activities. Most of this information will be in a Maintenance of Traffic Plan that will outline the requirements contractors will have to adhere to in their*

work. As shown in Table 3-21 in the Final EIS, travel lanes will not be permanently taken away by the Project.

- 3) Chapter 3 notes that all stations will provide bike racks. Rail vehicles will be designed to accommodate bicycles, luggage, and surfboards, as long as these items will not interfere with the safety or comfort of other passengers and will be regulated according to a policy to be developed. Construction workers' tools and large items would follow the same guidelines.
- 4) Each station will have a secured public restroom. Patrons will ask the station attendant for access to the restroom. DTS does not intend to compete with private enterprise by placing retail within stations. Final internal configurations of stations, including the location and amount of seating, will be completed as station planning is finalized.
- 5) One of the two alternatives for a maintenance and storage facility is located in an agricultural district. The other site option is near Leeward Community College on the site of a former Navy fuel drumming operation. This is the preferred site, and the City has been working with the Navy and the Department of Hawaiian Home Lands to acquire it. If the site near Leeward Community College is acquired, the impact on agricultural lands on Oahu will be much less than is described in the Final EIS. Aloun Farm's headquarters, located at the other site, would not have to move if the Navy drum site is acquired. Farm operators that are affected by the Project will be given as much information as possible so they can best plan their productive use of the leased lands.
- 6) An analysis of the impacts to businesses during construction is provided in Section 4.18.1 of the Final EIS and in Section 5.2.2 of the Economics Technical Report. This report is available at the City and County of Honolulu and DTS offices, as well as on the Project website (www.honolulustransit.org). The primary impacts are anticipated to result from inconveniences and disruptions to adjacent residents, businesses, and business customers that are inherent in any major construction project. These include the following:

- Presence of construction workers and materials
- Temporary road closures and traffic diversions
- Temporary reductions in parking availability
- Airborne dust, noise, and vibrations
- Businesses' loss of visibility to customers

Section 4.18.1 of the Final EIS states that proposed mitigation to reduce adverse economic hardships for existing businesses along the project alignment during construction activities may include the following:

- Coordinate construction planning and phasing with nearby property owners and businesses
- Develop a public involvement plan prior to construction to inform business owners of the construction schedule and activities

- *Minimize the extent and number of business, jobs, and access affected during construction*
- *To the extent practicable, coordinate the timing of temporary facility closures to minimize impacts to business activities, especially those related to seasonal or high sales periods*
- *Minimize, as practical, the duration of modified or lost access to businesses*
- *Provide signage, lighting, or other information to indicate that businesses are open*
- *Provide public information (press releases, newsletters) regarding construction activities and ongoing business activities, including advertisements in print and on television and radio*
- *Phase construction in each area so as to maintain access to individual businesses for pedestrians, bicyclists, passenger vehicles, and trucks during business hours and important business seasons*
- *Provide advance notice if utilities will be disrupted and schedule major utility shutoffs during non-business hours*

Overall, the Project is projected to increase jobs in the nine years of construction to an average of about 10,000 per year, see Table 4-35 in Final EIS.

- 7) Construction activities for the majority of the transit system are similar to roadway and building construction. Appendix E of the Final EIS details construction methods that are widely used for both rail transit and elevated highway construction and were employed on the H-3 Freeway. Experienced labor is locally available. A limited number of specialists will be needed to work with locally available labor in certain areas, such as transit power and signaling specialists working with local electricians to install system equipment.*
- 8) The "soft costs," or professional services costs for the Project, include all professional, technical, and management services related to the design and construction of fixed infrastructure during the Preliminary Engineering, Final Design, and construction phases of the Project. This includes environmental work, design, engineering, and architectural services; specialty services, such as safety or security analyses; value engineering; risk assessment; cost estimating; scheduling; before and after studies; ridership modeling and analyses; auditing; legal services; administration; management; and other services provided by agency staff or outside consultants. As shown in Table 6-1 of the Final EIS, professional services costs for the Project are \$810 million in Fiscal Year 2009 dollars. As a percentage of the construction cost of the Project, this is consistent with experiences on other projects around the country.*
- 9 and 10) While there are many members of the team from other places, the majority of the planners and designers reside in Honolulu. (Note: the H-3 Freeway was designed by the same firm engaged in the fixed guideway project.) Construction activities for the majority of the transit system are similar to roadway and building construction. The majority of the Project work is construction of the guideway. This is not a specialized skill that requires labor from other places. Appendix E of the Final EIS details construction methods that are widely used for both rail transit and elevated highway construction and were employed on*

the H-3 Freeway. Experienced labor is locally available. A limited number of specialists will be needed to work with locally available labor in certain areas, such as transit power and signaling specialists working with local electricians to install system equipment.

- 11) *It is true that in many locations only partial property acquisitions are necessary. Every property acquisition is unique and will be addressed on a case-by-case basis. All property acquisitions will be conducted consistent with Federal and State regulations. Section 4.4.3 of the Final EIS states, "a partial acquisition typically is either a narrow strip of land or a more substantial portion of a large parcel. It is assumed that for the properties that will be partially acquired, existing land uses will not change."*
- 12) *There will be no noise impacts to schools along the Airport Alternative alignment. The Project will have an integrated noise-blocking parapet wall at the edge of the guideway structure that extends for 3 feet above the top of the rail and a system specification for vehicles with wheel skirts.*
- 13 and 14) *The ongoing station area planning process involves numerous aspects of transit system design. The process addresses design and planning issues in an integrated manner and focuses on the characteristics and preferences of the communities adjacent to each station. As discussed in Section 8.4 of the Final EIS, the City and County of Honolulu is also conducting workshops with communities that will have rail stations. The purpose of the workshops is to engage the public about rail stations and provide opportunities to residents to contribute ideas about the appearance of station entryways in their areas. Ideas generated at the workshops will be incorporated into the station design process. For more information and to get involved in this process, please visit the project website at www.honolulutransit.org.*

Guideway and column materials and surface textures will be selected in accordance with generally accepted architectural principles to achieve effected integration between the guideway and its surrounding environment. Landscaping and streetscape improvements will mitigate potential visual impacts.

The island's unique visual character and scenic beauty were considered in the visual and aesthetic analysis presented in the Draft and Final EISs. The Project will be set in an urban context where visual change is expected and differences in scales of structures are typical. The visual effects on Honolulu's downtown are discussed under the "Kalihi to Ala Moana Center Landscape Unit" heading in Section 4.8.3 of the Final EIS. The following measures will be included with the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

- *Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
- *Coordinate the project design with the City's transit-oriented development program within the Department of Planning and Permitting.*
- *Consult with the communities surrounding each station for input on station design elements.*
- *Consider specific sites for landscaping and trees during Final Design when plans for new plantings will be prepared by a landscape architect.*

The Project will provide users, including tourists, with expansive views from several portions of the corridor by elevating riders above highway traffic, street trees, and low structures adjacent to the alignment. In Section 4.8.3 of the Final EIS, specific environmental, architectural, and landscape design criteria are listed that will help minimize visual effects of the Project.

With the Project, visitors and residents will benefit by having more transportation options. Table 3-13 in the Final EIS shows daily person transit trips by purpose, broken down for residents and visitors. As this table shows, transit trips for both groups increase with the addition of the Project compared to the No Build Alternative. Daily resident person trips by transit increase 24 percent with the Project compared to without, while daily visitor person trips by transit increase 19 percent with the Project compared to without the Project in 2030. As stated in Section 3.4.2 of the Final EIS, approximately 9,900 visitors are expected to use the system daily, of which 1,800 are to or from the airport.

- 15) *As discussed in the Geology, Soils, Farmlands, and Natural Hazards Technical Report, the guideway and other structures will be designed and constructed to withstand wind forces from tropical storms. Some piers and stations will be located on floodplain, but no increased hazards are anticipated because the guideway and stations will be elevated. The system will have an upper limit on operating wind speed. Vehicles will be stored during events that exceed the operating limit.*

Since trains and rail stations will be electrically powered, the system's infrastructure is being designed to handle service disruptions. For example, trains will draw power from many points along the route, so an outage in a few areas should not disrupt service. If electrical power is lost system-wide, then train brakes are designed to stop the rail cars even without power. Lights will stay on in trains and stations; backup batteries will provide lighting for several hours. The train operations center will communicate with passengers via the public address system and intercom to provide guidance. If power is restored within a short time, service will resume. With a prolonged outage, the operations center will direct passengers to exit the trains and walk along a lighted emergency walkway on the guideway to the nearest station. For those unable to exit rail cars, help will be provided by emergency responders and transit staff. Passengers will be met at the train station by a coordinated response from emergency responders and city transportation workers.

- 16) *Bay Area Rapid Transit (BART) vehicle bodies are made of aluminum. The BART system, however, is a steel-wheel-on steel-rail system just like the one proposed for Honolulu. The vehicle itself has not yet been designed, so it could be made of aluminum or another equally effective material. Corrosion has not been a problem in any system similar to that proposed for Honolulu. In island environments, volcanic areas, and regions of high humidity, there is no concern about corrosion of the steel wheels and steel rails. Nevertheless, corrosion is part of the design considerations used to ensure that the system is as good as possible.*

Corrosion-control measures will be applied to the Project's fixed-steel facilities and neighboring utility structures to provide proper operation over their lifetime. These measures include the following:

1. *Protective coating specification for steel aerial structures*

2. *Coating specification for stations*
 3. *Preventive measures against stray current corrosion*
 4. *Corrosion-control design of transit underground utilities and neighboring utilities owned by others*
- 17) *While General Excise and Use Tax (GET) surcharge collections have declined, so too have the costs of the Project. The financial discussions in the Final EIS address concerns about the uncertainties associated with financial markets. The capital plan for the Project is presented in Section 6.3 of the Final EIS, which includes a description of the amount of funding anticipated from various sources. The capital plan takes the current economic downturn into account. Section 6.6 of the Final EIS describes risks and uncertainties associated with these funding assumptions. The financial plan is a dynamic document that will be updated as conditions warrant.*
- 18) *Ridership discussions in the Final EIS address concerns about the uncertainties associated with ridership. Ridership projections for the forecast year of 2030 have been developed using the travel demand model used by the Oahu Metropolitan Planning Organization (OahuMPO), which was calibrated against collected traffic and transit ridership information and then validated against recent counts to be sure it properly represents travel activity in the transportation system (Section 3.2.1 of the Final EIS). An on-board transit survey was completed in December 2005 and January 2006, and the latest socioeconomic information available as of October 2008 was incorporated. Traffic counts were collected in 2005, 2007, and 2008. The OahuMPO model is based on "best practices" for urban travel models in the U.S. and consistent with consultation with the FTA. The model is updated approximately every five years to reflect changes in land use, socioeconomic conditions, and transportation network improvements. The model is approved by the OahuMPO Technical Advisory Committee. The model is based upon a set of realistic input assumptions regarding land use and demographic changes between now and 2030 and expected transportation levels-of-service on both the highway and public transit system. Based upon the model and these key input assumptions, approximately 116,000 trips per day are expected to use the rapid transit system on an average weekday in 2030. Since the Draft EIS was published, the travel demand model has been refined by adding an updated air passenger model (which forecasts travel in the corridor related to passengers arriving or departing at Honolulu International Airport), defining more realistic drive access modes (driving alone or car pooling) to project stations and recognizing a more robust off-peak non-home-based direct demand element (trips that do not originate at home) based on travel surveys in Honolulu.*

The Project is one of the first in the country to design and undertake an uncertainty analysis of this type of travel forecast. The uncertainty analysis evaluates the variability of the forecast by establishing probabilistic upper and lower limits of ridership projections. FTA has worked closely with the City during this effort. A variety of factors were considered in the uncertainty analysis. Given all the factors considered, the anticipated limits for guideway ridership in 2030 is expected to be between 105,000 and 130,000 trips per day, bracketing the official forecast of 116,000 riders a day used for all calculations. A unified fare structure is planned, similar to the current structure for TheBus.

By City Council's current policy, ridership on the entire transit system is expected to pay for between 27 and 33 percent of the annual operating and maintenance costs. The City

Council will adjust the fare to maintain that level of revenue. The balance of the operating costs will be part of the City's annual budget, which includes sources currently used for TheBus: Federal funding and subsidies from the City's General and Highway Funds.

The amount of service provided will be scaled to generally match the demand. If the service attracts fewer riders than expected, then less service may be provided by adjusting headways or train length, thereby resulting in lower-than-expected operating and maintenance costs. There is no plan to offer free ridership on the fixed guideway system.

- 19) *The Ala Moana Center Station will be at about a 40-foot level just Koko Head of Kona Iki Street. The 35-foot station at Ala Moana Center is a practical solution for the first construction project to serve the shopping center and area properties. In the future, when funding is available, the extension would be designed to best accommodate the possibilities available at that time. The high level option over the shopping center is still available and does not obviate the need for the 35-foot option built now. There are operating plans for the system that will continue to rely on the 35-foot station even after an extension is built.*
- 20) *As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:*
 - *Match the anticipated schedule for right-of-way acquisition and utility relocations.*
 - *Reduce the time that each area will experience traffic and community disturbances.*
 - *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*
 - *Match the rate of construction to what can be maintained with local workforce and available financial resources.*
 - *Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

Mr. Jeremy Lam
Page 8

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Subject: Rail DEIS comments

Good Day Governor Lingle, Mr. Yoshioka, and Mr. Matley,

The following is my view of the most important shortcoming of the Draft Environmental Impact Statement (DEIS) for the proposed Light Rail in Honolulu.

The environmental impact statement fails to evaluate the *extended* adverse effects on traffic and normal function in Honolulu for the *extended* duration of rail system construction activity.

On page 3-45 of the DEIS the following statement is made in the first paragraph of section 3.5, referring to the timeline for completion of the rail system construction: "These effects would be temporary and would occur between 2009 and 2018...."

The current estimated rail construction duration for the rail system is unrealistic. Several years of

2/5/2009

litigation, protest, and technical delays need to be added to the construction duration estimate in order to make it accurate. The H-3 freeway was first proposed in the 1960's and completed well over 30 years later. The H-3 did not require condemnation of nearly as many residences and businesses (if any) as the rail project will. The rail project must anticipate a significant delay due to property rights litigation alone. The H-3 encountered protests, environmental litigation, cultural and archaeological sites, and technical delays, which the rail system construction timeline should also anticipate.

As such, the DEIS should be updated to reflect an *alternative timeline* for the construction of this project. The DEIS should anticipate an *extended period* of traffic delays and other construction related impacts due to construction accidents, failures, emergencies, and negligence, all of which occur normally on Oahu due to poor soil conditions, lack of expertise, inadequate planning and/or execution, and unexpected circumstances. Extensions to deadlines due to such issues during the construction process could add a number of years to the amount of time during which Honolulu will be forced to suffer construction-related impacts.

A realistic timeline is one that anticipates problems leading to an extension of the current construction phase timeline, which the DEIS does not reference with respect to a potentially *extended period* of disruption to the normal function of Honolulu. The DEIS must account for the fact that an *extended* construction period would (and likely will) significantly increase the impact of this project on Honolulu. In fact, the timeliness of the construction of this rail system is likely THE MOST IMPORTANT ISSUE for the majority of Oahu residents at this stage in the project. The fact that the potentially *extended* duration of construction is poorly addressed in the DEIS is indicative of a lack of understanding on behalf of the DEIS authors of the perspective and priorities of Oahu residents, and of the history of mega-projects in Hawaii. Oahu residents do not want to live with rail-construction-related traffic, dust, pollution, risk to life/property, unsightliness, and noise for the next 20-30 years while the rail is being built, repaired, demolished and rebuilt, protested, cordoned off, marched on, re-routed, stayed, and otherwise delayed. Therefore delays need to be anticipated and dealt with as soon as possible. Perhaps this comment will help that process begin.

Hoping for an ahead-of-schedule completion,

Matt Lamon

Dear Mr. Lamon:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal:

The construction estimates provided in the Final EIS are related to the length of time required to complete construction of the system. Any other activities not related to construction could cause delays that would pose greater impacts to communities.

Relocations will occur early in the process. Condemnation is a last resort.

Where relocations will occur, compensation will be provided to affected property owners, businesses, or residents in compliance with all applicable Federal and State laws and will follow the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act. The mitigation measures related to relocations include the following:

- *The City will assist all affected persons in locating suitable replacement housing and business sites within an individual's or businesses' financial means.*

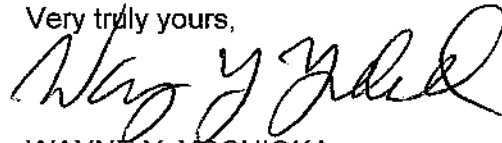

Mr. Matt Lamon
Page 2

- *A minimum 90-day written notice will be provided before any business or resident will be required to move.*
- *Relocation services will be provided to all affected business and residential property owners and tenants without discrimination; and persons, businesses, or organizations that are displaced as a result of the Project will be treated fairly and equitably.*

Section 3.5 of the Final EIS describes construction-phase effects on transportation during the approximately nine-year construction period. An "alternative timeline" for construction is not part of the Final EIS. The Project's deliverable timeframes and construction schedule are part of the contractor's proposal and become part of the binding construction contract documents. The selection of the construction contractor for the Project will be based on both qualifications and price with the evaluation of qualifications to include the examination of the contractor's prior history of meeting construction schedules for similar projects as well as an examination of recent claims history with regard to project schedules.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulustransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Issuance of the Record of Decision under NEPA and acceptance of the Final EIS by the Governor of the State of Hawaii are the next anticipated actions and will conclude the environmental review process for this Project.

Very truly yours,

WAYNE Y. YOSHIOKA

RE: Draft Environmental Impact Statement (DEIS)

Dear Sir or Madam:

As CPA's, we support viable and affordable traffic solutions for the City and County of Honolulu. We find several flaws regarding funding for the proposed rail project currently estimated to cost \$5.5 billion for the airport route adopted on January 28, 2009 and summarized in Section 6 of the Draft Environmental Impact Statement (DEIS). We believe these flaws are of such magnitudes that not only will this project be neither viable nor affordable; this project will jeopardize our City and County's financial health and sustainability.

How realistic are the funding assumptions?

The basis for funding the proposed rail system is a 1/2% excise surcharge assessed on county transactions from January 1, 2007 to December 31, 2021. Using the City's figures provided in Section 6 of the DEIS, this surcharge needs to generate a minimum of \$4.1 billion. The cash flow statement of the DEIS includes surcharge tax collections through 2023, two years past the 2021 collection expiration date provided by law. When the taxes for the additional two years are deleted from the City's projection, the required collections are short by \$473.5 million [Exhibit A].

The collections from January 2007 to December 2008, total \$294 million, substantially below the City's projections. It would require a minimum tax growth rate of 9.46% every year for thirteen [13] years [Exhibit B]. Based on the Honolulu's economic history and the current global economy, this growth rate is unattainable.

What do the economists say?

The Council on Revenues [the economic board that provide forecasts of tax revenues to the Governor and State Legislators] issued new tax collection forecasts on January 12, 2009 [Exhibit C.] The forecast for growth in Hawaii tax revenues for 2009 through 2015 are -3.1%, 1%, 3.5%, 5.3%, 6%, 6.5%, and 6.5%. Using these forecasts, it would require an increase, compounded annually; in collections of 25.29% from 2016 to 2021 [Exhibit D]. These forecasts do not include the additional cost for borrowing funds due to the shortfall in surcharge tax collections. This rate of required growth in tax collections is unattainable based on our economic history.

The funding should be based on the economic realities and reasonable factors:

1. 2007 and 2008: The actual surcharge collections
2. 2009 through 2015: The Council on Revenues forecasts
3. 2016 through 2021: Using a 6.5% growth rate of collections

Based on the above assumptions, the City will experience a **\$1.26 billion shortfall** by the year 2021 [Exhibit E].

How much will the federal government contribute?

The DEIS estimates this rail project will cost approximately \$5.5 billion, with \$ 1.4 billion to be provided by the U.S. Department of Transportation. The federal funds are to be paid through their "New Starts" grants in the amount \$200 million per year for seven [7] consecutive years. The 2009 budget for "new starts" is \$1.475 billion for 30 grants that were selected from mass transit program applications from municipalities nationwide. The average grant is \$47 million with two-thirds [2/3] of the grants going to cities with populations averaging 5.4 times the size of Honolulu. The average grant for smaller cities such as Honolulu is \$23.5 million. There is great competition for these grants. The DEIS assumption that Honolulu will successfully obtain 1/7 of the country's mass transit budget for seven consecutive years is unrealistic and not viable.

What are the risks?

- Honolulu could have a rail system that is never completed. With no monies available to complete the project, the useless concrete pillars will be a monument to an irresponsible act that will mar our landscape for years to come.
- Honolulu's credit rating could plummet resulting in higher unbudgeted costs for interest on borrowed funds.
- Residents could face tax increases to pay for the shortage that will put undue economic pressure on them and future generations.
- Honolulu could be bankrupt due to all the debt that even future generations cannot service.

The City and County of Honolulu has a duty to its residents and taxpayers to act appropriately and prudently when committing our resources to traffic solutions. **The solutions must be viable and affordable.** We await your response to our concerns.

Mr. David Latham
735 Bishop Street, Suite 432
Honolulu, Hawaii 96813

Dear Mr. Latham:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The Final EIS includes General Excise and Use Tax (GET) surcharge collections through December 31, 2022, in accordance with City Ordinance 05-027 which established the 0.5 percent County surcharge on the GET through this date. As shown in Table 6-4 in the Final EIS, the net GET surcharge revenue will equal \$3,524 million (YOE \$). The analysis in Chapter 6 of the Final EIS takes the current economic downturn into account.

Section 6.6 of the Final EIS discusses risks and uncertainties associated with the funding assumptions for the Project. A subsection under Section 6.6.3 has been added since the Draft EIS was published to address the Council on Revenues' forecasts. As stated in this section, in the short-term, GET surcharge revenues are subject to uncertainties related to the magnitude and timing of the economic recovery on Oahu. Over the long-term, GET surcharge revenues on Oahu depend on a variety of underlying economic factors outside of the City's control that may result in a higher or lower projection than the one used in this EIS.

Mr. David Latham
Page 2

While GET surcharge collections have gone down, so too have the costs of the Project. However, if GET surcharge revenues and/or Federal funding are not sufficient to meet the cash-flow requirement to cover capital expenditures, other potential revenue sources will be developed to close the funding gap.

The financial plan is balanced for the entire Project so there will not be a situation in which only a portion of the system will be built. If there is a shortfall, additional revenue sources will be identified. As noted above, Section 6.6 of the Final EIS discusses risks and uncertainties, as well as the potential sources to cover shortfalls.

The magnitude and timing of Federal funding is one source of risk that is discussed in Chapter 6 of the Final EIS. Density and transit use in the corridor are among the highest in the nation and higher than most areas that have qualified for New Starts funding in recent years. This Project has been developed in coordination with FTA since its inception. There is no indication to suggest that the Project will not qualify for the Federal funding requested.

The financial plan was developed in consideration of safeguarding the City's credit rating in light of the likelihood of General Obligation bond sales required to bridge any year-by-year funding shortfalls, with all debt service costs paid with GET surcharge revenues, because FTA Section 5309 will pay for some financing costs. The New Starts funds are also proposed for a significant increase in the latest Federal budget proposal. Further, there has been no indication from the FTA that the requested amount is unreasonable or unrealistic.

As discussed in Section 6.4.2 of the Final EIS, the City's contribution to transit operation and maintenance is currently funded through Federal funding, fare revenues, and the City's General and Highway Funds. This funding will be used to fund operating and maintenance costs of the Project. The General Fund includes property tax revenues and other taxes and fees. Beyond collection of property taxes that fund City operations, for which the City develops rates on an annual basis and part of which will fund transit services, there is no anticipated impact to property taxes. Fixed guideway operation costs will represent between 2 and 3 percent of the City's annual operating budget. Property tax revenues are not expected to be used to fund construction of the Project.

The financial plan is structured to ensure Honolulu will not go bankrupt. The debt amount is a minor part of the Project at less than 10 percent.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Dear Mr. Lantry:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

Comments on the State of Hawaii's transportation plans should be directed to the Hawaii Department of Transportation.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulustransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

These comments to the DEIS are my own informed opinion based on a long association with this project as a consultant for Itochu International Inc. Full disclosure, I am employed by this proponent for the HSST Urban Magnetic Levitation Train. These are my comments and not the comments of Itochu International Inc. or any associated company. When I first visited Mr. Toru Hamayasu in early 2007 the City plan was to have an open performance specification that would not be for any one technology, and allow technology suppliers and possibly turnkey teams to bid competitive systems. This was an attractive approach and many suppliers, Steel Wheel on Steel Rail, Rubber Tire on Concrete, Monorail and Maglev were interested.

The DEIS includes a short report of the technology selection panel. Before this panel was selected, the Mayor made up his mind that he favored SWSR technology. From that point on, the whole process was arranged and the public "outreach" was co-opted to promote the Mayor's choice.

The candidates and members of the panel were handpicked by the Mayor's management consultants. A requirement was added that the technology had to be limited to one type of fixed guideway technology to insure competitive proposals. This was not necessary if the City allowed different technologies to compete against each other. The panel met only once before a decision was made, and no meaningful discussion was allowed under the pretext of freedom of information and open public information. Instead of scheduling meetings, the panel made quick recommendations, and even before the recommendations were made, the Mayor's consultants were writing the recommendation, and extracting a few bullets from the panel's notes to present to the public. The panel was loaded with Steel Wheel proponents and even with people that had conflicts working for and with SWSR proponents. In our case, the panel did not understand or know the maglev technology being proposed and confused it with other high speed maglev technologies.

The "outreach" program was diverted to support the SWSR selection and more than \$2 Million of public money was spent promoting the SWSR decision, even before the City Council deadlocked on approving the technology choice. Instead of resolving this City Council impasse with more information or opening the competition, the Mayor and City pressed on with SWSR to make the scheduled imposed by the Mayor. This "outreach" program continued through the election and public vote on technology.

My major objection to the DEIS is this is supposed to be an environmental impact statement of the transit system. The technology is the most important decision regarding this impact. If the technology is limited to SWSR, as it has in this study document, then the public and taxpayers do not get a proper assessment of alternatives, only the

comparison made against buses and HOV lanes.

This study does not evaluate and study the possible benefits of lower noise, smaller guideway footprint, and lower maintenance cost possible with a system such as our HSST Urban maglev. This can also be said to some extent for a Monorail and for Rubber Tired systems. The City invited suppliers to compete and did not do a proper job in evaluating the environmental impact within this document.

As I write this the City has already solicited bids for the first guideway section for the SWSR system, again without the benefit of a final EIS. It is disappointing that the Oahu residents and taxpayers will not get the best system. The taxpayer will pay more for this system than they would if the technology was open for competition, even if the final decision was SWSR. The public deserves to see a complete environmental comparison.

Sincerely,

Frank Latino

Dear Mr. Latino:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As noted in Chapter 2 of the Final EIS, the selected transit technology would be electrically powered, industry-standard steel wheel on steel rail powered from a third-rail system. The Draft EIS fully evaluates the selected technology. As stated in Section 2.2.3 of this Final EIS, the NEPA Notice of Intent requested input on five transit technologies. A technical review process included the opportunity for public comment and was used in parallel with the alternatives analysis to select a transit technology. The process included a broad request for information that was publicized to the transit industry. Transit vehicle manufacturers submitted 12 responses covering all of the technologies listed in the Notice of Intent. An independent five-member technology panel composed of four transit experts and a transportation academic appointed by the City Council evaluated guided rubber-tire-on-concrete systems (e.g., Phileas bus system and VAL-type systems), monorail (which is a variation on rubber-tyred technology), steel-wheel-on-steel-rail systems, (e.g., light rail and rapid rail), and magnetic levitation

Mr. Frank Latino
Page 2

(MAGLEV) . The panel considered the performance, cost, and reliability of the proposed technologies.

Proprietary technologies, meaning those technologies that would have required all future purchases of vehicles or equipment to be from a single manufacturer, were eliminated because none of the proprietary technologies offered substantial proven performance, cost, and reliability benefits compared to steel wheel operating on steel rail.

The panel accepted public comment twice as part of its review. By a four-to-one vote, the panel chose a steel wheel vehicle operating on steel rail system because it was considered safe, reliable, economical, and non-proprietary. Those results are documented in the panel's report to the City Council dated February 22, 2008 entitled "Independent Technology Selection Panel Report".

The single operating urban magnetic levitation system has a maximum speed of 100 kilometers per hour (62 miles per hour) which is similar to the maximum operating speeds of 50 to 60 miles per hour for steel wheel on steel rail systems. While the system is inherently quieter, other systems may be designed to match the noise level of magnetic levitation when in operation. There is no specific safety improvement from the traction design. The assumed visual benefits for beam-track vehicles would not apply in the U.S. because of requirements to include an emergency egress walkway. Also, the smaller structures proposed in the comment result in shorter span-lengths, which increases the number of columns required and the percentage of view blocked by support structure. There is a single operating urban magnetic levitation system in the world, in Japan, which opened for operation in 2004. No comparative project has ever been built within the U.S. Therefore, no data is available to support a cost estimate. Some of the savings recognized in other countries for beam-track vehicles would not apply in the U.S. because of requirements to include an emergency egress walkway. Also, the smaller structures proposed in the comment result in shorter span-lengths, which increases the number of columns required and the cost to construct both the additional foundations and columns. With no comparative data available to support an operating cost estimate, there is no means to verify this statement. The HSST system operators have declined to make operating expenses available.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Dear Mr. Lauu:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

Your preference for a Fixed Guideway Transit Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the

Mr. Leama Lauu, Jr.
Page 2

alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Submission Content/Notes : I was just looking at the rail route from the pdfs on this website and just wanted to know if there were going to be any more public presentations for the rail project. Kind of like the neighborhood meetings they have on OIelo (Ch. 49 on basic cable). My main concern was the current issue to change the route from the Salt Lake route to the Pearl Harbor/Airport route, and I just wanted to voice some concern or see what the reasoning is on both sides of the debate. Basically, I'm all for the airport, but why Pearl Harbor? There's a much larger population to address in the Salt Lake area opposed to Pearl Harbor (and the bus ride from Stadium to Pearl Harbor isn't that long) but at the same time, the airport makes sense once the Waikiki extension is completed.

And how long until the extensions to Manoa and Waikiki are started on/completed?

Thanks, and keep up the great work guys.

Mr. Andrew Le
Page 2

EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The proposed future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of this Final EIS. The future extensions are not part of this Project, thus they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and the National Environmental Policy Act (NEPA). Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in this Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

THE LEAGUE
OF WOMEN VOTERS OF HONOLULU

February 6, 2009

Mr. Wayne Y. Yoshioka
Department of Transportation Services
City and County of Honolulu
650 South King Street, 3rd Floor
Honolulu, HI 96813
808-768-8303
Email: wyooshioka@honolulu.gov

Dear Mr. Yoshioka:

Attached are our comments on the Draft Environmental Impact Statement for the Honolulu High Capacity Transit Corridor Project. We have severe reservations about this project and particularly with the Draft EIS which we feel to be inadequate.

We respectfully request that a Supplemental DEIS be prepared that addresses the issues we raise and those raised by others before the DEIS becomes final. We also request that the Supplement be available as a printed copy for whoever requests it. DVDs are admirable but they are not a substitute for the written word. Too many people do not have computer capabilities and are unjustly excluded from the public participation process. Even those of us who have computers do not necessarily have an office-sized printer that can handle 11 x 17 paper which means we cannot print out the many maps for this project.

Thank you for this opportunity to comment.

Sincerely yours,

Piilani Kaopuiki, President
League of Women Voters of Honolulu

Process

The draft EIS for the rail transit project has been made available on the web. It is also provided on a DVD disk. When we asked for a hard paper copy for the League of Women Voters to review, we were told it would cost us \$59. When we looked at a copy in the library we could understand why. There are many colored illustrations and foldout maps. But that is exactly the point! These can only be printed on a large office printer that can use 11" x 17" paper. The League doesn't have such a printer and most people don't. Not to mention the burden of the cost of color cartridges for ink jet printers!

This is so ridiculous! Many of our members and the general public are not computer literate – they need something they can hold in their hands and read. Even we who are used to using computers need to print out pages that need close attention.

We think that some of the money that went into producing this beautiful document could have been allocated to a less expensive book that was made widely available to people who want to read it. And considering all the money that has been spent in promoting the rail project, even printing a lot of copies of the expensive version would have not been that outrageous.

If you want the public to participate, you have to make it easy. Otherwise, it is just a shibai. We think the City should stop the whole process and start over again, making a printed copy of the DEIS available to everyone who wants one. It should certainly make printed copies of the Supplement to the DEIS that we request available to anyone who wants one.

Chapter 01: Background, Purpose and Need

The Department of Business, Economic Development and Tourism (DBEDT) 2030 population projection series was used in the DEIS. However, DBEDT issued its 2035 population projection series in January 2008 which is lower than the 2030 series figures for Oahu. The lower figures would have an impact on transit ridership and employment.

The U.S Census Bureau's annual estimates of the population for Oahu from 2000 to 2007 were lower than the DBEDT 2030 population series for that period. Estimates are improvement over projections. The average annual growth rate of the census estimates between 2000 and 2007 was much lower than both the 2030 and 2035 DBEDT annual growth rates for this period. If this continues to 2030, then our population would be lower than 2030 and 2035 population series have projected.

Since early 2008, Honolulu has been in a recession, which has caused a decline in tourism and employment, thus reducing in-migration. The Supplemental DEIS must cover these points.

Chapter 2: Alternatives Considered

The Managed Lane alternative was given insufficient consideration. Cost assigned to this alternative was grossly inflated. Ridership projection was unrealistically low. The improvement to bus service resulting from this alternative was dismissed, resulting in too small a projected benefit.

Why does the train start in Kapolei? The stated reason of starting at the maintenance facility is inadequate. Every other new system was started in the city, where the riders are. Washington, DC, experienced unexpected revenue from midday riders going to lunch. How did other systems cope with the distance from maintenance?

The descriptions of the planned rail stations are inadequate:
How high will the Ala Moana station be?
Will there be restrooms in any of the stations?
In the illustrations, mezzanines (in the text) are called concourses. Or are these 2 different things?

Chapter 4

Environmental Justice Sections 4.6.5 Banana Patch Community and 4.6.6 Mitigation

The DEIS notes that this is a multi-generational community in the area bordering Waipahu and Pearl City. Residents who are primarily of Asian extraction and poor occupy it. It is also the place designated for the Pearl Highland park-and-ride lot that will serve the Pearl Highlands Station. All of the Build Alternatives would displace residences, including single-family homes, businesses and one church.

This section concludes, "Impacts to the Banana Patch community suggest a disproportionate effect on community cohesion and isolation in addition to the relocation effects. The displacement of residences could result in social interaction or sense of community, stability, and psychological unity by removing residents who have resided in the same community for generations. Due to the high cost of living and available land, it is unlikely that residents would be co-located in another area of the city." In other words, the residents so dislocated have no place to go. It will be hard enough to relocate the families individually who will most likely join the ever-increasing ranks of the homeless.

Under 4.6.6 Mitigation it is stated, "The identification of a disproportionately high and adverse effect on EJ populations does not preclude a project from moving forward if a mitigation measure that would avoid or reduce the disproportionately high and adverse effects are not practicable." The document further states that since the project would not result in disproportionately high and adverse impacts within the Oahu metropolitan planning EJ areas, no specific mitigation measures to reduce impacts are warranted. Again, in other words, tough luck. As long as you don't wipe out a really big hunk of low-income areas, you don't have to worry about destroying small areas, no matter how poor or desperate the residents may be.

If we remember correctly, the City's response to the protests against urban renewal in Chinatown with widespread displacement of poor people was, since there was no other affordable place to move them to, the displaced simply had to accept it. Fortunately People Against Chinatown Evacuation (PACE) was formed and wielded enough pressure that the project was abandoned.

It is bad enough that we have a throwaway society as far as material things are concerned. There is no way we can justify throwaway people. If you cannot mitigate bad effects, you don't proceed!

Elsewhere in the document re-alignments are suggested to save historic buildings. But no such measures are considered necessary when it is only poor people that are in the way of the train or a parking lot!

We believe the mitigation measures in this case are totally inadequate. Either the plan should be changed or the residents suitably relocated.

Visual and Aesthetic Conditions, 4.7

The rail transit system will be highly visible and generally unsightly. We note that each station will have one, two, or three platforms, each 300 feet long and a minimum of 12 feet wide. Center platforms will be a minimum of 30 feet wide. These are huge! The most deleterious impacts will be on existing buildings where the train comes close, blocking views, light, and air. The overall impact on the island of Oahu will be such that it is certain to have an adverse impact on tourism, our main economic industry. Who will want to visit a "tropical paradise" that is just as ugly, if not uglier, than the place you live?

The DEIS presents many simulated viewpoint figures that are useful in projecting the visual impacts of the project. However, the last figure in the series Figures 4-17 through 4-36 is of the station near Mother Waldron Park near Halekauwila and Cooke Streets. There is no figure for the station at Ala Moana Center. Please include one in the Supplemental Draft/Final EIS. There are also no descriptions of the planned future stations on the routes to the University of Hawaii and Waikiki. Including these in the Supplemental Draft/Final EIS would be helpful.

The DEIS notes that the Chinatown station will be 30 feet above street level and that other stations in the downtown area will block views from the fourth and fifth story windows. In the Supplemental Draft/Final EIS, please indicate the actual dimensions and the elevation above street level of each station in the text accompanying the figures.

Chapter 06: Cost and Financial Analysis

The declining economy is a major concern that affects this project. The Supplemental DEIS should address the following points:

If the revenue of the general excise and use tax surcharge declines, what steps will the city take to make up the shortfall? Already, citizens are decreasing their spending. How will this affect the capital costs?

If Queen Street replaces Halekauwila Street as part of the transit route, how will this impact transit cost?

Does Federal Transit Administration contingency allocation take into consideration a recession

Ms. Piilani Kaopuiki, President
League of Women Voters of Honolulu
49 South Hotel Street, Room 314
Honolulu, Hawaii 96813

Dear Ms. Kaopuiki:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Process

The Draft EIS was available in hard copy for public review at local libraries and City offices to accommodate those individuals that do not have computer access. It was provided for free on disk, by request, to assist users in searching the document. Due to cost constraints, the number of printed copies was limited. However, bound printed copies were available at cost to anyone who requested one from the City. The use of 11-by-17 inch pages and color in the document allowed maps to be reproduced at a readable resolution and photographs and other figures to convey information about the Project and its impacts. The Final EIS is being widely distributed in an electronic format to maximize public review and to allow the public to understand its contents.

Chapter 1—Background, Purpose and Need

The EIS uses the socio-economic data that was available from OahuMPO at the time that the EIS work began, based on DBEDT's "Population and Economic Projections for the State of Hawaii to 2030" prepared in August 2004. The 2030 forecast year used in the EIS is consistent with FTA's guidance for New Starts projects.

As the comment notes, DBEDT has prepared new forecasts at the County level, "Population and Economic Projections for the State of Hawaii to 2035" issued in January 2008. For use in travel forecasting, these County-level forecasts must be disaggregated to the level of "Travel Analysis Zones" of which there are 764 on Oahu. At the time of the publication of the Draft EIS, these zonal-level forecasts had not been prepared and accepted by OahuMPO.

Your comment notes that the January 2008 DBEDT forecasts have lower population projected than the August 2004 forecasts. Specifically, the January 2008 population forecast for Oahu for 2035 is 3.3 percent lower than the August 2004 forecast. However, the 2035 employment forecast for Oahu from the January 2008 forecasts is 5.8 percent higher than the August 2004 forecast. Thus, it is not clear what the effect on ridership projections would be of using the January 2008 forecast, since the higher employment forecast would likely result in more work trips, which are attractively served by transit, while the lower population forecast would likely result in fewer trips for other purposes.

The financial information contained throughout Chapter 6 of the Final EIS, including in the capital cost analysis in Section 6.3, recognizes the change in economic conditions since the Draft EIS was issued and reflects reduced General Excise and Use Tax (GET) surcharge collections and lower costs of some materials. A statement to that effect is presented in Section 6.1 of the Final EIS. Since economic conditions are continually changing and a snapshot in time will only be valid for that time, the financial plan for the Project is a dynamic document and will be updated periodically to reflect the latest conditions as the Project continues. The plan assumes there will be ups and downs in the economy and is designed as a long-term strategic document that will weather short-term trends. Moreover, the financial plan is reviewed by the FTA under strict guidelines to ensure forecasts of costs and revenues (both capital and operating) are reasonable and that the plan is fiscally viable. Section 6.6 of the Final EIS describes risks and uncertainties associated with the funding assumptions.

Chapter 2—Alternatives Considered

In Chapter 2 of the Alternatives Analysis Report (DTS 2006b), as well as in Chapter 2, of the Final EIS, two options were considered for the Managed Lane Alternative—Two-direction and Reversible. This alternative would have provided a two-lane elevated toll facility between Waipahu and Downtown Honolulu, with variable pricing strategies to maintain free-flow speeds for transit and high-occupancy vehicles (HOVs). The Two-direction Option would have served express buses operating in both directions during the entire day. To maintain free-flow speeds in the Two-direction Option, it might be necessary to charge tolls to manage the number of HOVs using the facility. For the Reversible Option, three-person HOVs would be allowed to use the facility for free, while single-occupant and two-person HOVs would have to pay a toll. The Reversible Option was found to be optimal.

The findings are summarized in Section 2.2.2 of Chapter 2 of the Final EIS as follows: "The Managed Lane Alternative was evaluated for its ability to meet project goals and objectives related to mobility and accessibility, supporting planned growth and economic development, constructability and cost, community and environmental quality, and planning consistency. While this alternative would have slightly reduced congestion on parallel highways, system-wide traffic congestion would have been similar to the No Build Alternative as a result of increased traffic on arterials trying to access the facility. Total islandwide vehicle hours of delay would have increased with the Managed Lane Option compared to the No Build Alternative, indicating an increase in system-wide congestion" (see Table 2-2 of the Final EIS).

The Managed Lane Alternative would not have supported planned concentrated future population and employment growth because it would not provide concentrations of transit service that would serve as a nucleus for transit-oriented development (TOD). The Managed Lane Alternative would have provided little transit benefit at a high cost. The cost-per-hour of transit-user benefits for the Managed Lane Alternative would have been two to three times higher than that for the Fixed Guideway Alternative. Similar to the Transportation System Management (TSM) Alternative, the Managed Lane Alternative would not have substantially improved service or access to transit for transit-dependent communities. No funding sources were identified for the Managed Lane Alternative. Toll revenues from the Managed Lanes Alternative would pay for ongoing operations and maintenance while remaining revenues would be used to repay debt incurred to construct the system.

The Managed Lane Alternative would have generated the greatest amount of air pollution, required the greatest amount of energy for transportation use, and would have resulted in the largest number of transportation noise impacts of all the alternatives evaluated. Because the Managed Lane Alternative would have served a shorter portion of the study corridor (approximately 16 miles compared to the 20 miles served by the fixed guideway), it would have resulted in fewer displacements and would have impacted fewer archaeological, cultural, and historic resources than the Fixed Guideway Alternative. The Managed Lane Alternative would not have affected any farmlands. Visually, the elevated structure would have extended a shorter distance, but it would have been more visually intrusive because its elevated structure, with a typical width of between 36 and 46 feet, would have been much wider than the Fixed Guideway Alternative.

As stated in Table 2-2 in Section 2.2.2 of Chapter 2 of the Final EIS, as well as in Chapter 2 of the Alternative Analysis Report (page 2-16), the total capital costs for the Managed Lane Alternative would range between \$3.6 and \$4.7 billion, of which \$2.6 to \$3.8 billion would be for construction of the managed lanes. As stated in the City's Transit Task Force Report, a committee was charged with reviewing cost estimates for the two Alternatives involving construction (Managed Lane Alternative and Fixed Guideway Alternative). The report states that "the Task Force agrees with this committee that the Alternatives Analysis' construction cost estimates were fairly and consistently prepared, and that they may be used for both planning and cost comparisons." Information was obtained by the Task Force from the Hawaii Department of Transportation and others familiar with high-occupancy toll (HOT) facilities. The transit operating costs for the Managed Lane Alternative would range between approximately \$251 and \$261 million as a result of additional buses that would be put in service under that alternative. These costs do not include the cost of maintaining the managed lane facility.

By contrast, as noted in Table 6-2 of Chapter 6 of the Final EIS, the capital cost of the Fixed Guideway Alternative, including bus system and TheHandiVan costs, would be \$6.5 billion in year-of-expenditure dollars. Total operating and maintenance costs for the Fixed Guideway Alternative, including bus, TheHandi-Van and fixed guideway, would be approximately \$489 million in year-of-expenditure dollars.

After the Alternatives Analysis phase was completed, several scoping comments were received requesting reconsideration of the Managed Lane Alternative that was considered and rejected during the Alternatives Analysis. Because no new information was provided that would have changed the findings of the Alternatives Analysis regarding the Managed Lane Alternative, it was not included in the Draft EIS for further consideration.

The Fixed Guideway Alternative would be more cost-effective in the long run. As stated in Chapter 6 of the Final EIS, funding sources for the capital investments include a GET surcharge, City general obligation bonds, and FTA funds. Only the Fixed Guideway Alternative could be funded with the GET surcharge. GET is expected to generate \$3.5 billion through 2022, and the FTA has agreed to consider at least \$1.4 billion as a Federal contribution to the Project under the New Starts program. No funding sources were identified for the Managed Lane Alternative toll revenues from the Managed Lanes Alternative would pay for ongoing operations and maintenance. Any remaining toll revenues would be used to repay debt incurred to construct the system, but other undefined sources of funding would be needed to pay for construction.

As described in Section 2.5.10 in Chapter 2 and further in Section 8.6.9 in Chapter 8 of the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable property. No location has been identified closer to Downtown with sufficient available property to construct a maintenance and storage facility; therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- Reduce the time that each area will experience traffic and community disturbances.*
- Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*
- Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- Balance expenditure of funds to minimize borrowing.*

The portion of the corridor Ewa of Pearl Highlands is less developed than the areas Koko Head. Therefore, the right-of-way can be obtained more quickly, which will allow the overall project construction to begin sooner, resulting in lower total construction costs. Construction is planned to continue uninterrupted Koko Head from Pearl Highlands to Aloha Stadium, then Kalihi, and finally to Ala Moana Center. Transit systems are typically connected

to a maintenance site at the time they open for operation to allow proper management of rolling stock and systems.

Appendix B of the Final EIS includes detailed project plans and a system profile. The Ala Moana Center Station platform will have an elevation of approximately 35 feet above the existing ground. The stations will have restrooms accessible to the public, but individuals will be required to obtain access to these facilities from the station attendant. In the Draft EIS, the terms mezzanine and concourse were used interchangeably. For the Final EIS, the term concourse is used for ease of reference and to cut down on any potential confusion.

Chapter 4—Environmental Analysis, Consequences, and Mitigation Environmental Justice Sections 4.7.5 and 4.7.6, Banana Patch Community and Mitigation

Regarding Banana Patch, the Final EIS has been revised to reflect public outreach coordination with this community during the Draft EIS comment period. As discussed in Section 4.7.4, the City has been coordinating with residents of the Banana Patch community since October 2008. Every household has been visited by City staff, right-of-way staff, and engineering staff to discuss the Project, as well as special needs and relocation assistance for residents who will be displaced. Strategic outreach was conducted for this neighborhood, and it was found the residents were mostly interested in learning more about the right-of-way acquisition process. Residents asked when acquisition might occur, how their property would be appraised, and how soon they might receive compensation. Residents of the community did not object to being relocated to decent, safe, and sanitary housing. Because the City has to comply with the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act, all residents will be relocated to decent, safe, and sanitary housing. No resident of the Banana Patch or resident in any other community within the study area will be left homeless due to the Project.

In addition, no concerns were expressed during Banana Patch outreach meetings about keeping the community intact for relocation purposes. Because the Pearl Highlands Station will displace this community, the location of the station and associated facilities was examined under the USDOT Order on Environmental Justice (Order 5610.2). First, the need for the station was examined. Analysis showed that this station is projected to have the second highest passenger volume of all of the project stations. It will serve as the transfer point for all users in Central Oahu, whether they drive or take TheBus. As such, there is substantial need for the Pearl Highlands Station.

Secondly, two alternatives to the guideway and highway ramp alignments, station locations, and park-and-ride locations for the station were evaluated to access feasibility. One alternative would move the park-and-ride to Leeward Community College. This modification would require a number of changes. The net increase in cost for this alternative would be approximately \$90 million. The second alternative considered moving the park-and-ride to the Hawaii Laborers Training program site. This change would prevent the placement of a track switch to access the maintenance and storage facility site near Leeward Community College in the Koko Head direction, which would make this maintenance and storage facility site impractical. The net increase in cost for this alternative would be more than \$63 million.

In conclusion, relocating the park-and-ride facilities under either of the two alternatives would provide less efficient transportation access and circulation to the park-and-ride.

Moreover, displaced residents of the Banana Patch community did not voice opposition to the Project, did not express concern about the adverse effects, and appeared satisfied with mitigation measures with regard to relocation. As such, the Project will not result in disproportionately high or adverse impacts to the Banana Patch community.

Where relocations will occur, compensation will be provided to affected property owners in compliance with all applicable Federal and State laws and would follow the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act (49 CFR 24). The following measures will be implemented for relocations:

- The City will assist all affected persons in locating suitable replacement housing or businesses within an individual's financial means.*
- A minimum 90-day written notice will be provided before any business or resident will be required to move.*
- Relocation services will be provided to all affected businesses and residential property owners and tenants without discrimination; persons, businesses or organizations that are displaced as a result of the Project will be treated fairly and equitably.*

Visual and Aesthetic Conditions Section 4.8

The island's unique visual character and scenic beauty was considered in the visual and aesthetic analysis presented in the Final EIS. The Project will be set in an urban context where visual change is expected and differences in scales of structures are typical. The following measures will be included with the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

- Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
- Coordinate the project design with the City's TOD program within the Department of Planning and Permitting.*
- Consult with the communities surrounding each station for input on station design elements.*
- Consider specific sites for landscaping and trees during the final design phase when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will serve to mitigate potential visual impacts.*

It should also be noted that the Project will provide users, including tourists, with expansive views from several portions of the corridor by elevating riders above highway traffic, street trees, and low structures adjacent to the alignment. In Section 4.8.3 of the Final EIS under the heading Design Principals and Mitigation, specific environmental, architecture, and landscape design criteria are listed that will help minimize visual effects of the Project.

As stated in Section 4.8.3 of the Final EIS, "The Ala Moana Center Station will be at the end of the Project. The station and the guideway will be located between the Ala Moana Center and mid- to high-rise buildings and will not substantially change the view from adjacent offices and residences." Additional simulations were conducted for specific views. As there are no protected views planes in the Ala Moana Station area, additional simulations were not developed for this station. Additional simulations were conducted after the Draft EIS and are included in the Final EIS. These include Figures 4-39 through 4-41 and 4-44 through 4-50. Visual simulations of the Project were developed for 19 representative viewpoints that will be affected by the Project to illustrate commonly experienced visual effects. The locations of these viewpoints are shown on Figure 4-16. The simulations (Figures 4-20 through 4-38) depict the guideway and other project elements to illustrate the facilities' sizes and positions but do not include detailed design features. For stations, they show a typical prototype without design detail because station configurations and finishes have yet to be developed, and input will be considered from communities surrounding each station through the Final EIS and design processes.

The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS. However, the future extensions are not part of this Project; thus, they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions and their relative stations (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the extensions are proposed for implementation in the future, environmental analysis of the extensions and their stations and appropriate alternatives will be undertaken at that time.

The actual dimensions of each station will be determined during the final design phase, but they will generally be about 30 feet above the ground unless special conditions prevail. The station's touchdown elements that house stairways, escalators and elevators will vary in size and design, and will be the subject of workshops that are being held with the public. The City is conducting workshops with communities that will have rail stations. The purpose of the workshops is to engage the public about rail stations and provide opportunities to residents and businesses to contribute ideas about the appearance of station entryways in the surrounding areas. Ideas generated at the workshops will be incorporated into the station design process. The simulations included as figures in Section 4.8 of the Final EIS represent the range of scale and spatial relationships of project elements to surrounding land uses and structures, so that the visual effects of the Project can be determined. The visual effects of the Project are documented in this section of the Final EIS.

Chapter 6—Cost and Financial Analysis

The capital plan for the Project is presented in Section 6.3 of the Final EIS, and includes a description of the amount of funding anticipated from various sources. This financial plan and analysis take the current economic downturn into account. Section 6.6 of the Final EIS

describes risks and uncertainties associated with these funding assumptions and how a shortfall in revenue could be handled.

A Queen Street alignment was evaluated at two stages in the Alternatives Analysis process. This alignment had significant visual impacts, impacts on historic properties, impacts on street traffic patterns, and severe engineering constraints and was not brought forward into the Draft EIS. It is not a replacement for Halekauwila Street.

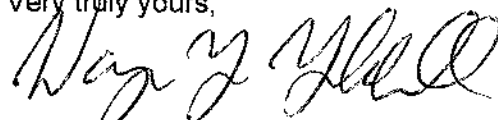

As stated in Chapter 6, page 6-3 of the Alternatives Screening Memorandum, an alignment along Queen Street, rather than Halekauwila Street, had been proposed for screening. Following initial scoping of the alternatives and further engineering analysis, however, it was determined that the Queen Street alignment might not prove to be feasible. As noted in the Alternatives Screening Memo (page 6-3), "The elevated alignment [along Queen Street] would have to pass very near high-rise buildings in some locations. Locating stations within the physical constraints of this alignment is a particular challenge."

Both the Queen Street and the Halekauwila Street alignments were advanced to the Alternatives Analysis. The Queen Street alignment would have direct, significant impacts on a number of historical resources. The Queen Street alignment would also have significant visual impacts on an historic area of Downtown. As noted in the Alternatives Analysis (Pages 6-4 and 6-5), "The Queen Street alignment would have somewhat greater negative visual impact because the narrow available right-of-way would require a stacked alignment in the Downtown area and because it would cross between Hale Auhau and the rest of the Hawaii Capital Historic District. The Nimitz Highway/Halekauwila Street/Kapiolani Boulevard alignment would be the best alignment option within Section V." As a result, the Queen Street alignment did not advance from the Alternatives Analysis to the Draft EIS, and no cost estimate was prepared. Contingency amounts estimated for the capital cost of the Project are intended to account for additional costs that are currently unknown but which are reasonably expected to occur.

In the event of an economic recession, it is likely that construction costs will decline, or at least will not escalate at as high a rate as would be the case in the absence of a recession. Thus, contingency amounts estimated for the Project could be larger than needed. As discussed above, the financial plan is a dynamic document that will be revisited to respond to changing conditions. FTA reviews the estimate regularly using third party specialists and has found the cost estimate to be sound.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Dear Faanati Leano:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the

Faanati Leano
Page 2

Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

Your preference for a Fixed Guideway Transit Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically

Ms. Nadia Leano
Page 2

supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Dear Mr. Curtis:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS should focus on the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Life of the Land Comment 1

As stated in Section 2.2 of the Final EIS, prior to selecting an elevated fixed guideway system, a variety of high-capacity transit options were evaluated during the Primary Corridor Transportation Project (1998—2002) and Alternatives Analysis. Options evaluated and rejected included an exclusively at-grade fixed guideway system using light-rail or bus rapid transit (BRT) vehicles, as well as a mix of options consisting of both at-grade and grade-separated segments.

The Alternatives Screening Memorandum (DTS 2006a) recognized the visually sensitive areas in Kakaako and Downtown Honolulu, including the Chinatown, Hawaii Capital, and Thomas Square/Honolulu Academy of Arts Special District. To minimize impacts on historic resources, visual aesthetics, and surface traffic, the screening process considered 15

combinations of tunnel, at-grade, or elevated alignments between Iwilei and Ward Avenue. Five different alignments through Downtown Honolulu were advanced for further analysis in the Alternatives Analysis, including an at-grade portion along Hotel Street, a tunnel under King Street, and elevated guideways along Nimitz Highway and Queen Street (Figure 2-4).

The Alternatives Analysis Report (DTS 2006b) evaluated the alignment alternatives based on transportation and overall benefits, environmental and social impacts, and cost considerations. The report found that an at-grade alignment along Hotel Street would require the acquisition of more parcels and could potentially affect more burial sites than any of the other alternatives considered. The alignment with at-grade operation Downtown and a tunnel under King Street, was not selected because of the environmental effects, such as impacts to cultural resources, reduction of street capacity, and property acquisition requirements of the at-grade and tunnel sections, which would cost an additional \$300 million.

The Project's purpose is "to provide high-capacity rapid transit" in the congested east-west travel corridor (see Section 1.7 of the Final EIS). The need for the Project includes improving corridor transit mobility and reliability. The at-grade alignment would not meet the Project's Purpose and Need because it could not satisfy the mobility and reliability objectives of the Project (see bullets below). Some of the technical considerations associated with an at-grade versus elevated alignment through Downtown Honolulu include the following:

- **System Capacity, Speed, and Reliability**—The short, 200-foot (or less) blocks in Downtown Honolulu would permanently limit the system to two-car trains to prevent stopped trains from blocking vehicular traffic on cross-streets. Under ideal operational circumstances, the capacity of an at-grade system could reach 4,000 passengers per hour per direction, assuming optimistic five minute headways. Based on travel forecasts, the Project should support approximately 8,000 passengers in the peak hour by 2030. Moreover, the Project can be readily expanded to carry over 25,000 in each direction by reducing the interval between trains (headway) to 90 seconds during the peak period. To reach a comparable system capacity, speed, and reliability, an at-grade alignment would require a fenced, segregated right-of-way that would eliminate all obstacles to the train's passage, such as vehicular, pedestrian, or bicycle crossings. Even with transit signal priority, the at-grade speeds would be slower and less reliable than an elevated guideway. An at-grade system would travel at slower speeds due to the shorter blocks, tight and short radius curves in places within the constrained and congested Downtown street network, the need to obey traffic regulations (e.g., traffic signals), and potential conflicts with other at-grade activity, including cars, bicyclists, and pedestrians. These effects mean longer travel times and far less reliability than a fully grade-separated system. None of these factors affects an elevated rail system. The elevated rail can travel at its own speed any time of the day regardless of weather, traffic, or the need to let cross traffic proceed at intersections.
- **Mixed-Traffic Conflicts**—The Project will run at three minute headways. However, three-minute headways with an at-grade system would prevent effective coordination of traffic signals in the delicately balanced signal network in downtown Honolulu. A disruption of traffic signal cycle coordination every three minutes would severely affect traffic flow and capacity of cross-streets.

Furthermore, there would be no option to increase the capacity of the at-grade rail system by reducing the headway to 90 seconds, which would only exacerbate the signalization problem. An at-grade system would require removal of two or more existing traffic lanes on affected streets. This effect is significant and would exacerbate congestion. Congestion would not be isolated to the streets that cross the at-grade alignment but, instead, would spread throughout Downtown. The Final EIS shows that the Project's impact on traffic will be isolated and minimal with the elevated rail, and, in fact will reduce system-wide traffic delay by 18 percent compared to the No Build Alternative (Table 3-14 in the Final EIS). The elevated guideway will require no removal of existing through travel lanes, while providing a reliable travel alternative. When traffic slows, or even stops due to congestion or incidents, the elevated rail transit will continue to operate without delay or interruption.

An at-grade light rail system with continuous tracks in-street would create major impediments to turning movements, many of which would have to be closed to eliminate a crash hazard. Even where turning movements are designed to be accommodated, at-grade systems experience potential collision problems. In addition, mixing at-grade fixed guideway vehicles with cars, bicyclists, and pedestrians presents a much higher potential for conflicts compared to grade-separated conditions. Where pedestrian and automobiles cross the tracks in the street network, particularly in areas of high activity (e.g., station areas or intersections), there is a risk of collisions involving trains that does not exist with an elevated system. There is evidence of crashes between trains and cars and trains and pedestrians on other at-grade systems throughout the country (e.g., Phoenix, Houston, LA). This potential would be high in the Chinatown and Downtown neighborhoods, where the number of pedestrians is high and the aging population presents a particular risk.

- **Construction Impacts**—Constructing an at-grade rail system could have more effects than an elevated system in a number of ways. The wider and continuous footprint of an at-grade rail system compared to an elevated rail system (which touches the ground only at discrete column foundations, power substations, and station accessways) increases the potential of utility conflicts and impacts to sensitive cultural resources. In addition, the extra roadway lanes utilized by an at-grade system would result in increased congestion or require that additional businesses or homes be taken to widen the roadway through Downtown. Additionally, the duration of short-term construction impacts to the community and environment with an at-grade system would be considerably greater than with an elevated system. Because of differing construction techniques, more lanes would need to be continuously closed for at-grade construction and the closures would last longer than with elevated construction. This would result in a greater disruption to business and residential access, prolonged exposure to construction noise, and traffic impacts.

Because it is not feasible for an at-grade system through Downtown to move passengers rapidly and reliably without significant detrimental effects on other transportation system elements (e.g., the highway and pedestrian systems, safety, reliability, etc.), an at-grade system would have a negative system-wide impact that would reduce ridership throughout the system.

The at-grade system would not meet the Project's Purpose and Need and, therefore, does not require further analysis.

As stated previously, the short 200-foot (or less) blocks in Downtown Honolulu would permanently limit the system to two-car trains to prevent stopped trains from blocking vehicular traffic on cross-streets. Even with transit signal priority, the at-grade speeds will be slower and less reliable than an elevated guideway. Under ideal circumstances, the capacity of an at-grade system could reach 4,000 passengers per hour per direction, assuming optimistic five minute headways. Based on travel forecasts, the Project should support approximately 8,000 passengers in the peak hour by 2030. Moreover, the Project can be readily expanded to carry over 25,000 in each direction by reducing the interval between trains (headway) to 90 seconds during the peak period. To reach a comparable system capacity, speed and reliability, an at-grade alignment would require a fenced, segregated right-of-way that would eliminate all obstacles to the train's passage, such as vehicular, pedestrian or bicycle crossings.

Life of the Land Comment 2

As discussed in the response to Comment 1 in this letter, 15 combinations of tunnel, at-grade, or elevated alignments between Iwilei and Ward Avenue were considered during the screening process. Five different alignments through Downtown were advanced for further analysis in the Alternatives Analysis, including an at-grade portion along Hotel Street and a tunnel under King Street. The Alternatives Analysis Report (2006) and the Alternatives Screening Memorandum (2006) provide a discussion regarding the at-grade alignments considered. The reference sections of these reports list other resources that support the alternatives analysis.

Life of the Land Comment 3

Enhanced bus service was considered during the Alternatives Analysis Phase (referred to as the Transportation System Management (TSM) Alternative). As discussed in Chapter 2, Section 2.2.2 of the Final EIS, the TSM Alternative was designed to serve the study corridor based on a hub-and-spoke network of bus routes, similar to today. The alternative included express bus service that operated as bus rapid transit in existing facilities. Bus frequencies would have been increased during peak periods to provide improved service for work-related trips, particularly from developing areas such as Royal Kunia, Koa Ridge, and Waiawa. The bus fleet was assumed to increase from 525 to 765 buses, and park-and-ride lots were assumed at West Kapolei, UH West Oahu, Waipio, and Aloha Stadium. In addition, the present a.m. peak-hour-only zipper lane would have been modified to operate in both the a.m. and p.m. peak periods, and relatively low-cost improvements would have been made on selected roadways to give priority to buses.

The analyses found that the TSM Alternative would have improved transit travel times somewhat by reducing the amount of time riders would have to wait for a bus to arrive at a bus stop. As a result, the TSM Alternative would have led to a slightly larger number of daily transit trips than the No Build Alternative (Table 2-2). This alternative would have generated fewer hours of transit-user benefits than either the Managed Lane or Fixed Guideway Alternative. Since most buses would still operate in mixed traffic, the TSM Alternative would have done little to improve corridor mobility and travel reliability. Roadway congestion also would not have been alleviated. In addition, because of the dispersed nature of transit service, slow bus

speeds, and unreliable service, the TSM Alternative would not have supported the City's goals of concentrating growth within the corridor and reducing development pressures in rural areas.

In terms of its environmental impacts, the TSM Alternative would have generated fewer physical impacts than the Managed Lane and Fixed Guideway Alternatives. However, it would have required more transportation system energy and generated more air pollutant emissions and water pollution than the Fixed Guideway Alternative (Table 2-3). Although the TSM Alternative would have been very cost-effective, financial feasibility was a concern. Currently, State legislation does not allow the local excise and use tax surcharge to be used for enhancement of the existing bus transit system.

Life of the Land Comment 4

The Alternatives Analysis Report (2006) and the Alternatives Screening Memorandum (2006) provide a discussion on the TSM Alternative, including results of the analysis. The reference sections of these reports list other resources that support the alternatives analysis, including analysis of the TSM Alternative.

Life of the Land Comment 5

As discussed in the response to Comment 1 in this letter, 15 combinations of tunnel, at-grade, or elevated alignments between Iwilei and Ward Avenue were considered during the screening process. Five different alignments through Downtown were advanced for further analysis in the Alternatives Analysis, including an at-grade portion along Hotel Street and a tunnel under King Street. The Alternatives Analysis Report (2006) and the Alternatives Screening Memorandum (2006) provide a discussion regarding the at-grade alignments considered. The reference sections of these reports list other resources that support the alternatives analysis.

Life of the Land Comment 6

The Project's technology, which is steel wheel on steel rail, may be operated above grade (elevated), at-grade (street level), or below grade (underground). The requirement is that the system operates in an exclusive right-of-way. To preserve system speed and reliability, neither automobiles nor pedestrians can be allowed to cross the tracks. For at-grade operation, this would require a fenced right-of-way with no crossings. It is not possible to construct such a system in developed portions of the corridor such as in the Downtown area. Portions of the alignment in undeveloped areas could be constructed at-grade with a fenced right-of-way. However, this would prohibit at-grade access to the future development. Placing any part of the system in mixed right-of-way would affect reliability of the entire system as described above.

Life of the Land Comment 7

See response to Life of the Land Comment 6. Regarding costs, an at-grade system is less costly, but the compromise in performance would make it infeasible in Honolulu. A good comparison is Phoenix, which recently opened a fully at-grade system that is 20 miles long, similar in length to this Project. It takes over 1-½ hours to travel from end-to-end compared to the 42 minutes it will take in Honolulu. Phoenix has also had some vehicular and pedestrian safety challenges as people negotiate the streets with the new system. In Phoenix, the at-grade system works because it has plenty of alternative street options for vehicular traffic to use. That flexibility does not exist in Honolulu.

Life of the Land Comment 8

To meet system requirements as outlined in Section 2.5.1 of the Final EIS, at-grade operation would require a fenced right-of-way. Cross-streets and local access would preclude at-grade operation adjacent to Farrington Highway. As discussed above, an at-grade system was found not to be feasible therefore an investigation of right-of-way on specific streets for an at-grade system was not conducted.

Life of the Land Comment 9

The Project follows Farrington Highway, not H-1 in the Kapolei-Ewa area. During the Alternatives Analysis process, the Hawaii State Department of Transportation (HDOT) informed DTS that all of the H-1 right-of-way needs to be preserved for future freeway use.

Life of the Land Comment 10

Farrington Highway lanes could not be used for a rail line. One of the project design requirements is operation in an exclusive right-of-way. Using lanes on Nimitz Highway would create pedestrian-vehicle conflicts. In addition, reducing the number of travel lanes would worsen congestion for highway users.

Life of the Land Comment 11

At-grade operation would require a fenced right-of-way. Cross-streets and local access along Farrington Highway would preclude at-grade operation in Waipahu.

Life of the Land Comment 12

The Project alignment goes directly through the mauka portion of the Leeward Community College (LCC) campus and includes a station at LCC. A spur was not considered. The alignment follows this route because it serves the LCC campus and other nearby activity centers and provides access to the preferred maintenance and storage facility, which is located adjacent to LCC. Details about the alignment selection can be found in the Alternatives Analysis Report (2006).

Life of the Land Comment 13

The fixed guideway Project will serve LCC. Figure 3-9 in this Final EIS shows 190 passenger boardings and 700 alightings at this station during the a.m. two hour peak period (6 a.m. to 8 a.m.). Figure 3-10 shows 3,200 daily boardings and alightings.

Life of the Land Comment 14

The Project will serve Central Oahu with feeder bus service. A future rail extension to this area is not precluded. Future bus routes and frequencies are shown in Appendix D in the Final EIS.

Life of the Land Comment 15

The Waipio area will be served by the fixed guideway station in Waipahu with buses serving the surrounding communities. Figure 3-9 in the Final EIS shows 1,050 passenger boardings and 350 alightings at this station during the a.m. two hour peak period. Figure 3-10 shows 3,080 daily boardings and alightings. A spur line to Waipio has not been evaluated.

Life of the Land Comment 16

The Project does not serve Mililani directly via the fixed guideway system. However, the Project does include a major transit center and park-and-ride facility at the H-1/H-2 merge (Figure 2-21 in this Final EIS) that will be accessible via a direct off-ramp from H-2. Figure 3-7 in this Final EIS shows that travel times will be reduced for those traveling from Mililani to Downtown using the fixed guideway system for a portion of their commute. A spur line to Mililani has not been evaluated.

Life of the Land Comment 17

The Kamehameha Highway right-of-way abuts private property and construction of even one rail track on the makai side of this road would require acquiring right-of-way near Pearl Highlands Center, Pearl City Shopping Center, and the Pearl Ridge Shopping Center. These locations will be instead served by an elevated guideway system, which minimizes the amount of right-of-way needed in this area.

Life of the Land Comment 18

The Kamehameha Highway right-of-way abuts private property and construction of even one rail track on the mauka side of this road would require acquiring right-of-way near Pearl Highlands Center, Pearl City Shopping Center, and the Pearl Ridge Shopping Center. These locations will instead be served by an elevated guideway system, which minimizes the amount of right-of-way needed in this area.

Life of the Land Comment 19

There is sufficient space for an elevated guideway makai of the Airport Viaduct. Ewa of Aolele, the Project is makai of the H-1 and Nimitz Highway interchange. Koko Head of Aolele, it

would be difficult to cross over the airport access ramps, and fewer riders would be served than with the proposed alignment serving the Airport along Aolele and Ualena Streets.

Life of the Land Comment 20

All land on both sides of Kamehameha Highway near the Pearl Harbor Naval Base is controlled by the Federal government, and much of it contains historic resources. There is insufficient land makai of Kamehameha Highway for a rail line and/or station at-grade. The Pearl Harbor Naval Base station will touch down on the mauka side of Kamehameha Highway at Radford Drive to avoid the historic resources on the makai side.

Life of the Land Comment 21

Pearl Harbor Naval Base will be served by the Project with a station at Kamehameha Highway and Radford Drive. Figure 3-9 in this Final EIS shows 550 passenger boardings and 1,410 alightings at the Pearl Harbor Naval Base Station during the a.m. two hour peak period. Figure 3-10 shows 5,440 daily boardings and alightings. There will be bus service connecting the rail station with destinations on Pearl Harbor Naval Base.

Life of the Land Comment 22

There will be a fixed guideway station serving Pearl Harbor Naval Base. Figure 3-9 in this Final EIS shows 550 passenger boardings and 1,410 alightings at this station during the a.m. two hour peak period. Figure 3-10 shows 5,440 daily boardings and alightings.

Life of the Land Comment 23

The Project will serve the Hickam Air Force Base with feeder bus service. The routes are shown in Appendix D in the Final EIS. This service is included in the ridership forecasting presented in the Draft and Final EISs. The service on-base is not available to the general public. Due to the feeder bus system, a spur was not included in the Project.

Life of the Land Comment 24

A spur line to Hickam Air Force Base is not part of the Project. Hickam Air Force Base will be served by the Pearl Harbor Naval Base fixed guideway station with feeder buses running between the fixed guideway station at the Naval Base and the Air Force Base. Figure 3-9 in this Final EIS shows 550 passenger boardings and 1,410 alightings at this station during the a.m. two hour peak period. Figure 3-10 shows 5,440 daily boardings and alightings. Due to the feeder bus system, a spur was not included in the Project.

Life of the Land Comment 25

As discussed in Chapter 3, Section 3.4.6, and in Appendix B to the Final EIS, the rail line will provide access to Honolulu International Airport. There will be a rail station on Airport property near the overseas parking garage just Ewa of the parking garage exist lanes, fronting Ala Onaona Street. The station will be about 600 to 800 feet from the interisland and overseas terminal and ground level pedestrian walkways will connect the station to the terminals.

Figure 3-10 in this Final EIS shows daily boardings at the Honolulu International Airport Station (3,260 boardings and 3,060 alightings).

The line will not displace roadways or vehicles from the Airport; hence, security will not be affected by displacement of vehicle access. As the rail line will not affect roadway access or operations, it will not cause congestion or idling of vehicles.

Life of the Land Comment 26

The Project provides a direct connection between Ewa and Honolulu via the Honolulu International Airport. Therefore, the addition of a loop at the Airport is not necessary.

Life of the Land Comment 27

The Project connects between Ewa and Honolulu via the Honolulu International Airport with stations located at Aloha Stadium, Pearl Harbor Naval Base, and Honolulu International Airport. As a result, the loop as described in your comment is not necessary.

Life of the Land Comment 28

The fixed guideway system will serve Honolulu International Airport with a station directly located on airport property, as described in response to Comment 25 (above). Figure 3-9 in this Final EIS shows 380 passenger boardings and 1,330 alightings at this station during the a.m. two hour peak period. Figure 3-10 shows 3,260 boardings and 3,060 alightings at this station.

Life of the Land Comment 29

The Purpose and Need of this Project is discussed in Section 1.7 and 1.8 of the Final EIS. Any questions about Airport plans to provide shuttle service around the airport should be directed to the Hawaii State Department of Transportation Airports Division.

An alignment mauka of the Airport Viaduct was evaluated in the Alternatives Analysis. There is sufficient space for an elevated guideway; however, transfer of riders to the Honolulu International Airport is difficult and the ridership projections for the alignment are the lowest figures of the evaluated alignments.

Life of the Land Comment 30

According to Table 2-8 in this Final EIS, there will be 600 spaces at the Aloha Stadium Park-and-Ride facility. The travel demand forecasting model estimated projected demand at guideway stations and these estimates are for year 2030 (Table 3-22 in the Final EIS). Design for all Project stations is currently in the preliminary design stage. All coordination letters can be found in Appendix F of the Final EIS.

Life of the Land Comment 31

At-grade operation would require a fenced right-of-way throughout the alignment. Cross-streets and local access would preclude at-grade operation adjacent to Nimitz Highway in

the Iwilei area. Please see response to Comment 1 for a discussion of the effects of an at-grade system.

Life of the Land Comment 32

Using lanes on Nimitz Highway for a rail line would not be feasible as this would create potential conflicts between the train and pedestrians and other vehicles. In addition, reducing the number of travel lanes on Nimitz Highway would worsen traffic congestion.

Life of the Land Comment 33

A future rail line and park and ride could be constructed to Sand Island but it is not part of this Project. However, the Project does not include a rail line to Sand Island or a park-and-ride in this area. The Project travels along Dillingham Boulevard and transitions to Nimitz Highway at Kekaulike Street, which is Koko Head of Sand Island.

Life of the Land Comment 34

A below ground route on Nimitz Highway was never evaluated. Since Nimitz Highway runs along the water front, a below ground route would be below the water line, which would add significant cost to construction. Table 5-2 in the Alternatives Analysis Report shows the cost of a below ground route through Chinatown along King Street would cost \$1,900 million in 2006 dollars (the year the alternative was evaluated) for just that segment between Iwilei and UH Manoa. This was the most expensive alignment evaluated between Iwilei and UH Manoa. The ideal above ground alignment studied in this area was estimated to cost \$1,230 million in 2006 dollars.

Life of the Land Comment 35

An alignment along Ala Moana Boulevard was considered during early alternative screening and eliminated because of view and parkland impacts.

Life of the Land Comment 36

An alignment along Ala Wai Boulevard is discussed in the Alternatives Screening Memo. This report states that the aesthetic impact of an aerial structure along Ala Wai Boulevard and the Ala Wai Canal would be severe. As a result, it was not considered further as part of the Alternatives Analysis phase.

Life of the Land Comment 37

The Screening Memo discusses the elevated routes that were examined between Ala Moana Center and UH Manoa. At-grade routes to UH Manoa were not considered due to the impact to existing travel lanes and potential conflicts with pedestrians, bicyclists and drivers. This area of the corridor is very congested and an at-grade alignment would have required removal of traffic lanes, which would have resulted in increases in traffic congestion.

The Project will serve the UH Manoa campus with feeder bus service transferring at Ala Moana Center. The routes are shown in Appendix D in this Final EIS. This service is included

in the ridership forecasting presented in the Section 3.4.2 of the Draft and Final EISs. Additionally, Table 3-29 in this Final EIS shows that the potential rail extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa would increase fixed guideway ridership by approximately 25 percent in addition to 116,000 ridership estimated for the Project.

Life of the Land Comments 38 and 39

City Council Resolution 08-261 identified the Airport Alternative from East Kapolei to Ala Moana Center as the preferred alternative. Table 3-29 in this Final EIS shows that the potential extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa would increase fixed guideway ridership by approximately 25 percent in addition to 116,000 ridership estimated for the Project. Enhanced bus service from Ala Moana Center to Waikiki will be provided until the fixed guideway extensions are implemented. Projected transit ridership with the future extensions (West Kapolei, Salt Lake Boulevard, UH Manoa, and Waikiki) are provided in Table 3-29 of the Final EIS.

Life of the Land Comment 40

The fixed guideway Project will provide greater transportation options. Currently, people on Oahu can travel by private automobile, TheBus, bicycle, or walking. The fixed guideway Project will add another option. Since the fixed guideway vehicles will be completely separated from roadway traffic operations, the Project will provide higher transit service reliability compared to the No Build Alternative.

Life of the Land Comment 41

After completion of construction, the Project will not decrease or increase regional population or the number of jobs; however, it will influence the distribution, rate, density, and intensity of development in the study corridor. Without the Project, growth is more likely to be dispersed outside of the study corridor, including in undeveloped areas of Central and North Oahu.

Life of the Land Comment 42

As described in Section 2.5.10 and further in Section 8.6.9 in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- Reduce the time that each area will experience traffic and community disturbances.*
- Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*

- *Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- *Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

Ridership numbers would be higher if construction started on the Koko Head end of the line, however, the lack of available space for a maintenance and storage facility on that end of the corridor makes such phasing unfeasible. Figure 3-9 and Figure 3-10 in this Final EIS show ridership on the Project. These figures show peak period and daily ridership totals traveling Koko Head-bound and Ewa-bound once the entire Project is in operation.

Life of the Land Comment 43

The Project is focused exclusively on the construction and implementation of rail transit service, which is analyzed in the EIS. However, as mentioned in Section 4.19.2 in this Final EIS, transit-oriented development (TOD) would be expected to occur in Project station areas as an indirect effect of the Project.

The increased mobility and accessibility the Project will provide would increase the desirability and value of land near the stations, thereby attracting new real estate investment nearby (in the form of TOD). Planning and zoning around station areas will be established and conducted by the City's Department of Planning and Permitting under a process covered by the City's new TOD Ordinance 09-4.

Life of the Land Comment 44

As discussed in Section 4.19.2 in this Final EIS, after completion of construction, the Project will not decrease or increase regional population or the number of jobs; however, it will influence the distribution of development.

Life of the Land Comment 45

The Project will not change any zoning or other development rights. Questions pertaining to development rights should be directed to the City's Department of Planning and Permitting.

Any changes to zoning or other development rights near the stations will be determined by the City Council.

Life of the Land Comment 46

According to Section 4.19.2 in this Final EIS, experience in other cities indicates that property sales values increase by \$60 to \$2,300 for every 100 feet closer to a transit station (see Table 4-38 in this Final EIS). The effect cannot be isolated from other market forces; therefore, the precise effect of the transit system cannot be determined.

Life of the Land Comment 47

Elevated transit systems that serve various Chinatowns have been built in Chicago, Boston, Los Angeles, Manila and Singapore.

Life of the Land Comment 48

Each of the cities listed in Life of the Land Comment 47 is unique and the introduction of transit has affected each differently. Generally, Chinatowns are located in relatively dense urban areas near downtown and therefore have benefited from access to transit.

Life of the Land Comment 49

Section 4.8.3 in this Final EIS discusses shade and shadow effects of the system.

According to the Federal Transit Administration's Safety Management Information Statistics for 1997, the most recent data available in the Transportation Research Board (TRB) Report "Improving Transit Security," there was one serious offense for every one million passenger miles carried on rail. There is a need for security on transit systems, just as there is a need for police and other security in all aspects of modern society, but there is no evidence that crime rates associated with transit are any higher than for society in general. Crime rates on transit systems are correlated closely with crime rates in the neighborhoods within which the stations are located (e.g., "Crime in public transit systems: An environmental design perspective", Adele Pearlstein and Martin Wachs).

Life of the Land Comment 50

The majority of the system will be located in roadway medians. It will not be enclosed in barbed wire.

Life of the Land Comment 51

Several fixed guideway stations will be located at or near existing or planned bicycle facilities. Many bicycle lanes (planned by the City or State) could connect to fixed guideway stations. Each station will have facilities for parking bicycles, and each guideway vehicle will be designed to accommodate bicycles, as regulated by a bicycle policy to be developed by the City. Locations where potential effects on bicycle facilities could occur are shown in Table 3-25 in this Final EIS.

Life of the Land Comments 52

Public involvement (e.g., conducting public meetings, providing project information, and requesting public comments,) is an integral and essential part of the project planning process. Guidelines set forth by NEPA, and Chapter 343 of the Hawaii Revised Statutes stipulate that public involvement be carried out on large-scale projects such as the rail project. Thus, a broad range of print and visual media, including presentations, was employed to reach multiple population segments and is described further in Chapter 8 of the Final EIS.

Life of the Land Comments 53

The project team does not have information of the expenditures of other government-funded entities.

Life of the Land Comment 54

The Project will provide high-capacity transit service between East Kapolei and Ala Moana Center. The Project will connect multiple activity centers, provide cost-effective transit user benefits, and meet the Purpose and Need for the Project. This Project provides significant passenger capacity, which could be easily increased in the future by adding additional vehicles or decreasing headways. As a result, this Project will increase the time until another major transit upgrade is needed.

Life of the Land Comment 55

Ridership projections for the forecast year of 2030 have been developed using a travel demand model calibrated against collected traffic and transit ridership information and then validated against recent counts to be sure it properly represents travel activity in the transportation system (Section 3.2.1 of the Final EIS). An on-board transit survey was completed in December 2005 and January 2006, and the latest socioeconomic information available as of October 2008 was incorporated. Traffic counts were collected in 2005, 2007, and 2008. The model is based upon a set of realistic input assumptions regarding land use and demographic changes between now and 2030 and expected transportation levels-of-service on both the highway and public transit system. Based upon the model and these key input assumptions, approximately 116,300 trips per day are expected to use the rapid transit system on an average weekday in 2030. Since the Draft EIS was published, the travel demand model has been refined by adding an updated air passenger model (which forecasts travel in the corridor related to passengers arriving or departing at Honolulu International Airport), defining more realistic drive access modes (driving alone or car pooling) to project stations and recognizing a more robust off-peak non-home-based direct demand element (trips that do not originate or end at home) based on travel surveys in Honolulu.

Ridership is projected to reach 116,000 in 2030. This figure includes approximately 40,000 passengers who would otherwise have had to drive on the roadways. The forecasts show 88,000 riders when the full system opens in 2019. Honolulu is one of the first projects in the country to design and undertake an uncertainty analysis for this type of travel forecast. The uncertainty analysis evaluates the variability of the forecast by establishing likely upper and lower limits of ridership projections. FTA has worked closely with Honolulu during this work effort. A variety of factors were considered in the uncertainty analysis, ranging from variations

in assumptions regarding the magnitude and distribution patterns of future growth in the Ewa end of the corridor, to the impact of various levels of investment in highway infrastructure, to the expected frequency of service provided by the rapid transit system, to park-and-ride behavior with the new system in place, and to such things as the implications on ridership of vehicle and passenger amenities provided by the new guideway vehicles. Given all the factors considered, the anticipated limits for guideway ridership in 2030 are expected to be between 105,000 to 130,000 trips per day.

Life of the Land Comment 56

The General Excise and Use Tax (GET) is regressive and applied to all transactions. The GET is discussed in Section 6.3.2 of the Final EIS.

Life of the Land Comment 57

Section 4.18.6 of the Final EIS indicates that approximately 7.5 trillion BTUs will be required to construct the Project.

Life of the Land Comment 58

As shown in Table 3-18 in this Final EIS the fixed guideway will carry approximately 116,000 persons daily or approximately 36 million riders per year in 2030. Section 4.18.6 indicates that approximately 7.5 trillion BTUs will be required to construct the Project.

Life of the Land Comments 59, 60, and 61

The energy consumed could be from multiple sources. However, assuming all energy is generated from oil, the Project will have a carbon equivalence of about 20 metric tons of carbon per billion BTUs consumed (U.S. Department of Energy, Transportation Energy Data Book). Using the above values, approximately 150 thousand metric tons of carbon equivalence will be generated from construction.

Life of the Land Comments 62, 63, 64, and 65

The energy required to construct and operate the system is presented in this Final EIS. Table 4-21 in the Final EIS indicates that 1,690 million BTUs will be consumed daily in 2030 to power the Project, while the daily roadway energy consumption will decrease by 3 million BTUs daily in 2030 as a result of the operation of the system.

The energy consumed could be from multiple sources. However, assuming all energy is generated from oil, the Project will have a carbon equivalence of about 20 metric tons of carbon per billion BTUs consumed (U.S. Department of Energy, Transportation Energy Data Book). Project construction will consume approximately 210 million BTUs per annual rider. Using the estimated energy calculation provided in Comment 58 (above), construction will generate about 4 metric tons of carbon equivalence per annual rider.

Life of the Land Comment 66

The energy mix for electricity generation will depend on HECO's power production. The State of Hawaii has established a goal of using renewable energy sources for 40 percent of electricity production by 2030. In 2007, 16 percent of energy production in Hawaii was from renewable sources.

Life of the Land Comment 67

As stated in Section 2.5.2 in this Final EIS, the system will be powered by electricity.

Life of the Land Comment 68

The Draft EIS identified estimated traffic volumes for year 2030. Traffic is expected to grow with or without the Project. However, as indicated in Chapter 3, Table 3-14 of the Draft EIS (Section 3.4.1), "VMT (vehicle miles traveled), VHT (vehicle hours traveled), and VHD (vehicle hours of delay) are projected to decrease under each Build Alternative as compared to the No Build Alternative." The Final EIS shows an 18 percent decrease in VHD with the Project compared to without (Table 3-14). The use of cars in the next 10 and 20 years will be less with the Project than if the Project were not constructed.

Life of the Land Comment 69

Section 4.8 in this Final EIS evaluates visual effects of the Project. It is not possible to calculate the specific number of residential units that would be affected by the Project in a particular way. Because it is an elevated guideway, views below and above the guideway will still be available.

Life of the Land Comments 70 and 71

The transit system will provide a transportation alternative to residents. It is not planned to change the rate of population growth on Oahu. As described in Section 4.19.2 in this Final EIS, the Project will not increase or decrease regional population or the number of jobs; however, it will influence the distribution of the development, especially near transit stations. It is not possible to predict the number of people relocating to Hawaii from other states.

Life of the Land Comment 72

In the long-term, it may be appropriate to construct additional rail lines; however, Honolulu's population lives largely within a narrow corridor that is well served by a linear system.

Life of the Land Comment 73

The transit system will provide a transportation alternative to residents. It is not planned to change the rate of growth on Oahu.

Life of the Land Comment 74

As detailed in Chapter 1 in this Final EIS, the Project supports the planned development of Kapolei and the Ewa area. Section 4.2.2 in this Final EIS indicates the Ewa region is a rural and agricultural area that is undergoing urbanization and includes Kapolei, which is developing as Oahu's 'second city.' The terminal station in the west end of the Project is at East Kapolei. The west end of the Project will serve the area where both population and employment are forecasted to grow by approximately 400 percent. This growth is anticipated to occur with or without the Project. As described in Section 4.19.3 of the Final EIS, current land use plans anticipate extensive development of the Ewa plain irrespective of whether or not the Project is built. Thus, the Project may have the effect of intensifying land use in the areas near the planned stations; however, the overall development plan will not be substantially altered by the Project. The State of Hawaii prepared an Environmental Assessment (EA) of the effects of two major transportation projects, the North-South Road and Kapolei Parkway in the Ewa area. The evaluated growth-inducing and cumulative impacts of the projects under the Hawaii Environmental Policy Act, see EA § 3.15.4.

Life of the Land Comment 75

The Project resulting in any substantial change in agricultural self-sufficiency would be speculative. As detailed in Section 4.2 in this Final EIS, the Project will require some farmland that is currently owned by individuals, corporations, or agencies that plan to develop them in conformance with the Ewa Development Plan. For more detail, see Section 4.19. and Section 4.2.3 of the Final EIS.

Life of the Land Comment 76

As stated in Chapter 4, Section 4.2.3 of the Final EIS, the farmlands that will be acquired for the Project are in the Ewa Plain. The Ewa Development Plan designates areas for dense development while preserving other areas for agriculture. A maximum of 80 acres of prime farmland and 8 acres of statewide-important farmlands will be acquired by the Project, of which 70 acres are actively cultivated. All of the affected properties designated as prime, unique, or of statewide importance and/or actively farmed are owned by individuals, corporations, or agencies that plan to develop them in conformance with the Ewa Development Plan.

The 88 acres of agricultural impacts includes land needed for a maintenance and storage facility. One of the two site options for a maintenance and storage facility is in agricultural-related use (Aloun Farms) near Hoopili. The other potential site option is located near Leeward Community College and is the site of a former Navy fuel storage and delivery facility. The Leeward Community College location is the preferred site for the maintenance and storage facility, and the City has been working with the Navy to acquire it. If the City can acquire this site, only 47 acres of land designated as prime or of statewide importance will be used for the Project. Aloun Farms' headquarters, located at the Hoopili site, would not have to move if the Leeward Community College location is used.

Life of the Land Comment 77

As detailed in Section 4.11 in this Final EIS, total transportation energy consumption will decrease as a result of the Project. Combined with the State of Hawaii's commitment to

Mr. Henry Curtis
Page 18

renewable electricity production, the system will substantially reduce the consumption of petroleum and therefore improve energy self-sufficiency.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Submission Content/Notes : I strongly support the Mass Rail Transit project. It's about time it was built. We've been talking about it for decades. As much as I dislike Councilman Djou's "tactics" to prolong the debate on the project, he has a point in building the Aiea to Downtown portion first. It would bring the most ridership at the project's very beginning. The proposal to run the route by the Honolulu Airport makes more sense. It would give our visitors another option to get to Waikiki and would give residents an option of getting to the airport without our cars.

Dear Mr. Lee:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- *Reduce the time that each area will experience traffic and community disturbances.*
- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*

Mr. Gilbert Lee
Page 2

- *Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- *Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

Your preference for the Airport Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been identified as the Preferred Alternative as described above. Compared to the other alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly lower impacts to the natural and built environment. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Dear Mr. Legrand:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

The fare to use the system will be the same as for TheBus. If the system were operating today, it would be \$2.25 one way or riders could use the same monthly pass you use for TheBus. As described in Chapter 2 of the Final EIS, the bus and rail systems will have a unified fare structure, including monthly passes that work for both modes. Riders will be able to use a free transfer to change from one mode to another. If TheBoat is restored in the future, the cost will be the same as well.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Dear Mr. Leong:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

Your preference for a Fixed Guideway Transit Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the

Mr. Greg Leong
Page 2

Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments. Updates will be available on the Project website (www.honolulutransit.org).

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

re: Honolulu High-Capacity Transit Corridor Project (DEIS)

Submitted pursuant to 49 USC 1610 et. seq., 16 USC 470(f), 49 USC 303,
42 USC 4332(2)(c), 23 CFR 771, and Hawaii Revised Statutes Chapter 343

Life of the Land is Hawai'i's own energy, environmental and community action group advocating for the people and 'aina for almost four decades. Our mission is to preserve and protect the life of the land through sound energy and land use policies and to promote open government through research, education, advocacy and, when necessary, litigation.

This document is a joint NEPA and Hawai'i Revised Statutes Chapter 343 Draft EIS.
(Preface ii)

The Council on Environmental Quality, as part of its oversight of

Life of the Land Comments re Honolulu Rail Line Draft EIS * 1

implementation of the National Environmental Policy Act, held meetings in the ten Federal regions with Federal, State, and local officials to discuss administration of the implementing regulations. The forty most asked questions were compiled in a memorandum to agencies for the information of relevant officials. In order efficiently to respond to public inquiries this memorandum is reprinted in this issue of the Federal Register.

<http://www.nepa.gov/nepa/regs/40/40p1.htm>

In response to the many requests from the agencies and other participants, CEQ has compiled forty of the most important or most frequently asked questions and their answers and reduced them to writing. The answers were prepared by the General Counsel of CEQ in consultation with the Office of Federal Activities of EPA. These answers, of course, do not impose any additional requirements beyond those of the NEPA regulations. This document does not represent new guidance under the NEPA regulations, but rather makes generally available to concerned agencies and private individuals the answers which CEQ has already given at the 1980 regional meetings. (www.nepa.gov/nepa/regs/40/40p2.htm)

NEPA's Forty Most Asked Questions
(www.nepa.gov/nepa/regs/40/40p3.htm)

2a. Alternatives Outside the Capability of Applicant or Jurisdiction of Agency. If an EIS is prepared in connection with an application for a permit or other federal approval, must the EIS rigorously analyze and discuss alternatives that are outside the capability of the applicant or can it be limited to reasonable alternatives that can be carried out by the applicant?

A. Section 1502.14 requires the EIS to examine all reasonable alternatives to the proposal. In determining the scope of alternatives to be considered, the emphasis is on what is "reasonable" rather than on whether the proponent or applicant likes or is itself capable of carrying out a particular alternative. Reasonable alternatives include those that are practical or feasible from the technical and economic standpoint and using common sense, rather than simply desirable from the standpoint of the applicant.

2b. Must the EIS analyze alternatives outside the jurisdiction or capability of the agency or beyond what Congress has authorized?

A. An alternative that is outside the legal jurisdiction of the lead agency must still be analyzed in the EIS if it is reasonable. A potential conflict with local or federal law does not necessarily render an alternative unreasonable, although such conflicts must be considered. Section 1506.2(d). Alternatives that are outside the scope of what Congress has approved or funded must still be evaluated in the EIS if they are reasonable, because the EIS may serve as the basis for modifying the Congressional approval or funding in light of NEPA's goals and policies. Section 1500.1(a).

1. Is it reasonable to consider an at-grade (ground-level) rail system? Please elaborate.
 2. Please list each document and the number of pages in each of those documents that considered an at-grade (ground-level) rail system.
 3. Is it reasonable to consider an enhanced express bus system? Please elaborate.
 4. Please list each document and the number of pages in each of those documents that considered an enhanced express bus system
 5. What rail segments did you consider at the ground level? Please discuss each segment and why it was rejected.
 6. Why were specific ground level rail segments were rejected and why? Please discuss each segment and why it was rejected.
 7. What is the relative cost for ground-based and elevated rail for each segment?
 8. Is there sufficient space along Farrington Highway for a ground-based track system?
 9. Is there sufficient space along the HI-1 in the Kapolei-Ewa area for a ground-based track system?
 10. What would be impact of using an existing lane of Farrington Highway for a rail line?
 11. Did you consider an above-ground line in Kapolei-Ewa becoming at-grade in the greater Waipahu area? Please elaborate.
 12. Would it be better to have the train go directly to Leeward Community College or should the college be fed by a spur track?
 13. How many additional riders would take the train if it stopped at Leeward Community College? Please elaborate.
 14. Would it be better to have the train go directly to Waipio and Mililani or should Central Oahu have a spur track? Please elaborate.
- How would a separate line, or a spur line, from Central O`ahu to this proposed line impact ridership:
15. How many additional riders would take the train if it stopped at Waipio?
 16. How many additional riders would take the train if it stopped at Mililani?
 17. Is there sufficient space in the land just makai of Kamehameha Highway in the Pearl Highlands Center, Pearl City Shopping Center and the Pearl Ridge Shopping Center area for at least one rail track?
 18. Is there sufficient space in the land just mauka of Kamehameha Highway in the Pearl Highlands Center, Pearl City Shopping Center and the Pearl Ridge Shopping Center area for

at least one rail track? two tracks?

19. Is there sufficient space in the land just mauka of Kamehameha Highway in the Pearl-Harbor-Hickam area for at least one rail track? two tracks?

20. Is there sufficient space in the land just makai of Kamehameha Highway in the Pearl-Harbor-Hickam area for at least one rail track? two tracks?

21. Should there be a spur route into Pearl Harbor? Please elaborate re ridership.

22. How many additional riders would take the train if there were a spur rail line into Pearl Harbor Naval Station? Please elaborate re ridership.

23. Should there be a spur route into Hickam Air Force Base?

24. How many additional riders would take the train if there were a spur rail line into Hickam Air Force Base? Please elaborate re ridership.

25. Should the rail line go into Honolulu International Airport? Please elaborate re ridership. How would security be affected with a rail line displacing vehicle flows into the airport? What reductions in idling time by vehicles would be anticipated?

26. Should there be a rail loop at Honolulu International Airport, which could act as the beginning/end for trains going towards Honolulu or Ewa? Please elaborate.

27. Could the Airport Rail Loop end at Aloha Stadium and intersect the Ewa-Honolulu Rail Line at a transfer station? Please elaborate.

28. How many additional riders would take the train if stopped at Honolulu International Airport? Please elaborate.

29. How many additional riders would take the train if there were a loop around Honolulu International Airport? Please elaborate.

30. How many cars could park at Aloha Stadium during the day from Monday-Friday? Please elaborate. Please list all documents the City reviewed or wrote regarding this concept.

31. When did the City considered consider converting one or more lanes of the Nimitz near Iwilei to non-vehicular traffic only? Would this save money, using existing paved roads for the transit system?

32. Could one or more lanes of the Nimitz be used for a rail line?

33. Could the Rail Line go into Sand Island and then via a tunnel to the Homeless Shelter-Medical School area? Could a park-and-ride rail station be built in this area?

34. What is the comparative costs associated with an above ground and a below ground route through Chinatown? What is the comparative costs associated with an above ground and a below ground route along the Nimitz?

35. Did the City consider a route along the Ala Moana Blvd edge of Ala Moana Park?
36. Did the City consider a route along the edge of the Ala Wai Golf Course? Why or why not? What impact would this have on ridership?
37. What ground routes did consider going to any portion of the University of Hawai'i at Manoa Campus? Why or why not? What impact would this have on ridership?
38. How many additional riders would take the train if it stopped at the University of Manoa? Why or why not? What impact would this have on ridership?
39. How many additional riders would take the train went to Waikiki? Why or why not? What impact would this have on ridership?
40. Will the rail line enable greater transportation options?
41. Will these greater transportation options lead to faster population growth rates?
42. What would be the comparable ridership levels if the rail line were build from west-to-east OR east-to-west?
43. Will the transit system be encouraged that high population densities around built around transit stations?
44. How will this impact population growth projections?
45. Will land owners around planned transit stops get new development rights which will increase their property values?
46. How much will property values rise on Oahu due to the new transit stops?
47. Which Chinatowns in the U.S. or elsewhere had overhead transit lines built?
48. How did this affect those Chinatowns?
49. What analysis has been done concerning new dark spaces created by overhead transit and any change in crime, criminal behavior or potential crime?
50. Will areas under the transit line be barbed wired to prevent homeless from gathering along the route?
51. How will the rail line impact the uses of bicycles?
52. How much money has been spent by (a) the City; (b) by contractors and (c) by subcontractors in public relations regarding this proposal?
53. Please provide a list of each government-funded or partially government-funded entity and the amount of money they spend on public relations / advertisement regarding this proposed system.

54. Will this proposed system increase or decrease the time until another major transit upgrade is needed?

55. What is the likelihood of insufficient ridership to make the system worthwhile?

56. Is the excise tax increase regressive?

Any system that is built uses energy and releases greenhouse gases (carbon equivalence) during both the construction phase and the use phase. This information can be broken down into total use/released and per rider use/release

57. In terms of building the system: How much energy will be used?

58. In terms of building the system: How much energy per anticipated rider will be used?

59. In terms of building the system: How many tons of carbon equivalence is required

60. In terms of building the system: How many tons of carbon equivalence will be used?

61. In terms of building the system: How many tons of carbon equivalence will be used?

62. In terms of operating the system: How much energy per anticipated rider will be used?

63. In terms of operating the system: How many tons of carbon equivalence is required?

64. In terms of operating the system: How many tons of carbon equivalence will be used?

65. In terms of operating the system: How many tons of carbon equivalence will be used?

66. What fuel will be used to generate the electricity necessary to build this system?

67. What form of energy will power the system?

68. Assuming the transit system is built, what is the projected rise in the use of cars over the next ten and twenty years?

69. How many blue views of the ocean from residential units will be lost as a result of this system?

70. Will the transit system lead to a rise in population along the route?

71. What percent of that population rise will be from people not currently living in the state?

72. Should Honolulu build a single linear line or a network of intersecting transit lines?

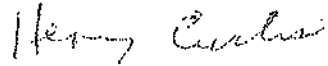

73. How much faster can Ewa grow with the transit route installed as opposed to continuing the existing process without a transit system?

74. One Congressman testified before the State Legislature that building the line will enable tens of thousands of new homes in the Ewa region. How true is that statement?

75. How will pressure to develop agricultural lands be affected as a result of this project?

76. Will this project increase or decrease the likelihood that Hawai'i will become agriculturally self-sufficient? Please elaborate.

77. Will this project increase or decrease the likelihood that Hawai'i will become energy self-sufficient? Please elaborate.

Henry Curtis
Executive Director

Honolulu High-Capacity Transit Corridor Project

Welcome to the Honolulu High-Capacity Transit Corridor Project's Public Hearing for the Draft Environmental Impact Statement/Section 4(f) Evaluation.

This public meeting and hearing has been designed to inform the public about the transit project, explain materials contained in the Draft EIS, answer questions from the public, and collect public input on project issues related to the Draft EIS, Section 106 of the National Historic Preservation Act, Section 4(f) of the U.S. Department of Transportation Act, and floodplains affected by the project.

Please review the project information and ask project staff any questions about the project that you might have. The Draft EIS is available on the project website at www.honolulutransit.org.

You may provide official comments in several ways. Here at this Public Hearing you may provide oral comments to a court reporter who will record them for the record or use this form to provide written comments. After the meeting, you may provide an on-line comment at www.honolulutransit.org or use this form to send a written comment to the Department of Transportation Services. All comments must be postmarked or received by January 7, 2009 in order for them to be included in the Final EIS.

Ms. Shirley Lin
(Incomplete address provided)

Dear Ms. Lin:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

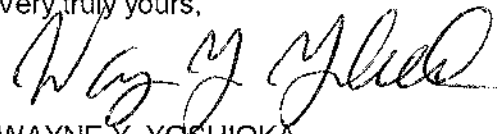

Your preference for the Airport Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more

Ms. Shirley Lin
Page 2

information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Submission Content/Notes : The airport route is the one that needs to be built. The number of bus routes in the airport vicinity already justifies the greater number of potential riders than Salt Lake and Pearl Harbor should be served also. Ideally the route should proceed into Waikiki to eliminate the need for taxis, shuttle vans and buses to that destination. Many Asian visitors are users of similar systems so it would be a comfortable, familiar mode. Since a goal was to serve the university population, I wonder of the possibility / feasibility / cost concerns of the route continuing through Waikiki across the Ala Wai and to the university as opposed to a spur to both? I understand the need for equipment service yards to be located to the west but please build this service as quickly as possible, preferably from Ala Moana out. Let the park & rides and bus transfers work to keep cars from the congested downtown / Ala Moana areas.

Dear Mr. Loder:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been identified as the Preferred Alternative as described above. Compared to the other alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly lower impacts to the natural and built environment. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative.

Mr. Clint Loder
Page 2

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

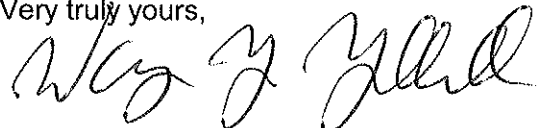

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- *Reduce the time that each area will experience traffic and community disturbances.*
- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*
- *Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- *Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

January 15, 2009

Mr. Wayne Yoshioka
Director, Department of Transportation Services
City and County of Honolulu
650 South King Street, Third Floor
Honolulu, HI 96813

Dear Mr. Yoshioka:

I moved to Hawaii with my disabled husband two years ago and made a sizeable investment in a condominium at 1296 Kapiolani Boulevard. Our unit faces the ocean, one block from Kona Street and Ala Moana Mall. We came to the islands to enjoy its unique beauty and tranquility, but find ourselves located in an area committed to the unsightly and noisy effects of a rail system we vehemently oppose.

I have several reasons to question the advisability of such a plan beyond the negative effects it will have on my personal enjoyment and the property value upon which our economic well-being relies.

I am hoping your response to this inquiry will allay my fears that this project is a mere monument to the current city and county administration and is in the worst interest of the misled citizens and the tourism industry upon which the state's depend so heavily.

First, the promises for tax stability seem without foundation. Even if the Federal Government provides the subsidy you seek, there seems to be no provision for maintenance and repair for the system that will obviously be required. Please address this issue.

Beyond that, there seem to be so many critical needs that have no alternative solutions than financial commitments. The priorities for improved quality of life seem to be skewed in favor of a pet project of the administration at the expense of our abysmal educational system and the rapidly deteriorating infrastructure. I was amazed to see "The Honolulu Advertiser's" headlines admitting that the mayor is willing to fight the Federal Government's assertion that the sewer system is in such desperate need of repair and expansion, it should

DEPARTMENT OF TRANSPORTATION SERVICES

JAN 21 12:25

RECEIVED

addressed without delay. The administration apparently is willing to see it deteriorate further, while eagerly devoting billions of dollars on a rail project for which there are reasonable and cost effective alternatives that you refuse to consider.

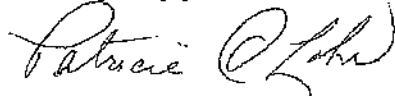

While I'm sure engineering issues are significant, I am clearly not professionally equipped to challenge them. Instead, my specific questions will address the effects on the beauty of the area and effects on the citizens and their livelihoods.

1. Honolulu should not be compared with Washington, D.C., or any other mainland city which has selected a rail system to facilitate its transportation needs. None of them possess the unique historic and cultural issues that exist here in Hawaii. None of these cities professes to be a tropical paradise and advertises itself as such to attract tourists and ensure they will return and recommend Hawaii to others. How can you ensure that the natural beauty of our island is not going to be marred by miles of concrete pillars and noisy rail cars?
2. How will the noise and the elevation of rail cars affect our dwindling bird population?
3. How will rail affect the tourists who come to Hawaii to escape the industrialization of their own areas for the beauty and serenity of the Islands? Or will they simply flock to the other islands abandoning Oahu for its fair share of the state's tourist dollar?
4. Experiencing how natural disasters are addressed here (even a relatively minor thunder storm can result in a 36-hour power outage), how will you ensure that the rail system will be sustained during emergency situations.
5. What will happen to people whose homes and/or businesses will be confiscated? What assistance will be given to people (owners and employees) who must relocate? How will they be compensated in the meantime?
6. Space for expansion to suitable locations is practically non-existent in the city now. How can you ensure there will be no detrimental consequence to businesses?

7. This project succeeded among a small-majority of voters because of the promise to generate jobs. What percentage of the jobs will require specialized skills possessed by rail-professionals and necessarily imported from the mainland?

I will look forward to your response to these questions and whatever other information you can provide to assure Oahu residents that given the economic situation facing Hawaii and the nation, it is appropriate to proceed with this costly and non-essential project.

Very truly yours,

Patricia O. Lohr

Honolulu, Hawaii 96814

Dear Ms. Lohr:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

To answer your first item, the maintenance and operations costs of the Project are discussed in Chapter 6 of the Final EIS. They represent about half of what is now being spent on TheBus and will be accommodated in the City's annual budget. Operating and maintenance costs represent between 2 and 3 percent of the City's operating budget.

All municipalities face many needs. By their actions, the City Council has decided that the transportation system in the City and County of Honolulu is one of the priorities that need immediate attention. Regarding the alternative transportation options studied, none was found to have the benefits of the fixed guideway now in development. This is discussed in Chapter 2 of the Final EIS.

Your letter also included specific questions. We will address these questions in the same order as asked.

1. The Project was compared to Washington, D.C., for purposes of estimating operating costs only. The comparison is reported in Chapter 6 of the Final EIS. It does not suggest the two places are the same. This was done to address a review by the FTA that seeks to find comparable operating parameters in estimating costs. The cost of living in Washington, D.C. and Honolulu are very similar, which is a primary reason for the comparison.
2. As noted in Chapter 4 of the Final EIS, the noise impact of the Project is not significant. Rail vehicles will generate less noise than a bus at the same distance. Wildlife field surveys were performed for birds along the project alignment in September 2007, and bird point counts were conducted from December 2007 to January 2008. There will be no direct impact of the Project on the bird population. The majority of the system is located in noisy urban areas where birds coexist with people and tall buildings. The only state threatened or endangered species that is present in the study corridor is the white tern, and none of the species have critical habitat in the area. Project specifications will require that any large trees where white terns nest will not be removed or pruned until the young birds have fledged. The Honolulu High-Capacity Transit Corridor Project Ecosystems and Natural Resources Technical Report (RTD 2008j) documents the results of this survey. This report is available on the project website (www.honolulutransit.org).
3. Visitors to Oahu travel to many attractions within the fixed guideway corridor, as noted in Chapter 1. Table 3-13 in the Final EIS shows an increase in the number of visitors that will use transit with the addition of the Project. One of the major detriments to the visitor experience is traffic congestion, which has become a pervasive problem on the island. The Project will offer tourists a transportation alternative that links them directly with many key destinations and thereby reduce the need for use of a car. The majority of visitor facilities are located in the general Waikiki area. The Final EIS identifies Waikiki as one of the future extensions to the first construction project with the objective of serving the tourist industry. Furthermore, the corridor is largely in a well-developed portion of the island and covers primarily highly urbanized commercial districts where the transportation system is becoming increasingly congested. This is, in large part, the basis of the need for a high-capacity system.

The island's unique visual character and scenic beauty were considered in the visual and aesthetic analysis presented in the Draft and Final EISs. As discussed in Section 4.8 of the Final EIS, the Project will be set in an urban context where visual change is expected and differences in scales of structures are typical. The following measures will be included with the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

- *Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
- *Coordinate the project design with the City's transit-oriented development program within the Department of Planning and Permitting.*
- *Consult with the communities surrounding each station for input on station design elements.*
- *Consider specific sites for landscaping and trees during Final Design when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will mitigate potential visual impacts.*

The Project will provide users, including tourists, with expansive views from several portions of the corridor by elevating riders above highway traffic, street trees, and low structures adjacent to the alignment. In Section 4.8.3 of the Final EIS, specific environmental, architectural, and landscape design criteria are listed that will help minimize visual effects of the Project. Increasing the number of transportation options and reducing overall traffic are also benefits to the Project for everyone, including tourists.

4. *Since trains and rail stations will be electrically powered, the system's infrastructure is being designed to handle service disruptions. For example, trains will draw power from many points along the route, so an outage in a few areas should not disrupt service overall on the system. If electrical power is lost system-wide, then train brakes are designed to stop the rail cars even without power. Lights will stay on in trains and stations; backup batteries will provide lighting for several hours. The train operations center will communicate with passengers via the public address system and intercom to provide guidance.*

If power is restored within a short time, service will resume. With a prolonged outage, the operations center will direct passengers to exit the trains and walk along a lighted emergency walkway on the guideway to the nearest station. For those unable to exit rail cars, such as the groups referenced in your letter, help will be provided by emergency responders and transit staff. Passengers will be met at the train station by a coordinated response from emergency responders and city transportation workers. The system will be designed to meet earthquake and hurricane design standards. The system will have an upper limit on operating wind speed. Vehicles will be stored during events that exceed the operating limit.

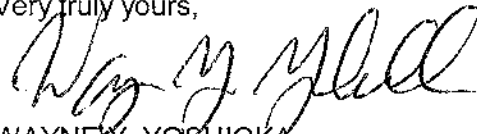

5. *Those from whom property is to be acquired will be treated according to the requirements of the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act. The Act provides for purchase at fair market value and includes relocation assistance to those affected. It also requires that those in need of relocation be placed in comparable quarters. The Project affects few properties compared to other projects of this size and requires full acquisition of*

only 34 properties, as indicated in Chapter 4 of the Final EIS. Section 4.4.3 of the Final EIS presents the mitigation associated with acquisitions, displacements, and relocations for full and partial property acquisitions.

- 6. Section 4.18.1 of the Final EIS lists the mitigation measures to reduce adverse economic hardships for existing businesses (including small businesses) along the project alignment during construction. The City's right-of-way team has contacted each potentially affected parcel owner.*
- 7. Construction activities for the majority of the transit system are similar to roadway and building construction. Appendix E of the Final EIS details construction methods that are widely used for both rail transit and elevated highway construction and were employed on the H-3 Freeway. Experienced labor is locally available. A limited number of specialists will be needed to work with locally available labor in certain areas, such as transit power and signaling specialists working with local electricians to install system equipment.*

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Submission Content/Notes : To make public rail transit (which I am all for) to work, this project must be either "all in" or it will fizzle and die. You must make the lines accessible to everyone across the island, not just in one small corridor along the south. You must go to all sides, and though the middle of Oahu in order to get maximum ridership an public acceptance. You also need to study the successes and failures of communities and countries where rail has either worked or fell short and disappeared. Most of all you need to change the mindset of people and special interest groups who oppose change and progress in this state all in the name of tradition and keeping Hawaii country and blockading "mainland" ideas. You need to forge ahead with these plans (and further expansion) and stop getting caught-up in all this "environmental study" foolishness which has thwarted progress. Sometimes you need to force bad-tasting medicine down someone's throat; even though they hate it, it makes them better in the end. BUILD THE RAIL!

Dear Mr. Lovejoy:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The Project will include enhanced bus service integrated with the fixed guideway system. The local bus feeder system will connect neighborhoods and commercial districts to the fixed-guideway system. In addition, experience gained from systems in other cities has been applied to the development of this Project.

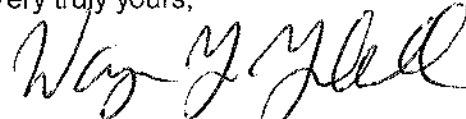

Lastly, the Project is proceeding as quickly as practical, as illustrated in the schedule presented in Chapter 2 of the Final EIS. Because Federal funds will be used, it is required by law that the environmental process, as detailed in NEPA, be followed.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this

Mr. Jeff Lovejoy

Submission Content/Notes : I am distressed at the inaccurate low cost estimates of the rail by the City Administration. Also, estimates of usage are misleading. The few City comments on private car parking and/or bus link infrastructure are a concern. The bus replacement plans for the next few years reduce quantity of bus replacements. The rail plan cite rerouting of buses to accomodate rail station access. I am concerned about existing buses to areas not supported by rail. I am afraid that the City may "Rob Peter to Pay Paul" resulting in reduced bus support.

The 10,000+ homes planned for Waipio Gentry area will exacerbate the Center of Oahu traffic for example. As a senior citizen, the increased property taxes impact me. With tourism in Hawaii reduced, I am sure the City will feel that they must increase property taxes again for to build and short term (and probably long term) subsidize rail support/use.

Prior to the election, The Mayor cited very few residential and business properties would be impacted by rail. Then he said a few people would be impacted for the good of many. Now more properties are being considered for impact. Why is the City inferring that I (and all Oahu residences) should trust them because they have experts and they know what is best for us all.

Dear Mr. Lowery:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Cost estimates are detailed and based on an engineering analysis of the conditions and needs of the Project. These costs are detailed in Chapter 6 of the Final EIS.

Regarding estimates of usage, as noted in Section 3.2.1 of the Final EIS, the estimates for transit ridership were derived from a travel demand forecasting model used by the Oahu Metropolitan Planning Organization for the Oahu Regional Transportation Plan 2030. The model is based on "best practices" for urban travel models in the U.S. and guidelines established by the FTA. Ridership projections for the forecast year of 2030 have been developed using the travel demand model, which was calibrated against collected traffic and transit ridership information and then validated against recent counts to be sure it properly represents travel activity in the transportation system (Section 3.2.1 of the Final EIS). An on-board transit survey was

completed in December 2005 and January 2006, and the latest socioeconomic information available as of October 2008 was incorporated. Traffic counts were collected in 2005, 2007, and 2008. The model is based upon a set of realistic input assumptions regarding land use and demographic changes between now and 2030 and expected transportation levels-of-service on both the highway and public transit system.

As noted in Chapter 2, Table 2-8 of the Final EIS, park-and-ride facilities will be provided at four locations: East Kapolei, UH West Oahu, Pearl Highlands, and Aloha Stadium. Certain local bus routes will be rerouted to provide frequent and reliable connections to the nearest rail station. Because of the high frequency of rail service (every three minutes during peak periods and every ten minutes during off-peak periods), riders transferring from buses to trains will experience minimal wait times. Riders transferring from trains to buses will benefit from improved frequencies on existing bus routes serving stations. In addition, several new bus routes with high frequencies will be provided as feeders to the rail system. Since these routes will primarily operate in residential areas, they will provide greater reliability versus routes operating along congested arterials.

In some cases, alterations to the bus network will enhance service to areas not supported by rail. Bus routes, or portions of routes, will only be altered or eliminated to reduce duplication of services provided by the fixed guideway system. Certain local routes will be rerouted to provide frequent and reliable connections to the nearest fixed guideway station. Buses removed from service in the study corridor will be shifted to service in other parts of the island. Additional information about changes to TheBus system is included in Appendix D of the Final EIS.

The travel demand forecasting model uses forecasted 2030 information that includes predicted land uses on Oahu, including Waipio Gentry, and resulting growth in traffic. Using the latest results of the model, the Final EIS concludes that conditions on highways will worsen by 2030. The comparison that is key to the Project is that rail will improve conditions compared to what they would be if the Project were not built.

Regarding funding for the Project, Section 6.3 of the Final EIS describes the funding sources anticipated to be used to pay for the capital costs of the Project and the City's overall public transportation system. Capital costs of the Project, including finance charges, are expected to be fully paid for by a combination of FTA Section 5307 and FTA Section 5309 New Starts funds from the Federal government and the revenues from the County's General Excise and Use Tax surcharge (GET) revenues levied from 2007 through 2022. Section 6.4 of the Final EIS describes the funding sources that will be used to pay for ongoing operating and maintenance costs associated with maintaining the resulting transit system in a state of good repair. Ordinance 07-001 prohibits the use of property taxes to fund the Project's construction. Operating and maintenance costs will be paid for from the same sources currently used for TheBus, which includes Federal funding, fare revenues, and subsidies from the City's General and Highway Funds.

Lastly, right-of-way needs for the Build Alternatives developed prior to issuance of the Draft EIS were estimated based on conceptual design. As more detailed design is prepared, right-of-way needs will continue to be refined. Refined right-of-way needs are shown in

Mr. Hugh Lowery
Page 3

Appendix C of the Final EIS. One goal of the Project is to minimize the amount of property and relocations by using an elevated guideway.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

San Francisco, CA 94105

Dear Mr Matley:

Re: Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Project

The draft Environmental Impact Statement for the city's rail transit project is unacceptable because it is written solely for a steel wheel on steel rail system. There are other forms of fixed rail that may be better and more cost-effective than steel wheels on steel rails. Using other technologies, it may be possible to build the entire system for the same cost as steel-on-steel, thereby further mitigating the current environmental problems associated with lack of a mass transit system.

To build a system that costs more and delivers less, as would be the case with steel-on-steel, would adversely affect

Oahu quality of life for many years to come.

Please rewrite this EIS to cover the other technologies, such as monorail and maglev, to ensure that the city will obtain the best transit system at the best price.

Very truly yours,

Dear Mr. Luehring:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

As noted in Chapter 2 of the Draft EIS, the selected transit technology would be electrically powered, industry-standard steel wheel on steel rail powered from a third-rail system. Technologies other than steel wheel were eliminated. An independent five-member technology panel composed of four transit experts and a transportation academic appointed by the City Council evaluated guided rubber-tire-on-concrete systems (e.g., Phileas bus system and VAL-type systems), monorail (which is a variation on rubber-tyred technology), steel-wheel-on-steel-rail systems, (e.g., light rail and rapid rail), and magnetic levitation (MAGLEV). The panel considered the performance, cost, and reliability of the proposed technologies.

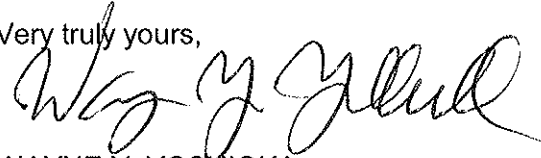

Mr. Davidson Luehring
Page 2

Proprietary technologies, meaning those technologies that would have required all future purchases of vehicles or equipment to be from a single manufacturer, were eliminated because none of the proprietary technologies offered substantial proven performance, cost, and reliability benefits compared to steel wheel operating on steel rail.

The panel accepted public comment twice as part of its review. By a four-to-one vote, the panel chose a steel wheel vehicle operating on steel rail system because it was considered safe, reliable, economical, and non-proprietary. Those results are documented in the panel's report to the City Council dated February 22, 2008 entitled "Independent Technology Selection Panel Report".

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Subject: Comments to the Draft EIS

I have been a passenger on the Vancouver Skytrain Expo Line and also on the Vancouver Skytrain Millennium Line and both have quite different constructed guideways. The guideway for the Expo Line is a larger concrete structure with each a separate guideway for each direction. The Millennium Line columns are much smaller with a single guideway (tracks) in both directions and a less intrusive structure. Also the approximate 14.6 mile system (more or less) of the Millennium Line was completed in two years at a cost of about \$700 million in U.S. dollars and completed under budget of a \$1 million in U.S. dollars in 2002. The Millennium Line costs also included 12 transit stations and the Bombardier's MK II vehicles built in B.C. at Bombardier's Centre for Advanced Transit System

Each of the transit stations of the Honolulu High-Capacity-Transit Corridor should have provisions for attractive retail outlets like newsstands, grab and go coffee/snack bars, florists, specialty stores and bank machines. This will help create more activity and extra eyes on what's going on and in and around stations, contributing to a safe and more secure environment and convenient shopping for people as they enter or depart the station. Today's consumer expect more convenience. Also convenient retail and creative art pieces will help create a memorable journey.

Creating a safe environment should be a fundamental principal of station design. Wrapping the new transit stations with glass, letting everyone see in and see through the stations. The elevators also should be enclosed in glass instead of other materials. Also a Station Manager's Office in each that is visible will help and there should be barriers in each station to ensure only paying passengers enter and leave.

Each side of the transit vehicles should have three (3) wide pairs of doors to allow passengers and bicycles to board and disembark quickly. Quick connection to local and regional bus service is a must to ensure more island-wide passengers to use this form of public transportation. The Middle Street Transit Station with its planned multi-deck parking planned will help for PUC and Windward residents to use the Honolulu High-Capacity-Transit System in both directions east and west as land is limited for parking cars for this elevated rail system.

Mahalo and blessings,

Wendell Lum (member, Kaneohe Neighborhood Board No. 30)

Mr. Wendell Lum
(No address or e-mail provided)

Dear Mr. Lum:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your comments are noted. As stated in Section 4.19.2 of the Final EIS, transit-oriented development (TOD) is expected to occur in project station areas as an indirect effect of the Project. Planning and zoning around station areas will be conducted by the City's Department of Planning and Permitting under a process covered by the City's new TOD ordinance. These plans will be developed with input from local communities within which the stations are located.

There will be between two and four doors on each transit vehicle. This will be decided when the transit vehicles are selected.

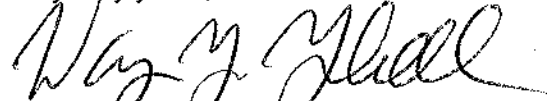

As stated in Chapter 3 of the Final EIS, because of the high frequency of the fixed guideway service (three-minute headways between trains during peak periods), riders transferring from buses to the fixed guideway will experience minimal wait times. Riders transferring from the guideway service to buses will benefit from improved frequencies on

Mr. Wendell Lum
Page 2

existing bus routes serving stations. In addition, several new routes with high frequencies will be provided as feeders to the guideway system.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulustransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is fluid and cursive, with a long horizontal stroke at the end.

Subject: Draft Environmental Impact Statement, Honolulu High-Capacity Corridor Project.

I support the need for a mass transit system in Honolulu, and supported the Mayor's position on the proposed transit related amendment to the City Charter that was considered this past November.

However, with regard to the Draft Environmental Impact Statement (DEIS), Honolulu High-Capacity Corridor Project, I am of the opinion that the draft document needs to address similar mass transit alternatives that would not be elevated; in other words, similar alternatives that would be built at grade for either the entire route or portions of the route. Without an analysis of at grade alternatives, there is no basis for determining that the elevated system is the preferred alternative, particularly with respect to cost, visual impacts, and noise impacts.¹ Compared to the elevated alternative, at grade alternatives would not have as significant visual impacts and would likely be less costly.

The DEIS also does not have detailed information regarding the visual and noise impacts, and detailed information how these and other adverse impacts will be mitigated. Without this detailed information, there is not a meaningful basis of evaluating the impacts and the proposed mitigation measures.

In general, and specifically with respect to the two prior comments, as drafted, the DEIS does not meet the requirements of HAR 11-200-17 (g) through (n).

Mahalo a nui loa,
A. Lono Lyman

¹ HRS §343-5 (b) states: "Whenever an agency proposes an action in subsection (a), other than feasibility or planning studies for possible future programs or projects that the agency has not approved, adopted, or funded, or other than the use of state or county funds for the acquisition of unimproved real property that is not a specific type of action declared exempt under section 343-6, the agency shall prepare an environmental assessment for such action at the earliest practicable time to determine whether an environmental impact statement shall be required." [Underscoring added]

HAR 11-200-5 (d) states: "For agency actions, chapter 343, HRS, exempts from applicability any feasibility or planning study for possible future programs or projects which the agency has not approved, adopted, or funded. Nevertheless, if any agency is studying the feasibility of a proposal, it shall consider environmental factors and available alternatives and disclose these in any future assessment or subsequent statement. . . ." Dear Mr. Lyman:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The Alternatives Screening Memorandum (DTS 2006a) recognized the visually sensitive areas in Kakaako and Downtown Honolulu, including the Chinatown, Hawaii Capital, and Thomas Square/Academy of Arts Special Design Districts. To minimize impacts on historic resources, visual aesthetics, and surface traffic, the screening process considered 15 combinations of tunnel, at-grade, or elevated alignments between Iwilei and Ward Avenue. Five different alignments through Downtown Honolulu were advanced for further analysis in the Alternatives Analysis, including an at-grade portion along Hotel Street, a tunnel under King Street, and elevated guideways along Nimitz Highway and Queen Street.

The Alternatives Analysis Report (DTS 2006b) evaluated the alignment alternatives based on transportation and overall benefits, environmental and social impacts, and cost considerations. The report found that an at-grade alignment along Hotel Street would require the acquisition of more parcels and potentially affect burial sites than any of the other

alternatives considered. The alignment with at-grade operation Downtown and a tunnel through the Capital Historic District, in addition to the environmental effects such as impacts to cultural resources, reduction of street capacity, and property acquisition requirements of the at-grade and tunnel sections, would cost an additional \$300 million.

The Project's purpose is "to provide high-capacity rapid transit" in the congested east-west travel corridor (see Section 1.7 of the Final EIS). The need for the Project includes improving corridor mobility and reliability. The at-grade alignment would not meet the Project's Purpose and Need because it could not satisfy the mobility and reliability objectives of the Project (see bullets below). Some of the technical considerations associated with an at-grade versus elevated alignment through Downtown Honolulu include the following:

- **System Capacity, Speed, and Reliability:** The short, 200-foot (or less) blocks in Downtown Honolulu would permanently limit the system to two-car trains to prevent stopped trains from blocking vehicular traffic on cross-streets. Under ideal operational circumstances, the capacity of an at-grade system could reach 4,000 passengers per hour per direction, assuming optimistic five minute headways. Based on travel forecasts, the Project should support approximately 8,000 passengers in the peak hour by 2030. Moreover, the Project can be readily expanded to carry over 25,000 in each direction by reducing the interval between trains (headway) to 90 seconds during the peak period. To reach a comparable system capacity, speed, and reliability, an at-grade alignment would require a fenced, segregated right-of-way that would eliminate all obstacles to the train's passage, such as vehicular, pedestrian, or bicycle crossings. Even with transit signal priority, the at-grade speeds would be slower and less reliable than an elevated guideway. An at-grade system would travel at slower speeds due to the shorter blocks, tight and short radius curves in places within the constrained and congested Downtown street network, the need to obey traffic regulations (e.g., traffic signals), and potential conflicts with other at-grade activity, including cars, bicyclists, and pedestrians. These effects mean longer travel times and far less reliability than a fully grade-separated system. None of these factors affect an elevated rail system. The elevated rail can travel at its own speed any time of the day regardless of weather, traffic or the need to let cross traffic proceed at intersections.
- **Mixed-Traffic Conflicts:** The planned three-minute headways on the guideway will prevent effective coordination of traffic signals in the delicately balanced signal network in Downtown Honolulu. A three minute cycle of traffic lights would affect traffic flow and capacity of cross-streets. Furthermore, there would be no option to increase the capacity of the rail system by reducing the headway to 90 seconds, which would only exacerbate the signalization problem. An at-grade system would require removal of two or more existing traffic lanes on affected streets. This effect is significant and would exacerbate congestion. Congestion would not be isolated to the streets that cross the at-grade alignment but, instead would spread throughout Downtown. The Final EIS shows that the Project's impact on traffic will be isolated and minimal with elevated rail, and in fact will reduce system-wide traffic delay by 18 percent compared to the No Build Alternative (Table 3-14 in the Final EIS). The elevated guideway will require no removal of existing travel lanes, while providing a reliable travel alternative.

When traffic slows, or even stops due to congestion or incidents, the elevated rail transit will continue to operate without delay or interruption.

An at-grade light rail system with continuous tracks in-street, would create major impediments to turning movements, many of which would have to be closed to eliminate a crash hazard. Even where turning movements are designed to be accommodated, at-grade systems experience potential collision problems. In addition, mixing at-grade fixed guideway vehicles with cars, bicyclists, and pedestrians presents a much higher potential for conflicts compared to grade-separated conditions. Where pedestrians and automobiles cross the tracks in the street network, particularly in areas of high activity (e.g., station areas or intersections), there is a risk of collisions involving trains that does not exist with an elevated system. There is evidence of crashes between trains and cars and trains and pedestrians on other at-grade systems throughout the country. This potential would be high in the Chinatown and Downtown neighborhoods, where the number of pedestrians is high and the aging population presents a particular risk.

- **Construction Impacts:** *Constructing an at-grade rail system could have more effects than an elevated system in a number of ways. The wider and continuous footprint of an at-grade rail system compared to an elevated rail system (which touches the ground only at discrete column foundations, power substations and station accessways) increases the potential of utility conflicts and discovery of sensitive cultural resources. In addition, the extra roadway lanes taken away for the system would result in increased congestion or require that additional businesses or homes be taken to widen the roadway through Downtown. Additionally, the duration of short-term construction impacts to the community and environment with an at-grade system would be greater than with an elevated system. Because of differing construction techniques, more lanes would need to be continuously closed for at-grade construction and the closures would last longer than with elevated construction. This would result in a greater disruption to business and residential access.*

Because it is not feasible for an at-grade system through Downtown to move passengers rapidly and reliably without significant detrimental effects on other transportation system elements (e.g., the highway and pedestrian systems, safety, reliability, etc.), an at-grade system would have a negative system-wide impact that would reduce ridership throughout the system. The at-grade system would not meet the Project's Purpose and Need and, therefore, does not require additional analysis.

The island's unique visual character and scenic beauty were considered in the visual and aesthetic analysis presented in the Draft and Final EISs. The assessment of visual effect due to the Project as described in Section 4.8.3 of the Final EIS considers changes to the visual landscape and viewer responses to those changes. This includes the existing development along the Project alignment. Within the Project corridor the environment changes from rural at the Wai'anae end of the corridor to dense high-rise development at the Koko Head end. As part of the design process, the City has developed design principles, which are identified in the Honolulu High-Capacity Transit Corridor Project Compendium of Design Criteria (RTD

2009m) that will be implemented in final design to minimize visual effects of the Project. For example, guideway materials and surface textures will be selected in accordance with generally accepted architectural principles to achieve effective integration between the guideway and its surrounding environment. Landscape and streetscape improvements will mitigate potential visual impacts, primarily for street-level views.

Other measures to address visual impacts of the Project are being developed through the station design and planning process. The initial station area plans and design guidelines were first developed with coordination between DTS and the Department of Planning and Permitting (DPP). The next level of transit station design focuses on integrating individual neighborhood characteristics of the communities served by the stations.

The following mitigation framework will be included in the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

- Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.
- Coordinate the project design with City TOD planning and DPP.
- Consult with the communities surrounding each station for input on station design elements.
- Consider specific sites for landscaping and trees during the final design phase when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will serve to mitigate potential visual impacts.

Section 4.8.3 of the Final EIS, Design Principles and Mitigation includes information related to the mitigation framework described above. Specifically architecture and landscape design criteria include guidelines regarding site design, materials and finishes, and lighting, which apply to stations, station areas, and the guideway.

As stated in Section 4.10.3 of the Final EIS, the Project will cause no severe noise impacts. Moderate impacts will occur at upper floors of a few high-rise buildings (as shown in Table 4-18 in the Final EIS). With the recommended mitigation in place (sound absorbing material and wheel skirts), the noise analysis indicates that the new noise generated by the Project will be lower than the existing noise levels in most places.

The project design includes an integrated noise-blocking parapet wall at the edge of the guideway structure that extends three feet above the top of the rail. The parapet wall will substantially reduce ground-level noise.

Wheel skirts will increase the benefit from the parapet wall at locations above the elevation of the track. The use of sound-absorptive materials below the tracks in the areas that will experience moderate noise impacts will reduce the Project noise levels from the upper floors to below the impact level. Once the Project is operating, noise levels will be re-measured to confirm that there are no noise impacts from the Project.

Mr. A. Lono Lyman
Page 5

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Dear Ms. Maae:

**Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement**

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

To answer your first question, yes, the rail system could be damaged in the same way that any building or transportation system could be damaged. The system budget does include maintenance and repair funding.

As stated in Section 3.2.1, rail ridership was analyzed using a Travel Demand Forecasting Model, which is also used by the Oahu Metropolitan Planning Organization. The approach has proven to be effective in estimating traffic impacts in other cities. This model is based on guidelines established by the FTA. Traffic conditions will be worse in 2030 under any circumstance and regardless of which solution is applied. The Alternatives Analysis stated this. The comparison that is key to the Project is that rail will improve conditions compared to what they would be if the Project were not built. With the fixed guideway system, total islandwide congestion (as measured by vehicle hours of delay) will decrease by 18 percent, compared to the No Build Alternative (as shown in Table 3-14 in the Final EIS). Accordingly, traffic

Ms. Brittany Maae
Page 2

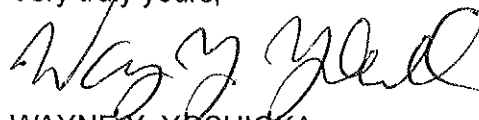

conditions will be substantially better with the Project than any of the other potential solutions studied. In addition to the fixed guideway, there are approximately \$3 billion in proposed transportation improvements included in the Oahu Regional Transportation Plan. These include widening the H-1 Freeway and other facilities at key choke points, adding a westbound zipper lane, and other substantial transportation projects. A list of these projects can be found in Table 2-4 of the Final EIS. The traffic assessment conducted for the Draft and Final EISs included these projects in the modeling done for the No Build and Build Alternatives.

Many types of jobs will be needed for this Project. During construction, a broad range of planners, engineers, and construction workers will be employed on the Project. After completion of construction, direct employment by the Project will include operators, maintenance personnel, and supporting staff for the system.

In response to your question regarding whether rail is necessary, you can find a discussion of the process that determined that rail transit is the best option for improving person-mobility for Honolulu in Chapter 2 of the Final EIS.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Subject: Objections to Rail DEIS

Subject: Objections to Rail DEIS

Dear Governor Lingle, Mr. Yoshioka and Mr. Matley,

I'm writing to express grave concerns over deficiencies in the DEIS for Honolulu's heavy rail system.

I found the draft EIS statement to be deficient in numerous areas and have specific questions and concerns about the following:

1. How will this project affect current traffic congestion?
2. The comparison of energy use of rail to bus should be done for hybrids, not traditional combustion engine as this report appears to have done.
3. It is unclear how congestion will be remedied during the many years of construction. Lanes of traffic are to be eliminate in certain areas. Where and when this will happen, and what will happen to congestion in those areas?
4. Will there be bike racks on the train and where will they be located? Will bikes be allowed on the train? Will there be a place for surfboards? What about luggage for airport passengers? What about construction workers' tools?
5. The impacts of relocations has not been adequately addressed for important food producers like Aloun Farms, 14 community facilities that will be "partially acquired" as well as small businesses that will not survive a move or reduction in operations. Historic and cultural sites are also not adequately addressed.
6. There is insufficient information on plans to mitigate noise at the 16 schools that are adjacent to the alignment. How will the noise affect the learning environment?

7. The analysis of job creation does not adequately analyze job losses. There is no mention of what will happen to the jobs that are lost due to businesses downturn during construction?
8. The report does not adequately assess the potential harm an elevated rail system does to our unique tourist industry and the image of Oahu. How will the tourists see noise and visual impacts of heavy rail? Will the more idyllic neighbor Islands absorb an even larger share of tourism and hurt our County's revenues?
9. The provisions for managing with lower than projected ridership and tax revenue support are inadequate.
10. The plan is also deficient in outlining how corrosion will be mitigated. BART in the SF bay area is made of aluminum. What will happen to steel in a salt air environment? An evaluation of steel vs. aluminum is lacking in this report.
11. Likewise, the DEIS plans for mitigation of graffiti on the concrete support pillars, stations and cars is inadequate. This deficiency will impact the accuracy of predicting the future cost of the project maintenance.
12. Finally, I have concerns that the ADA issues have not been adequately assessed. How long will the doors be open for to access the train? How will an elderly or handicapped person be able to get on and off the train in this time period? Please provide detailed plans on handling handicapped access. How does this effect the efficiency of the train and speed of commute?

Thank you for your thoughtful consideration of my concerns. Please feel free to call me if you have any questions about this letter.

Aloha,
Beverly Major,

521-8889

Dear Ms. Major:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address your comments received from agencies and the public on the Draft EIS. The following paragraphs, based on how your comments were formatted, address comments regarding the above-referenced submittal:

1. A travel demand forecasting model was used to forecast traffic conditions at six screenlines during the a.m. and p.m. peak hours. The model showed that in 2030, the Project will reduce congestion up to 11 percent during the a.m. peak hour and up to 10 percent during the p.m. peak hour over the No Build Alternative (as shown in Tables 3-9 and 3-10 in the Final EIS). In addition, vehicle hours of delay will decrease by 18 percent with the Project compared to No Build conditions (Table 3-14 of the Final EIS).

As shown in Table 3-23 of the Final EIS, project-related traffic will affect delay at six intersections in the corridor. The Project includes measures that will mitigate these effects (as discussed in Section 3.4.7 of the Final EIS). As a result, the Project will not negatively affect traffic congestion.

2. The energy use analysis presented in the Draft and Final EISs includes all vehicles currently operating on Oahu, as presented in Section 4.11.1, "The analysis of operational energy consumption on Oahu was based on the transportation analysis prepared for the Project. Changes in overall transportation energy use for vehicles traveling on Oahu were assessed using daily [vehicle miles traveled] and speed values calculated from the transportation demand forecasting model." Hybrid vehicles do not account for a large enough percentage for the vehicle mix to change the project-wide energy consumption calculations.

3. As discussed in Chapter 3 of the Final EIS, a Maintenance of Traffic (MOT) Plan will identify measures to mitigate temporary construction-related effects on transportation. The contractor will develop the MOT Plan with approval from the City or Hawaii Department of Transportation. The MOT Plan will address roadway closures for streets identified in Table 3-27 of the Final EIS. Additional temporary lane closures will occur during non-peak hours so that effects on heavy commuter traffic will be minimized. As stated in Section 3.5.7 of the Final EIS, an extensive public information program will be implemented to provide motorists with a thorough understanding of the location and duration of construction activities, as well as anticipated traffic conditions.

As stated in Section 3.4.3 and shown in Table 3-21 of the Final EIS, there will be no permanent reduction in the number of roadway travel lanes with the Project.

4. Bike racks will be available at all stations. Bicycles, surfboards, luggage, and construction workers' tools will be allowed on trains subject to some restrictions during heavy peak periods, according to policies which are yet to be developed. These items will be allowed on trains as long as they do not impede other passengers or pose safety risks.

5. There are two site options being considered for a maintenance and storage facility. The preferred site is near Leeward Community College (LCC) and is the site of a former Navy fuel drumming operation. Discussions are under way with the Department of Hawaiian Home Lands to acquire it. An alternate site is in Hoopili, which is the location of Aloun Farms. If the Project can acquire the LCC site, then the impact on agricultural lands on Oahu will be much less than is described in the Draft and Final EISs and Aloun Farms' headquarters would not have to move as a result of the Project.

Relocations are discussed in Section 4.4 of the Final EIS, and impacts to archaeological, cultural and historic resources are discussed in Section 4.15. A partial acquisition typically is either a narrow strip of land or a more substantial portion of a large parcel. It is assumed that for the properties that will be partially acquired, existing land uses will not change. For residential properties, if the right-of-way line comes within approximately five feet of a residential structure, it is considered a full acquisition. If the right-of-way line is more than five feet, it will generally be considered a partial acquisition. For commercial properties, including situations where the commercial property could lose its function, full acquisition was considered. Businesses and residents from whom property is to be acquired will be treated according to the requirements of the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act. It provides for purchase at fair market value and includes relocation assistance to those affected. The Act provides that those in need of relocation must be placed in comparable (living or business) quarters.

6. The project design includes an integrated noise-blocking parapet wall at the edge of the guideway structure that extends three feet above the top of the rail. The parapet wall will substantially reduce ground-level noise. Wheel skirts will increase the benefit from the parapet wall at locations above the elevation of the track. The use of sound-absorptive materials below the tracks in the areas that will experience moderate noise impacts will reduce the Project noise levels from the upper floors to below the impact level. Once the Project is operating, noise levels will be re-measured to confirm that there are no noise impacts from the Project. No noise impacts are predicted for any schools along the alignment. For schools and other noise-sensitive locations that do not have nighttime sleep activities, the FTA Transit Noise and Vibration Impact Assessment compares the existing maximum-hour noise level to the maximum-hour noise that the transit line will produce by itself. A project noise level of 63 dBA or above would be an impact. The Project is predicted to have a maximum-hour Leq noise level of 51 dBA. Noise impacts are not predicted at the schools, and maximum-hour noise levels will stay the same.

In addition, construction noise will be a short-term impact and all local noise ordinances will be followed to reduce noise annoyance to the residence and schools. A variance will be obtained from the Hawaii Department of Health. The permit will regulate construction times and activities and include mitigation commitments.

7. An analysis of construction impacts to businesses is provided in Section 4.17.1 of the Draft EIS, 4.18.1 of the Final EIS, and Section 5.2.2 of the Economics Technical Report. This report is available at the City and County of Honolulu and the Department of Transportation Service offices and on the project website (www.honolulutransit.org). The primary impacts are anticipated to result from inconveniences and disruptions to adjacent residents, businesses, and business customers that are inherent in any major construction project, and include the following:

- Presence of construction workers and materials.
- Temporary road closures and traffic diversions.
- Temporary reductions in parking availability.
- Airborne dust, noise, and vibrations.
- Businesses's loss of visibility to their customers.

Section 4.18.1 of the Final EIS states that proposed mitigation to reduce adverse economic hardships for existing businesses along the project alignment during construction may include the following:

- Coordinate construction planning and phasing with nearby property owners and businesses.
- Develop a public involvement plan prior to construction to inform business owners of the construction schedule and activities.

- *Minimize the extent and number of businesses, jobs, and access affected during construction.*
- *To the extent practicable, coordinate the timing of temporary facility closures to minimize impacts to business activities, especially those related to seasonal or high sales periods.*
- *Minimize, as practical, the duration of modified or lost access to businesses.*
- *Provide signage, lighting, or other information to indicate that business are open.*
- *Provide public information (press releases, newsletters) regarding construction activities and ongoing business activities, including advertisements in print and on television and radio.*
- *Phase construction in each area so as to maintain access to individual businesses for pedestrians, bicyclists, passenger vehicles, and trucks during business hours and important business seasons.*
- *Provide advance notice if utilities will be disrupted and schedule major utility shutoffs during non-business hours.*

Overall, the Project is projected to increase jobs in the nine years of construction to an average of about 10,000 per year, see Table 4-35 in the Final EIS.

8. Negative impacts of the rail system with respect to property values and tax impact are detailed in the Economics Technical Report. Section 4.2.2 of the Draft EIS and Section 4.3.2 of the Final EIS summarize the impact of railway construction on Real Property Taxes.

Aesthetic effects of the system are described in Section 4.8 of the Final EIS. The Project is substantially different from systems in New York and Chicago, as it will have a different structural design. There is no evidence that the Project will have a negative impact on the tourism industry. Section 4.19 of the Final EIS states, "the economic forecast is for continued steady growth. Planned projects are intended to continue to encourage and enable economic growth in the region. Continued focus on tourism is anticipated."

The Project will offer tourists a transportation alternative that links them directly with many key destinations and reduce the need for a car. Table 3-13 in the Final EIS shows daily person transit trips by purpose, broken down for residents and visitors. As seen in this table, transit trips for both groups increase with the addition of the Project compared to the No Build Alternative. Daily resident person trips by transit increase 24 percent with the Project compared to without, while daily visitor person trips by transit increase 19 percent with the Project compared to without the Project in 2030. As stated in Section 3.4.2 of the Final EIS, approximately 9,900 visitors are expected to use the system daily, of which 1,800 are to or from the airport.

The island's unique visual character and scenic beauty were considered in the visual and aesthetic analysis presented in the Draft and Final EISs. As discussed in Section 4.8 of the Final EIS, the Project will be set in an urban context where visual change is expected and differences in scales of structures are typical. The following measures will be included with the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

- Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
- Coordinate the project design with the City's transit-oriented development program within the Department of Planning and Permitting.*
- Consult with the communities surrounding each station for input on station design elements.*
- Consider specific sites for landscaping and trees during Final Design when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will mitigate potential visual impacts.*

The Project will provide users, including tourists, with expansive views from several portions of the corridor by elevating riders above highway traffic, street trees, and low structures adjacent to the alignment. The fact that this will be the only island with high-capacity transit, with an efficient airport connector, may attract more tourists who value the convenience, potential cost savings, and decreased travel time between various tourist destinations along the Project's alignment. In Section 4.8.3 of the Final EIS, specific environmental, architecture, and landscape design criteria are listed that will help minimize visual effects of the Project.

9. Both ridership and financial discussions in the Final EIS address concerns about the uncertainties associated with ridership and financial markets. Ridership projections for the forecast year of 2030 have been developed using the travel demand model used by the Oahu Metropolitan Planning Organization (OahuMPO), which was calibrated against collected traffic and transit ridership information and then validated against recent counts to be sure it properly represents travel activity in the transportation system (Section 3.2.1 of the Final EIS). An on-board transit survey was completed in December 2005 and January 2006, and the latest socioeconomic information available as of October 2008 was incorporated. Traffic counts were collected in 2005, 2007, and 2008. The OahuMPO model is based on "best practices" for urban travel models in the U.S. and consistent with guidance from the FTA. The model is updated approximately every five years to reflect changes in land use, socioeconomic conditions, and transportation network improvements. The model is approved by the OahuMPO Technical Advisory Committee. The model is based upon a set of realistic input assumptions regarding land use and demographic changes between now and 2030 and expected transportation levels-of-service on both the highway and public transit system. Based upon the model and these key input assumptions, approximately 116,000 trips per day are expected to use the rapid transit system on an average weekday in 2030. Since the Draft EIS was published, the travel demand model has been refined by adding an updated air passenger model (which forecasts travel in the corridor related to

passengers arriving or departing at Honolulu International Airport), defining more realistic drive access modes (driving alone or car pooling) to project stations and recognizing a more robust off-peak non-home-based direct demand element (trips that do not originate at home) based on travel surveys in Honolulu.

The Project is one of the first in the country to design and undertake an uncertainty analysis of this type of travel forecast. The uncertainty analysis evaluates the variability of the forecast by establishing probabilistic upper and lower limits of ridership projections. FTA has worked closely with the City during this effort. A variety of factors were considered in the uncertainty analysis. Given all the factors considered, the anticipated limits for guideway ridership in 2030 is expected to be between 105,000 to 130,000 trips per day, bracketing the official forecast of 116,000 riders a day used for all calculations.

The capital plan for the Project is presented in Section 6.3 of the Final EIS, which includes a description of the amount of funding anticipated from various sources. The capital plan takes the current economic downturn into account. Section 6.6 of the Final EIS describes risks and uncertainties associated with these funding assumptions. The financial plan is a dynamic document that will be updated as conditions warrant.

10. Bay Area Rapid Transit (BART) is a steel-on-steel system, the same type as proposed for Honolulu. This was a question discussed by the technology panel and it found that corrosion is not a significant issue with steel-on-steel systems in any kind of climate. Steel-on-steel systems exist throughout the world on other islands, in high-humidity climates, volcanic environments, etc., and they operate without issues. Nonetheless, corrosion is part of the design considerations in ensuring the system performs as effectively as possible. The vehicle shell for the BART system is made of aluminum; however, the vehicle for Honolulu has not yet been designed, so it could be aluminum or some other equally effective material.

Corrosion-control measures will be applied to the Project's fixed-steel facilities and neighboring utility structures to provide proper operation over their lifetime. These measures include the following:

- Protective coating specification for steel aerial structures.*
- Coating specification for stations.*
- Preventive measures against stray current corrosion.*
- Corrosion-control design of transit underground utilities and neighboring utilities owned by others.*

11. Section 4.6.3 of the Final EIS describes potential safety and security issues once the Project is operating. The discussion notes that to reduce the potential for crime, the FTA requires the development and implementation of a Safety and Security Management Plan for new fixed guideway projects (49 CMR 633). Graffiti is one of the safety and security issues that will be addressed. The Project is looking into using graffiti-resistant materials, where possible, to

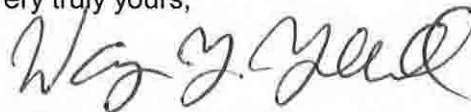

Ms. Beverly Major
Page 7

minimize graffiti. Graffiti removal is an anticipated maintenance activity and is reflected in project costs.

12. The transit system will conform to guidelines of the Americans with Disabilities Act (ADA). Elevators and escalators will be provided at all stations. In addition, platforms will be level with trains for ease of boarding; therefore, stairs or lifts, as used on buses, will not be required. The system operation plan considers all ADA requirements. Dwell time is anticipated to be an average of 20 seconds at each station. This dwell time is incorporated into the station-to-station travel times presented in Table 3-16 of the Final EIS. As shown, travel from the East Kapolei Station to the Ala Moana Center Station will take 42 minutes.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Other Submission Method :
Submission Date : 12/27/2008
Submission Content/Notes : I understand the concept of rail very well, I have lived in San Francisco for about two years then returned home in Ewa Beach, and have taken many commuter rails such as CALtrain/Muni Metro/ VTA and BART. I prefer BART because of its speed, as well as length of trains and its similarities to what Hawaii is planning. We (the people of Hawaii) need to start thinking of a designated length of train (how many cars long) and our own design. Ever television ad that I have seen so far, only depicts a train that is two cars long, and in turn can give the public second thoughts. "If the train will only be that long, whats the point in even taking it, if I have to wait in a crowded station anyway?" BART trains, in my experience have ranged anywhere from 4-10 cars long, allowing for more passengers to travel at once.

We need to start thinking of our own design(s) as well as educating the general public that the planned rail project doesn't just have to be whats depicted on TV, but what is depicted is just an idea borrowed from other rail systems.

Dear Mr. Mapa:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As described in Chapter 2 of the Final EIS, the system is planned to operate with multi-vehicle trains approximately 120 to 180 feet long, with each train capable of carrying 325 to 500 passengers. The system will be expandable to accommodate longer trains in the future. Smaller trains at higher frequencies reduce waiting times and maximize convenience for passengers.

The Honolulu system, while based on industry standard technology, is being designed to reflect local demand patterns and integrate into the existing environment. Section 2.2.2 of the Draft EIS summarizes system requirements. These have been further detailed in Section 2.5 of the Final EIS.

Mr. Christopher Mapa
Page 2

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is fluid and cursive, with the first name "Wayne" being the most prominent.

To: Wayne Yoshioka
From: Robert B. Marrone

Aloha,

On page 1-17 of the DEIS, Figure 1-10 indicates Use of the HOV lane reduces a.m. town-bound travel time by an average of 12 minutes. This appears to be a greater reduction in travel time than what a full service rail line, with all planned stops, would provide. Further, it can be presumed that additional HOV lanes would reduce travel time by an even greater margin. Hence, I would like to know why additional HOV lanes would not be the primary option under consideration.

Sincerely,

Robert B. Marrone

Dear Mr. Marrone:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

High-occupancy vehicles (HOV) already experience improvements in travel time. Providing national HOV lanes would not result in substantial additional improvement for the HOVs already using the system. In addition, roadway congestion will worsen by 2030. As shown in Tables 3-9 and 3-10 in the Final EIS, the H-1 Freeway HOV at the Kaluaao screenline would deteriorate from LOS E in 2005 to LOS F in 2030 without the Project. The Project will reduce congestion on roadways and, as a result, the H-1 Freeway HOV lane will operate at LOS E with the Project. Lastly, the guideway operates in an exclusive right-of-way and, therefore, travel times on the guideway will not be affected by local traffic conditions.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of

Mr. Robert B. Marrone
Page 2

this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Dear Martinez:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- *Reduce the time that each area will experience traffic and community disturbances.*

- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*
- *Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- *Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Subject: Relating to Honolulu Transit Corridor Project Environmental Impacts

One of the most significant adverse impacts of the proposed archaic elevated steel-on-steel heavy rail system is the irreparable blight it will implant through the vital heart of the Downtown Honolulu Waterfront and beyond. This obtrusive blight will impact four protected historic sites along the proposed Waterfront route - specifically Aloha Tower, Irwin Park, the Dillingham Transportation Building, and Mother Waldron Park.

Because of the City's requirement for federal funding for the proposed elevated rail project, it must comply with Section 106 of the National Historic Preservation Act and Section 4(f) of the Department of Transportation Act. It will therefore be taken into account that such elevated infrastructure blight would be "visually incompatible and block the view of the historic resource (e.g., the scale of the infrastructure would overwhelm the resource's historic appearance)" and would cause the "loss of integrity of setting, feeling and association" of these historic sites. The historic view planes to the Harbor from Bishop Street and the Chinatown Historic District will be similarly impacted.

It would therefore be a fatal mistake for Honolulu's future if the City forces the intrusion of elevated transit blight on the Honolulu Waterfront and the *mauka-makai* harbor views. If the Downtown Honolulu Waterfront is allowed to be impacted by the fatal mistake of elevated guideway infrastructure, the vital visual, and indeed historic, character and integrity of the waterfront centerpiece of Downtown and its harbor entrance to Honolulu will be lost. One only needs to consider the blight created by the Embarcadero Freeway along the San Francisco Waterfront, and the universal public elation when it was torn down. It is time that the City and County of Honolulu learns by the mistakes of others before it is too late.

The City also proposes to slam the elevated heavy rail route through Kaka'ako adjacent to another registered historic site, Mother Waldron Park on Halekauwila Street, diminishing its historic character and integrity, and usefulness and attraction as a vital recreational open space for today's growing population. The Kaka'ako Mauka master plan designates Halekauwila Street and its extension to Kamake'e Street as a significant "promenade" street, a pedestrian-friendly boulevard with wide tree-lined sidewalks and new human-scale residential neighborhoods. Thus, the proposed elevated steel-on-steel heavy rail transit infrastructure blight slicing through these neighborhoods is also tragically misplaced.

December 8, 2008
Department of Transportation Services
Page 2

In conclusion, there are very serious concerns surrounding the City's disregard and neglect of the significant adverse impacts of an elevated transit route along the Honolulu Waterfront specific to the complex of registered historic sites that include Aloha Tower, Irwin Park and the Dillingham Transportation Building, and Mother Waldron Park. This badly-planned project cannot be allowed to overshadow and overpower these significant historic sites or destroy the visual character and integrity of the vital Downtown Waterfront.

Sincerely,

Michelle Spalding Matson

Dear Ms. Matson:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The island's unique visual character and scenic beauty were considered in the visual and aesthetic analysis presented in the Draft and Final EISs. The Project will be set in an urban context where visual change is expected and differences in scale of structures are typical. The visual effects on Honolulu's Downtown, including the Aloha Tower, Bishop Street, Chinatown Historic District, Irwin Park, and Dillingham Transportation Building, are discussed under the "Kalihi to Ala Moana Center Landscape Unit" heading in Section 4.8.3 of the Final EIS. The Project will comply with Section 106 of the National Historic Preservation Act and Section 4(f) of the Department of Transportation Act. Coordination with the regulatory agencies that are responsible for compliance is ongoing as documented in Section 4.16 and Chapter 5 of this Final EIS.

The Embarcadero Freeway in San Francisco was an elevated highway, not rail, and thus

is not directly comparable to this project.

In Section 4.8.3 of the Final EIS, specific environmental, architecture, and landscape design criteria are listed that will help minimize visual effects of the Project. The City will implement the following measures to minimize negative visual effects and enhance the visual and aesthetic opportunities that the Project creates:

- Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
- Coordinate the project design with the City's transit-oriented development program within the Department of Planning and Permitting.*
- Conduct public involvement workshops to consult with the communities surrounding each station for input on station design elements.*
- Consider specific sites for landscaping and trees during Final Design when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will serve to mitigate potential visual impacts.*

Even with mitigation measures, some obstruction and changes to views will result in a high level of visual impact, or, a significant visual impact, and changes to some views will be unavoidable. These effects will be most noticeable where the guideway and stations are nearby or in the foreground of views.

Some views and vistas protected by City development plans will change as a result of the project, including public views along streets and highways, mauka-makai view corridors, panoramic and significant landmark views from public places, views of natural features, heritage resources and other landmarks. Depending on the degree of view obstruction or blockage, some changes in view will be significant. Viewers' response to these changes will vary with their exposure and sensitivity and depend on the alignment orientation, guideway and station height, and height of surrounding trees and buildings. View changes will be less notable in wider vista or panoramic views where the project elements are smaller components of the larger landscape. Generally, the project elements will not be dominant features in these views.

The visual effects on Irwin Park are not specifically mentioned in Table 4-10 of the Draft EIS. However, they are part of the larger views assessed in Viewpoint 15 in the Final EIS. The text on Page 4-88 of the Draft EIS has been refined in the Final EIS to clarify the visual impact analysis presented in the Draft EIS as described above.

Although mitigation measures will minimize many adverse visual effects by providing visual buffers and reducing visual contrasts between the project elements and their surroundings, the Final EIS acknowledges, as concluded in the Draft EIS, that probable unavoidable adverse effects, such as view blockage, cannot be mitigated and will be significant (noted as a "High" level of visual impact in the Draft EIS) in some areas.

The Project will introduce a new linear visual element to the corridor, and changes to some views will be significant (or, a high level of visual impact) and unavoidable. The guideway

and some stations will partially block mauka-makai public views from streets that intersect the alignment.

Preliminary effect determinations for DOT Harbors Division Offices, Piers 10/11, Aloha Tower, Irwin Park, Dillingham Transportation Building, Chinatown Historic District, and Mother Waldron Neighborhood Playground documented in the Draft EIS were reevaluated in the Honolulu High-Capacity Transit Corridor Project Historic Effects Report (RTD 2009) issued by FTA on April 14, 2009. Analysis of the Project's direct, indirect, and cumulative impacts to these properties, as described in the Historic Effects Report, include effects to setting. Consultation with the State Historic Preservation Office (SHPO) has continued since release of the Draft EIS. This Final EIS summarizes all effect determinations to historic properties and Section 106 consultation as described in text and tables of Section 4.16 and Chapter 5.

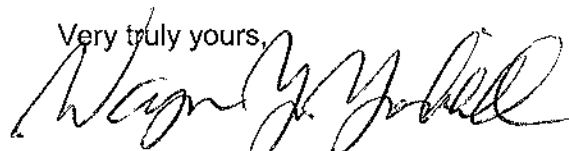

The visual effects on Honolulu's Downtown, including Mother Waldron Neighborhood Park and the Kakaako neighborhood, are discussed under the "Kalihi to Ala Moana Center Landscape Unit" in Section 4.8.3 of the Final EIS. To minimize negative visual effects and enhance visual and aesthetic opportunities, the City will consult with the Kakaako community for input on station design elements. In addition, design guidelines that establish a consistent design framework for the Project with consideration of local context will be developed and applied.

As described in Section 4.2, Land Use in this Final EIS, Appendix J, and expanded upon in the Honolulu High-Capacity Transit Corridor Project Land Use Technical Report (RTD 2008b), the Project is consistent with State and local plans.

Within the Kakaako area, land uses adjacent to the alignment include two- and three-story walk-up apartments and commercial uses. Because Kakaako has been designated a redevelopment area, Kaiāulu 'o Kaka'ako Master Plan (HCDA 2008), changes in land uses to transit-oriented development are likely. This may result in a change in character along the alignment, especially near stations depending on local community input and what redevelopment plans administer. Substantial development has recently occurred in the neighborhood; several high-rise condominium developments have been built and additional residential and commercial development is planned. The elevated transit structure will not create a barrier to pedestrian or other modes of travel.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Attention: Wayne Y. Yoshioka, Director

Subject: Honolulu High-Capacity Transit Corridor Project
Draft Environmental Impact Statement

Dear Sir:

The following comments center on the significance of the Honolulu Waterfront as a historic complex, which is greatly understated and poorly depicted in the subject Draft EIS. The callous insensitivity and abandonment of sound planning and preservation practices demonstrated by the promoters of the proposed project destined to blight this historic complex, across which the subject elevated industrial infrastructure is proposed to span, is appalling.

The Honolulu Waterfront is representative of Honolulu's history from the days of Kamehameha's strategic harbor village, to a Pacific port that welcomed visitors by clipper ship and exported sugar cane across the seas, to today's destination for cruise ships and container cargo essential to the State's sustainability. The permanent visual damage to the appearance and experience of this historic area caused by the proposed industrial infrastructure will be irreparable.

Aloha Tower has long been a beacon that has welcomed travelers to Honolulu. Irwin Memorial Park was Honolulu's first beautification project as the landscaped companion to Aloha Tower, and both landmarks are listed on the Hawaii Register of Historic Places. Together they were, and remain, the landscaped gateway to Honolulu for thousands of residents and visitors alike.

As a family descendent of those who deeded Irwin Memorial Park in trust to the Territory of Hawaii, and writer of the nomination of this site for the Historic Register, I have a vested interest in the protection and preservation of this historic open space held in the public trust. Irwin Memorial Park was indeed a landscaped centerpiece park as intended by the donors until the federal government converted a portion of it into a World War II military parking lot. Since that time plans have been commissioned for the Park's restoration, which has been part of ongoing planning discussions with the State's Aloha Tower Development Corporation.

**HONOLULU WATERFRONT'S FOUR REGISTERED HISTORIC SITES:
ALOHA TOWER AND RESTORED IRWIN PARK WITH THE HARBOR AND PASSENGER TERMINAL BEYOND
AS VIEWED FROM THE DILLINGHAM TRANSPORTATION BUILDING ON BISHOP STREET**

IRREVERSIBLE AND IRRETRIEVABLE COMMITMENTS OF VALUED PUBLIC RESOURCES

One of the most significant adverse impacts of the proposed elevated steel-on-steel heavy rail system is the irreparable blight it will implant through the vital heart of the Downtown Honolulu Waterfront and beyond. This obtrusive blight will impact five protected registered historic sites along the proposed Waterfront route – specifically the Piers 10 and 11 Maritime Passenger Terminal, Aloha Tower, Irwin Park, the Dillingham Transportation Building, and Mother Waldron Park beyond.

Because of the City's requirement for federal funding for the proposed elevated rail project, there must be compliance with Section 106 of the National Historic Preservation Act and Section 4(f) of the Department of Transportation Act. It will therefore be taken into account that such elevated infrastructure slicing across the historic waterfront will substantially visually impair and block the views of these historic resources, i.e., the scale of the infrastructure would overwhelm the appearance of the adjacent historic resources and would cause the loss of integrity of setting, feeling and association of these historic sites and their scenic quality, scale and prominence within the visual environment of this significant location. The historic public view corridors to Honolulu Harbor from Bishop Street, Fort Street, and the Chinatown historic district will be similarly substantially impaired.

The Draft EIS clearly inaccurately accounts for these significant cumulative adverse effects and fails to adequately evaluate the effects of the proposed project on the view corridor. According to the Code of Federal Regulations, 36 CFR Part 800, significant effect is defined as "alteration of the characteristics of a historic property qualifying it for inclusion or eligibility for the National Register," and adverse effect is constituted as, among other things, "introduction of visual, atmospheric, or audible elements that diminish the integrity of the property's significant historic feature."

The Draft EIS states on page 2-37 that Irwin Memorial Park "does not derive a substantial part of its value from its visual setting" and "the project would not substantially impair aesthetic features that are important contributing elements of the property." The Draft EIS overlooks the visual significance of Irwin Memorial Park's landscaped open space together with three other registered historic structures within the uninterrupted view plane. Visually sensitive resources include landmarks, significant views and vistas, view corridors, and historic sites. Because of the proximity and placement of these historic sites it is the views within this historic complex associated with the sites, i.e., to, from and around them, that are significant. A flat roadbed does not adversely impact view planes, corridors or sight lines as they relate to the historic site, but massive rail infrastructure built to thirty (30) feet in height with "visual, atmospheric, and audible elements" would have adverse effects "that diminish the integrity of the property's significant historic feature," and would thus appear to qualify the historic site for protection under Section 4(f).

The visual effects of the proposed project are listed on Table 4-10, and the visual quality of Irwin Park and Aloha Tower is acknowledged to be high. However, the Draft EIS curiously claims that the adverse visual effect of the proposed project on the visual integrity of Irwin Park and Aloha Tower will be "moderate" and "low" when in reality the overall visual effects in this area would be significantly high. Further, the Draft EIS provides a degree of self-contradiction by acknowledging on page 4-88 that "the guideway and columns would change the visual character of the streetscape and substantially affect the visual setting of the Dillingham Transportation Building and Irwin Park. Overall visual effects in this area would be high." Moreover, the Draft EIS flies in the face of moral logic and public policy by blindly declaring on page 4-44 that "The transit system would have little effect on the integrity of the historic districts or their uses," and thus falls flat in assessing the affected visual environment's character and quality.

Further, in both text and depiction the Draft DEIS ignores the high visual quality of this historic complex as approached ewa-bound from the Diamond Head direction, makai from Bishop Street and the historic Dillingham Transportation Building, and makai from Fort

Street and historic Walker Park to Aloha Tower. These more prominent view planes are superior to the alternate perspectives apparently arbitrarily chosen for the Draft EIS, and if superimposed with the elevated rail infrastructure these views would demonstrate the true significant adverse visual effects of the proposed elevated rail infrastructure proposed to span the Honolulu Waterfront from Chinatown to the Federal Building.

The proposed project's cumulative adverse visual and aesthetic impacts to the Honolulu Waterfront and its historic sites would conflict with established policy documents, specifically the Oahu General Plan (Objective B, Policies 2 and 3; Objective E, Policies 4,5 and 9), the Primary Urban Center Development Plan (Objective 3.1.2 and Policy 3.1.2) and the Revised Ordinances of Honolulu (Chapter 21, Article 9, Section 21-9.60), as follows:

- Substantially visually changing and contextually impacting the entire Downtown Honolulu Waterfront area, which is both a historic and scenic asset.
- Positioning elevated infrastructure adjacent to and/or in the foreground of existing historic sites and views
- Altering existing makai views and mauka view corridors
- Introducing dominant features in the views, i.e., elevated infrastructure and expansive station elements
- Substantially contrasting with the pedestrian scale and character of the streetscape
- Substantially affecting the aesthetic setting of the historic sites

Thus the elevated infrastructure and stations will irretrievably alter the significant views and sense of historic place of the Honolulu Waterfront. The visual impact of overpowering industrial infrastructure will ruin the waterfront experience for residents and visitors alike for generations to come, including motorists traveling along the waterfront and pedestrians crossing the roadway under the overshadowing monolithic infrastructure. Many major viewer groups who now enjoy the attractive surroundings and experience of the Downtown Honolulu Waterfront will be sensitive to the visual change and will be adversely affected by the altered views and substantial changes in light and shadows around the massive elevated infrastructure.

It would therefore be a fatal mistake for Honolulu's future if the City forces intrusion of elevated transit blight on the Honolulu Waterfront and its historic mauka-makai harbor views. As a consequence, the vital visual historic character and integrity of the waterfront centerpiece of Downtown Honolulu and its Harbor will be lost. One only needs to consider the blight of the Embarcadero Freeway along the San Francisco Waterfront, and the universal public elation when it was torn down. It is time that the City and County of Honolulu learns by the mistakes of others and does not continue to blunder forward.

Because of the high adverse impact to the visual quality of the Honolulu Waterfront, blocking views and clashing with historic buildings and open space in terms of size, scale and character, the Downtown Waterfront transit corridor route must be rerouted via available alternatives. The Draft EIS provides several Avoidance Alternative Alignments to minimize harm and ensure protection of valued features and sites along the transit route, and the Honolulu Waterfront is more than worthy of this consideration, action and protection. In addition, on January 28, 2009, the Honolulu City Council, as the elected policy-making body for the City and County of Honolulu, approved rerouting a major segment of the proposed rail corridor. If this cannot or will not be done for the Downtown segment, and because it will be impossible to mitigate the unyielding mass of the industrial elevated design framework to preserve significant visual resources, the proposed elevated rail system should be terminated in Iwilei with connection to a dedicated, flexible and convenient grade level Downtown circulator system serving the entire area.

The Draft EIS claims on page 4-44 that as the elevated rail alignment transitions from the Honolulu Waterfront to Halekauwila Street, a narrow local tree-lined road dating from the 1800's, there are "highrise buildings with little or no space between them" and "tall trees already obstruct views." In fact, the public buildings at this Civic Center end of Halekauwila Street, while not much taller than the train would be, are surrounded by mature healthy shade tree canopies and wide setbacks, which are in themselves are welcome comforts within the public visual experience of this district. Again, the visual integrity of this area would be hideously overshadowed, bisected and deformed by the massive industrial elevated rail infrastructure. Indeed, the Draft EIS states on page 4-88 that the "overall visual effects in this area would be high."

The Draft EIS also proposes to carve the elevated heavy rail route through Kaka'ako immediately adjacent to the next historic site, Mother Waldron Park on Halekauwila Street, diminishing its historic character and integrity, and usefulness and attraction as a vital recreational open space for today's growing population. The Draft EIS states on page 4-89 that the proposed project "would substantially change views and contrast with the scale and character of the surrounding environment. Overall visual effects would be high.... Views of the horizon would be partially blocked... including mauka views from the park at Halekauwila Street and Cooke Street. The bulk and scale of the guideway and columns would conflict with the pedestrian-oriented streetscape."

Further, the revised Kaka'ako Mauka master plan designated Halekauwila Street and its extension to Kamake'e Street as a significant "promenade street," a pedestrian-friendly boulevard with wide tree-lined sidewalks and new low-rise residential neighborhoods. Thus

the proposed elevated steel-on-steel heavy rail transit infrastructure blight bisecting these planned Kaka'ako neighborhoods is also tragically misplaced.

There has been little, if any, consideration of the local context in this train proposal for Downtown Honolulu, or from Kaka'ako to the gateway of Manoa's green valley, as it has been railroaded though an uninformed planning process. Hundreds of mature trees that have been protected and preserved for decades are destined to be destroyed or otherwise removed in direct conflict with the Oahu General Plan (Objective A, Policy 9) and the Revised Ordinances of Honolulu (Chapter 41, Article 13). The Draft EIS discloses on page 4-89 that "Mature trees would be removed from Pi'ikoi Street through the Ala Moana Center Station area, substantially changing the character of the streetscape."

The condition and appearance of Honolulu's streets and public open spaces are important factors in, and essential attributes to, the visual character and quality for which Honolulu is known. Significant views and vistas in policy documents include protected mauka and makai views as well as views of prominent landmarks, and the environmental visual character and quality must be fully assessed along with any potential physical impacts.

In conclusion, it has become abundantly clear that the presently proposed elevated transit project is, in some significant aspects, contrary to the public interest. Very serious public concerns surround the City's disregard and neglect of the significant adverse impacts of the proposed elevated rail infrastructure. Specific to the complex of registered sites that include the Piers 10 and 11 Maritime Passenger Terminal, Aloha Tower, Irwin Park and the Dillingham Transportation Building, along with Mother Waldron Park, this badly-planned project cannot, and must not, be allowed to proceed further to overshadow and overpower these significant historic sites and destroy the visual character and integrity of the Downtown Honolulu Waterfront.

Sincerely,

Michelle S. Matson

Dear Ms. Matson:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The island's unique visual character and scenic beauty were considered in the visual and aesthetic analysis presented in the Final EIS. The Project primarily will be set in an urban context where visual change is expected and differences in scales of structures are typical. The visual effects on Honolulu's Downtown, including the Aloha Tower, Irwin Park, Dillingham Transportation Building, Mother Waldron Neighborhood Park, Bishop Street, Chinatown Historic District, and the Kakaako neighborhood are discussed under the "Kalihi to Ala Moana Center Landscape Unit" heading, discussed in Section 4.8.3 in this Final EIS. The City and FTA have complied with Section 106 of the National Historic Preservation Act and Section 4(f) of the Department of Transportation Act as presented in this Final EIS, Section 4.16 and Chapter 5.

Inclusion of the viewer group's responses, received during the Draft EIS comment period, resulted in refinement of the visual impact rating for three key views. The refinement

resulted in revised ratings from moderate to significant for Views 12, 14 and 15 in the downtown area. In addition, the discussion of protected views and vistas provided in this Final EIS includes new summary tables and new visual simulations that were not part of the Draft EIS. The analysis of protected views and vistas was provided in the Visual and Aesthetic Resources Technical Report (2008e); however, this Final EIS more clearly describes the visual effects on these resources.

The Embarcadero Freeway in San Francisco was an elevated highway, not rail, and thus is not directly comparable to this project.

The overall conclusions of the Draft EIS have not changed, but through these refinements, the following clarifications have been made:

- Viewpoint 12. Visual impact rating refined to reflect that some views would be blocked and to expressly point out the contrast of project elements with Chinatown's historic character.*
- Viewpoint 14. Visual impact rating refined to reflect the bulk and scale of the guideway and columns being out of character with the pedestrian-oriented environment at this viewpoint.*
- Viewpoint 15: Visual impact rating refined to reflect the bulk and scale of the station as well as the other elements noted in the Draft EIS.*

The Draft EIS described several types of visual effects and the refinements reflect the same type of visual effects identified in the Draft EIS and shown in these Viewpoints in the Draft EIS. The Draft EIS concluded that changes to some views including protected views and vistas would be unavoidable, and the refinements confirmed this conclusion.

Although mitigation measures will minimize many adverse visual effects by providing visual buffers and reducing visual contrasts between the project elements and their surroundings, the Final EIS acknowledges, as concluded in the Draft EIS, that probable unavoidable adverse effects, such as view blockage, cannot be mitigated and will be significant (noted as a "High" level of visual impact in the Draft EIS) in some areas.

The Project will introduce a new linear visual element to the corridor, and changes to some views will be significant (or, a high level of visual impact) and unavoidable. The guideway and some stations will partially block mauka-makai public views from streets that intersect the alignment.

The City will implement the following mitigation framework (as further described in Section 4.8.3 in this Final EIS) with the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

- Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*

- *Coordinate the project design with the City's TOD program within the Department of Planning and Permitting.*
- *Conduct public involvement workshops to consult with the communities surrounding each station for input on station design elements.*
- *Consider specific sites for landscaping and trees during the final design phase when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will serve to mitigate potential visual impacts.*

Even with mitigation measures, some obstruction and changes to views will result in a high level of visual impact, or, a significant impact, and changes to some views will be unavoidable. These effects will be most noticeable where the guideway and stations are nearby or in the foreground of views.

Some views and vistas protected by City development plans will change as a result of the Project, including public views along streets and highways, mauka-makai view corridors, panoramic and significant landmark views from public places, views of natural features, heritage resources and other landmarks. Depending on the degree of view obstruction or blockage, some changes in view will be significant. Viewers' response to these changes will vary with their exposure and sensitivity and depend on the alignment orientation, guideway and station height, and height of surrounding trees and buildings. View changes will be less notable in wider vista or panoramic views where the project elements are smaller components of the larger landscape. Generally, the project elements will not be dominant features in these views.

The visual effects on Honolulu's Downtown, including Mother Waldron Neighborhood Park and the Kakaako neighborhood are discussed under the "Kalihi to Ala Moana Center Landscape Unit" heading in Section 4.8.3 of the Final EIS. To minimize adverse visual effects and enhance visual and aesthetic opportunities, the City will consult with the Kakaako community for input on station design elements. Specifically, the Kakaako Station workshop will be held in conjunction with the Civic Center and Ala Moana Stations. In addition, design guidelines that establish a consistent design framework for the Project with consideration of local context will be developed and applied.

The visual effects on Irwin Park are not specifically mentioned in Table 4-10 of the Draft EIS. However, they are part of the larger views assessed in Viewpoint 15 in the Final EIS. The text on Page 4-88 of the Draft EIS has been refined in the Final EIS to clarify the visual impact analysis presented in the Draft EIS as described above.

Preliminary effect determinations for DOT Harbors Division Offices, Piers 10/11 (Maritime Passenger Terminal), Aloha Tower, Irwin Park, Dillingham Transportation Building, Chinatown Historic District, and Mother Waldron Neighborhood Playground documented in the Draft EIS were reevaluated in the Honolulu High-Capacity Transit Corridor Project Historic Effects Report (RTD 2009) issued by FTA on April 14, 2009. Analysis of the Project's direct, indirect, and cumulative impacts to these properties, as described in the Historic Effects Report, include effects to setting. Consultation with the SHPO has continued since release of the Draft

EIS. This Final EIS summarizes all effect determinations to historic properties and Section 106 consultation as described in text and tables of Section 4.16 and in Chapter 5 of the Final EIS.

As described in Section 4.2, Appendix J, and expanded upon in the Honolulu High-Capacity Transit Corridor Project Land Use Technical Report (RTD 2008b), the Project is consistent with State and local plans.

The specific wording in the Draft EIS on Pages 4-44 and 4-45 states that "As the alignment transitions to Halekauwila Street, a relatively narrow street, the adjacent buildings become primarily high-rise government office buildings with little or no open space between them. Views of the alignment would be limited to short segments as the guideway crosses city streets since high-rise buildings and tall trees already obstruct views." It is acknowledged that tree canopies and building setbacks enhance the public's visual experience of the area and as explained on Page 4-88 of the Draft EIS, canopies of several mature monkeypod trees along Halekauwila Street would be trimmed. The guideway and columns would also block views from the fourth- and fifth-story windows of adjacent offices and residences, creating additional shade and shadows, and "...the overall visual effects in this area would be high."

Section 4.13.3 of the Draft EIS states that, "effects to trees would be mitigated by transplanting existing trees or planting new ones." Additional information on street trees is offered in the Honolulu High-Capacity Transit Corridor Project Street Trees Technical Report (RTD 2008I). Street trees along the project alignment are discussed in Section 4.15 of the Final EIS. Affects to street trees will be mitigated by transplanting existing trees where possible, or planting new ones. Other possible mitigation measures are discussed in Section 4.15.3 in the Final EIS.

Within the Kakaako area, land uses adjacent to the alignment include two- and three-story walk-up apartments and commercial uses. Because Kakaako has been designated a redevelopment area, Kaiāulu 'o Kaka'ako Master Plan (HCDA 2008), changes in land uses to transit-oriented development are likely. This may result in a change in character along the alignment, especially near stations depending on local community input and what redevelopment plans administer. Substantial development has recently occurred in the neighborhood; several high-rise condominium developments have been built and additional residential and commercial development is planned. The elevated transit structure will not create a barrier to pedestrian, cyclist or automobile modes of travel.

Regarding your comment about public concerns specific to historic sites the following text from Section 8.2.3 of the Final EIS explains the process and the efforts taken both prior to the Draft document and since its publication. The lead agency is responsible for complying with Section 106 of the National Historic Preservation Act. Section 106 requires the lead agency to "accommodate historic preservation concerns with the needs of Federal undertakings through consultation among the agency official and other parties with an interest in the effects of the undertaking on historic properties..." [36 CFR 800.1(a)]. Although other parties are consulted for their input, the Federal agency has the authority to make all decisions. Extensive effort was made to identify, contact, and consult with groups entitled to be consulting parties relating to archaeological, cultural, and historic resources within the Area of Potential Effect (APE). The purpose of consultation was to identify archaeological, cultural, and historic resources and to

discuss other issues relating to the Project's potential effects on such resources. Information was obtained from individuals and organizations likely to have knowledge of potential resources in the study corridor. A reasonable and good faith effort was made to identify Native Hawaiian organizations that might attach religious and cultural significance to historic properties in the APE, and they were given opportunities to discuss issues and concerns.

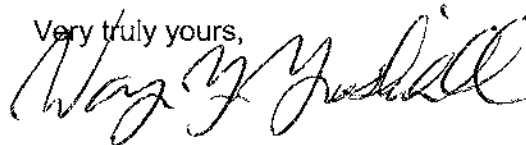

In addition to consultation with the State Historic Preservation Officer (SHPO), the City also consulted with organizations and agencies with concerns regarding archaeological, cultural, and historic areas. This consultation included Hawaiian civic clubs that may have an interest in the Project. Letters sent by the FTA initiated an ongoing consultation process with the following groups (Section 106 consulting parties) to identify resources, consider project effects, and develop mitigation to limit the adverse effects of the Project:

- *Advisory Council on Historic Preservation*
- *U.S. Navy (U.S. Naval Base Pearl Harbor)*
- *Historic Hawaii Foundation*
- *National Park Service*
- *National Trust for Historic Preservation*
- *University of Hawaii Historic Preservation Certificate Program*
- *American Institute of Architects*
- *Hawai'i Community Development Authority*
- *Office of Hawaiian Affairs*
- *Oahu Island Burial Council*
- *Hui Malama I Na Kupuna O Hawaii Nei*
- *Royal Order of Kamehameha*
- *The Ahahui Ka'ahumanu*
- *The Hale O Na Ali'i O Hawaii*
- *The Daughters and Sons of Hawaiian Warriors*
- *Association of Hawaiian Civic Clubs—and 15 individual civic clubs*

Between July 28, 2009 and November 13, 2009, FTA and the City invited all consulting parties to participate in a series of meetings to develop the Programmatic Agreement (PA) (see Section 4.16 and Appendix H). Appendix F includes copies of all Section 106 correspondence.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Submission Content/Notes : Just a comment that I think the extension to UH is a great idea. A necessary one that will help with minimizing traffic. I notice the traffic difference when UH is not in session as traffic time during morning rush hour is cut. I have been watching the traffic differences between private school sessions and UH and it appears that those commuting to UH are a big factor in traffic. I also think students would opt more to commuting via the rail system than other traffic groups. Thanks.

Mr. Tad Matsuno
krankedparts@aol.com

Dear Mr. Matsuno:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

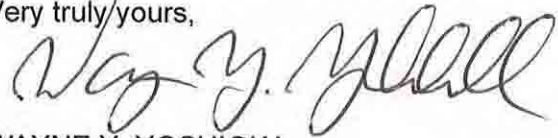

Your support of the future UH Manoa extension has been noted. The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS; however the future extensions are not part of this Project, thus they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time. As stated in Chapter 3

Mr. Tad Matsuno
Page 2

of the Final EIS, transit ridership would be 28 percent higher with the planned extensions to UH Manoa, Waikiki, Salt Lake Boulevard, and West Kapolei (Table 3-29 in the Final EIS). The extensions would also further reduce roadway congestion (Table 3-30). Bus service between Ala Moana Center, UH Manoa, and Waikiki will be enhanced until those extensions are built.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulustransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

To: Yoshioka, Wayne; Ted.Matley@dot.gov
Subject: Draft EIS for the Honolulu High-Capacity Transit Project

Please accept my feelings about the subject EIS.

I disagree with the wording of the EIS because it is written solely for a steel wheel on steel rail system. Other forms of fixed rail should be considered because they may be superior to steel wheels and more cost effective. Please rewrite the EIS to include other forms of mass transit such as monorail or magnetic levitation systems. This should insure the selection of the overall best system.

Thank you for your consideration.

Dan C. Matthews, Lt Col, USAF, Retired
Pearl City, Hawaii

Dear Mr. Matthews:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As stated in Section 2.2.3 of this Final EIS, the NEPA Notice of Intent requested input on five transit technologies. A technical review process included the opportunity for public comment and was used in parallel with the alternatives analysis to select a transit technology. The process included a broad request for information that was publicized to the transit industry. Transit vehicle manufacturers submitted 12 responses covering all of the technologies listed in the Notice of Intent. An independent five-member technology panel composed of four transit experts and a transportation academic appointed by the City Council evaluated guided rubber-tire-on-concrete systems (e.g., Phileas bus system and VAL-type systems), monorail (which is a variation on rubber-tyred technology), steel-wheel-on-steel-rail systems, (e.g., light rail and rapid rail), and magnetic levitation (MAGLEV). The panel considered the performance, cost, and reliability of the proposed technologies.

Proprietary technologies, meaning those technologies that would have required all future

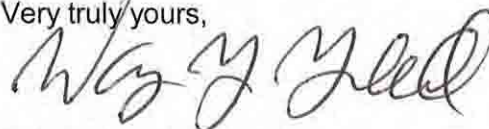

Mr. Dan C. Matthews
Page 2

purchases of vehicles or equipment to be from a single manufacturer, were eliminated because none of the proprietary technologies offered substantial proven performance, cost, and reliability benefits compared to steel wheel operating on steel rail.

The panel accepted public comment twice as part of its review. By a four-to-one vote, the panel chose a steel wheel vehicle operating on steel rail system because it was considered safe, reliable, economical, and non-proprietary. Those results are documented in the panel's report to the City Council dated February 22, 2008 entitled "Independent Technology Selection Panel Report".

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Dear Ms. Maulupe:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

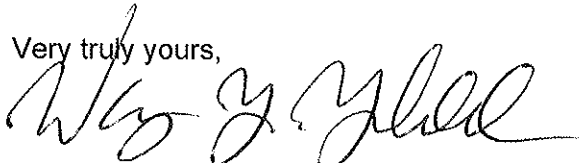

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the

Ms. Pepe Maulupe
Page 2

Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments. The Project is proceeding as quickly as practical, as illustrated in the schedule presented in Chapter 2 of the Final EIS.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Dear Mr. and Ms. Mayer:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The assessment of visual effect due to the Project as described in Section 4.8.3 of the Final EIS considers changes to the visual landscape and viewer responses to those changes. This includes the existing development along the Project alignment. Within the Project corridor the environment changes from rural at the Wai'anae end of the corridor to dense high-rise development at the Koko Head end.

As part of the design process, the City has developed design principles, which are identified in the Honolulu High-Capacity Transit Corridor Project Compendium of Design Criteria (RTD 2009m) that will be implemented in final design to minimize visual effects of the Project. For example, guideway materials and surface textures will be selected in accordance with generally accepted architectural principles to achieve

Mr. Irwin Mayer
Ms. Michelina Mayer
Page 2

effective integration between the guideway and its surrounding environment. Landscape and streetscape improvements will mitigate potential visual impacts, primarily for street-level views.

Other measures to address visual impacts of the Project are being developed through the station design and planning process. The initial station area plans and design guidelines were first developed with coordination between DTS and the Department of Planning and Permitting (DPP). The next level of transit station design focuses on integrating individual neighborhood characteristics of the communities served by the stations.

The following mitigation framework will be included in the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

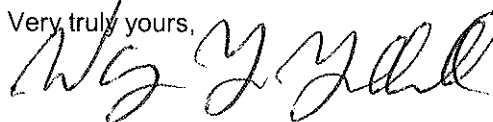

- *Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
- *Coordinate the project design with City TOD planning and DPP.*
- *Consult with the communities surrounding each station for input on station design elements.*
- *Consider specific sites for landscaping and trees during the final design phase when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will serve to mitigate potential visual impacts.*

Section 4.8.3 of the Final EIS, Design Principles and Mitigation includes information related to the mitigation framework described above. Specifically architecture and landscape design criteria include guidelines regarding site design, materials and finishes, and lighting, which apply to stations, station areas, and the guideway.

DTS, with assistance from the Honolulu Police Department, is developing a security plan for transit facilities, including park-and-ride lots. As discussed in Section 2.5.4 of the Final EIS, all stations, park-and-ride facilities, and vehicles will include security cameras that are monitored at all times of operation, will have audible and visual messaging systems, and have an intercom link to the system operations center. Security personnel will also patrol the system. Interior and safety lighting will be provided at all stations and park-and-ride facilities. The technology used for the Honolulu system has advanced substantially since development of elevated rail lines in New York and other mainland cities.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Regarding the DEIS for the Rail Project in Honolulu

Dear Mr. Yoshioka:

My comments regarding the DEIS for the rail project in Honolulu have to do with the financing of the \$5 billion cost.

In the beginning of this process, I heard representatives of the city, including you, state how we would finance the rail when it was being estimated at \$3.5 billion. That number, we in the public were assured, was covered with the General Excise Tax increase of 12.5 percent, the federal funding of \$900 million and \$1 billion in contingencies.

As you know, the economy has tanked, so our GE tax revenue is way down from estimated figures. We still have not been approved for the federal funding. And the cost of the project has gone up by \$1.5 billion from earlier estimates.

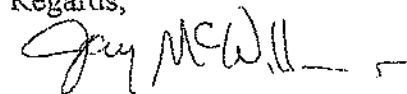

The mayor wants to start giving out contracts for this project and this is where I have a major concern.

Does the city have a plan to protect us from financial liability for this project in the event we can not raise the money necessary to build it? Call it a parachute plan or whatever, but are we going to be tied in to contracts for this project if the money we collect does not match the money we need for it?

Since the mayor has promised over and over again that he will not raise taxes any more in order to pay for rail, I would like to know what will be done to make the costs for rail match once again with the projected funding for it.

Thank you for your time concerning this matter.

Regards,

Jay McWilliams

Dear Mr. McWilliams:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The Project will be implemented through a large series of contracts, currently expected to number approximately 33. The City will not enter into an individual contract unless money sufficient to pay for the contract has been appropriated.

Section 6.3 of the Final EIS describes the funding sources anticipated to be used to pay for the capital costs of the Project and takes into account the current economic downturn. Capital costs of the Project, including finance charges, are expected to be fully paid for by a combination of FTA Section 5309 New Starts Funds and FTA Section 5307 Funds from the Federal government and revenues from the County's General Excise and Use Tax surcharge levied from 2007 through 2022. Section 6.6 of the Final EIS describes risks and uncertainties associated with these funding assumptions.

Mr. Jay McWilliams
Page 2

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is written in a cursive style with a large, stylized initial "W".

Add to Mailing List : Both
Submission Method : Website
Other Submission Method :
Submission Date : 01/15/2009

Submission Content/Notes : MY CONCERNS:

1. OUR PROJECT IS AN ELEVATED, HEAVY RAIL SYSTEM - NOT LIGHT RAIL
 2. TOTAL COSTS ESTIMATES OF THE RAIL ARE NOT LINE LINE WITH OTHER SYSTEMS RECENTLY EMPLOYED
 3. FUNDS PROVIDED BY TOURIST GET PAYMENTS ARE ALREADY SIGNIFICANTLY LESS THAT ESTIMATED AND THIS TREND WILL CONTINUE
 4. THE CITY IS FACING MONUMENTAL FINANCIAL COMMITMENTS FOR SEWER, ROADS, AND LANDFILL PROJECTS
 5. THE RECENTLY ANNOUNCED CONTRAFLOW LANES AND MIDDLE STREET LANES ON THE FREEWAY SHOULD ALEVIATE ALOT OF CONGESTION. THE NEED FOR A RAIL SYSTEM SHOULD BE REVISITED ONCE THESE CHANGES HAVE BEEN IMPLEMENTED.
 6. THE RAIL IS AN INFLEXIBLE SYSTEM THAT CANNOT AVAIL ITSELF OF NEW TECHNOLOGY.
 7. CALTRANS AND UC BERKLEY ARE CONDUCTING AN AUTOMATED BUS GUIDANCE SYSTEM - A MAGNETIC GUIDANCE SYSTEM DEMONSTRATION PROJECT IN SAN LEANDRO (ALSO IN EUGENE, OREGON). THE ESTIMATED COSTS FOR BUS RAPID TRANSIT ARE MATERIALLY LESS THAN LIGHT RAIL NOT TO MENTION HEAVY RAIL.
 8. I DO NOT BELIEVE THE PROJECTED RIDERSHIP WILL TRANSLATE TO ACTUAL RIDERSHIP AND THAT THE ACTUAL RIDERSHIP WILL NOT RESULT IN SIGNIFICANT RELIEF.
 9. TECHNOLOGY IS RAPIDLY CHANGING ALL ASPECTS OF OUR LIVES - TELECOMMUTING FOR WORK AND SCHOOLING, ELECTRIC & FUEL CELL CARS. WE NEED A SYSTEM THAT CAN BE ADAPTABLE TO OUR CHANGING NEEDS AND TECHNOLOGY.
 10. AN ELEVATED RAIL SYSTEM IS TRULY CONTRARY TO A HAWAII SENSE OF PLACE. STATIONS EQUIPED WITH ESCALATORS, ELEVATORS, BATHROOMS AND SHELTERS ARE GRAFFITI MAGNETS.
- PLEASE BE CAREFUL WITH OUR AND FUTURE GENERATION'S MONEY.

Dear Ms. Meier:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following responses address comments regarding the above-referenced submittal:

- 1. The system specification is compatible with either a light- or rapid-rail vehicle.*
- 2. While the capital cost estimates for the Project, which are used in the financial analysis, are higher than those of other recent rail lines this reflects higher construction costs in Hawaii and higher shipping costs of materials to Hawaii.*
- 3. The financial analysis described in the Final EIS is subject to a number of risks and uncertainties, as described in Section 6.6 of the Final EIS. The Final EIS reflects the latest economic trends in both cost and revenue forecasts.*

4. *Enabling legislation for the County General Excise and Use Tax surcharge and Ordinance 07-001 preclude the use of the collected funds for purposes other than a fixed guideway transit system.*
5. *A travel demand forecasting model was used to forecast roadway conditions in 2030, both with and without the Project. As described in Chapter 3, Section 3.4 of the Final EIS, modeling took into account committed transportation projects anticipated to be operational by 2030. Committed transportation projects are those identified in the Oahu Regional Transportation Plan (as shown in Table 2-4 of the Final EIS). These projects include a p.m. reversible 'zipper' lane and widening H-1 at Middle Street. As shown in Tables 3-9 and 3-10 of the Final EIS, roadway conditions will get worse, despite these improvements. However, these tables also show that traffic conditions will improve up to 11 percent with the fixed guideway system. In addition, a Managed Lane Alternative was evaluated during the Alternatives Analysis phase of the Honolulu High-Capacity Transit Corridor Project. While the Managed Lane Alternative would reduce freeway congestion (measured as vehicle hours of delay), it would increase overall system congestion by inducing additional travelers to drive, which would result in increased congestion on arterial and collector facilities accessing the freeways. System-wide congestion will be greater in 2030 than today. Spot congestion in some locations could decrease with the managed lane alternative; however, the reversible managed lane alternative would result in an increase in system-wide congestion compared to the No Build Alternative, while the Project will result in a decrease in congestion compared to the No Build Alternative.*
6. *Modern rail technology continues to evolve. The modern transit vehicle is less similar to an eighteenth-century locomotive than a modern automobile is to the Model T.*
7. *Guided bus systems constructed on an elevated guideway, as would be required for use in Honolulu, would require a larger and more expensive structure than required for rail transit.*
8. *As discussed in Chapter 3, Section 3.2.1 of the Final EIS, the ridership forecasts are based on a travel demand forecasting model used by the Oahu Metropolitan Planning Organization (OahuMPO) for the Oahu Regional Transportation Plan. The OahuMPO model is based on "best practices" for urban travel models in the U.S. This modeling approach has proven effective in estimating ridership in other areas such as Los Angeles County, Salt Lake City, and the Denver region in the last 10 years. This model is based on guidelines established by the FTA. Projections for 2030 have been developed using the travel demand model, which was calibrated and validated to current year conditions. The model is based upon a set of realistic input assumptions regarding land use and demographic changes between now and 2030 and expected transportation levels-of-service on both the highway and public transit system. Based upon the model and these key input assumptions, approximately 116,000 trips per day are expected to use the rapid transit system on an average weekday in 2030. Since the Draft EIS was*

published, the travel demand model has been refined by adding an updated air passenger model, defining more realistic drive access modes to project stations and recognizing a more robust off-peak non-home based direct demand element based on travel surveys in Honolulu.

The Project is among the first in the country to design and undertake an uncertainty analysis of this type of travel forecast. The uncertainty analysis evaluates the variability of the forecast by establishing probabilistic upper and lower limits of ridership projections. FTA has worked closely with the City during this work effort. A variety of factors were considered in the uncertainty analysis, including the following:

- Variations in assumptions regarding the magnitude and distribution patterns of future growth in the Ewa end of the corridor*
- The impact of various levels of investment in highway infrastructure*
- The expected frequency of service provided by the rapid transit system*
- Park-and-ride behavior with the new system in place*
- The implications on ridership of vehicle and passenger amenities provided by the new guideway vehicles*

Given all the factors considered, the anticipated limits for guideway ridership in 2030 is expected to be between 105,000 to 130,000 trips per day, bracketing the official forecast of 116,000 riders a day used for all calculations.

As identified in Chapter 3, Table 3-14 of the Final EIS, the Project will result in reduced vehicle hours of delay of 18 percent compared to the No Build alternative. The reduction in delay will be attributable to shifts in travel demand from automobile to transit.

- 9. While information technology has enabled people to remain connected from any location, it has not eliminated the need or desire of people to travel on the island.*
- 10. As discussed in Section 4.8 of the Final EIS, the Project will be set in an urban context where visual change is expected and differences in scales of structures are typical. The following measures will be included with the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:*
 - Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
 - Coordinate the project design with the City transit-oriented development program within the Department of Planning and Permitting.*

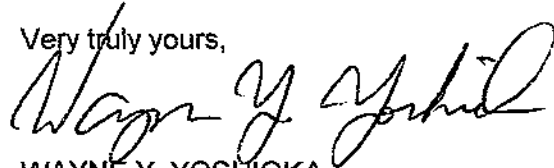

Ms. Kathleen Meier
Page 4

- *Consult with the communities surrounding each station for input on station design elements.*
- *Consider specific sites for landscaping and trees during the final design phase when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will serve to mitigate potential visual impacts.*

It should also be noted that the Project will provide users with expansive views from several portions of the corridor by elevating riders above highway traffic, street trees, and low structures adjacent to the alignment. In Section 4.8.3 of the Final EIS, Environmental Consequences and Mitigation under the heading Design Principals and Mitigation, specific Environmental, Architecture and Landscape Design Criteria are listed that will help minimize visual effects of the Project.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Issuance of the Record of Decision under NEPA and acceptance of the Final EIS by the Governor of the State of Hawaii are the next anticipated actions and will conclude the environmental review process for this Project.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

RE: Draft Environmental Impact Statement (DEIS)

Dear Sir or Madam:

As CPA's, we support viable and affordable traffic solutions for the City and County of Honolulu. We find several flaws regarding funding for the proposed rail project currently estimated to cost \$5.5 billion for the airport route adopted on January 28, 2009 and summarized in Section 6 of the Draft Environmental Impact Statement (DEIS). We believe these flaws are of such magnitudes that not only will this project be neither viable nor affordable; this project will jeopardize our City and County's financial health and sustainability.

How realistic are the funding assumptions?

The basis for funding the proposed rail system is a 1/2% excise surcharge assessed on county transactions from January 1, 2007 to December 31, 2021. Using the City's figures provided in Section 6 of the DEIS, this surcharge needs to generate a minimum of \$4.1 billion. The cash flow statement of the DEIS includes surcharge tax collections through 2023, two years past the 2021 collection expiration date provided by law. When the taxes for the additional two years are deleted from the City's projection, the required collections are short by \$473.5 million [Exhibit A].

The collections from January 2007 to December 2008, total \$294 million, substantially below the City's projections. It would require a minimum tax growth rate of 9.46% every year for thirteen [13] years [Exhibit B]. Based on the Honolulu's economic history and the current global economy, this growth rate is unattainable.

What do the economists say?

The Council on Revenues [the economic board that provide forecasts of tax revenues to the Governor and State Legislators] issued new tax collection forecasts on January 12, 2009 [Exhibit C.] The forecast for growth in Hawaii tax revenues for 2009 through 2015 are -3.1%, 1%, 3.5%, 5.3%, 6%, 6.5%, and 6.5%. Using these forecasts, it would require an increase, compounded annually; in collections of 25.29% from 2016 to 2021 [Exhibit D]. These forecasts do not include the additional cost for borrowing funds due to the shortfall in surcharge tax collections. This rate of required growth in tax collections is unattainable based on our economic history.

The funding should be based on the economic realities and reasonable factors:

1. 2007 and 2008: The actual surcharge collections
2. 2009 through 2015: The Council on Revenues forecasts
3. 2016 through 2021: Using a 6.5% growth rate of collections

Based on the above assumptions, the City will experience a **\$1.26 billion shortfall** by the year 2021 [Exhibit E].

How much will the federal government contribute?

The DEIS estimates this rail project will cost approximately \$5.5 billion, with \$ 1.4 billion to be provided by the U.S. Department of Transportation. The federal funds are to be paid through their "New Starts" grants in the amount \$200 million per year for seven [7] consecutive years. The 2009 budget for "new starts" is \$1.475 billion for 30 grants that were selected from mass transit program applications from municipalities nationwide. The average grant is \$47 million with two-thirds [2/3] of the grants going to cities with populations averaging 5.4 times the size of Honolulu. The average grant for smaller cities such as Honolulu is \$23.5 million. There is great competition for these grants. The DEIS assumption that Honolulu will successfully obtain 1/7 of the country's mass transit budget for seven consecutive years is unrealistic and not viable.

What are the risks?

- Honolulu could have a rail system that is never completed. With no monies available to complete the project, the useless concrete pillars will be a monument to an irresponsible act that will mar our landscape for years to come.
- Honolulu's credit rating could plummet resulting in higher unbudgeted costs for interest on borrowed funds.
- Residents could face tax increases to pay for the shortage that will put undue economic pressure on them and future generations.
- Honolulu could be bankrupt due to all the debt that even future generations cannot service.

The City and County of Honolulu has a duty to its residents and taxpayers to act appropriately and prudently when committing our resources to traffic solutions. **The solutions must be viable and affordable.** We await your response to our concerns.

COUNCIL ON REVENUES

STATE OF HAWAII
P.O. BOX 259
HONOLULU, HAWAII 96809-0259

January 12, 2009

The Honorable Linda Lingle
Governor, State of Hawaii
Executive Chambers
State Capitol, Fifth Floor
Honolulu, HI 96813

Dear Governor Lingle:

At its meeting on January 9, 2009, the Council on Revenues adjusted downward the forecast growth rates of General Fund tax revenues. The forecast was reduced from -0.5% to -3.0% for fiscal year (FY) 2009, from 3.5% to 1.0% for FY 2010, and from 4.5% to 3.5% for FY 2011. The Council also updated its forecasts of General Fund tax revenues for FYs 2012 through 2015, generally lowering the revenue gains while leaving the percentage increases the same for the out-year projections.

The revised forecasts of state general fund tax revenues for fiscal years 2009 through 2015 are listed below:

Fiscal Year	Thousands of Dollars	% Growth From Previous Year
2009	\$4,502,616	-3.0%
2010	\$4,547,642	1.0%
2011	\$4,706,809	3.5%
2012	\$4,956,270	5.3%
2013	\$5,253,646	6.0%
2014	\$5,595,133	6.5%
2015	\$5,958,817	6.5%

Line-item detail of State General Fund tax revenues by revenue category for FY 2009 through FY 2015 are presented in the attached table. These detailed forecasts are based on the Council's forecast for total state general fund tax revenues and the econometric model currently used by the Tax Research and Planning Office.

EXHIBIT C

Dear Ms. Meier:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The Final EIS includes General Excise and Use Tax (GET) surcharge collections through December 31, 2022, in accordance with City Ordinance 05-027 which established the 0.5 percent County surcharge on the GET through this date. As shown in Table 6-4 in the Final EIS, the net GET surcharge revenue will equal \$3,524 million (YOE \$). The analysis in Chapter 6 of the Final EIS takes the current economic downturn into account.

Section 6.6 of the Final EIS discusses risks and uncertainties associated with the funding assumptions for the Project. A subsection under Section 6.6.3 has been added since the Draft EIS was published to address the Council on Revenues' forecasts. As stated in this section, in the short-term, GET surcharge revenues are subject to uncertainties related to the magnitude and timing of the economic recovery on Oahu. Over the long-term, GET surcharge revenues on Oahu depend on a variety of underlying economic factors outside of the City's control that may result in a higher or lower projection than the one used in this EIS.

While GET surcharge collections have gone down, so too have the costs of the Project. However, if GET surcharge revenues and/or Federal funding are not sufficient to meet the cash-flow requirement to cover capital expenditures, other potential revenue sources will be developed to close the funding gap.

The financial plan is balanced for the entire Project so there will not be a situation in which only a portion of the system will be built. If there is a shortfall, additional revenue sources will be identified. As noted above, Section 6.6 of the Final EIS discusses risks and uncertainties, as well as the potential sources to cover shortfalls.

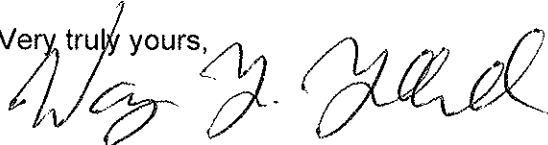

The magnitude and timing of Federal funding is one source of risk that is discussed in Chapter 6 of the Final EIS. Density and transit use in the corridor are among the highest in the nation and higher than most areas that have qualified for New Starts funding in recent years. This Project has been developed in coordination with FTA since its inception. There is no indication to suggest that the Project will not qualify for the Federal funding requested.

The financial plan was developed in consideration of safeguarding the City's credit rating in light of the likelihood of General Obligation bond sales required to bridge any year-by-year funding shortfalls, with all debt service costs paid with GET surcharge revenues, because FTA Section 5309 will pay for some financing costs. The New Starts funds are also proposed for a significant increase in the latest Federal budget proposal. Further, there has been no indication from the FTA that the requested amount is unreasonable or unrealistic.

As discussed in Section 6.4.2 of the Final EIS, the City's contribution to transit operation and maintenance is currently funded through Federal funding, fare revenues, and the City's General and Highway Funds. This funding will be used to fund operating and maintenance costs of the Project. The General Fund includes property tax revenues and other taxes and fees. Beyond collection of property taxes that fund City operations, for which the City develops rates on an annual basis and part of which will fund transit services, there is no anticipated impact to property taxes. Fixed guideway operation costs will represent between 2 and 3 percent of the City's annual operating budget. Property tax revenues are not expected to be used to fund construction of the Project.

The financial plan is structured to ensure Honolulu will not go bankrupt. The debt amount is a minor part of the Project at less than 10 percent.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Dear Aulama Melei:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

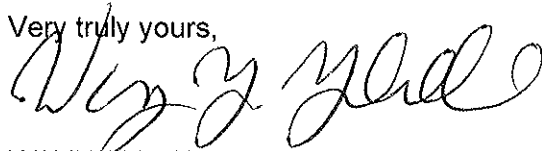

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

Your preference for a Fixed Guideway Transit Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the

alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Dear Mr. Mercado:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 C.F.R. § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

Your comments have been noted. Chapter 2 of the Final EIS summarizes the alternatives screening and selection process. Beginning in the fall of 2005, an initial screening process considered alternatives identified through previous transit studies, a field review of the study corridor, an analysis of current population and employment data for the study corridor, a literature review of technology modes, ongoing work completed as part of the Oahu Regional Transportation Plan 2030 (ORTP) prepared by the Oahu Metropolitan Planning Organization (OahuMPO) (OahuMPO 2007), and public and agency comments received during the formal Alternatives Analysis scoping process.

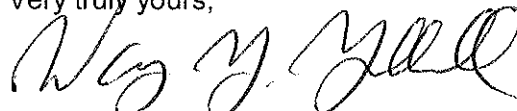

The screening process is documented in the Honolulu High-Capacity Transit Corridor Project Alternatives Screening Memorandum (DTS 2006a). Three scoping meetings were held during the screening process in December 2005, which included a presentation of initial alternatives to the public, interested agencies, and officials to receive comments on the Purpose and Need, alternatives, and scope of the Alternatives Analysis. Refinements were made to the alternatives based on the public input during scoping.

Mr. Clifford Mercado
Page 2

After completion of screening in the winter of 2006, the following alternatives were studied in the Alternatives Analysis: No Build Alternative, Transportation System Management (TSM) Alternative, Managed Lane Alternative, and the Fixed Guideway Alternative. After review of the Alternatives Analysis Report and consideration of public comments, the City Council identified a fixed guideway transit system extending from Kapolei to UH Manoa with a connection to Waikiki as the Locally Preferred Alternative. This identification, which eliminated the TSM and Managed Lane Alternatives from further consideration, became Ordinance 07-001 on January 6, 2007. The NEPA process considered a range of alternatives that was consistent with the identified Locally Preferred Alternative. As discussed in Section 2.2, there were no alternatives that had not been previously studied and eliminated for good cause that would satisfy the Purpose and Need at less cost, with greater effectiveness, or less environmental or community impact.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,
