The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses comments regarding the above-referenced submittal:

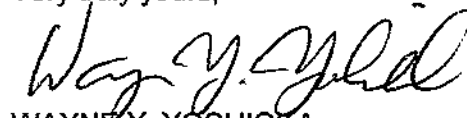

Your preference for the Airport Alternative has been noted. While each of the alternatives includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana Center has been selected as the Preferred Alternative. The identification of the Airport Alternative as the Preferred Alternative was made by the City to comply with FTA's NEPA regulations that state that the Final EIS should focus on the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative, public input on the Draft EIS, and City Council Resolution 08-261 identifying the Airport Alternative as the Project. The selection of the Airport Alternative is described in Chapter 2 of this Final EIS. The discussion of the alternatives considered is included in Chapter 2 of this Final EIS and the Alternatives Analysis. As discussed in Section 3.4.2 of this Final EIS, the Airport Alternative will carry the most passengers with 116,000 daily passengers and 282,500 daily trips in 2030, thereby resulting in the greatest transit-user benefits. The Airport Alternative will also result in the fewest vehicle miles traveled and vehicle hours of delay, as well as provide

Ms. Cheri Michel
Page 2

access to major employment areas, including Honolulu International Airport, that will have substantially greater ridership than the other alternatives considered.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulustransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Issuance of the Record of Decision under NEPA and acceptance of the Final EIS by the Governor of the State of Hawaii are the next anticipated actions and will conclude the environmental review process for this Project.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Submission Content/Notes : I got this email. Please send me the answers so I can respond. Mahalo!

1. In the end, how much will rail cost?

a. The mayor's office today (via honolulutransit.org, 12/4/08) claims rail will cost \$5.3 to \$5.4 billion dollars, depending on the route. Here is the claim, quoted: "The Salt Lake route will cost an inflation-adjusted \$5.3 billion and the airport route will cost an inflation-adjusted \$5.4 billion."

i. From what report do these figures come from?

2. How will we pay for rail?

a. Here's a list from the honolulutransit.org website: Firstly, will you please list and verify your sources for each of these?

- "From the 1/2% GET surcharge" = \$2.6 - \$3.2 billion (49%-60% of \$5.3 billion) - When will this tax sunset?

- "The Federal Transit Administration's New Starts program." = \$1.7 - \$2.2 billion (32%-42% of \$5.3 billion) - Mr. Cayetano and others have said this money is not certain (<http://www.honoluluadvertiser.com/article/20081013/BREAKING01/81013045>): what reasons (historical examples and laws), documents and/or testimonies do you have to dispute Mr. Cayetano's claim?

- "\$15.5 million for the planning phase has been appropriated by Congress for this year" = (0.28% of \$5.3 billion-- is this worth mentioning?)

- "and another \$20 million is in the pipeline." (0.38% of \$5.3 billion-- Again, a negligible amount unless there are larger political implications to this (if so, what are they, and how can we be certain of them?))

- "Local funding, with more than \$250 million banked for the project." (4.7% of \$5.3 billion) - Who specifically are these investors?

- "Federal funding is expected to increase significantly as the project moves to construction." - Which historical examples, laws, or testimonies of federal officials should we build our expectations for this on?

- Totalling all these, this puts revenues at: \$4.6-\$5.7 billion, well above the \$3.7 billion number the mayor claimed not long ago. Is the mayor responsible for this billion dollar gap? If not, who is?

Dear Mr. Mick:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The total cost of the Project, including finance charges, is \$4.6 billion in 2009 dollars and \$5.5 in inflated dollars. Please refer to Chapter 6 of the Final EIS. Table 6-1 of the Final EIS provides information about the Project's cost. The capital plan that analyzes capital expenditures for the Project is presented in Section 6.3 of the Final EIS, including a description of the amount of funding anticipated from various sources. Section 6.6 of the Final EIS describes risks and uncertainties associated with these funding assumptions.

In addressing your question regarding the funding for the Project:

- *The General Excise and Use Tax (GET) surcharge will raise \$3.524 billion through 2022. This represents a reduction in GET revenue as a result of the economic downturn.*

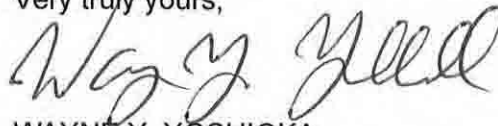

Mr. Bryan Mick
Page 2

- *The Federal New Starts program will contribute \$1.55 billion and is subject to Congressional approval. Indications from the FTA have been very supportive.*
- *The \$15.5 million and \$20 million FTA allocations are provided to support the planning and engineering efforts and reflect the support of the Project.*
- *The \$250 million is a reference to the funding already collected from the GET surcharge since January 2007. As of August 2009, over \$400 million has been collected from the GET surcharge.*

The total from all sources is \$5.5 billion in inflated dollars, the amount needed to build the Project.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Submission Content/Notes : To whom it may concern, I was a IBEW steward in PHNSY and approximately four years ago I was part of a team to negotiate for all Shipyard workers to obtain a free Bus pass. Originally shipyards were required to pay \$17 to be able to get a monthly Bus pass, but today we receive a free Bus pass due to the Union negotiation and the DOT paying for Federal workers public transportation. Today we have 800+ Bus riders and 800+ Van Pool users all paid by DOT. Unfortunately our numbers would increase if we had a system like the Rapid Transit that comes to Pearl Harbor at various times through out the day. Presently we only have buses running at the start of our work day (0630 hours) and at the end (1500 hours) and they only service six areas. We feel that if the Rapid Transit does come close to Pearl Harbor the ridership will go up and many more workers at Pearl would take advantage of the free passes. This must happen to help make Rapid Transit become a success. Mahalo Tommy Miguel

Dear Mr. Miranda:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal.

Appendix C (Right-of-Way Plans) of the Final EIS contains specific right-of-way information for the Project, including the Waimalu area. Section 4.19.2 of the Final EIS discusses the potential influence the Project could have on future development. The station areas are where the greatest changes may occur. In March 2009, the City Council approved and the Mayor of Honolulu signed Bill 10 (09-4), which defines the City's approach to transit-oriented development (TOD) around fixed guideway stations. Zoning regulations, which will be developed in late 2009, will address parking standards, new density provisions, open space, and affordable housing. While the Project is coordinating with City and State agencies to encourage development of enhanced pedestrian and bicycle facilities and other land use changes near the stations, the actual construction of such facilities and zoning changes are beyond the scope of the Project. A map of the Project alignment is included in Chapter 2 of the

Mr. Ralph Miranda
Page 2

Final EIS.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Honolulu High-Capacity Transit Corridor Project

Welcome to the Honolulu High-Capacity Transit Corridor Project's Public Hearing for the Draft Environmental Impact Statement/Section 4(f) Evaluation.

This public meeting and hearing has been designed to inform the public about the transit project, explain materials contained in the Draft EIS, answer questions from the public, and collect public input on project issues related to the Draft EIS, Section 106 of the National Historic Preservation Act, Section 4(f) of the U.S. Department of Transportation Act, and floodplains affected by the project.

Please review the project information and ask project staff any questions about the project that you might have. The Draft EIS is available on the project website at www.honolulustransit.org.

You may provide official comments in several ways. Here at this Public Hearing you may provide oral comments to a court reporter who will record them for the record or use this form to provide written comments. After the meeting, you may provide an on-line comment at www.honolulustransit.org or use this form to send a written comment to the Department of Transportation Services. All comments must be postmarked or received by January 7, 2009 in order for them to be included in the Final EIS.

Comment(s):

I feel that the initial plan should be
from Pearl City to Waikiki via the airport.
Many hotel employees live in the ~~the~~ Leeward
area, the maintenance facility & parking
are at the Pearl City end & it would
provide for the needs of many residents
since Waikiki has many bus feeder
routes.

Dear Ms. Mist:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your preference for the Airport Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been identified as the Preferred Alternative as described above. As compared to the other alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly lower impacts to the natural and built environment. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative.

The Alternatives Analysis phase, which preceded the EIS process, is documented in Chapter 2 of the Final EIS. It evaluated a range of modal and general alignment alternatives, in terms of their costs, benefits, and impacts. The scoping process for the Alternatives Analysis involved a presentation of the viable alternatives to the public and interested public agencies and officials to receive comments on the Purpose and Need, alternatives, and scope of the analysis. Scoping for the EIS followed the FTA process that provides for a culling of alternatives studied in the EIS through an Alternatives Analysis. The scoping process initiated for the Alternatives Analysis included a variety of highway, bus and fixed guideway options for consideration. During the later scoping effort for the EIS, the public was requested to propose alternatives that would satisfy the purpose and need at less cost or with greater effectiveness, less environmental or community impact and to propose alternatives that were not previously studied and eliminated for good cause. The only alternative that emerged that met these criteria was a fixed-guideway alternative following several alternative alignments. All reasonable alternatives that emerged from these processes were ultimately evaluated in the Draft and Final EISs.

Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts, and mitigation commitments.

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- Reduce the time that each area will experience traffic and community disturbances.*
- Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*
- Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project. Bus routes that feed the Waikiki area from the Leeward side of the island will continue to operate during construction to facilitate the transportation of hotel employees to Waikiki.

Ms. Sally Mist

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Submission Content/Notes : I do not support this rail project as it stands, for several reasons.

It costs too much for what we are getting.

Steel on steel is especially not good for Hawaii due to high maintenance. At-grade light rail would be infinitely better than elevated steel on steel rail - cheaper and safer, especially due to our earthquake and hurricane prone islands.

I am afraid what it will do to the areas that are developed around it (increased crime, noise, and depression; visual blight)

Again, it is too expensive. 6 billion dollars (or more) for something that will not alleviate traffic; this is billed simply as an 'alternative' - we can do better. Even a BRT/light rail system would be better - and more flexible. Now that it is supposed to go through the airport, I suppose you think tourists are going to take it half-way to Waikiki? Think again. They'd have to catch it with luggage, perhaps children, elderly, etc. in tow, stop 19 times, get to Ala Moana, grab all the luggage, etc. & then what - call a cab?

This is insanity... please consider how to better spend our tax dollars. You're planning to give the bulk of the money to a mainland company who is going to bring in mainland employees. Yes, they'll spend money, but the bulk of it won't stay here. You can build cheap (that's an oxymoron if I ever heard one) housing in the areas surrounding the stations, but who is going to rent there with the train screaming through every 2 minutes (so they say) from 4 am to midnight? People who can't afford to live anywhere else, that's who. The same low-income, mostly low class people who get subsidized fares, housing, & food - bus riders. Would YOU live in housing next to a train, especially with neighbors like that? I have my doubts...

Anyway, I hope this project doesn't go through as it's sort of planned - we can do better. WAY better.

Sincerely yours,

JMitchell

Dear J. Mitchell:

**Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement**

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal:

Your comments regarding the Project are noted. Section 6.3 of the Final EIS describes the financial resources anticipated to pay for the capital costs of the Project. Capital costs, including finance charges, are expected to be fully paid for by a combination of FTA Section 5309 New Starts and FTA Section 5307 Funds from the Federal government and revenues from the County General Excise and Use Tax surcharge levied from 2007 through 2022 on Oahu.

To answer your question about the maintenance of the system, steel-wheel systems have lower long-term maintenance costs than other high-capacity, fixed guideway technologies. The steel that will be used for the Project will be compatible for use in a marine environment. Steel rail is capable of long-term operation in such an environment. For example, excursion service is still provided in Ewa using rails that are over 100 years old.

The Alternatives Screening Memorandum (DTS 2006a) recognized the visually sensitive areas in Kakaako and Downtown Honolulu, including the Chinatown, Hawaii Capital, and Thomas Square/Academy of Arts Special Design Districts. To minimize impacts on historic resources, visual aesthetics, and surface traffic, the screening process considered 15 different combinations of tunnel, at-grade, or elevated alignments between Iwilei and Ward Avenue. Five different alignments through Downtown Honolulu were advanced for further analysis in the Alternatives Analysis, including an at-grade portion along Hotel Street, a tunnel under King Street, and elevated guideways along Nimitz Highway and Queen Street.

The Alternatives Analysis Report (DTS 2006b) evaluated the alignment alternatives based on transportation and overall benefits, environmental and social impacts, and cost considerations. The report found that an at-grade alignment along Hotel Street would require the acquisition of more parcels and affect more burials than any of the other alternatives considered. The alignment with at-grade operation Downtown and a tunnel through the Capital Historic District, in addition to the environmental effects such as impacts to cultural resources, reduction of street capacity, and property acquisition requirements of the at-grade and tunnel sections, would cost more than \$300 million more than the least expensive alternative.

The Project's purpose is "to provide high-capacity rapid transit" in the congested east-west travel corridor. The need for the Project includes improving corridor mobility and reliability. The at-grade alignment would not meet the Project's Purpose and Need because it could not satisfy the mobility and reliability objectives of the Project. Some of the technical considerations associated with an at-grade versus elevated alignment through Downtown Honolulu include the following:

- **System Capacity, Speed, and Reliability:** The short, 200-foot blocks (or less) in Downtown Honolulu would permanently limit the system to two-car trains to prevent stopped trains from blocking vehicular traffic on cross-streets. Even with transit signal priority, the at-grade speeds would be slower and less reliable than an elevated guideway. Under ideal circumstances, the capacity of an at-grade system could reach 6,000 passengers per hour per direction. Based on travel forecasts, the Project will need to carry more than 9,000 passengers by the early 2020s. Moreover, the system can be readily expanded to carry over 25,000 in each direction by reducing the interval between trains (headway) to 90 seconds during the peak period. To preserve a comparable system capacity, speed, and reliability, an at-grade alignment would require a fenced, segregated right-of-way that would eliminate all obstacles to the train's passage, such as vehicular, pedestrian, or bicycle crossings.
- **Mixed-Traffic Conflicts:** With the planned three-minute headways, the short cycle of traffic lights would affect traffic flow and capacity of cross-streets. Furthermore, there would be no option to increase the capacity of the system by reducing the headway to 90 seconds.
- **Construction Impacts:** An at-grade system would consume two or more lanes of existing roadway, resulting in increased congestion or requiring that additional businesses or homes be taken to widen the roadway through Downtown. This

would also have greater construction impacts and potentially affect cultural practices and burials to a greater extent than the placement of discrete column foundations for an elevated structure.

Because it is not feasible for an at-grade system through Downtown to move passengers rapidly and reliably without significant detrimental effects on other transportation system elements (e.g., the highway and pedestrian systems, safety, reliability, etc.), an at-grade system would have a negative system-wide impact that would reduce ridership throughout the system. The at-grade system would not meet the Project's Purpose and Need and therefore does not require additional analysis.

The City passed a transit-oriented development (TOD) Ordinance 09-4 in March 2009 in anticipation of the Project. Development in the study corridor, whether highway-oriented or TOD, will be based on market demands. Pursuant to the policy, TOD may occur in project station areas as an indirect effect of the Project. The increased mobility and accessibility that the Project will provide may also increase the desirability and value of land near stations, attracting new real estate investment nearby. Therefore, an indirect effect of the Project will be to alter development near stations by attracting higher densities than presently planned or could otherwise be developed near transit stations. If development occurs around stations, it is anticipated that City infrastructure would be improved in these areas. There is no noise impact associated with transit station locations.

As discussed in Chapter 2 of the Final EIS, the design of stations and public areas will apply Crime Prevention through Environmental Design (CPTED) principles to minimize the incidence of crime. These measures have proven effective with other systems.

As discussed previously, the financial resources anticipated to pay for the capital costs of the Project are described in Section 6.3 of the Final EIS. As shown in Table 6-1, the Project will cost about \$4.6 billion in 2009 dollars and \$5.5 billion in inflated dollars. Please refer to Chapter 6 of the Final EIS. As shown in Chapter 3 of the Final EIS, roadway congestion, as measured by vehicle hours of delay, will decrease 18 percent with the Project.

A Bus Rapid Transit Alternative is a variation on the Transportation System Management (TSM) Alternative that was evaluated in the Alternatives Analysis. As summarized in the Draft EIS, while the alternative has merit for cost-effectiveness, its overall system benefit would be low compared to fixed guideway transit. Light rail technology was not eliminated; however, at-grade light rail would not meet project speed and reliability requirements. Additional clarification has been included in the Final EIS.

The connection to Honolulu International Airport will benefit visitors, but the primary reason for the connection is the large concentration of employees in the area. Of the 116,000 daily fixed guideway trips, 9,900 trips are by visitors, of which 1,800 are to or from the Airport. The Airport Alternative serves major employment destinations at and near the Airport and at Pearl Harbor. As shown in Table 3-13 of the Final EIS, about 50 percent of daily transit trips either originate or end at work. In addition, there are only 10 stops between the Airport and Ala Moana Center.

Most construction workers will be local, although some specialized expertise will be brought in. The bulk of the money will be paid to people on the island. Regarding housing, as seen in other cities, the value of properties with access to transit stations is higher than for properties that are distant from the system. In addition, other development, including retail, businesses, schools, etc., could occur near transit stations. There is no anticipation that housing will be subsidized.

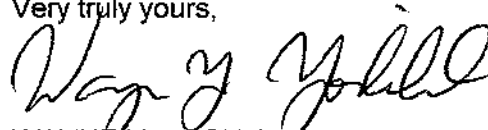

As stated in Section 4.10.3 of the Final EIS, the Project will cause no severe noise impacts. Moderate impacts will occur at upper floors of a few high-rise buildings (as shown in Table 4-18 in the Final EIS). With the recommended mitigation in place (sound absorbing material and wheel skirts), the noise analysis indicates that the new noise generated by the Project will be lower than the existing noise levels in most places.

The project design includes an integrated noise-blocking parapet wall at the edge of the guideway structure that extends 3 feet above the top of the rail. The parapet wall will substantially reduce ground-level noise.

Wheel skirts will increase the benefit from the parapet wall at locations above the elevation of the track. The use of sound-absorptive materials below the tracks in the areas that will experience moderate noise impacts will reduce the Project noise levels from the upper floors to below the impact level. Once the Project is operating, noise levels will be re-measured to confirm that there are no noise impacts from the Project.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Issuance of the Record of Decision under NEPA and acceptance of the Final EIS by the Governor of the State of Hawaii are the next anticipated actions and will conclude the environmental review process for this Project.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Submission Method : Website
Other Submission Method :
Submission Date : 11/05/2008
Submission Content/Notes : Pass to Mayor Hannemann, please reconsider the start of rail construction locations based on this message:

The rail construction should start from the Aloha Stadium to Aloha Tower first so that people can start using this rail system as soon as possible while the rest of the system from the stadium to Kapolei is being completed. Second phase should be from Pearl City to the stadium, then from Kapolei to Pearl City.

First phase, people can park at the stadium and ride the rails from there. Second phase, provide express bus to Pearl City since parking will be a problem.

Being age 70, I sure would like to be alive for a portion of it to be completed and running.

Dear Mr. Miura:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- *Reduce the time that each area will experience traffic and community disturbances.*

Mr. Jimbo Miura
Page 2

- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*
- *Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- *Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Re: Honolulu High-Capacity Transit Corridor

Aloha kakou,

As a graduate student at the University of Hawai'i at Manoa, I have avidly awaited the Draft EIS for this project. As I have a B.S. in Civil Engineering, specializing in Transportation Engineering (U. Minnesota '86), along with several years of work in transportation noise analysis, I have been asked to study and comment upon this project on many occasions, and I have studied it extensively, including through field research.

I think the Draft EIS is substantially adequate and should be approved without amendments. Regarding routing, I think the Salt Lake Boulevard alternative should be chosen, with a branch line to the Honolulu airport leaving the mainline near Middle Street and Dillingham Boulevard.

The first segment constructed should be between Kapolei and Pearl City to 1) provide two potential options for the necessary vehicle maintenance and storage facility, and 2) relieve station and parking capacity problems resulting if the Pearl Highlands transit center were the 'Ewa-side terminus. Although the existing Kalihi bus garage might be an adequate place for a temporary/secondary facility, that facility would have to be replaced elsewhere at considerable cost. Moreover, terminating major routes like 40 (Makaha), 42 ('Ewa Beach), and 52 (North Shore) at Middle Street and Dillingham Boulevard would inconvenience a large fraction of the rail system riders, since that location is not a major activity center or residential area. Incidentally, one major transit system that made a similar decision is Bay Area Rapid Transit (BART); its first segment was between Concord and Walnut Creek, California near a major maintenance center, and it did not extend across the Bay to San Francisco until ten years later (BART 2008, p. 1-4).

Having dispensed with these preliminaries, I would like to share research I have developed on the principal build alternative to the fixed-guideway transit line: A multi-lane elevated roadway. This was embodied by the "Managed Lane" alternative in the 2006 Alternatives Analysis, and the "EZ-Way" HOV/BRT (High-Occupancy Vehicle/Bus Rapid Transit) project proposed by Dr. Panos Prevedourous and Councilmember Ann Kobayashi in 2008, as well as the "HOT Lane" ("High-Occupancy Toll") proposal originally proposed by Dr.

Prevedourous several years ago. In addition to the disadvantages and impacts listed in the Alternatives Analysis, with which I concur, I found several serious problems which I think make a "Managed Lane" facility, whether or not including a major BRT (Bus Rapid Transit) component through urban Honolulu, Waipahu, and 'Ewa plain, impractical in this application:

- Congestion at the *Ewa* (main entrance during the a.m. peak period) end of the "EZ-Way" would determine that the overall capacity of the facility is too low to meet predicted travel demand.
- Noise impacts from a "Managed Lane" facility would be much greater than the proposed fixed-guideway transit line.
- Grade separation (i.e., "overpasses" and "underpasses") at "major intersections," as Kobayashi and Prevedourous proposed, would be costly and impractical.
- Operation of double-articulated Phileas buses is largely impractical on the proposed route, given the amount of conflicting traffic and surrounding land uses.
- Signal interconnection and synchronization would not significantly mitigate the problems with operating BRT on an at-grade alignment.
- Lack of park-and-ride facilities in the Kobayashi/Prevedourous proposal would make the proposed BRT facility much less attractive to riders than the proposed fixed-guideway transit alternative.

As the Alternatives Analysis did not address these issues, presumably because other data was deemed sufficient to support rejection of the Managed Lanes alternative, I am sharing my findings as "new information" that supports the decisions made thus far by the City and County of Honolulu. This research was conducted last year during the campaign for the rail transit charter amendment (i.e., "Amendment 4"), although much of it was not extensively publicized. In anticipation of challenges to the approval of the Final EIS on the grounds that the Managed Lanes alternative was improperly rejected during the Alternatives Analysis stage, I hereby present a summary of my findings, in brief. If you would like to examine my research more closely, I will be happy to supply whatever I can.

Entrance ramp congestion

In his original proposal, expressed in the document he released entitled "Effective Traffic Relief for Oahu: HOT Expressway and Underpasses," Dr. Prevedourous proposed funneling traffic from four roads: H-1, H-2, Farrington Hwy., and Kamehameha Hwy. (from Mililani) into three HOV/HOT lanes, all merging within scarcely 1,000 feet. Given this short spacing of merge points, I calculate that the actual capacity at this point would be 4,180 PCE (Passenger Car-Equivalent)/hr. at LOS C or 2,890 PCE/hr. at LOS B. At LOS E—the absolute maximum—the capacity would be 6,150 PCE/hr. This table describes conditions at the facility entrance:

	LOS B (60 mph+)	LOS C (approx. 55 mph)	LOS E/F (30 mph to zero)
Buses (PCE)	186	186	186
HOV users	2,444	2,444	2,444
HOT users (%SOV users)	260 (1.2%)	1,550 (6.9%)	3,520 (15.6%)
Total	2,890 PCE/hr. (47% capacity)	4,180 PCE/hr. (68% capacity)	6,150 PCE/hr. (max. capacity)

The capacity of three lanes at LOS E/F would be the same regardless of interchange spacing because traffic would no longer be moving freely. Therefore:

- At the service quality promised by Prevedourous, only 1-7% of all motorists driving alone on H-1 could enjoy the HOT facility—at any price! A true “Lexus Lane.”
- If operated at the speed promised by Prevedourous (“60 mph”), traffic on the HOV/HOT facility would constantly exceed 55 mph, since the maximum LOS C volume at the entrance junction is LOS B volume on the mainline! Therefore, accidents would be frequent and often severe at the terminus, and at sharper curves. While operation at LOS E would be relatively safe, that would erase the speed/time advantage that Prevedourous promises.
- Finally, entry delays to the HOV/HOT facility would consume much of the time advantage of using the facility; delays due to accidents and breakdowns would often erase all time savings.

Although the intermediate exits (in the a.m. direction) that Dr. Prevedourous proposes would help relieve exit-end congestion, they would do nothing to relieve congestion at the entrance to the HOV/HOT facility. Intermediate entrances would only create additional merge points, adding more traffic to a roadway that would regularly operate at high capacity. Finally, these additional ramps would increase the cost of HOV/HOT facility to equal or more than a fixed-guideway transit line.

The “EZ-Way” plan makes the poor design by Dr. Prevedourous impractical. Kobayashi and Prevedourous proposed to allow anyone driving a car with a “33 mpg” or higher fuel efficiency to use the elevated lanes, even if they are the only vehicle occupant. Second, the “EZ-Way” dedicated one lane to guided buses, evidently leaving only two lanes for all carpool, vanpool, single-occupancy vehicle, motorcycle, and non-guided bus traffic. Since the table above shows that a three-lane HOV facility is inadequate for serving travel demand between Pearl City and Downtown, a two-lane HOV/SOV facility is obviously inadvisable.

Relative noise impact

For all that has been said about the noise impacts from rail transit, little information has been made available about the noise impacts from an elevated high-speed roadway. Using Federal Transit Administration methods, the adjacent table shows that any elevated high-speed roadway between Waipahu and Downtown would subject adjacent persons to much more noise than the proposed fixed-guideway transit line. The difference would be especially noticeable where the roadway leaves the H-1 alignment: Along Kamehameha Highway through Pearl City and Aiea, and along Nimitz Highway through Kalihi, Kapalama, and Iwilei.

In addition, peak noise levels (L_{max}) from passing buses would be noticeably louder than the proposed rail transit trains. For example, the peak noise level from an internal-combustion-powered (e.g., diesel-powered) bus passing by at 60 mph is 91 dBA (decibel, A-weighted) at 50 feet. By comparison, the absolute peak noise level from a rail car passing by at 50 mph is only 82 dBA at the same distance. In regards to the experience of a passenger standing next to a bus or train departing a station, the maximum noise level heard by an adjacent pedestrian (i.e., much closer than 50 feet) from a diesel-powered bus has been measured at 84 dBA, while that for a rail transit passenger was only 75 dBA (Gershon, et al. 6).

Although electrically powered buses would be about 10 dBA quieter (Rossa and Staiano 2007)—i.e., about as loud as an electrically-powered rail car—the cost, visual impact, and route-inflexibility of using *two* overhead wires (one for power, the other for ground) all militate toward simply choosing automated light rail trains. Advanced batteries, fuel cells, flywheels, and other exotic alternatives are relatively expensive and untested.

In addition, since electric buses consume more electricity than electric rail vehicles, largely due to the higher friction of rubber tires compared to steel wheels, resorting to electric buses obviates claims that rail transit will require construction of additional electricity generation capacity. However, I have independently confirmed that this is a canard, and the actual peak power demand will be about 18 megawatts, as stated in the Draft EIS.

Moreover, these predicted noise levels neglect the potential for noise mitigation techniques. As you have amply explained elsewhere, noise mitigation for rail transit is considerably more practical and efficient than when trying to shield noise from diesel-powered buses and automobiles.

<u>EZ-Way (2008)</u>	<u>Hourly L_{eq} at 50 feet</u>
93 express buses/hr.	69 dBA
2,474 HOV and SOV veh./hr.	76 dBA
TOTAL:	77 dBA
<u>Original HOT Lane proposal</u>	<u>Hourly L_{eq} at 50 feet</u>
93 express buses/hr.	69 dBA
3,994 HOV and SOV veh./hr.	78 dBA
TOTAL:	79 dBA
<u>Automated Light Rail Transit</u>	<u>Hourly L_{eq} at 50 feet</u>
40 two-car trains/hr.	65 dBA
40 three-car trains/hr.	67 dBA

Trackless Trains in urban and suburban areas.

A “Phileas” double-articulated bus is about 85 feet long (Advanced Public Transport Systems 2008). This is longer than most light-rail vehicles, and comparable to the double-articulated light-rail vehicles built for the Seattle light rail line that is now nearly complete. First, because the tires of a guided bus contact the exact same pavement every time it passes a particular point, the pavement along the entire route must be intensively reinforced, as even the manufacturer of the Phileas system admits (Van der Spek and Splint 33). The cost of reinforcing the pavement will be much higher than the cost of installing permanent magnets or other guidance technology into the roadway.

More important operationally, a Phileas “bus” is a “trackless train,” and its impacts on traffic are approximate to that of a light rail vehicle on at-grade right-of-way. Providing an exclusive bus lane on Farrington Highway and Fort Weaver Road, as proposed in the “EZ-Way” plan, would require removing parking and/or driving lanes from those roads, which would likely raise opposition from local merchants and residents, who would receive relatively little benefit from express buses making infrequent stops. In addition, conflicts with vehicles turning *across* the BRT lanes, or even *stopping* on the lanes to turn into traffic, would be a serious hindrance to transit operations, given that the Alternatives Analysis predicted a need for up to 93 buses per hour in the a.m. peak-hour direction, or one bus every 39 seconds.

At every station stop, a Phileas bus would block off nearly 90 feet of road to any turning vehicle, even if the station platform was much shorter. Whether in suburban areas like Waipahu, or urban areas like Makiki, maintaining access to businesses near a bus stop—most often a corner business—would be difficult or impossible. Providing safe and convenient pedestrian, bicycle, wheelchair, and other access to a mid-street and even mid-block station poses major engineering and security challenges.

In comparison to the proposed fixed-guideway alternative, the “EZ-Way” plan does not mention including any “park-and-ride” facilities. Without park-and-ride lots, the Kobayashi BRT plan is much *less* accessible to local residents than the rail line would be; if every rider must either walk, bicycle, ride a bus, or be dropped off by a motorist at a station, the guided bus is truly a “trackless train.” As explained above, because of their operational requirements, as well as their great length, the Phileas buses can *not* be driven off their prepared route into local neighborhoods.

Lastly, grade-separating intersections, as Kobayashi and Prevedourous proposed, would raise many problems, including:

- Reduced lane width on lanes adjacent to transition points between at-grade and elevated segments, i.e., “ramps.”
- Lost access to streets and driveways by motorists *and* pedestrians at all transition points along ramps.
- Increased noise impacts (probably severe), energy demand, and brake dust emissions at all ramps.
- Significantly increased cost, especially for underpasses, at many locations near the ocean or a stream, e.g., along Nimitz Boulevard.

A Phileas bus is 8.4 feet wide, similar to a conventional transit bus. Besides two feet between the two bus lanes (necessary to prevent the side-mounted rear-view mirrors from

colliding, at minimum), two feet should be provided at the base of the wall for reaction space and a drainage gutter along the conventional driving lanes. Since the width of two retaining walls must be much greater than eight inches each, about three 10-12 foot lanes must be removed or narrowed from the street below wherever the Phileas bus route climbs over an intersecting street. Kobayashi's claim that her solution will have "ZERO" impact on downtown streets (p. 9) is unsupportable.

Furthermore, these ramps will run over 500 feet on either side of the intersecting street. An underpass must drop about 16 feet below grade (a transit bus is 11 feet high); descending at 3% will require 533 feet on either side of the street. Although as steeper grade is feasible—albeit leading to greater noise and other impacts—the Phileas double-articulated design requires that the vertical curve must be limited, so 3% is a good planning figure. Moreover, at least 20 feet of rise must be achieved at overpasses; 667 feet will be required for a 3% grade. Thus allowing for the width of intersecting street being bypassed, the total combination of ramps and bridges will be 1200 to 1500 feet in length.

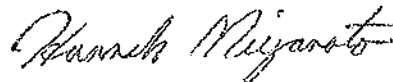

Signal synchronization

From my experience studying the extensive interconnected signal system in St. Paul, Minnesota for the Minnesota Department of Transportation (Mn/DOT), I have found that signal interconnection works best on one-way streets with minimum turning onto and off the road. Two way roads are only amenable to signal interconnection if cross streets are evenly-spaced.

In comparison to the St. Paul city street system, Honolulu is not a grid or even rectangular. Moreover, all any signal-controlling computer can do is optimize traffic flow. With heavy traffic, especially left-turning traffic and mid-block entries, along with heavy pedestrian traffic, severe congestion will develop.

Conclusion: No at-grade solution will provide sufficiently reliable service to attract as many drivers from their cars as grade-separated rail transit in the Honolulu-Kapolei corridor. Consequently, the Draft EIS should be approved immediately, and the proposed fixed guideway transit system should be constructed as soon as funds and other resources allow.

Sincerely,

Hannah Miyamoto, B.S.C.E., J.D., M.S.

Dear Ms. Miyamoto:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your preference for the Salt Lake Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been identified as the Preferred Alternative as described above. As compared to the other alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly lower impacts to the natural and built environment. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the

alternatives, more than 75 percent were in support of the Airport Alternative.

The Alternatives Analysis phase, which preceded the EIS process, is documented in Chapter 2 of the Final EIS. It evaluated a range of modal and general alignment alternatives, in terms of their costs, benefits, and impacts. The scoping process for the Alternatives Analysis involved a presentation of the viable alternatives to the public and interested public agencies and officials to receive comments on the Purpose and Need, alternatives, and scope of the analysis. Scoping for the EIS followed the FTA process that provides for a culling of alternatives studied in the EIS through an Alternatives Analysis. The scoping process initiated for the Alternatives Analysis included a variety of highway, bus and fixed guideway options for consideration. During the later scoping effort for the EIS, the public was requested to propose alternatives that would satisfy the purpose and need at less cost or with greater effectiveness, less environmental or community impact and to propose alternatives that were not previously studied and eliminated for good cause. The only alternative that emerged that met these criteria was a fixed-guideway alternative following several alternative alignments. All reasonable alternatives that emerged from these processes were ultimately evaluated in the Draft and Final EISs.

Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts, and mitigation commitments.

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- Reduce the time that each area will experience traffic and community disturbances.*
- Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*
- Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west

Ms. Hannah S. Miyamoto
Page 3

end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

Your comments about the Managed Lane Alternative have been noted.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is fluid and cursive, with the first name "Wayne" being the most prominent.

To help pay for the maintenance of the rail.. Sell advertisement.. billboard type that can be put on the outside of the trains also at the train stations. Also, put in flat screen monitors inside of the train and sell commercial time and also Public announcements such as "Sunset at the beach, Taste of Honolulu, Blood Drive, Toys for Tots, UH Football information". Also, private industry can place their commercial time. You have the consumer's complete attention on the train for 30 to 45 minutes. Maybe even free wi-fi.

Lot of potential this TRAIN system!!
Lot of new businesses will be good around the train station!

Aloha

Dear Mr. Miyashiro:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

The idea of using advertisements and billboards to help pay for the maintenance of the rail system has been discussed as possibilities to supplement operating revenue. As noted in Section 6.6.4 of the Final EIS, the City currently receives a small amount of transit-related advertising revenues annually. These ideas to supplement operating revenue will be considered. It will then be the City Council's decision to review current policy toward advertising once it is weighed against other considerations.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Submission Content/Notes : Honolulu Transit,

I would like to support building the first segment from Pearl City to Downtown. If an elevated base yard could be put over the lower Aloha Stadium parking lot, maybe the proposal could work and we could get significant traffic relief much earlier. It could be a temporary base yard till the build out is completed and then a park and ride.

With the economy in the tank, businesses and property owners may be more inclined to cooperate. The right of way would be cheaper in a down economy. Businesses would recover faster with the rail going by earlier.

Please think about this option seriously. I believe this option provides the best benefit to the citizens of Honolulu. If the economy goes into a depression, this may be the only segment completed for many years.

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- *Reduce the time that each area will experience traffic and community disturbances.*
- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*

- *Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- *Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

Section 2.5.8 of the Final EIS addresses the maintenance and storage facility. The two potential locations for the maintenance and storage facility are detailed in Figures 2-38 and 2-39. Either of these sites will require less relocation and will have fewer property impacts than a maintenance facility in a developed urban area such as Downtown Honolulu. Construction methodologies in these less-developed areas can be refined more easily to reduce impacts to the natural and built environments. As also discussed in Chapter 2 of the Final EIS, park-and-ride lots are planned at East Kapolei, UH West Oahu, Pearl Highlands, and Aloha Stadium. These stations have been identified as having the highest demand for drive-to-transit access.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As discussed in the Final EIS Section 2.5.4 Safety and Security Measures, a project-specific Safety and Security Management Plan has been developed in accordance with FTA requirements to define the safety and security activities and methods for identifying, evaluating, and resolving potential safety hazards and security vulnerabilities of the system. It establishes responsibility and accountability for safety and security during the Preliminary Engineering, Final Design, construction, testing, and start-up phases of the Project. The Honolulu Police Department, the Honolulu Fire Department, the Honolulu Department of Emergency Management, and the Honolulu Emergency Services Department have been involved in preparing and will be part of implementing the plan. The plan addresses public safety and security concerns, including threats and hazards associated with the Project, specific issues that were identified through community outreach efforts, and design and architectural details to

Mr. Richard Mori
Page 2

enhance safety.

The integration of solar panels is still being evaluated.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Submission Content/Notes : The so called "experts" who dismissed Maglev by stating: ("none of the proprietary technologies offered substantial proven performance, cost, and reliability benefits compared to steel wheel operating on steel rail.") are dooming the people of HAWAII to an inferior more expensive system. Allowed to compete and bid the MAGLEV would offer: 1. Less construction costs due to the concrete work being approximately 25% less and construction time would be sped up. The smaller guideway (21 feet versus 31 feet wide for steel) would result in a savings of over HALF A BILLION DOLLARS. 2. As shown in the DEIS O&M costs the MAGLEV also excels as there is nothing to wear out compared to steel. With the steel (YOE) dollars for O & M costs of \$133 Million/year, assuming a 25% savings; over 30 years the cost saving in O & M is approximately 1 BILLION DOLLARS!!!. All the cost savings could be used to complete the whole system from Kapolei to UH Manoa. 3. The noise level for MAGLEV is also 3.5 times less (62 dba versus 80 DBA for steel), This would have less impact on the adjacent residents to the rail line and would preclude the need of additional costs for noise walls along the route. The steel system would have to be in compliance with the HRS. This would be an eyesore and would be a magnet for graffiti. With successful commercial operation in Nagoya Japan with no accidents which compare to the 6 steel accidents on the mainland in the past 8 months. 4. Safety is of utmost importance; due to the wrap around design there is no chance for derailment as opposed to steel. Steel would require drivers further adding to the costs to our taxpayers that are already paying the highest in the nation. MAGLEV would be completely automated. Finally the superior hill climbing ability of MAGLEV is vastly superior to steel. I WANT THE BEST RAIL SYSTEM FOR THIS SPECIAL PLACE WE CALL HAWAII. I JUST HOPE THAT YOU DO TOO!!!

Dear Mr. Mori:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your comments have been noted. As stated in Section 2.2.3 of this Final EIS, the NEPA Notice of Intent requested input on five transit technologies. A technical review process included the opportunity for public comment and was used in parallel with the alternatives analysis to select a transit technology. The process included a broad request for information that was publicized to the transit industry. Transit vehicle manufacturers submitted 12 responses covering all of the technologies listed in the Notice of Intent. An independent five-member technology panel composed of four transit experts and a transportation academic appointed by the City Council evaluated guided rubber-tire-on-concrete systems (e.g., Phileas bus system and VAL-type systems), monorail (which is a variation on rubber-tyred technology), steel-wheel-on-steel-rail systems, (e.g., light rail and rapid rail), and magnetic levitation (MAGLEV). The

Mr. Richard Mori
Page 2

panel considered the performance, cost, and reliability of the proposed technologies.

Proprietary technologies, meaning those technologies that would have required all future purchases of vehicles or equipment to be from a single manufacturer, were eliminated because none of the proprietary technologies offered substantial proven performance, cost, and reliability benefits compared to steel wheel operating on steel rail.

The panel accepted public comment twice as part of its review. By a four-to-one vote, the panel chose a steel wheel vehicle operating on steel rail system because it was considered safe, reliable, economical, and non-proprietary. Those results are documented in the panel's report to the City Council dated February 22, 2008 entitled "Independent Technology Selection Panel Report".

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Enclosure

Dear Mr. Matley:

The draft Environmental Impact Statement for the City and County of Honolulu rail transit project is unacceptable because it is written solely for a steel wheel on steel rail system. There are other forms of fixed rail that may be better and more cost-effective than steel wheels. Please have the City rewrite this EIS to cover the other technologies, such as monorail and maglev, to ensure that our taxpayers will obtain the best transit system at the best price.

The so called "experts" who dismissed Maglev by stating: ("none of the proprietary technologies offered substantial proven performance, cost, and reliability benefits compared to steel wheel operating on steel rail.") are dooming the people of HAWAII to an inferior more expensive system. Allowed to compete and bid the MAGLEV would offer:

1. Less construction costs due to the concrete work being approximately 25% less and construction time would be sped up. The smaller guideway (21 feet versus 31 feet wide for steel) would result in a savings of over HALF A BILLION DOLLARS.

2. As shown in the DEIS O&M costs the MAGLEV also excels as there is nothing to wear out compared to steel. With the steel (YOE) dollars for O & M costs of \$133 Million/year, assuming a 25% savings; over 30 years the cost saving in O & M is approximately 1 BILLION DOLLARS!!!

3. The noise level for MAGLEV is also 3.5 times less (62 dba versus 80 DBA for steel), This would have less impact on the adjacent residents to the rail line and would preclude the need of additional costs for noise walls along the route. The steel system would have to be in compliance with the HRS. This would be an eyesore and would be a magnet for graffiti. With successful commercial operation in Nagoya Japan with no accidents which compare to the 6 steel accidents on the mainland in the past 8 months. Just yesterday (2/2/2009) 100 people were injured in the BART steel system on the mainland.

4. Safety is of utmost importance; due to the wrap around design there is no chance for derailment as opposed to steel. Steel would require drivers further adding to the costs to our taxpayers that are already paying the highest in the nation. MAGLEV would be completely automated. Finally the superior hill climbing ability of MAGLEV is vastly superior to steel. I WANT THE BEST RAIL SYSTEM FOR THIS SPECIAL PLACE WE CALL HAWAII. I JUST HOPE THAT YOU DO TOO!!! Thank you very much for your time.

Sincerely,
Richard Mori

Dear Mr. Mori:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As noted in Chapter 2 of the Final EIS, in parallel with the alignment analysis, a five-member panel appointed by the City Council and the Mayor considered the performance, cost, and reliability of the five proposed technologies for the fixed guideway system. The panel twice accepted public comment as part of this review. By a four-to-one vote, the panel selected steel wheel operating on steel rail as the technology for the Project evaluated in the Final EIS. The four panel members selected steel-wheel technology because it is mature, proven, safe, reliable, economical, and non-proprietary. Proprietary technologies, meaning those technologies that would have required all future purchases of vehicles or equipment to be from a single manufacturer, were eliminated because none of the proprietary technologies offered substantial proven performance, cost, and reliability benefits compared to steel wheel operating on steel rail.

Selecting a proprietary technology also would have precluded a competitive bidding process, likely resulting in increased overall project costs.

No comparative Maglev project has ever been built within the U.S. Therefore, there is no data available to support a lower-cost estimate. Some of the savings recognized in other countries for beam-track vehicles would not apply in the U.S. because of requirements to include an emergency egress walkway. In addition, the smaller-width structures proposed in the comment result in shorter span-lengths, which increases the number of columns required and the cost to construct both the additional foundations and the columns.

The HSST system operators have declined to make operating expenses available; therefore, with no comparative data available to support an operating cost estimate, there is no means to verify this statement.

While the system is inherently quieter, other systems may be designed to match the noise level of magnetic levitation when in operation. There is no specific safety improvement from the traction design. The assumed visual benefits for beam-track vehicles would not apply in the U.S. because of requirements to include an emergency egress walkway.

There is no specific safety improvement from the traction design. Loss of levitation force results in the vehicle dropping to the track which results in wear or damage to safety systems. A steel-wheel system would not require an operator any more than a magnetic levitation system would. The Project does not include any grades too steep for steel wheel systems.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Submission Content/Notes : I am in favor of the Salt Lake rail route instead of the airport route. Keeping the Salt Lake route will cost less rather than going to the airport. The spur to the airport from Salt Lake will cost less than if there was a spur from the airport to Salt Lake. The airport route should be considered when the decision to spur to Waikiki is made. If the purpose is to help relief traffic from Leeward and Central Oahu, there is more population density in the Salt Lake area vs. the airport which is mostly commercial and military which would help with the traffic congestion we have now. With the economy in recession, the cost should be considered when making the final decision as to the rail route. This is why I am in favor of keeping the Salt Lake rail route.

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

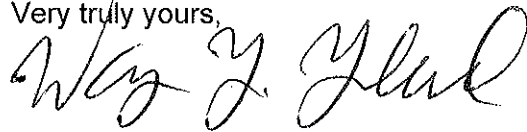

Your preference for the Salt Lake Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the

Mr. Maurice Morita
Page 2

alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Submission Content/Notes : One of the things we should emphasize if the Hot Lanes / EZ-Way will have a much bigger overhead visual impact, be a larger / wider structure, be much noisier with constant noise (not just when a train goes by), and be much more polluting. The toll road will also put more cars on the roads and those cars have to go back onto to surface streets at the end of the toll road, thus INCREASING traffic downtown.

Also, the proposed "variable toll" for the Hot Lanes is ridiculous. The worse the traffic, the higher the toll? And a private company will set the tolls - hmmm, now what will their motivation be? To charge the highest price the traffic will bear - BAD PLAN! This needs to be brought to the public's attention ASAP. The Hot Lane's representative during the last debate said that "there will always be someone to pay a price to beat the traffic". To maintain the 3,000 vehicles per hour flow on the Hot Lanes, they will raise the toll depending on how bad the traffic is on H-1. So on heavy traffic days or when there is an accident on H-1 they can raise the toll from \$3 each way to \$5 or even \$7. Predatory pricing for the Hot Lanes.

Honolulu High-Capacity Transit Corridor Project

Welcome to the Honolulu High-Capacity Transit Corridor Project's Public Hearing for the Draft Environmental Impact Statement/Section 4(f) Evaluation.

This public meeting and hearing has been designed to inform the public about the transit project, explain materials contained in the Draft EIS, answer questions from the public, and collect public input on project issues related to the Draft EIS, Section 106 of the National Historic Preservation Act, Section 4(f) of the U.S. Department of Transportation Act, and floodplains affected by the project.

Please review the project information and ask project staff any questions about the project that you might have. The Draft EIS is available on the project website at www.honolulutransit.org.

You may provide official comments in several ways. Here at this Public Hearing you may provide oral comments to a court reporter who will record them for the record or use this form to provide written comments. After the meeting, you may provide an on-line comment at www.honolulutransit.org or use this form to send a written comment to the Department of Transportation Services. All comments must be postmarked or received by January 7, 2009 in order for them to be included in the Final EIS.

Comment(s):

^{(30-120 feet) TRANSIT}
An elevated RAIL system for oahu will
be difficult ^{to board} for passengers with difficulty in
walking - the senior citizens/handicapped/wheel chairred.
It will also be very difficult for passengers
who are deadly afraid of heights. I know 2
persons who have this phobia, and have seen them
go through a very nerve wracking experience
hugging the wall, walk very slowly with their
eyes closed. Imagine if passengers with this
phobia need to ride the RAIL TRANSIT at
30 - 80 - 120 feet high, it will be very difficult
to get this passenger on board so others may board
to be on time.

Dear Ms. Murai:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As stated in Section 2.5 of the Final EIS (and reproduced below), the transit system will comply with regulations of the Americans with Disabilities Act (ADA). Elevators and escalators will be provided at all stations. In addition, level boarding will be provided to trains; therefore, stairs or lifts, as used on buses, will not be required.

All buildings, facilities, and vehicles will conform to applicable Federal, State, and County accessibility guidelines and standards. HRS Section 103-50 requires that all State or County government buildings, facilities, and sites be designed and constructed to conform to the Architectural Barriers Act/Americans with Disabilities Act Accessibility Guidelines (36 CFR 1190 and 1191), issued by the U.S. Access Board, and other

Ms. Daisy Murai
Page 2

applicable design standards as adopted and amended by the Disability and Communication Access Board. The law further requires all plans and specifications prepared for construction of State or County government buildings, facilities, and sites be reviewed by the Disability and Communication Access Board for conformance to those guidelines and standards.

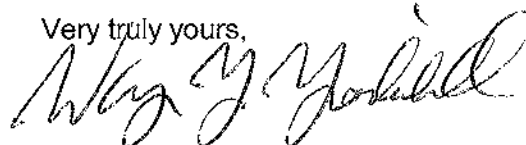

Station platforms will be of similar height to the third or fourth floor of buildings. Individuals who are uncomfortable above ground level may choose to take local bus transit that avoids elevated freeway sections.

Projections of future transit ridership consider projected demographics for Oahu in 2030. Ridership projections are presented in Section 3.4.2 of the Final EIS. As shown in this section, transit ridership will increase 44 percent with the Project as opposed to not building it.

Tele-working is becoming increasingly acceptable as a work-place alternative. Specific decisions about workforce management would be made by individual employers. It is possible that local and state government could create policy incentives to employers to encourage alternative workplace arrangements to better accommodate a tech-savvy generation of workers.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

DIRECTOR'S OFFICE
DEPT. OF
TRANSPORTATION SERVICES

Mr. Wayne Yoshioka, Director
Dept. of Transportation Services
City & County of Honolulu
650 S. King Street, 3rd Floor
Honolulu, HI 96813

RE: Oahu's High Capacity Mass Transit Environmental Impact Statement (EIS)
NOT IN SUPPORT of a STEEL ON STEEL RAIL TRANSIT SYSTEM

Director Yoshioka:

My name is Daisy Murai, a resident of Kapahulu, which is next neighborhood to Waikiki, in the Primary Urban Center (PUC). My main mode of my transportation needs is serviced by the City's Public Bus System on a daily bases, unless I car pool, walk, take a taxi or trolley. I am fortunate that the buses in the Primary Urban Center come quite frequently within minutes of each other and very near to my home or destination(s), unlike other areas of the Island, where the bus stop is about 1/2 mile or farther away from homes and the service is 30 minutes to once an hour.

I enjoy and have had the experience of riding the Public Mass Transit Systems/Network in other Cities I have traveled, such as buses in New York City, St. John (New Brunswick), Japan and Las Vegas. I have also ridden the Staten Island Ferry in New York City (going to the Statue of Liberty), St. Charles Street Car in New Orleans and the Metro System in Washington D.C. The St. Charles Street Car (rail tracks are at street level) and Metro System of Washington D.C. (rail tracks are mostly underground -except for areas such as Arlington Station which is above ground), both of these systems use a steel on steel technology, which require huge areas of land for the tracks, transit trams and stations. I have found this system of steel wheels running on steel tracks also generates lots of noise, each time the trams starts up and stops on the steel tracks - and even making screeching noises when it stops.

The traffic congestion and gridlock facing Oahu drivers during the morning and afternoon Rush Hours from the West side to Downtown, is the reason for a High Capacity Mass Transportation System or some other Transportation Network System, which should alleviate traffic congestion and keep the traffic flow during these few hours of the day from Monday through Friday. The population base continues to grow on the West side of Oahu, as the City's Department of Planning and Permitting continue to issue Building Permits for future Residential and Commercial Development Projects, without increasing transportation infrastructural projects to meet population density increases.

The City's High Capacity Mass Transit or better known as "RAIL TRANSIT" Project is an elevated fixed guideway with a Steel on Steel Technology Transit System, of which the surface of the tracks will not be able to be utilized by any rubbernized vehicles, even emergency vehicles. The height of the fixed guideway with an elevation between 30 to 120 feet tall and support columns with a diameter of 6 feet wide and wider. It will be built in places with open lands of Kapolei as well as farm lands (Aloun Farms) and continue through the Primary Urban Center of Honolulu (building between existing buildings - including Historical areas), forcing the City to purchase private properties or even obtain the properties via eminent domain condemnation for the project, since Oahu is not as large as other places on the Mainland or the world.

The City's EIS does not address the complete Locally Preferred Alternative (LPA) route selected and approved by the City Councilmembers, which should also address the University of Hawaii at Manoa and Waikiki segments. The current route chosen to end at Ala Moana Center's Nordstrom's Department Store is actually Mayor Hannemann's Minimum Operational Segment (MOS) route, which is only a portion of the entire LPA approved by the City Council. I feel the entire LPA approved by the Councilmembers should be in the EIS. The route has just been changed and approved by the City Councilmembers on January 28, 2009 with a portion going to the Airport rather than through the Residential Community of Salt Lake.

The planning, design, land acquisition and constructing of Oahu's largest public works project will certainly require years to complete and will exhaust the Rail Transit funds collected by the State of Hawaii through a ½% General Excise tax to the year 2022. Even if the Federal Government somehow manages to release \$ 1 Billion dollars for this ambitious public works project on such a small land mass area and small population base (with comparable Cities) on the island of Oahu, the amount collected on the ½% general excise tax alone is not enough. In fact, Mayor Hannemann's wish list from the State of Hawaii is the State's 10% administration fee for collecting the ½% G.E. tax for Oahu and money collected for Traffic Violations by the City. (Refer to the articles in our 2 daily Newspapers dated January 14, 2009).

There are portions of the Rail Line (Nimitz Highway) which is several feet away from the ocean. Hafekauwila, Queen and Kona Streets are also close to the Ocean. The project developers, when digging the properties for the Rail Transit will at times stumble upon human bones, which is a common occurrence in Hawaii. There were several projects, such as the Super Center Wal-Mart/Sam's Club on Keeaumoku Street, H-3 Tunnel/Freeway and Whole Foods Structure at Ward Centre are just a few examples, where workers have uncovered human bones from old and unmarked burial sites. In the 1800's, the people of Hawaii would bury their loved ones close to the ocean or in the mountains in unmarked gravesites.

This project will require roughly 9 years for the first phase as mentioned at the City's Dept. of Transportation Services, presentation of October 29, 2009 at the State Capitol. By that time most of the current Baby Boomers will have retired, such as myself. If I were to utilize this Rail Transit System to get to Aloha Tower Station from my home in Kapahulu for example, I would need to catch a circulator bus from my home to Ala Moana Center, get off at Ala Moana Boulevard, walk across the Center to Nordstrom Department Store (10 minute walk), go up 30-80 feet (another 5 minutes) to ride the tram, get off at the Aloha Tower Station Transit Station, go down to street level and walk across to Aloha Tower Marketplace. If I caught the circulator bus, I would get off at the Aloha Tower Stop on Ala Moana Boulevard, (which is 5 - 7 minutes away from Ala Moana Center) and walk 2 - 3 blocks, which is a more direct route and get there much faster than the Rail Transit System.

The Rail Transit trams will be in operation 3-10 minutes apart and from 4 in the early morning to 12 midnight every single day. The 3 - 6 minute intervals between trams will make it extremely difficult for passengers with walking difficulties and wheelchair bound to board the ADA compliant trams during "RUSH HOURS" - even if the platform and boarding passageway are of the same level. The reason is due to the relatively short time of 3 - 6 minutes to board, settle and be secured in their seats. Not all handicapped & wheelchair bound passengers will be able to settle safely into their seats within 3 - 6 minutes. I have observed some of these passengers who use the current buses, require much more than 3 minutes to maneuver their wheelchair and be properly secured, once they have boarded the buses. Some of them require several minutes of back & forth movement of their wheelchair to be in the correct position for the drivers to secure their wheelchair. I also understand that bicyclists will not be able to board the trams with their bicycles during "RUSH HOURS", since they will slow down other passengers from boarding the trams, as mentioned by Outreach Coordinator Pat Lee. I did not witness any wheelchair bounded passengers ride the METRO System in Washington D.C. It could be due to the limited time required to board the trams since the trams run on a tight schedule, even if these passengers were able to get below street level to the platforms.

I have 2 friends who live on the Westside of Oahu and drive to work. They both are deadly afraid of heights to the point where they will, close their eyes, break out in a cold sweat and inch their way slowly while they hug the building walls without looking downward whenever they know they are several feet above the ground. These 2 will continue to drive to work, further adding to the traffic congestion. There are other drivers who are also deadly afraid of heights and probably continue to drive during "RUSH HOUR" than ride the Rail Transit.

The State's Director of Transportation (DOT) nor Governor Lingle at this time, have NOT approved the City using the State's Highways, Freeways and surface streets (H1, H2, Farrington Highway, Kamehameha Highway, Nimitz Highway, parts of Ala Moana Boulevard and other State owned roadways) for the City's Fixed Guideway Rail Transit project. These are crucial Right-of-Way roadways needed for the City's RAIL Project to reach Downtown and beyond. State's DOT Director Brennon Morioka and Governor Lingle announced 2 State High-way projects to

help relieve traffic congestion for motorists traveling to and from West Oahu. The Federal Government and the Governor have both released funds to start these 2 projects. Project No. 1 will replace the current morning zipper lane on the H1 Freeway with 2 contra-flow (East bound in the morning and Westbound in the afternoon between Keehi & Waiawa Interchanges) lanes during Rush Hours. The 2nd project is to widen the Middle Street merge going eastbound to relieve bottlenecking from Ola Lane to Vineyard Boulevard. Please refer to the State of Hawaii's web site (www.hawaii.gov) dated January 23, 2009 under Governor Lingle's press releases.

These are the reasons, why I feel other Transportation Alternatives needs to be re-visited for a better solution, than to totally rely on the "Steel on Steel RAIL TRANSIT" as the only source for traffic congestion relief. I would suggest:

- 1) Build an elevated EXPRESS Way for High Occupancy Vehicles (3 or more per vehicle) without charge, and charge other motorists with less than 3 in the vehicle. An electronic eye could monitor if payment is due. The payments collected would help pay for the operation and maintenance of this project.
- 2) The City's Dept. of Transportation Services mentions additional buses on the roadway will further compound traffic, causing gridlock on the roadways. The solution could be, keep the bus fleet at 525 buses, but change some of the routes to go into areas with new Residential Developments (not just keep it on the Main roadways), change 1 bus on the current route to an Express Bus, and change more routes to connect to other communities on Oahu. The Express Buses are well used by bus passengers, once they understand the route it travels. I usually take the Express Buses A, B, C and E unless I need to get off at a bus stop the Express Bus does not stop at. The Express buses on the whole are well utilized by the number of passengers I see riding them daily during Rush Hour. These buses are not as crowded at other times, but very convenient and a fast way to get to your destinations.
- 3) The power source to fuel the steel tracks & trams for the Rail Transit is electricity, generated by Hawaiian Electric Company (HECO) on the island of Oahu. Recently, HECO's system has been tested with an Island-wide (Island of Oahu) Black-Out situation – the October 6, 2006 earthquake and the December 26, 2008 lightening storm incidents (please refer to our 2 daily newspapers regarding information to the Island-wide black-outs at www.honoluluadvertiser.com or www.honolulustarbulletin.com for articles dated the following day of each instance). In both cases, the generators at the relay stations turned off automatically to prevent major damage to the system. In both instances, it took HECO several hours – even lasting into the following day to be back to full capacity. Even though HECO is looking into alternative energy sources for the future and is to be the sole provider of electricity, based upon it's performance of restoring power to the 2 island-wide power black-out incidents, it will be several hours or days before the Rail Transit will be back in full operation. HECO needs to restore power to it's customers – especially the Health-Care providers, Schools, Safety and other Emergency facilities, before restoring full power to the other customers and the Rail Transit System.

Upon completion of the project, the residents traveling during "RUSH HOUR" to Downtown and back to the West side will be the current younger generation of which many continue to travel via their own private vehicle rather than use the City's Mass Transportation System, further compounding traffic gridlock. I feel it would make more sense to build an elevated roadway for smoother traffic flow, charge for vehicles carrying less than 3 using the Express Roadway, and improve the current Bus routes would be a better system. This would not be as costly as the "Elevated Fixed RAIL TRANSIT". The businesses in the near future may even have their employees work from home to reduce traffic congestion. My cousin & his wife, who live in California, both are salespersons of major Corporations and both work from home, but will commute to their work place only when needed –which means 2 few cars on the roadway.

Thank you for the Opportunity to Speak. I DO NOT SUPPORT a \$ 5 - 6 plus Billion Elevated Fixed Guideway with a RAIL STEEL ON STEEL Transit project for the Island of Oahu. I would appreciate the City and County of Honolulu to revisit other alternatives in the EIS, especially since the State of Hawaii auditor's report clearly shows grave over-sight on problems with of our Superferry, (a State of Hawaii project) which is showing up now - several months after the Superferry started operating between the islands of Oahu and Maui. The State did not do an EIS prior to the start of this interisland transportation system, which is clearly showing that impact problems should have been addressed in the EIS. (Please refer to Honolulu Advertiser and Honolulu Star Bulletin articles dated from December 18, 2008). I was told by a testifier at the Public Meeting, that the City will allow only 1 testimony per person at any public hearing -even if there might be new information presented after the testimony, which I feel that the City is clearly inhibiting the general public's input - especially when the Impact of this project is so enormous and Most people on Oahu will be affected.

Honolulu, Hawaii 96815

Dear Ms. Murai:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Initial Comments

Concern about land acquisition

Land acquisition requirements for the system will be limited because the elevated system will not be interspersed with traffic. The elevated system takes advantage of vertical space over existing roadways eliminating the need to accommodate transit-dedicated space at-grade alongside mixed traffic.

Section 4.4 of the Final EIS and Appendix C address acquisitions, displacements, and relocations. Table 4-4 indicates that the Project will require 40 full and 159 partial acquisitions. Where acquisition of property will occur, compensation will be provided to affected property owners, businesses, or residents in compliance with all applicable Federal and State laws and will follow the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act.

The guideway will have a maximum track height of approximately 110 feet and will accommodate only steel-wheeled vehicles.

The discussion of farmland, including that in use by Aloun Farms takes place in the Final EIS Section 4.2.3. The analysis concludes that the Project's effect will not be substantial and no mitigation will be required.

Concern about noise mitigation

Final EIS Section 4.10 addresses strategies to mitigate for noise impacts through materials and design, including the use of wheel skirts. With mitigation, the Project will not have noise impacts per FTA criteria.

The Project will provide transit infrastructure designed to meet the mobility needs of an increasing, and increasingly densely situated population.

Concern about operating in a dense urban environment

Final EIS Section 4.16 addresses impacts and mitigation to Archaeological, Cultural, and Historic Resources. The Project is subject to compliance with the National Historic Preservation Act (NHPA) of 1966, as amended (16 USC 470 et seq.). The Project will have adverse effects to historic properties; those effects and required mitigation to address them is addressed in the Programmatic Agreement in Appendix H.

Concern about alignment

Chapter 1 of the Final EIS describes the entire proposed action of construction and operation of a fixed guideway transit system between logical termini in East Kapolei and Ala Moana Center. Since selection of the First Project by City Council Resolution 07-039, project information has detailed the limits of the Project and illustrated other areas that were included in the Long-Range Plan as future or planned extensions. The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future.

Concern about future extensions

The proposed future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS. Future extensions may have additional stops in Waikiki or the Diamond Head area. The future extensions are not part of this Project; thus, they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in this Final EIS. If the future extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time.

Concern about financial resources

Section 6.3 of the Final EIS describes the financial resources anticipated to be needed to pay for the capital costs of the Project. Capital costs of the Project, including finance charges, are expected to be fully paid for by a combination of FTA Section 5309 New Starts and

FTA Section 5307 Funds from the Federal government and revenue from the County General Excise and Use (GET) Tax surcharge levied from 2007 through 2022 on Oahu.

Chapter 2 of the Draft EIS, as well as in Chapter 2 of the Alternative Analysis, show the total capital costs for the Managed Lane Alternative would range between \$3.6 and \$4.7 billion, of which \$2.6 to \$3.8 billion would be for construction of the managed lanes. The transit operating costs for the managed lane would range between approximately \$251 and \$261 million as a result of additional buses that would be put in service under that alternative. These costs do not include the cost of maintaining the managed lane facility. In Chapter 6 of the Final EIS, the capital costs of the Fixed Guideway Alternative, including bus system costs, will be \$4.6 billion, including finance charges, in 2009 dollars. Total operating costs for the Fixed Guideway Alternative, including bus, TheHandi-Van, and fixed guideway, will be approximately \$298 million in 2009 dollars.

The Fixed Guideway will be more cost-effective over the long-term. As stated in Section 6.3 of the Final EIS, funding sources for the capital investments include FTA Section 5309 New Starts and FTA Section 5307 funds from the Federal government and the GET surcharge. Only the Fixed Guideway Alternative could be funded with the GET surcharge. The GET is expected to generate \$3.5 billion through 2022 and the FTA's agreement to consider at least \$1.55 billion for Federal contribution to the Project the New Starts program for the Fixed Guideway. No funding sources were identified for the Managed Lane Alternative. Toll revenues from the Managed Lane Alternative would pay for ongoing operating and maintenance while remaining revenues would be used to repay debt incurred to construct the system.

The taxes used to fund the Project will provide a system that will serve the vast majority (70 percent) of the population and employment within the corridor. It also furthers the policy guidance of the City Council regarding alternatives modes and support of the development of Kapolei as Oahu's "second city." The capacity of the proposed system is sufficient to accommodate very large increases in demand over time. While the present design identifies approximately 8,000 passengers in the peak hour peak direction and provides the vehicles to handle that demand, the system can handle over 50,000 people an hour by adding cars to each train and reducing the time between trains.

Concern about archaeology and management of unmarked graves

Final EIS chapter 4.16 Archaeological, Cultural, and Historic Resources describes the Programmatic Agreement (PA) developed in consultation with the State Historic Preservation Division (SHPD), the Advisory Council on Historic Preservation, Native Hawaiian organizations, and other stakeholders to address management of inadvertent archaeological, cultural, or historic finds during construction.

The Project may be subject to compliance with the Native American Graves Protection and Repatriation Act (NAGPRA) (25 USC 3001) where it crosses lands controlled or owned by the Federal Government. Any human remains found on lands owned or controlled by the Federal government will be addressed in accordance with NAGPRA and 43 CFR 10—the regulations that define the process and procedures of NAGPRA.

During the archaeological sampling, Native Hawaiian burials will be identified and managed in compliance with applicable laws. This will include consultation with project proponents, the Oahu Island Burial Council, SHPD, and recognized lineal and/or cultural descendants to develop burial treatment plans. Although the goal of the archaeological sampling will be to identify all burials and treat them appropriately prior to the start of construction in a particular area, the possibility exists that additional previously undiscovered burials will be encountered during construction. In addition, protection zones would be created around resources that are identified prior to construction. The PA outlines the treatment of burials discovered during construction.

Concern about travel times

Travel times with the fixed guideway system will be faster than bus travel. The rail station is immediately adjacent to the bus terminal at Ala Moana Center. Trip time via fixed guideway from Ala Moana Center to Downtown would only take four minutes (as shown in Table 3-16 in the Final EIS). There will be a mezzanine level at the Downtown Station, thus allowing an individual to access Aloha Tower without crossing Nimitz Highway at street level. Traffic congestion on roadways is expected to worsen by 2030 and this will cause an increase in bus or car trip times. In addition, all fixed guideway stations will be equipped with escalators and elevators.

The dwell time at each station will be approximately 30 seconds. This is sufficient time for passengers, even those using wheelchairs, or individuals with strollers, carts, or rolling luggage to enter or exit the vehicle. Because of the smooth automated train operation, driver securement will not be required for wheelchairs. Bicycles will be allowed on the system as regulated by a bicycle policy. As stated in Section 2.5.1 of the Final EIS: "Bicycles, luggage, and surfboards will be allowed on trains and regulated by policy to address high demand periods or special conditions."

Concern for those with height phobias

The station platforms will be of similar height to the third or fourth floor of buildings. Individuals who are uncomfortable above ground level may choose to take local bus transit that avoids elevated freeway sections. Projections of future transit users consider projected demographics for Oahu in 2030.

Concern about right of way acquisition

The Hawaii Department of Transportation (HDOT) is a cooperating agency on the Project. There is continuous coordination between DTS and HDOT. Easement agreements and permits to use State right-of-way can only be finalized after acceptance of the Final EIS.

Under the No Build and Airport Alternative, the travel forecasting model has assumed that several transportation projects, including congestion-relief items for Oahu streets and highways, would be in place in 2030. These projects are detailed in Table 2-4 of the Final EIS and include the p.m. zipper lane and widening of the H-1 Freeway. As identified in Table 3-14 of the Final EIS, the Project will reduce vehicle delay by 18 percent compared to the No Build Alternative. This reduction in delay is attributable to shifts in travel demand from the automobile to transit.

In Chapter 2 of the Alternatives Analysis Report (DTS 2006b), which is available on the project website (www.honolulustransit.org), and Chapter 2 of the Final EIS, two options were considered for the Managed Lane Alternative (Two-direction Option and Reversible Option). This alternative would have provided a two-lane elevated toll facility between Waipahu and Downtown Honolulu, with variable pricing strategies to maintain free-flow speeds for transit and high-occupancy vehicles (HOVs). The Two-direction Option would have served express buses operating in both directions during the entire day. To maintain free-flow speeds in the Two-direction Option, it may be necessary to charge tolls to manage the number of HOVs using the facility. For the Reversible Option, three-person HOVs would be allowed to use the facility for free, while single-occupant and two-person HOVs would have to pay a toll. The Reversible Option was found to be optimal.

Proposal of an Express Way

The proposal for an elevated "EXPRESS Way" has been evaluated previously as the Managed Lane Alternative in the Alternatives Analysis Report. The findings are summarized in Chapter 2 of the Final EIS as follows: "The Managed Lane Alternative was evaluated for its ability to meet project goals and objectives related to mobility and accessibility, supporting planned growth and economic development, constructability and cost, community and environmental quality, and planning consistency. Transit reliability would not have been improved except for express bus service operation in the managed lanes. While this alternative would have reduced congestion on parallel highways, system-wide traffic congestion would have been similar to the No Build Alternative as a result of increased traffic on arterials trying to access the facility. Total islandwide vehicle hours of delay would have increased with the Managed Lane Alternative compared to the No Build Alternative, indicating an increase in system-wide congestion (Table 2-2, Final EIS)."

The Managed Lane Alternative would not have supported planned concentrated future population and employment growth because it would not provide concentrations of transit service that would serve as a nucleus for transit-oriented development. The Managed Lane Alternative would have provided little transit benefit at a high cost. The cost-per-hour of transit-user benefits for the Managed Lane Alternative would have been two to three times higher than that for the Fixed Guideway Alternative. Similar to the TSM Alternative, the Managed Lane Alternative would not have substantially improved service or access to transit for transit-dependent communities. No funding sources were identified for the Managed Lane Alternative. Toll revenues from the Managed Lane Alternative would pay for ongoing operating and maintenance while remaining revenues would be used to repay debt incurred to construct the system.

The Managed Lane Alternative would have generated the greatest amount of air pollution, required the greatest amount of energy for transportation use, and would have resulted in the largest number of transportation noise impacts of all the alternatives evaluated. Because the Managed Lane Alternative would have served a shorter portion of the study corridor (approximately 16 miles compared to the 20 miles served by the fixed guideway), it would have resulted in fewer displacements and would have impacted fewer archaeological, cultural, and historic resources than the Fixed Guideway Alternative. The Managed Lane Alternative would not have affected any farmlands. Visually, the elevated structure would have extended a shorter distance, but it would have been more visually intrusive because its elevated

structure, with a typical width of between 36 and 46 feet, would have been much wider than the Fixed Guideway Alternative.

After the Alternatives Analysis was completed, several scoping comments were received requesting reconsideration of the Managed Lane Alternative that was considered and rejected during the Alternatives Analysis. Because no new information was provided that would have changed the findings of the Alternatives Analysis regarding the Managed Lane Alternative, it was not included in the Draft EIS for further consideration.

Proposal to limit future bus fleet size

The proposal to limit the future bus fleet to the size of the existing fleet of 525 buses would result in a fleet that is insufficient to handle ridership demand in 2030 without the Project. As stated in Section 3.4.2 of the Final EIS, "Although some increases in bus services would occur under the No Build Alternative, a review of route-specific demand and service levels for 2030 indicates that bus capacity would be exceeded for several routes. In some cases the demand per bus trip would be more than twice the seating capacity. In these instances, passengers would be unable to board the bus."

Figure 3-1 of the Final EIS offers the primary explanation why the transit ridership achieved in 1984 has not been surpassed even though the bus fleet has increased. Due to increasing traffic congestion, bus operating speeds deteriorated between 1984 and 1992. During this period, no other comparably sized bus system in the United States moved more riders per bus hour than the Honolulu service. This is according to annual reports filed by the transit operators with the Federal government.

Buses were added in Honolulu to maintain service levels. In 1989, there were 475 buses available for service as reported in The State of Hawaii Data Book 2000. The number of available buses increased to 495 in 1993 and 525 in 1995. In 2007, the total number of available buses was 531. However, increasing congestion required more buses to provide the same level of service along the same route because the total trip time for one bus to serve the entire route was increasing. For example, Figure 1-11 of the Final EIS shows how afternoon scheduled trip times for selected routes have increased from 1992 to 2008 (Source: TheBus public timetables). The time for Route 52 (Circle Isle) to complete a trip has increased over 30 minutes, and the trip time for Ewa Beach has increased almost 60 minutes. The result has been that a bus can no longer make as many trips as it did in the past. This has required the need to add buses to routes to maintain the same interval between buses.

Over the past 10 years, the system operating speed has continued to decline. Even though the annual number of miles operated in revenue service has increased 11 percent from 1997 to 2007 per the National Transit Database, it took a 16 percent increase in the annual number of hours to operate those additional miles. This has contributed to higher operating costs.

Careful examination of Figure 3-1 of the Final EIS depicts two times when bus operating speeds slightly and temporarily increased. Both of these occasions were the result of concerted efforts to enact systematic and comprehensive improvements to TheBus system. The most recent of these was from 1999 to 2001. New service design substantially improved bus services in the Ewa and Waianae areas with the introduction of a wide array of new community circulators, local, and CountryExpress! bus routes.

The benefits of these improvements have been temporary. Increasing system usage and traffic congestion have combined to negatively impact the overall system operating speed as shown in Figure 3-1 of the Final EIS.

Since the early 1990s, the number of TheBus trips to and from Waikiki has decreased from over 1,050 trips to 994 trips today. For example, Route 8 had 189 trips to and from Waikiki in 1992; today the route has 143 trips. Similarly, Route 19 has experienced a decrease in trips to and from Waikiki from 125 to 71 trips today. The number of trips on Route 20 has decreased from 78 to 39 trips.

Figure 1-2 of the Final EIS presents population, vehicle ownership, and vehicle miles trends for Oahu. The significant relationship in this graphic is the disproportionate increase in vehicle miles traveled compared to population and vehicle registrations. The consequence of the increase in vehicle miles traveled is congestion, causing slower operating speeds for all vehicles, including transit. This impact is depicted in Figure 3-1 of the Final EIS.

The fleet size has not stagnated. However, to operate the same number of miles of service in 2007 at 13.2 miles per hour requires about 50 more buses than in 1984 when the operating speed was 14.7 miles per hour.

The purpose of Figures 1-5 and 1-6 of the Final EIS is to show population and employment distribution and growth for Oahu. Appendix D of the Final EIS includes existing and future bus routes, including route numbers and frequencies.

The Project is designed with 240-foot station platforms that can accommodate trains with up to four 60-foot cars. Each car can hold over 160 passengers, so a four-car train can carry more than 600 passengers. The train control system is being designed to accommodate 90-second headway service, or 40 trains per hour. Forty 4-car trains in an hour could accommodate at least 24,000 passengers per hour per direction. This demand is larger than is forecast to occur in 2030. 2030 peak hour demand for the Project is expected to be about 8,100 passengers per hour in the peak direction. This demand can be accommodated by operating 3-minute headway service with a mixture of two-car and three-car trains. A fleet of approximately 150 vehicles to accommodate this demand is budgeted for purchase as part of the Project. However, as noted above, more than three times as many passengers per hour can be accommodated at some future date merely by expanding the fleet size.

Concern related to electrical generation and delivery

Since trains and rail stations will be electrically powered, the system's infrastructure is being designed to handle service disruptions. For example, trains will draw power from many points along the route, so an outage in a few areas should not disrupt service. If electrical power is lost system-wide, then train brakes are designed to stop the rail cars even without power. Lights will stay on in trains and stations; backup batteries will provide lighting for several hours. The train operations center will communicate with passengers via the public address system and intercom to provide guidance.

If power is restored within a short time, service will resume. With a prolonged outage, the operations center will direct passengers to exit the trains and walk along a lighted emergency walkway on the guideway to the nearest station. For those unable to exit rail cars,

help will be provided by emergency responders and transit staff. Passengers will be met at the train station by a coordinated response from emergency responders and city transportation workers.

As stated previously, the Managed Lane Alternative was examined during the Alternatives Analysis and was found to provide little community benefit, as it would not have resulted in substantially improved transit access in the corridor.

Final Comments

Tele-working is becoming increasingly acceptable as a work-place alternative. Specific decisions about workforce management would be made by individual employers. It is possible that local and state government could create policy incentives to employers to encourage alternative workplace arrangements to better accommodate a tech-savvy generation of workers.

Comparison with the super ferry project

The NEPA process is a federal requirement only for federally funded projects. If the Super ferry project did not involve a federal agency, then the level of environmental review would have been determined by State and local jurisdictions only.

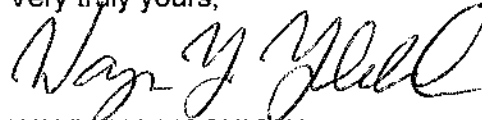

Testimony at local hearings

In response to your concern that "the City will allow only one testimony per person at any public hearing – even if there might be new information presented after the testimony." Under NEPA, FTA encourages ongoing dialogue with members of the public about its federally funded transit projects. It is possible that in order to provide all participants with an opportunity to speak, the City may suggest time limits for verbal comments. This is not intended to stifle public response; rather it is intended to provide an opportunity for everyone who would like to speak.

Multiple forms of testimony were supported at each hearing, including a hearing examiner, provision of a separate court reporter to record testimony, and comment forms to provide written testimony. Individuals could come to as many or few hearings as desired and testify at each hearing. The public was also able to provide comment via the project website (www.honolulutransit.org), or could provide written comment directly to DTS.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Submission Content/Notes : I agree with Charles Djou that the rail system should start in town and build out to Kapolei. The reason being income generating and ridership. There would be more people using the rail system starting from town because of the population base. Secondly with more people riding the rail there will be more revenues generated to off set the cost of building the rail. Another point I would like to make is the Airport route is more favorable vice the Salt Lake route. Every major city has a rail system that incorporates the airport as a significant stop because of the people traffic. No one other than the Salt Lake residence would want to drop off or get on at a Salt Lake rail stop. On the other hand all of the people of Hawaii from the neighboring islands as well as the windward side of Oahu would consider using an airport rail stop sometime in their life. The airport rail stop could be a means of transportation to get to an overnight stay at any hotel. The rail stop could be a means of avoiding the Middle street and Punahou Street road traffic bottleneck. The Rail System has been approved by the State of Hawaii now lets build it in the most practical way possible where all the people of Hawaii can get to see and use the system as soon as possible. No more studies, no more discussions, let's start breaking ground and get to work.

Dear Mr. Muramatsu:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- *Reduce the time that each area will experience traffic and community disturbances.*
- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*

- *Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- *Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

Your preference for the Airport Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been identified as the Preferred Alternative as described above. As compared to the other alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly lower impacts to the natural and built environment. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative.

The Alternatives Analysis phase, which preceded the EIS process, is documented in Chapter 2 of the Final EIS. It evaluated a range of modal and general alignment alternatives, in terms of their costs, benefits, and impacts. The scoping process for the Alternatives Analysis involved a presentation of the viable alternatives to the public and interested public agencies and officials to receive comments on the Purpose and Need, alternatives, and scope of the analysis. Scoping for the EIS followed the FTA process that provides for a culling of alternatives studied in the EIS through an Alternatives Analysis. The scoping process initiated for the Alternatives Analysis included a variety of highway, bus and fixed guideway options for consideration. During the later scoping effort for the EIS, the public was requested to propose alternatives that would satisfy the purpose and need at less cost or with greater effectiveness, less environmental or community impact and to propose alternatives that were not previously studied and eliminated for good cause. The only alternative that emerged that met these criteria was a fixed-guideway alternative following several alternative alignments. All reasonable alternatives that emerged from these processes were ultimately evaluated in the Draft and Final EISs.

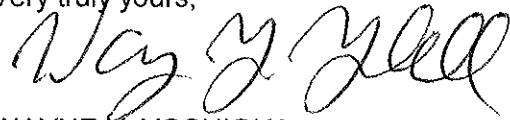

Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts, and mitigation commitments.

Mr. Byron Muramatsu
Page 3

Lastly, it should be noted that Project construction will be paid for with the local General Excise and Use Tax (GET) surcharge and Federal funding as stated in Chapter 6, Section 6.4.2 of the Final EIS. Revenue generated from ridership will be used to fund operating and maintenance costs.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is fluid and cursive, with the first name "Wayne" being the most prominent.

Subject: Honolulu High Capacity Transit Corridor Project
City and County of Honolulu
Draft Environmental Impact Statement/4(f) Evaluation
November 2008

Dear Messrs. Matley and Yoshioka:

As long time residents of the Ala Moana-Sheridan neighborhood, we read with interest the Draft EIS for Honolulu's High Capacity Transit project dated November 2008.

We participated in the City and County of Honolulu's preparation of the draft Sheridan community plan in 2006, and appreciated how the vision is consistent with the City and County of Honolulu's Primary Urban Center Development Plan's designation of the Sheridan and Kaheka neighborhoods as In-Town Residential Neighborhoods. In Ala Moana-Sheridan, over 20% of the population is over 65 years old, and the proportion of elderly is steadily increasing (Draft Ala Moana-Sheridan Community Plan, 2006)." In light of this fact, the 2006 draft Plan discusses how public roads and facilities in and around our neighborhood need to be more pedestrian friendly to the elderly, general pedestrians and bicyclists. Therefore, we reviewed the Transit DEIS for a description and analysis of how access to the Transit Corridor Project would be pedestrian friendly for the Ala-Moana-Sheridan neighborhoods.

Instead, we found the Transit Corridor Project DEIS to be heading in the opposite direction making the area more congested with traffic and in turn creating a more rushed environment. The DEIS directly comments that the proposed TOD in the area will change the feel of the area, presumably making it more urban, "Because Kaka'ako has been designated a redevelopment area, changes in land uses to TOD is likely, which may result in a change in character along the alignment, especially near stations...(DEIS, p. 4-45). While we understand change is inevitable, the Transit DEIS does not even discuss basic project features such as access to the Ala Moana transit station for the affected neighborhood. Since safe and secure pedestrian access to and from the Ala Moana transit station is not discussed or analyzed in the Transit DEIS, we assume no design studies or even serious consideration has been devoted to this, the City and County of Honolulu's major public infrastructure project.

Please revise and expand the Transit DEIS to include detailed descriptions and analyses of the range of pedestrian and bicycle access ways to and from the Ala Moana station. If no consideration has yet been devoted to this project element for the Ala Moana-Sheridan community, we submit the DEIS is deficient and is not yet a complete Draft EIS.

Sincerely, *Doris Nakamura*

Dear Y. Murata:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Many pedestrians currently use the network of sidewalks in the Ala Moana-Sheridan neighborhood. The pedestrian volume in the neighborhood will continue to grow with or without the Project. Those walking to the station from surrounding areas will use the existing network of sidewalks. As stated in Section 2.5.5 of the Final EIS, design criteria developed for stations place highest emphasis on walk and bicycle access. Pedestrian access to stations, including accessible routes, shall be given first priority for reasons of safety.

It is estimated that most passengers using this station will transfer to or from buses directly on Kona Street. Those walking to the station from surrounding areas will use the existing network of sidewalks. Bicyclists will access the station via existing streets and/or

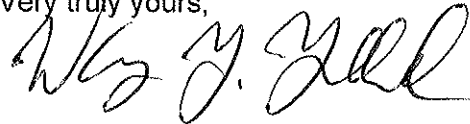

Y. Murata
Page 2

sidewalks in the area. The station will be designed to accommodate the expected volume of pedestrians and will provide parking for bicycles.

As indicated in Section 4.6.3 of the Final EIS, ongoing coordination efforts with the public will help develop design measures to enhance the interface between the transit system and the surrounding community. The extent, nature, and location of these design measures will be determined in Final Design through these coordination efforts.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Dear Samoa Naea:

**Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement**

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses comments regarding the above-referenced submittal:

While each of the alternatives includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana Center has been selected as the Preferred Alternative. The identification of the Airport Alternative as the Preferred Alternative was made by the City to comply with FTA's NEPA regulations that state that the Final EIS should focus on the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative, public input on the Draft EIS, and City Council Resolution 08-261 identifying the Airport Alternative as the Project. The selection of the Airport Alternative is described in Chapter 2 of this Final EIS. The discussion of the alternatives considered is included in Chapter 2 of this Final EIS and the Alternatives Analysis. As discussed in Section 3.4.2 of this Final EIS, the Airport Alternative will carry the most passengers with 116,000 daily passengers and 282,500 daily trips in 2030, thereby resulting in the greatest transit-user

benefits. The Airport Alternative will also result in the fewest vehicle miles traveled and vehicle hours of delay, as well as provide access to major employment areas, including Honolulu International Airport, that will have substantially greater ridership than the other alternatives considered. The Project is proceeding as quickly as practical, as illustrated in the schedule presented in Chapter 2 of the Final EIS.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Issuance of the Record of Decision under NEPA and acceptance of the Final EIS by the Governor of the State of Hawaii are the next anticipated actions and will conclude the environmental review process for this Project.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is fluid and cursive, written over the typed name below.

Subject: Honolulu Transit Project DEIS comments

Feb. 1, 2009

Mr. Wayne Yoshioka

Department of Transportation Services

-

2/4/2009

City and County of Honolulu

650 S. King St. 3rd Floor

Honolulu, HI 96813

Dear Sir,

Regarding the Honolulu High Capacity Transit Project, I have concerns that are not adequately addressed in the DEIS. I will refer to this project in this correspondence as "the train". I am requesting a response as I feel these issues need further clarification. My concerns specifically relate to power outages that occur regularly in Hawaii, caused by storms as well as for unexplained reasons. Our power grid is not tied in to a neighboring state and we have little alternate power available. Our electricity system is not as modern as most other states in the US as this island chain is almost 2500 miles away from the nearest land mass. We experience unique tropical weather patterns causing regular major power outages that we are used to just dealing with.

During the recent power outage on December 26, 2008 on Oahu a representative from the City and County of Honolulu was on the radio and several people called in expressing concern about what would happen to the train during a massive power outage such as the one we were experiencing at that time. That official assured listeners there would be backup power for the train, however I feel this issue has not been adequately addressed in the DEIS.

In reviewing the table of contents I cannot locate anything about alternate generators that will take over in the event of a power outage. Could you please provide me with the location in the DEIS of the specific electricity plan for the train should a power outage such as the one that occurred on December 26, 2008 occur once the train is up and running?

I would like information on the cost of such a system, the planned operating expenses, the planned maintenance of this system, the manpower needed to operate such a system, the location of these alternate generators, and how exactly this backup plan would be implemented. I would like to see the entire backup power system described in full detail along with supporting financial estimates.

Could you please address how it would be justified as well to use the generator for the purpose of the train when hospitals, schools, and homes would need this alternate power source during this time? Please also address the affect of the loss of power on emergency vehicles who may need to get to point a to point b with no alternate route as they would not be able to use the train tracks.

2/4/2009

Another issue that has not been adequately addressed in the DEIS is the affect of a hurricane or earthquake on the train. I understand that during the recent hurricane in Houston Texas (Ike) their train was shut down for several days and I would anticipate the same here. I would like to know how loss of power for this system would be mitigated, and how the effects of tropical weather would be mitigated.

It is hard to imagine that if in Houston Texas it took several days to get their train up and running it would take any less time here. Everything takes longer in Hawaii. Please provide the comparison of our system vs. Houston's system as it relates to a hurricane or earthquake.

Thank you in advance for your detailed response.

Dear Ms. Nagamine:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Since trains and rail stations will be electrically powered, the system's infrastructure is being designed to handle service disruptions. For example, trains will draw power from many points along the route, so an outage in a few areas should not disrupt service. The location of traction power substations are shown in Appendix B of the Final EIS.

If electrical power is lost system-wide, then train brakes are designed to stop the rail cars even without power. Lights will stay on in trains and stations; backup batteries will provide lighting for several hours. The train operations center will communicate with passengers via the public address system and intercom to provide guidance.

If power is restored within a short time, service will resume. With a prolonged outage, the operations center will direct passengers to exit the trains and walk along a lighted emergency walkway on the guideway to the nearest station. For those unable to exit rail cars, help will be provided by emergency responders and transit staff. Passengers will be met at the train station by a coordinated response from emergency responders and city transportation workers. In

response to your comment, we have added text about train operation during power outages to Section 2.5.2 of the Final EIS.

Section 6.3 of the Final EIS describes the financial resources anticipated to be needed to pay for the capital cost of the Project and the City's overall public transportation system. Capital costs of the Project, including finance charges, are expected to be fully paid for by a combination of FTA Section 5307 and FTA Section 5309 New Starts Funds from the Federal government and revenues from the County General Excise and Use Tax Surcharge levied from 2007 through 2022 on Oahu. The analysis takes the current economic downturn into account. Section 6.4 of the Final EIS describes the funding sources to pay for ongoing operating and maintenance costs associated with maintaining the transit system in a state of good repair. Operating and maintenance costs will be paid for from the same sources currently used for TheBus: Federal funding, fare revenues, and subsidies from the City's General and Highway Funds. Costs include construction and maintenance of elements of the power system. The manpower needed to operate the system cannot be determined until the final operating plan is completed. This plan will be completed prior to service.

There will be an uninterruptible power supply at each station, with capability to energize critical systems, such as lighting and communications, for a few hours in the case of a temporary power outage. There will also be a UPS backup for the Operations Control Center (OCC) and a backup diesel generator for long-term backup of the OCC. There will also be a special connection at each station to allow for a portable generator to be used in case of a longer-term outage affecting a single station.

As stated in Section 4.5.3 of the Final EIS, the Project will improve the operation of the roadway network compared to the No Build Alternative by reducing congestion and will improve emergency response times. The Project will not affect police, fire, or emergency medical facilities adjacent to the alignment.

As discussed in the Honolulu High-Capacity Transit Corridor Project Geology, Soils, Farmlands, and Natural Hazards Technical Report, the guideway and other structures will be designed and constructed to withstand earthquakes and wind forces from tropical storms. Some piers and stations will be located on floodplains, but no increased hazards are anticipated because the guideway and stations will be elevated. This technical report is available at libraries, from the DTS, and on the Project website at www.honolulustransit.org.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Subject: Honolulu Rail Project DEIS

Mr. Ted Matley
FTA Region IX
201 Mission St. Suite 1650
San Francisco, CA 94105

Dear Sir,

Regarding the proposed rail transit system in Honolulu, and the DEIS that is currently being reviewed, I would like to point out some flaws in the process of determining the locally preferred alternative, thus flaws in the DEIS, and the outcome of the recent election.

I do not feel there was fair public input in determining the locally

preferred alternative. Thus, alternatives were not evaluated in the DEIS, rather 3 different rail routes or a no build alternative.

I also feel the public was swayed using tax money to influence the vote in favor of rail.

I also feel the city council of Honolulu ignored public input on the issue and did not answer questions raised by voters.

Review the following personal experiences with this process:

Sometime during 2006: I attended a city council meeting on the issue. Hundreds of people testified, I waited for several hours and had to leave to go back to work. It was difficult to even get in the room because of all the union members who were there.

Sometime during 2006: The city asked for input as they were determining the "locally preferred alternative". I provided my input, which was against rail and in favor of improving the bus system. I got no response other than an acknowledgment and I was put on the city mailing list so I would get their slick shiny brochures promoting their rail project every month.

November 2006: I attended a meeting at Windward Community College and testified against rail. My estimate is there were 40 people who testified, 5 in favor of rail and 35 against rail. Several city council members were there, and there was little dialog. There was no further response to any testimony.

August 28, 2007 I sent a letter to the City Council asking questions regarding what was going on (letter below) and I DID NOT EVER GET A RESPONSE.

From 2007 through June 2008 2.6 million dollars of tax money was spent on advertising and "public outreach" to promote the rail project.

July 2008 through mid October 2008 unknown amounts of additional taxpayer money was spent on massive advertising blitz including print media and radio and public outreach meetings, which promoted this project and influenced the vote. These meetings were all held during October, and an 8 page, full color glossy brochure was inserted in the 3 major newspapers two weeks before the election, all paid for with tax dollars.

November 2008 outcome of the vote:

The vote was clearly influenced. 50.6% of the voters voted in favor of rail, the balance voted against or didn't vote on the issue. Had both sides had equal access to resources, then the vote would have been fair, however the City had TAXPAYER money to spend, thus the election was unfairly influenced.

Although the mayor and city powers claimed they listened to public input, from personal experience that was not at all the case. Rather, people attended meetings and provided feedback to city council members and heard nothing back. The city had no interest in listening to what

people had to say.

Where is the public testimony, and where is the city's response to that testimony? What happened to everything people said? Was it totally dismissed? Where are the spending records, how much money was really spent influencing the vote?

Why did I not get my questions of city council members from August 28, 2007 answered?

This project has been handled in an underhanded fashion from day one and I feel it is my civic duty that you should be aware of the kind of manipulation that went on during the entire process. I urge you to dismiss this DEIS, it is seriously flawed.

Yours very truly,

Nancy Nagamine

CC Wane Yoshioka, City and County of Honolulu
Governor Linda Lingle, Governor of the State of Hawaii

LETTER REFERENCED ABOVE SENT TO CITY COUNCIL:

August 28, 2007

What is going on at Honolulu Hale?

Since August 7 I have read every editorial regarding the 5 billion dollar fixed rail project that has been printed in the Honolulu Advertiser. Results as follows:

In favor of the project: 4

Against the project/ see better alternatives: 12

Pro arguments are quite weak with the predominant ones being that we need rail because people are tired of sitting in traffic and that we have talked about it long enough, let's just go ahead with it. (It has been proven that the rail project will not help with traffic congestion.)

Opposing arguments:

The cost/ value relationship is not justifiable.

The bus is flexible, it is easy to add buses and subsidize them, costing far less than rail.

Busses go to where the people are, throughout the island. (Flexible, not fixed. And serve more people.)

Many busses can be running during crunch time before 8 AM which will help people more.

Toll roads will cost far less, be self-supporting, AND relieve traffic as proven in Tampa.

The rail system will not help traffic congestion.

Hanneman is leading the city in to fiscal abyss. Homeowners BEWARE.

The federal money we hope to get will be nothing relative to the overall cost.

Fixed rail goes from point A to B and back, what about C, D, and E and so on?

There will be low rider ship on rail as in other cities.
It is inconvenient, need too many transfers, total travel time far too long.
Honolulu is too small to afford this system.
The system will be outdated by the time it is completed.
15 years is too long to wait, other solutions would offer more immediate relief.
Any government run project is plagued with maintenance problems and the system will likely fall in to disrepair.
Dismal record of similar public works projects including calamitous cost over runs, misleading cost-benefit calculations, exaggerated development effects, overlooked and ignored environmental problems, and violation of established practices of good governance, transparency, and public participation in decision making.

City council members, are you paying attention to what your constituents want?

Everyone agrees traffic is a problem, but we want solutions, not government works projects that will not help the problem.
Why will you not at least do what Ann Kobayashi suggests and look at what appears to be a better system? This is starting to smell like a skunk, and you know what they say "if it smells like a skunk there probably is one". We need to find the skunk! (Follow the money.)
Speaking of smells, why did the city run an ad in the Advertiser on 8/22 asking people to protest the possible EPA requirement to add secondary treatment facilities at Sand Island for 1.2 billion dollars? It is OK for you to spend 5 billion of TAXPAYERS money on something that will not fix the traffic problem, yet ask people to protest spending 1.2 billion to fix the treatment facilities? I don't like you spending my money to run this ad!

You have now agreed to pay 86 million to PB Americas (formerly Parsons Brinckerhoff) for an environmental impact study for the train? I don't like you spending my money for this either.

Please, can someone explain to me what is going on at Honolulu Hale?

Dear Ms. Nagamine:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The overall public information program has been continuous since the beginning of the Project in 2005. The Alternatives Analysis phase evaluated a range of transit mode and general alignment alternatives in terms of their costs, benefits, and impacts. An initial screening process considered alternatives identified through previous transit studies, a field review of the study corridor, an analysis of current population and employment data for the study corridor, a literature review of technology modes, work completed for the Oahu Regional Transportation Plan 2030 (ORTP) prepared by the Oahu Metropolitan Planning Organization (OahuMPO) (OahuMPO 2007), and public and agency comments received during the formal Alternatives Analysis scoping process.

During the fall of 2005 and winter of 2006, the City and County of Honolulu (City) completed the alternatives screening process that is documented in the Honolulu High-Capacity Transit Corridor Project Alternatives Screening Memorandum (DTS 2006a). Scoping meetings were held, which included a presentation of alternatives to the public and interested agencies and officials to receive comments on the Purpose and Need, alternatives, and scope of the analysis for the Alternatives Analysis. Refinements were made to the alternatives. In total, 75 fixed guideway alignment options were screened.

The following alternatives were studied in the Alternatives Analysis: No Build Alternative, Transportation System Management (TSM) Alternative, Managed Lane Alternative, and the Fixed Guideway Alternative. After review of the Alternatives Analysis Report and consideration of public comments, the City Council selected a fixed guideway transit system extending from Kapolei to UH Manoa with a connection to Waikiki as the Locally Preferred Alternative. The selection, which eliminated the TSM and Managed Lane Alternatives, became Ordinance 07-001 on January 6, 2007.

Project funds paid for the public involvement activities listed in Chapter 8 of the Final EIS as required by NEPA; however, no funds were spent on "influencing" the voting process. The Project disseminated information pertaining to the Project that you may not have agreed with; however, we feel this information was accurate and relevant to properly engage the public.

Guidelines set forth by NEPA, as amended, and Chapter 343 of the Hawaii Revised Statutes stipulate that public involvement be carried out on large-scale projects such as this one. As a large infrastructure project, the City felt it was important to disseminate information to as many people as possible. Thus, a broad range of print and visual media was necessary to reach different population segments. In addition, all testimony and comments received during the public hearings will be answered and a written or electronic letter will be sent when the Final EIS is issued. However, your comments regarding your experiences with the Project have been noted.

The City held five public hearings in December 2008 throughout the study corridor. Both City employees and the City's consultants were available to answer questions. Attendees were allowed to make official comments on the Project by giving testimony to the Public Hearing Officer (which was recorded by a court reporter), providing a private statement to a court reporter, or submitting their comments in writing. More information concerning the public hearing process can be found in Chapter 8 of the Final EIS.

Your opinion of the process has been noted. The following responses address comments in your letter dated August 28, 2007:

As discussed in Section 7.4 of the Final EIS, the cost-effectiveness analysis considers whether the Project's benefit would justify its capital and operating costs. The cost-effectiveness indices for the Project compared to the baseline is within the "medium" range established by FTA for its New Starts ratings, which, along with other considerations, is currently required to qualify for New Starts funding.

Chapter 3 states that adding substantial passenger capacity in 2030 with more buses is not feasible in some key locations along the system because of roadway capacity constraints. Increasing frequency would require headways at five minutes or less. Further, the Downtown street network cannot support the number of buses that would be required to meet projected demand. As a result of growth in traffic congestion and the lack of exclusive right-of-way for transit vehicles, bus speeds have gradually declined over the past several years and would continue to decline under the No Build Alternative.

In addition, the TSM Alternative studied during the Alternatives Analysis increased bus service. The alternative included express bus service that operated as bus rapid transit in existing facilities. Bus frequencies would have been increased during peak periods to improve service for work-related trips, particularly from developing areas. The bus fleet was assumed to increase from 525 to 765 buses, and park-and-ride lots were assumed at West Kapolei, UH West Oahu, Waipio, and Aloha Stadium. The TSM Alternative would have improved transit travel times, but it would have done little to improve corridor mobility and travel reliability. Roadway congestion also would not have been alleviated.

With the Project, bus service will be enhanced and the bus network will be modified to coordinate with the fixed guideway system. Some existing bus routes, including peak-period express buses, will be altered or eliminated to reduce duplication of services provided by the fixed guideway system. Buses removed from service in the study corridor will be shifted to service in other parts of Oahu, resulting in improved transit service islandwide. Certain local routes will be rerouted or reclassified as feeder buses to provide frequent and reliable connections to the nearest fixed guideway station. Bus routes and frequencies with the Project are shown in Appendix D of the Final EIS.

Regarding toll roads, the analysis of the HOT facility in Honolulu from the Alternatives Analysis shows the cost to be \$2.6 billion in 2006 dollars (higher today). This estimate was reviewed by HDOT and others familiar with HOT facilities. It is the only estimate to date that addresses Honolulu conditions. There is no substantiation of the estimate from the Tampa Bay toll facility being applicable in Honolulu. The designer of the Tampa Bay facility stated that to apply such an estimate without detailed consideration of the many differences between the two locations is not reasonable. Regarding the comparison of the Tampa Bay facility, the Transit Task Force report states that "the committee concluded that the projects are sufficiently different (actual costs versus projected costs with contingencies; available, accessible ROW vs. construction in actively used highways; no utilities relocation vs. extensive relocations) as to make the comparison unreasonable."

Regarding traffic congestion with the Project, rail will take approximately 40,000 cars off the roads and reduce congestion by 18 percent (as measured by vehicle hours of delay (VHD)). These forecasts are from a travel demand model that has been reviewed by FTA and proven effective in cities across the United States.

Your comment regarding the level of Federal funds is noted. Chapter 6 of the Final EIS describes the financial resources anticipated to pay for the capital cost of the Project and for ongoing operating and maintenance costs. Federal grants will amount to about 30 percent of the total cost of the Project.

As discussed previously, the bus network will be restructured to provide frequent and reliable connections to fixed guideway stations. As shown in Table 3-20 in the Final EIS, 90 percent of fixed guideway riders will access the system via walking, biking, or bus. In addition, four park-and-ride facilities will be provided for those wishing to drive to access the system. Lastly, the fixed guideway system could encourage new development within walking and biking distance of stations.

Regarding your comment on ridership, ridership projections for the forecast year of 2030 have been developed using the travel demand model, which was calibrated against collected traffic and transit ridership information and then validated against recent counts to be sure it properly represents travel activity in the transportation system (Section 3.2.1 of the Final EIS). An on-board transit survey was completed in December 2005 and January 2006, and the latest socioeconomic information available as of October 2008 was incorporated. Traffic counts were collected in 2005, 2007, and 2008. The model is based upon a set of realistic input assumptions regarding land use and demographic changes between now and 2030 and expected transportation levels-of-service on both the highway and public transit system. Based upon the model and these key input assumptions, approximately 116,300 trips per day are expected to use the rapid transit system on an average weekday in 2030. Since the Draft EIS was published, the travel demand model has been refined by adding an updated air passenger model (which forecasts travel in the corridor related to passengers arriving or departing at Honolulu International Airport), defining more realistic drive access modes (driving alone or car pooling) to project stations and recognizing a more robust off-peak non-home-based direct demand element (trips that do not originate at home) based on travel surveys in Honolulu.

As stated in Chapter 3 of the Final EIS, with the Project, the rate of transfers will be higher than under the No Build Alternative because of changes in local bus service to maximize access to the fixed guideway system. However, because of the high frequency of the fixed guideway service (three-minute headways between trains during peak periods), riders transferring from buses to the fixed guideway will experience minimal wait times. Riders transferring from the guideway service to buses will benefit from improved frequencies on existing bus routes serving stations. Also, several new routes with high frequencies will be provided as feeders to the guideway system. Since these routes will primarily operate in residential areas, they will provide greater reliability versus routes operating along congested arterials. The travel demand forecasting model includes a time penalty for transfers. With these characteristics in place, the transit system with the Project would still have ridership levels 44 percent higher than the No Build Alternative. While people typically try to minimize transfers on any trip, the more fundamental criterion for making a trip decision is how long the trip takes. Rail will offer people a shorter overall trip time compared to other options, even with the transfers as noted in Figure 3-7 in the Final EIS.

The funding plan is based on revenue sources already in place. Chapter 6 of the Final EIS discusses the funding sources for the Project.

The system to be built in Honolulu is similar to systems being built around the world. As noted in Chapter 2 of the Final EIS, in parallel with the alignment analysis, a five-member panel appointed by the City Council and the Mayor considered the performance, cost, and reliability of the five proposed technologies for the fixed guideway system. The panel twice accepted public

comment as part of this review. By a four-to-one vote, the panel selected steel wheel operating on steel rail as the technology for the Project evaluated in the Final EIS. The four panel members selected steel-wheel technology because it is mature, proven, safe, reliable, economical, and non-proprietary. Proprietary technologies, meaning those technologies that would have required all future purchases of vehicles or equipment to be from a single manufacturer, were eliminated because none of the proprietary technologies offered substantial proven performance, cost, and reliability benefits compared to steel wheel operating on steel rail. Selecting a proprietary technology also would have precluded a competitive bidding process, likely resulting in increased overall project costs.

Project construction is scheduled to be complete in 2018. Neither construction activities nor construction costs are scheduled to continue beyond 2018. Any other alternative that could be built in a shorter time frame would not be as effective as the fixed guideway system. The Fixed Guideway Alternative performed better at meeting the Project's Purpose and Need than any of the other alternatives evaluated in the Alternatives Analysis. A fixed guideway system will improve transit performance and reliability, be more cost-effective, and will substantially reduce VHD for all travelers, not just transit users.

A version of the system proposed by Ann Kobayashi was studied in the Alternatives Analysis phase and shown to be ineffective compared to rail.

Your other comments have been noted.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Subject: Honolulu High Capacity Transit Corridor Project
City and County of Honolulu
Draft Environmental Impact Statement/4(f) Evaluation
November 2008

Dear Messrs. Matley and Yoshioka:

As long time residents of the Ala Moana-Sheridan neighborhood, we read with interest the Draft EIS for Honolulu's High Capacity Transit project dated November 2008.

We participated in the City and County of Honolulu's preparation of the draft Sheridan community plan in 2006, and appreciated how the vision is consistent with the City and County of Honolulu's Primary Urban Center Development Plan's designation of the Sheridan and Kaheka neighborhoods as In-Town Residential Neighborhoods. In Ala Moana-Sheridan, over 20% of the population is over 65 years old, and the proportion of elderly is steadily increasing (Draft Ala Moana-Sheridan Community Plan, 2006). In light of this fact, the 2006 draft Plan discusses how public roads and facilities in and around our neighborhood need to be more pedestrian friendly to the elderly, general pedestrians and bicyclists. Therefore, we reviewed the Transit DEIS for a description and analysis of how access to the Transit Corridor Project would be pedestrian friendly for the Ala-Moana-Sheridan neighborhoods.

Instead, we found the Transit Corridor Project DEIS to be heading in the opposite direction making the area more congested with traffic and in turn creating a more rushed environment. The DEIS directly comments that the proposed TOD in the area will change the feel of the area, presumably making it more urban, "Because Kaka'ako has been designated a redevelopment area, changes in land uses to TOD is likely, which may result in a change in character along the alignment, especially near stations...(DEIS, p. 4-45). While we understand change is inevitable, the Transit DEIS does not even discuss basic project features such as access to the Ala Moana transit station for the affected neighborhood. Since safe and secure pedestrian access to and from the Ala Moana transit station is not discussed or analyzed in the Transit DEIS, we assume no design studies or even serious consideration has been devoted to this, the City and County of Honolulu's major public infrastructure project.

Please revise and expand the Transit DEIS to include detailed descriptions and analyses of the range of pedestrian and bicycle access ways to and from the Ala Moana station. If no consideration has yet been devoted to this project element for the Ala Moana-Sheridan community, we submit the DEIS is deficient and is not yet a complete Draft EIS.

Sincerely, *Doris Nakamura*

Dear Ms. Nakamura:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Many pedestrians currently use the network of sidewalks in the Ala Moana-Sheridan neighborhood. The pedestrian volume in the neighborhood will continue to grow, with or without the Project. Those walking to the station from surrounding areas will use the existing network of sidewalks. As stated in Section 2.5.5 of the Final EIS, design criteria developed for stations place highest emphasis on walk and bicycle access. Pedestrian access to stations, including accessible routes, shall be given first priority for reasons of safety.

It is estimated that most passengers using this station will transfer to or from buses directly on Kona Street. Those walking to the station from surrounding areas will use the existing network of sidewalks. Bicyclists will access the station via existing streets and/or

Ms. Doris Nakamura
Page 2

sidewalks in the area. The station will be designed to accommodate the expected volume of pedestrians and will provide parking for bicycles.

As indicated in Section 4.6.3 of the Final EIS, ongoing coordination efforts with the public will help develop design measures to enhance the interface between the transit system and the surrounding community. The extent, nature, and location of these design measures will be determined in Final Design through these coordination efforts.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is written in a cursive, flowing style.

RT 12/08-291320

Testimony to Honolulu High-Capacity Transit Corridor Project Public Hearing
Blaisdell Center, Draft EIS, Dec. 8, 2008

I was born and raised in Honolulu and until recently, a 30-year resident of the San Francisco Bay Area.

I feel a great deal of frustration over the rail issue. Having lived in the Bay Area for so long, I understand both the benefits of mass transit and the evils of it. As I rode the BART system to San Francisco from the East Bay suburbs every day, I passed over many decimated neighborhoods, whose vitality and quality of life was destroyed by the BART tracks slicing through communities and businesses.

Like this High-Capacity Transit project, those who pushed for BART did not adequately address serious sociological and economic impacts of the proposed rail system. Instead like Honolulu rail advocates, BART supporters were anxious for federal tax dollars. Or they wanted to rush through the project to make up for year of delay in the past. Then, as now, those motivations are riding roughshod over serious concerns about the rail system's impacts.

One thing is different now, though. We are now faced with billions of dollars of federal deficits, not to mention our own serious economic challenges in the state. There is no way the rail project will NOT meet significant cost overruns and costly delays, even if the federal government meets its promise to provide its share of capital funding – a very iffy promise given the current national economic crisis.

More importantly, Honolulu is not any other city. The potential visual impacts of the rail project have hardly been debated, and the impacts will be substantial. I can point to the tearing down of the Embarcadero Freeway in waterfront San Francisco, referenced in last night's debate, as an example of the city belatedly realizing what a treasure it obstructed in the rush to build a freeway. The same can be said of the rush to build a rail system without forethought to the environmental effects on a city that relies on its physical attraction as part of its uniqueness as both a destination location and a beloved home to its residents.

Lastly, it is apparent the high stakes the city has put on the project just by the veritable horde of consultants and staff at last night's meeting. Reference was made to the money spent on consultants to the rail project. I agree with that criticism, and add to it my anger over taxpayer-funded advertisements run endlessly before the election to PROMOTE the rail project, not provide public education.

OTS
RAPID TRANSIT

Honolulu High-Capacity Transit Corridor Project

Welcome to the Honolulu High-Capacity Transit Corridor Project's Public Hearing for the Draft Environmental Impact Statement/Section 4(f) Evaluation.

This public meeting and hearing has been designed to inform the public about the transit project, explain materials contained in the Draft EIS, answer questions from the public, and collect public input on project issues related to the Draft EIS, Section 106 of the National Historic Preservation Act, Section 4(f) of the U.S. Department of Transportation Act, and floodplains affected by the project.

Please review the project information and ask project staff any questions about the project that you might have. The Draft EIS is available on the project website at www.honolulustransit.org.

You may provide official comments in several ways. Here at this Public Hearing you may provide oral comments to a court reporter who will record them for the record or use this form to provide written comments. After the meeting, you may provide an on-line comment at www.honolulustransit.org or use this form to send a written comment to the Department of Transportation Services. All comments must be postmarked or received by January 7, 2009 in order for them to be included in the Final EIS.

Dear Ms. Nakao:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The Final EIS presents the environmental impacts of the Project on the built environment. The following resources of the affected built environment were analyzed in the Final EIS: transportation system (Chapter 3); land use (Section 4.2); economic activity (Section 4.3); acquisitions, displacements, and relocations (Section 4.4); community services and facilities (Section 4.5); neighborhoods (Section 4.6); environmental justice (Section 4.7); visual and aesthetic conditions (Section 4.8); noise and vibration (section 4.10); energy and electric and magnetic fields (section 4.11); and hazardous waste and materials (Section 4.12). In fact, the majority of the environmental analysis presented in the Final EIS pertains to impacts on the built environment versus the natural environment. The potential impacts of the Project on the built environment have been thoroughly analyzed in the environmental process and those results are presented in the Final EIS.

Section 6.3 of the Final EIS describes the anticipated funding sources for the capital cost of the Project. Capital costs of the Project, including finance charges, are expected to be fully paid by a combination of FTA Section 5309 New Starts Funds and FTA Section 5307 Funds from the Federal government and the revenues from the County General Excise Tax Surcharge levied from 2007 through 2022. As a note regarding cost overruns, the capital cost estimate includes over \$1 billion in 2009 dollars in contingencies to account for such eventualities. Section 6.6 of the Final EIS describes risks and uncertainties associated with these funding assumptions. FTA has given no indication that they will not fund the Project at the levels requested.

The island's unique visual character and scenic beauty were considered in the visual and aesthetic analysis presented in the Draft and Final EISs. The assessment of visual effect due to the Project as described in Section 4.8.3 of the Final EIS considers changes to the visual landscape and viewer responses to those changes. This includes the existing development along the Project alignment. Within the Project corridor the environment changes from rural at the Wai'anae end of the corridor to dense high-rise development at the Koko Head end.

As part of the design process, the City has developed design principles, which are identified in the Honolulu High-Capacity Transit Corridor Project Compendium of Design Criteria (RTD 2009m) that will be implemented in final design to minimize visual effects of the Project. For example, guideway materials and surface textures will be selected in accordance with generally accepted architectural principles to achieve effective integration between the guideway and its surrounding environment. Landscape and streetscape improvements will mitigate potential visual impacts, primarily for street-level views.

Other measures to address visual impacts of the Project are being developed through the station design and planning process. The initial station area plans and design guidelines were first developed with coordination between DTS and the Department of Planning and Permitting (DPP). The next level of transit station design focuses on integrating individual neighborhood characteristics of the communities served by the stations.

The following mitigation framework will be included in the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

- Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
- Coordinate the project design with City TOD planning and DPP.*
- Consult with the communities surrounding each station for input on station design elements.*
- Consider specific sites for landscaping and trees during the final design phase when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will serve to mitigate potential visual impacts.*

Section 4.8.3 of the Final EIS, Design Principles and Mitigation includes information related to the mitigation framework described above. Specifically architecture and landscape design criteria include guidelines regarding site design, materials and finishes, and lighting, which apply to stations, station areas, and the guideway.

Ms. Ann F. Nakao
Page 3

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

650 South King Street, 3rd Floor
Honolulu, HI 96813

Dear Mr. Yoshioka:

My comments for the EIS report.

I do have to drive around our city streets every day and almost everywhere I go bumpity bump and it bothers me that our road maintenance is so poor. It bothers me because you think it is nothing to spend these billions of dollars on the train and let our roads go to pot. It also tells me that in the future, our train and stations will not be maintained properly, too. Do you know that San Francisco's Bart is not reliable and that there is millions of dollars maintenance backlog on the BART? Bet this is the scenario for Honolulu too.

We need a billion + dollars for our sewer system to meet EPA standards. I stopped buying locally caught akule for my mother because the skin felt very slimy and the gut was huge, fat, wormy looking. (Returned fish to the store) I dare say that it was caught near the sewer outfall area. Fixing the sewer system is a MUST.

We also must have aging water pipes because we have so many water main breaks. We lose a lot of our good precious water; therefore, we must have a system of replacing these aging pipes.

To maintain our sewer and water system is a PRIORITY. People's health and welfare depends on it.

What I don't like about the train too is that is to be elevated. Plus steel on steel is very much old fashioned. Heavy steel train on elevated tracks is just ugly and very un-Hawaiian.

Most of all it is too big a cost burden for the people of Oahu – even if you get some Federal monies for building it; where is the money for the operating and maintaining coming from? Also where is the money for the acquisition of property coming from? It does not appear that the finances justify this huge, unrealistic expenditure for the City. Your projections for rider ship and finances are skewed like it was on all the huge projects elsewhere.

You know that there are other ways of solving the traffic problem without spending so much money but you are not looking at them. Where is your creativity?

Mahalo and Aloha,
Ruth Nakasone

Dear Ms. Nakasone

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As noted in Chapter 6 of the Final EIS, the funding for the Project is a dedicated source that was authorized by the State Legislature and approved by the City Council for this single use. It does not take funding from other purposes such as road repair, sewers, or other needs. The enabling legislation for the General Excise and Use Tax (GET) surcharge precludes the use of the collected funds for purposes other than a fixed guideway transit system.

Your next comments were regarding the selection of an elevated system. The Alternatives Screening Memorandum (DTS 2006a) recognized the visually sensitive areas in Kakaako and Downtown Honolulu, including the Chinatown, Hawaii Capital, and Thomas Square/Honolulu Academy of Arts Special District. To minimize impacts on historic resources, visual aesthetics, and surface traffic, the screening process considered 15 combinations of

tunnel, at-grade, or elevated alignments between Iwilei and Ward Avenue. Five different alignments through Downtown Honolulu were advanced for further analysis in the Alternatives Analysis, including an at-grade portion along Hotel Street, a tunnel under King Street, and elevated guideways along Nimitz Highway and Queen Street (Figure 2-4).

The Alternatives Analysis Report (DTS 2006b) evaluated the alignment alternatives based on transportation and overall benefits, environmental and social impacts, and cost considerations. The report found that an at-grade alignment along Hotel Street would require the acquisition of more parcels and could potentially affect more burial sites than any of the other alternatives considered. The alignment with at-grade operation Downtown and a tunnel under King Street, was not selected because of the environmental effects, such as impacts to cultural resources, reduction of street capacity, and property acquisition requirements of the at-grade and tunnel sections, which would cost an additional \$300 million.

The Project's purpose is "to provide high-capacity rapid transit" in the congested east-west travel corridor (see Section 1.7 of the Final EIS). The need for the Project includes improving corridor transit mobility and reliability. The at-grade alignment would not meet the Project's Purpose and Need because it could not satisfy the mobility and reliability objectives of the Project (see bullets below). Some of the technical considerations associated with an at-grade versus elevated alignment through Downtown Honolulu include the following:

- **System Capacity, Speed, and Reliability**—The short, 200-foot (or less) blocks in Downtown Honolulu would permanently limit the system to two-car trains to prevent stopped trains from blocking vehicular traffic on cross-streets. Under ideal operational circumstances, the capacity of an at-grade system could reach 4,000 passengers per hour per direction, assuming optimistic five minute headways. Based on travel forecasts, the Project should support approximately 8,000 passengers in the peak hour by 2030. Moreover, the Project can be readily expanded to carry over 25,000 in each direction by reducing the interval between trains (headway) to 90 seconds during the peak period. To reach a comparable system capacity, speed, and reliability, an at-grade alignment would require a fenced, segregated right-of-way that would eliminate all obstacles to the train's passage, such as vehicular, pedestrian, or bicycle crossings. Even with transit signal priority, the at-grade speeds would be slower and less reliable than an elevated guideway. An at-grade system would travel at slower speeds due to the shorter blocks, tight and short radius curves in places within the constrained and congested Downtown street network, the need to obey traffic regulations (e.g., traffic signals), and potential conflicts with other at-grade activity, including cars, bicyclists, and pedestrians. These effects mean longer travel times and far less reliability than a fully grade-separated system. None of these factors affects an elevated rail system. The elevated rail can travel at its own speed any time of the day regardless of weather, traffic, or the need to let cross traffic proceed at intersections.
- **Mixed-Traffic Conflicts**— The Project will run at three minute headways. However, three-minute headways with an at-grade system would prevent effective coordination of traffic signals in the delicately balanced signal network in

downtown Honolulu. A disruption of traffic signal cycle coordination every three minutes would severely affect traffic flow and capacity of cross-streets. Furthermore, there would be no option to increase the capacity of the at-grade rail system by reducing the headway to 90 seconds, which would only exacerbate the signalization problem. An at-grade system would require removal of two or more existing traffic lanes on affected streets. This effect is significant and would exacerbate congestion. Congestion would not be isolated to the streets that cross the at-grade alignment but, instead, would spread throughout Downtown. The Final EIS shows that the Project's impact on traffic will be isolated and minimal with the elevated rail, and, in fact will reduce system-wide traffic delay by 18 percent compared to the No Build Alternative (Table 3-14 in the Final EIS). The elevated guideway will require no removal of existing through travel lanes, while providing a reliable travel alternative. When traffic slows, or even stops due to congestion or incidents, the elevated rail transit will continue to operate without delay or interruption.

An at-grade light rail system with continuous tracks in-street would create major impediments to turning movements, many of which would have to be closed to eliminate a crash hazard. Even where turning movements are designed to be accommodated, at-grade systems experience potential collision problems. In addition, mixing at-grade fixed guideway vehicles with cars, bicyclists, and pedestrians presents a much higher potential for conflicts compared to grade-separated conditions. Where pedestrian and automobiles cross the tracks in the street network, particularly in areas of high activity (e.g., station areas or intersections), there is a risk of collisions involving trains that does not exist with an elevated system. There is evidence of crashes between trains and cars and trains and pedestrians on other at-grade systems throughout the country (e.g., Phoenix, Houston, LA). This potential would be high in the Chinatown and Downtown neighborhoods, where the number of pedestrians is high and the aging population presents a particular risk.

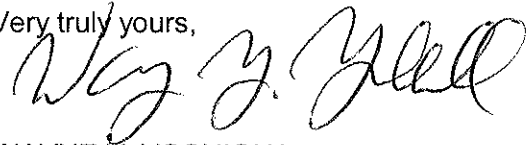

- **Construction Impacts**—Constructing an at-grade rail system could have more effects than an elevated system in a number of ways. The wider and continuous footprint of an at-grade rail system compared to an elevated rail system (which touches the ground only at discrete column foundations, power substations, and station accessways) increases the potential of utility conflicts and impacts to sensitive cultural resources. In addition, the extra roadway lanes utilized by an at-grade system would result in increased congestion or require that additional businesses or homes be taken to widen the roadway through Downtown. Additionally, the duration of short-term construction impacts to the community and environment with an at-grade system would be considerably greater than with an elevated system. Because of differing construction techniques, more lanes would need to be continuously closed for at-grade construction and the closures would last longer than with elevated construction. This would result in a greater disruption to business and residential access, prolonged exposure to construction noise, and traffic impacts.

Because it is not feasible for an at-grade system through Downtown to move passengers rapidly and reliably without significant detrimental effects on other transportation system elements (e.g., the highway and pedestrian systems, safety, reliability, etc.), an at-grade system would have a negative system-wide impact that would reduce ridership throughout the system. The at-grade system would not meet the Project's Purpose and Need and, therefore, does not require further analysis.

Lastly, to address your questions regarding the cost of the Project, the Project costs discussed in Chapter 6 of the Final EIS include the cost of property acquisition. This chapter also describes the financial resources anticipated to be needed to pay for the capital cost of the Project and for ongoing operating and maintenance costs. Capital costs (including property acquisitions) of the Project, including finance charges, are expected to be fully paid for by a combination of FTA Section 5307 and FTA Section 5309 New Starts Funds from the Federal government and revenues from the County GET Surcharge levied from 2007 through 2022 on Oahu. Operating and maintenance costs include costs associated with maintaining the transit system in a state of good repair and will be paid for from the same sources currently used for TheBus: Federal funding, fare revenues, and subsidies from the City's General and Highway Funds. Ridership forecasts follow detailed guidance established by the FTA for this type of project.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

DEPARTMENT OF TRANSPORTATION SERVICES

I am writing on behalf of Paulette Ka'anohiokalani Kaleikini, who has retained the services of the Native Hawaiian Legal Corporation in order to protect *iwi* along the proposed transit corridor from unnecessary disturbance.

The City has failed to provide adequate information on the risks of encountering ancient Hawaiian burial remains (*iwi kūpuna*) in the Draft Environmental Impact Statement despite the clear requirements of the National Environmental Policy Act, section 106 of the National Historic Preservation Act, HRS Chapter 343, HRS Chapter 6E and the Hawai'i Constitution Art. XII § 7. Prior to decisionmaking, the City must have sufficient information to objectively evaluate the impacts of the high-capacity transit system on native Hawaiian burials. With this information the City can reach an informed decision on (a) whether to move forward with the project and (b) how the project can be redesigned or re-routed so that burials are not affected.

Services made possible with major funding from the Office of Hawaiian Affairs.

Ni'iloa. Upright, straight, stately, tall and straight as a tree without branches; sharply peaked, as mountains. Fig., righteous, correct.

The Statutory Scheme for Protecting Iwi Kūpuna. Under the statutory schemes provided by both HEPA, NEPA, and the NHPA, decision-makers must gather the required relevant information that will allow it to *avoid* disturbances of and impacts on preexisting iwi kūpuna, with as much advance information on them so the chances of desecrating them during construction are minimized and ultimately eliminated. A contractor building the rail system should not have to move iwi kūpuna in the midst of construction, if proper investigation and burial identification is completed prior to decisionmaking.

The State Constitution provides that the:

... State shall protect all rights, customarily and traditionally exercised for subsistence, cultural and religious purposes and possessed by ahupua`a tenants who are descendants of native Hawaiians who inhabited the Hawaiian Islands prior to 1778, subject to the right of the State to regulate such rights.

Haw. Const. Art. XII § 7. As such, the State and all its agencies are "required under the Hawaii Constitution to preserve and protect customary and traditional practices of native Hawaiians." *Ka Pa`akai O Ka`aina v. Land Use Comm'n*, 94 Hawai'i 31, 45 (2000). This places the State under "an affirmative duty" to "protect these rights and to prevent any interference with the exercise of these rights." *Id.* In order to fulfill its duty to preserve and protect customary and traditional native Hawaiian rights to the extent feasible, the state and its political subdivisions:

must -- at a minimum -- make specific findings and conclusions as to the following: (1) the identity and scope of "valued cultural, historical, or natural resources" in the ... area, including the extent to which traditional and customary native Hawaiian rights are exercised in the petition area; (2) the extent to which those resources --including traditional and customary native Hawaiian rights -- will be affected or impaired by the proposed action; and (3) the feasible action, if any, to be taken . . . to reasonably protect native Hawaiian rights if they are found to exist.

Ka Pa`akai 94 Haw. at 47; See also HRS §§ 205A-4(a), 205A-2(b)(2) and 205A-5(b).

Under HRS chapter 6E, the Island Burial Councils, consisting of a majority of cultural practitioners sensitive to burial matters, have primary jurisdiction over the fate of the iwi kūpuna at rest in "previously identified" burial sites. HRS § 6E-43; HAR § 13-300-33. On the other hand, if those same burials are "inadvertently discovered" because no archaeological inventory survey identified and located them beforehand, the staff of the SHPD must determine the treatment disposition of these burials. HRS § 6E-43.5; HAR § 13-300-40. The only rational reading of this statute is that the island burial council should be given as much information as early as possible in order to assure the proper treatment of any burial remains which could be impacted by development. Accordingly, the State Historic Preservation Division (SHPD) must assure that the councils get as much timely and complete information on the presence and location of iwi kūpuna as possible, so the council may properly exercise its role.

Moreover, the environmental review process requires in part the completion of a "cultural impact assessment" that is designed to shed light on a full range of issues, including the presence of iwi kūpuna which could be impacted by any development. HRS chapter 343. *The Sierra Club v. State Department of Transportation*, 115 Haw. 299, 319; 167 P.3d 292, 326 (2007), citing *Sierra Club v. Hawai'i Tourism Auth.*, 100 Hawai'i 242, 266, 251, 59 P.3d 877, 886, 901 (2002) (declaring that the main thrust of HEPA is to require agencies to consider the environmental effects of projects before action is taken.) This information should be provided at the earliest practicable time in the development review process. *Id.* at 320, 167 P.3d at 327 (mandating an environmental assessment for such action at the earliest practicable time to determine whether an environmental impact statement is required).

Furthermore, Section 106 of the National Historic Preservation Act of 1966 (Public Law 102-575) mandates, in part:

The head of any Federal agency having direct or indirect jurisdiction over a proposed Federal or federally assisted undertaking in any State and the head of any Federal department or independent agency having authority to license any undertaking shall, prior to the approval of the expenditure of any Federal funds on the undertaking or prior to the issuance of any license, as the case may be, take into account the effect of the undertaking on any district, site, building, structure, or object that is included in or eligible for inclusion in the National Register. . . .

(Emphasis added). 16 U.S.C. 470f.

The implementation of Section 106 therefore mandates that any federal agency providing financial support for any undertaking engage in *advance* consultation with affected native Hawaiian organizations who attach religious and cultural significance to historic properties which may be affected. That consultation must precede any choice of alternatives. See, <http://www.achp.gov/regs-nhos.html> for specific official Advisory Council on Historic Preservation guidance in conforming to these consultation requirements.¹

A History of Desecration. In recent years, hundreds of burials have been disturbed in urban Honolulu – most of them *after* projects have been approved, contrary to legislative intent. Repeatedly, in dozens of construction projects conducted within the Honolulu urban corridor, the SHPD summarily approved commencement of construction without archaeological inventory

¹ In particular, the federal guidelines for this process specifies:

The agency must make a reasonable and good faith effort to identify Native Hawaiian organizations that might attach religious and cultural significance to historic properties in the area of potential effects and invite them to be consulting parties.

...
The agency consults with Native Hawaiian organizations to develop and evaluate alternatives to avoid, minimize, or mitigate adverse effects.

surveying in advance. For example, as the SHPD argued in a legal challenge to its handling of the construction of the Keeaumoku Wal Mart store,

... Because the probability of historic sites including burials in the area was low, the State did not recommend any further archeological work for the project. ... Because of the history of this area, land use, environmental data, and the low incidence of burials in surrounding and nearby areas, this project was treated the same as numerous other projects in the nearby and surrounding areas. See Declaration of Sara Collins.

Hui Malama I Na Kūpuna O Hawai'i Nei v. Wal-Mart, Civ. No. 03-1-1112-05 (1st Cir. Ct. 2003), Defendants State of Hawaii, Department of Land and Natural Resources, State Historic Preservation Division, Peter Young, and Holly McEldowney's Memorandum in Opposition to Plaintiffs' Motion for Preliminary Injunction filed June 20, 2003 (hereafter, "2003 SHPD Memo"). In 2003, the SHPD, and developers in general whose projects it reviewed, repeatedly and systematically allowed minimal archaeological review of areas such as the Keeaumoku Wal Mart site, under the mistaken presumption that no burials were likely to be present in such circumstances. This approach was egregiously wanting in terms of protecting these public trust resources.

Following this time period, officials at the State Historic Preservation Division belatedly recognized that its previous presumption that no further archaeological survey work in the Honolulu urban corridor was necessary due to prior ground disturbances might be false, given a pattern of unexpected disturbances:

21. According to SHPD records, between 1986 and 2002, in the areas from River Street to Keaumoku Street, and from Nimitz and King Street, 308 human burials have been found on twenty-six different project sites. Five burials in two projects were preserved in place, and 303 burials were relocated.

22. The 303 burials that were relocated include all of the remains that could have been considered a concentration such as 116 burials found during archeological monitoring of the Queen Street widening project near Kawaihao Church Cemetery, or the 11 burials (of 25 total relocated) from the Honuakaha Smallpox Cemetery that were found during an inventory survey conducted for the Brewery/Honuakaha development project.

Declaration of Sara Collins, attached to 2003 SHPD Memo. Thus, according to the SHPD, its own data confirmed that hundreds of iwi kūpuna had been systematically disturbed by construction activity within the Honolulu urban corridor for 16 years because of the failure to require advance archaeological inventory surveying. The SHPD allowed the vast majority, 303 of the 308 remains, to be relocated. The mistaken presumption was that prior ground disturbing construction activity within this urban corridor obviated the need to look further.

Simultaneously, the City and County of Honolulu avoided professional reviews of sites targeted for development by failing to submit proposed permits to the SHPD for professional review and comment as required under HRS § 6E-42. These failures to implement that statute are currently on appellate review by the Hawai'i Supreme Court. Appellate review was necessitated by the City's refusal to reasonably interpret its trust obligations to request review and comment from the SHPD under that statute. The City contends that, notwithstanding its total lack of expertise in the area, its own unilateral assessment of the potential impact on iwi kūpuna of pending permit applications is all that is required.

Usurpation of the Role of the Burial Council. Most disturbing, this pattern of relying on prior ground disturbances to relax more rigorous archaeological analysis has sadly resulted in other more serious procedural consequences. Had properly conducted archaeological surveys identified and located burials in advance of construction, the work of the O'ahu Island Burial Council could begin in earnest and with the luxury of time to process all the information, in advance of any pressured environment once construction starts. This would provide iwi kupuna with the dignity and respect they clearly deserve.

Accordingly, the failure to rigorously attempt to identify and locate iwi kūpuna so they are categorized as "previously identified" resulted in the transfer of power and accountability for protecting burials from the island burial council, consisting primarily of cultural practitioners sensitive to burial concerns, to the professional archaeological staff at the SHPD, which is less equipped to deal with the cultural appropriateness of these issues and are saddled with the pressure placed on them by the relationships between state administrative officials and developers. Moreover, when "inadvertently discovered" iwi kūpuna are subject to disposition determination by the SHPD staff, it technically has only 2-3 days to make that determination, typically under the financial pressures facing the developer who must otherwise halt construction. In contrast, the island burial council typically has 90 days to act on a "previously identified" burial site, after it has had a chance to identify cultural and lineal descendants notified of the presence of burials in an area. This extended period and less pressured atmosphere allows for better decisions on often sensitive and contentious matters.

Lessons Learned. This systemic desecration of iwi kūpuna for at least 16 years (and probably longer) apparently caught no one's attention until the Wal Mart litigation, and then subsequently in the legal challenge to the SHPD's handling of the General Growth Properties construction of the future Whole Foods store site and planned condominium complex at its nearby Auahi Street properties. *Kaleikini v. Young*, Civ. No. 07-1-0067-01 RKOL (1st Cir Ct 2006).

During the *Wal Mart* litigation, the SHPD suggested it acknowledged lessons from its past failings in summarizing the data it had been accumulating:

8. The nature and extent of prior ground disturbance and development may be a reliable indicator of the probable presence or absence of subsurface historic sites. If

prior buildings or structures have not had deeply excavated foundations or pilings, or if there has been little or no prior installation of such features as underground storage tanks or wastewater systems, it is more likely that historic sites, including human burials, are still present below the ground surface.

9. With regard to underlying soil characteristics, there is generally a higher probability of subsurface historic sites, including human burials, in areas underlain by sand deposits.

10. Historical data - such as, inter-alia, early written accounts or records, maps, and Mahele information - can indicate the potential for subsurface historic sites, if the subject parcel has not undergone substantial, subsequent modification.

11. Previous archeological work - including inventory survey, data recovery, and monitoring - provides valuable information on the probable presence or absence of subsurface historic sites. Archeological reports on such work normally contain descriptive data of any historic sites found, and include stratigraphic profiles of the buried cultural layers and underlying soil deposits.

Declaration of Sara Collins, attached to 2003 SHPD Memo. These same lessons bear on the current proposed construction of the Rail Transit system.

There is a growing body of knowledge and information about the presence and location of iwi kūpuna along the contemplated rail transit route. The City needs to conscientiously search for and obtain as much advance information on the location of iwi kūpuna along its entire route as early as possible to effect reasoned decision-making on the routing of the system. It should not be swayed by previous ground disturbances that do not impact subsurface features, like iwi kūpuna. It should be conscious of the presence of sand deposits anywhere developments are proposed. It should review the growing knowledge base from past projects which have unearthed burials and build upon that material and information.

Need for Correction. The failure to follow the law has already disrupted hundreds of what should have been "previously identified" burials in the urban corridor between River and Keaumoku Streets. These are properties which have immense religious and cultural significance to Hawaiians. Had the statutes been followed, subsequent construction activity should never have "inadvertently discovered" these burials and forced their relocation. Repeating these same mistakes with the planned mass transit construction will undermine state and federal statutes designed to protect historic properties of this sort.

Given the high likelihood that burials are located along the route of the proposed transit corridor, clearly past practices must change. The law and the importance of protecting the dignity of these burials require no less.

In short, well in advance of any planning and design decisions, the City should perform an archaeological inventory survey, including subsurface testing, of all areas where (1) stations could be located (b) support pillars could be located and (c) existing underground infrastructure will be moved. It is highly inappropriate and offensive to iwi kupuna and native Hawaiians to delay such testing until after decisionmaking. The information generated AFTER such surveys must and should be included in any DEIS, in order to give the public, interested Hawaiian organizations, and individuals the opportunity to comment on it. Under HEPA, NEPA, and HRS chapter 6E, this information is needed now to ensure that an informed decision is made. Additionally, any delay could jeopardize federal funding because of failure to comply with Section 106 of the NHPA, particularly in developing alternatives to the transit routing.² Federal guidelines would restrict taking any action that fails to account for the views of affected native Hawaiian organizations.

In fact, page 4-143 of the DIES states "Native Hawaiian testimonies in Land Commission Award claims indicate that there are documented burials within the study corridor." By acknowledging it has this information, the City is duty-bound to suspend its current approach and comply with the statutory schemes designed to protect these historic properties of religious and cultural significance to so many Hawaiians. Much more advance investigation and surveying is required before any DEIS is made public for comment.

In truth, the contemplated action in the DEIS has it backwards. On page 4-163, the DEIS reads, "Prior to construction, additional archaeological work would be completed to investigate the potential for sub-surface deposits. This additional work would focus on locations of columns, once they are known." Contrary to this proposed approach, the City must first investigate and generate information regarding burial sites so that the City will not locate columns, stations and other underground work where known burial sites are identified and located.

Moreover, the City cannot and should not avoid information that would help locate and identify such historic properties. Instead, it should affirmatively and aggressively attempt to . .

² Specifically, the Advisory Council on Historic Preservation requires, in part, the development of alternatives in consultation with native Hawaiian organizations:

Involvement of Native Hawaiian organizations in the development of program alternatives

- The agency must consult with affected Native Hawaiian organizations in the development of program alternatives.
- If a program alternative may affect historic properties of religious and cultural significance to a Native Hawaiian organization, the agency shall identify those organizations and consult with them.
- The agency and ACHP must take into account the views of Native Hawaiian organizations in reaching a final decision.

See, Advisory Council on Historic Preservation at: <http://www.achp.gov/regs-nhos.html>.

gather it so complete information is available to generate alternatives, as contemplated under the Section 106 process. The City should also include all this information in this version of the DEIS. Its omission denies affected native Hawaiian organizations the opportunity to be truly engaged and involved in consulting with the applicable federal agency so that these organizations can have a substantive role in the alternatives developed. If it ignores the omitted information, the City will be proceeding down a treacherous path that can only lead to unnecessary delay and cultural conflict.

Ms. Kaleikini has additional concerns about the completeness of the DEIS and urges the City to address these points as follows:

- The DEIS includes no meaningful information regarding the impact on burial sites or any discussion regarding alternatives to affecting these sites. This information is crucial to any development of alternatives as required by federal law.
- Section 4.1 of the DEIS regarding existing land uses should explicitly recognize that burial sites are an existing land use along this corridor.
- Section 4.3 of the DEIS should discuss whether the City plans to displace and relocate existing burial sites and give details about the timing, location and process related to each of these relocations and displacements.
- Section 4.6 of the DEIS should note that desecration – including the relocation – of existing burial sites – is an issue of environmental injustice. The DEIS should, as such, discuss the impact of continuing the pattern set by previous developments, especially in the Honolulu urban core, as outlined above.
- Section 4.17 should be revised in the same manner sections 4.1, 4.3 and 4.6 should be.

Most importantly, these sections of the DEIS need to be amended to identify where burial sites may be so that stations, pillars and underground infrastructure work can be proposed in areas that will not affect burial sites. The need for developing alternatives is crucial and affording affected native Hawaiian organizations the ability and the opportunity to consult on these alternatives is essential. Without the supporting information to allow for a discussion of alternatives, the DEIS is fatally flawed.

Sincerely,

Camille K. Kalama
Attorney for Ms. Kaleikini

Dear Ms. Kalama:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

In your letter, you raise various issues specifically and generally. Your overarching concern appears to be related to the possibility that the Project may encounter native Hawaiian burials, the process that DTS followed regarding these resources, and whether sufficient information has been provided to decision makers regarding these resources. The following discussion addresses these concerns and others raised in your letter. In your letter, you also provided a bullet-point list of specific recommendations. Those are addressed on the last page of this letter.

The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The identification of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative. 23 CFR § 771.125 (a)(1). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261,

identifying the Airport Alternative as the Project to be the focus of the Final EIS. Chapter 2 of the Final EIS describes this identification process. The Final EIS also includes additional information and analyses, as well as minor refinements to the Project that were made to address comments received from agencies and the public on the Draft EIS.

The purpose of the Project is to provide high-capacity rapid transit in the highly congested east-west transportation corridor between Kapolei and UH Mānoa, as specified in the O'ahu Regional Transportation Plan (O'ahu MPO 2007). See Sections 1.7 and 1.8 of the Final EIS. The need for the Project is based on the following goals: Improve corridor mobility, Improve corridor travel reliability, Improve access to planned development to support City policy to develop a second urban center, and Improve transportation equity.

As discussed in Section 2.5.10 and shown in Figure 2-41 of the Final EIS, DTS proposes constructing the Project in four phases East Kapolei to Pearl Highlands, Pearl Highlands to Aloha Stadium, Aloha Stadium to Middle Street, and Middle Street to Ala Moana Center. As shown in Figure 2-42 of the Final EIS, each construction phase will start in the following years 2010, 2011, 2012, and 2013, respectively. As discussed below, an archaeological inventory survey (AIS) will be completed for each phase prior to construction, as stipulated in the Project's Programmatic Agreement (PA), prepared pursuant to Section 106 of the National Historic Preservation Act of 1966 (NHPA). See Section 5.4 of the Final EIS. An AIS has already been completed for the first construction phase between East Kapolei and Pearl Highlands in consultation with the State Historic Preservation Division (SHPD) and the Oahu Island Burial Council (OIBC).

The Project is unlike the facts in Hui Malama I Na Kupuna O Nei v. Wal-Mart, 223 P.3d 236 (Haw. Ct. App. 2009), cert. rejected, 2010 WL 1973594, May 17, 2010, which you cited in your letter. In that case, the Intermediate Court of Appeals (ICA) of the State of Hawaii affirmed the trial court's holding. The trial court held that the City Department of Planning and Permitting's (DPP) determination that a property slated for construction of a Wal-Mart and Sam's Club was not likely to affect historic property or burial sites; and therefore, DPP did not need to consult with SHPD prior to issuing grading and grubbing permits under HRS § 6E-42. DPP's determination was based on a review of its comprehensive computer database of historic sites and known burials, and knowledge that the Wal-Mart/Sam's Club property had been extensively developed and used for commercial and industrial purposes for over fifty years. The Project is doing much more than what the ICA allowed in Hui Malama. Unlike Hui Malama, the Project has already conducted archaeological and cultural reports, as discussed below. In addition, the Project will conduct an AIS prior to each construction phase. The City has consulted with, and continues to consult with, SHPD and OIBC. Any native Hawaiian burials discovered during the AIS will be treated as previously identified burial sites. This ensures that OIBC remains intimately involved in any discussion related to the treatment of native Hawaiian burials.

Under HRS § 6E-42, the provision you cite in your letter, the City must consult with SHPD prior to the issuance of state or county land use entitlements if the Project "may affect historic property . . . or a burial site." In addition to the studies already prepared and the consultation with SHPD and OIBC already conducted and ongoing, the City will conduct an AIS for each construction phase of the Project. As discussed herein, this is the best approach for identifying native Hawaiian burials that may be affected by the Project. During the NEPA and Section 106 process, the FTA limits the level of design and engineering that project sponsors

can conduct on their projects so as to not prejudice the consideration of alternatives, including the no action alternative. Consequently, the placement of column foundations is a design activity that requires a level of design that typically takes place after the NEPA and Section 106 processes conclude. To balance the current level of project design, the desire to limit disturbance of native Hawaiian burials and residences in Phase IV of the project area, and the potential transportation benefits that would accrue from the proposed Project, a detailed approach for conducting archaeological investigations for Phase IV for the Project was developed in the PA. As part of the Section 106 consultation process and preparation of the PA, there was extensive consultation with various parties including the following: OIBC, the Office of Hawaiian Affairs, Hui Malama in Na Kupuna O Hawaii Nei, the Royal Order of Kamehameha, the Ahahui Kaahumanu, the Daughters and Sons of the Hawaiian Warriors, the Association of Hawaiian Civic Clubs, the Ahahui Siwila Hawaii O Kapolei, the Alii Pauahi, the Ewa-Puuloa Hawaiian Civic Club, the Honolulu Hawaiian Civic Club, the King Kamehameha Hawaiian Civic Club, the Kalihi-Palama Hawaiian Civic Club, the Pearl Harbor Hawaiian Civic Club, the Merchant Street Hawaiian Civic Club, the Nanaikapono Hawaiian Civic Club, the Princess Kaiulani Hawaiian Civic Club, the Waianae Hawaiian Civic Club, the Wahiawa Hawaiian Civic Club, and the Waikiki Hawaiian Civic Club.

DTS recognizes in Figure 4-73 of the Final EIS that the area of the Project with the highest likelihood of encountering native Hawaiian burials is in Phase IV. The proposed schedule for starting Phase IV construction is 2013. Although the development of more detailed design, and therefore archaeological investigations, for the last construction phase would have typically been delayed until closer to the anticipated construction start date, DTS has committed to starting the process much earlier. As stated in the PA,

Within 60 days of execution of this PA, the City shall consult with the OIBC, lineal and cultural descendents, and other interested parties that are identified in discussion with OIBC, about the scope of investigation for the AIS Plan for construction of Phase 4. The City shall provide Preliminary Engineering plans and existing utility maps to assist in the scoping process. The AIS Plan will provide for investigation of the entire Phase 4 area, including from Waiakamilo Road to Ala Moana Center. In the portion of Phase 4 with the greatest potential for resources, the AIS Plan will evaluate all areas that will be disturbed by the Project. The AIS Plan will include a review of historical shoreline location, soil type, and, where indicated by conditions, the survey measures listed in Stipulation III.C, including subsurface testing, for each column location, utility relocation, and major features of each station and traction power substation location based on Preliminary Engineering design data.

The plan developed through this consultation would need to be submitted to SHPD within four months of execution of the PA. Archaeological investigations would start after SHPD approves the plan within 30 days of receipt. The City would be required to complete the archaeological investigations during a period of time where there is still flexibility in project design. In addition, within six months of the execution of the PA, the City, in coordination of the OIBC, shall complete a draft protocol for consultation regarding treatment of any native Hawaiian burials identified during the AIS. The protocol would also include a workflow of avoidance alternatives, which might include the relocation of columns, change in column design from a center alignment to a straddle bent or other alternatively supported design, modification of span length, and alternate utility locations.

The Final EIS discussion on native Hawaiian burials was compiled in good faith and sets forth sufficient information to enable the decision maker to make an informed decision regarding the significant impacts on the environment, including native Hawaiian burials and cultural resources, as discussed in Section 4.16 of the Final EIS entitled, Archaeological, Cultural, and Historic Resources. The evaluation of impacts to native Hawaiian burials discussed in the Final EIS is supported by various studies including the Honolulu High-Capacity Transit Corridor Project Archaeological Resources Technical Report (RTD 2008n), the Honolulu High-Capacity Transit Corridor Project Historic Resources Technical Report (RTD 2008o), the Honolulu High-Capacity Transit Corridor Project Cultural Resources Technical Report (RTD 2008p), the Honolulu High-Capacity Transit Corridor Project Addendum 01 to the Historic Resources Technical Report (RTD 2010), and the Honolulu High-Capacity Transit Corridor Project Historic Effects Report (RTD 2009d). All technical reports referenced in this letter and in the Final EIS are available from DTS and on the Project website at www.honolulutransit.org.

Identification and protection of native Hawaiian burials was carried out in the Cultural Resources Technical Report, dated August 1, 2008, prepared for and referenced in the Draft and Final EISs. The Cultural Resources Technical Report was prepared by Lani Ma'a Lapilio. Ms. Lapilio earned her juris doctorate and is the former Principal of Ku'iwalu, a Native Hawaiian business specializing in cultural resource compliance, community outreach, and public affairs. Her former positions include executive director of the Judiciary History Center and legal counsel for the Office of Hawaiian Affairs, Native Hawaiian Historic Preservation Council. Ms. Lapilio currently serves as the Hawai'i Advisor to the National Trust for Historic Preservation and is the at-large member on the National Trust's Executive Committee. The Cultural Resources Technical Report was prepared in large part to identify traditional and customary practices of native Hawaiians within the project area. The extensive efforts to identify, contact, and consult with individuals, organizations, and agencies specifically sought to develop data on native Hawaiian burials and native Hawaiian burial concerns. See, e.g., Cultural Resources Technical Report at Sections 4.3.2, 5.2.1, and 5.2.4. Several cultural informants provided information regarding native Hawaiian burials. See, e.g., Cultural Resources Technical Report at F-4, F-8 (comments of Louis Agard, Jr.), F-10 (comments of Claire Pruet); and F-24, F-25 (comments of Shad Kane). Land documents were examined to identify any accounts of native Hawaiian burials. See, e.g., Cultural Resources Technical Report at 5-7, H-5, and H-6.

The Archaeological Resources Technical Report, dated August 15, 2008, prepared for and referenced in the Draft and Final EISs, lists burials as the first category of resources to be identified. See, e.g., Archaeological Resources Technical Report at S-1, Table S-1, and Section 3.4. The Archaeological Resources Technical Report identifies (Section 6.2) a number of steps to protect native Hawaiian burials, including a multi-step approach of: (1) preparation of an Archaeological Inventory Survey Plan, (2) use of Ground Penetrating Radar, (3) completion of an Archaeological Inventory Survey, (4) Archaeological Data Recovery (as appropriate), and (5) an Archaeological Monitoring Program (to begin with an Archaeological Monitoring Plan). Each of these additional archaeological studies is to be reviewed and accepted by SHPD prior to groundbreaking for each construction phase. See Archaeological Resources Technical Report at Section 3.5.2.

Even prior to the preparation of the EIS, efforts to address the possibility of encountering native Hawaiian burials began during the Alternatives Analysis phase of the Project. As discussed in Chapter 2 of the Final EIS, environmental factors that were considered during the Alternatives Analysis phase included land use and economic activity, displacements,

neighborhoods and communities, farmlands, visual and aesthetic resources, air quality and energy, noise and vibration, water resources, natural resources, and cultural, historic, and archaeological resources. During the Alternatives Analysis phase, the City consulted with SHPD regarding historic properties and evaluated the likely effect to historic properties of each alternative. The outcome is documented in the Honolulu High-Capacity Transit Corridor Project Alternatives Analysis Historic and Archaeological Technical Report (DTS 2006e). The Federal undertaking was defined by selection of the Locally Preferred Alternative (LPA). Following the selection of the LPA, the City and FTA initiated consultation under Section 106.

The Archaeological Technical Report, dated August 28, 2006 (see Pages 2 and 3), was prepared to support the Alternatives Analysis and specifically evaluated potential impacts to burials and the potential impact of various proposed alternatives summarizing the available information pertaining to the previous identification of burials. See, e.g., Archaeological Technical Report at 4-1, 4-2, 4-11, 4-13, 4-14, 4-15, 4-25, 4-27, 4-28, 4-41, 4-43, 4-44, 4-51, 4-53, 4-54, 4-56, 4-61, 4-62, and 4-64 to 4-75. The data on the presence of native Hawaiian burials was a specific category of analysis taken into consideration in route and alternative selection. See, e.g., Archaeological Technical Report at 5-94, 5-96, 5-97, 5-99, 5-101, 5-102, 5-104, 5-105, 5-106, 5-108, 5-112, 5-113, 5-114, 5-116, 5-123, and 5-133. This study took into account available data on soil types, previously recorded archaeological resources, historic land records, and previously recorded burial locations.

The City specifically evaluated potential impacts to burials and specifically evaluated the potential impacts of various proposed alternatives in consideration of the data provided in the Archaeological Technical Report dated August 28, 2006. Follow-through with and implementation of the approaches listed in the Archaeological Resources Technical Report and summarized above will provide the City with information on the risks of encountering native Hawaiian burials prior to the beginning of the construction work. The preparation of the Cultural Resources Technical Report for the Draft EIS and the extensive and continuing consultation with native Hawaiian individuals, groups, and agencies has been a good faith effort to assess cultural impacts.

As you have noted, Land Commission Award (LCA) claims associated with the Project corridor indicate the possibility of burials within the project corridor—specifically in two cases. In the case of LCA 247 to Charles Kanaina, this is a vast alii claim involving many lands; and it in fact appears most likely that the burials referred to were in a former alii mausoleum on the grounds of the present Iolani Palace (well away from the project corridor). In the second case, LCA 30 to Kahoowaha, it appears there were two apana located mauka of Nimitz Highway between Kekaulike Street and Maunakea Street. Our studies to date indicate that one of the two LCA 30 apana did indeed have a narrow flaglot extension as far south as the Nimitz Highway right-of-way. This general area has indeed been associated with a number of burial finds. We certainly agree that this specific area of LCA 30 extending to Nimitz Highway merits consideration of avoidance. Certainly, intensive subsurface testing well in advance of construction in the vicinity will be in order to allow for relocation of column foundations away from any sensitive areas.

In addition to the issues raised in your letter, we address your bullet-point suggestions as follows:

- The Final EIS includes information regarding the impact of the Project on burial sites and a discussion on how to avoid those sites if encountered, as discussed above. Based on the various studies identified above, no cemeteries or known burial sites will be affected by the Project. However, the City does recognize the likelihood of encountering native Hawaiian burials in certain areas of the Project. As discussed above, pre-construction AISs for each construction phase will allow the Project to identify native Hawaiian burials during final design and prior to construction for each construction phase.
- Section 4.1 of the Draft EIS, is now Section 4.2 of the Final EIS. This section describes the existing land uses, including farmlands, development trends, and long-term plans for the study corridor. It also evaluates the Project's consistency with the long-term plans for the study corridor. Your concern regarding the identification of native Hawaiian burial sites is addressed in Section 4.16.2 of the Final EIS, which identifies three general categories of archaeological resources that could be affected: burials, pre-contact archaeology, and post-contact archaeology. These resources are shown by area and rated by probability of occurrence in Figure 4-73 of the Final EIS.
- Section 4.3 of the Draft EIS is now Section 4.4 of the Final EIS. This section documents the effects on properties from necessary right-of-way acquisition for the Project. Your suggestion that this section should "discuss whether the City plans to displace and relocate existing burial sites and give details about the timing, location and process related to each of these relocations and displacements" is unrelated to property acquisition described in Section 4.4. However, the following language was added to 4.16.1 of the final EIS:

*"The City will develop an archaeological inventory survey (AIS) plan for the APE for each construction phase in accordance with 36 CFR 800.4, which allows for phased identification of archaeological resources to limit disturbance of potential resources during the investigation. The City will use PE plans to focus the investigation in locations where there is the potential to affect archaeological resources by project construction. The AIS plans will follow the requirements of HAR Chapter 13-276. The City will conduct the archaeological fieldwork as presented in the AIS plan for each construction phase. The archaeological fieldwork will be completed in advance of the completion of final design so that measures to avoid and/or minimize adverse effects to the historic properties can be incorporated into the design. **The O'ahu Island Burial Council will have jurisdiction to determine the treatment of previously identified Native Hawaiian burial sites in accordance with HAR Chapter 13-300. Any 'iwi kupuna (Native Hawaiian burials) discovered during the AIS shall be treated as previously identified burial sites.**"*

(Emphasis added.) Under HRS § 6E-43(b), the OIBC has jurisdiction to "determine whether preservation in place or relocation of previously identified native Hawaiian burial sites is warranted[.]"

- Section 4.6 of the Draft EIS is now Section 4.7 of the Final EIS. While the City is sensitive to the issues related to native Hawaiian burials, it is not an issue of

environmental injustice. Hawaii's burial laws and federal historic preservation laws (for burials that qualify for the National Register of Historic Places) allow development in areas where native Hawaiian burials are located subject to the procedural requirements of those state and federal regulations. As discussed above and in the Final EIS, the City has made a good faith effort to avoid, minimize, and mitigate impacts to areas where native Hawaii burials may be present throughout the EIS preparation process and will continue to avoid, minimize, and mitigate impacts during final design.

- *In your last bullet-point, you state "Section 4.17 should be revised in the same manner sections 4.1, 4.3 and 4.6 should be." The Draft EIS did not have a Section 4.17, but we assume you mean Section 4.15 of the Draft EIS, entitled, Archaeological, Cultural, and Historic Resources. Section 4.15 of the Draft EIS is now Section 4.16 of the Final EIS. Since you have not specified your concerns regarding Section 4.16, here are some of the general changes we made to that section based on comments and continued consultation:*

The Area of Potential Effects (APE) was reevaluated following publication of the Draft EIS as a result of ongoing Section 106 consultation. The Historic Effects Report (RTD 2009d) was completed, and the FTA accepted the effect determination recommended by SHPO. The effect determinations of the 81 historic resources are presented; the discussion of Section 106 consultation has been updated; and mitigation was added in accordance with the signed PA. In addition, this section included additional discussion on Act 50, which requires a HRS Chapter 343 EIS to "include the disclosure of the effects of a proposed action on the cultural practices of the community and State." This section also included consideration of the Hawai'i Supreme Court decision in Ka Pa'akai, which you cited in your letter, wherein the Court held that native Hawaiian rights are a subset of culture protected by Act 50. Cultural resource assessment and findings are based in part on the Cultural Resources Technical Report (RTD 2008p).

The extensive and ongoing advance consultation with native Hawaiian individuals, groups, and agencies is in keeping with the letter and spirit of the NHPA and Section 106. As you know, a standing sub-committee of the OIBC has been established with consultation ongoing monthly. In addition, as discussed above, AIS investigations have begun. The AIS program is ongoing and will be taken into account in final plans prior to construction.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Submission Method : Website
Other Submission Method :
Submission Date : 12/06/2008
Submission Content/Notes : I believe that construction of the project should start in Honolulu and be built towards the far end terminus. This will permit immediate use by commuters as segments are completed. I believe the Kapolei-Waipahu segment which be largely unused until the system is built out to Honolulu. If the base yard is absolutely critical, then construction should start at both ends and connect at some point.
I also support the airport route instead of going through Salt Lake. And the closer the route comes to Pearl Harbor and Hickam, the better. There are too many workers in the Pearl Harbor/Hickam complex to be ignored. And the airport and surrounding industrial area are also major employers.
Finally, If there is any way whatever, the link to UH should be included in the initial phase. We all are familiar with the significant reduction of traffic when UH is not in session. And there are a number of private schools in the area that further contributes to our traffic problems.

Dear Mr. Nelson:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*

- *Reduce the time that each area will experience traffic and community disturbances.*
- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*
- *Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- *Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

As also discussed in Chapter 2 of the Final EIS, park-and-ride lots are planned at East Kapolei, UH West Oahu, Pearl Highlands, and Aloha Stadium. These stations have been identified as having the highest demand for drive-to-transit access.

Your preference for the Airport Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been identified as the Preferred Alternative as described above. As compared to the other alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly lower impacts to the natural and built environment. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative.

The Alternatives Analysis phase, which preceded the EIS process, is documented in Chapter 2 of the Final EIS. It evaluated a range of modal and general alignment alternatives, in terms of their costs, benefits, and impacts. The scoping process for the Alternatives Analysis involved a presentation of the viable alternatives to the public and interested public agencies and officials to receive comments on the Purpose and Need, alternatives, and scope of the analysis. Scoping for the EIS followed the FTA process that provides for a culling of alternatives studied in the EIS through an Alternatives Analysis. The scoping process initiated for the Alternatives Analysis included a variety of highway, bus and fixed guideway options for consideration. During the later scoping effort for the EIS, the public was requested to propose alternatives that would satisfy the purpose and need at less cost or with greater effectiveness,

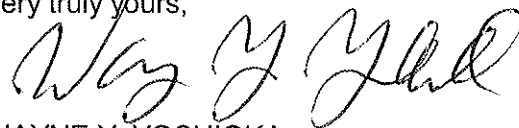

less environmental or community impact and to propose alternatives that were not previously studied and eliminated for good cause. The only alternative that emerged that met these criteria was a fixed-guideway alternative following several alternative alignments. All reasonable alternatives that emerged from these processes were ultimately evaluated in the Draft and Final EISs.

Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts, and mitigation commitments.

At this time, expected funding is not sufficient to complete the extension to UH Manoa. The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The proposed future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of this Final EIS. However, the future extensions are not part of this Project, thus they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and the NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in this Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time. Bus service between Ala Moana Center and Waikiki and UH Manoa will be enhanced until those extensions are built.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Dear Mr. Neumann:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

Your comment has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section

Submission Content/Notes : The O'ahu Invasive Species Committee is concerned that the massive amount of construction equipment and materials that will be imported to the island may harbor species that do not currently occur on O'ahu and may become invasive. Dirty construction equipment is a known pathway for plant, animal and invertebrate invasive species. However, there is an easy way that the City and County of Honolulu can protect the island from these threats. The City can include in the Request for Bids specifications, a requirement that the winning bidder ensure any construction equipment or material imported to O'ahu from the mainland, neighbor islands or foreign countries be free of dirt, vegetative matter, insects and animals.

There are precedents for this action. The Hawai'i Department of Transportation has included such specifications in the Request for Bids for North-South Road. Australia and New Zealand, two policy leaders in invasive species prevention, require any equipment imported into their country be free of dirt and vegetative matter. Dirty equipment is sent back to its country of origin at the shipper's expense.

By requiring the chosen construction company to ensure that equipment and materials are clean, the City and County of Honolulu will save money in control efforts later.

Invasive species on construction equipment is a real threat. Seeds, vegetative matter, insects, and even small animals could be accidentally transported to O'ahu on large vehicles and harm our watersheds, local agriculture, environment and way of life. Invasive species such as pampas grass and Red Imported Fire Ant cost mainland taxpayers millions of dollars each year in control efforts. Requiring the companies constructing the light rail system to clean their equipment before they bring it to O'ahu will be a progressive and cost-effective step towards protecting our island from invasive species.

The O'ahu Invasive Species Committee would be happy to assist in any way the crafting of language to insert a clean-vehicle specification into the Request for Bids. Please call me at 292-6691 or email at rneville@hawaii.edu, should you have any questions about this comment. I have also mailed a hard copy to the Department of Transportation Services.

Dear Ms. Neville:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

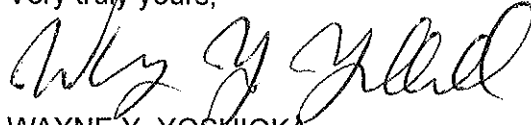

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

The introduction of invasive species to Oahu is a concern and has been addressed in the Final EIS. The Hawaii Department of Transportation (HDOT) developed construction specifications for Invasive Species Management Section 665 for North-South Road. Once adopted by HDOT as a standard specification, the Project will comply with it. Criteria for cleaning, inspecting, and treating plants that are at risk of harboring pests will be part of the landscaping requirements for the Project. Species that can be harmful invaders or contribute to existing problems will not be used for project plantings. Construction specifications will state that construction equipment from other parts of the island or other counties will have to be washed before being brought to the project site.

Ms. Rachel Neville

Honolulu High-Capacity Transit Corridor Project

Welcome to the Honolulu High-Capacity Transit Corridor Project's Public Hearing for the Draft Environmental Impact Statement/Section 4(f) Evaluation.

This public meeting and hearing has been designed to inform the public about the transit project, explain materials contained in the Draft EIS, answer questions from the public, and collect public input on project issues related to the Draft EIS, Section 106 of the National Historic Preservation Act, Section 4(f) of the U.S. Department of Transportation Act, and floodplains affected by the project.

Please review the project information and ask project staff any questions about the project that you might have. The Draft EIS is available on the project website at www.honolulutransit.org.

You may provide official comments in several ways. Here at this Public Hearing you may provide oral comments to a court reporter who will record them for the record or use this form to provide written comments. After the meeting, you may provide an on-line comment at www.honolulutransit.org or use this form to send a written comment to the Department of Transportation Services. All comments must be postmarked or received by January 7, 2009 in order for them to be included in the Final EIS.

Comment(s): I personally have been opposed to the rail system as planned.
I feel it detracts from our Islands natural beauty, blocking mountain + ocean views
Perhaps it could utilize our original rail system on the ground of which we have tracks
that remaining in some areas plus a train depot still standing right down town.
Then I discovered the system plans to go down the middle of my narrow street
right in the front of my apartment residence. I am already awoken by our city
garbage pickups 4:00 am plus in the morning with their trucks whirling their bodies
beeping which I don't understand as there is no order prefer to signal at that hour.
They say that was Heleluaniwa St. chosen to go from downtown Honolulu to
Kona St. at the Ala Moana Mall - wouldn't it make more sense + more scenic
to go down a wide street on Ala Moana Blvd where it could go down the center of
the street not disrupting any residences or businesses, etc or even on the Mahele
 (over)

side of the street not cluttering as many businesses make as well as providing the redesign a more scenic ride. (Review easier access to stations in the future)

Also I'd like to point out the cost projected is not realistic in the present day or the accelerating future. Please show an estimate that hasn't even been considered as security & so much more.

I pray you will consider these recommendations in future planning.

Thanks for leaving my concerns,

[Signature]

Dear C. Newman:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your preference for the No Build Alternative has been noted. The No Build Alternative does not address the Project's needs or meet its purpose as established in Sections 1.7 and 1.8 of the EIS. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft

EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The island's unique visual character and scenic beauty were considered in the visual and aesthetic analysis presented in the Draft and Final EISs. As discussed in Section 4.8 of the Final EIS, the Project will be set in an urban context where visual change is expected and differences in scales of structures are typical. The following measures will be included with the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

- Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
- Coordinate the project design with the City's transit-oriented development program within the Department of Planning and Permitting.*
- Consult with the communities surrounding each station for input on station design elements.*
- Consider specific sites for landscaping and trees during Final Design when plans for new plantings will be prepared by a landscape architect.*

DTS will consult with the communities surrounding each station for input on station design elements. The Project will provide users, including tourists, with expansive views from several portions of the corridor by elevating riders above highway traffic, street trees, and low structures adjacent to the alignment. In Section 4.8.3 of the Final EIS, specific environmental, architectural, and landscape design criteria are listed that will help minimize visual effects of the Project. The Project will also provide residents and tourists with more transportation options.

As described in Chapter 2 of the Final EIS, several alignments were evaluated during the Alternatives Analysis process. One evaluated alignment was the historic OR&L line. A combination of issues, including utilities that have been placed in the right-of-way, poor location in several places, and the previous loss of the right-of-way in several locations, all contributed to the elimination of that option. During the analysis, several streets were evaluated for either elevated or underground alignment and determined to be inferior to Halekauwila Street. An elevated system on either Beretania or King Streets would run in front of either the State Capitol or Iolani Palace and would require removal of traffic lanes. Queen Street is narrower than Halekauwila Street and adjacent to numerous historic resources.

Noise effects from the Project are detailed in Section 4.10 of the Final EIS. The Project will not cause any severe noise impacts. Three receptors will experience moderate impacts that

will occur on the fifth through ninth floors of several buildings. The Project includes several features to reduce noise from the system, including an integrated noise-blocking parapet wall at the edge of the guideway structure that extends three feet above the top of the rail and a system specification for vehicles with wheel skirts. Wheel skirts on trains will also increase the benefit of the parapet wall at locations above the elevation of the track. The use of sound-absorptive materials under the tracks in these three areas will reduce the project noise exposure at upper floors to below the moderate noise impact threshold. With mitigation, the Project will not generate any noise impacts. Although it may be possible to hear the train, the noise it makes will be at a level that is close to what is currently experienced.

Regarding financial concerns, Chapter 6 of the Final EIS describes the financial resources anticipated to be needed to pay for the capital costs of the Project and for ongoing operating and maintenance costs. Capital costs of the Project, including finance charges, are expected to be fully paid for by a combination of FTA Section 5309 New Starts Funds from the Federal government and the General Excise and Use Tax surcharge revenues collected from 2007 through 2022 on Oahu. Operating and maintenance costs will be paid for from the same sources currently used for TheBus: Federal funding, fare revenues, and City revenues from the General and Highway Funds. Security costs are reflected in the operating and maintenance costs shown in the Final EIS.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Dear Ms. Nishimura:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been identified as the Preferred Alternative as described above. As compared to the other alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly lower impacts to the natural and built environment. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically

supported one of the alternatives, more than 75 percent were in support of the Airport Alternative.

The Alternatives Analysis phase, which preceded the EIS process, is documented in Chapter 2 of the Final EIS. It evaluated a range of modal and general alignment alternatives, in terms of their costs, benefits, and impacts. The scoping process for the Alternatives Analysis involved a presentation of the viable alternatives to the public and interested public agencies and officials to receive comments on the Purpose and Need, alternatives, and scope of the analysis. Scoping for the EIS followed the FTA process that provides for a culling of alternatives studied in the EIS through an Alternatives Analysis. The scoping process initiated for the Alternatives Analysis included a variety of highway, bus and fixed guideway options for consideration. During the later scoping effort for the EIS, the public was requested to propose alternatives that would satisfy the purpose and need at less cost or with greater effectiveness, less environmental or community impact and to propose alternatives that were not previously studied and eliminated for good cause. The only alternative that emerged that met these criteria was a fixed-guideway alternative following several alternative alignments. All reasonable alternatives that emerged from these processes were ultimately evaluated in the Draft and Final EISs.

Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts, and mitigation commitments.

Bicycle racks will be available at each transit rail station, and trains will be designed to accommodate bicycles as regulated by a bicycle policy. Bicycle rental programs are outside the scope of this Project; however, this Project does not preclude such a program.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Reference: THE DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS), City
of Honolulu's Heavy Rail Transit Project

Aloha, Director Yoshioka,

Thank you for allowing me the opportunity to present my opinions and comments on the heavy, massive rail transit project, perhaps the largest capital public works project the City and County of Honolulu will ever undertake at the expense of the taxpaying public, of which I strongly *oppose!*

My name is Glenn Oamilda, born and raised in Waipahu on the O'ahu sugar plantation, now residing in nearby 'Ewa Beach, where for the last twenty-five (25) years I have remained active and continue to be involved in community organizations and activities, political, social and cultural, with greater concerns over development issues and problems that have directly impacted my community and the greater 'Ewa region.

Today, many who reside in the region are angry and frustrated with the everyday hassles of meandering through the myriad of traffic and development problems, issues and impacts, just to get to work and back. Some people remain very cynical that positive changes will come soon; while other feel that more on-going and continuous planning is really needed to insure a well maintained, sustainable and balanced growth throughout the region.

I cannot forget the very first meeting ever held, nearly fifteen (15) years ago, when people in the region came together to-talk-story and plan that brought forth a vision for a second city. After the closing of both 'Ewa and Waipahu sugar plantations, people watched and witnessed as sugar lands were slowly being transformed and developed into a city. Although, along with the many positive changes, came all the negative changes as well.

The Second City of Kapolei: The 'Ewa Development Plan vs. Mass Rail Transit

After many years without much government oversight, the public living in the region have come know how to deal and faced the daily complexities that development brings. They have agreed, instead of groping effortlessly in the dark to find solutions and remedies, the 'Ewa Development Plan a planning guide and a public/government document is the alternative that offers a more realistic and pragmatic approach that addresses and deals with all the present mounting impacts and future and predictable issues, and problems related to development and traffic. They understand the EDP serves with much government and public leadership and oversight that outlines the policies, with and guidance, controls and enforcements over development.

There is no doubt in 2005, when the incoming mayor made a serious pitch for mass transit, it became a top priority on his political agenda. And he aggressively challenged anyone who dare to oppose, or even question his motive on how to solve the leeward traffic congestion problems. After his first term in office, the mayor had shown no desire, no interest in the 'Ewa Development Plan. It was only evident by his unwillingness to engage in a concerted effort to partner with people in the region to find solutions and answers to all the present and future development impacts, issues and problems.

Today mind you, the city have shown no interests or hints of wanting to come together in partnership to seriously discuss present and future plans for the second city. I think the city purposely and intentionally side-stepped the public's EDP review process on all the new proposals and on-going projects. This passive inaction and insensitive display only heightened and further increased public teasions with deepening negative feelings. With on-going daily psychological pressures, financial and physical stresses, residents living in the region cannot continue to remain positive and hopeful their vision and goal will ever come to fruition in the planning and the building of the second city. So why then is government dragging its feet on initiating a meeting, a task force or a conference?

And yet, the mayor and the city response to 'Ewa's woes is a-go-at-it-alone mind-set, by proposing an elevated mass transit system. I think this proposed project is simply an illusion. At the initial meeting on the Plan, nearly fifteen years ago, rail was never on the agenda, never an agenda item at subsequent meetings, or a topic of conversation by any committee member, nor even a subject of interest at any public community meetings. In the EDP, only an intra-modal transportation system circulating within the second city of Kapolei is mentioned, with no provision for an elevated mass transit. So, I ask: Why hasn't the mayor expressed any real interest or responded with great concern by partnering with residents on the west side to

find answers and solutions to the regional problems? Or is this train project a political game of follow the money, a quid pro quo, "something-for-something" arrangement with private developers, or corporate affiliates to further his political ambitions?

Planning: Less Cost to Taxpayers

My answer to them, based on my own personal experience and years of observation is to repeat the same concerns the general public has about development and that, its simply utilizing the EDP already in place as the main planning tool.

In my opinion, the Plan will eventually lessen the \$6 billion dollars estimated projected cost for rail, leading government to consider other cheaper alternatives, by: 1) Aggressively promoting or persuading business employers to relocate to 'Ewa, or by offering tax incentive and tax credits as inducements; 2) Urging business employers to bring with them workers back to the area, that would greatly reduce the traffic congestion by the amount of car from 'Ewa going to town every morning and returning home every evening; and, 3) Lessening the stresses on the environment, the precious resources and retaining the natural beauty of the island.

However, for the last two and a half years, I attended nearly fifteen (15) City and County of Honolulu sponsored public forums where Parsons/Brinkerhoff, the city's lead contracted planners, made each presentation on the mass transit project, and yet, there was nothing compelling or convincing enough that would sway me to think otherwise that, this proposal would be a benefit to the all communities and the taxpayers as well, that: 1) The city can justify, by its own estimates, the high cost of building the rail of between \$3.5 and \$6 billion dollars (including property condemnation), and the annual perpetual maintenance cost of \$60 million dollars; 2) It will reduce traffic congestion, on the amount of cars traveling east bound every morning and the reverse west bound in the afternoon; and, 3) This massive and heavy elevated rail system is, in many way, environmentally green and earth friendly.

I cannot fully accept the city's decision or motive or its data, nor even feel comfortable and optimistic that rail is the answer and it will work. This is clearly a unilateral, a one-sided approach, based on statistical findings predicated only on assumptions, inferences and suppositions, with no hard guarantees, assurances or other viable transportation alternatives, but to the city rail is the only solution. But the city feels hopeful and confident this proposed heavy and massive rail project will literally get working people out of their automobile, hop on the train in the morning to Honolulu and back to 'Ewa in the afternoon. Frankly, I said before and I am going to repeat it again, this proposed mass transit is one man's illusion to think that rail will get people out of cars.

Let me give an example, in the year 2000, the state with federal dollars initiated the ferry pilot project which ran from 'Ewa Beach to Aloha Tower it offered perks and freebees as inducements to get drivers from the west side out of their cars. But after a year, because of the low public ridership, the ferry project went 'belly up.' Its plain and simple, drivers in Hawai'i are simply captivated by their big gas guzzling sedans and heavy SUV trucks. They don't mind traveling far distances, and won't even blink an eye at the cost of higher gas prices, even car and bus pooling, stretching the freeways, rearranging workers schedules have not worked at all. The city should have learned from this picture by connecting all the dots. By the estimated huge price tag for the proposed massive elevated rail which the city is asking taxpayers to shoulder is simply foolish and irresponsible. Its just throwing hard earned working dollars at a very bad project. In my opinion, rail is just another choice, another alternative offered to the general public, and the likelihood people will choose the automobiles. What would I suggest? Let me start by addressing automobiles going into downtown Honolulu from 'Ewa, that the city considers passing and enforcing an ordinance that would restrict private automobile movement from entering this 'no drive zones,' a mile radius from the civic center. The other idea is to enact a law that controls that sets a ceiling on the amount of automobiles on the island.

The City and County of Honolulu justifies its argument and swears by its presumptive assertion, supported by a Traffic Alternative Analysis study citing data that, by the year 2030 build out, the public will see an eleven percent (11%) to about twenty-three (23%) reduction in traffic that, a rail transit system is needed now, as the only option and the only answer to solving the daily vehicular work traffic congestion problems. I think these are sorry and dismal numbers that taxpayers can be pleased with, and can be convinced their dollars are being spent wisely, money not just thrown against the wall hoping something sticks. If the city stand by these figures, then perhaps, all the decisions-makers and politicians should reside in the 'Ewa area so they can sympathize and empathize with the pain and anguish the residents the go through every morning. People who have lived in the region for years have come to know, come to understand and agree that the most sensible and rational way to deal with the morning and evening traffic congestion problem is to begin the planning process.

Vision is to Plan Now: Don't Wait Until 2030 Build-out

Mr. Yoshioka, lets be real, this is 2009, between now and the next twenty-one (21) years when the city estimates by 2030 the second city of Kapolei will be built-out, what hopeful suggestions can the city make to the people and to the commuting public? Mind you, if there are no suggestions from you or the mayor, then residents and commuters alike can continue crossing their fingers, hoping for the best, and chug-a-long in daily traffic as they normally did, and ignoring on-going

development by just pretending as if nothing is going on. I think waiting twenty-one (21) years by this administration for the second city massive built-out is just a cheap and easy-way-out than to deal with the public's every day problems in the region. It only points out how inept and incompetent government really is. Historically as far back as the early '80s, every community on the 'Ewa plains and along the Wai'anāe coast foresaw a massive influx of people with a shift in island population along with huge developments. Indicators and predictors proved to be correct, now we all share the same common development impacts, issues and problems.

When Kapolei was designated the second city by the state of Hawai'i, there were no concerted efforts or suggestions made by past city administrations, or even this one, to all the players in the region to come together in partnership and engage in the planning process with serious and continuous ongoing dialogues, discussions and discourses.

The 'Ewa Beach community, for example, which relies primarily on the Fort Weaver Road corridor, the only main arterial roadway in and out of the area, requested and pressed the city and county for an alternate road, one that was parallel and within the federal limited guidelines, in and out of 'Ewa Beach. But

after years and years of political "foot dragging," and with mauka housing developments moving rapidly makai into 'Ewa Beach, the community unfortunately lost out and is now tucked away, cornered in on the leeward side of O'ahu, locked in makai by the ocean and mauka by land.

Lack of Planning: Communities Question Government's Role

Today, Mr. Yoshioka, as the Honolulu City Council debates the alternate transit alignment from 'Ewa thru the community of Salt Lake by-passing the Honolulu airport to town, as one option; or by-passing Salt Lake thru Honolulu to town as the other option, what alternative can you offer the community of 'Ewa Beach having no more than one-roadway-in and one-roadway-out, yet unlike the Salt Lake community having multiple accessible roadways in and out of the area? However, at the present time, to say the least, discussions continue between the city council and the Salt Lake community representative councilman Romy Cachola. Whatever the outcome, its just an awesome display of caring and concern by an elected public official in representing his constituents. In contrast, I can say with great certainty, that 'Ewa Beach for many years, never had good, solid and decisive elected representation; and in fact, I think the area councilman, Todd Apo, has already hopped on the train with the mayor.

Furthermore, I can also attest that on the initial rail proposal, the city and area elected officials never met with members of the 'Ewa Beach community; nor was the

public given the opportunity to openly discuss and dialogue the elevated rail transit, the alignment, or the choices of alternate rail technologies. Regretfully, as of today, the community is still without an alternate route out of the area, 'Ewa Beach commuters must continue to deal unbearably with twelve (12) traffic lights, daily road work and home construction; for residents who waste time sitting in traffic and drivers who must drive daily, the five (5) miles distance just to get to H-1, doing the math calculation is a no brainer *its total insanity!*

In the late '80s, when the State of Hawai'i designated Kapolei as the Second City, it only meant that the downtown Honolulu business district and its surrounding populated areas were showing signs of bursting at the seams, of being over crowded.

The political and social strategies was to relocate business employers to the second city bringing workers along by offering them businesses tax incentives and tax credits; and at the same time, attracting housing developers who would design and build well-planned communities. Newly relocated workers would move in these planned communities, commuting workers would return to the region to work and together they all can live, work and play in the area, thereby spending more time strengthening family relationships, community ties and enhancing the *life-style* values from Hawai'i's unique cultures and traditions.

When the housing developers arrived, in the mid-to late '90s, they were noticeable by the staggering numbers of permit requests for land zoning, rezoning, waivers, amendments and agreements. The high numbers of permit approvals for housing developments, easily out paced government's ability, not only to provide guidance and leadership toward a *balanced* and *sustainable* growth, but also lacked the power to control and mitigate the predictable mounting impacts caused by the uncontrollable and rampant developments on the 'Ewa plains. Moreover, with development came more housing construction, but businesses never kept pace with development and the growing working population, and as a result, many area workers had to travel back and forth to town. With the lack of oversight and aggressive control over housing construction and traffic congestion, some people have grown more leery, angry, apathetic and the lost of trust and confidence in government and elected politicians; while others have deepening resentment that the city had simply yielded its authority and acceded power to the developers.

Residents also, strongly believe that construction of only houses creates bedroom communities. It minimizes the *qualities-of-life* and diminishes *life-styles*; hearing developers talk of making huge profits, meeting deadlines, rushing to build-out and building more homes because of buyer-markets, have been seen by the general public as being too greedy! These sorts of thinking and behavior has only lessened the chances and prospects of ever obtaining a well *balanced* and *sustainable* growth

in the region. In addition, the city's Department of Planning and Permitting (DPP) has projected that there will be about forty thousand (40,000) new homes built on the 'Ewa plains. This estimate does not include those houses already permit approved, shovel ready and on-going housing projects. This projected data points out that without proper and serious planning, one can only visualize that by the 2030 build-out the second city of Kapolei will look like a massive, sprawling bedroom metropolis.

Moreover, public protest and anguish over too much cars!, too much traffic lights!, too much housing construction!, no alternate roads out!, no infrastructure!, of over building, of over development, of traffic impacts, of the lost of a life-style and the quality-of-life continues until this very day. It has intensified to a point that for many residents living in 'Ewa has become so unbearable *mentally, physically and financially!*

In addition, public dissent and dissatisfaction has manifested itself in other area of the island as well. Community leaders and residents living in the Central O'ahu area from Waipio Gentry, Mililani, Wahiawa, and others communities mauka, are skeptical that short term traffic solutions can be found. They have made it also clear at many community gatherings and meetings, that increased traffic congestion from the west side will make it even tougher for them to get to town every morning and back home every evening.

The Honolulu city council, in late 1997, adopted the 'Ewa Development Plan. Through a *visioning team* consisting of community members and leaders from local boards, activities, organizations and in partnership with the city's planning department came together to address all future developments on the 'Ewa plains.

After months and years of public discourses, dialogues and discussions, the team set in place a regional plan, a public/government document, consistent with a vision, concepts and policies, principles and goals with realistic guidelines for a *balanced and sustainable growth*.

Clearly, the EDP underscores two (2) important points: 1) In provision 5.1.2 that says "the city must take an active role in the planning and coordinating construction of needed infrastructure And the development of the regional transportation system", and, 2) In provision 2.2.10 "as a condition for zoning approval to insure that development does not outpace infrastructure development "

The 'Ewa Development Plan: Review, Reassess and Revise

The 'Ewa Development Plan, however, is ten (10) years late and over due for

public review. It missed the first and second five (5) year review cycles. As of November, 2008, after ten years of added proposed and on-going projects in the region, the public will finally get to review, reassess and make the necessary changes to the draft EDP proposal.

Yea but, the questions I have lingering in my mind are: What will happen to all those construction projects from the last ten (10) years that have been included and approved by the Department of Planning and Permitting (DPP) that have already been built, in the paper mill or shovel ready? Furthermore, does the public get to decide what projects stay and what projects go? And is the city willing to partner with the players the region in reviewing and assessing the draft EDP? And as a follow-up, is the city willing to engage the public in continuous discussions, dialogues and discourses on solutions to the present traffic and development issues, problems and impacts? And is the city willing to be involved in present, on-going and continuous future planning?

Everyone should be reminder that the 'Ewa Development Plan came to life as the result of government partnering with the public. To repeat again, the EDP is a government / public document that outlines the principles, policies and goals and serves as a planning guide to on-going and future developments in the region that would help mitigate most, if not all, of the present and future impacts and issues.

I remembered very clearly, when the city presented to the public for the first time its conceptual layout of the mass transit project at Kapolei Hale. On fielding questions from the audience, I asked the mayor a question of which I thought was very simple and very direct: Mr. mayor with the high cost of the proposed rail transit couldn't the money be redirected and wisely spent in the 'Ewa region for the purposes of mitigating some of the impacts, like building new and repairing roads, repairing and upgrading sewer plant and transmission lines throughout the entire 'Ewa region?

He retorted with sarcasm, saying, "Glenn, your thinking is in the minority!" He quickly turned to all his department heads, city aides and workers who were standing in front of the glossy colored layouts sitting on top about a dozen and a half easels depicting the mass rail transit route alignment, and asked them: "Does anyone agree with Glenn?" He got an instant response. In unison, they all clapped and with a big roar said, "No!" At that point I knew that this transit project was a 'done deal,' leaving no doubt in my mind that this project was going to be his *baby* his *legacy!*

Mr. Yoshioka, by those responses nearly three years ago, the mayor was adamant and unmoved that the proposed rail transit project, which would move people daily

to Honolulu to work and home, costing taxpayers billions of dollars, is the only solution to 'Ewa's problems. People don't think the mayor fully understands the severity of just how the daily issues and problems related development have greatly impacted their lives. They can relate stories and experiences on how they have coped daily with all the financial and psychological stresses and traumas brought about by all the impacts.

They sense the city is narrowly focused on rail only and nothing else. They have seen no signs or a willingness to partner in a parallel planning process that addresses the issues and impacts now, and not wait until 2030. Its blows my mind just to think that the city and county with all the available resources at its disposal cannot approach or engage the communities in problem solving. Yet today, the city continues to move forth with plans for the massive rail project, leaving area commuters and residents with an apathetic and insecure feeling that the city is incapable of "chewing gum and walking at the same time."

Finally, let me leave with these suggestions: 1) That the city in partnership with all the players in 'Ewa region engage in a parallel planning process - continue to plan the rail project, and in tandem; continue to address and find solutions to the traffic congestion and infrastructure problems; 2) That we enforce the provisions of the 'Ewa Development Plan by maintaining a presence in the 'Ewa region exerting strong leadership and guidance and control coordination over development activities; 3) That we utilize the EDP as the guide to a sustainable and balanced growth; 4) Entertain plans for Kapolei to become a "real" city with a government structure in place; 5) That we recreate financial strategies to attract and draw more business employers to the region, i.e., offers of tax incentives, tax credits, etc.; and, 6) Take more social and sensitive approaches to Hawai'i's 'life-style' - the inherent cultural and traditional values - with a clear-cut mandate to insure and preserve the *quality-of-life* for every citizen.

The Environment Vs. Rail: Concrete in the Sky

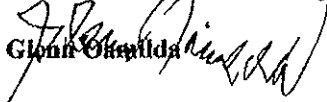

In Hawai'i the environment is really dear to everyone who live here. Residents respect and revere nature in every form. Visitors alike appreciate the natural scenic views and pristine beauty of the island. This proposed rail system will destroy the view and beauty of the 'Ewa area. The city's own Alternative Analysis study indicates there will be cement columns and piers, rising like towers in the sky, built and constructed to support concrete platform bays. There will be nineteen (19) of them each with a maximum heights of eighty (80)feet (comparable to a six or seven story building), and a minimum of thirty (30) feet (similar to a two story building), running twenty-three miles, starting at the eastern end of the 'Ewa plains and terminating at the University of Hawai'i in east Honolulu. The reference and description made by many people that, this proposed heavy, elevated and massive

rail transit as being just "concrete in the sky." I concur with them as a true assessment of the project, the city is insensitive and out of touch with the rest of the O'ahu's population. I'd like to remind the city, make no exceptions, we are all stewards of the environment - from the mountain to the sea - over, under and above the land and over, under and above the ocean. The mayor thinks his rail project is 'environmentally friendly,' but I beg to differ with him. Government should be in the forefront, leading the public on mitigating environment issues, but this city administration chooses to trade-off hawai'i's fragile environment for an elevated rail system. Is it humanly possible to simply throw hard earned taxpayers' money at this proposed rail transit and ignore the cognizant consequences to the environment?

Noise pollution is another issue that the proposed heavy rail regarding will have on the environment. The city's Traffic Alternative Analysis study indicates that high pitched screeching sound emitted from the train's metal-on-metal, steel wheels, running on steel rails would be no louder than the noise of a car's rubber on concrete or asphalt traveling at the maximum freeway speed. This assumption remains to be validated, but all is known that noise is definitely pollution.

Lastly, the city is throwing everything it has in its arsenal in hopes this proposed massive, elevated rail transit system will be successful despite the low state and federal revenue projections. To me its a bad proposition to just throw hard earned tax dollars at a bad project, with hopes of getting the greatest bang out of taxpayers money. The present economic down turn, which is reflected not only on the national level, also felt here in Hawai'i is completely irresponsible and heartless for the Hannemann administration to ask the taxpayers to fund this project. The cost to all O'ahu taxpayers to fund, condemn property (displace people) and maintain, in perpetuity, the heavy and massive rail system is a big request for taxpayers to shoulder, plus the tremendous environmental, psychological and economic accompanying risks. Mahalo 'io 'oe!

With sensible and rational planning,

Glenn Okamoto

Ewa Beach, Hawaii 96706

Dear Mr. Oamilda:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your comments and opinions have been noted. Comprehensive land use planning in the Ewa Development Plan area was considered during development of the Project, and the Project will support the objectives and goals of the Ewa Development Plan, as noted in Section 4.2 of the Final EIS. However, the issues of promoting private development and providing incentives for businesses are beyond the scope of this EIS.

The Project was approved by the City Council in 2006. The cost of the Project is defined by the type of construction, which is justified by the high quality of service to be offered. This decision was made in light of the substantially higher performance of the fixed guideway compared to all the alternatives that have been studied since the Alternatives Analysis was

begun in 2005 and including previous efforts to improve transportation in the corridor. This information is discussed in Chapters 2 and 6 of the Final EIS.

Regarding traffic congestion, Section 3.4.1 of the Final EIS identified changes in congestion between the Project and the No Build Alternative. With the fixed guideway system, total islandwide congestion (as measured by vehicle hours of delay) will decrease by 18 percent compared to the No Build Alternative (as shown in Table 3-14 in the Final EIS). In addition, traffic volumes were studied at various screenlines in the study corridor. The travel demand forecasting model was used to forecast traffic volumes at these screenlines in 2030, both with and without the Project. Analysis revealed that traffic volumes at these screenlines will decrease up to 11 percent with the Project (as shown in Tables 3-9 and 3-10 in the Final EIS). In addition, as detailed in Chapter 4 the Final EIS, the Project will result in a decrease in energy consumption and air and water pollution compared to the No Build Alternative.

The Project is intended to increase transportation options, not to restrict people's freedom of movement. Your suggestion has been noted.

One of the needs for the Project is to support the development of Kapolei as the "second city." The East Kapolei termini will support transportation to this community prior to 2030. Coordination has been ongoing with the City of Kapolei to meet its planning goals. The EIS process is independent of the electoral process or results.

The Project Team has met with area representatives from the Ewa Beach area and has had several meetings with residents of the community. In addition, information booths were provided at several community events within or close by the Ewa Beach area. Participants at these meetings had the opportunity to speak with project representatives and also provide their comments. The last public meeting held at Holomua Elementary School on October 14, 2008, was attended by the letter writer. Members of the project consultant staff, as well as DTS representatives, were available at this meeting. Other City projects are expected to assist in alleviating current traffic problems in the Ewa Beach area. The benefits of this Project, in addition to other planned projects, should help lessen traffic congestion currently experienced by Ewa Beach residents. This comment addresses concerns with the Ewa Development Plan, which is a separate City planning process.

The Project was developed through the OahuMPO's islandwide planning process. This planning is integrated with all other islandwide transportation planning on Oahu and will contribute to the long-term mobility of residents of the Ewa area. The City is working with various land owners in Ewa to integrate their planned developments. As stated in Section 4.2 of the Final EIS, the Project will be consistent with adopted State and Local government transportation land use plans and policies (these include Ewa, Central Oahu, and the Primary Urban Center development plans). Section 1.8.3 of the Final EIS discusses the planned growth envisioned by the Ewa Development Plan. Your comment to create financial strategies to attract more business employers to the region is noted, but these financial strategies are beyond the scope of the Project. Your other comments have been noted.

The DTS and FTA have planned the Project very carefully to ensure that social and cultural issues are accounted for and avoided and/or protected, where possible. The Final EIS

evaluates the Project, which is defined as extending from East Kapolei to Ala Moana Center. The Project has logical termini and independent utility from any extensions that may be constructed in the future. The future extensions to East Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS. The future extensions are not part of the Project; thus, they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time. Visual effects related to the UH Manoa planned extension are discussed in the Visual and Aesthetic Resources Technical Report (see discussion in Section 5.2.1 of that report).

The assessment of visual effect due to the Project as described in Section 4.8.3 of the Final EIS considers changes to the visual landscape and viewer responses to those changes. This includes the existing development along the Project alignment. Within the Project corridor the environment changes from rural at the Wai'anae end of the corridor to dense high-rise development at the Koko Head end.

As part of the design process, the City has developed design principles, which are identified in the Honolulu High-Capacity Transit Corridor Project Compendium of Design Criteria (RTD 2009m) that will be implemented in final design to minimize visual effects of the Project. For example, guideway materials and surface textures will be selected in accordance with generally accepted architectural principles to achieve effective integration between the guideway and its surrounding environment. Landscape and streetscape improvements will mitigate potential visual impacts, primarily for street-level views.

Other measures to address visual impacts of the Project are being developed through the station design and planning process. The initial station area plans and design guidelines were first developed with coordination between DTS and the Department of Planning and Permitting (DPP). The next level of transit station design focuses on integrating individual neighborhood characteristics of the communities served by the stations.

The following mitigation framework will be included in the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

- Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
- Coordinate the project design with City TOD planning and DPP.*
- Consult with the communities surrounding each station for input on station design elements.*

Mr. Glenn J. Oamilda
Page 4

- *Consider specific sites for landscaping and trees during the final design phase when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will serve to mitigate potential visual impacts.*

Section 4.8.3 of the Final EIS, Design Principles and Mitigation includes information related to the mitigation framework described above. Specifically architecture and landscape design criteria include guidelines regarding site design, materials and finishes, and lighting, which apply to stations, station areas, and the guideway.

The noise effects of the Project are presented in Section 4.10.3 of the Final EIS and were assessed following FTA noise impact analysis procedures. In addition, noise will not be continuous but episodic (only as trains pass). As noted in Section 4.10.3, with mitigation, operation of the Project will not cause any noise impacts.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Submission Date : 12/09/2008

Submission Content/Notes : I am in favor of the rail transit being diverted from Salt Lake and taken via the Airport area for the following reasons:
The number of citizen who can be services by the Airport route would serve the greater whole of the island. Those living in the Salt lake area have ample city buses that could take them to a connection site for rail, thus leaving Salt Lake, an already congested area during school hours, with less cars on the road, less construction interfering with present businesses and again serving a greater population. The inclusion of running the rail from Kalaeloa Blvd., would even allow those in the homeless transition chelters a cheaper means of transport (instead of using their cars) and yet ample transportation to Honolulu and work sites. The inclusion of UH Manoa, is a no brainer...let the rail take the people where they need to be! By providing ample transportation to Manoa, rail will serve students who do not drive, cars can be left home for those who do and thus still saving all money! The extention to Waikiki..our source of revenues...tourism. The tourist already hear that Honolulu has one of the best City Bus systems in the USA, we rank high in terms of money saved instead of driving and providing the rail can provide a sense of safety for those moving about the island without knowing dangerous areas for tourist. More tourist traveing to the West side could mean better sales and job opportunities on the West side to cater to tourist from Waikiki. The proposed route change (via Airport) also allows for access to specific points of interest, Kapolei: the second city and soon to be new Family Court/Detention Services locations,Ewa Beach: reducing the already terrible traffic there, Waipahu and the outlet stores, Pearl City/Aiea, access to Pearl harbor, the mighty Mo and aloha Stadium for sports or swaps meets or concert events, The Airport area; just getting to the airport without having to bring your car, Kalihi/Honolulu to serve workers, Historical places such as access to the Palace, museums and gardens, District Courts and many meeting/business areas. Finally of course Ala Moana Center, which we all hope will still exist by the time rail is completed.
I may be retired by time the rail is completed, but that I still have reasons to travel out of Honolulu to get to the West side, which does not happen often enough now because of traffic, the long drive and gas. I believe those supporters of rail are realistic and looking to the future, maybe my grand kids or even theirs..we need to plan for the next 100 years and take lessons learned form the last 50 years!
Please consider my comments and opinion when making final decisions for Rail Transit and its final route.

Dear Ms. Oana:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall indentify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your preference for the Airport Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more

information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The proposed future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of this Final EIS. However, the future extensions are not part of this Project, thus they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in this Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time. Bus service between Ala Moana Center and Waikiki and UH Manoa will be enhanced until those extensions are built.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

SUBJECT: Comments on Honolulu High-Capacity Transit Corridor Project, Draft EIS

Thank you for all the time and effort that has gone into this precedent setting project. Overall I support this project. My comments are:

1. "Make no small plans." – *Frederick Law Olmstead, Landscape Architect for Central Park New York City, and World Columbian Exposition (The White City) Chicago, 1893.* My main concern with this project is not that it goes too far, but that it does not go far enough. Since a large part of our State's revenue is dependent on tourism, I support the Airport Route. We are going to look silly if we stop the rail just short of Waikiki at Ala Moana Shopping Center. Now is the time to build the rail to Waikiki and the University of Hawai'i (UH). Times of economic hardship are also times of economic opportunity, and rail transit is a chance to set Honolulu on a better course, which will pay back in many ways for years into the future. At the time Chicago was building the White City, our nation was headed into an economic downturn. The White City was a catalyst, full of new technology and aesthetic principles that invigorated our nation for decades into the 20th Century.
 - a. As someone who has traveled Nimitz Highway, the H-1 Freeway, and Dillingham Boulevard for most of 21 years, I can attest to the fact that traffic is lighter when UH is on break. Extending the rail transit project now to UH will ease traffic congestion and speak volumes about the value of education.
 - b. Having the rail go into Waikiki will provide an alternative means of travel for tourists and residents of Honolulu. Whether you are a resident celebrating a special occasion, or a member of the military looking for some rest and relaxation, being able to take rail transit as an alternative to driving in and out of our major entertainment district, Waikiki, is smart.
 - c. With the hundreds of billions of dollars our Federal government has been, and is, pouring into our Nation's economy, even if the Honolulu Rail Transit project were to double in cost, it will provide more value in our future than any other project.
2. Rail provides room for more commuters in less space and moves them faster. Moving 30 miles per hour is faster than driving 10 miles per hour or less in rush hour traffic. (I sometimes beat the number 19, 20, and 42 buses at rush hour on my bicycle and I am not a fast biker!) Alternative projects are flawed.
 - a. Buses running east and west across the south side of O'ahu get caught in vehicular traffic. Mass transit that is grade separated provides a more efficient commute, such as the New York City subway that I always took uptown and downtown during my 3 years there.

Copy 1

1 of 6 pages

- b. Agree that rubber tires on pavement are not as efficient as steel wheels on steel rail – both energy wise and maintenance wise.
 - c. Elevated highways (no matter what you call them EZ-way, or Fly-way) pander to a false perception that you will have a shorter commute by getting closer to your destiny faster. In reality, you have to wait the same amount of time where the overhead freeway joins the other traffic. All the overhead freeway accomplishes is creation of the misperception that there is a shorter line of traffic, when in reality it is the same amount of traffic stacked, instead of spread-out long ways. Overhead freeways are also more visually intrusive in that they usually have a wide, low stance, creating a shadowy dungeon below, instead of a taller, narrower stance allowing sunlight below.
3. The Honolulu Rail transit should be thought of as a way to get to key points east and west on the south side of O'ahu, with a secondary on grade system providing transportation mauka-makai for those who cannot, or choose not to, walk a mile in a reasonable 20 minutes. The EIS should provide the proposed rearranged routes for the buses that connect at the transit stations.
- a. Passengers should be able to bring their bicycles on the train and continue to bring them on the bus. Passengers traveling to and from the airport should be able to carry one suitcase, a carry-on, and a personnel item.
 - b. In order to create additional width on the train without widening the structure, the parapet on either side of the track should be removed (if possible), which will create an even narrower appearance for the overhead track. The train cars should be widened to cantilever over the edge of the track. The sides of the cars should extend down over the steel wheels and rail to quiet the movement of the train (providing the appearance of a monorail type train).
 - c. The typical passenger train car design, which is over one hundred years old, should be re-thought. Instead of having masses of commuters entering and exiting the train through doorways that are not much larger than the doorway to someone's house, would it be possible to have the side of the train raise up (gull-wing, or a curved slide-up) to enable easy access and egress, and a piece drop down to cover the gap between the platform and the train. In this configuration seats would be placed in the middle allowing passengers to look out at the views over Honolulu as they pass by. The curved upper part of the train could have an energy efficient transparent material creating a sky and mountain view, giving an outward Art-Deco era motion appearance, like the Colorado Zephyr.
 - d. Center platform stations should be used where possible to minimize the width of the rail stations. Where stations can also provide an alternative means for pedestrians to cross streets near dangerous intersections, concessions stands should be leased in these stations to create an incentive for pedestrians to go up and back down, rather than cross at street level.
 - e. At busy rail stations where the stations cannot be built directly above or close to connections, a people mover should be provided to make the transition. Example: According to Figure 2-27, on page 2-30 the Airport Station appears to be on the other side of the airport parking garages from the front of the Airport terminal. Either locate the Airport Rail Station closer to the Airport Terminal (This avoids having to walk over a bridge through the garage area to get to the train) or install a people mover system to cover the distance across the bridge to the train.
 - f. Kuntz Gate on Elliot Street provides access to Hickam AFB for the number 19 Bus, pedestrians, and bicycle riders. A total number of 16,096 persons work on Hickam AFB, which includes military, civilians, and contractors. Recommend locating a rail

station near where the Airport Route crosses Elliot Street intersection with Nimitz Highway. A rail station at Elliot Street not only provides better access to Hickam AFB, but also provides better access to other facilities in this area, and to bus stops (sheltered by the Airport viaduct), and the popular bicycle path under the Airport viaduct. (Note: Appendix B, Drawing RW051, needs to show the intersection of Elliot Street and Nimitz Highway on the drawing.) An Elliot Street Station would also enable more frequent cycles of the number 19 Bus on Hickam AFB because the 19 Bus would not get caught in traffic around the Airport loop, or in traffic by the Pearl Harbor transit station should it be considered as an alternative transfer point.

4. Start construction of the rail transit system in the middle of the route at the Airport, and build outward in both east and west directions. This will get a difficult and important part of the rail system built first while tourism is in a downturn. It will enable more use of the rail system when the first parts of construction are complete. Tourists with a few hours between flights will be able to access the Arizona Memorial and Battleship Missouri (some of the most visited sites in Hawai'i). In the Diamond Head direction the rail would provide access between the Airport and Downtown Honolulu sooner than the proposed phasing of construction in this draft BIS
 - a. Lay down yards for materials to start construction in this area could be located at Keehi Lagoon Park. Alternative access for paddlers may have to be established during construction. After construction Keehi Lagoon Park can be restored into a beautiful new landscape. Alternative lay down areas that could be considered are: along Lagoon Drive near the eastside of the Airport; Shafter Flats; or possibly Kapalama Military Reservation (further away, but closer to where construction materials arrive by ship). The cost of rail construction should include money for revitalizing areas disturbed by construction. Thus, the rail project will have a double impact, not only providing alternative efficient transport, but also revitalizing areas in current need of improvement.
5. Downtown Honolulu rail route should be reconsidered.
 - a. Disruption of vehicular traffic during construction on Nimitz Highway is likely to cause major traffic delays. Example: On Oct. 30, 08 a truck got stuck in the middle of Alakea Street near the corner of Nimitz Highway during the evening rush hour. It backed-up traffic headed east on Nimitz all the way to Sand Island Road, because drivers had difficulty getting past vehicles waiting to turn Mauka on Alakea Street. The delay lasted about an hour till the truck was towed away.
 - b. Rail stations help stimulate real property development [Transit Oriented Development (TOD)]. The lower downtown area along the waterfront near Aloha Tower Market Place is already an attractive area. There is not much room for TOD in this area without displacing the sense of place that attracts business and visitors to this area. Downtown Honolulu has a good blend of new buildings and well maintained historic buildings. If the balance were to be tilted toward more new development the smaller historic buildings would be replaced, and the downtown would lose its visual rich culture, actually degrading the area rather than improving it. Similar to the relationship between Lower and Mid-town Manhattan, growth in Downtown Honolulu needs to move Mauka.
 - c. Security is also enhanced by routing the rail Mauka. Example: Around 2 PM on a sunny day in 1986 the Tsunami warning siren sounded. Commuters left their work for their homes, or places on higher ground, but before they could get where they wanted to go many had to travel east or west, and many took Nimitz Highway. Had the Tsunami occurred most commuters along Nimitz Highway probably would have been killed. The above grade rail transit provides a safer way to move east and west along the south side of O'ahu, provided it does not travel adjacent to the waterfront. During an on coming

Tsunami people are encouraged to move to higher ground. Moving the rail Mauka would be an incentive for people to move Mauka. Otherwise there will be commuters walking to, and congregating at, the station on Nimitz Highway near Aloha Tower when a Tsunami warning siren sounds.

- d. Instead of traveling past Downtown Honolulu along the waterfront, the rail route should turn from Dillingham Boulevard onto Liliha and turn east onto Vineyard Boulevard. Accommodations should be made if some residents need to be displaced in the housing complex on the corner of Liliha and Vineyard. If this cannot be worked, then an alternative may be to turn Mauka from Dillingham Boulevard along the Kokea. I prefer the Liliha route because the station near Kaaahi could provide on grade access to the waterfront area of the downtown if an on grade connection could be made out to Nimitz Highway from where Kaaahi now deadends.
 - e. From Vineyard Boulevard consider routing the rail along Lusitania Street in back of Queen's Hospital and turning Makai in back of the Board of Water Supply down Alapa to South Street and from there either turn east along the present route on Halekauwii, or Queen Street, or Kapiolani Boulevard. Halekauwii provides better access to the Medical School, but Kapiolani route would create some synergy for pedestrians enabling them to cross dangerous intersections near Keeaumoku and near the Convention Center.
 - f. This Mauka route should allow for new mixed income TOD and back-up office space and business development. It also provides potential for alternative transit close to Queen's Hospital.
 - g. If the Kapiolani route were to be chosen the rail transit should enter Waikiki via Kalakaua Ave. If the Halekauwii route is utilized, the rail transit system should take the intended course into Waikiki. Either way, instead of going down Kuhio Ave, there should be a Rail Transit Station in Fort DeRussy with a transfer to an on grade bus route around Waikiki. From the Fort DeRussy Rail Transit Station the rail route should turn Mauka through Kalaimoku, cross the Ala Wai Canal and proceed up University Avenue to UH. This enables good access to Waikiki and UH with less disruption.
6. While planning for the completion of the Rail Transit System the State, City and County of Honolulu, the Federal government, and Hawaiians should consider the possibility of hosting a World's Fair in Hawai'i. The Fair could be Asian, Pacific oriented and focus on how multi-nations and cultures can come together to improve the Environment, Technology, Economy, and Cultural Appreciation. The Columbian Exposition of 1893 and the New York World's Fair of 1938 raised spirits, provided hope, and helped to spur economic recovery. Gauntlets can be thrown down to challenge individuals, businesses, and Nations to display new energy efficient ways to travel to the islands with incentive prizes going to category winners that combine efficiency with speed, and/or best traveling experience. Just as the White City was the focus of the Columbian Exposition, "Honolulu a Garden City Expo" would be the focus of our fair with our new rail system the transportation heart of the fair, connecting dis-contiguous diverse exhibits, conferences, and events.
- a. Example UH could hold conferences and exhibits on reinventing public education as a life long learning experience, so that school systems serve people of all ages in their communities. How do we do this economically? Maybe a four 10-hour day work week would provide one day per week, or even every other week, when people can volunteer in their community. Some volunteer work could be meeting at the local school, learning from each other and then applying what you learn.
 - b. A Medical Expo could be held near the transit station close to Queen's Hospital. Diet and exercise could be promoted as the means to long life without needing some of the

- futuristic medical procedures on display. Medical conferences could be held with the Medical Expo.
- c. Aloha Stadium could be revitalized as not only a place for spectator sport events, but also a place for learning and participating in sports. Our Capital District could host Government meetings. Defense agencies could host conferences and exhibits on creating a stable secure world.
 - d. Like Expo 67 in Montreal, Canada, a diverse group of architects could design exciting new buildings for the Fair, near transit stations. The best part is, because our fair is discontinuous, these exciting buildings near rail transit stations can be utilized after the fair is over, and be a catalyst for TOD. Some of the ground breaking architecture from Expo 67 were: the USA Pavilion, a Geodesic Sphere influenced by Bucky Fuller; the German Pavilion, a tension structure by Frei Otto; and Habitat, a futuristic vertical community of homes that gave each family a rooftop garden, by Moshe Safdie.
 - e. Because the fair is spread along the transit route, visitors stopping at the different transit stations and exhibits can dine in Honolulu's diverse local restaurants, and patronize local businesses, and Arts and Craft Fairs etc.
7. Why "Honolulu a Garden City Expo?" What is a "Garden City?" Why is rail transit key to initiating reform of our built environment into "Garden Cities"? How will this save and protect the Aina?
- a. Honolulu is uniquely positioned to become a model city to win the hearts and minds of Americans, and the International community, which can set a new course for the human environment around the globe. Hawaii'i has natural resources to set a path toward energy independence. The Hawaiian culture provides a land use model for sustainability, where each community of the island gets a piece of diverse resources in each Ahupua'a. Our rail transit system will provide an energy efficient way of connecting these areas in Honolulu.
 - b. The term "Garden City" comes from Ebenzer Howard's book "Garden Cities of Tomorrow." Much like the Hawaiian Ahupua'a system "Garden Cities of Tomorrow" paints a vision of communities where each community has diverse land use. In Howard's vision, rail transit stations are near the gathering places of each community, and each rail station is in walking distance for most of the community. Small local farming occurs around the perimeter of each community, along with natural areas. Like Ebenzer Howard's "Garden Cities," rail transit is the most efficient way to join the various communities comprising Honolulu together.
 - c. In the evolution of cities around the world, we are at a turning point. For more than 100 years, success has been measured by rapid growth, accelerated by the industrial revolution. If we are to succeed in the next 100 years, success will be measured by sustainability and quality of life, rather than quantity of possessions consumed. The Interstate Highway system enabled rapid development of real estate to where extended suburbs (exurbs) have been built beyond the suburbs. We are at a point where the amount of roadway needed to be maintained and created for expanding populations will not improve quality of life. Rail transit is key to creating communities with improved quality of life and an efficient way of connecting communities. Creating quality communities around rail stations helps to save the Aina in much the same way the Ahupua'a system saved the Aina. Communities in walking distance to rail transit enable land outside walking distance to be transformed over time into gardens, small farms, recreation, and nature areas. Honolulu has the basic ingredients of a recipe to become a "Garden City." Other cities could follow by example. America could restore existing buildings and construct new buildings in areas like, Newark, N.J., South Chicago, and

Detroit, creating a rich diversity of architecture within the "Garden City" concept. These parts of America's inner cities deteriorated as development grew further away from the inner city over the last 50 years.

8. What if we create a situation where Hawai'i becomes so desirable that we have too many visitors, part time residents, and new residents for the islands to sustain?
 - a. Now that we are beyond the era where rapid growth can improve quality of life, and should be moving into an era where sustainable communities can improve quality life, part of maintaining quality of life for visitors and residents can be accomplished during the fair by declaring Hawai'i a State Park, and providing park passes (fair passes) to visitors and residents. This will enable a quality experience for all, and assure that Hawai'i continues to maintain an economic and cultural diversity of people.
 - b. "Honolulu a Garden City Expo" (with its new rail transit system) would be the focus of this proposed World's Fair - as a separate project, coinciding with the completion of the Honolulu rail transit system. However, the other islands could also choose to have coinciding exhibits and events. Example: the Big Island could feature some alternative energy solutions. The Big Island also has some State land from the former sugar plantation that perhaps Japan, for example, may want to show-off an exhibit based on its small local farms centered around a small village. Although industrial farming appears to provide less expensive products, the Japanese system of farming may be less expensive because it puts more people to work. This localized farming would also thematically tie into the "Honolulu Garden City Expo." It also raises the discussion as to whether the core of the economic downturn is in part caused by producing too many goods, too efficiently, resulting in an oversupply of products and people out of work, as happened in the Great Depression after the boom of the 1920s. The answer may be decentralization of industry, and purchasing goods for longevity. This also ties into the "Garden City" theme because some industry is part of the "Garden City," and some of this industry could be assembly and repair shops. Local industry would assemble quality products that could then be locally repaired, extending a products life, putting more people to work, and conserving resources for all.
9. In summary, we are not just creating an alternative mode of transportation, we are determining a quality of life for our future. We need to get synergy out of this transit project by looking at coinciding opportunities.

Gary O'Donnell

Honolulu, Hawaii 96815

Dear Mr. O'Donnell:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal:

1. *Your support for the Project has been noted. While each of the alternatives includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana Center has been selected as the preferred alternative. The identification of the Airport Alternative as the Preferred Alternative was made by the City to comply with FTA's NEPA regulations that state that the Final EIS should focus on the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative, public input on the Draft EIS, and City Council Resolution 08-261 identifying the Airport Alternative as the Project. The selection of the Airport Alternative is described in Chapter 2 of this Final EIS. The discussion of the alternatives considered is included in Chapter 2 of this Final EIS and the Alternatives Analysis. As discussed in Section 3.4.2 of this Final EIS, the Airport Alternative will carry the most passengers with 116,000 daily passengers and*

282,500 daily trips in 2030, thereby resulting in the greatest transit-user benefits. The Airport Alternative will also result in the fewest vehicle miles traveled and vehicle hours of delay, as well as provide access to major employment areas including Honolulu International Airport, that will have substantially greater ridership than the other alternatives considered. Anticipated funds are not sufficient to extend the current project Koko Head of Ala Moana Center. Please see Chapter 6 of the Final EIS for more information concerning the Project' finances.

2. As stated in #1, the Airport Alignment will result in the fewest vehicle miles traveled and vehicle hours of delay, more information can be found in Chapter 3 of the Final EIS. An elevated Managed Lane Alternative was previously evaluated and eliminated for the reasons detailed in Section 2.1 of the Draft EIS.

3. The Project is intended to facilitate movement along the main "spine" of commuter activity in Honolulu. To address your other comments:

a. Rail vehicles will be designed to accommodate luggage that does not interfere with the safety or comfort of other passengers, to be regulated according to a luggage policy to be developed. No change to policy on TheBus is proposed at this time. Rail vehicles will also be designed to accommodate bicycles, which will be permitted on trains according to a bicycle policy to be developed.

b. The structure is required to have a side safety barrier. Using a solid parapet wall adds substantial noise reduction as well. The vehicle specifications include a wheel skirt that covers the wheel. It is made effective in combination with the parapet wall.

c. Such a configuration would reduce vehicle strength and add to vehicle weight, making the entire system less efficient.

d. Center platform stations generally have a greater total shaded area because of the need to widen and split the track structure prior to the station. Center platform stations are proposed where appropriate. DTS does not intend to compete with private enterprise by placing retail within stations.

e. A people-mover system is not part of the Project, but the Project does not preclude its construction. As shown in Figure 2-27 of the Draft EIS, the Airport Station will not be significantly farther away from the terminal than the parking garages. The Station will be connected to the parking garages and terminal by a pedestrian path.

f. The location of the Airport Station will not be changed. As noted in Section 2.2.2 of the Draft EIS, "bus service would be enhanced and the bus network would be modified to coordinate with the fixed guideway system." Existing and future bus routes, including route numbers and frequencies, are presented in Appendix D of the Final EIS.

4. As described in Section 2.5.10 of the Final EIS, to support phased opening of the system, the first construction phase must be connected to a maintenance and storage facility, which requires considerable land. The first phase of the Project must be connected to the maintenance and storage facility because, in addition to maintenance of equipment and ongoing operations, the maintenance and storage facility houses the main control center for the entire Project, and the required testing and operation of the system could not be completed without access to it. No location has been identified closer to Downtown, with sufficient available land to construct a maintenance and storage facility. The Project will be constructed in phases to accomplish the following:

- Match the anticipated schedule for right-of-way acquisition and utility relocations.
- Reduce the time that each area will experience traffic and community disturbances.
- Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.
- Match the rate of construction to what can be maintained with local workforce and resources.
- Balance expenditure of funds to minimize borrowing.

The portion of the corridor Ewa of Pearl Highlands is less developed than the areas Koko Head. As a result, right-of-way can be obtained more quickly and overall Project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted Koko Head from Pearl Highlands to Aloha Stadium, then Kalihi, and finally to Ala Moana Center.

a. The suggested location of Keehi Lagoon Park is a publically owned recreational facility that may not be converted to transportation use. The other listed sites are not available or do not provide sufficient space for a facility. The Project will restore any areas directly affected by construction.

5. To address those comments:

a. As shown in Table 3-27 in the Final EIS, lane closures are expected on Nimitz Highway during construction. As stated in Section 3.5.7 of the Draft EIS, a Maintenance of Traffic (MOT) Plan will be developed by the contractor that must be approved by the City and the Hawaii Department of Transportation. The MOT Plan will help mitigate construction-related traffic effects.

b. As stated in Section 4.18.2 of the EIS, the Downtown Station area already has transit-oriented development (TOD) or TOD-like developments. Further redevelopment could occur, particularly around the Port, and incorporate more TOD elements in the future. Development in the historic districts is somewhat limited. The Project is unlikely to substantially alter future development plans in the Downtown area.

c. The platform will be more than 30 feet above street level. It will allow transit patrons to be above surge level.

d. The proposed alignment would result in several additional displacements, would be less centralized, and would not be able to serve Downtown and Kakaako as well as the Project. The Project includes a station at Kaaahi Street.

e. The proposed alignment would not meet the design criteria of a minimum 500-foot curve radius without the removal of several buildings.

f. A King Street alignment was evaluated in the Alternatives Analysis and shown to serve substantially fewer riders than the Dillingham to Kakaako alignment included in the Project.

g. As shown in Figure 2-8 of the Draft EIS, the Project follows Halekauwila Street.

6. Thank you for your suggestions. However, any such fair would be outside the authority of the DTS. In addition, it is not in the purview of the EIS to determine future uses of Aloha Stadium, which is under the jurisdiction of the State.

7 & 8. It is not in the purview of the EIS to initiate reform of the built environment into a "Garden City." The City plans, not the EIS, direct future development that will occur within the study corridor. In addition, thank you for submitting your ideas of integrating the Project with other opportunities. It is not within the purview of the EIS to address these opportunities.

9. Thank you for your comment.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Issuance of the Record of Decision under NEPA and acceptance of the Final EIS by the Governor of the State of Hawaii are the next anticipated actions and will conclude the environmental review process for this Project.

Very truly yours,

WAYNE Y. YOSHIOKA

Dear Mr. Ogura:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

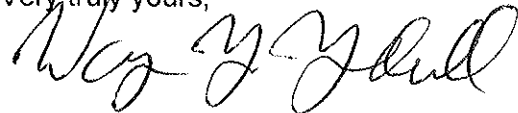

The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS; however, the future extensions are not part of this Project. Thus, they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time. The

Mr. Daniel Ogura
Page 2

anticipated future extension to the UH Manoa campus would include stations in the McCully vicinity. While the future extension has not been designed and is therefore subject to change, stations in the vicinity of McCully and Date Streets are anticipated. Appendix C of the Final EIS provides information about properties that will be affected by the Project for you to review.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Honolulu, HI 96813

Dear Mayor Mufi Hannemann,

I am writing to enquire you about the Rail Transit. I am afraid that I do not support this topic. I am aware of the fact that this will cost billions of dollars. I believe that we could use this money for other purposes. This money can be used to help our community's facilities, business, and schools, for our economy is going through a crisis. We should focus more on education to help further our learning of technology, for it is what our future holds.

I oppose the rail transit system for it does not look very nice and it can ruin the beauty of Hawaii, our paradise. It can be dangerous and harmful to our community for, accidents can occurred as of it has happened in the past, loud construction work will be an annoyance since there are houses and business taking place and it will take many years to plan and build. Some people do not support the idea because taxes will be raised and some do not have any need for the rail transit. Gas prices are decreasing and it would be more convenient to drive a car to get to places faster than to use the rail transit, waiting to get to your destination. The cost of the transit is high priced using our tax money, yet that's only to build it. After it is built, we would have to pay a fee to ride it which I'm afraid might be costly for Hawaii residents. The bus system is inexpensive and works perfectly fine and the same as if the rail transit would be used. In the end, this involves having too many technological and financial problems.

I am enclosing this and I hope that you can reconsider this thought. I appreciate your time being, Thank you and mahalo again for reading this.

Yours Sincerely,

Crysta Okabe
(student)

Dear Ms. Okabe:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final

EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

Regarding the possibility of using Project money for other purposes, the enabling legislation for the General Excise and Use Tax (GET) surcharge precludes the use of the collected funds for purposes other than a fixed guideway transit system.

Your letter also commented on the visual aspects of the Project. The island's unique visual character and scenic beauty were considered in the visual and aesthetic analysis presented in the Draft and Final EISs. As discussed in Section 4.8 of the Final EIS, the Project will be set in an urban context where visual change is expected and differences in scales of structures are typical. The following measures will be included with the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

- Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
- Coordinate the project design with the City's transit-oriented development program within the Department of Planning and Permitting.*
- Consult with the communities surrounding each station for input on station design elements.*
- Consider specific sites for landscaping and trees during Final Design when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will mitigate potential visual impacts.*

The Project will provide users, including tourists, with expansive views from several portions of the corridor by elevating riders above highway traffic, street trees, and low structures adjacent to the alignment. Section 4.8 of the Final EIS describes the effect of the Project on the visual environment and provides simulations to convey a sense of the look and "feel" of the guideway. This section also shows simulations of many locations where the guideway will be built, with simulations comparing possible "before" and "after" conditions. It discusses mitigation of those effects through design, vegetation, and other means to preserve views and maintain as much as possible the integrity of the neighborhoods through which the guideway will run. Section 4.8.3 of the Final EIS also lists specific environmental, architectural, and landscape design criteria that will help minimize visual effects of the Project.

Regarding safety, Section 2.5.4 of the Final EIS states that the Project is designed to meet safety and security criteria typical of fixed guideway transit systems. Operation in exclusive right-of-way eliminates the potential for accidents between automobiles and fixed guideway transit vehicles. Because pedestrians will not be allowed to cross the tracks, the potential for pedestrian accidents is virtually eliminated. Platform edges will be delineated with high-contrast visual and textured markings. All stations, park-and-ride facilities, and vehicles will include security cameras that are monitored at all times of operation, will have audible and

visual messaging systems, and an intercom link to the system operations center. Security personnel will also patrol the system. Interior and safety lighting will be provided at all stations and park-and-ride facilities.

Construction noise will be a short-term impact, and all local noise ordinances will be followed to reduce noise annoyance to residences and schools. A variance will be obtained from the Hawaii Department of Health. The permit will regulate construction times and activities and include mitigation commitments. Construction effects are documented in Section 4.18.5 of the Final EIS in detail. All efforts will be made to minimize inconvenience during construction, but, as with any construction project, there will be some disruption.

The Project is being funded largely by a 0.5 percent increase in the GET surcharge that has been in effect since the beginning of 2007. Chapter 6 of the Final EIS describes the financial resources anticipated to be needed to pay for the capital costs of the Project and for ongoing operating and maintenance costs. Capital costs of the Project, including finance charges, are expected to be fully paid for by a combination of FTA Section 5309 New Starts Funds from the Federal government and the GET surcharge revenues collected from 2007 through 2022 on Oahu. Operating and maintenance costs will be paid for from the same sources currently used for TheBus, Federal funding, fare revenues, and City revenues from the General and Highway Funds.

Lastly, regarding your comments about the existing bus system, the cost to ride the fixed guideway will be the same as TheBus and free transfers will be provided between TheBus and the fixed guideway (and vice-versa). Gas prices are lower now but are not likely to stay that way; and even if you can drive to your destination, congestion will make the trip stressful and long. The same happens now with trips on TheBus. With increasing traffic congestion over the last 20 years, scheduled trip times for bus routes have been lengthened to reflect the additional time each bus trip takes. Transit inefficiency consumed \$13.5 million in additional operating budget expenses in 2007 without adding new service. Roadway congestion would worsen by 2030 under No Build conditions, which would further decrease transit speed and efficiency. These limitations are detailed in Chapter 3 of the Final EIS. The Project will not suffer from congestion issues because it will be above grade and will not compete with cross-traffic, pedestrians, and bicyclists. The trip will be much faster than by car during peak periods and a lot less stressful.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Honolulu, HI 96813

February 2, 2009

Dear Mr. Yoshioka, Mr. Matley and reviewing board,

Thank you for reviewing my comments to the City's DEIS on Honolulu's proposed rail system. I'd like to submit the current DEIS has neglected to present the details on the complete route approved by the city council and expected by the public.

Timeline:

1. In 2006, the City Council approved the fixed guide way route from East Kapolei to the University of Hawaii Manoa with a connection to Waikiki (DTS2006b).
2. In this past 2008 general election, there was a ballet question to approve or disapprove the fixed guide way system.
 - a) The last information the public had on the proposed route was based in the Locally Preferred Alternative approved by the city council. The route was to go from Kapolei to University of Hawaii, Manoa and Waikiki.
 - b) The city and other entities created television, print and radio ads showing students excited on a convenient way to get to school.
3. The DEIS came out after the general election.
 - a) The DEIS does not contain any details of the route past Ala Moana Center.
 - b) The DEIS does not contain any feasibility figures of the full route including UH Manoa or Waikiki.

The public was presented a route which included Kapolei, UH Manoa and Waikiki. The Manoa and Waikiki spurs may be future spurs; however, it will impact the current route. Full disclosure on its impact and viability should be included in this DEIS.

Thank you,

Dear Mr. Onishi:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

Your comments have been noted. As discussed in Section 1.1.2 of the Draft EIS, the City Council selected the First Project from East Kapolei to Ala Moana Center by Resolution 07-039. The First Project must be fiscally constrained to anticipated funding sources. The Project, as addressed in the Draft and Final EISs, reflects the limits established in Resolution 07-039. The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The proposed future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS. The future extensions are not part of this Project; thus, they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative

Mr. Gary Onishi
Page 2

impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is fluid and cursive, with the first name "Wayne" being particularly prominent.

Governor Linda Lingle
Executive Chambers
Hawaii State Capitol
Honolulu, Hawaii 96813

January 17, 2009

Dear Gentlemen and Governor Lingle,

Overview

Kakaako Mauka is home for a diverse group of construction services, wholesalers, fabricators, mechanics, retailers and single family residents. The DEIS, through the current rail alignment and TOD plans envision a vibrant mixed use urban environment. The alignment favors a route which will force the city to take 82 partial and 24 full land parcels. I'd like to submit the DEIS fails to recognize the current economic and social value Kakaako Mauka provides. It also fails to mitigate potential damage of displacing or interrupting the current business activity.

Economic Impacts

Businesses in Kakaako are in the area because of its unique location. Kakaako services the direct Honolulu Central Business district, Waikiki and surrounding Makiki, Manoa, residential areas. Any relocation effort to move these businesses outside of the Kakaako area would surely undermine the reason why they are in Kakaako. The DEIS does not address the impact of how displacement of these business will impact the surrounding loss of services these businesses provide. The DEIS also indicates it will give 90 days notice for a resident or business to relocate. This clearly is not enough time. Many of these businesses have specialized equipment and site requirements. Selection of a new site, negotiating with the new sites owner and making the move clearly can not be done within that amount of time. The DEIS does not address any specific mitigation measures.

Markettrends Pacific studied the Kakaako business contribution in 2007. It revealed Kakaako Mauka's non retail population employed roughly 17,000 people. This is about 4% of Honolulu's non-agriculture workers. Annual sales in 2006 were \$2.02 billion or about 6% and 4% of Honolulu's and the State's economy respectively. (Further information can be obtained from Market Trends Pacific 808-532-0733 or email: info@markettrendspacific.com) Displacement of Kakaako Mauka businesses would impact not only Kakaako businesses but also impact statewide economies.

Total / Partial Condemnation and Construction Impacts

The DEIS is vague on property acquisition mitigation solutions. The DEIS only says it will follow an outline provided by the Real Estate Acquisition Management Plan

To expand on the acquisition impact, the DEIS doesn't indicate if or how it would mitigate construction obstructions. Construction obstructions can take many forms. For example obstructions may include:

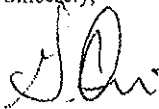

1. Location of support columns
 - a. They may sit in the center of a street but interfere with egress or ingress of a property
 - b. They may interfere with loading and unloading operations of a business
 - c. They may interfere with the visibility of a business from the street.
2. Noise
3. Construction detours
4. Road closures
5. Loss of street parking

The extent of these impacts may be determined by the length of time and how meaningful each impact is on a business. For some businesses, these impacts may be permanent. The DEIS offers no mitigation solutions.

Partial property condemnations may also greatly impact business viability. Per the Federal Real Estate Acquisition Plan, if partial condemnation impacts the economic viability of a property, the acquiring agency must offer the fair compensation for any remnant. If the City is required to acquire most of the 82 partially impacted properties, not to mention the hundreds outside of Kakaako, it brings to question the economic viability of the DEIS.

Kakaako businesses support Honolulu and the states economic base. These businesses are here now and are major contributors to Hawaii's economy and growth. The ripple effect of disruption to this base goes beyond any potential economic growth promised by TOD. The impacts go beyond the proposed alignment. Disruption to Kakaako will affect the state economy now and into the future.

Sincerely,

Gary Onishi

Dear Mr. Onishi:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The following paragraphs address comments regarding the above-referenced submittal. As presented in Appendix B of the Final EIS, between the proposed Civic Center Station and the proposed Ala Moana Center Station, 61 total parcels will be affected through full or partial acquisition. Of the 61 affected parcels, 11 are proposed for full acquisition. The displacement of business from these parcels, assuming these businesses relocate in Honolulu, is not anticipated to generate economic impacts to the statewide economy.

As stated in the Final EIS, 4.4.3 Environmental Consequences and Mitigation: Where relocations will occur, compensation will be provided to affected property owners, businesses, or residents in compliance with all applicable Federal and State laws and will follow the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act (49 CFR 24). In addition to the minimum 90-day written notice will be provided before any business or resident will be required to move. The City will assist all affected persons in locating suitable

replacement housing and business sites within an individual's or business's financial means and these relocation services will be provided without discrimination so that all persons, organizations or businesses displaced by the Project will be treated fairly and equitably. Construction impacts on businesses are discussed in Section 4.18.1 of the Final EIS. As discussed, a Maintenance of Traffic (MOT) Plan will be developed to address temporary effects on access to businesses during construction. Proposed mitigation to reduce adverse economic hardships for existing businesses along the Project alignment during construction activities may include the following:

- *Coordinate construction planning and phasing with nearby property owners and businesses.*
- *Develop a public involvement plan prior to construction to inform business owners of the construction schedule and activities.*
- *Initiate public information campaigns to reassure people that businesses are open during construction and to encourage their continued patronage.*
- *Minimize the extent and number of businesses, jobs, and access affected during construction.*
- *To the extent practicable, coordinate the timing of temporary facility closures to minimize impacts to business activities—especially those related to seasonal or high sales periods.*
- *Minimize, as practical, the duration of modified or lost access to businesses.*
- *Provide signage, lighting, or other information to indicate that businesses are open.*
- *Provide public information (e.g., press releases or newsletters) regarding construction activities and ongoing business activities, including advertisements in print and on television and radio.*
- *Phase construction in each area so as to maintain access to individual businesses for pedestrians, bicyclists, passenger vehicles, and trucks during business hours and important business seasons.*
- *Provide advance notice if utilities will be disrupted and scheduling major utility shutoffs during non-business hours.*

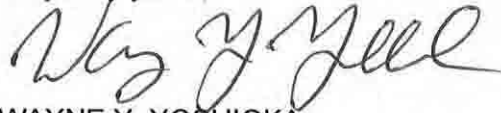

As discussed in Section 4.4.1 of the Final EIS, generally, if only a portion of the property will be required and remain usable, then it is considered a partial acquisition. However, if a substantial amount of the land and/or the primary structure were located within the portion of the parcel to be acquired, then the entire property will be purchased. This is referred to as a full acquisition. As shown in Section 6.3.1 and Table 6-1 of the Final EIS, right-of-way costs, while significant, are a fraction of the total project budget.

Mr. Gary Onishi
Page 3

Right-of-way information has been updated in the Final EIS. Please see Section 4.4 Acquisitions, Displacements, and Relocations as well as Table 4-4 the Acquisitions and Displacements Summary. In addition, Appendix C has parcel-by-parcel information for all anticipated acquisitions for the Project.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is fluid and cursive, with the first name "Wayne" being the most prominent.

Dear Mr. Ornellas:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

As described in Section 2.5.10 in Chapter 2 and further in 8.6.9 in Chapter 8 of the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable property. No location has been identified closer to Downtown with sufficient available property to construct a maintenance and storage facility; therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- *Reduce the time that each area will experience traffic and community disturbances.*
- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*

Mr. John Ornellas
Page 2

- *Match the rate of construction to what can be maintained with local workforce and resources.*
- *Balance expenditure of funds to minimize borrowing.*

The portion of the corridor Ewa of Pearl Highlands is less developed than the areas Koko Head. Therefore, the right-of-way can be obtained more quickly, which will allow the overall project construction to begin sooner, resulting in lower total construction costs. Construction is planned to continue uninterrupted Koko Head from Pearl Highlands to Aloha Stadium, then Kalihi, and finally to Ala Moana Center.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Dear Mr. Oshiro:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

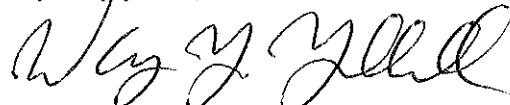

Your preference for the Airport Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the

Mr. Calvin Oshiro
Page 2

Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

RE: Honolulu High Capacity Transit Corridor Project Draft Environmental Impact Statement

Aloha Mr. Yoshioka:

OVERVIEW

To paraphrase the Draft Environmental Impact Statement (DEIS), The Honolulu Transit Project is destined to become the most visually dominant and intrusive construction project in the history of Hawai'i. While its ability to ease traffic problems on O'ahu has been the subject of lengthy debate, its negative impact on the visual environment of this island cannot be denied and is virtually immeasurable.

The Outdoor Circle's review finds that the project's DEIS fails to adequately describe the cumulative impacts of the project and how those impacts will be mitigated with respect to view planes, street trees, landscaping, utility lines and overall intrusiveness in our communities. Additionally we do not find the information provided about the alternatives to contain enough detail to make an informed assessment of the project.

Throughout the comments provided in this document, all material in quotes and underscored have been copied word-for-word from the DEIS.

VIEW PLANES and COMMUNITY INTRUSIONS

The Honolulu High-Capacity Transit Corridor Project will become the single most dominant man-made feature in the State of Hawai'i. It will intrude upon "the open and undeveloped character" of the Ewa Plain. It will block views of parks, and historic sites in Pearl City. In the airport district it will "obstruct the views of East Loch and the Pearl Harbor historic sites" for hundreds of homes. Please provide details as to how these impacts will be mitigated. In Kalihi the raised guideway will be the "dominant feature in the views along Dillingham Blvd." In Chinatown the proposed project "blocks makai views," and will be "out of character with the pedestrian oriented environment" in one of the most historic and sensitive

Mr. Wayne Yoshioka
February 6, 2009
Page 2

neighborhoods on the island. Again, no details are given as to how this will be mitigated. In order to analyze the full impacts of the project the EIS must provide specifics.

As it passes through the city's central business district, the guide way and the proposed Downtown Station will "be dominant features in the views along Nimitz Highway." It will "contrast substantially with the pedestrian character of the streetscape" and it will "substantially affect the visual setting of the Dillingham Transportation Building and Irwin Park." Finally it will "block makai views" from numerous residences. "Overall visual effects in this area would be high." As the project approaches historic structures such as the two listed above more consideration must be given to alleviating the negative impacts the guide way will have. Please provide more information.

As the guideway heads to Ala Moana Center there will be more "block(ed) views on the fourth and fifth floors of residences and offices" and will "increase light and glare on upper story residences." Throughout this part of the city the project will "block protected mauka-makai views of the Ko'olau and Waianae Mountains; the ocean and Honolulu Harbor and Diamond Head, Punchbowl and Aliamau craters" "Overall the visual effects in these areas would be high." Once again we ask what efforts the city will undertake to lessen these impacts.

The assessments made in the DEIS are mostly based upon predicted impacts on people from fixed locations. Barely mentioned is the fact that the project also will have enduring, significant negative impacts on anyone who travels near it, whether a Windward or North Shore resident or one of the millions of people who visit our island every year.

The document contains broad promises of designing various elements to minimize negative visual effects. However, the lack of specific descriptions of how to overcome the visual impacts leaves our organization with little confidence that damages to the visual environment can or will be considered as the project moves forward. It is imperative that the EIS provide further explicit detail.

In addition, the document offers little in the way of alternatives. We believe that alternatives that have a lesser impact on the scenic environment should be studied and detailed. Only then can an informed decision be made.

STREET TREES

Of equal concern to The Outdoor Circle is the fate of literally hundreds of street trees. Honolulu has fostered a worldwide image of being a city full of beautiful trees. It is an important part of Honolulu's appeal to both residents and visitors. But the system's chosen alignment will result in the removal of more than 800 street trees. About one-half to two-thirds of those trees will be transplanted to unspecified "appropriate areas," but that leaves a possible deficit of more than 300 trees with no mitigation to the environment for the tree removals. For the sake of island aesthetics, pollution reduction, oxygen production, storm water reduction and ambient temperature moderation the city must revise its mitigation

Mr. Wayne Yoshioka
February 6, 2009
Page 3

plans so that the result of the project is a net increase of three shade trees for every one tree removed. Also, the EIS must be species specific as to what will be replanted.

Further, The Outdoor Circle knows how difficult it is to find available tree planting sites in our city. We believe the EIS must provide specific sites for tree relocations now. The language in the draft document is too vague. Please address this issue.

Of great distress is the proposal to eliminate "notable" trees in two separate areas. The project calls for the removal of 19 beautiful Kamani trees on the mauka side of Dillingham Boulevard near Honolulu Community College. It proposes keeping the Kamanis on the makai side which already have been severely pruned by HECO contractors to keep them away from the power lines. The result of this pruning has left these important trees barely recognizable. We believe the EIS must require that the power lines be placed beneath the fixed guideway or placed underground to eliminate additional blight. We also believe that keeping the badly misshaped Kamani trees while removing the beautiful, completely healthy trees across the street is unacceptable. The EIS should provide for the guide way alignment to shift to the makai side of Dillingham where the already compromised Kamanis could be removed instead of the beautiful trees on the mauka side.

Additionally, we find it completely unconscionable that the City would remove 23 beautiful, fully mature Monkeypod trees from Kapiolani Boulevard in the area of University Avenue as is proposed for the future alignment to the University of Hawai'i. The Kapiolani Boulevard Monkey Pod trees are a community resource that must be preserved and protected as they currently exist. The City must rethink and adjust the transit alignment that would result in the removal of any of the Monkey Pod trees on Kapiolani Boulevard.

The DEIS briefly discusses how to mitigate the "substantial damage" to street trees. However the language is uncertain and unconvincing. It states that a contractor "would prepare new planting plans." and that additional trees "could be planted to offset this impact." The Outdoor Circle does not believe "would and could" are the kind of guarantees the people of Honolulu are looking for. The final EIS must specifically state how the City intends to fully, not partially, mitigate the loss to our urban forest.

TREE PROTECTION

The DEIS fails to present plans for protecting existing trees during construction. These include trees in close proximity to the project elements including all transit stations, the fixed guide way and all other infrastructure that will be constructed or installed as part of the project. This oversight could result in significant negative impacts to the trees, their canopies and/or roots resulting in the unintended damage or destruction of hundreds of trees. It is absolutely essential that the EIS include detailed tree protection plans that meet the standards of the International Society of Arboriculture (ISA). The plan also must state that all tree protection work will be supervised by qualified certified arborists who will be present during construction to ensure the integrity of the tree protection plan is maintained.

LANDSCAPING PLANS

The DEIS fails to specifically outline plans for mitigating the visual impacts of each of the transit stations as well as the large pillars that will support the fixed guide way for the entire length of the project. The Outdoor Circle believes the EIS must be much more specific in its landscaping plans in order to reduce the hard, physical presence of hundreds of support columns in every community along the planned alignment. These plans must include the planting of adequate greenery—trees and/or shrubs—to reduce the substantial visual impacts of the concrete supports.

Equally intrusive and in desperate need of specific landscaping plans are the more than two dozen transit stations that will rise above the fixed guide way and surrounding neighborhoods. These plans must be laid out in the EIS and their costs incorporated into the project budget. Landscaping must be included from the project's initial conception and not as an add-on after the fact.

SIGNS and ADVERTISING

Also not included in the DEIS is any mention of a commitment by the City to reject proposals that would allow signage in, around or on any part of the project—including all "transit oriented development" that may violate existing state or county sign laws. The EIS must address this issue fully. Also, there must be an absolute prohibition against any exterior commercial advertising on the train, the transit stations or any portion of the transit infrastructure such as its maps. The failure to address these concerns is an oversight that must be corrected to ensure that this project will not deviate from the long-standing protection of the visual environment against the scourge of inappropriate off-site advertising or excessive signage.

UTILITY LINES

We believe that this project offers a unique opportunity for the City and County of Honolulu and the wide range of O'ahu's utility providers to remove a long standing and persistent eyesore from the visual environment. One of the most intrusive elements that detract from the beauty of Hawai'i is the overbearing presence of utility poles and lines. The Outdoor Circle believes that relocating all utility lines along the transit route and placing them underground or along the under side of the fixed guide way will enhance the view planes. In addition, committing to this action will provide some mitigation for the visual damage created by the project. The visual burden of the fixed guide way and existing overhead utility lines is unacceptable. The EIS should discuss the effects of the utility poles and lines in detail and then provide information on the cumulative impacts of the lines with the fixed guide way.

FINAL OBSERVATIONS

The Outdoor Circle believes the City has substantially downplayed the visual impacts the project will have on our communities and our quality of life. Nor does the city offer acceptable mitigation throughout the DEIS for the damage this project will inflict.

Mr. Bob Loy, Director of Environmental Programs
The Outdoor Circle
1314 South King Street, Suite 306
Honolulu, Hawaii 96814

Dear Mr. Loy:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

1. **Concerns about View Planes and Community Intrusion**

The island's unique visual character and scenic beauty were considered in the visual and aesthetic analysis presented in the Draft and Final EISs. The Project will be set in an urban context where visual change is expected and differences in scale of structures are typical. The visual effects on Honolulu's Downtown are discussed under the Kalihi to Ala Moana Center Landscape Unit heading in Section 4.8.3 of the Final EIS.

It is acknowledged that the guideway and stations will noticeably contrast with smaller size buildings and the affect the undeveloped character of the Ewa plain and other areas along the alignment. In addition, views in the Downtown and the other areas referenced by the

commenter, including protected mauka-makai views (Honolulu Ordinance Section 24-1.4), will be blocked, and some views will change substantially, resulting in substantial visual effects. Section 4.8 of the Final EIS further assesses protected mauka-makai views from what was presented in the Draft EIS (see Tables 4-10 through 4-14 and Figures 4-39 through 4-50). Protected views and vistas are identified in policy documents that govern the project corridor and include protected mauka and makai views, as well as views of prominent landmarks. The protected views and vistas are identified in Figures 4-17 to 4-19. These figures are included in the Visual and Aesthetics Resources Technical Report (RTD 2008e).

Furthermore, protected views and vistas, including mauka and makai views and views of prominent landmarks in the study corridor are identified in City development plans, including the Ewa Development Plan, Central Oahu Sustainable Communities Plan, and the Primary Urban Center Development Plan. The Project is consistent with the land use objectives included in these plans (See Final EIS Appendix J.).

The assessment acknowledges that some view obstructions and changes to views will be unavoidable and substantial. They will be most noticeable where the guideway and stations are nearby or in the foreground of views. This includes views for those who travel near the alignment. The degree of visual effect will vary with the alignment orientation, guideway and station height, and height of surrounding buildings and trees, along with the viewer's expectations of view quality. It is also noted that the Project will conflict with Honolulu Ordinance Section 24-1.4 where project elements such as the guideway would block protected mauka-makai view corridors. View changes are not likely to be obtrusive in wider vistas or regional panoramic views where the project elements serve as smaller components of the larger landscape.

Section 4.8.3 of the Final EIS under the heading Design Principles and Mitigation, lists specific environmental, architecture and landscape design criteria to minimize visual effects of the Project. The Final EIS commits to the following measures to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

- Develop and apply design guidelines that establish a consistent design framework for the Project with consideration of local context.*
- Coordinate the project design with the City's TOD program within the Department of Planning and Permitting.*
- Consult with the communities surrounding each station for input on station design elements.*
- Consider specific sites for landscaping and trees during the final design phase when plans for new plantings will be prepared by a landscape architect. Landscaping, streetscape improvements, and utility relocation will mitigate potential visual impacts.*

It should also be noted that the Project will provide rail users with expansive views from several portions of the corridor by elevating riders above highway traffic, street trees, and low structures adjacent to the alignment.

2. Street Trees

The city intends to fully mitigate the Project's impacts to Honolulu's street trees. Section 4.15 of the Final EIS includes information about notable trees and explains that:

Tree removal will be minimized to the greatest extent possible, but pruning is likely next to the guideway. Twenty-eight "Notable" true kamani trees along Dillingham Boulevard will be removed. Approximately 100 street trees will be pruned, 550 will be removed, and 300 will be transplanted. Mitigation measures will consist of transplanting existing trees or planting new ones. Pruning will be in compliance with City and County ordinances and require supervision by a certified arborist. The City will coordinate with the State of Hawaii Department of Transportation landscape architect.

As requested, Section 4.15 of the Final EIS identifies the specific tree species to be transplanted.

As you stated in your letter, trees on the makai side of the street are already periodically pruned because of the presence of utilities. Trees on the mauka side of Dillingham Boulevard are not pruned and will be preserved. The Project will not affect any trees on Kapiolani Boulevard. Effects to street trees will be mitigated by transplanting existing trees or planting new ones, where possible. Trees suitable for transplanting that are displaced by construction will be relocated to the City project nursery until they can be transplanted to another part of the project area. The City will coordinate with HDOT's highway landscape architect. The City also will coordinate with SHPD for the removal of the group of 28 True Kamani Trees on the makai side of Dillingham Boulevard in accordance with the Programmatic Agreement (PA), Appendix H. The location where street trees will be transplanted will be selected based on project-specific criteria that could include the following:

- *Areas where existing landscaping will be lost along the corridor.*
- *Areas where opportunities exist for enhancing existing streetscapes near the study corridor.*
- *Areas where stations and parking lots will be constructed.*
- *Areas where shared benefits will be accomplished, such as areas adjacent to parks or historic sites.*

Street tree pruning, removal, and planting will comply with City ordinances and will require that a certified arborist manage the pruning of any Exceptional trees. Trees suitable for transplanting that are displaced by construction will be relocated to a City project nursery until they can be transplanted to another part of the project area. The City will coordinate with HDOT's highway landscape architect. In addition to transplanting existing trees, plans for new plantings will be prepared by a landscape architect during final design to further mitigate effects to street trees. To mitigate any substantial effects in areas that require tree removal, special attention will be given to developing landscaping plans so that new plantings will provide similar advantages to the community. If new plantings will not offer equitable mitigation (e.g., older

mature trees that are removed), additional younger trees could be planted that will, in time, develop similar benefits.

Specific sites for relocating and planting trees will be considered during the Final Design phase when plans for new plantings will be prepared by the Project's landscape architects. To mitigate any substantial effects in areas that require tree removal, special attention will be given to developing landscaping plans so that new plantings will provide similar advantages to the community. If new plantings will not offer equitable mitigation (e.g., older mature trees that are removed), additional younger trees could be planted that will, in time, develop similar benefits.

3. Tree Protection

As discussed in Chapter 4, Section 4.18.8 of the Final EIS, street trees that require pruning for construction activities will be pruned more extensively than they will later for system operation. For street trees that will not be affected by system operation, a tree protection zone will be established during construction. The protection zone will be delineated by protective fencing.

4. Landscaping Plans

The ongoing station area planning process involves numerous aspects of transit system design. The process addresses design and planning issues in an integrated manner and focus on the characteristics and preferences of the communities adjacent to each station.

Section 4.8 of the Final EIS addresses Visual and Aesthetic Conditions and mitigation measures derived in accordance with USDOT guidance. The assessment methodology used for this analysis is adapted from the Federal Highway Administration's (FHWA) Visual Impact Assessment for Highway Projects (Publication No. FHWA HI-88-054).

In Section 4.8.3 of the Final EIS, specific environmental, architecture, and landscape design criteria are listed that will help minimize visual effects of the Project. The City will implement the following measures to minimize negative visual effects and enhance the visual and aesthetic opportunities that the Project creates:

- Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
- Coordinate the project design with the City's transit-oriented development program within the Department of Planning and Permitting.*
- Conduct public involvement workshops to consult with the communities surrounding each station for input on station design elements.*
- Consider specific sites for landscaping and trees during Final Design when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will serve to mitigate potential visual impacts.*

Even with mitigation measures, some obstruction and changes to views will result in a high level of visual impact, or, a significant visual impact, and changes to some views will be unavoidable. These effects will be most noticeable where the guideway and stations are nearby or in the foreground of views.

Some views and vistas protected by City development plans will change as a result of the project, including public views along streets and highways, mauka-makai view corridors, panoramic and significant landmark views from public places, views of natural features, heritage resources and other landmarks. Depending on the degree of view obstruction or blockage, some changes in view will be significant. Viewers' response to these changes will vary with their exposure and sensitivity and depend on the alignment orientation, guideway and station height, and height of surrounding trees and buildings. View changes will be less notable in wider vista or panoramic views where the project elements are smaller components of the larger landscape. Generally, the project elements will not be dominant features in these views.

5. Signs and Advertising

DTS has developed specifications and design criteria that establish Project requirements, please see Section 4.8.3 of the Final EIS. Commercial advertising on the system will be in compliance with State and City laws.

6. Utility Lines

As discussed in Section 4.18.2 of the Final EIS, "Communication and coordination have been initiated with the affected utility agencies and companies and will continue throughout design and construction." Further, "Design criteria will govern all new utility construction outside of buildings, as well as the support, maintenance, relocation, and restoration of utilities encountered and affected by construction of the fixed guideway." In addition, "Along several roadway corridors, most existing overhead utilities in conflict with the guideway and safety clearance requirements will be relocated underground. Existing overhead electrical and communication utilities not in conflict with the aerial guideway and safety clearance requirements will remain overhead. Coordination will occur with emergency services and utility companies to ensure that utility relocations meet their needs and that sufficient clearance is provided. The City will evaluate relocation of utilities that are in conflict with the fixed guideway during preliminary design.

7. Final Observation

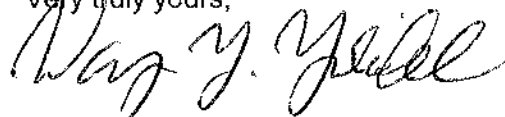

As stated in the Executive Summary of the Final EIS, "The purpose of the EIS is to provide the City and County of Honolulu Department of Transportation Services Rapid Transit Division, the Federal Transit Administration, and the public and interested parties with the information necessary to make an informed decision, based on full and open analysis of cost, benefits, and environmental impacts of alternatives considered." This analysis, which is detailed in the Final EIS and related documentation, includes environmental commitments to avoid and/or reduce environmental effects. Further, additional analysis was included in the Final EIS based on comments received from the public on the Draft EIS.

Mr. Bob Loy
Page 6

Section 4.8.2 of the Final EIS states that the Outdoor Circle provided data or input on the visual assessment for the Project. In addition, Section 4.15.1 states that coordination with Outdoor Circle was initiated at the start of the NEPA process and that coordination will be ongoing as the Project progresses.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Dear Ms. Pa:

**Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement**

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses comments regarding the above-referenced submittal:

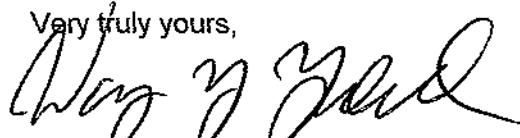

Your planned use of a Fixed Guideway Transit Alternative has been noted. While each of the alternatives includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana Center has been selected as the Preferred Alternative. The identification of the Airport Alternative as the Preferred Alternative was made by the City to comply with FTA's NEPA regulations that state that the Final EIS should focus on the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative, public input on the Draft EIS, and City Council Resolution 08-261 identifying the Airport Alternative as the Project. The selection of the Airport Alternative is described in Chapter 2 of this Final EIS. The discussion of the alternatives considered is included in Chapter 2 of this Final EIS and the Alternatives Analysis. As discussed in Section 3.4.2 of this Final EIS, the Airport Alternative will carry the most passengers with 116,000 daily passengers

Ms. Florita Pa
Page 2

and 282,500 daily trips in 2030, thereby resulting in the greatest transit-user benefits. The Airport Alternative will also result in the fewest vehicle miles traveled and vehicle hours of delay, as well as provide access to major employment areas, including Honolulu International Airport, that will have substantially greater ridership than the other alternatives considered.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Issuance of the Record of Decision under NEPA and acceptance of the Final EIS by the Governor of the State of Hawaii are the next anticipated actions and will conclude the environmental review process for this Project.

Very truly yours,

WAYNE Y. YOSHIOKA

Subject: Draft Environmental Impact Statement Review Comments for the Honolulu High-Capacity Transit Corridor Project

Dear Messrs. Matley and Yoshioka:

Pacific Guardian Center (PGC) supports the City's concept of a steel-on-steel rail fixed guideway system as an integral means of connecting our island communities. Because PGC is located along the proposed transit route and will be directly impacted by the project, we welcome this opportunity to comment on the Draft Environmental Impact Statement (DEIS) dated November 2008.

Existing Conditions

Pacific Guardian Center (PGC) is located within Honolulu's Central Business District, and the property is bounded by Bishop, Alakea, and Queen Streets, and Nimitz Highway. The property consists of the low-rise historic Dillingham Transportation Building (DTB), a pedestrian plaza, and two high-rise office towers (Mauka and Makai Towers) with a multi-level parking structure at the lower floors.

As noted in the DEIS, the DTB is listed on the Hawaii Register of Historic Places, and *"retains a high level of integrity, as the only major changes involve the creation of first-floor storefronts and two arcades by removal of some of the store spaces to provide Bishop Street access and address for the circa-1980 Pacific Guardian Center towers."* It should be noted that this remarkable historic and architectural integrity is possible primarily because the pedestrian plaza serves as both a buffer from and a connection to the more recent Mauka and Makai towers.

The existing plaza consists of pedestrian circulation, outdoor seating, and open gathering areas defined by generously planted trees and landscaping. Tenants and visitors alike regularly enjoy this outdoor space for meals, informal meetings, work breaks, or while waiting for others. The plaza also provides a convenient venue for private daytime or evening events and programs. In short, this gathering place is a well-used and desirable tenant amenity. The plaza also serves as the primary pedestrian entry path for both the Mauka and Makai towers. Since on-site parking is housed within the base of the towers, many DTB tenants also access the DTB via the plaza. In addition, the water feature at the makai end of the plaza currently houses the DTB's only common trash enclosure. This water feature serves to screen off views of the roadway and masks traffic noise.

Proposed Changes

According to preliminary information provided by the City, our understanding is that the proposed Downtown Station platform along Nimitz Highway between Bishop and Alakea Streets will rise approximately 40 feet above grade and that the overhead canopy structure will be more than 55 feet tall. We also understand that the station platform will span a width of approximately 50 feet and that connecting stair concourses will extend that overhead coverage to nearly 80 feet. We also understand that approximately 2,400 sq ft of the plaza between PGC and DTB would be appropriated for the mauka Downtown Station entrance along Nimitz Highway. During transit system operating hours of 4 a.m. to midnight, trains would arrive every 3 to 10 minutes.²

Impacts to Dillingham Transportation Building, Pacific Guardian Center, and Plaza

We are therefore concerned that the location, size, and bulk of the proposed elevated guideway and Downtown Station as well as the large passenger volume will have significant and detrimental impacts to the DTB, PGC, and their respective tenants.

Although approximately 2,400 sq ft of the existing plaza is proposed to be appropriated for the new Downtown Station entrance, we respectfully disagree with the assertion that the Downtown Station entrance "would not eliminate the open space or alter its use."³ According to the Draft EIS, the Downtown Station will be the primary destination for downtown Honolulu commuters and is projected to accommodate over 2,500 passengers within the 2 hour peak morning and evening hours and over 6,000 passengers are expected per day.⁴

The natural desire for convenience suggests that the majority of passengers will rely heavily upon the mauka station entrance as this offers a far more expedient access to the Central Business District than the station entrance on the makai side of Nimitz Highway. Our understanding is that this large volume of people passing in and out of the mauka station entrance will also require a significantly larger bulk and footprint than is proposed in order to provide adequately-sized stair, escalator, and elevator access. Furthermore, the remainder of the entire plaza will likely need to be forfeited and completely redesigned to properly accommodate this large flow of public pedestrian traffic. Corresponding increases in PGC's on-site security as well as operations and maintenance will be necessary. We are therefore deeply concerned that the open space of the plaza will be significantly reduced by a larger station entrance and that the use of the plaza will be changed from a private, tenant amenity to a public thoroughfare. We are also concerned that there is no available alternative location on the property for the displaced DTB trash enclosure.

While we sincerely appreciate the City's efforts to avoid locating the Downtown Station platform directly opposite to the historic DTB, it should be noted that the elevated guideway structure still remains approximately 40 feet from the DTB's Nimitz Highway façade, and the ewa end of the station is only 30-40 feet away from makai-Diamond Head corner of the building. This proximity of the elevated guideway structure and its supporting columns will block DTB tenants' makai views "from fourth and fifth-story windows"⁵ and significantly diminish the economic value of these spaces. In addition, although the Draft EIS lists ground level noise readings near the Downtown Station, no projected noise exposure levels are provided for upper floor levels.⁶ Since the proposed noise mitigation measures rely primarily on raised parapet walls along the edges of the guideway to direct upward and away from the ground, we are concerned that the noise of trains regularly passing immediately adjacent to the DTB and PGC will disturb and interrupt upper floor businesses and make it further difficult to attract and retain tenants in the affected spaces. We have similar concerns regarding detrimental impacts to tenants because "trains traveling on the guideway would create light and glare, and the Chinatown and Downtown stations would increase this effect."⁷

Although the several lanes of vehicular traffic along Nimitz Highway tend to discourage easy pedestrian travel between Downtown Honolulu and Honolulu Harbor, the proximity of DTB and PGC to Aloha Tower Marketplace and its views of and from Honolulu Harbor remain highly attractive features of the property. We are therefore concerned that the location, size, and bulk of the elevated guideway and station structures will only further visually and physically isolate our

property from the Aloha Tower Marketplace and considerably diminish its connection with the waterfront. Because *"the addition of the guideway and columns would change the visual character of the streetscape and substantially affect the visual setting of the Dillingham Transportation Building and Irwin Park,"*⁸ our fear is that the pedestrian environment along our property's Nimitz boundary will be significantly degraded.

We also remain doubtful of the City's assertion that the *"the project would cross, but not block, views along...protected mauka-makai street view corridors"*⁹ when immediately following this the DEIS states that *"the guideway and columns would be dominant elements in makai views between Nimitz Highway and Queen Street, and views of the horizon would be partially blocked."*¹⁰ Also contributing to our misgivings is the disclosure that *"the guideway and columns would reduce the open character of the streetscape, create shade and shadows, and block portions of makai views along...Bishop [Street]."*¹¹

Recommendations

It is our understanding that compared to at-grade transit solutions, elevated systems require inherently larger station structures to accommodate necessary elevators, escalators, and stairs as well as connecting walkways and concourses. Despite being placed overhead, this larger overall bulk would seem to reduce the City's flexibility in planning suitable station and route locations in historic, visually-sensitive, and pedestrian-oriented districts.

We therefore strongly urge the City to consider implementing an at-grade, overhead wire light-rail transit system similar to popular systems in Portland, Denver, and Salt Lake City. Such technology would allow the transit system to safely operate at-grade along the transit corridor and to be elevated above-grade when required by local site conditions. We strongly suspect that this would offer the City increased flexibility in planning station and route locations and minimize the associated negative impacts along the transit route.

It is also our opinion that the Downtown Station should ideally be one of the most noteworthy transit stations by virtue of its high passenger volume and its anticipated role as the primary gateway to and from the Central Business District. This station's civic prominence also suggests that it should be located along a gracious, public pedestrian thoroughfare. In contrast, the proposed Downtown Station entrance between the DTB and PGC appears to be the smallest along the transit route especially when compared with stations of comparable or lesser ridership. The Draft EIS confirms that it *"would be the highest volume station in the system without an associated transit center"*.¹² The proposed station entrance location also challenges pedestrians with a less obvious and less direct path. Passengers must either navigate around or through the DTB to access the primary mauka station entrance.

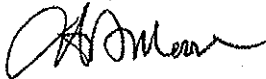

We therefore strongly urge the City to consider incorporating an at-grade Downtown Station into the TOPA Tower complex located between Bishop Street and Fort Street. Fort Street Mall is already a prominent existing public pedestrian thoroughfare, and it would provide a clear and direct user connection to the transit system because it runs straight through the core of the Central Business District from the Aloha Tower waterfront all the way to Beretania Street. While we appreciate that the DEIS considers Fort Street as an alternative, we respectfully disagree with the reasoning that a reduction of the rail's curve radius *"would result in increased travel time and a substantial decrease in user benefits."*¹³ When approaching or departing from the Downtown Station, trains will naturally need to decelerate or accelerate from a stop, regardless of being located near a curve or not. Therefore, slower train speeds near the Downtown Station should already be expected as part of normal operations, and rail curvature would not appear to be a relevant limiting factor in this case. Furthermore, an at-grade Downtown Station at TOPA Tower and Fort Street Mall avoids historic and visual impacts to Irwin Memorial Park, Aloha Tower, and the area in general.

If the Downtown Station must be located within the PGC property, we recommend that the City consider incorporating the Downtown Station into the DTB instead of appropriating any portions

of the adjacent plaza, and we would be open to future discussions on how best to achieve this. In the meantime, we wish to point out that the DTB's first floor arcade could serve as a gracious station entrance and would more easily distribute heavy pedestrian traffic onto Bishop Street and perhaps Queen Street. In this way the Central Business District would be provided a more visible access point and an appropriately grander identity while conserving PGC's tenant use of the plaza. Incorporating the Downtown Station into the DTB would also offer a more cost effective alternative to the necessary acquisition of the entire plaza as a public thoroughfare. Adaptive reuse of the DTB could potentially allow the station spaces themselves to help buffer between passing trains and any remaining tenant areas. Finally, concealing much of the station structure within the DTB would result in significantly less visual impact to the area.

Pacific Guardian Center sincerely thanks the City and County of Honolulu for this opportunity to offer our comments and recommendations. We also appreciate the City's willingness to meet and update us on with preliminary plans and information regarding the Downtown Station.

Sincerely Yours,

H. Brian Moore

Dear Mr. Moore:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Existing Conditions

Your comments are noted.

Proposed Changes

Your comments are noted.

Dillingham Transportation Building, Pacific Guardian Center, and Plaza

Your disagreement with the Project's assertion concerning the Downtown Station is noted. Chapter 5 of the Draft and Final EISs explains in detail the effect on the Pacific Guardian

Center complex and its plaza area. All affected facilities and services will be relocated as appropriate and the plaza maintained as a local amenity.

The visual effects on Downtown, including Aloha Tower, the Dillingham Transportation Building, and Irwin Memorial Park, are discussed under the "Kalihi to Ala Moana Center Landscape Unit" heading in Section 4.8.3 of the Final EIS. The Project will be set in an urban context where visual change is expected and differences in scales of structures are typical. The Final EIS acknowledges that the guideway will partially block mauka-makai public views from streets that intersect the alignment. However, the guideway will be in the median of Nimitz Highway, which is a busy thoroughfare comprised of six lanes of traffic.

The Final EIS further states that depending on the degree of view obstruction or blockage, some view changes will be significant. As stated in Section 4.8.3 of the Final EIS (see Viewpoints 13-18), "The Downtown Station and guideway will be dominant features in views along the Nimitz Highway." More specifically, this section states that the Project will "...block portions of makai views along the following perpendicular streets: Kekaulike, Maunakea, Nuuanu, Bethel, Fort, Bishop, and Richards." DTS will coordinate with the City to identify the particular needs of each view; however, changes to some views are unavoidable, including the periodic change in view when a train is passing by. The viewer's response to this change will vary with exposure and sensitivity and depend on the alignment orientation, guideway and station height, and the height of surrounding trees and buildings.

The Project will cause no severe noise impacts, and no impacts to your building. Moderate impacts will occur at several sites listed in Noise Impacts Table in Section 4.10.3 in the Final EIS. Noise levels at higher-level floors were analyzed and discussed in Section 4.10.3 of the Final EIS. The results show moderate noise impacts to one residential building between the Civic Center and Kakaako Stations. These findings are based on FTA Transit Project Noise Impact Criteria- Land Use Categories Table and FTA Transit Project Noise Exposure Impact Criteria Figure both in Section 4.10.1 of the Final EIS. As no noise impacts have been found for your building, there is no reason there would be any noise-related economic impacts to rental values. Once the Project is operating, noise levels will be re-measured to confirm that there are no project noise impacts.

Recommendations

The Alternatives Screening Memorandum (DTS 2006a) recognized the visually sensitive areas in Kakaako and Downtown Honolulu, including the Chinatown, Hawaii Capital, and Thomas Square/Honolulu Academy of Arts Special District. To minimize impacts on historic resources, visual aesthetics, and surface traffic, the screening process considered 15 combinations of tunnel, at-grade, or elevated alignments between Iwilei and Ward Avenue. Five different alignments through Downtown Honolulu were advanced for further analysis in the Alternatives Analysis, including an at-grade portion along Hotel Street, a tunnel under King Street, and elevated guideways along Nimitz Highway and Queen Street (Figure 2-4).

The Alternatives Analysis Report (DTS 2006b) evaluated the alignment alternatives based on transportation and overall benefits, environmental and social impacts, and cost considerations. The report found that an at-grade alignment along Hotel Street would require the acquisition of more parcels and could potentially affect more burial sites than any of the other alternatives considered. The alignment with at-grade operation Downtown and a tunnel under

King Street, was not selected because of the environmental effects, such as impacts to cultural resources, reduction of street capacity, and property acquisition requirements of the at-grade and tunnel sections, which would cost an additional \$300 million.

The Project's purpose is "to provide high-capacity rapid transit" in the congested east-west travel corridor (see Section 1.7 of the Final EIS). The need for the Project includes improving corridor transit mobility and reliability. The at-grade alignment would not meet the Project's Purpose and Need because it could not satisfy the mobility and reliability objectives of the Project (see bullets below). Some of the technical considerations associated with an at-grade versus elevated alignment through Downtown Honolulu include the following:

- **System Capacity, Speed, and Reliability**—*The short, 200-foot (or less) blocks in Downtown Honolulu would permanently limit the system to two-car trains to prevent stopped trains from blocking vehicular traffic on cross-streets. Under ideal operational circumstances, the capacity of an at-grade system could reach 4,000 passengers per hour per direction, assuming optimistic five minute headways. Based on travel forecasts, the Project should support approximately 8,000 passengers in the peak hour by 2030. Moreover, the Project can be readily expanded to carry over 25,000 in each direction by reducing the interval between trains (headway) to 90 seconds during the peak period. To reach a comparable system capacity, speed, and reliability, an at-grade alignment would require a fenced, segregated right-of-way that would eliminate all obstacles to the train's passage, such as vehicular, pedestrian, or bicycle crossings. Even with transit signal priority, the at-grade speeds would be slower and less reliable than an elevated guideway. An at-grade system would travel at slower speeds due to the shorter blocks, tight and short radius curves in places within the constrained and congested Downtown street network, the need to obey traffic regulations (e.g., traffic signals), and potential conflicts with other at-grade activity, including cars, bicyclists, and pedestrians. These effects mean longer travel times and far less reliability than a fully grade-separated system. None of these factors affects an elevated rail system. The elevated rail can travel at its own speed any time of the day regardless of weather, traffic, or the need to let cross traffic proceed at intersections.*
- **Mixed-Traffic Conflicts**—*The Project will run at three minute headways. However, three-minute headways with an at-grade system would prevent effective coordination of traffic signals in the delicately balanced signal network in downtown Honolulu. A disruption of traffic signal cycle coordination every three minutes would severely affect traffic flow and capacity of cross-streets. Furthermore, there would be no option to increase the capacity of the at-grade rail system by reducing the headway to 90 seconds, which would only exacerbate the signalization problem. An at-grade system would require removal of two or more existing traffic lanes on affected streets. This effect is significant and would exacerbate congestion. Congestion would not be isolated to the streets that cross the at-grade alignment but, instead, would spread throughout Downtown. The Final EIS shows that the Project's impact on traffic will be isolated and minimal with the elevated rail, and, in fact will reduce system-wide traffic delay by 18 percent compared to the No Build Alternative (Table 3-14 in the Final EIS). The elevated guideway will require no removal of existing through travel lanes,*

while providing a reliable travel alternative. When traffic slows, or even stops due to congestion or incidents, the elevated rail transit will continue to operate without delay or interruption.

An at-grade light rail system with continuous tracks in-street would create major impediments to turning movements, many of which would have to be closed to eliminate a crash hazard. Even where turning movements are designed to be accommodated, at-grade systems experience potential collision problems. In addition, mixing at-grade fixed guideway vehicles with cars, bicyclists, and pedestrians presents a much higher potential for conflicts compared to grade-separated conditions. Where pedestrian and automobiles cross the tracks in the street network, particularly in areas of high activity (e.g., station areas or intersections), there is a risk of collisions involving trains that does not exist with an elevated system. There is evidence of crashes between trains and cars and trains and pedestrians on other at-grade systems throughout the country (e.g., Phoenix, Houston, LA). This potential would be high in the Chinatown and Downtown neighborhoods, where the number of pedestrians is high and the aging population presents a particular risk.

- **Construction Impacts**—*Constructing an at-grade rail system could have more effects than an elevated system in a number of ways. The wider and continuous footprint of an at-grade rail system compared to an elevated rail system (which touches the ground only at discrete column foundations, power substations, and station accessways) increases the potential of utility conflicts and impacts to sensitive cultural resources. In addition, the extra roadway lanes utilized by an at-grade system would result in increased congestion or require that additional businesses or homes be taken to widen the roadway through Downtown. Additionally, the duration of short-term construction impacts to the community and environment with an at-grade system would be considerably greater than with an elevated system. Because of differing construction techniques, more lanes would need to be continuously closed for at-grade construction and the closures would last longer than with elevated construction. This would result in a greater disruption to business and residential access, prolonged exposure to construction noise, and traffic impacts.*

Because it is not feasible for an at-grade system through Downtown to move passengers rapidly and reliably without significant detrimental effects on other transportation system elements (e.g., the highway and pedestrian systems, safety, reliability, etc.), an at-grade system would have a negative system-wide impact that would reduce ridership throughout the system. The at-grade system would not meet the Project's Purpose and Need and, therefore, does not require further analysis.

In addition, high passenger volumes are expected at this station with many riders heading to office buildings and other destinations Downtown. As you recommend in your letter, a station entrance through the first-floor arcade of the Dillingham Transportation Building is being incorporated into the design. Signage will help first-time users find the station entrance. As discussed in the Final EIS, the TOPA Tower complex location was evaluated and eliminated because it does not meet the Project's design criteria.

Mr. H. Brian Moore
Page 5

The Project is attempting to minimize all impacts to the Dillingham Transportation Building. The station entry design is envisioned to open into the existing plaza, with pedestrians approaching the entrance primarily through the Dillingham Transportation Building arcade. DTS does not plan to acquire or use the entire plaza.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Submission Content/Notes : I have two points I'd like to make about the development of the necessary and majority voted mass transit. The re-routing around Salt Lake and through the airport was a way to trick the residents of Salt Lake to vote for the rail. In actuality, fairness is not met in the goals here, nor the other 5 goals but re-routing around the communities of Oahu.

I live in a family owned apartment in Waikiki and have been a personal witness to the unintended consequence of steel rebar rusting within the concrete it's put in. Every 30 years or so, steel on steel (in concrete) will have to be maintained to the point of rendering the whole system as being unreliable and not worth using. There will be so much construction in noise and delays of regular routes that it could render the entire project futile and money wasted. I think that even professionals are baffled by the causes of this phenomenon. (Otherwise they wouldn't build lanai's like the ones all over waikiki today) It could be a combination of steel, salt air (which is unescapeable to Hawaii, salt water (being in proximity to the ocean), we don't even know. And we probably cannot avoid construction continual costs in taxes, and permanent construction.

As we have seen in other cities that mass transit is a real and much needed relief to cities congestion and consumption. But all too many times, for example Seattle, if transit hasn't been done right, then the whole project could go bad. In Seattle, they voted to spend the largest amount of money on their dear city (and infrastructure) and 30 years ago invested in the Monorail. The monorail was so expensive (building it on "legs") that it only spanned about 4 blocks downtown (between hotels and shopping malls) No one but tourists (to Seattle, so not that many) use it. And now they are pitted in years of undecided election results because everyone is so burnt out of transits costs (they vote on something, then tax, and then vote to change it and all over again).

In Hawaii, we don't have the apathetic voters just yet. And we haven't already invested in bad mass transit infrastructure. We have a hopeful lot that's willing to see a change. So, please don't screw it up.

A registered voter and long time Hawaii resident,
Monika Panfiglio

Dear Ms. Panfiglio:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The Draft EIS evaluated both the Salt Lake and Airport Alternatives. While there is trade-offs between the alternatives, as detailed in Chapter 7 of the Draft EIS, all Build Alternatives evaluated meet the Project's Purpose and Need. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS

discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The steel rails that will be used for the Project will be compatible for use in a marine environment. Steel rail is capable of long-term operation in such an environment. For example, train excursion service is still provided in Ewa using rails that are more than 100 years old. Steel wheel technology provides several benefits related to lifetime cost, reliability, and maintainability. In parallel with the alignment analysis, a five-member panel appointed by the City Council and the Mayor considered the performance, cost, and reliability of the five proposed technologies for the fixed guideway system. Monorail technology was among the technologies reviewed. The panel twice accepted public comment as part of this review. By a four-to-one vote, the panel selected steel wheel operating on steel rail as the technology for the Project evaluated in the Final EIS. The four panel members selected steel-wheel technology because it is mature, proven, safe, reliable, economical, and non-proprietary. Proprietary technologies, meaning those technologies that would have required all future purchases of vehicles or equipment to be from a single manufacturer, were eliminated because none of the proprietary technologies offered substantial proven performance, cost, and reliability benefits compared to steel wheel operating on steel rail. Selecting a proprietary technology also would have precluded a competitive bidding process, likely resulting in increased overall project costs.

Project construction is scheduled to be complete in 2019. Neither construction activities nor construction costs are scheduled to continue beyond 2019. The financial plan includes provisions for ongoing preventive maintenance of the Project.

The Project will provide substantial congestion relief. As shown in the Final EIS, in comparison to the No Build Alternative, the Project will result in an 18 percent reduction in islandwide congestion, as measured by daily vehicle hours of delay. In addition, the projected ridership will be substantial once the Project is complete, with approximately 116,300 boardings daily for the system between East Kapolei and Ala Moana Center in 2030. Both visual and noise effects of the alternatives are discussed in Chapter 4 of the Draft and Final EISs.

Traffic impacts during construction are discussed in Section 3.5 of the Final EIS, and noise impacts during construction are detailed in Section 4.18 of the Final EIS. These temporary effects will not continue beyond the construction period; therefore, they will not have any effect on long-term system viability. Mitigation measures will be incorporated to lessen any construction-related traffic, noise, and environmental impacts.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

RE: Draft Environmental Impact Statement for the Honolulu High Capacity
Transit Corridor Project

Before I comment of the substance of the DEIS, I would like to draw attention to its production and distribution. It is not sufficient to make it available on DVD disk only. Many people are not computer literate and even we who are, prefer to have a hard copy when we are reading seriously. Also, the maps can only be printed out with a commercial-sized computer which can use 11 x 17 paper.

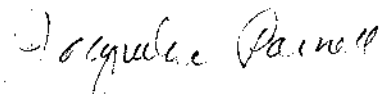

It would be far better to make a less beautiful and cheaper version which can be distributed widely. I should not have to pay \$59 to get a real copy of the document or be limited to reading it at the library.

Please make any supplements and the Final EIS available to everyone.

I do not think the DEIS fully showed how large and ugly the elevated transit stations will be. They will not fit in with the character of our islands at all. We are already in trouble attracting tourists. This big ugly project will surely ensure that nobody will want to visit our "tropical paradise" again! People have voted for rail but I believe they were sold on it through false advertising. What they are picturing in their minds is nothing like what you have presented in the DEIS even though that is understated.

Even domestically it is inappropriate. In order to provide adequate ridership, we will have to have high-density developments around the stations. But that is not what the residents of Oahu want! There will be strong objections to the necessary rezoning. It does not seem fair to use the transit to create planning and zoning changes which would otherwise be rejected by the citizenry. This is "we know what's good for you whether you like it or not" planning. As a retired planning professional, I strongly object.

Sincerely yours

Jacqueline Parnell, FAICP

Dear Ms. Parnell:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The Draft EIS was available at local libraries and City offices. It was provided for free on disk to assist users in being able to search the document. Bound copies were provided at reproduction cost. The use of 11-by-17-inch pages and color in the document allowed maps to be reproduced at a readable resolution and photographs and other figures to best convey project information. The Final EIS is likewise being widely distributed in an easy-to-use format to maximize the ability of the public to review and understand its content.

Figures 2-10 through 2-12 of the Draft EIS showed detailed layouts for stations. Figures 2-14 through 2-37 of the Draft EIS showed the specific layouts to scale for each station area. Visual simulations of stations in several locations were provided in Figures 4-23, 4-24, 4-28, 4-29, and 4-32 of the Draft EIS. These have been further supplemented in the Final EIS.

Ms. Jacqueline A. Parnell
Page 2

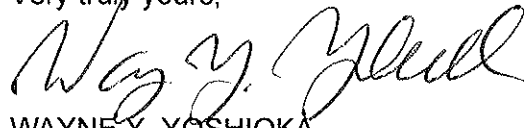

The City is conducting workshops with communities that will have rail stations. The purpose of the workshops is to engage the public about rail stations and provide opportunities to residents to contribute ideas about the appearance of station entryways in their areas. Ideas generated at the workshops will be incorporated into the station planning process. For more information and to get involved in this process, please visit the project website at www.honolulustransit.org

The Project is focused exclusively on the construction and implementation of rail transit service, and that is what is covered in the Draft and Final EISs. However, as discussed in Section 4.19.2 of the Final EIS, transit-oriented development (TOD) is expected to occur in project station areas as an indirect effect of the Project. The increased mobility and accessibility that the Project will provide may also increase the desirability and value of land near stations, thereby attracting new real estate investment nearby (in the form of TOD). Planning and zoning around station areas will be conducted and established by the City's Department of Planning and Permitting under a process covered by the City's new TOD Ordinance 09-4.

In March 2009, the City approved and the Mayor of Honolulu signed TOD Ordinance 09-4, which defines the City's approach to TOD near fixed guideway stations. Future zoning regulations will address parking standards, new density provisions, open space, and affordable housing. Financial incentives could include public-private partnerships, real property tax credits, and infrastructure financing. While the Project is coordinating with City and State agencies to encourage development of enhanced pedestrian and bicycle facilities and other land use changes near stations, the actual construction of such facilities and zoning changes are beyond the scope of this Project. The special districts also encourage public input into the design of TOD neighborhood plans to reflect unique community identities.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

February 5th, 2009

SUBJECT: Concerns about the draft Environmental Impact Statement (DEIS) for the proposed Honolulu Rail Transit System.

Dear Mr. Yoshioka:

Although I am an active member of the Honolulu Chapter of the American Institute of Architects this letter represents my personal opinions and should not be regarded as the official opinion or statement emanating from the Honolulu Chapter of the AIA. I have had my own Architectural firm since 1968 and have witnessed the progressive rising of construction costs here in Hawaii. Since no major overhead rail system has been built in the United States for many years there has to be little confidence in obtaining a realistic cost comparison when projecting the costs of the current rail project. Preliminary engineering costs are but a shot in the dark. There are many obstacles ahead that will increase the present estimate. These include soil testing (lava tubes or unsuitable ground conditions), Hawaiian Burial sites, higher property acquisition costs, litigation, and the extensive relocation of utilities to name a few. Major construction projects on the mainland have generally increased by forty or more per cent from original estimates. The final cost will only be established when final construction drawings are prepared, and even then one can expect many change orders.

There are so many inaccuracies in the above referenced document that it is hard to decide just where to begin in setting out a sound response to its many flaws. Before listing these many shortfalls it is important to state up front that in spite of the results of the recent election, forty nine percent of Oahu residents did not vote in favor of the project. This happened in spite of millions of taxpayer dollars being spent by the city on fraudulently false propaganda. One of the most outlandish claims hurled at the voters on television and radio prior to the election was the heralding of the success of the Charlotte rail system. That system is a LIGHT RAIL AT GRADE rail line and is nothing remotely similar to the proposed Honolulu project. I notice that even now in the City's "On The Move" newsletter of January 26th there continues to be praise for the LIGHT RAIL on grade Phoenix rail line which again has no similarity to the one that is proposed in the draft EIS. Both local daily newspapers heavily endorsed the scheme together with local politicians and a pro rail group partially financed by Parsons Brinkerhoff interests. In contrast the opponents of the project were greatly disadvantaged by having just limited grass roots financing and were only able to purchase very limited media advertising. And yet they still garnered almost half of the total election votes opposing the rail project as it now stands.

Perhaps the most glaring error in the slick advertising paid for by the taxpayers and aired relentlessly on TV and radio by the City was the showing of pictures of cars stalled in traffic. The draft EIS even admits (for once honestly!) that traffic will only get worse even with rail. Honolulu needs traffic relief NOW and the rail project does NOTHING to address that problem. The cold facts are that during construction over the next many years, with closing of lanes and disruption of businesses, traffic congestion will only be far worse. The State's newly revealed plans to add lanes to the H I freeway and its other extensive road improvement programs do at least address the traffic congestion problem. But this will result in a profusion of road closings caused by the competing projects.

How in the world as the draft EIS states can there be "No adverse affects to neighborhoods" when the proposed high level rail line overpowers each street that it penetrates virtually destroying the very heart and soul of the neighborhood. On the subject of neighborhoods it is relevant to reflect on the recent games played by the City Council on the Salt Lake Alternative. In order to obtain the deciding original vote to approve the project, the Councilman for the Salt Lake area forced the Council to route the rail through his district. Prior to the election there was a tremendous sales pitch on persuading the Salt Lake area residents to vote for rail. They did. And guess what!! Several days after the election the City Council decided to move the alternate alignment back to the airport. If voters in the Salt Lake area had known prior to the election that the routing through their community would be cancelled then the no rail vote might have persevered. In defense of the Salt Lake area Councilman it must be conceded that he is the one member who has concerns about the overall costs and who predicted that because of the lowering projections of the rail tax due to the current recession and a major drop off in tourist dollars that in a few years the rail project could be Two Billion dollars in arrears.

One of the most troubling sections in the draft EIS has been the failure to fairly address the alternative systems. A light rail system at grade is the preferred option in virtually every mainland city as it avoids the huge expense and aesthetic disaster of having an overhead rail system destroying the fabric of the historic urban area. It is simply not true that the light rail alternative at grade could possibly be more expensive than the proposed overhead rail project. The savings in having at grade stations would be considerable as there would be no need for escalators, elevators, stairs and the extensive concrete structures. Both the High Occupancy Hot Lanes (HOV) and the Transportation System Management Alternative (TSM) were also not adequately studied in the draft EIS. Both these systems have proven to be most successful in several mainland cities and would be far superior to the proposed overhead heavy rail project. They would also cost much less of taxpayers money and would be completed in a shorter time frame than the presently proposed system. The statement on Page 2-1 of the draft EIS contains a gross falsehood by stating that the proposed overhead rail system would cost less and have less environmental community impact than the alternative projects. Many of the people that voted for the rail project did not realize that the proposed Elevated third rail project has no comparison to the Charlotte rail project that was so brazenly praised in the many television and radio advertising paid for with taxpayer money.

The recently opened Phoenix Light Rail System should provide a serious eye opener to those people who still believe that the proposed third rail overhead system proposed in the draft EIS is the answer to Oahu's traffic problems. The Phoenix system cost one point four million dollars for a twenty mile light rail at grade system, of which almost half was paid for by the Federal Government. The Phoenix metropolitan area has a population of over four million, more than four times that of Oahu and their light rail system was completed in four years. The question is: why have the so called traffic experts burdened our city's taxpayers on this ill conceived project, costing (without future change orders) at least twice the cost of the Phoenix system. There are thirty five mainland cities that have chosen an on grade light rail system, whereas only one city, Miami, (in the nineteen seventies) has chosen an elevated heavy third rail solution. Cleveland, Ohio which is sixteenth in Metropolitan area population has a heavy rail system and no city between Cleveland and Honolulu, which is in fifty sixth place in population has an overhead rail system.

The draft EIS admits that the so called ideal corridor is but one mile wide in places with the mountains on one side and the ocean on the other. To support a train of this magnitude it is imperative to have many miles of heavy urbanized population on both sides of the rail corridor not just mountains and ocean. If people today still insist on commuting with one person to a car and decline the choice of car pooling or the express bus then there is little chance that in the future they would board the train with its many stops and much more limited freedom of movement. The ridership projections appear to be grossly overstated. The fact of Honolulu being the third most expensive city in country, after New York and San Francisco, has resulted in more people leaving the State than those coming in. The following statement in the draft EIS in chapter 4, page 4 "...would reduce transportation energy consumption" is a pure lie. The true fact is that Light Rail at grade would consume eight times less BTU's per hour.

There appears to be a total conflict of interest when having the main contractor on the project being the one to prepare the EIS, which in this case has resulted in the document becoming a highly suspect and prejudiced sales pitch in favor of the project. What is the point of even having an EIS if it is just to become a rubber stamp for the project. An independent EIS would have exposed the serious environmental and aesthetic concerns that this one does not honestly address. It is comforting to know that a recent press release from the City described the next contract to be signed for the project. Having spent weeks responding to the draft EIS we are now told that this new contract will be a feasibility and risk management report. If this is to be an independent study then there is hope that the proposed rail project should be terminated since an impartial study will reveal that the proposed rail project is far too expensive and will do little to solve traffic congestion, the sole reason for its development. With the recent lingering dispute over the EIS for the Super Ferry service it is interesting to note that the Ferry issue was primarily about the impact on whales, whereas the draft EIS for rail has a thousand times more impact as it will essentially destroy the whole character of urban Honolulu.

The proposed elevated rail system will have a devastating effect on the neighborhoods over which it will pass, in many cases displacing businesses and private property. The elevated stations and overhead concrete guideway will dominate the existing skyline resulting in a blocking of ocean and mountain views. The sound of an overhead train passing every few minutes will have a major impact on the lives of those people working or living in the immediate vicinity of its path. This will be extremely severe where it penetrates and destroys the present character of Dillingham Boulevard, Halekauwila street and the other streets as it proceeds towards Ala Moana Center. There will also be serious negative impingement to the character of Chinatown and an overpowering negative effect as it penetrates downtown passing Bishop Street, Aloha Tower and Irwin Park. Several years ago there was a concrete overhead structure at the foot of Bishop Street which was demolished resulting in opening up the view to the harbor. Other cities such as San Francisco, Baltimore and New York have also removed obstructive concrete structures near the waterfront in order to recover important view planes to the harbor.

In looking to the future it is relevant to consider the major financial burdens that are facing the New York Metropolitan Transit system, which has the highest ridership in America. The projected shortfall in millions of dollars is so critical that plans are afoot to lay off hundreds of workers, cut service on many of the routes, close down several stations, increase fares and charge tolls on all the presently free bridges in order to balance the budget. How can we even consider building this commuter train that will be running virtually empty for most of the day on an island just a small fraction of the size or population of New York. These mainland cities have major transportation projects already in place for many years and their financial problems are still severe although unlike Honolulu many of their systems have already been paid for.

With the almost daily breaks in the city's water lines and sewers and the serious eroding of the condition of the existing streets which have been neglected over the years it seems that these utilities are far more worthy of the spending of taxpayer money than the proposed heavy rail system which will do little to solve the traffic problems. On December 12th, 2008 there were nine serious overflows of sewage being spilt into almost all shorelines of Oahu, not exactly the environment that the millions of tourists expect when they come to Oahu. The excise taxes put aside for the transit project will be falling far short of projections due to the failing economy and downturn in the tourist industry. The public hearings have addressed many of these concerns to the City Council but unfortunately the testimony given from many well qualified professionals and concerned citizens has fallen on deaf ears and the project continues to move forward regardless.

Where did we go wrong? In 2004 the candidate for Mayor had a strong campaign slogan which was "Do We Need it, Can we Afford it, Can we Maintain it" Nothing about rail, which surfaced some year or two after his election. Fast forward to today and the question is the same, and the answer is a resounding "NO"

The removal of hundreds of trees to accommodate the project is simply not acceptable and the construction of heavy concrete columns down the center of existing streets will have a devastating effect on each neighborhood that it penetrates. The vast areas under the overhead concrete guide ways will become urban eyesores, devoid of landscaping and presenting an opportunity for homeless shelters and accompanying crime. Dillingham Boulevard, Halekauwila Street and all the other existing streets below the rail line will be reduced to a dark and dreary no mans' land similar to the existing portion of Nimitz Highway under the H-1 running past the airport. The proposed land acquisition is also a major concern as it will force many residents and businesses to relocate from their present neighborhoods.

In spite of these many concerns it is troubling that the draft EIS in chapter four, page six states: "Since there would be no adverse effects to neighborhoods, no mitigation is required". Another great concern is that although the future extensions to Manoa and Waikiki are shown on the draft EIS maps, there is no evaluation given to the enormous environmental impact that these future branch lines would impose on these very special areas of Honolulu. It appears to be extremely imprudent of the City to even contemplate starting construction without receiving approval for the entire system. If as an architect I am commissioned to design a project, and after many months of preliminary design, the client (the taxpayer) determines that the project does not meet the requirements of cost, aesthetics and the reason for the project (easing traffic congestion), then the contract should be mutually terminated.

It is surely time to pull the plug on this ill conceived poorly planned project that will bankrupt Honolulu both financially and aesthetically placing a huge burden of debt and sacrifice on our children and grandchildren in the years ahead. It is time to start planning immediately either on the development of a light rail system at grade, or to reconsider the benefits of the alternatives and coordinate with the State in expanding its plans to overhaul and improve our badly neglected highway system. The City Council's vote for "Steel on Steel" could still be valid, but only with an on grade light rail system similar to the one that the City has been praising in Charlotte and Phoenix. In responding to the many concerns submitted from many associations and private citizens it is time for the City to address those concerns and terminate the current contracts. Nine years is too long to wait for a project that is too expensive, does not solve our traffic problems and will forever destroy the character of our city.

Sincerely Yours

Geoffrey G., Paterson AIA Emeritus

Dear Mr. Paterson:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The FTA imposes guidelines for estimating costs to prevent the type of overruns mentioned in the comment. They include conservative cost factors and high contingencies. Cost estimates are carefully reviewed by various FTA representatives, and risks and uncertainties are considered in developing financial plans for the Project. Chapter 6 of the Final EIS discusses these, along with other financial information. The Federal government will contribute between 20 and 25 percent of the total capital cost.

Your comments on the election results have been noted. The Project is an entirely grade-separated transit system (see discussion below). However, the EIS process is independent of the electoral process or results that your letter mentioned.

Traffic conditions on highways will be worse in 2030 under any circumstances and regardless of which solution is applied. The key comparison is that the Project will improve conditions compared to what they would be if the Project were not built. With the fixed guideway system, total islandwide congestion (as measured by vehicle hours of delay) will decrease by 18 percent, compared to the No Build Alternative (see Table 3-13 in this Final EIS). In addition, traffic volumes were studied at various screenlines in the study corridor. The travel demand forecasting model was used to forecast traffic volumes at these screenlines in 2030, both with and without the Project (see Table 3-9 and Table 3-10 in this Final EIS). Analysis revealed that traffic volumes at these screenlines will decrease up to 11 percent with the Project. Accordingly, traffic conditions will be substantially better with the fixed guideway than any of the other alternatives studied. A Maintenance of Traffic (MOT) Plan, as discussed in Section 3.5.7 of the Final EIS, will be developed by the contractor and must be approved by the City and/or the Hawaii Department of Transportation. The MOT Plan will mitigate construction-related effects on transportation access and mobility. It will also address effects on streets and highways, transit, businesses and residences, and pedestrians and bicyclists.

As described in Section 3.4 of this Final EIS, modeling took into account committed transportation projects anticipated to be operational by 2030. Committed transportation projects are those identified in the Oahu Regional Transportation Plan (as shown in Table 2-4 of this Final EIS). These projects include a p.m. reversible "zipper" lane and widening the H-1 Freeway at Middle Street. As shown in Tables 3-9 and 3-10 of the Final EIS, roadway conditions will get worse despite these improvements. However, as shown in these tables, traffic conditions will improve up to 11 percent with the Project.

Your comment about neighborhoods is noted. The Project follows major roads and highways that have already created a barrier through neighborhoods. It will not create a substantial new barrier. The Project will improve connectivity between neighborhoods. Regarding the decision by City Council for the Airport Alternative, again, the EIS process is independent of the electoral process or results. General Excise and Use Tax (GET) surcharge revenue and FTA New Starts funds are anticipated to cover project construction costs.

The Alternatives Screening Memorandum (DTS 2006a) recognized the visually sensitive areas in Kakaako and Downtown Honolulu, including the Chinatown, Hawaii Capital, and Thomas Square/Honolulu Academy of Arts Special District. To minimize impacts on historic resources, visual aesthetics, and surface traffic, the screening process considered 15 combinations of tunnel, at-grade, or elevated alignments between Iwilei and Ward Avenue. Five different alignments through Downtown Honolulu were advanced for further analysis in the Alternatives Analysis, including an at-grade portion along Hotel Street, a tunnel under King Street, and elevated guideways along Nimitz Highway and Queen Street (Figure 2-4).

The Alternatives Analysis Report (DTS 2006b) evaluated the alignment alternatives based on transportation and overall benefits, environmental and social impacts, and cost considerations. The report found that an at-grade alignment along Hotel Street would require the acquisition of more parcels and could potentially affect more burial sites than any of the other alternatives considered. The alignment with at-grade operation Downtown and a tunnel under King Street, was not selected because of the environmental effects, such as impacts to cultural

resources, reduction of street capacity, and property acquisition requirements of the at-grade and tunnel sections, which would cost an additional \$300 million.

The Project's purpose is "to provide high-capacity rapid transit" in the congested east-west travel corridor (see Section 1.7 of the Final EIS). The need for the Project includes improving corridor transit mobility and reliability. The at-grade alignment would not meet the Project's Purpose and Need because it could not satisfy the mobility and reliability objectives of the Project (see bullets below). Some of the technical considerations associated with an at-grade versus elevated alignment through Downtown Honolulu include the following:

- **System Capacity, Speed, and Reliability**—The short, 200-foot (or less) blocks in Downtown Honolulu would permanently limit the system to two-car trains to prevent stopped trains from blocking vehicular traffic on cross-streets. Under ideal operational circumstances, the capacity of an at-grade system could reach 4,000 passengers per hour per direction, assuming optimistic five minute headways. Based on travel forecasts, the Project should support approximately 8,000 passengers in the peak hour by 2030. Moreover, the Project can be readily expanded to carry over 25,000 in each direction by reducing the interval between trains (headway) to 90 seconds during the peak period. To reach a comparable system capacity, speed, and reliability, an at-grade alignment would require a fenced, segregated right-of-way that would eliminate all obstacles to the train's passage, such as vehicular, pedestrian, or bicycle crossings. Even with transit signal priority, the at-grade speeds would be slower and less reliable than an elevated guideway. An at-grade system would travel at slower speeds due to the shorter blocks, tight and short radius curves in places within the constrained and congested Downtown street network, the need to obey traffic regulations (e.g., traffic signals), and potential conflicts with other at-grade activity, including cars, bicyclists, and pedestrians. These effects mean longer travel times and far less reliability than a fully grade-separated system. None of these factors affects an elevated rail system. The elevated rail can travel at its own speed any time of the day regardless of weather, traffic, or the need to let cross traffic proceed at intersections.
- **Mixed-Traffic Conflicts**— The Project will run at three minute headways. However, three-minute headways with an at-grade system would prevent effective coordination of traffic signals in the delicately balanced signal network in downtown Honolulu. A disruption of traffic signal cycle coordination every three minutes would severely affect traffic flow and capacity of cross-streets. Furthermore, there would be no option to increase the capacity of the at-grade rail system by reducing the headway to 90 seconds, which would only exacerbate the signalization problem. An at-grade system would require removal of two or more existing traffic lanes on affected streets. This effect is significant and would exacerbate congestion. Congestion would not be isolated to the streets that cross the at-grade alignment but, instead, would spread throughout Downtown. The Final EIS shows that the Project's impact on traffic will be isolated and minimal with the elevated rail, and, in fact will reduce system-wide traffic delay by 18 percent compared to the No Build Alternative (Table 3-14 in the Final EIS).

The elevated guideway will require no removal of existing through travel lanes, while providing a reliable travel alternative. When traffic slows, or even stops due to congestion or incidents, the elevated rail transit will continue to operate without delay or interruption.

An at-grade light rail system with continuous tracks in-street would create major impediments to turning movements, many of which would have to be closed to eliminate a crash hazard. Even where turning movements are designed to be accommodated, at-grade systems experience potential collision problems. In addition, mixing at-grade fixed guideway vehicles with cars, bicyclists, and pedestrians presents a much higher potential for conflicts compared to grade-separated conditions. Where pedestrian and automobiles cross the tracks in the street network, particularly in areas of high activity (e.g., station areas or intersections), there is a risk of collisions involving trains that does not exist with an elevated system. There is evidence of crashes between trains and cars and trains and pedestrians on other at-grade systems throughout the country (e.g., Phoenix, Houston, LA). This potential would be high in the Chinatown and Downtown neighborhoods, where the number of pedestrians is high and the aging population presents a particular risk.

- **Construction Impacts**—*Constructing an at-grade rail system could have more effects than an elevated system in a number of ways. The wider and continuous footprint of an at-grade rail system compared to an elevated rail system (which touches the ground only at discrete column foundations, power substations, and station accessways) increases the potential of utility conflicts and impacts to sensitive cultural resources. In addition, the extra roadway lanes utilized by an at-grade system would result in increased congestion or require that additional businesses or homes be taken to widen the roadway through Downtown. Additionally, the duration of short-term construction impacts to the community and environment with an at-grade system would be considerably greater than with an elevated system. Because of differing construction techniques, more lanes would need to be continuously closed for at-grade construction and the closures would last longer than with elevated construction. This would result in a greater disruption to business and residential access, prolonged exposure to construction noise, and traffic impacts.*

Because it is not feasible for an at-grade system through Downtown to move passengers rapidly and reliably without significant detrimental effects on other transportation system elements (e.g., the highway and pedestrian systems, safety, reliability, etc.), an at-grade system would have a negative system-wide impact that would reduce ridership throughout the system. The at-grade system would not meet the Project's Purpose and Need and, therefore, does not require further analysis.

In Chapter 2 – Alternatives Considered of the Alternative Analysis Report, November 2007, as well as in Chapter 2 – Alternatives Considered of the Final EIS, two options were considered for the Managed Lane Alternative - Two-direction and Reversible. This alternative would have provided a two-lane elevated toll facility between Waipahu and Downtown Honolulu,

with variable pricing strategies to maintain free-flow speeds for transit and high-occupancy vehicles (HOVs). The Two-direction Option would have served express buses operating in both directions during the entire day. To maintain free-flow speeds in the Two-direction Option, it may have been necessary to charge tolls to manage the number of HOVs using the facility. For the Reversible Option, three-person HOVs would have been allowed to use the facility for free, while single-occupant and two-person HOVs would have had to pay a toll. The Reversible Option was found to be optimal.

The findings are summarized in Chapter 2 of the Final EIS as follows: The Managed Lane Alternative was evaluated for its ability to meet project goals and objectives related to mobility and accessibility, supporting planned growth and economic development, constructability and cost, community and environmental quality, and planning consistency. While this alternative would have reduced congestion on parallel highways, systemwide traffic congestion would have been similar to the No Build Alternative as a result of increased traffic on arterials trying to access the facility. Total islandwide vehicle hours of delay would have increased with the Managed Lane Alternative compared to the No Build Alternative, indicating an increase in systemwide congestion (Table 2-2, Final EIS).

The Managed Lane Alternative would not have supported planned concentrated future population and employment growth because it would not have provided concentrations of transit service that would have served as a nucleus for transit-oriented development. The Managed Lane Alternative would have provided little transit benefit at a high cost. The cost-per-hour of transit-user benefits for the Managed Lane Alternative would have been two to three times higher than that for the Fixed Guideway Alternative. Similar to the Transportation System Management (TSM) Alternative, the Managed Lane Alternative would not have had substantially improved service or access to transit for transit-dependent communities. No funding sources were identified for the Managed Lane Alternative. Toll revenues from the Managed Lanes Alternative would have paid for ongoing operations and maintenance while remaining revenues would have been used to repay debt incurred to construct the system.

The Managed Lane Alternative would have generated the greatest amount of air pollution, required the greatest amount of energy for transportation use, and would have resulted in the largest number of transportation noise impacts of all the alternatives evaluated. Alternatively, because the Managed Lane Alternative would have served a shorter portion of the study corridor, it would have resulted in fewer displacements and would have affected fewer archaeological, cultural, and historic resources than the Fixed Guideway Alternative. The Managed Lane Alternative would not have affected any farmlands. Visually, the elevated structure would have extended a shorter distance, but it would have been more visually intrusive because its elevated structure, with a typical width of between 36 and 46 feet, would have been much wider than the Fixed Guideway Alternative.

After the Alternatives Analysis phase was completed, several scoping comments were received requesting reconsideration of the Managed Lane Alternative that was considered and rejected during the Alternatives Analysis process. However, because no new information was provided that would have changed the findings of the Alternatives Analysis regarding the Managed Lane Alternative, it was not included in the Draft EIS for further consideration.

In addition, the TSM Alternative studied during the Alternatives Analysis increased bus service. The alternative included express bus service that operated as bus rapid transit in existing facilities. Bus frequencies would have been increased during peak periods to improve service for work-related trips, particularly from developing areas. The bus fleet was assumed to increase from 525 to 765 buses, and park-and-ride lots were assumed at West Kapolei, UH West Oahu, Waipio, and Aloha Stadium. The TSM Alternative would have improved transit travel times, but it would have done little to improve corridor mobility and travel reliability. Roadway congestion also would not have been alleviated.

After review of the Alternatives Analysis Report and consideration of public comments, the City Council selected a fixed guideway transit system extending from Kapolei to UH Manoa with a connection to Waikiki as the Locally Preferred Alternative. The selection, which eliminated the TSM and Managed Lane Alternatives, became Ordinance 07-001 on January 6, 2007. The NEPA Notice of Intent and Scoping Information Package for the EIS included the No Build Alternative and two Build Alternatives (a Fixed Guideway Transit Alternative via Salt Lake Boulevard and a Fixed Guideway Transit Alternative via the Airport & Salt Lake Boulevard). Accordingly, the Managed Lane and TSM Alternatives were not included in the EIS.

The conditions between Phoenix and Honolulu are different. The systems are both 20 miles long, but the Phoenix line is estimated to carry less than half the riders of the Honolulu system and take more than twice as long to travel the 20 miles. Moreover, the Phoenix line removes two lanes of traffic along most of the route. There are numerous alternative routes available for motorists in the Phoenix metro area. The Project in Honolulu will not remove any travel lanes. It will add to the capacity of the overall transportation system without reducing the existing, limited roadway supply. Phoenix did not need to preserve highway capacity; Honolulu must do so. To accomplish that, the system must be elevated (underground is more expensive). The cost of an elevated system is higher than an at-grade line such as the recently opened system in Phoenix, but the Honolulu system will have a much higher capacity and will be more reliable. In addition, the Phoenix metropolitan area, for example, has much lower population density than Honolulu, and a very small portion of the population will be served by the first rail line, which was opened recently. Grade-separated transit systems operate worldwide, including many in the United States, such as BART in the San Francisco Bay Area, MARTA in Atlanta, and the Washington Metro. These three systems each include elevated sections.

The effectiveness of rail transit is closely linked to the population density of the area served. As described in Chapter 1 of the Final EIS, the majority of the population on Oahu is located in a narrow corridor, which makes it ideal to support rail transit. The corridor from Kapolei to UH Manoa (i.e., the study corridor) is well suited for the fixed guideway project. In 2000, 63 percent of Oahu's population of 876,200 and 80 percent of its 501,100 jobs were located within the study corridor. By 2030, these percentages will increase to 69 percent of the population and 83 percent of the employment as development continues to be concentrated into the Primary Urban Corridor and Ewa Development Plan areas. As stated in Section 1.3.1 of the Final EIS, 2,036,000, or 73 percent, of the approximately 2,790,000 islandwide daily trips, and 350,000, or 64 percent, of the 544,000 a.m. peak-period work-related trips are currently generated within the study corridor. The study corridor attracts an even higher percentage of

islandwide work-related trips with 446,000, or 82 percent, of a.m. peak-period work-related trips having destinations within the study corridor.

Figure 3-7 in the Final EIS shows 2030 travel times between selected travel markets with and without the Project. This information represents the time required to complete a trip from origin to destination and assumes that at least a portion of the trip will be made on the fixed guideway system. As shown in Figure 3-7, travel times will improve significantly (up to a 60 percent travel time savings) with the Project as compared to the No Build Alternative. The largest improvement in travel-time savings occurs for trips from Kapolei to Pearl Harbor. Even trips to and from Milliani and Waikiki, which are not along the project alignment, will benefit from reduced travel times when using the guideway. These decreases in travel times are anticipated to attract motorists out of their cars. There will also be coordinated transfers between the fixed guideway system and the bus, which will minimize wait times. Forecasts indicate that riders who are predicted to use the train are those who will find it is more beneficial than another transportation alternative. Some fixed guideway riders are those who currently use TheBus, but many will be from other modes. Forecasts indicate that approximately 40,000 vehicles will be removed from roadways as a result of the Project. Most guideway systems are attractive to automobile users because of the time benefit and the lower stress levels during the ride.

As identified in Section 3.2.1 of the Final EIS, transit ridership forecasts for rail and bus service are based on a travel demand forecasting model used by the Oahu Metropolitan Transportation Organization (OahuMPO) for the Oahu Regional Transportation Plan. The OahuMPO model is based on "best practices" for urban travel models in the U.S. The model is updated approximately every five years to reflect changes in land use, socio-economic conditions, and transportation network improvements. The model is approved by the OahuMPO Technical Advisory Committee. As indicated in the Final EIS, this modeling approach has proven to be effective in estimating ridership levels in other areas such as Los Angeles County, Salt Lake City, and the Denver region in the last 10 years. This model is based on guidelines established by the FTA. The travel demand forecasting model has been refined since the Draft EIS was published to account for non-home-based direct-demand trips (trips that do not originate or end at home) during off-peak periods. In addition, the air passenger model (which forecasts travel in the corridor related to passengers arriving or departing at Honolulu International Airport) was updated to reflect current conditions. The Final EIS reflects updated ridership numbers resulting from model refinement. Lastly, an at-grade light rail system must stop and accelerate at signalized intersections and, accordingly, the at-grade system is marginally less energy-efficient than an elevated system.

The Draft and Final EISs were prepared by an independent planning and engineering consulting company selected based on company qualifications. The company will not be a construction contractor on the Project. As stated in the Preface to the Draft EIS, the purpose of the EIS is to provide DTS, the FTA, and the public and interested parties with the information necessary to make an informed decision based on a full and open analysis of costs, benefits, and environmental impacts of the alternatives considered. Chapter 4 of the Final EIS presents the environmental effects of the Project, including aesthetic effects in Section 4.8. General Excise and Use Tax (GET) surcharge revenue and FTA New Starts funds are anticipated to cover project construction costs. In comparison to the No Build Alternative, in 2030 the Project

will reduce congestion by 18 percent, as measured by daily vehicle hours of delay, as shown in Table 3-14 in the Final EIS. The Project is not related to the Super Ferry, or any findings of that evaluation.

The island's unique visual character and scenic beauty were considered in the visual and aesthetic analysis presented in the Draft and Final EISs. The Project will be set in an urban context where visual change is expected and differences in scales of structures are typical. The visual effects on Honolulu's Primary Urban Center are discussed under the "Kalihi to Ala Moana Center Landscape Unit" heading in Section 4.8.3 of the Final EIS. This includes visual effects along Dillingham Boulevard and Halekauwila Street, and at Chinatown, Aloha Tower, and Irwin Park.

The following measures will be included with the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

- Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
- Coordinate the project design with the City's transit-oriented development program within the Department of Planning and Permitting.*
- Consult with the communities surrounding each station for input on station design elements.*
- Consider specific sites for landscaping and trees during Final Design when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will mitigate potential visual impacts.*

The Project will also provide users, including tourists, with expansive views from several portions of the corridor by elevating riders above highway traffic, street trees, and low structures adjacent to the alignment. In Section 4.8.3 of the Final EIS, specific environmental, architectural, and landscape design criteria are listed that will help minimize visual effects of the Project.

As discussed in Section 4.10.3 of the Final EIS, the Project will include an integrated noise blocking parapet wall at the edge of the guideway structure that extends three feet above the top of the rail and a system specification for vehicles with wheel skirts. The parapet wall will substantially reduce ground-level noise. Wheel skirts will increase the benefit of the parapet wall at locations above the elevation of the track. Measures to reduce noise levels above the track elevation, such as sound-absorptive materials in the track area, will be evaluated during Preliminary Engineering for the Project. Once the Project is operating, noise levels will be measured to determine the actual extent of project noise impacts. There are no severely impacted areas in the corridor.

In addition, your observations regarding New York City are noted.

Your letter contained several points about the possibility of using funds dedicated through the GET surcharge for other needs. However, the enabling legislation for the GET

surcharge precludes the use of the collected funds for these purposes. GET surcharge revenue and FTA New Starts funds are anticipated to cover project construction costs.

Street trees along the Project alignment are discussed in Section 4.15 of the Final EIS. Twenty-eight Notable true kamani trees on the makai side of Dillingham Boulevard will be removed. As stated in your letter, trees on the makai side of the street are already periodically pruned because of the presence of utilities. Trees on the mauka side of Dillingham Boulevard are not pruned and will be preserved. The State Historic Preservation Division has determined that some trees on Dillingham Boulevard are eligible for the historic register. The Project will not affect any trees on Kapiolani Boulevard. Effects to street trees will be mitigated by transplanting existing trees or planting new ones, where possible. Trees suitable for transplanting that are displaced by construction will be relocated to the City and County project nursery until they can be transplanted to another part of the project area. The City will coordinate with the Hawaii Department of Transportation's highway landscape architect. The location where street trees will be transplanted will be selected based on project-specific criteria that could include the following:

- Areas where existing landscaping will be lost along the corridor*
- Areas where opportunities exist for enhancing existing streetscapes near the study corridor*
- Areas where stations and parking lots will be constructed*
- Areas where shared benefits will be accomplished, such as areas adjacent to parks or historic sites*

In addition to transplanting existing trees, plans for new plantings will be prepared by a landscape architect during Final Design to further mitigate effects to street trees. To mitigate any substantial effects in areas that require tree removal, special attention will be given to the development of landscaping plans so that new plantings will provide similar advantages to the community. If new plantings will not offer equitable mitigation (e.g., older mature trees that are removed), additional younger trees could be planted that will, in time, develop similar benefits. As stated in the mitigation discussion, existing trees will be retained where practical. This includes station areas.

Regarding the homeless, Section 4.6.3 of the Final EIS describes potential safety and security issues once the Project is operating. The discussion notes that to reduce the potential for crime, the FTA requires the development and implementation of a Safety and Security Management Plan (SSMP) for new fixed guideway projects (49 CMR 633). The SSMP will address the technical and management strategies for analyzing safety or determining security risks throughout the Project's life cycle.

To address your concerns about relocations and acquisitions, where relocations will occur, compensation will be provided to affected property owners, businesses, or residents in compliance with all applicable Federal and State laws and will follow the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act. Actions to be undertaken include the following:

- *The City will assist all affected persons in locating suitable replacement housing and business sites within an individual's or business's financial means.*
- *A minimum 90-day written notice will be provided before any business or resident will be required to move.*

As stated in Section 4.4 of the Final EIS, relocation services will be provided to all affected business and residential property owners and tenants without discrimination; and persons, businesses, or organizations that are displaced as a result of the Project will be treated fairly and equitably.

The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The proposed future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS. The future extensions are not part of this Project; thus, they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time.

The City will not begin construction on the Project until completion of the Federal Record of Decision and acceptance of the Hawaii Revised Statutes Chapter 343 Final EIS.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Mr. Kirk Paterson
1259 South Beretania Street, Suite 1
Honolulu, Hawaii 96814

Dear Mr. Paterson:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

Your preference for the Airport Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more

Mr. Kirk Paterson
Page 2

information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is fluid and cursive, with the first name "Wayne" being the most prominent.

Honolulu, Hawaii 96815

Dear Mr. Pazaglia:

**Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement**

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses comments regarding the above-referenced submittal:

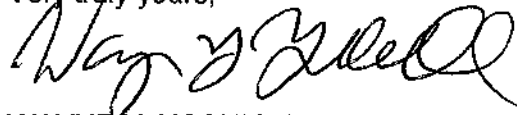

Your preference for a Fixed Guideway Transit Alternative has been noted. While each of the alternatives includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana Center has been selected as the Preferred Alternative. The identification of the Airport Alternative as the Preferred Alternative was made by the City to comply with FTA's NEPA regulations that state that the Final EIS should focus on the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative, public input on the Draft EIS, and City Council Resolution 08-261 identifying the Airport Alternative as the Project. The selection of the Airport Alternative is described in Chapter 2 of this Final EIS. The discussion of the alternatives considered is included in Chapter 2 of this Final EIS and the Alternatives Analysis. As discussed in Section 3.4.2 of this Final EIS, the Airport Alternative will carry the most passengers with 116,000 daily passengers and 282,500 daily trips in 2030, thereby resulting in the greatest transit-user benefits. The

Mr. Lance Pazaglia
Page 2

Airport Alternative will also result in the fewest vehicle miles traveled and vehicle hours of delay, as well as provide access to major employment areas, including Honolulu International Airport, that will have substantially greater ridership than the other alternatives considered.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Issuance of the Record of Decision under NEPA and acceptance of the Final EIS by the Governor of the State of Hawaii are the next anticipated actions and will conclude the environmental review process for this Project.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is fluid and cursive, with a large, stylized initial "W".

Dear Mr. Pearson:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

Your comments have been noted. The capital plan for the Project is presented in Section 6.3 of the Final EIS, including a description of the amount of funding anticipated from various sources. Section 6.6 of the Final EIS describes risks and uncertainties associated with these funding assumptions. The effects of the Project are discussed in Chapters 3 and 4 of the Final EIS.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka".

Mr. Wayne Yoshioka
Director, Department of Transportation Services
City and County of Honolulu
650 South King St. 3rd Floor
Honolulu, HI 96813

Dear Mr. Yoshioka:

Regarding the heavy rail DEIS report; does it adequately address the issue of rail's visual impact on our environment and the affect it will have on our city's number one industry, tourism? Changing our image from an island paradise into one contaminated by urban blight, noise, and fumes will surely have unacknowledged consequences on tourism, and nowhere in your report are they addressed.

My sister-in-law who lives just South of Chicago was aghast with the proposed project. She said tourists came to our beautiful island to get away from the fumes and noise of the big city. She asked me, "Why would they destroy paradise?" Why, indeed?

Obscuring Aloha Tower, the shoreline and mountain views will forever change Oahu's unique "Sense of Place?" The report slides over the issue by stating, "Mitigation issues would focus on preserving visual resources and enhancing the project design to comply with applicable policies. The following measures would be included to minimize visual affects and enhance the visual and aesthetic opportunities it creates." Can the nebulous suggested measures, such as trees and lighting, truly preserve our visual resources?

In a Star-Bulletin 12/14/08 letter to the editor the writer discussed his experience with a steel-on-steel rail system in Sydney, Australia, and it was not positive. He wrote of "car walls marred with graffiti and windows etched with the same ... sides of the tracks were littered and the squealing of the rails was irritating." What impact will the day-in day-out monotony of squealing wheel noise have on school children at schools and homeowners who live along the route?

Besides the onerous impact of heavy rail on the Island's visual environment, other issues require clarification. Why were other cheaper more environmentally friendly options not *seriously* considered? How can the expenditure of billions of dollars be justified for only a 1% improvement in traffic congestion? Why has the UH West Oahu campus not been a priority when it is evident that traffic congestion is mitigated when UH Manoa is not in session? What emergency procedures will be in place during another Island wide blackout? How would passengers be rescued? Why should the public trust steel wheels on steel rail would not rust in our salt laden air when Aloha Stadium exemplifies the opposite?

Does the Federal Transportation Administration know the electorate was swayed into passing (barely) a Charter amendment for rail because the City and County of Honolulu unethically spent over \$3 million of taxpayer funds promoting it? Do they

know the City unequivocally assured voters nearly one billion dollars from the FTA was promised without such evidence in writing? Is the FTA aware that politics caused a logical Airport, Shipyard, Pearl Harbor, and Hickam route to be bypassed in favor of the illogical Salt Lake Blvd route?

One can only hope that City leaders and other locals with a financial stake in the outcome will step back and take another look at the impact this massive project will have on our beautiful Island home and ask themselves, "In the end, will we be happy and proud of our legacy?"

Sincerely,

Janice Pechauer

Dear Ms. Pechauer:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

With the Airport Alternative, visitors and residents will benefit by having more transportation options. Table 3-13 in the Final EIS shows daily person transit trips by purpose, broken down for residents and visitors. As seen in this table, transit trips for both groups increase with the addition of the Project compared to the No Build Alternative. Daily resident person trips by transit increase 24 percent with the Project compared to without, while daily visitor person trips by transit increase 19 percent with the Project compared to without the Project in 2030. As stated in Section 3.4.2 of the Final EIS, approximately 9,900 visitors are expected to use the system daily, of which 1,800 are to or from the airport.

Your comment is noted. The island's unique visual character and scenic beauty were considered in the visual and aesthetic analysis presented in the Draft and Final EISs. The Project will be set in an urban context where visual change is expected and differences in scales of structures are typical. The assessment of visual effect due to the Project as described in Section 4.8.3 of the Final EIS considers changes to the visual landscape and viewer responses to those changes. This includes the existing development along the Project alignment. Within

the Project corridor the environment changes from rural at the Wai'anae end of the corridor to dense high-rise development at the Koko Head end.

As part of the design process, the City has developed design principles, which are identified in the Honolulu High-Capacity Transit Corridor Project Compendium of Design Criteria (RTD 2009m) that will be implemented in final design to minimize visual effects of the Project. For example, guideway materials and surface textures will be selected in accordance with generally accepted architectural principles to achieve effective integration between the guideway and its surrounding environment. Landscape and streetscape improvements will mitigate potential visual impacts, primarily for street-level views.

Other measures to address visual impacts of the Project are being developed through the station design and planning process. The initial station area plans and design guidelines were first developed with coordination between DTS and the Department of Planning and Permitting (DPP). The next level of transit station design focuses on integrating individual neighborhood characteristics of the communities served by the stations.

The following mitigation framework will be included in the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

- Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
- Coordinate the project design with City TOD planning and DPP.*
- Consult with the communities surrounding each station for input on station design elements.*
- Consider specific sites for landscaping and trees during the final design phase when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will serve to mitigate potential visual impacts.*

Section 4.8.3 of the Final EIS, Design Principles and Mitigation includes information related to the mitigation framework described above. Specifically architecture and landscape design criteria include guidelines regarding site design, materials and finishes, and lighting, which apply to stations, station areas, and the guideway.

As discussed in Section 4.10.3 of the Final EIS, the Project will not result in any noise impacts to schools or residences.

The Alternatives Analysis phase evaluated a range of transit mode and general alignment alternatives in terms of their costs, benefits, and impacts. An initial screening process considered alternatives identified through previous transit studies, a field review of the study corridor, an analysis of current population and employment data for the study corridor, a literature review of technology modes, work completed for the Oahu Regional Transportation Plan 2030 (ORTP) prepared by the Oahu Metropolitan Planning Organization (OahuMPO) (OahuMPO 2007), and public and agency comments received during the formal Alternatives Analysis scoping process.

During the fall of 2005 and winter of 2006, the City and County of Honolulu (City) completed the alternatives screening process that is documented in the Honolulu High-Capacity

Transit Corridor Project Alternatives Screening Memorandum (DTS 2006a). Scoping meetings were held and included a presentation of alternatives to the public and interested agencies and officials in which they could provide comments on the Purpose and Need, alternatives, and scope of the Alternatives Analysis. Refinements were made to the alternatives based on this input. In total, 75 fixed guideway alignment options were screened.

The following alternatives were studied in the Alternatives Analysis: No Build Alternative, Transportation System Management (TSM) Alternative, Managed Lane Alternative, and the Fixed Guideway Alternative. After review of the Alternatives Analysis Report and consideration of public comments, the City Council selected a fixed guideway transit system extending from Kapolei to UH Manoa with a connection to Waikiki as the Locally Preferred Alternative. The selection, which eliminated the TSM and Managed Lane Alternatives, became Ordinance 07-001 on January 6, 2007. The fixed guideway system is the most cost-effective system of all the alternatives studied. Less expensive options would not have improved system performance.

The one percent referenced is an islandwide figure that includes all travel during the day, including short trips in neighborhoods and trips in the North Shore, Kaneohe, or Hawaii Kai, which are not directly served by the Project. The most visible benefits of transit are within a corridor and during the peak travel times of the day. Table 3-12 shows daily islandwide trips, while Figure 3-11 in the Final EIS shows transit shares of home-based work trips during the a.m. two-hour peak period for key travel markets. As shown in Table 3-12, on a daily, islandwide basis, transit use is not expected to increase substantially. However, as shown in Figure 3-11, there is a substantial increase in transit trips during the a.m. peak period within the study corridor because of the Project. As stated in Section 3.4.2 of the Final EIS, for many travel markets, the transit share for trips under the Project would double or triple the share occurring under the No Build Alternative. For example, the commute-to-work transit share of the Kapolei to Downtown Honolulu travel market would increase from 23 percent under the No Build Alternative to 60 percent under the Project. In other words, more than half of the people going from Kapolei to Downtown for work in the morning would use transit with the Project, compared to only a quarter without the Project. Congestion, as measured in vehicle miles of delay, will decrease 18 percent with the Project compared to the No Build Alternative.

The fixed guideway station at the UH West Oahu campus will be part of the first construction phase of the Project. The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The proposed future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS. The future extensions are not part of this Project; thus, they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time. Bus service will be enhanced between Ala Moana Center and UH Manoa until a future extension is built.

Regarding your questions about emergency procedures, since trains and rail stations will be electrically powered, the system's infrastructure is being designed to handle service

disruptions. For example, trains will draw power from many points along the route, so an outage in a few areas should not disrupt service to the remaining route overall. If electrical power is lost systemwide, then train brakes are designed to stop the rail cars even without power. Lights will stay on in trains and stations; backup batteries will provide lighting for several hours. The train operations center will communicate with passengers via the public address system and intercom to provide guidance. If power is restored within a short time, service will resume. With a prolonged outage, the operations center will direct passengers to exit the trains and walk along a lighted emergency walkway on the guideway to the nearest station. For those unable to exit rail cars, help will be provided by emergency responders and transit staff. Passengers will be met at the train station by a coordinated response from emergency responders and City transportation workers.

To respond to your questions about corrosion, control measures will be applied to the Project's fixed steel facilities and neighboring utility structures to provide proper operation over their lifetime. These measures include the following:

- 1. Protective coating specification for steel aerial structures*
- 2. Coating specification for stations*
- 3. Preventive measures against stray current corrosion*
- 4. Corrosion-control design of transit underground utilities and neighboring utilities owned by others*

Lastly, the FTA has been apprised of the Project's development throughout the process and has met periodically to discuss project issues in terms of design and community concerns. The FTA is aware of the Project's public involvement plan and actions. The FTA is also aware of Council resolutions passed throughout the course of this Project, including its resolution to select the Airport Alignment. However, although these resolutions are passed by the City, they are not binding on the NEPA process or the decision by the FTA on a proposed action, per the requirements of NEPA policy.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

Dillingham Boulevard near Waiakamilo Road will require widening to the makai side. Additional right-of-way will be required to relocate the sidewalk farther makai and allow for the widening. You can find right-of-way maps in Appendix C of the Final EIS. All owners of properties where an acquisition is required have been individually contacted to discuss right-of-way impacts to their respective property. As design progresses, there will be a refinement of property requirements.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Dear Mr. Pickard:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

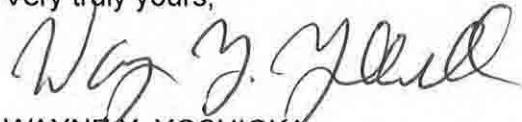

Your preference for a Fixed Guideway Transit Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the

Mr. Tom Pickard
Page 2

Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

DIRECTOR OF BUDGET
GENERAL SERVICES
CSC OF HONOLULU

Dear Mayor Mufi Hanneman,

My mom, dad, and I waste a lot of time going to places across the island such as Ewa Beach and Hawaii Kai for parties and get-togethers because of traffic. The roads will probably be more congested in the future, and that will eat up even more of our time. My parents sometimes don't want to pick me up from school because of the traffic, and I'm left finding my own ways of transportation home. If a rail transit were built, I would have a new way to get home and my family and I would save loads of time.

Although this rail transit may benefit me, I feel that it won't benefit everyone else. The cost of making this rail transit, 3.7 billion dollars, is way too expensive. We are already in a recession. I don't want our economy to be in even worse shape just because we are worried about too much traffic on our roads.

Worst of all, I feel that the transit will be more harmful than beneficial, too. After looking up how the rail will affect the environment, I found that it would actually take up more energy and release more emissions than the number of cars the rail is meant to replace! I know that it has already been approved to be built sometime in the future, but please, if you may, keep Hawaii's beautiful environment first on your mind while constructing it.

Sincerely,

Bryan Pineda

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As shown in Chapter 3 of the Final EIS, roadway congestion (as measured in terms of vehicle hours of delay) will decrease 18 percent with the Project compared to No Build conditions. In addition, as shown in Figure 3-7, there will be significant improvements in transit travel time. The fixed guideway system will provide an additional mode of travel.

Chapter 6 of the Final EIS describes the financial resources anticipated to be needed to pay for the capital cost of the Project and for ongoing operating and maintenance costs. Capital costs of the Project, including finance charges, are expected to be fully paid for by a combination of FTA Section 5307 and FTA Section 5309 New Starts Funds from the Federal government and revenues from the County General Excise and Use Tax Surcharge levied from 2007 through 2022 on Oahu. Chapter 6 in the Final EIS reflects the latest information on the economy in both cost and revenue forecasts.

Mr. Bryan Pineda
Page 2

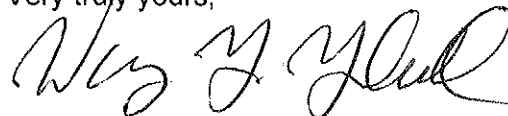

In addition, the construction of the Project is anticipated to provide employment opportunities. An average of about 10,000 per year of construction jobs will be created in building the project as noted in Section 4.18 of the Final EIS.

Traffic congestion is wasteful in terms of resources and time. In the long run, the inability to move efficiently because of traffic congestion could have a substantially detrimental impact on economic activity within the Honolulu area. The Rail project will offer another option to maintain mobility.

Comment noted. Section 4.9.3 of the Final EIS states that the Project is predicted to demonstrate a four percent reduction in vehicle miles traveled and no change in overall network speed compared to the No Build Alternative. This will result in predicted pollution reductions ranging from 3.9 to 4.6 percent compared to the No Build Alternative. As stated in Section 4.11.3, the total transportation energy demand for transit and highway vehicles will be lower than for the No Build Alternative. Table 4-21 summarizes the anticipated average daily transportation demand in 2030 for the Project. The Project is anticipated to reduce daily transportation energy demand by approximately 3 percent compared to the No Build Alternative.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Dear Mr. Plechaty:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

Your preference for the Airport Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more

Mr. George Plechaty

Subject: Comment on Draft Environmental Impact Statement (DEIS)
"Honolulu High-capacity transit corridor Project", Issue- Project
Construction Phasing will not provide early traffic relief

Fact:

The rail project construction phasing is proposed in four phases as discussed on DEIS page 2-38 and as shown on Figure 2-44 as follows:

- East Kapolei to Pearl Highlands (First Construction Phase)
- Pearl Highlands to Aloha Stadium (Second Construction Phase)
- Aloha Stadium to Middle Street (Third Construction Phase)
- Middle Street to Ala Moana Shopping Center (Fourth and final Construction Phase)

Discussion:

The primary purpose of any mass transit system is to provide traffic relief and to provide relief in the near term. The major West and Central Oahu traffic bottlenecks are at the Middle Street merge and at the H-1/H2 merge. Construction phases for the rail should be prioritized to reduce the traffic bottlenecks at these two locations. Therefore, the project construction phasing shown above should be reversed:

- Middle Street to Ala Moana Shopping Center (First Construction Phase)
- Aloha Stadium to Middle Street (Second Construction Phase)
- Pearl Highlands to Aloha Stadium (Third Construction Phase)
- East Kapolei to Pearl Highlands (Fourth Construction Phase)

This revised project phasing is logical because:

- a) The Middle Street to Ala Moana Shopping Center first phase will provide early traffic relief to the Middle Street bottle neck.
- b) The funding source for the entire 20 mile segment is not guaranteed, recognizing that the General Excise Tax is not meeting projections in revenue due to the expected long term slumping economy. The taxpayer will not tolerate any increase in property tax or GET to fund any rail fund shortfall.
- c) The funding amount from the Federal Transit Authority is not guaranteed.
- d) If rail funds are delayed, providing traffic relief to the traffic bottlenecks on H-1 will be delayed.

e) Each phase for rail will provide the maximum bang for the dollar. The rail will be completely useable and serve the most number of commuters as each phase is completed. Conversely, the Kapolei to Pearl Highlands would serve very few commuters as most commuters will be destined for east of Pearl Harbor and beyond in the easterly direction.

Vehicle Maintenance and Storage Facility for each construction phase can be temporarily established to support each construction phase as modified:

a) For the Middle Street phase, some 40 acres could be obtained along Lagoon Drive to include portions of Keehi Lagoon Park, Airport vacant areas and commercial businesses including Budget Car Rental. At least 10 acres for park and ride can be acquired in the airport area alongside Aolele Street and Lagoon Drive.

b) For the Aloha Stadium phase, portions of the Aloha Stadium Parking lot can be temporarily used for the Storage Facility and temp facilities for vehicle maintenance.

c) For the Pearl Highlands Phase, a 43-acre vacant site near Leeward Community College is available (DEIS figure 2-42).

d) A 41-acre site is identified for the Kapolei phase (DEIS figure 2-41).

Conclusion:

Construction of the Middle Street to Ala Moana Phase as a first priority is consistent with providing near-term traffic relief, will initially serve the most number of commuters, will be completely useable and cost effective, and will not force the taxpayer to pay more taxes to fund additional rail segments should rail funding sources not achieve revenue projections.

Recommendation:

The DEIS should reverse the construction project phasing as discussed above starting with the Middle Street to Ala Moana Shopping Center as the First Phase.

Dear Mr. Ramelb:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal dated December 18, 2008 with subject [Comment on Draft Environmental Impact Statement (DEIS) "Honolulu High-capacity transit corridor Project", Issue- Project Construction Phasing will not provide early traffic relief]:

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. The first phase of the Project must be connected to the maintenance and storage facility because, in addition to maintenance of equipment and ongoing operations, this facility houses the main control center for the entire Project. Accordingly, the required testing and operation of the system could not be completed without access to it. No location has been identified closer to Downtown with sufficient available land to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations*
- *Reduce the time that each area will experience traffic and community disturbances*
- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding*
- *Match the rate of construction to what can be maintained with local workforce and available financial resources*
- *Balance expenditure of funds to minimize borrowing*

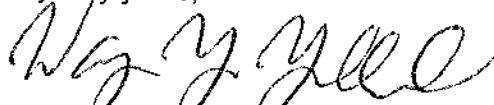

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

The financial plan is balanced for the entire Project so there will not be a situation in which only a portion of the system will be built. If there is a shortfall, additional revenue sources will be considered. Section 6.6 of the Final EIS discusses risks and uncertainties, as well as potential sources to cover shortfalls.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Subject: Comment on Draft Environmental Impact Statement (DEIS)
"Honolulu High-capacity transit corridor Project",

Issue : The DEIS lacks the Managed Lane Alternative (MLA) as stated in the Notice of Intent (NOI) dated 7 Dec 2007 (reference (a), which states: "The Federal Transit Administration (FTA) and the City and County of Honolulu, Department of Transportation Services (DTS) intend to prepare an EIS (and Alternative Analysis (AA)) on a proposal by the City and County of Honolulu to implement transit improvements that potentially include high-capacity transit service in a 25-mile travel corridor between Kapolei and the University of Hawaii at Manoa and Waikiki. Alternatives proposed to be considered in the AA and draft EIS include No Build, Transportation System Management, Managed Lanes, and Fixed Guideway Transit. Other transit alternatives may be identified during the scoping process."

Discussion:

The process used by the City & County of Honolulu (City) for assessing the Managed Lane Alternative (MLA) in the City's Alternatives Analysis (AA) was flawed.

- a) A similar length Managed Lane, reversible three-lane transit way was built for \$320 million in Tampa in year 2005, while the City AA estimated the similar MLA to cost \$2.6 Billion.
- b) Professor Panos Prevedouros published a study for Managed Lanes (reversible) in March 2008, "Transportation Alternatives Analysis for Mitigating Traffic Congestion between Leeward Oahu and Honolulu" which shows the 11 mile three-lane cost estimate to be \$900 million which is in line with the \$320 million Tampa three-lane reversible transit way. The professor believes the Plan's costs are accurate based on cost estimate spreadsheet analysis received from a local heavy construction estimation expert is \$818,634,000 in 2008 dollars. Again, this estimate is more in line with the Tampa three lane reversible Transit way estimate and refutes the AA estimate of \$2.6 Billion. The AA estimate disqualified the Managed Lane Alternative to be inferior to the Rail Alternative which cost \$3.7 Billion.
- c) 2008 Mayoral Candidate Ann Kobayashi, using the Professor's Managed Lane study and the former Mayor Harris Administration BRT Study, proposed a similar Managed Lane 15-mile fixed guideway which is estimated at \$1.2 Billion. The estimate is similar to the 11 mile Managed Lane and which should have been used in the AA rather than \$2.6 Billion.

d) Parsons Brinkerhoff (PB) and the City proposed that automobiles with two or more occupants should be allowed toll free on the MLA. This made the current contraflow zipper lane untenable and thus provided the rationale for removing it. The net result was that the additional two lane advantage that the MLA offered to the Corridor was reduced to one lane. They failed to publish their assessment of the option of having all autos pay a toll, which would have resulted in the zipper lane and the two-lane advantage being retained. And they failed to analyze MLA options with higher occupancy thresholds, such as three through five occupants.

e) PB and the City added unnecessary costs to the project by proposing a 16-mile facility while not testing the viability of shorter 10 to 12-mile versions.

f) PB and the City inflated MLA operating costs to make the project appear uncompetitive with the Fixed Guideway Alternative. Just two examples are a) the projection of a totally unnecessary 5,400 parking stalls for the MLA, and b) saddling the MLA with inflated bus operating costs.

g) PB and the City engineered the ingress and egress ramps in a way that could only result in heavy traffic congestion at these points. In fact, the MLA has exit/off ramps along its route for access to job centers other than downtown Honolulu.

h) PB and the City grossly inflated the capital costs of the MLA with the result that, if correct, it would be twice the cost per lane mile of any highway ever built in the U.S. In his letter to the City and copied to FTA, Dr. Panos Prevedouros, Professor of Traffic Engineering at the University of Hawaii, Chair of the Transportation Research Board's Highway Micro-simulations Committee and a member of the Task Force, commented, "the most egregious violation of FTA's rules on alternative specification and analysis was the deliberate underengineering of the Managed Lanes Alternative to a degree that brings ridicule to prevailing planning and engineering principles."

i) The 11 mile, elevated reversible MLA, with three lanes as proposed by Professor Prevedouros, has the commuter capacity to eliminate the two H-1 bottlenecks at Pearl City and at Middle Street merge. The Rail, according to the AA, table 3-12, will result in 17,500 vehicles per hour on H-1 (H-1 full capacity = 9,500 vph) because the Rail cannot accommodate the full commuter demand in year 2030.

Conclusion: The City's AA wrongly estimated the cost of the Managed Lane Alternative and the MLA capacity to eliminate the H-1 bottlenecks on H-1.

Recommendation: It is requested that the Managed Lane Alternative as proposed by Ann Kobayashi's EzWay proposal or the Professor Prevedouros Managed Lane Study be reinstated into the Honolulu's Transit Corridor Draft Environmental Impact Statement

Dear Mr. Ramelb:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal dated December 29, 2008 with subject [Comment on Draft Environmental Impact Statement (DEIS) "Honolulu High-capacity transit corridor Project"]:

Regarding the "Discussion" section of your letter:

a) *The analysis of the Managed Lane Alternative from the Alternatives Analysis Report (DTS 2006b) shows the cost to be \$2.6 billion in 2006 dollars (higher today). As stated in the City Council's Transit Advisory Task Force Report, a committee was charged with reviewing cost estimates for the two alternatives involving construction (the Managed Lane Alternative and Fixed Guideway Alternative). The report states that "the Task Force agrees with this committee that the Alternatives Analysis' construction cost estimates were fairly and consistently prepared, and that they may be used for both planning and cost comparisons." Information was obtained by the Task Force from the*

Hawaii Department of Transportation and others familiar with managed lane facilities. It is the only estimate to date that addresses Honolulu conditions.

There is no substantiation of the estimate from the Tampa Bay toll facility being applicable in Honolulu. The designer of the Tampa Bay facility herself admitted that to apply such an estimate without detailed consideration of the many differences between the two locations is not reasonable. For clarification, the Tampa Bay elevated toll lanes extend only 5.8 miles within the 10-mile expressway. The costs quoted are from 2002, long before the costs of materials and construction rose dramatically after 2004. Furthermore, the corridor within which the Tampa Bay lanes are built required no right-of-way, had no significant utility conflicts, no major structures or crossings, and was built in much more favorable geotechnical conditions than exist on Oahu. In addition, the Transit Task Force Report dated December 14, 2006, states that "the committee concluded that the projects are sufficiently different (actual costs versus projected costs with contingencies; available, accessible ROW vs. construction in actively used highways; no utilities relocation vs. extensive relocations) as to make the comparison unreasonable."

b) As stated in response to your previous comment, the City Council's Transit Advisory Task Force reviewed the Alternatives Analysis Report. The Task Force concluded in its report dated December 14, 2006, that the assessment of each alternative was "fair and accurate," and that capital cost estimates were compiled using the same methodology and unit costs, and that the construction cost estimates were fairly and consistently prepared. The Task Force also concluded that the Project is not comparable to the Tampa Bay toll facility for the reasons stated above.

c) The proposed EzWay is similar to the Managed Lane Alternative that was thoroughly evaluated in the Alternatives Analysis, which also accommodated both single occupant and transit vehicles. No known cost estimate for the EzWay proposal was prepared or validated by a qualified registered professional engineer. As a point of reference, the State of Hawaii's Highway Modernization Plan dated January 22, 2009, estimates the cost of the Nimitz Viaduct at \$600 million for an approximately 2.5-mile elevated highway with two lanes, which equals \$240 million per mile. Using this estimate, a 15-mile facility would cost approximately \$3.6 billion.

d) As discussed in the Chapter 5, Alternative 3b of the Detailed Definition of Alternatives Report (2006), the reversible lane Managed Lane Alternative provides three managed/HOV lanes in the peak direction, which is sufficient to satisfy the demand for restricted lanes. Eliminating the zipper lane frees up two off-peak direction lanes – one HOV and one general purpose lane. By 2030, the directional transportation demand will be more balanced than it is today. Eliminating the zipper lane while evaluating the Reversible Option for the Managed Lane Alternative provided the greatest benefit to modeled freeway users by increasing capacity in both directions. The system was optimized to balance demand without regard to toll policy. As stated in the Alternatives Analysis Report, for the Reversible Option, three-person high-occupancy vehicles (HOVs) would be allowed to use the facility for free while single-occupant and two-person HOVs would have to pay a toll.

e) A shorter managed lane system would have resulted in proportionately less benefit. As shown in the Alternatives Analysis, the full system evaluated already would provide substantially less benefit than the Fixed Guideway Alternative. Shortening of the Managed Lane Alternative, whether to 14 miles, or 10 to 12 miles, would not have increased the benefits to the traveling public compared to the alternative evaluated.

f) The operating and maintenance costs for all alternatives addressed in the Alternatives Analysis Report, including the Managed Lane Alternative, were estimated in a consistent manner as described in Chapter 5 of the Alternatives Analysis Report. The supply of park-and-ride stalls assumed for the Managed Lane Alternative was sized to meet forecast demand. The number of parking spaces was reflected in the capital costs of the Managed Lane Alternative, not in the operating and maintenance costs. One purpose of the Project is to improve benefits to transit users. With the Managed Lane Alternative, those benefits could only be provided through improvements to the bus system.

g) The Managed Lane Alternative evaluated in the Alternatives Analysis Report was designed by experts in such facilities. Access ramps were placed at locations that required direct access to the managed lanes because demand was high. Because of engineering requirements, access ramps require substantial rights-of-way and, as a result, are very costly. More ramps could be added, but it would make the project more expensive and reduce the point-to-point functionality of the system.

h) Please see the answers above to points a and b.

i) The Managed Lane Alternative would not eliminate congestion and bottlenecks on the H-1 Freeway. Table 3-12 in the Alternative Analysis Report shows that there would be 18,049 vehicles per hour (vph) operating on the H-1 Freeway in 2030 under the No Build Alternative. Vehicle volumes rise to 18,327 vph (Two-direction Option) or 18,419 vph (Reversible Option) with the Managed Lane Alternative, while traffic volumes decrease to 17,209 vph with the 20-mile Fixed Guideway Transit Alternative. Accordingly, the Fixed Guideway Transit Alternative will reduce traffic volumes from those projected under the 2030 No Build Alternative.

There could be many other versions of this type of system with minor adaptations to suit one or another special concern. In the end, the above approaches all have similar challenges as a primary solution to Honolulu's transportation problems. They do not reduce congestion, increase the reliability of the transportation system, serve future land use plans, or improve the fairness of and access to the transportation system. While the Managed Lane Alternative would reduce freeway congestion (measured as vehicle hours of delay), it would increase overall system congestion by inducing additional travelers to drive, which would result in increased congestion on arterial and collector facilities accessing the freeways and the managed lane. In addition, once a vehicle leaves the managed lane, that vehicle is still subjected to congestion on surrounding roadways. They also do not offer an alternative to perpetuating a reliance on limited existing travel modes. For example, localized bypasses would not meet system goals for corridor-wide

Mr. Ben Ramelb
Page 4

benefits to mobility, reliability, access, and equity. In sum, they do not address the Purpose and Need of the Project.

To address your conclusion and recommendation, the Managed Lane Alternative as proposed by Ann Kobayashi and Professor Prevedourous were evaluated and subsequently eliminated from further consideration. Their proposal is similar to the Managed Lane Alternative that was thoroughly evaluated in the Alternatives Analysis, which also accommodated both single occupant and transit vehicles. As stated previously, there could be many other versions of this type of system with minor adaptations to suit one or another special concern. In the end, the above approaches all have similar challenges as a primary solution to Honolulu's transportation problems. Please see points a and b regarding cost estimates for the Managed Lane Alternative.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

FAX: (808) 587-6080

Subject: Comment on Draft Environmental Impact Statement (DEIS)
"Honolulu High-capacity transit corridor Project", Issue : The DEIS and
alternative Analysis do not investigate a wide range of alternatives as
required by law.

Discussion: The Alternative Analysis and DEIS failed to provide "... an
assessment of a wide range of public transportation alternatives ..."
and/or "... sufficient information to enable the Secretary to make the
findings of project justification ..." as required by statute.

In addition, we believe that you will find that the City, PB and FTA failed
to, "Rigorously explore and objectively evaluate all reasonable
alternatives," and "Devote substantial treatment to each alternative
considered in detail including the proposed action so that reviewers may
evaluate their comparative merits," as required by the Council on
Environmental Quality (CEQ) Sec. 1502.14.

Four alternatives should be assessed:

1) BRT transit system as proposed by the Harris Administration. The
BRT route downtown should be limited to King and Beretania Streets (a
couplet) and exclude Dillingham Blvd and Kapiolani Blvd which do not
have sufficient lanes to accommodate BRT.

2) Managed Lane (reversible three lanes) as proposed by Professor
Panos Prevedouros Study, "Transportation Alternatives Analysis for
Mitigating Traffic Congestion between Leeward Oahu and Honolulu"
which shows the 11 mile three-lane cost estimate to be \$900 million
which is in line with the \$320 million Tampa three-lane reversible transit
way. The full report is available at
www.eng.hawaii.edu/~panos/UHCS.pdf.

3) Former mayoral candidate Ann Kobayashi's proposal for a 15 mile
EzWay. See
<http://www.honoluluadvertiser.com/article/20081015/NEWS01/810150392/1001>

4) Build two elevated highway bypasses around the H-1 bottlenecks at H-
1/H-2 merge and at Middle St. merge. The bypasses include: (a)
"Kamehameha HOV Flyover", a four-mile, three-lane reversible elevated
hwy over the Kamehameha Hwy median between the H-1/H-2 merge
and the H-1 Viaduct east of Aloha Stadium and (b) "Nimitz Flyover", a
three- mile, three-lane reversible elevated hwy over the Nimitz Hwy
median between the H-1 Viaduct at Keehi Lagoon Drive and Hotel
St/Alakea St./ Halekauwila St/Ala Moana Blvd. An on/off ramp to
Waikamilo Rd from the Nimitz bypass would reduce the number of lanes

from three to two between Waikamilo Rd and Iwilei. See attachment for more information on HOV Flyovers.

Recommendation: Include the above four alternatives in the DEIS.

Respectfully,

Ben Ramelb P.E.

Attachment – Description of Nimitz and Kamehameha HOV Flyovers

Nimitz Flyover, Reversible HOV:

The Nimitz HOV Flyover is a 3-mile reversible, elevated, three-lane structure over the Nimitz Highway median from the Airport Viaduct at Keehi Lagoon to Hotel Street and Alakea St/Halekiauwiia St. The Flyover would be built similar to the Tampa Elevated three-lane Reversible HOV as described in-
<http://www.tollroadsnews.com/node/172> .

One of the three lanes would exit the Flyover at Waikamilo Rd. to provide access to job centers in Kalihi, resulting in the Flyover having only two lanes entering downtown. The downtown terminal connections from the Nimitz HOV Flyover include an elevated busway from Iwilei to Hotel Street and a single lane underpass to both Alakea St/Halekiauwiia Streets. These connections are described in a Managed Lane Study "Transportation Alternatives Analysis for Mitigating Traffic congestion between Leeward Oahu and Honolulu". The full report is available at www.eng.hawaii.edu/~panos/UHCS.pdf.

The initial 2005 cost for the 10 mile Tampa Reversible was \$320 million or \$32 Million per highway mile, however, a geotechnical design error increased the cost to \$420 million or \$42 million per mile. Using a geographic and escalation factor of 100 percent, the 3-mile Nimitz HOV

Flyover at \$60 to \$80 million per mile would cost \$180 million to \$240 million.

The "Nimitz Flyover" has an approved Final Environmental Impact Statement which allows for early construction.

Kamehameha Flyover, Reversible HOV:

The Kamehameha HOV Flyover is a 3-mile reversible, elevated, three-lane structure over the median of Kamehameha Highway from the H-1/H-2 merge at the Waiawa Interchange to the Airport Viaduct just diamond head of the Aloha Stadium. The Flyover would be built similar to the Tampa Elevated three-lane Reversible HOV as described in-
<http://www.tollroadsnews.com/node/172>

The Kamehameha Flyover would be connected to H-1, H-2, Kamehameha Highway and Farrington Highway at the west end and to the Airport Viaduct at the east end. These connections are described in a Managed Lane Study "Transportation Alternatives Analysis for Mitigating Traffic congestion between Leeward Oahu and Honolulu". The full report is available at www.eng.hawaii.edu/~panos/UHCS.pdf.

The initial 2005 cost for the 10 mile Tampa Reversible was \$320 million or \$32 Million per highway mile, however, a geotechnical design error increased the cost to \$420 million or \$42 million per mile. Using a geographic and escalation factor of 100 percent, the 4-mile Kamehameha HOV Flyover at \$60 to \$80 million per mile would cost between \$240 million to \$320 million.

The Draft Environmental Impact Statement (DEIS) - Honolulu High-Capacity Transit Corridor Project Nov 2008, shows the rail route over Kamehameha Highway between Pearl City and Aloha Stadium which could conflict with the proposed three-lane "Kamehameha Flyover" route outlined above. If the rail is built, it is suggested that both the Kamehameha Highway "Flyover" and the Rail be built within the elevated Kamehameha Highway corridor. In this case, only a two-lane "Kamehameha Flyover" is needed (instead of three-lanes) to be built alongside and parallel to the Rail transit. The rail with a capacity of 6,000 commuters per hour and the two-lane "Kamehameha Flyover", with a capacity of 4,000 vehicles per hour, should be adequate to substantially reduce the bottleneck at the H-1/H-2 merge and the traffic congestion on H-1 between Pearl City and Aloha Stadium.

Dear Mr. Ramelb:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal dated December 29, 2008 with subject [Comment on Draft Environmental Impact Statement (DEIS) "Honolulu High-capacity transit corridor Project", Issue: The DEIS and alternative Analysis do not investigate a wide range of alternatives as required by law]:

In response to the discussion section of your letter, the Alternatives Analysis process, as documented in Chapter 2 of the Draft EIS, evaluated a broad range of transit mode and general alignment alternatives to provide improved mobility in the study corridor. An initial screening process considered alternatives identified through previous transit studies, a field review of the study corridor, an analysis of current population and employment data for the study corridor, a literature review of technology modes, work completed for the Oahu Regional Transportation Plan 2030 (ORTP) prepared by the Oahu Metropolitan Planning Organization (OahuMPO) (OahuMPO 2007), and public and agency comments received during the formal Alternatives Analysis scoping process.

During the fall of 2005 and winter of 2006, the City and County of Honolulu completed the alternatives screening process that is documented in the Honolulu High-Capacity Transit Corridor Project Alternatives Screening Memorandum (DTS 2006a). Scoping meetings were held, which included a presentation of alternatives to the public and interested agencies and officials to receive comments on the Purpose and Need, alternatives, and scope of the analysis for the Alternatives Analysis. Refinements were made to alternatives.

The scoping process in March of 2007 requested that the public propose alternatives that would satisfy the Purpose and Need at less cost or with greater effectiveness or less environmental or community impact and were not previously studied and eliminated for good cause. The only alternative proposed that met this criteria was Fixed Guideway Transit following an alternative alignment. All reasonable alternatives that have been identified and that satisfy the Purpose and Need at less cost or with greater effectiveness or less environmental or community impact and were not previously studied and eliminated for good cause have been evaluated in the Draft EIS.

In response to the four alternatives suggested in your letter:

1) As stated in Chapter 2 of the Final EIS, prior to selecting an elevated fixed guideway system, a variety of high-capacity transit options were evaluated during the Primary Corridor Transportation Project (1998-2002) and Alternatives Analysis. Options evaluated and rejected include an exclusively at-grade fixed guideway system using bus rapid transit vehicles. In addition to comments received during the Alternatives Analysis and EIS scoping sessions, these studies provided a critical foundation for the conclusion that an elevated system would result in the best overall performance and better support of the Purpose and Need for the Project. In addition, the proposed Bus Rapid Transit Alternative, as stated in your letter, is a variation of the Transportation System Management Alternative that was evaluated in the Alternatives Analysis. While this alternative has merit for cost-effectiveness, its overall system benefit would be very low.

2) The Managed Lane Alternative was fully evaluated in the Alternatives Analysis. The Managed Lane Alternative would not eliminate congestion and bottlenecks on the H-1 Freeway. Table 3-12 in the Alternative Analysis shows that, under the No Build Alternative, there would be 18,049 vehicles per hour (vph) operating on the H-1 Freeway in 2030. Vehicle volumes rise to 18,327 vph (Two-direction Option) or 18,419 vph (Reversible Option) with the Managed Lane Alternative, while traffic volumes decrease to 17,209 vph with the 20-mile Fixed Guideway Transit Alternative. Accordingly, the Fixed Guideway Transit Alternative will reduce traffic volumes from those projected under the 2030 No Build Alternative.

The analysis of the Managed Lane Alternative from the Alternatives Analysis Report (DTS 2006b) shows the cost to be \$2.6 billion in 2006 dollars (higher today). As stated in the City Council's Transit Advisory Task Force Report, a committee was charged with reviewing cost estimates for the two alternatives involving construction (the Managed Lane Alternative and Fixed Guideway Alternative). The report states that "the Task Force agrees with this committee that the Alternatives Analysis' construction cost estimates were fairly and consistently prepared, and that they may be used for both

planning and cost comparisons.” Information was obtained by the Task Force from the Hawaii Department of Transportation and others familiar with managed lane facilities. It is the only estimate to date that addresses Honolulu conditions.

There is no substantiation of the estimate from the Tampa Bay toll facility being applicable in Honolulu. The designer of the Tampa Bay facility herself admitted that to apply such an estimate without detailed consideration of the many differences between the two locations is not reasonable. For clarification, the Tampa Bay elevated toll lanes extend only 5.8 miles within the 10-mile expressway. The costs quoted are from 2002, long before the costs of materials and construction rose dramatically after 2004. Furthermore, the corridor within which the Tampa Bay lanes are built required no right-of-way, had no significant utility conflicts, no major structures or crossings, and was built in much more favorable geotechnical conditions than exist on Oahu. In addition, the Transit Task Force Report dated December 14, 2006, states that “the committee concluded that the projects are sufficiently different (actual costs versus projected costs with contingencies; available, accessible ROW vs. construction in actively used highways; no utilities relocation vs. extensive relocations) as to make the comparison unreasonable.”

3) The EzWay 15-mile, three-lane viaduct concept was developed as a hybrid of a plan for elevated toll lanes and some form of rubber-tire-on-concrete transit system. It is similar to the Managed Lane Alternative that was thoroughly evaluated in the Alternatives Analysis, which also accommodated both single occupant and transit vehicles. No known cost estimate for the EzWay proposal was prepared or validated by a qualified registered Professional Engineer. As a point of reference, the State of Hawaii’s Highway Modernization Plan dated January 22, 2009, estimates the cost of the Nimitz Viaduct at \$600 million for an approximately 2.5-mile elevated highway with two lanes, which equals \$240 million per mile. Using this estimate, a 15-mile facility would cost approximately \$3.6 billion.

4) Localized bypasses would not meet system goals for corridor-wide benefits to mobility, reliability, access, and equity. The Hawaii Department of Transportation, which is responsible for the freeway system, has evaluated needs for the freeway system and identified the highway projects that would be most efficient at reducing congestion on Oahu. The projects in the Oahu Regional Transportation Plan, including a Nimitz Flyover, are listed in Table 2-3 of the Draft EIS and included in the analysis for all project alternatives (the No Build Alternative and the Project). Effects of the Nimitz Flyover on traffic conditions in 2030 are discussed in Section 3.4.2 of the Final EIS. Travel on the Nimitz Flyover was included for the following travel pairs under the No Build Alternative: Kapolei to Downtown, Ewa to Downtown, and Mililani to Downtown. As shown in Figure 3-7 of the Final EIS, the Nimitz Flyover does improve transit travel times with the No Build Alternative between certain travel pairs (e.g., between Mililani and Downtown) compared to 2007 conditions. However, as also shown in this figure, travel times improve substantially more with the addition of the Project. As a point of clarification, a Final EIS was never prepared for the Nimitz Flyover.

There could be many other versions of this type of system with minor adaptations to suit one or another special concern. In the end, the above approaches all have similar challenges as a primary solution to Honolulu's transportation problems. They do not reduce congestion, increase the reliability of the transportation system, serve future land use plans, or improve the fairness of and access to the transportation system. While the Managed Lane Alternative would reduce freeway congestion (measured as vehicle hours of delay), it would increase overall system congestion by inducing additional travelers to drive, which would result in increased congestion on arterial and collector facilities accessing the freeways and the managed lane. In addition, once a vehicle leaves the managed lane, that vehicle is still subjected to congestion on surrounding roadways. They also do not offer an alternative to perpetuating a reliance on limited existing travel modes. For example, localized bypasses would not meet system goals for corridor-wide benefits to mobility, reliability, access, and equity. In sum, they do not address the Purpose and Need of the Project.

As noted in response to your comments above, the four alternatives that you have proposed would not substantially reduce or eliminate system-wide traffic congestion nor are they as effective at meeting the goals and objectives for the Project.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Subject: Comment on Draft Environmental Impact Statement (DEIS)
"Honolulu High-capacity transit corridor Project: Issue - Scope of Work
reduced in DEIS from scope stipulated in 2006 Notice of Intent

Fact:

The project scope outlined in the 2006 Notice of Intent (NOI) agreement between the Federal Transit Administration and the City and County of Honolulu is violated. The NOI explicitly mentions a fixed guideway from Kapolei to the UH. The DEIS fixed guide way starts well outside Kapolei and ends at Ala Moana Shopping Center. The 34 miles have become 20 miles in the DEIS.

Discussion:

The DEIS reduces the project scope as stated in the Notice of Intent (NOI) dated 7 Dec 2007 reference (a), which states:
"The Federal Transit Administration (FTA) and the City and County of Honolulu, Department of Transportation Services (DTS) intend to prepare an EIS (and Alternative Analysis (AA)) on a proposal by the City and County of Honolulu to implement transit improvements that potentially include high-capacity transit service in a 25-mile travel corridor between Kapolei and the University of Hawaii at Manoa and Waikiki."

Discussion:

The City's 2006 Alternatives Analysis states that "The primary project study area is the travel corridor between Kapolei and the University of Hawaii at Manoa.

The DEIS covers a fixed guideway route of 20 miles from Kapolei to Ala Moana Center. The Draft Environmental Impact of the fixed guideway is limited to only the 20 miles rather than the full 34 miles from Kalaeloa to Waikiki and UN Manoa.

Conclusion:

The project scope outlined in the 2006 Notice of Intent (NOI) agreement between the Federal Transit Administration and the City and County of Honolulu is violated.

Recommendation:

It is strongly recommended that the project scope contained in the DEIS be expanded to include a rail route to both Waikiki and to UH Manoa.

Respectfully,

Ben Ramelb P.E.

Dear Mr. Ramelb:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal dated December 29, 2008 with subject [Comment on Draft Environmental Impact Statement (DEIS) "Honolulu High-capacity transit corridor Project: Issue - Scope of Work reduced in DEIS from scope stipulated in 2006 Notice of Intent]:

The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS. However, the future extensions are not part of this Project; thus, they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by

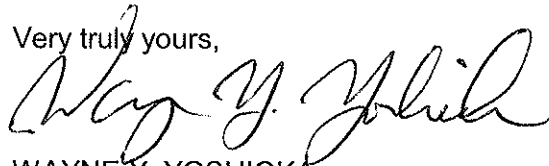

Mr. Ben Ramelb
Page 2

the City and FTA. If the future extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time.

The December 2005 Notice of Intent was superseded by the March 2007 Notice of Intent for preparation of the NEPA EIS. The March 2007 Notice of Intent states: "Both alignment alternatives would have a future extension from Downtown Honolulu to UH Manoa with a future branch to Waikiki, and a future extension at the Waianae (western) end to Kalaeloa Boulevard in Kapolei." No Notice of Intent for the Project was issued in 2006. While the fixed guideway system directly connects East Kapolei to Ala Moana Center, the remainder of the study corridor is served by buses integrated with the system. Future extensions would be subject to a complete environmental review at the time they are proposed.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Subject: Comment on Draft Environmental Impact Statement (DEIS)
"Honolulu High-capacity transit corridor Project", Issue : The DEIS
incorrectly excludes Managed Lanes and other alternatives

Discussion: DEIS Chapter 2 summarizes alternatives considered for the
Honolulu High-Capacity Transit Corridor Project. The alternatives
considered were chosen primarily by the Alternative Analysis published
in 2006.

The AA was flawed because it failed to include several transit
alternatives, each with the capability to substantially reduce or eliminate
the traffic congestion on H-1 at Pearl City and Middle St. merge in year
2030. As shown on Table 3-12 of the AA and DEIS Table 3-12, All rail
alternatives result in worse traffic congestion on H-1 AFTER any rail
alternative is built and operating.

The fact that rail will worsen congestion on H-1 after spending a
minimum of \$6.2 Billion for the Rail alternative, it is totally unacceptable
to the Oahu taxpayer to continue to face worse traffic congestion on H-1
which is the single, primary reason for building a "mass transit system".

As a minimum, the DEIS should include the following additional
alternatives:

Four alternatives should be assessed:

- 1) BRT transit system as proposed by the Harris Administration. The
BRT route downtown should be limited to King and Beretania Streets
and exclude Dillingham Blvd and Kapiolani Blvd.
- 2) Managed Lane (reversible) as proposed by Professor Panos
Prevedouros Study, "Transportation Alternatives Analysis for Mitigating
Traffic Congestion between Leeward Oahu and Honolulu" which
shows the 11 mile three-lane cost estimate to be \$900 million which is in
line with the \$320 million Tampa three-lane reversible transitway.
- 3) Former mayoral candidate Ann Kobayashi's proposal for a 15 mile
EzWay. See
<http://www.honoluluadvertiser.com/article/20081015/NEWS01/810150392/1001>
- 4) Build two elevated highway bypasses around the H-1 bottlenecks at H-
1/H-2 merge and at Middle St. merge. The bypasses include: a) a 4
mile, three-lane reversible elevated highway (Kamehameha Flyover)
over the Kamehameha Hwy median between the H-1/H-2 merge and the
H-1 Viaduct at Aloha Stadium and b) a 3 mile, three-lane reversible

elevated hwy (Nimitz Flyover) over the Nimitz Hwy median between the H-1 Viaduct at Keehi Lagoon Drive and Hotel St/Alakea St./ Halekauwila St/Ala Moana Blvd. An on/off ramp to Waikamilo Rd from the Nimitz bypass would reduce the number of lanes from three to two between Waikamilo Rd and Iwilei. See attachment for more information on HOV flyovers.

Conclusion: The above four transit alternatives meet the goals and objectives of the Honolulu General Plan and Oahu Regional Transportation Plan and therefore should be included for consideration for Oahu Mass Transit system in the West Oahu corridor.

Recommendation: Include the above four alternatives in the DEIS.

Respectfully,

Ben Ramelb P.E.

Attachment – Description of Nimitz and Kamehameha HOV Flyovers
Nimitz Flyover, Reversible HOV:

The Nimitz HOV Flyover is a 3-mile reversible, elevated, three-lane structure over the Nimitz Highway median from the Airport Viaduct at Keehi Lagoon to Hotel Street and Alakea St/Halekauwila St. The Flyover would be built similar to the Tampa Elevated three-lane Reversible HOV as described in-

<http://www.tollroadsnews.com/node/172> .

One of the three lanes would exit the Flyover at Waikamilo Rd. to provide access to job centers in Kaihi, resulting in the Flyover having only two lanes entering downtown. The downtown terminal connections from the Nimitz HOV Flyover include an elevated busway from Iwilei to Hotel Street and a single lane underpass to both Alakea St/Halekauwila Streets. These connections are described in a Managed Lane Study

"Transportation Alternatives Analysis for Mitigating Traffic congestion between Leeward Oahu and Honolulu". The full report is available at www.eng.hawaii.edu/~panos/UHCS.pdf.

The initial 2005 cost for the 10 mile Tampa Reversible was \$320 million or \$32 Million per highway mile, however, a geotechnical design error increased the cost to \$420 million or \$42 million per mile. Using a geographic and escalation factor of 100 percent, the 3-mile Nimitz HOV Flyover at \$60 to \$80 million per mile would cost \$180 million to \$240 million.

The "Nimitz Flyover" has an approved Final Environmental Impact Statement which allows for early construction.

Kamehameha Flyover, Reversible HOV:

The Kamehameha HOV Flyover is a 3-mile reversible, elevated, three-lane structure over the median of Kamehameha Highway from the H-1/H-2 merge at the Waiawa Interchange to the Airport Viaduct just diamond head of the Aloha Stadium. The Flyover would be built similar to the Tampa Elevated three-lane Reversible HOV as described in-
<http://www.tollroadsnews.com/node/172>

The Kamehameha Flyover would be connected to H-1, H-2, Kamehameha Highway and Farrington Highway at the west end and to the Airport Viaduct at the east end. These connections are described in a Managed Lane Study "Transportation Alternatives Analysis for Mitigating Traffic congestion between Leeward Oahu and Honolulu". The full report is available at www.eng.hawaii.edu/~panos/UHCS.pdf.

The initial 2005 cost for the 10 mile Tampa Reversible was \$320 million or \$32 Million per highway mile, however, a geotechnical design error increased the cost to \$420 million or \$42 million per mile. Using a geographic and escalation factor of 100 percent, the 4-mile Kamehameha HOV Flyover at \$60 to \$80 million per mile would cost between \$240 million to \$320 million.

The Draft Environmental Impact Statement (DEIS) - Honolulu High-Capacity Transit Corridor Project Nov 2008, shows the rail route over Kamehameha Highway between Pearl City and Aloha Stadium which could conflict with the proposed three-lane "Kamehameha Flyover" route outlined above. If the rail is built, it is suggested that both the Kamehameha Highway "Flyover" and the Rail be built within the elevated Kamehameha Highway corridor. In this case, only a two-lane "Kamehameha Flyover" is needed (instead of three-lanes) to be built alongside and parallel to the Rail transit. The rail with a capacity of 6,000 commuters per hour and the two-lane "Kamehameha Flyover", with a capacity of 4,000 vehicles per hour, should be adequate to substantially reduce the bottleneck at the H-1/H-2 merge and the traffic congestion on H-1 between Pearl City and Aloha Stadium.

Mr. Ben Ramelb
1148 Ala Liliko'i Street
Honolulu, Hawaii 96818

Dear Mr. Ramelb:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal dated December 29, 2008 with subject [Comment on Draft Environmental Impact Statement (DEIS) "Honolulu High-capacity transit corridor Project", Issue : The DEIS incorrectly excludes Managed Lanes and other alternatives]:

In response to the discussion section of your letter, the Alternatives Analysis phase evaluated a range of transit mode and general alignment alternatives in terms of their costs, benefits, and impacts. An initial screening process considered alternatives identified through previous transit studies, a field review of the study corridor, an analysis of current population and employment data for the study corridor, a literature review of technology modes, work completed for the Oahu Regional Transportation Plan 2030 (ORTP) prepared by the Oahu Metropolitan Planning Organization (OahuMPO) (OahuMPO 2007), and public and agency comments received during the formal Alternatives Analysis scoping process.

During the fall of 2005 and winter of 2006, the City and County of Honolulu completed the alternatives screening process that is documented in the Honolulu High-Capacity Transit Corridor Project Alternatives Screening Memorandum (DTS 2006a). Scoping meetings were held, which included a presentation of alternatives to the public and interested agencies and officials to receive comments on the Purpose and Need, Alternatives, and Scope of the analysis for the Alternatives Analysis. Refinements were made to alternatives.

The scoping process in March of 2007 requested that the public propose alternatives that would satisfy the Purpose and Need at less cost or with greater effectiveness or less environmental or community impact and were not previously studied and eliminated for good cause. The only alternative proposed that met this criteria was Fixed Guideway Transit following an alternative alignment. All reasonable alternatives that have been identified and that satisfy the Purpose and Need at less cost or with greater effectiveness or less environmental or community impact and were not previously studied and eliminated for good cause have been evaluated in the Draft EIS.

In response to the four alternatives suggested in your letter:

1) As stated in Chapter 2 of the Final EIS, prior to selecting an elevated fixed guideway system, a variety of high-capacity transit options were evaluated during the Primary Corridor Transportation Project (1998-2002) and Alternatives Analysis. Options evaluated and rejected include an exclusively at-grade fixed-guideway system using bus rapid transit vehicles. In addition to comments received during the Alternatives Analysis and EIS scoping sessions, these studies provided a critical foundation for the conclusion that an elevated system would result in the best overall performance and better support of the Purpose and Need for the Project. In addition, the proposed Bus Rapid Transit Alternative, as stated in your letter, is a variation of the Transportation System Management Alternative that was evaluated in the Alternatives Analysis. While this alternative has merit for cost-effectiveness, its overall system benefit would be very low.

2) The Managed Lane Alternative was fully evaluated in the Alternatives Analysis. The Managed Lane Alternative would not eliminate congestion and bottlenecks on the H-1 Freeway. Table 3-12 in the Alternative Analysis Report shows that, under the No Build Alternative, there would be 18,049 vehicles per hour (vph) operating on the H-1 Freeway in 2030. Vehicle volumes rise to 18,327 vph (Two-direction Option) or 18,419 vph (Reversible Option) with the Managed Lane Alternative, while traffic volumes decrease to 17,209 vph with the 20-mile Fixed Guideway Transit Alternative. Accordingly, the Fixed Guideway Transit Alternative will reduce traffic volumes from those projected under the 2030 No Build Alternative.

The analysis of the Managed Lane Alternative from the Alternatives Analysis Report (DTS 2006b) shows the cost to be \$2.6 billion in 2006 dollars (higher today). As stated in the City Council's Transit Advisory Task Force Report, a committee was charged with reviewing cost estimates for the two alternatives involving construction (the Managed Lane Alternative and Fixed Guideway Alternative). The report states that "the Task Force agrees with this committee that the Alternatives Analysis' construction cost estimates were fairly and consistently prepared, and that they may be used for both

planning and cost comparisons.” Information was obtained by the Task Force from the Hawaii Department of Transportation and others familiar with managed lane facilities. It is the only estimate to date that addresses Honolulu conditions.

There is no substantiation of the estimate from the Tampa Bay toll facility being applicable in Honolulu. The designer of the Tampa Bay facility herself admitted that to apply such an estimate without detailed consideration of the many differences between the two locations is not reasonable. For clarification, the Tampa Bay elevated toll lanes extend only 5.8 miles within the 10-mile expressway. The costs quoted are from 2002, long before the costs of materials and construction rose dramatically after 2004. Furthermore, the corridor within which the Tampa Bay lanes are built required no right-of-way, had no significant utility conflicts, no major structures or crossings, and was built in much more favorable geotechnical conditions than exist on Oahu. In addition, the Transit Task Force Report dated December 14, 2006, states that “the committee concluded that the projects are sufficiently different (actual costs versus projected costs with contingencies; available, accessible ROW vs. construction in actively used highways; no utilities relocation vs. extensive relocations) as to make the comparison unreasonable.”

3) The EzWay 15-mile, three-lane viaduct concept was developed as a hybrid of a plan for elevated toll lanes and some form of rubber-tire-on-concrete transit system. It is similar to the Managed Lane Alternative that was thoroughly evaluated in the Alternatives Analysis, which also accommodated both single occupant and transit vehicles. No known cost estimate for the EzWay proposal was prepared or validated by a qualified registered professional engineer. As a point of reference, the State of Hawaii’s Highway Modernization Plan dated January 22, 2009, estimates the cost of the Nimitz Viaduct at \$600 million for an approximately 2.5-mile elevated highway with two lanes, which equals \$240 million per mile. Using this estimate, a 15-mile facility would cost approximately \$3.6 billion.

4) Localized bypasses would not meet system goals for corridor-wide benefits to mobility, reliability, access, and equity. The Hawaii Department of Transportation, which is responsible for the freeway system, has evaluated needs for the freeway system and identified the highway projects that would be most efficient at reducing congestion on Oahu. The projects, including a Nimitz Flyover, are listed in Table 2-3 of the Draft EIS and included in the analysis for all project alternatives. Effects of the Nimitz Flyover on traffic conditions in 2030 are discussed in Section 3.4.2 of the Final EIS. Travel on the Nimitz Flyover was included for the following travel pairs under the No Build Alternative: Kapolei to Downtown, Ewa to Downtown, and Millilani to Downtown. As shown in Figure 3-7 of the Final EIS, the Nimitz Flyover does improve transit travel times with the No Build Alternative between certain travel pairs (e.g., between Millilani and Downtown) compared to 2007 conditions. However, as also shown in this figure, travel times improve substantially more with the addition of the Project. As a point of clarification, a Final EIS was never prepared for the Nimitz Flyover.

There could be many other versions of this type of system with minor adaptations to suit one or another special concern. In the end, the above approaches all have similar

Mr. Ben Ramelb
Page 4

challenges as a primary solution to Honolulu's transportation problems. They do not reduce congestion, increase the reliability of the transportation system, serve future land use plans, or improve the fairness of and access to the transportation system. While the Managed Lane Alternative would reduce freeway congestion (measured as vehicle hours of delay), it would increase overall system congestion by inducing additional travelers to drive, which would result in increased congestion on arterial and collector facilities accessing the freeways and the managed lane. In addition, once a vehicle leaves the managed lane, that vehicle is still subjected to congestion on surrounding roadways. They also do not offer an alternative to perpetuating a reliance on limited existing travel modes. For example, localized bypasses would not meet system goals for corridor-wide benefits to mobility, reliability, access, and equity. In sum, they do not address the Purpose and Need of the Project.

As noted in response to your comments above, the four alternatives that you have proposed would not substantially reduce or eliminate system-wide traffic congestion, nor are they as effective at meeting the goals and objectives of the Project.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Subject: Comment on Draft Environmental Impact Statement (DEIS)
"Honolulu High-capacity transit corridor Project", Issue : The DEIS
unjustly excludes Managed Lanes and other alternatives

Discussion:

DEIS Chapter 2 evaluates only "No build and Steel Wheel Rail Transit" alternatives identified by the 2006 City Alternative Analysis. The AA intentionally assigned flawed information to the Managed Lanes Alternative (MLA) to eliminate the MLA from further consideration for Oahu's Mass Transit system. The flawed information is further displayed in Honolulutransit.com which makes a comparison of Mass Transit Options including the MLA (aka HOT) and is shown below. Honolulutransit.com provides a chart to compare the Mass Transit options and concludes that Steel Wheel Rail Transit is the best option.

The Mass Transit Options included:

- 1) Steel Wheel Rail Transit (SWRT)
- 2) Rubber Tire Fixed Guideway (RTFG)
- 3) Elevated "HOT" Toll roads or Managed Lanes (HOT)

Comparison of Options (see chart in www.honolulutransit.com/FAQ under "Why was steel wheel Technology chosen for Honolulu?")

A) Lowest construction cost: SWRT – YES ; RTFG – NO ; HOT - NO.
B) Lowest Cost to maintain and operate: SWRT – YES ; RTFG – NO ; HOT - NO.

C) Qualifies for federal transit funding: SWRT – YES ; RTFG – YES ; HOT - NO.

D) Highest Passenger Capacity: SWRT – YES ; RTFG – YES ; HOT - NO.

E) Electric-powered, can run on wind, solar, H-power: SWRT – YES ; RTFG – YES ; HOT - NO.

F) Lightest construction impact on community: SWRT – YES ; RTFG – YES ; HOT - NO.

G) Greatest relief of traffic congestion: SWRT – YES ; RTFG – YES ; HOT - NO.

H) Lowest operating noise levels: SWRT – YES ; RTFG – NO ; HOT - NO.

I) Most proven transit solution: SWRT – YES ; RTFG – NO ; HOT - NO.

There are comparison flaws between HOT and SWRT or RTFG in each of the above topics. However, the major flawed comparisons are found in comparisons "A", "D", and "G" as explained below.

Discussion of Comparison A) - (Rail has) Lowest construction Cost:

The capital cost estimate for the 30 mile SWRT in the Alternative Analysis (Table 5-1) is \$5.5 Billion for Kamokila to Waikiki or \$183 million per mile (rail includes 20 + four story rail stations, 180 land acquisition and power substations at each rail station). The Alternative Analysis assigns a capital cost estimate for 11 mile HOT two-lane reversible highway from Waialeale to Iwilei at \$2.57 Billion or \$233 million per mile (HOT has zero bus stations and zero power substations). The AA-assigned capital cost estimate for the HOT reversible at \$233 per mile is grossly incorrect based on several factors:

a) The Oahu Regional Transportation Plan (ORTP 2030) link http://oahumpo.org/ortp/ORTP2030/OMPO_Report_FINAL.pdf shows the State Project No. 52 - 2.2 mile Nimitz two-lane elevated flyover at \$250 million (State DOT cost Estimate) or \$113 million per mile.

b) The 10 mile Tampa three-lane elevated expressway <http://www.tollroadsnews.com/node/172> cost \$420 million or \$42 million per mile.

c) The AA assigned cost estimate for the HOT reversible would conclude that the HOT would cost twice as much per lane mile as H-3, the most expensive highway because it had to bore two tunnels through the Koolaus.

d) Professor Panos Prevedouros study "Transportation Alternative Analysis for Mitigating traffic Congestion between Leeward Oahu and Honolulu" March 2008, shows a cost estimate for a three lane, 11 mile elevated Managed Lane for \$900 million or \$81 million per mile. The Managed Lane facility is similar in construction to the Tampa three lane elevated reversible. The full report is available at www.eng.hawaii.edu/~panos/UHCS.pdf.

Conclusion: It is concluded that the AA-assigned capital cost estimate for the HOT reversible at \$233 per mile is grossly incorrect and that a three-lane reversible HOT or managed lane is estimated to cost not more than \$80 million per mile or \$880 million for 11 miles from the H-1/H-2 merge to downtown Hotel Street.

Discussion of Comparison D) - (Rail has) Highest Passenger Capacity: Numbers from Table 3-12 of city 2006 Nov Alternative Analysis (\$10 million report):

Rail only: The rail has a peak passenger capacity of 6,000 commuters per hour (2,000 seated, 4,000 standees) based on 300 commuters per train group at 3 minute intervals. Also see honolulutransit.com/FAQ "What is Honolulu Rail Transit?" for rail commuter capacity.

HOT or Managed Lane: The HOT will have three lanes, each lane has a capacity of 2000 vph. For three lanes, the vehicular capacity is 6000 vehicles per hour. The HOT person capacity is calculated thus:

Projected use of the HOT during peak hour includes:

200 express buses w/~50 pns = 10,000 pns

500 HOV5 (carpool) = 2,500 pns

500 vanpool (~5pns) = 2,500 pns.

Remaining excess capacity available for low occupancy vehicles:

6,000 vph minus (200 + 500 + 500) = 4,800 vph. 4,800 low occupancy vehicles

Average persons per vehicle = 1.2 pns per vehicle
4,800 vehicles with 1.2 pns = 5700 pns

Summary: HOT persons capacity = 10,000 + 2,500 + 2,500 + 5,700 = ~
20,700 pns

Conclusion: Rail carries 6,000 commuters per hour while a three-lane
HOT or Managed Lane carries about 20,000 commuters per hour.
Managed Lane Alternative carries over three times the commuter
capacity of rail.

Comparison G) - (Rail provides) Greatest relief of traffic congestion:
Numbers from Table 3-12 of city 2006 Nov Alternative Analysis (\$10
million report):

Rail only: The rail has a peak passenger capacity of 6,000 commuters
per hour (2,000 seated, 4,000 standees) based on 300 commuters per
train group at 3 minute intervals.

H-1 only: rated capacity = 9,500 vehicles per hour (equivalent 15,400
commuters per hour)

H-1 forecast yr 2030 traffic load = 17,500 vehicles per hour per City AA
Table 3-12 (or 8,000 vph overload = 9,600 commuters per hour)

Managed Lane three-Lane HOV Reversible Flyover: capacity = 6,000
high occupancy vehicles per hour (equivalent 21,600 commuters per
hour). Capacity based on HOV use on Flyover by 200 express buses
per peak hour, car pools, van pools, green cars and HOV2. (50 pns per
express bus and 5800 vph at avge 2 pns per vehicle).

Year 2030 commuter load by City AA Report = Rail (6000) + H-1
overload (9,600) + H-1 capacity (15,400) = 31,000 commuters.

2030 Load = 31,000 commuters per hour

Rail + H-1 = 21,400 commuters per hour

Managed Lane HOV + H-1 = 37,000 commuters per hour

Conclusion: Rail does not have sufficient commuter capacity which will
cause 9,600 commuters to be stuck in gridlock on H-1 or stuck at rail
stations (especially at stations between Waipahu and Kalihi). Managed
Lane HOV Alternative will eliminate congestion and bottlenecks on H-1.
Overall Conclusion and Recommendation:

It is concluded that the Managed Lane (three-Lane HOT) Alternative was
erroneously discarded for further evaluation in the Alternative Analysis
and therefore it is recommended that the Managed Lane (Three-Lane
elevated HOT) must be reinstated into the DEIS for consideration as a
viable Mass Transit Alternative.

Dear Mr. Ramelb:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal dated December 29, 2008 with subject [Comment on Draft Environmental Impact Statement (DEIS) "Honolulu High-capacity transit corridor Project", Issue : The DEIS unjustly excludes Managed Lanes and other alternatives]:

Regarding the beginning of your discussion, during the Alternatives Analysis, the capital costs of the various Managed Lane Alternative options and the various Fixed Guideway Transit Alternative options were estimated using a consistent methodology. The analysis of the Managed Lane Alternative from the Alternatives Analysis Report (DTS 2006b) shows the cost to be \$2.6 billion in 2006 dollars (higher today). As stated in the City Council's Transit Advisory Task Force Report dated December 14, 2006, a committee was charged with reviewing cost estimates for the two alternatives involving construction (the Managed Lane Alternative and Fixed Guideway Alternative). The report states that "the Task Force agrees with this committee that the Alternatives Analysis' construction cost estimates were fairly and consistently prepared, and that they may be used for both planning and cost comparisons." Information was obtained by the Task Force from the Hawaii Department of Transportation and others familiar with managed lane facilities. It is the only estimate to date that addresses Honolulu conditions.

We will now address your comments about the Alternatives Analysis in the same manner as submitted.

Discussion of Comparison A) – Construction Cost:

a) The State of Hawaii's Highway Modernization Plan dated January 22, 2009, estimates the cost of the Nimitz Viaduct at \$600 million for an approximately 2.5-mile elevated highway with two lanes, which equals \$240 million per mile.

b) There is no substantiation of the estimate from the Tampa Bay toll facility being applicable in Honolulu. The designer of the Tampa Bay facility herself admitted that to apply such an estimate without detailed consideration of the many differences between the two locations is not reasonable. For clarification, the Tampa Bay elevated toll lanes extend only 5.8 miles within the 10-mile expressway. The costs quoted are from 2002, long before the costs of materials and construction rose dramatically after 2004. Furthermore, the corridor within which the Tampa Bay lanes are built required no right-of-way, had no significant utility conflicts, no major structures or crossings, and was built in much more favorable geotechnical conditions than exist on Oahu. In addition, the Transit Task Force Report dated December 14, 2006, states that "the committee concluded that the projects are sufficiently different (actual costs versus projected costs with contingencies; available, accessible ROW vs. construction in actively used highways; no utilities relocation vs. extensive relocations) as to make the comparison unreasonable."

c) According to construction cost indices prepared by the Washington State Department of Transportation, construction costs doubled between 1997 (the year construction ended on the H-3 Freeway) and 2006 (the year of the Alternatives Analysis). If construction of the H-3 Freeway had begun in 2006, that project would have cost approximately \$2.6 billion. In addition, both the H-3 Freeway and the Managed Lane Alternative face unique situations that affect cost estimates. Construction of the Managed Lane Alternative would have occurred in a heavily developed corridor. As a result, there would be substantial disruptions to traffic and utilities, both of which add to the time, and thus cost, of a project. The H-3 Freeway was built in an undeveloped part of the island and which it had its own challenges, expensive traffic and utility disruptions were minimal.

d) The analysis of the Managed Lane Alternative from the Alternatives Analysis Report shows the cost to be \$2.6 billion in 2006 dollars (higher today). As stated in the City Council's Transit Advisory Task Force Report dated December 14, 2006, a committee was charged with reviewing cost estimates for the two alternatives involving construction (the Managed Lane Alternative and Fixed Guideway Alternative). The report states that "the Task Force agrees with this committee that the Alternatives Analysis' construction cost estimates were fairly and consistently prepared, and that they may be used for both planning and cost comparisons." Information was obtained by the Task Force from the Hawaii Department of Transportation and others familiar with managed lane facilities. It is the only estimate to date that addresses Honolulu conditions. As stated previously, the State of Hawaii's Highway Modernization Plan dated January 22, 2009, estimates the cost of the Nimitz Viaduct at \$600 million for an

approximately 2.5-mile elevated highway, which equals \$240 million per mile. Using this estimate, a 15-mile facility would cost approximately \$3.6 billion. As stated previously, providing a managed lane system in Honolulu is not comparable to the Tampa Bay toll facility that you reference.

Discussion of Comparison D) — Passenger Capacity:

Since the Draft EIS was published, the travel demand model has been refined by adding an updated air passenger model (which forecasts travel in the corridor related to passengers arriving or departing at Honolulu International Airport), defining more realistic drive access modes (driving alone or car pooling) to project stations and recognizing a more robust off-peak non-home-based direct demand element (trips that do not originate at home) based on travel surveys in Honolulu. These revisions were made based on consultation with FTA. As stated in Chapter 3 of the Final EIS, the travel demand forecasting model predicts a maximum peak direction volume of 14,700 passengers during the a.m. two-hour peak period. As a result of updated ridership forecasts, the operating plan for the fixed guideway system has been revised and the system will have a minimum capacity of approximately 17,300 passengers per direction during the two-hour peak period. The fixed guideway system is planned to operate with two- or three-car trains with a capacity of between 325 and 500 passengers each. At three-minute headways during the peak period, that provides capacity for approximately 8,650 passengers per peak direction per peak hour. This capacity figure applies in both directions for a total system capacity of approximately 17,300 passengers per peak hour. The full capacity of the fixed guideway with four-car trains and 90-second headways is over 25,000 passengers per hour per direction or over 50,000 passengers total. Accordingly, the fixed guideway system will provide sufficient capacity based on travel demand forecasting results.

The Managed Lane Alternative, including its potential capacity, was evaluated in the Alternatives Analysis. While the Managed Lane Alternative would reduce freeway congestion (measured as vehicle hours of delay), it would increase overall system congestion by inducing additional travelers to drive, which would result in increased congestion on arterial and collector facilities accessing the freeways and the managed lane. In addition, once a vehicle leaves the managed lane, that vehicle is subjected to congestion on surrounding roadways. This alternative was also less consistent with the Honolulu General Plan because it was less effective at supporting planned growth and development than the Fixed Guideway Transit Alternative.

Comparison G) — Traffic Congestion:

As stated in response to the comment above, the fixed guideway system would provide a peak minimum capacity of over 17,300 passengers during the two-hour peak period per direction. Should higher volumes be realized, the system is expandable to accommodate longer trains and to reduce the headways between trains from three minutes to 90 seconds resulting in an increase in capacity of more than 100 percent. Accordingly, the fixed guideway system will provide sufficient commuter capacity based on travel demand forecasting results.

Overall Conclusion and Recommendations:

As stated in Chapter 2 of the Final EIS, the Managed Lane Alternative was evaluated for its ability to meet project goals and objectives related to mobility and accessibility, supporting planned growth and economic development, constructability and cost, community and environmental quality, and planning consistency. The Managed Lane Alternative would fail to meet the Project's Purpose and Need, as described in Chapter 1 of this Final EIS, because it fails to moderate anticipated traffic congestion. While this alternative would have reduced congestion on parallel highways, system-wide traffic congestion would have been similar to the No Build Alternative as a result of increased traffic on arterials trying to access the facility. Total islandwide vehicle hours of delay would have increased with the Managed Lane Alternative compared to the No Build Alternative, indicating an increase in systemwide congestion (see Table 2-2 in the Final EIS). It also would be less effective than the Fixed Guideway Alternative at providing a faster and more reliable public transportation service as well as an alternative to private automobile travel. The Managed Lane Alternative would not have supported planned concentrated future population and employment growth because it would not provide concentrations of transit service that would serve as a nucleus for transit-oriented development.

After the Alternatives Analysis was completed, several scoping comments were received requesting reconsideration of the Managed Lane Alternative that was considered and rejected during the Alternatives Analysis. Because no new information was provided that would have changed the findings of the Alternatives Analysis regarding the Managed Lane Alternative, it was not included in the Draft EIS for further consideration.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Subject: Comment on Draft Environmental Impact Statement (DEIS)
"Honolulu High-capacity transit corridor Project", Issue : The DEIS
shows Summary of Alternative Analysis Findings which contains inflated
Capital cost for Managed Lane Alternative (MLA)

Fact:

DEIS Chapter 2, Table 2-1 shows a Summary of Alternative Analysis
Findings including Type of alternative and Total Capital cost for each
alternative:

Alternative	Total Capital Cost
- 2030 No Build	\$600 million
- 2030 Transp. Sys. Mgmt	\$856 million
- 2030 Managed Lane (MLA)	\$3.6 to \$4.7 Billion (two-lanes, 11 miles)
- 2020 Fixed Guideway	\$4.1 to \$6.1 Billion (28 miles)

Discussion:

Table 2-1 shows total capital cost information for the Managed Lane
Alternative (MLA) of \$3.6 to \$4.7 Billion or \$327 Million to \$427 million
per mile over 11 miles.

The AA-assigned capital cost estimate for the Managed Lane Alternative
(Two-lane elevated reversible hwy) is grossly incorrect based on several
factors:

a) The Oahu Regional Transportation Plan (ORTP 2030) link
http://oahumpo.org/ortp/ORTP2030/OMPO_Report_FINAL.pdf shows
the State Project No. 52 - 2.2 mile Nimitz two-lane elevated flyover at
\$250 million (State DOT cost Estimate) or \$113 million per mile.

b) The 10 mile Tampa three-lane elevated expressway
<http://www.tollroadsnews.com/node/172> cost \$420 million or \$42 million
per mile.

c) The AA assigned cost estimate for the HOT reversible would conclude
that the HOT would cost twice as much per lane mile as H-3, the most
expensive highway because it had to bore two tunnels through the
Koolaus.

d) Professor Panos Prevedouros study "Transportation Alternative
Analysis for Mitigating traffic Congestion between Leeward Oahu and
Honolulu" March 2008, shows a cost estimate for a three-lane, 11 mile
elevated Managed Lane for \$900 million or \$81 million per mile. The
Managed Lane facility is similar in construction to the Tampa three lane
elevated reversible. The full report is available at
www.eng.hawaii.edu/~panos/UHCS.pdf.

Conclusion: It is concluded that the AA-assigned capital cost estimate for the HOT reversible at \$327 Million to \$427 million per mile is grossly incorrect and that a three-lane reversible MLA is estimated to cost not more than \$80 million per mile or \$880 million for 11 miles from the H-1/H-2 merge to downtown Hotel Street.

Recommendation:

It is recommended that the DEIS show a revised lower cost for the Managed Lane Alternative (Elevated three-Lane reversible), including Table 2-1, as depicted in www.eng.hawaii.edu/~panos/UHCS.pdf, and that the MLA be reinstated into the DEIS for consideration as a viable Mass Transit Alternative.

Honolulu, Hawaii 96818

Dear Mr. Ramelb:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal dated December 29, 2008 with subject [Comment on Draft Environmental Impact Statement (DEIS) "Honolulu High-capacity transit corridor Project", Issue: The DEIS shows Summary of Alternative Analysis Findings which contains inflated Capital cost for Managed Lane Alternative (MLA)]:

The analysis of the Managed Lane Alternative in Honolulu as shown in Table 5-1 in the Alternatives Analysis Report (DTS 2006b) shows the cost to be \$2.6 billion in 2006 dollars (higher today) for construction, right-of-way, and contingencies associated with the 16-mile managed lane facility. The total capital cost of \$3.6 billion in 2006 dollars for the Reversible Option includes the 2030 bus fleet, bus replacements prior to 2030, TheHandi-Van replacements, and bus facilities. As stated in the City Council's Transit Advisory Task Force Report dated December 14, 2006, a committee was charged with reviewing cost estimates for the two alternatives involving construction (the Managed Lane Alternative and Fixed Guideway Alternative). The report states that "the Task Force agrees with this committee that the Alternatives Analysis' construction cost estimates were fairly and consistently prepared, and that they may be used for both planning and cost comparisons." Information was obtained by the

Task Force from the Hawaii Department of Transportation and others familiar with managed lane facilities. It is the only estimate to date that addresses Honolulu conditions.

In response to the "Discussion" section of your letter:

a) The State of Hawaii's Highway Modernization Plan dated January 22, 2009, estimates the cost of the Nimitz Viaduct at \$600 million for an approximately 2.5-mile elevated highway with two lanes, which equals \$240 million per mile.

b) There is no substantiation of the estimate from the Tampa Bay toll facility being applicable in Honolulu. The designer of the Tampa Bay facility herself admitted that to apply such an estimate without detailed consideration of the many differences between the two locations is not reasonable. For clarification, the Tampa Bay elevated toll lanes extend only 5.8 miles within the 10-mile expressway. The costs quoted are from 2002, long before the costs of materials and construction rose dramatically after 2004. Furthermore, the corridor within which the Tampa Bay lanes are built required no right-of-way, had no significant utility conflicts, no major structures or crossings, and was built in much more favorable geotechnical conditions than exist on Oahu. In addition, the Transit Task Force Report dated December 14, 2006, states that "the committee concluded that the projects are sufficiently different (actual costs versus projected costs with contingencies; available, accessible ROW vs. construction in actively used highways; no utilities relocation vs. extensive relocations) as to make the comparison unreasonable."

c) According to construction cost indices prepared by the Washington State Department of Transportation, construction costs doubled between 1997 (the year construction ended on the H-3 Freeway) and 2006 (the year of the Alternatives Analysis). If construction of the H-3 Freeway had begun in 2006, that project would have cost approximately \$2.6 billion. In addition, both the H-3 Freeway and the Managed Lane Alternative face unique situations that affect cost estimates. Construction of the Managed Lane Alternative would have occurred in a heavily developed corridor. As a result, there would be substantial disruptions to traffic and utilities, both of which add to the time, and thus cost, of a project. The H-3 Freeway was built in an undeveloped part of the island and which it had its own challenges, expensive traffic and utility disruptions were minimal.

d) The analysis of the Managed Lane Alternative from the Alternatives Analysis Report shows the cost to be \$2.6 billion in 2006 dollars (higher today). As stated previously, the City Council's Transit Advisory Task Force Report states that "the Task Force agrees with this committee that the Alternatives Analysis' construction cost estimates were fairly and consistently prepared, and that they may be used for both planning and cost comparisons." As stated previously, the State of Hawaii's Highway Modernization Plan dated January 22, 2009, estimates the cost of the Nimitz Viaduct at \$600 million for an approximately 2.5-mile elevated highway, which equals \$240 million per mile. Using this estimate, a 15-mile facility would cost approximately \$3.6 billion. As stated previously, providing a managed lane system in Honolulu is not comparable to the Tampa Bay toll facility that you reference.

In response to the "Recommendation" section of your letter:

As stated in Chapter 2 of the Final EIS, the Managed Lane Alternative was evaluated for its ability to meet project goals and objectives related to mobility and accessibility, supporting planned growth and economic development, constructability and cost, community and environmental quality, and planning consistency. The Managed Lane Alternative would fail to meet the Project's Purpose and Need, as described in Chapter 1 of this Final EIS, because it fails to moderate anticipated traffic congestion. While the Managed Lane Alternative would reduce freeway congestion (measured as vehicle hours of delay), it would increase overall system congestion by inducing additional travelers to drive, which would result in increased congestion on arterial and collector facilities accessing the freeways and the managed lane. In addition, once a vehicle leaves the managed lane, that vehicle is still subjected to congestion on surrounding roadways. Total islandwide vehicle hours of delay would have increased with the Managed Lane Alternative compared to the No Build Alternative, indicating an increase in system-wide congestion (see Table 2-2 in the Final EIS). It also would be less effective than the Fixed Guideway Alternative at providing a faster and more reliable public transportation service as well as an alternative to private automobile travel. The Managed Lane Alternative would not have supported planned concentrated future population and employment growth because it would not provide concentrations of transit service that would serve as a nucleus for transit-oriented development.

After the Alternatives Analysis was completed, several scoping comments were received requesting reconsideration of the Managed Lane Alternative that was considered and rejected during the Alternatives Analysis. Because no new information was provided that would have changed the findings of the Alternatives Analysis regarding the Managed Lane Alternative, it was not included in the Draft EIS for further consideration. The cost estimates shown in Table 2-2, Summary of Alternatives Analysis Findings, in the Final EIS have not been revised.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Subject: Comment on Draft Environmental Impact Statement (DEIS)
"Honolulu High-capacity transit corridor Project", Issue : The DEIS must
expand Mass transit alternatives for evaluation as required by law

Discussion: The Alternative Analysis and DEIS failed to provide "... an
assessment of a wide range of public transportation alternatives ..."
and/or "... sufficient information to enable the Secretary to make the
findings of project justification ..." as required by statute.

Furthermore, the City, Parsons Brinkerhoff (PB) and the Federal Transit
Authority failed to "Rigorously explore and objectively evaluate all
reasonable alternatives," and "Devote substantial treatment to each
alternative considered in detail including the proposed action so that
reviewers may evaluate their comparative merits," as required by the
Council on Environmental Quality (CEQ) Sec. 1502.14.

For example, the Managed Lane Alternative (MLA) in the Alternative
Analysis (AA) established a capital cost estimate for 11 mile MLA two-
lane reversible highway from Waikale to Iwilei at \$2.57 Billion or \$233
million per mile. The 2006 AA did not consider the fact that the Tampa
three-lane, 10 mile, elevated expressway was built for \$420 million or
\$42 million per mile. See Tampa
<http://www.tollroadsnews.com/node/172> . Had the city AA PB consultant
reviewed the Tampa Reversible Expressway actual construction cost,
the AA would have assigned a Capital cost estimate for the two-lane
MLA at no more than \$80 million per mile instead of \$233 million per
mile.

There are alternatives other than fixed guideway which the AA should
have considered knowing that Mayor Mufi Hannemann have, for over
two years, insisted that the people of West Oahu wanted traffic
congestion on H-1 be solved and they wanted a solution NOW! The PB
consultants should have identified the congestion problem from West
and Central Oahu to be the two major "H-1 bottlenecks" which are at the
H-1/H-2 merge and at the Middle Street merge. The PB consultants
should then have identified transit alternatives to eliminate the two
bottlenecks. Instead, PB proceeded to support the more expensive \$6.0
+ rail transit as the most cost effective transit solution. The final PB
prepared AA indicates that the \$6.+ Billion rail transit WORSENS the
congestion at the two bottlenecks as shown on AA table 3-12 which
shows that traffic OVERLOAD on H-1 after rail is built will increase from
1,500 vehicles per hour overload to 8,000 vph overload!
PB, with their expertise, should have had the ability to know that the first

low-cost alternative to eliminate the H-1 bottlenecks is to build a three-lane, three-mile elevated reversible "Nimitz HOV Flyover" from the Airport Viaduct/Keehi Lagoon Drive to downtown Hotel Street and Alakea Street. This Nimitz flyover will easily eliminate the Middle Street bottleneck for less than \$300 million, details can be found in a 2008 study www.eng.hawaii.edu/~panos/UHCS.pdf. Furthermore, this project is identified as State Project as Number 52 in the Oahu Regional Transportation Plan (ORTP 2030) and a Final EIS was approved during the Ben Cayetano Administration.

PB could have also easily identified that a similar "Kamehameha Flyover", a 4-mile, three-lane elevated reversible HOV over Kamehameha Hwy median between the H-1/H-2 merge and the Airport Viaduct east of Aloha Stadium. This Kamehameha Flyover has the capacity to eliminate the H-1/H-2 traffic bottleneck because it would have 3 lanes of one-way HOV traffic during peak period. The capacity evaluation for the Kam flyover follows:

Numbers from Table 3-12 of city 2006 Nov Alternative Analysis (\$10 million report):

Rail only: capacity = 6000 commuters per peak hour (equivalent 5000 vehicles per peak hour.)

H-1 only: rated capacity = 9,500 vehicles per hour (equivalent 15,400 commuters per hour)

H-1 forecast yr 2030 traffic load = 17,500 vehicles per hour per City AA Table 3-12 (or 8,000 vph overload = 9,600 commuters per hour)

Managed Lane three-Lane HOV Reversible Kamehameha Flyover: capacity = 6,000 high occupancy vehicles per hour (equivalent 21,600 commuters per hour). Capacity based on HOV use on Kamehameha Flyover by 200 express buses per peak hour, car pools, van pools, green cars and HOV2. (50 pns per express bus and 5800 vph at avge 2 pns per vehicle).

Year 2030 commuter load by City AA Report = Rail (6000) + H-1 overload (9,600) + H-1 capacity (15,400) = 31,000 commuters.

2030 Load = 31,000 commuters per hour

Rail + H-1 = 21,400 commuters per hour

Managed Lane HOV + H-1 = 37,000 commuters per hour

Conclusion: Rail does not have sufficient commuter capacity which will cause 9,600 commuters to be stuck in gridlock on H-1 or stuck at rail stations (especially at stations between Waipahu and Kalihi). Managed Lane HOV Alternative will eliminate congestion and bottlenecks on H-1. The PB consultants should have been aware of the 10 mile Tampa three lane elevated, reversible expressway which was built and completed in year 2005 for \$420 million or \$42 million per mile! If the PB consultants applied a 100 percent escalation and geographic cost factor and increase the cost to \$80 million per mile for the MLA evaluated in the Alternative Analysis, the cost for the 4 mile long Kamehameha Flyover (MLA reversible three lane) and 3 mile Nimitz Flyover (MLA reversible three lane) would have cost of \$320 million and \$240 million respectively, much lower than the \$2.57 Billion assigned to the MLA alternative in the AA.

Conclusion:

The Alternative analysis is wrong in excluding the MLA for further consideration, due to capital cost issues, as a viable alternative for mass transit for the West Oahu Corridor.

Recommendation:

The DEIS must reinstate the MLA Alternative which is an 11 mile, three-lane elevated HOV transitway from the H-1/H-2 merge to Hotel Street and Alakea Street/Halekiau Street as described in www.eng.hawaii.edu/~panos/UHCS.pdf. The Managed Lane alternative should be considered as two options: HOT Lane and as a HOV hwy limited to HOV vehicles and "green cars - hybrid or electric vehicles".

Honolulu, Hawaii 96818

Dear Mr. Ramelb:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal dated December 29, 2008 with subject [Comment on Draft Environmental Impact Statement (DEIS) "Honolulu High-capacity transit corridor Project", Issue: The DEIS must expand Mass transit alternatives for evaluation as required by law]:

In response to the "Discussion" section of your letter, the Alternatives Analysis process, as documented in Chapter 2 of the Draft EIS, evaluated a broad range of transit mode and general alignment alternatives to provide improved mobility in the study corridor. An initial screening process considered alternatives identified through previous transit studies, a field review of the study corridor, an analysis of current population and employment data for the study corridor, a literature review of technology modes, work completed for the Oahu Regional Transportation Plan 2030 (ORTP) prepared by the Oahu Metropolitan Planning Organization (OahuMPO) (OahuMPO 2007), and public and agency comments received during the formal Alternatives Analysis scoping process.

During the fall of 2005 and winter of 2006, the City and County of Honolulu completed the alternatives screening process that is documented in the Honolulu High-Capacity Transit Corridor Project Alternatives Screening Memorandum (DTS 2006a). Scoping meetings were held, which included a presentation of alternatives to the public and interested agencies and officials to receive comments on the Purpose and Need, Alternatives, and Scope of the analysis for the Alternatives Analysis. Refinements were made to alternatives.

The scoping process in March of 2007 requested that the public propose alternatives that would satisfy the Purpose and Need at less cost or with greater effectiveness or less environmental or community impact and were not previously studied and eliminated for good cause. The only alternative proposed that met this criteria was Fixed Guideway Transit following an alternative alignment. All reasonable alternatives that have been identified and that satisfy the Purpose and Need at less cost or with greater effectiveness or less environmental or community impact and were not previously studied and eliminated for good cause have been evaluated in the Draft EIS.

The analysis of the Managed Lane Alternative from the Alternatives Analysis Report (DTS 2006b) shows the cost to be \$2.6 billion in 2006 dollars (higher today) for a 16-mile facility. As stated in the City Council's Transit Advisory Task Force Report, a committee was charged with reviewing cost estimates for the two alternatives involving construction (the Managed Lane Alternative and Fixed Guideway Alternative). The report states that "the Task Force agrees with this committee that the Alternatives Analysis' construction cost estimates were fairly and consistently prepared, and that they may be used for both planning and cost comparisons." Information was obtained by the Task Force from the Hawaii Department of Transportation and others familiar with managed lane facilities. It is the only estimate to date that addresses Honolulu conditions.

There is no substantiation of the estimate from the Tampa Bay toll facility being applicable in Honolulu. The designer of the Tampa Bay facility herself admitted that to apply such an estimate without detailed consideration of the many differences between the two locations is not reasonable. For clarification, the Tampa Bay elevated toll lanes extend only 5.8 miles within the 10-mile expressway. The costs quoted are from 2002, long before the costs of materials and construction rose dramatically after 2004. Furthermore, the corridor within which the Tampa Bay lanes are built required no right-of-way, had no significant utility conflicts, no major structures or crossings, and was built in much more favorable geotechnical conditions than exist on Oahu. In addition, the Transit Task Force Report dated December 14, 2006, states that "the committee concluded that the projects are sufficiently different (actual costs versus projected costs with contingencies; available, accessible ROW vs. construction in actively used highways; no utilities relocation vs. extensive relocations) as to make the comparison unreasonable."

The Managed Lane Alternative was fully evaluated in the Alternatives Analysis. The Managed Lane Alternative would not eliminate congestion and bottlenecks on the H-1 Freeway. Table 3-12 in the Alternative Analysis shows that, under the No Build Alternative, there would be 18,049 vehicles per hour (vph) operating on the H-1 Freeway in 2030. Vehicle volumes rise to 18,327 vph (Two-direction Option) or 18,419 vph (Reversible Option) with the Managed Lane Alternative, while traffic volumes decrease to 17,209 vph with the 20-mile Fixed Guideway

Transit Alternative. Accordingly, the Fixed Guideway Transit Alternative will reduce traffic volumes from those projected under the 2030 No Build Alternative.

You are correct that the Nimitz Flyover is included in the Oahu Regional Transportation Plan and, accordingly, was included in the transportation modeling conducted for 2030 No Build and Project conditions. Effects of the Nimitz Flyover on traffic conditions in 2030 are discussed in Section 3.4.2 of the Final EIS. Travel on the Nimitz Flyover was included for the following travel pairs under the No Build Alternative: Kapolei to Downtown, Ewa to Downtown, and Millilani to Downtown. As shown in Figure 3-7 of the Final EIS, the Nimitz Flyover does improve transit travel times with the No Build Alternative between certain travel pairs (e.g., between Millilani and Downtown) compared to 2007 conditions. However, as also shown in this figure, travel times improve substantially more with the addition of the Project. In addition, the State of Hawaii's Highway Modernization Plan dated January 22, 2009, estimates the cost of the Nimitz Viaduct at \$600 million for an approximately 2.5-mile elevated highway, which equals \$240 million per mile.

While a bypass on either Nimitz Highway or Kamehameha Highway could reduce freeway congestion, it would increase overall system congestion by inducing additional travelers to drive, which would increase congestion on arterial and collector facilities accessing the freeways and the managed lane. In addition, once a vehicle leaves the managed lane, that vehicle is still subjected to congestion on surrounding roadways.

In response to your conclusion, since the Draft EIS was published, the travel demand model has been refined by adding an updated air passenger model (which forecasts travel in the corridor related to passengers arriving or departing at Honolulu International Airport), defining more realistic drive access modes (driving alone or car pooling) to project stations and recognizing a more robust off-peak non-home-based direct demand element (trips that do not originate at home) based on travel surveys in Honolulu. These revisions were made based on consultation with FTA. As stated in Chapter 3 of the Final EIS, the travel demand forecasting model predicts a maximum peak direction volume of 14,700 passengers during the a.m. two-hour peak period. As a result of updated ridership forecasts, the operating plan for the fixed guideway system has been revised and the system will have a minimum capacity of approximately 17,300 passengers per direction during the two-hour peak period. The fixed guideway system is planned to operate with two or three car trains with a capacity of between 325 and 500 passengers each. At three-minute headways during the peak period, that provides capacity for approximately 8,650 passengers per peak direction per peak hour. This capacity figure applies in both directions for a total system capacity of approximately 17,300 passengers per peak hour. The full capacity of the fixed guideway with four-car trains and 90-second headways is over 25,000 passengers per hour per direction or over 50,000 passengers total. Accordingly, the fixed guideway system will provide sufficient capacity based on travel demand forecasting results.

After the Alternatives Analysis was completed, several scoping comments were received requesting reconsideration of the Managed Lane Alternative that was considered and rejected during the Alternatives Analysis. Because no new information was provided that would have changed the findings of the Alternatives Analysis regarding the Managed Lane Alternative, it was not included in the Draft EIS for further consideration. The cost estimates shown in Table 2-2 in the Final EIS have not been revised.

Mr. Ben Ramelb
Page 4

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Subject: Comment on Draft Environmental Impact Statement (DEIS)
"Honolulu High-capacity transit corridor Project", Issue The DEIS
shows the Managed Lane Alternative (MLA) was rejected by the
Alternative Analysis for unjustified reasons

Fact:
The DEIS Table 2-2 "Alternatives and Technologies Considered but
rejected" states that the MLA was rejected by the Alternative analysis
because "MLA would not have supported Honolulu General Plan;
minimal impact to vehicle miles traveled and vehicles hours of delay"

Discussion:

1) A portion of the Honolulu General Plan is shown below and taken
from : <http://honoluludpp.org/planning/GeneralPlan/GPPreamble.pdf>

"Purpose of the Honolulu General Plan -

The General Plan for the City and County of Honolulu is a written
commitment by the City and County government to a future for the
Island of Oahu which it considers desirable and attainable. The Plan is a
statement of the long-range social, economic, environmental, and design
objectives for the general welfare and prosperity of the people of Oahu
and is a statement of broad policies which facilitate the attainment of the
objectives of the Plan.

The General Plan is a guide for all levels of government, private
enterprise, neighbor- hood and
citizen groups, organizations, and individual citizens in eleven areas of
concern:

- (1) population;
- (2) economic activity;
- (3) the natural environment;
- (4) housing,
- (5) transportation and utilities
- (6) etc."

2) A 10 mile, elevated Managed Lane (reversible three lanes) was built
in Tampa for \$420 million or \$42 million per mile. Evaluation of a similar
11 mile, three-lane reversible MLA on Oahu would cost \$900 million (
www.eng.hawaii.edu/~panos/UHCS.pdf) and would have the capability
to eliminate the two major
H-1 traffic bottlenecks at H-1/H-2 merge and at the Middle Street merge.
Elimination of the two major H-1 bottlenecks by the MLA would comply
with the Honolulu General Plan as it relates to the General Plan

objective, "Transportation and Utilities". The Traffic Capacity Analysis below shows that the MLA will have the capacity to eliminate the bottlenecks while the rail does not. Conversely, the \$6.0 Billion steel wheel fixed guideway alternative will cause a severe vehicular traffic overload at the two H-1 bottlenecks in the capacity analysis below and will not support the Honolulu General Plan.

3) Moreover, by removing the two major H-1 bottlenecks, the MLA would substantially reduce the "vehicle miles traveled and vehicles hours of delay" as compared with the steel wheel fixed guideway. SINCE THE Fixed guideway would result in severe traffic overload on H-1 in year 2030 (see capacity analysis below).

4) The single, most important goal for mass transit is to eliminate or substantially reduce traffic congestion. The MLA meets this goal while the fixed guideway does not.

Mass Transit Options Traffic Capacity Analysis:

Numbers from Table 3-12 of city 2006 Nov Alternative Analysis (\$10 million report):

Rail only: capacity = 6000 commuters per peak hour (equivalent 5000 vehicles per peak hour.)

H-1 only: rated capacity = 9,500 vehicles per hour (equivalent 15,400 commuters per hour)

H-1 forecast yr 2030 traffic load = 17,500 vehicles per hour per City AA Table 3-12 (or 8,000 vph overload = 9,600 commuters per hour)

Managed Lane three-Lane HOV Reversible Kamehameha Flyover: capacity = 6,000 high occupancy vehicles per hour (equivalent 21,600 commuters per hour). Capacity based on HOV use on Kamehameha Flyover by 200 express buses per peak hour, car pools, van pools, green cars and HOV2. (50 pns per express bus and 5800 vph at avg 2 pns per vehicle).

Year 2030 commuter load by City AA Report = Rail (6000) + H-1 overload (9,600) + H-1 capacity (15,400) = 31,000 commuters.

2030 Load = 31,000 commuters per hour

Rail + H-1 = 21,400 commuters per hour

Managed Lane HOV + H-1 = 37,000 commuters per hour

Finding: Fixed Guideway does not have sufficient commuter capacity which will cause 9,600 commuters to be stuck in gridlock on H-1 or stuck at rail stations (especially at stations between Waipahu and Kalihi). Managed Lane Alternative (HOV) will eliminate congestion and bottlenecks on H-1.

Conclusion:

The Alternative Analysis is wrong by rejecting the MLA because when compared with the fixed guideway alternative, the MLA will remove H-1 Traffic bottlenecks and will support Honolulu General Plan and will substantially reduce vehicles miles traveled and substantially reduce vehicles hours of delay.

Recommendation:

It is recommended that a three-lane MLA be reinstated into the DEIS for further consideration as a viable mass transit locally preferred alternative (LPA).

Dear Mr. Ramelb:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal dated December 29, 2008 with subject [Comment on Draft Environmental Impact Statement (DEIS) "Honolulu High-capacity transit corridor Project", Issue: The DEIS shows the Managed Lane Alternative (MLA) was rejected by the Alternative Analysis for unjustified reasons]:

In response to the "Discussion" section of your letter:

1) The General Plan language discussed in your letter is noted in Chapter 2 of the Final EIS.

2) There is no substantiation of the estimate from the Tampa Bay toll facility being applicable in Honolulu. The designer of the Tampa Bay facility herself admitted that to apply such an estimate without detailed consideration of the many differences between the two locations is not reasonable. For clarification, the Tampa Bay elevated toll lanes extend only 5.8 miles within the 10-mile expressway. The costs quoted are

from 2002, long before the costs of materials and construction rose dramatically after 2004. Furthermore, the corridor within which the Tampa Bay lanes are built required no right-of-way, had no significant utility conflicts, no major structures or crossings, and was built in much more favorable geotechnical conditions than exist on Oahu. In addition, the Transit Task Force Report dated December 14, 2006, states that "the committee concluded that the projects are sufficiently different (actual costs versus projected costs with contingencies; available, accessible ROW vs. construction in actively used highways; no utilities relocation vs. extensive relocations) as to make the comparison unreasonable." The \$900 million estimate stated in your letter for the facility in Honolulu lacked the benefit of a full understanding of the circumstances, according to its author Linda Figg. The more acceptable estimate in the Alternatives Analysis Report (DTS 2006b) for a 16-mile facility was \$2.6 billion, which has been vetted by the Hawaii Department of Transportation and other experts familiar with Honolulu.

The Managed Lane Alternative was fully evaluated in the Alternatives Analysis. The Managed Lane Alternative would not eliminate congestion and bottlenecks on the H-1 Freeway. Table 3-12 in the Alternative Analysis Report shows that, under the No Build Alternative, there would be 18,049 vehicles per hour (vph) operating on the H-1 Freeway in 2030. Vehicle volumes rise to 18,327 vph (Two-direction Option) or 18,419 vph (Reversible Option) with the Managed Lane Alternative, while traffic volumes decrease to 17,209 vph with the 20-mile Fixed Guideway Transit Alternative. Accordingly, the Fixed Guideway Transit Alternative will reduce traffic volumes from those projected under the 2030 No Build Alternative.

3) The Managed Lane Alternative would not have a substantial effect on vehicle miles traveled (VMT) or vehicle hours of delay (VHD), key metrics used to analyze transportation and environmental impacts. As stated in the response above, traffic on the H-1 Freeway would not improve with the Managed Lane Alternative. According to Table 3-12 from the Alternatives Analysis Report, the Two-direction Option for the Managed Lane Alternative would have a negligible impact on VMT and a slightly positive effect on VHD (4.3 percent). With the Fixed Guideway Transit Alternative, VMT and VHD would be reduced by 3.1 and 11 percent, respectively.

4) As stated previously, the fixed guideway system reduces congestion, as measured by VHD, while the Managed Lane Alternative does not. Since the Draft EIS was published, the travel demand model has been refined by adding an updated air passenger model (which forecasts travel in the corridor related to passengers arriving or departing at Honolulu International Airport), defining more realistic drive access modes (driving alone or car pooling) to project stations and recognizing a more robust off-peak non-home-based direct demand element (trips that do not originate at home) based on travel surveys in Honolulu. These revisions were made based on FTA direction. As stated in Chapter 3 of the Final EIS, the travel demand forecasting model predicts a maximum peak direction volume of 14,700 passengers during the a.m. two-hour peak period. As a result of updated ridership forecasts, the operating plan for the fixed guideway system has been revised, and the system will have a minimum capacity of approximately 17,300 passengers per direction during the two-hour peak period. The fixed guideway system is planned to operate with two or three car trains with a capacity of between 325 and 500 passengers each. At three-minute headways during the peak

period, that provides capacity for approximately 8,650 passengers per peak direction per peak hour. This capacity figure applies in both directions for a total system capacity of approximately 17,300 passengers per peak hour. The numbers presented in your comment understate the capacity of the fixed guideway by a substantial margin.

In addition, a major benefit of the fixed guideway is that once built, it is flexible enough to accommodate significant growth. For example, the full capacity of the fixed guideway with four-car trains and 90-second headways is over 25,000 passengers per hour per direction, or over 50,000 in total. Accordingly, the fixed guideway system will provide sufficient capacity based on travel demand forecasting results.

The fixed guideway will not affect the H-1 Freeway other than to reduce the demand for its use compared to what would happen if the fixed guideway were not built. As stated previously, the Fixed Guideway Transit Alternative will reduce traffic volumes from those projected under the 2030 No Build Alternative.

The conclusion drawn by the comment in favor of the Managed Lane Alternative is inconsistent with the findings of the Alternatives Analysis and the Draft EIS. The Managed Lane Alternative was eliminated following careful and thorough analysis over the two-year Alternatives Analysis process. After the Alternatives Analysis was completed, several scoping comments were received requesting reconsideration of the Managed Lane Alternative that was considered and rejected during the Alternatives Analysis. Because no new information was provided that would have changed the findings of the Alternatives Analysis regarding the Managed Lane Alternative, it was not included in the Draft EIS for further consideration. The cost estimates shown in Table 2-2 in the Final EIS have not been revised.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Subject: Comment on Draft Environmental Impact Statement (DEIS)
"Honolulu High-capacity transit corridor Project", Issue : The DEIS and
Alternative Analysis lacks a wide range of alternatives

Discussion:

The Alternative Analysis and DEIS failed to provide "... an assessment of a wide range of public transportation alternatives ..." and/or "... sufficient information to enable the Secretary to make the findings of project justification ..." as required by statute.

In addition, we believe that you will find that the City, PB and FTA failed to, "Rigorously explore and objectively evaluate all reasonable alternatives," and "Devote substantial treatment to each alternative considered in detail including the proposed action so that reviewers may evaluate their comparative merits," as required by the Council on Environmental Quality (CEQ) Sec. 1502.14.

Four alternatives should be assessed:

- 1) BRT transit system as proposed by the Harris Administration. The BRT route downtown should be limited to King and Beretania Streets and exclude Dillingham Blvd and Kapiolani Blvd.
- 2) Managed Lane (reversible) as proposed by Professor Panos Prevedouros Study, "Transportation Alternatives Analysis for Mitigating Traffic Congestion between Leeward Oahu and Honolulu" which shows the 11 mile three-lane cost estimate to be \$900 million which is in line with the \$320 million Tampa three-lane reversible transitway.
- 3) Former mayoral candidate Ann Kobayashi's proposal for a 15 mile EzWay. See <http://www.honoluluadvertiser.com/article/20081015/NEWS01/810150392/1001>
- 4) Build two elevated highway bypasses around the H-1 bottlenecks at H-1/H-2 merge and at Middle St. merge. The bypasses include: a) a 4 mile, three-lane reversible elevated hwy over the Kamehameha Hwy median between the H-1/H-2 merge and the H-1 Viaduct at Aloha Stadium and b) a 3 mile, three-lane reversible elevated hwy over the Nimitz Hwy median between the H-1 Viaduct at Keehi Lagoon Drive and Hotel St/Alakea St./ Halekauwila St/Ala Moana Blvd. An on/off ramp to Waikamilo Rd from the Nimitz bypass would reduce the number of lanes from three to two between Waikamilo Rd and Iwilei. See attachment for more information on HOV Flyovers.

Recommendation: Include the above four alternatives in the DEIS.

Attachment – Description of Nimitz and Kamehameha HOV Flyovers
Nimitz Flyover, Reversible HOV:

The Nimitz HOV Flyover is a 3-mile reversible, elevated, three-lane structure over the Nimitz Highway median from the Airport Viaduct at Keehi Lagoon to Hotel Street and Alakea St/Halekiauila St. The Flyover would be built similar to the Tampa Elevated three-lane Reversible HOV as described in-
<http://www.tollroadsnews.com/node/172> .

One of the three lanes would exit the Flyover at Waikamilo Rd. to provide access to job centers in Kalihi, resulting in the Flyover having only two lanes entering downtown. The downtown terminal connections from the Nimitz HOV Flyover include an elevated busway from Iwilei to Hotel Street and a single lane underpass to both Alakea St/Halekiauila Streets. These connections are described in a Managed Lane Study "Transportation Alternatives Analysis for Mitigating Traffic congestion between Leeward Oahu and Honolulu". The full report is available at www.eng.hawaii.edu/~panos/UHCS.pdf.

The initial 2005 cost for the 10 mile Tampa Reversible was \$320 million or \$32 Million per highway mile, however, a geotechnical design error increased the cost to \$420 million or \$42 million per mile. Using a geographic and escalation factor of 100 percent, the 3-mile Nimitz HOV Flyover at \$60 to \$80 million per mile would cost \$180 million to \$240 million.

The "Nimitz Flyover" has an approved Final Environmental Impact Statement which allows for early construction.

Kamehameha Flyover, Reversible HOV:

The Kamehameha HOV Flyover is a 4-mile reversible, elevated, three-lane structure over the median of Kamehameha Highway from the H-1/H-2 merge at the Waiawa Interchange to the Airport Viaduct just diamond head of the Aloha Stadium. The Flyover would be built similar to the Tampa Elevated three-lane Reversible MOV as described in <http://www.tollroadsnews.com/node/172>.

The Kamehameha Flyover would be connected to H-1, H-2, Kamehameha Highway and Farrington Highway at the west end and to the Airport Viaduct at the east end. These connections are described in a Managed Lane Study "Transportation Alternatives Analysis for Mitigating Traffic congestion between Leeward Oahu and Honolulu". The full report is available at www.eng.hawaii.edu/~panos/UHCS.pdf.

The initial 2005 cost for the 10 mile Tampa Reversible was \$320 million or \$32 Million per highway mile, however, a geotechnical design error increased the cost to \$420 million or \$42 million per mile. Using a geographic and escalation factor of 100 percent, the 4-mile Kamehameha HOV Flyover at \$60 to \$80 million per mile would cost between \$240 million to \$320 million.

The Draft Environmental Impact Statement (DEIS) - Honolulu High-Capacity Transit Corridor Project Nov 2008, shows the rail route over Kamehameha Highway between Pearl City and Aloha Stadium which could conflict with the proposed three-lane "Kamehameha Flyover" route outlined above. If the rail is built, it is suggested that both the Kamehameha Highway "Flyover" and the Rail be built within the elevated Kamehameha Highway corridor. In this case, only a two-lane "Kamehameha Flyover" is needed (instead of three-lanes) to be built alongside and parallel to the Rail transit. The rail with a capacity of 6,000 commuters per hour and the two-lane "Kamehameha Flyover", with a capacity of 4,000 vehicles per hour, should be adequate to substantially reduce the bottleneck at the H-1/H-2 merge and the traffic congestion on H-1 between Pearl City and Aloha Stadium.

Mr. Ben Rameib
1148 Ala Liliko'i Street
Honolulu, Hawaii 96818

Dear Mr. Rameib:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal dated December 29, 2008, with subject [Comment on Draft Environmental Impact Statement (DEIS) "Honolulu High-capacity transit corridor Project", Issue: The DEIS and Alternative Analysis lacks a wide range of alternatives]:

In response to the "Discussion" section of your letter, Chapter 2 of the Final EIS summarizes the alternatives screening and selection process. Beginning in the fall of 2005, an initial screening process considered alternatives identified through previous transit studies, a field review of the study corridor, an analysis of current population and employment data for the study corridor, a literature review of technology modes, ongoing work completed as part of the Oahu Regional Transportation Plan 2030 (ORTP) prepared by the Oahu Metropolitan Planning Organization (OahuMPO) (OahuMPO 2007), and public and agency comments received during the formal Alternatives Analysis scoping process.

The screening process is documented in the Honolulu High-Capacity Transit Corridor Project Alternatives Screening Memorandum (DTS 2006a). Three scoping meetings were held during the screening process in December 2005, which included a presentation of initial alternatives to the public, interested agencies, and officials to receive comments on the Purpose and Need, alternatives, and scope of the Alternatives Analysis. Refinements were made to the alternatives based on the public input during scoping.

After completion of screening in the winter of 2006, the following alternatives were studied in the Alternatives Analysis: No Build Alternative, Transportation System Management (TSM) Alternative, Managed Lane Alternative, and the Fixed Guideway Alternative. After review of the Alternatives Analysis Report and consideration of public comments, the City Council identified a fixed guideway transit system extending from Kapolei to UH Manoa with a connection to Waikiki as the Locally Preferred Alternative. This identification, which eliminated the TSM and Managed Lane Alternatives from further consideration, became Ordinance 07-001 on January 6, 2007. The NEPA process considered a range of alternatives that was consistent with the identified Locally Preferred Alternative. As discussed in Section 2.2, there were no alternatives that had not been previously studied and eliminated for good cause that would satisfy the Purpose and Need at less cost, with greater effectiveness, or less environmental or community impact.

1) As stated in Chapter 2 of the Final EIS, prior to selecting an elevated fixed guideway system, a variety of high-capacity transit options were evaluated during the Primary Corridor Transportation Project (1998-2002) and Alternatives Analysis. Options evaluated and rejected include an exclusively at-grade fixed-guideway system using bus rapid transit vehicles. In addition to comments received during the Alternatives Analysis and EIS scoping sessions, these studies provided a critical foundation for the conclusion that an elevated system would result in the best overall performance and better support of the Purpose and Need for the Project. In addition, the proposed Bus Rapid Transit Alternative, as stated in your letter, is a variation of the Transportation System Management Alternative that was evaluated in the Alternatives Analysis. While this alternative has merit for cost-effectiveness, its overall system benefit would be very low.

2) The analysis of the Managed Lane Alternative in Honolulu from the Alternatives Analysis Report (DTS 2006b) shows the cost to be \$2.6 billion in 2006 dollars (higher today) for a 16-mile facility. As stated in the City Council's Transit Advisory Task Force Report, a committee was charged with reviewing cost estimates for the two alternatives involving construction (the Managed Lane Alternative and Fixed Guideway Alternative). The report states that "the Task Force agrees with this committee that the Alternatives Analysis' construction cost estimates were fairly and consistently prepared, and that they may be used for both planning and cost comparisons." Information was obtained by the Task Force from the Hawaii Department of Transportation and others familiar with managed lane facilities. It is the only estimate to date that addresses Honolulu conditions.

There is no substantiation of the estimate from the Tampa Bay toll facility being applicable in Honolulu. The designer of the Tampa Bay facility herself admitted that to apply such an estimate without detailed consideration of the many differences between the two locations is not reasonable. For clarification, the Tampa Bay elevated toll lanes extend only 5.8

miles within the 10-mile expressway. The costs quoted are from 2002, long before the costs of materials and construction rose dramatically after 2004. Furthermore, the corridor within which the Tampa Bay lanes are built required no right-of-way, had no significant utility conflicts, no major structures or crossings, and was built in much more favorable geotechnical conditions than exist on Oahu. In addition, the Transit Task Force Report dated December 14, 2006, states that "the committee concluded that the projects are sufficiently different (actual costs versus projected costs with contingencies; available, accessible ROW vs. construction in actively used highways; no utilities relocation vs. extensive relocations) as to make the comparison unreasonable."

3) The EzWay 15-mile, three-lane viaduct concept was developed as a hybrid of a plan for elevated toll lanes and some form of rubber-tire-on-concrete transit system. It is similar to the Managed Lane Alternative that was thoroughly evaluated in the Alternatives Analysis, which also accommodated both single occupant and transit vehicles. No known cost estimate for the EzWay proposal was prepared or validated by a qualified registered Professional Engineer. As a point of reference, the State of Hawaii's Highway Modernization Plan dated January 22, 2009, estimates the cost of the Nimitz Viaduct at \$600 million for an approximately 2.5-mile elevated highway with two lanes, which equals \$240 million per mile. Using this estimate, a 15-mile facility would cost approximately \$3.6 billion.

4) Localized bypasses would not meet system goals for corridor-wide benefits to mobility, reliability, access, and equity. The Hawaii Department of Transportation, which is responsible for the freeway system, has evaluated needs for the freeway system and identified the highway projects that would be most efficient at reducing congestion on Oahu. The projects, including a Nimitz Flyover, are listed in Table 2-3 of the Draft EIS and included in the analysis for all project alternatives. Effects of the Nimitz Flyover on traffic conditions in 2030 are discussed in Section 3.4.2 of the Final EIS. Travel on the Nimitz Flyover was included for the following travel pairs under the No Build Alternative: Kapolei to Downtown, Ewa to Downtown, and Mililani to Downtown. As shown in Figure 3-7 of the Final EIS, the Nimitz Flyover does improve transit travel times with the No Build Alternative between certain travel pairs (e.g., between Mililani and Downtown) compared to 2007 conditions. However, as also shown in this figure, travel times improve substantially more with the addition of the Project. As a point of clarification, a Final EIS was never prepared for the Nimitz Flyover.

There could be many other versions of this type of system with minor adaptations to suit one or another special concern. In the end, the above approaches all have similar challenges as a primary solution to Honolulu's transportation problems. They do not reduce congestion, increase the reliability of the transportation system, serve future land use plans, or improve the fairness of and access to the transportation system. While the Managed Lane Alternative would reduce freeway congestion (measured as vehicle hours of delay), it would increase overall system congestion by inducing additional travelers to drive, which would result in increased congestion on arterial and collector facilities accessing the freeways and the managed lane. In addition, once a vehicle leaves the managed lane, that vehicle is still subjected to congestion on surrounding roadways. They also do not offer an alternative to perpetuating a reliance on limited existing travel modes. For example, localized bypasses would not meet system goals for corridor-wide benefits to mobility, reliability, access, and equity. In sum, they do not address the Purpose and Need of the Project.

Mr. Ben Ramelb
Page 4

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is written in a cursive, flowing style.

Subject: Comment on Draft Environmental Impact Statement (DEIS)
"Honolulu High-capacity transit corridor Project", Issue : The Alternative
Analysis evaluation of the Managed Lane Alternative was flawed which
caused the MLA to be excluded from further consideration in the DEIS

Discussion:

The Alternative Analysis rigged the specifications and analysis of the
Managed Lane Alternative . DEIS Chapter 2 summarizes alternatives
considered for the Honolulu High-Capacity Transit Corridor Project. The
alternatives considered were chosen primarily by the Alternative
Analysis published in 2006.

The AA was flawed because it failed to include several transit
alternatives, each with a capability to substantially reduce or eliminate
the traffic congestion bottlenecks on H-1 at Pearl City and Middle St.
merge in year 2030. As shown on Table 3-12 of the AA and DEIS Table
3-12, all rail alternatives result in worse traffic congestion on H-1 AFTER
any rail alternative is built and operating.

The fact that rail will worsen congestion on H-1 after spending a
minimum of \$6.2 Billion for the Rail alternative, it is totally unacceptable
to the Oahu taxpayer to continue to face worse traffic congestion on H-1.
The single and most important reason for building a "mass transit
system" is to substantially reduce or eliminate traffic congestion". The
AA and DEIS fails to include this most important purpose and need for
mass transit and therefore the AA and DEIS must be revised to include,
as a need, to substantially reduce or eliminate traffic congestion.

Accordingly, as a minimum, the DEIS should include the following four
additional alternatives for assessment on environmental impact:

- 1) BRT transit system as proposed by the Harris Administration. The
BRT route downtown should be limited to King and Beretania Streets
which can accommodate a BRT system and exclude Dillingham Blvd
and Kapiolani Blvd which are too narrow to accommodate a BRT
system.
- 2) Managed Lane (reversible) as proposed by Professor Panos
Prevedouros Study, "Transportation Alternatives Analysis for Mitigating
Traffic Congestion between Leeward Oahu and Honolulu" published
March 2008, which shows the 11 mile three-lane cost estimate to be
\$900 million which is in line with the \$320 million Tampa three-lane
reversible transit way.

3) Former mayoral candidate Ann Kobayashi's proposal for a 15 mile EzWay. See <http://www.honoluluadvertiser.com/article/20081015/NEWS01/810150392/1001>

4) Build two elevated highway bypasses around the H-1 bottlenecks at H-1/H-2 merge and at Middle St. merge. The bypasses include: a) a 4 mile, three-lane reversible elevated hwy over the Kamehameha Hwy median between the H-1/H-2 merge and the H-1 Viaduct at Aloha Stadium and b) a 3 mile, three-lane reversible elevated hwy over the Nimitz Hwy median between the H-1 Viaduct at Keehi Lagoon Drive and Hotel St/Alakea St./ Halekauwila St/Ala Moana Blvd. An on/off ramp to Waikamilo Rd from the Nimitz bypass would reduce the number of lanes from three to two between Waikamilo Rd and Iwilei. See attachment for more information on HOV Flyovers.

Recommendation: Include the above four alternatives in the DEIS.

Attachment – Description of Nimitz and Kamehameha HOV Flyovers
Nimitz Flyover, Reversible HOV:

The Nimitz HOV Flyover is a 3-mile reversible, elevated, three-lane structure over the Nimitz Highway median from the Airport Viaduct at Keehi Lagoon to Hotel Street and Alakea St/Halekauwila St. The Flyover would be built similar to the Tampa Elevated three-lane Reversible HOV as described in-

<http://www.tollroadsnews.com/node/172>

One of the three lanes would exit the Flyover at Waikamilo Rd. to provide access to job centers in Kalihi, resulting in the Flyover having only two lanes entering downtown. The downtown terminal connections

from the Nimitz HOV Flyover include an elevated busway from Iwilei to Hotel Street and a single lane underpass to both Alakea St/Halekiauwi Streets. These connections are described in a Managed Lane Study "Transportation Alternatives Analysis for Mitigating Traffic congestion between Leeward Oahu and Honolulu". The full report is available at www.eng.hawaii.edu/~panos/UHCS.pdf.

The initial 2005 cost for the 10 mile Tampa Reversible was \$320 million or \$32 Million per highway mile, however, a geotechnical design error increased the cost to \$420 million or \$42 million per mile. Using a geographic and escalation factor of 100 percent, the 3-mile Nimitz HOV Flyover at \$60 to \$80 million per mile would cost \$180 million to \$240 million.

The "Nimitz Flyover" has an approved Final Environmental Impact Statement which allows for early construction.

Kamehameha Flyover, Reversible HOV:

The Kamehameha HOV Flyover is a 4-mile reversible, elevated, three-lane structure over the median of Kamehameha Highway from the H-1/H-2 merge at the Waiawa Interchange to the Airport Viaduct just diamond head of the Aloha Stadium. The Flyover would be built similar to the Tampa Elevated three-lane Reversible HOV as described in <http://www.tollroadsnews.com/node/172>.

The Kamehameha Flyover would be connected to H-1, H-2, Kamehameha Highway and Farrington Highway at the west end and to the Airport Viaduct at the east end. These connections are described in a Managed Lane Study "Transportation Alternatives Analysis for Mitigating Traffic congestion between Leeward Oahu and Honolulu". The full report is available at www.eng.hawaii.edu/~panos/UHCS.pdf.

The initial 2005 cost for the 10 mile Tampa Reversible was \$320 million or \$32 Million per highway mile, however, a geotechnical design error increased the cost to \$420 million or \$42 million per mile. Using a geographic and escalation factor of 100 percent, the 4-mile Kamehameha HOV Flyover at \$60 to \$80 million per mile would cost between \$240 million to \$320 million.

The Draft Environmental Impact Statement (DEIS) - Honolulu High-Capacity Transit Corridor Project Nov 2008, shows the rail route over Kamehameha Highway between Pearl City and Aloha Stadium which could conflict with the proposed three-lane "Kamehameha Flyover" route outlined above. If the rail is built, it is suggested that both the Kamehameha Highway "Flyover" and the Rail be built within the elevated Kamehameha Highway corridor. In this case, only a two-lane "Kamehameha Flyover" is needed (instead of three-lanes) to be built alongside and parallel to the Rail transit. The rail with a capacity of 6,000 commuters per hour and the two-lane "Kamehameha Flyover", with a capacity of 4,000 vehicles per hour, should be adequate to substantially reduce the bottleneck at the H-1/H-2 merge and the traffic congestion on H-1 between Pearl City and Aloha Stadium.

Dear Mr. Ramelb:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal dated December 29, 2008, with subject [Comment on Draft Environmental Impact Statement (DEIS) "Honolulu High-capacity transit corridor Project", Issue: The Alternative Analysis evaluation of the Managed Lane Alternative was flawed which caused the MLA to be excluded from further consideration in the DEIS]:

In response to the "Discussion" section of your letter, Chapter 2 of the Final EIS summarizes the alternatives screening and selection process. Beginning in the fall of 2005, an initial screening process considered alternatives identified through previous transit studies, a field review of the study corridor, an analysis of current population and employment data for the study corridor, a literature review of technology modes, ongoing work completed as part of the Oahu Regional Transportation Plan 2030 (ORTP) prepared by the Oahu Metropolitan Planning Organization (OahuMPO) (OahuMPO 2007), and public and agency comments received during the formal Alternatives Analysis scoping process.

The screening process is documented in the Honolulu High-Capacity Transit Corridor Project Alternatives Screening Memorandum (DTS 2006a). Three scoping meetings were held during the screening process in December 2005, which included a presentation of initial

alternatives to the public, interested agencies, and officials to receive comments on the Purpose and Need, alternatives, and scope of the Alternatives Analysis. Refinements were made to the alternatives based on the public input during scoping.

After completion of screening in the winter of 2006, the following alternatives were studied in the Alternatives Analysis: No Build Alternative, Transportation System Management (TSM) Alternative, Managed Lane Alternative, and the Fixed Guideway Alternative. After review of the Alternatives Analysis Report and consideration of public comments, the City Council identified a fixed guideway transit system extending from Kapolei to UH Manoa with a connection to Waikiki as the Locally Preferred Alternative. This identification, which eliminated the TSM and Managed Lane Alternatives from further consideration, became Ordinance 07-001 on January 6, 2007. The NEPA process considered a range of alternatives that was consistent with the identified Locally Preferred Alternative. As discussed in Section 2.2, there were no alternatives that had not been previously studied and eliminated for good cause that would satisfy the Purpose and Need at less cost, with greater effectiveness, or less environmental or community impact. In addition, the City Council's Transit Advisory Task Force reviewed the Alternatives Analysis. The Task Force concluded in its report dated December 14, 2006, that the assessment of each alternative was "fair and accurate."

The Managed Lane Alternative was fully evaluated in the Alternatives Analysis. The Managed Lane Alternative would not eliminate congestion and bottlenecks on the H-1 Freeway. Table 3-12 in the Alternative Analysis Report shows that, under the No Build Alternative, there would be 18,049 vehicles per hour (vph) operating on the H-1 Freeway in 2030. Vehicle volumes rise to 18,327 vph (two-direction option) or 18,419 vph (reversible option) with the Managed Lane Alternative, while traffic volumes decrease to 17,209 vph with the 20-mile Fixed Guideway Transit Alternative. Accordingly, the Fixed Guideway Transit Alternative will reduce traffic volumes from those projected under the 2030 No Build Alternative.

The Managed Lane Alternative would not have a substantial effect on vehicle miles traveled (VMT) or vehicle hours of delay (VHD), key metrics used to analyze transportation and environmental impacts. As stated in the response above, traffic on the H-1 Freeway would not improve with the Managed Lane Alternative. According to Table 3-12 from the Alternatives Analysis Report, the Two-direction Option for the Managed Lane Alternative would have a negligible impact on VMT and a slightly positive effect on VHD (4.3 percent). With the Fixed Guideway Transit Alternative, VMT and VHD would be reduced by 3.1 and 11 percent, respectively. As shown in Table 6-1 of the Final EIS, the Project will cost \$4.6 billion in 2009 dollars and \$5.5 billion in inflated dollars, including finance charges. Project goals and objectives are discussed in Section 1.8 of the Final EIS. Section 1.8.1 in the Final EIS states that transit improvements are needed to "improve corridor mobility." This section explains that, "Currently, motorists traveling from West Oahu to Downtown experience highly congested traffic during the a.m. peak period. By 2030, after including all the planned roadway improvements in the ORTP, the level of congestion and travel time are projected to increase further.... Expansion of the roadway system between Kapolei and UH Manoa is constrained by physical barriers and by dense urban neighborhoods that abut many existing roadways. Given current and increasing levels of congestion, an alternative method of travel is needed within the study corridor independent of current and projected highway congestion."

1) As stated in Chapter 2 of the Final EIS, prior to selecting an elevated fixed guideway system, a variety of high-capacity transit options were evaluated during the

Primary Corridor Transportation Project (1998-2002) and Alternatives Analysis. Options evaluated and rejected include an exclusively at-grade fixed guideway system using bus rapid transit vehicles. In addition to comments received during the Alternatives Analysis and EIS scoping sessions, these studies provided a critical foundation for the conclusion that an elevated system would result in the best overall performance and better support of the Purpose and Need for the Project. In addition, the proposed Bus Rapid Transit Alternative, as stated in your letter, is a variation of the Transportation System Management Alternative that was evaluated in the Alternatives Analysis. While this alternative has merit for cost-effectiveness, its overall system benefit would be very low.

2) The analysis of the Managed Lane Alternative from the Alternatives Analysis Report (DTS 2006b) shows the cost to be \$2.6 billion in 2006 dollars (higher today) for a 16-mile facility. As stated in the City Council's Transit Advisory Task Force Report, a committee was charged with reviewing cost estimates for the two alternatives involving construction (Managed Lane Alternative and Fixed Guideway Alternative). The report states that "the Task Force agrees with this committee that the Alternatives Analysis' construction cost estimates were fairly and consistently prepared, and that they may be used for both planning and cost comparisons." Information was obtained by the Task Force from the Hawaii Department of Transportation and others familiar with managed lane facilities. It is the only estimate to date that addresses Honolulu conditions.

There is no substantiation of the estimate from the Tampa Bay toll facility being applicable in Honolulu. The designer of the Tampa Bay facility herself admitted that to apply such an estimate without detailed consideration of the many differences between the two locations is not reasonable. For clarification, the Tampa Bay elevated toll lanes extend only 5.8 miles within the 10-mile expressway. The costs quoted are from 2002, long before the costs of materials and construction rose dramatically after 2004. Furthermore, the corridor within which the Tampa Bay lanes are built required no right-of-way, had no significant utility conflicts, no major structures or crossings, and was built in much more favorable geotechnical conditions than exist on Oahu. In addition, the Transit Task Force Report dated December 14, 2006, states that "the committee concluded that the projects are sufficiently different (actual costs versus projected costs with contingencies; available, accessible ROW vs. construction in actively used highways; no utilities relocation vs. extensive relocations) as to make the comparison unreasonable."

3) The EzWay 15-mile, three-lane viaduct concept was developed as a hybrid of a plan for elevated toll lanes and some form of rubber-tire-on-concrete transit system. It is similar to the Managed Lane Alternative that was thoroughly evaluated in the Alternatives Analysis, which also accommodated both single occupant and transit vehicles. No known cost estimate for the EzWay proposal was prepared or validated by a qualified registered professional engineer. As a point of reference, the State of Hawaii's Highway Modernization Plan dated January 22, 2009, estimates the cost of the Nimitz Viaduct at \$600 million for an approximately 2.5-mile elevated highway with two lanes, which equals \$240 million per mile. Using this estimate, a 15-mile facility would cost approximately \$3.6 billion.

4) Localized bypasses would not meet system goals for corridor-wide benefits to mobility, reliability, access, and equity. The Hawaii Department of Transportation, which

is responsible for the freeway system, has evaluated needs for the freeway system and identified the highway projects that would be most efficient at reducing congestion on Oahu. The projects, including a Nimitz Flyover, are listed in Table 2-3 of the Draft EIS and included in the analysis for all project alternatives. Effects of the Nimitz Flyover on traffic conditions in 2030 are discussed in Section 3.4.2 of the Final EIS. Travel on the Nimitz Flyover was included for the following travel pairs under the No Build Alternative: Kapolei to Downtown, Ewa to Downtown, and Mililani to Downtown. As shown in Figure 3-7 of the Final EIS, the Nimitz Flyover does improve transit travel times with the No Build Alternative between certain travel pairs (e.g., between Mililani and Downtown) compared to 2007 conditions. However, as also shown in this figure, travel times improve substantially more with the addition of the Project. As a point of clarification, a Final EIS was never prepared for the Nimitz Flyover.

There could be many other versions of this type of system with minor adaptations to suit one or another special concern. In the end, the above approaches all have similar challenges as a primary solution to Honolulu's transportation problems. They do not reduce congestion, increase the reliability of the transportation system, serve future land use plans, or improve the fairness of and access to the transportation system. While the Managed Lane Alternative would reduce freeway congestion (measured as vehicle hours of delay), it would increase overall system congestion by inducing additional travelers to drive, which would result in increased congestion on arterial and collector facilities accessing the freeways and the managed lane. In addition, once a vehicle leaves the managed lane, that vehicle is still subjected to congestion on surrounding roadways. They also do not offer an alternative to perpetuating a reliance on limited existing travel modes. For example, localized bypasses would not meet system goals for corridor-wide benefits to mobility, reliability, access, and equity. In sum, they do not address the Purpose and Need of the Project.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Subject: Comment on Draft Environmental Impact Statement (DEIS)
"Honolulu High-capacity transit corridor Project", Issue : City Alternative
Analysis (AA) incorrectly inflates Managed Lane Alternative (MLA) cost
of \$2.6 Billion which wrongly excludes MLA from further transit
consideration in the DEIS

Facts:

- 1) 2006 Alternative Analysis show 14 mile, two lane elevated MLA capital cost at \$2.6 Billion or \$185 Million per mile.
- 2) AA shows 20 mile Rail to Ala Moana Shopping Center cost at \$3.7 Billion or \$180 million per mile.
- 3) Wayne Yoshioka, on Olelo 22 July 2008, 19 minutes into video, <http://www.honolulutransit.org/video/?id=9>, stated " \$3.7 Billion includes \$1.0 Billion contingency". Thus the 20 mile Rail cost estimate, without contingency, is \$2.7 Billion or \$135 million per mile.
- 4) The Rail project includes 180 + land acquisitions, 20 miles elevated structure, nineteen, four-story or higher rail stations, electric substations at each rail station, steel rails and the heavy copper lines to convey the high electrical load, escalators, elevators, and office/bathrooms/roadways/parking facilities at each rail station. Conversely, the MLA will have zero rail stations on the entire 11 mile length.
- 5) The ORTP 2030 link
http://oahumpo.org/ortp/ORTP2030/OMPO_Report_FINAL.pdf
Shows the 2.2 mile Nimitz two lane elevated flyover at \$250 million (State DOT cost Estimate) or \$113 million per mile.
- 6) The 10 mile Tampa three-lane elevated
<http://www.tollroadsnews.com/node/172> cost \$420 million or \$42 million per mile.
- 7) The MLA would cost twice as much per lane mile as H-3, the most expensive highway because it had to bore two tunnels through the Koolaus.
- 8) Professor Panos Prevedouros study "Transportation Alternative Analysis for Mitigating traffic Congestion between Leeward Oahu and Honolulu" March 2008, shows a cost estimate for a three lane, 11 mile elevated Managed Lane for \$900 million or \$81 million per mile. The Managed Lane facility is similar in construction to the Tampa three lane elevated reversible. The full report is available at www.eng.hawaii.edu/~panos/UHCS.pdf.

Discussion:

- a) The city AA discarded the MLA because of high cost and that it would not solve traffic congestion.
- b) The DEIS does not include the MLA because it was discarded by the AA from further consideration.
- c) The cost estimates above show that the MLA would cost not more than \$900 million based on the similar Tampa three lane reversible. Even is the MLA were to use the State of Hawaii's estimate in the ORTP, the 11 mile MLA would cost \$113 million per mile or \$1.2 Billion.
- d) if the two lane elevated MLA uses the elevated rail cost at \$135 million per mile, the MLA would cost \$1.5 Billion, far less than the AA estimate of \$2.6 Billion.

Conclusion:

The AA cost estimate for the MLA at \$2.6 Billion is incorrect and should be revised to less than \$1.0 Billion. Further, the MLA should be restudied within the DEIS process if the DEIS is to comply with NEPA.

Recommendation:

It is recommended that the Council on Environmental Quality (CEQ), in conjunction with the USDOT, require the FTA and the CITY re-assess the MLA in the EIS process. City and FTA re-study the MLA as an 11 mile, three-lane elevated reversible transit way within the DEIS process if the DEIS is to comply with NEPA.

Respectfully,

Ben Ramelb P.E.
1148 Ala Lilikoi St

Dear Mr. Ramelb:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal dated December 29, 2008 with subject [Comment on Draft Environmental Impact Statement (DEIS) "Honolulu High-capacity transit corridor Project", Issue : City Alternative Analysis (AA) incorrectly inflates Managed Lane Alternative (MLA) cost of \$2.6 Billion which wrongly excludes MLA from further transit consideration in the DEIS]:

In response to "Fact 1" in your letter, the Alternatives Analysis showed a 16-mile, two-lane elevated Managed Lane Alternative at \$2.6 billion. Regarding "Fact 2-4" the financial plan has been revised for the Final EIS and is summarized in Chapter 6 of the Final EIS. Table 6-1 of the Final EIS shows the capital cost breakdown for the system, including contingency and right-of-way acquisitions. Both the Managed Lane Alternative and the Fixed Guideway Alternative have right-of way-acquisitions.

Regarding "Fact 5" the State of Hawaii's Highway Modernization Plan dated January 22, 2009, estimates the cost of the Nimitz Viaduct at \$600 million for an approximately 2.5-mile elevated highway with two lanes, which equals \$240 million per mile. Using this estimate, a 15-mile facility would cost approximately \$3.6 billion. Regarding "Fact 6", there is no substantiation of the estimate from the Tampa Bay toll facility being applicable in Honolulu. The designer of the

Tampa Bay facility herself admitted that to apply such an estimate without detailed consideration of the many differences between the two locations is not reasonable. For clarification, the Tampa Bay elevated toll lanes extend only 5.8 miles within the 10-mile expressway. The costs quoted are from 2002, long before the costs of materials and construction rose dramatically after 2004. Furthermore, the corridor within which the Tampa Bay lanes are built required no right-of-way, had no significant utility conflicts, no major structures or crossings, and was built in much more favorable geotechnical conditions than exist on Oahu. In addition, the Transit Task Force Report dated December 14, 2006, states that "the committee concluded that the projects are sufficiently different (actual costs versus projected costs with contingencies; available, accessible ROW vs. construction in actively used highways; no utilities relocation vs. extensive relocations) as to make the comparison unreasonable."

Regarding "Fact 7", according to construction cost indices prepared by the Washington State Department of Transportation, construction costs doubled between 1997 (the year construction ended on the H-3 Freeway) and 2006 (the year of the Alternatives Analysis). If construction of the H-3 Freeway had begun in 2006, that project would have cost approximately \$2.6 billion. In addition, both the H-3 Freeway and the Managed Lane Alternative face unique situations that affect cost estimates. Construction of the Managed Lane Alternative would have occurred in a heavily developed corridor. As a result, there would be substantial disruptions to traffic and utilities, both of which add to the time, and thus cost, of a project. The H-3 Freeway was built in an undeveloped part of the island and which it had its own challenges, expensive traffic and utility disruptions were minimal.

Regarding "Fact 8", the analysis of the Managed Lane Alternative from the Alternatives Analysis Report (DTS 2006b) shows the cost to be \$2.6 billion in 2006 dollars (higher today) for a 16-mile facility. As stated in the City Council's Transit Advisory Task Force Report, a committee was charged with reviewing cost estimates for the two alternatives involving construction (the Managed Lane Alternative and Fixed Guideway Alternative). The report states that "the Task Force agrees with this committee that the Alternatives Analysis' construction cost estimates were fairly and consistently prepared, and that they may be used for both planning and cost comparisons." Information was obtained by the Task Force from the Hawaii Department of Transportation and others familiar with managed lane facilities. It is the only estimate to date that addresses Honolulu conditions.

To address your discussion points:

a) The Alternatives Analysis fully evaluated the Managed Lane Alternative and documented that it did not perform as well as the Fixed Guideway Transit Alternative under a broad range of metrics, as summarized in Chapter 2 of the Final EIS. As stated in this chapter and in the Summary of the Alternatives Analysis Report, of all the alternatives evaluated, the Managed Lane Alternative would have generated the greatest amount of air pollution, required the greatest amount of energy for transportation use, and would have resulted in the largest number of transportation noise impacts. Because the Managed Lane Alternative would have served a shorter portion of the study corridor, it would have resulted in fewer displacements and would have affected fewer archaeological, cultural, and historic resources than the Fixed Guideway Transit Alternative. The Managed Lane Alternative would not have affected any farmlands. Visually, the elevated structure would have extended a shorter distance, but it would have been more visually intrusive because its elevated structure would have been much

wider than that of the Fixed Guideway Transit Alternative. It would have provided little community benefit, as it would not have resulted in substantially improved transit access in the corridor. Lastly, no funding sources were identified for the Managed Lane Alternative.

b) After the Alternatives Analysis was completed, several scoping comments were received requesting reconsideration of the Managed Lane Alternative that was considered and rejected during the Alternatives Analysis. Because no new information was provided that would have changed the findings of the Alternatives Analysis regarding the Managed Lane Alternative, it was not included in the Draft EIS for further consideration.

c and d) The engineering cost estimate for a two-lane reversible managed lane facility, which was calculated following the same rigorous cost-estimating process used for the Fixed Guideway Transit Alternative, was \$2.6 billion in 2006 dollars. As stated previously, the Transit Advisory Task Force Report stated that "the Task Force agrees with this committee that the Alternatives Analysis' construction cost estimates were fairly and consistently prepared, and that they may be used for both planning and cost comparisons." The Project is not comparable to the Tampa Bay toll facility that is referenced in the comment for the reasons stated above.

Again, the Alternatives Analysis fully evaluated the Managed Lane Alternative and documented that it did not perform as well when compared to the Fixed Guideway Transit Alternative under a broad range of metrics. The Managed Lane Alternative will not be restudied in the Final EIS and, as a result, the cost estimates shown in Table 2-2 of the Final EIS for the Managed Lane Alternative have not been revised.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Subject: Comment on Draft Environmental Impact Statement (DEIS)
"Honolulu High-capacity transit corridor Project", Issue: The purpose and goals for the Honolulu High-capacity Transit Corridor Project Draft Environmental Impact Statement (DEIS) are not consistent with those of the Oahu Regional Transportation Plan 2030 (ORTP 2030).

Facts:

a) The ORTP 2030 states that its purpose is to provide a long-term vision document that outlines transportation goals, objectives, and policies for Oahu. The ORTP 2030 goals and objectives are listed in the discussion section below.

b) The ORTP 2030 document also identifies specific highway and transit projects that are designed to improve safety, reduce congestion, and increase mobility for Oahu's residents and visitors. This regional planning document is required by a number of state and federal mandates and requirements which include the Transportation Equity Act for the 21st Century ("TEA 21"). These requirements are mandated by the Federal Department of Transportation as a means of verifying the eligibility of metropolitan areas for Federal funds earmarked for surface transportation systems.

c) DEIS para. 1.7 states "The purpose of the Honolulu High-capacity Transit corridor is to provide high-capacity rapid transit in the transportation corridor.....as specified in the ORTP 2030."

d) DEIS para. 1.8 – States that there are several needs for transit improvements in the transit corridor: (1) improve corridor mobility, (2) improve corridor travel reliability, (3) improve access to planned development to support city policy to develop a second urban center, and (4) Improve transportation equity.

Discussion:

a) GOALS AND OBJECTIVES FOR THE 2030 OAHU REGIONAL TRANSPORTATION PLAN, October 2004

http://oahumpo.org/ortp/media/GoalsObjectives_041022_final.pdf

Transportation Services System Goal:

Develop and maintain Oahu's islandwide transportation system to ensure efficient, safe, convenient and economical movement of people and goods.

Objectives:

#1 Increase peak-period person-carrying capacities on Oahu's transportation network.

#2 Provide efficient, convenient and cost-effective transit service to Oahu citizens.

#3 Encourage the availability of adequate public and private services

safely integrated

with other transport modes.

#16 Develop a travel demand management system for Oahu that optimizes use of

transportation resources by encouraging programs to increase transit ridership,

increase ridesharing on Oahu, reduce single occupancy vehicle travel, and reduce

auto dependency.

#17 Minimize disruption of existing neighborhoods from construction of the transportation

system.

#18 Ensure that transportation facility design and maintenance are compatible with the

existing and planned physical and social character of new and existing developments.

#19 Maintain and upgrade existing facilities and design future transportation facilities in a

manner that is aesthetically pleasing and incorporates landscaping, tree planting, and

public safety.

#20 Develop transportation contingency plans for energy shortages, natural and manmade

disasters and other emergencies that would impact the transportation system.

2030 ORTP Planning Study 3 Goals and Objectives

GOALS AND OBJECTIVES FOR THE 2030 OAHU REGIONAL TRANSPORTATION PLAN

Land Use and Transportation Integration System Goal:

Develop and maintain Oahu's transportation system in a manner that integrates land use and transportation.

Objectives:

#21 Maintain and develop the transportation system to reinforce Oahu's planned

population distribution and land use development policies expressed in the City's

Development Plans through coordinated efforts of the public and private sectors.

#22 Encourage innovation in planning, design and maintenance of transportation

services and facilities.

#23 Encourage the implementation of land use development policies that support

efficient use of the transportation system via reduced vehicular tripmaking and

vehicle miles traveled.

b) DEIS purpose stated in paragraph 1.7 is not found in the ORTP goals and objectives listed above.

c) DEIS Needs paragraph 1.8 are not found in the ORTP goals and objectives listed above.

d) The single most important non-compliance of the DEIS with the ORTP 2030 is Objective No. 2 where the ORTP Objective No. 2 is to provide a transportation system that is "COST EFFECTIVE". The reason that Rail is NOT cost effective is that: (1) Rail will cost \$6.8 Billion but will still not eliminate the major H-1 bottlenecks at the H-1/H-2 merge and at the Middle Street merge. In fact, the Rail will increase the vehicular overload on H-1 from the present 11,000 vph to 17,500 vehicles per hour on the 9,500 vph capacity H-1 Freeway at Kalauao. The rail alternative must be compared with Professor Prevedouros' \$900 million 11 mile, Managed Three-Lane HOV Alternative explained in www.eng.hawaii.edu/~panos/UHCS.pdf. The Managed Three-Lane HOV Alternative eliminates the two H-1 bottlenecks at Pearl City and at Middle Street merge and should be considered "cost effective" by any definition

Conclusion: The purpose and goals for the Honolulu High-capacity Transit Corridor Project Draft Environmental Impact Statement (DEIS) do not conform with ORTP 2030 objective No. 2 with regard to rail being cost effective.

Recommendation: Reinstate the 11 mile Managed Lane HOV Alternative into the DEIS for evaluation as a transit system in terms of cost effectiveness and the potential to eliminate the H-1 bottlenecks at H-1/H-2 merge and at the Middle St. merge.

Honolulu, Hawaii 96818

Dear Mr. Ramelb:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal dated December 29, 2008 with subject [Comment on Draft Environmental Impact Statement (DEIS) "Honolulu High-capacity transit corridor Project", Issue: The purpose and goals for the Honolulu High-capacity Transit Corridor Project Draft Environmental Impact Statement (DEIS) are not consistent with those of the Oahu Regional Transportation Plan 2030 (ORTP 2030)]:

The Draft EIS does not specify that the fixed guideway project appears in the goals or objectives of the ORTP. However, Section 1.7 of the Final EIS states that the Fixed Guideway Project is specified in the Oahu Regional Transportation Plan (ORTP). Project Number 31 in the ORTP 2030, as amended and approved in May 2007, further states that the City will "plan, design, and construct a fixed guideway system between East Kapolei and Ala Moana."

As stated in Section 7.4 of the Final EIS, the cost-effectiveness is one of the key criteria that FTA uses to evaluate projects proposed for Section 5309 New Starts funding. The cost-effectiveness indices for the Project compared to the baseline is within the "medium" range established by FTA for its New Starts ratings which, along with other considerations, is currently required to qualify for New Starts funding (see Table 7-8 in the Final EIS). As shown in

Mr. Ben Ramelb
Page 2

Table 6-1 of the Final EIS, the Project will cost \$4.6 billion in 2009 dollars and \$5.5 billion in inflated dollars, including finance charges.

As shown in the Alternatives Analysis Report (DTS 2006b), the Managed Lane Alternative would not eliminate congestion and bottlenecks on the H-1 Freeway. Table 3-12 in the Alternative Analysis Report shows that, under the No Build Alternative, there would be 18,049 vehicles per hour (vph) operating on the H-1 Freeway in 2030. Vehicle volumes rise to 18,327 vph (Two-direction Option) or 18,419 vph (Reversible Option) with the Managed Lane Alternative, while traffic volumes decrease to 17,209 vph with the 20-mile Fixed Guideway Transit Alternative. Accordingly, the Fixed Guideway Transit Alternative will reduce traffic volumes from those projected under the 2030 No Build Alternative.

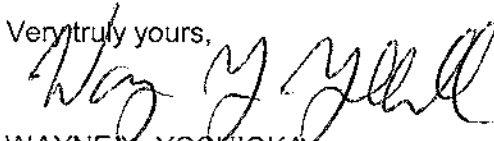

The analysis of the Managed Lane Alternative from the Alternatives Analysis Report (DTS 2006b) shows the cost to be \$2.6 billion in 2006 dollars (higher today) for a 16-mile facility. As stated in the City Council's Transit Advisory Task Force Report, a committee was charged with reviewing cost estimates for the two alternatives involving construction (the Managed Lane Alternative and Fixed Guideway Alternative). The report states that "the Task Force agrees with this committee that the Alternatives Analysis' construction cost estimates were fairly and consistently prepared, and that they may be used for both planning and cost comparisons." Information was obtained by the Task Force from the Hawaii Department of Transportation and others familiar with managed lane facilities. It is the only estimate to date that addresses Honolulu conditions.

The Alternatives Analysis fully evaluated the Managed Lane Alternative and documented that it performed poorly compared to the Fixed Guideway Transit Alternative on a broad range of metrics. Any slight changes to the alternative would not result in substantially different findings.

After the Alternatives Analysis was completed, several scoping comments were received requesting reconsideration of the Managed Lane Alternative that was considered and rejected during the Alternatives Analysis. Because no new information was provided that would have changed the findings of the Alternatives Analysis regarding the Managed Lane Alternative, it was not included in the Draft EIS for further consideration.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

between Waikiki, the airport and other tourist destinations. NO

#4 Promote intermodal efficiency of harbor terminal facilities, airport terminal facilities and land transportation systems.

#5 Ensure that no person shall, on the grounds of race, color, gender, age, income, disability, or national origin, be excluded from participation in, be denied the benefits of, or be subjected to discrimination in transportation services as provided for under current federal, state, and local legislation.

#6 Ensure user and community safety and security in the physical design and operation of transportation facilities.

#7 Ensure that Oahu's transportation system is planned, designed, constructed and operated in an integrated and cost-effective manner. NO

#8 Enhance the performance and efficiency of Oahu's transportation system through the use of operation management strategies, such as Intelligent Transportation System (ITS), Transportation System Management (TSM) and Transportation Demand Management (TDM).

#9 Enhance the integration and connectivity of the regional transportation system. NO

#10 Promote planning, design and construction of transportation facilities and systems to support economic development and vitality. NO

#11 Provide major rehabilitation/renewal/modernization of facilities in sufficient magnitude to ensure continued effective operation. NO

2030 ORTP Planning Study 2 Goals and Objectives GOALS AND OBJECTIVES FOR THE 2030 OAHU REGIONAL TRANSPORTATION PLAN

Environment and Quality of Life System Goal:

Develop and maintain Oahu's transportation system in a manner that maintains environmental quality and community cohesiveness.

Objectives:

#12 Develop and maintain Oahu's transportation system to meet or exceed noise, air and water quality standards set forth by federal, state and local agencies. NO

#13 Encourage energy conservation in transportation. NO

#14 Preserve Oahu's cultural integrity and sensitive natural resources, including beaches, scenic beauty, and sea and mountain vistas. NO

#15 Develop and maintain alternative transportation facilities, including bikeways,

walkways and other environmentally-friendly elements which can be safely integrated

with other transport modes. NO

#16 Develop a travel demand management system for Oahu that optimizes use of transportation resources by encouraging programs to increase transit ridership, increase ridesharing on Oahu, reduce single occupancy vehicle travel, and reduce auto dependency. NO

#17 Minimize disruption of existing neighborhoods from construction of the transportation system. NO

#18 Ensure that transportation facility design and maintenance are compatible with the existing and planned physical and social character of new and existing developments. NO

#19 Maintain and upgrade existing facilities and design future transportation facilities in a manner that is aesthetically pleasing and incorporates landscaping, tree planting, and public safety. NO

#20 Develop transportation contingency plans for energy shortages, natural and manmade disasters and other emergencies that would impact the transportation system. NO

2030 ORTP Planning Study 3 Goals and Objectives

GOALS AND OBJECTIVES FOR THE 2030 OAHU REGIONAL TRANSPORTATION PLAN

Land Use and Transportation Integration System Goal:

Develop and maintain Oahu's transportation system in a manner that integrates land use and transportation.

Objectives:

#21 Maintain and develop the transportation system to reinforce Oahu's planned population distribution and land use development policies expressed in the City's Development Plans through coordinated efforts of the public and private sectors. NO

#22 Encourage innovation in planning, design and maintenance of transportation services and facilities. NO

#23 Encourage the implementation of land use development policies that support efficient use of the transportation system via reduced vehicular tripmaking and vehicle miles traveled. NO

Findings:

The DEIS purpose and needs stated in paragraphs 1.7 and 1.8 do not

conform with many ORTP 2030 Goals and Objectives noted above for one or more reasons:

- (1) Rail transit will result in a net DECREASE in peak-period person-carrying capacities on Oahu's transportation network,
- (2) The \$6.8 Billion rail is not cost effective because rail will still not eliminate the major H-1 bottlenecks at the H-1/H-2 merge and at the Middle Street merge. In fact, the Rail will increase the vehicular overload on H-1 from the present 11,000 vph to 17,500 vehicles per hour on the 9,500 vph capacity H-1 Freeway at Kalauao ,
- (3) Rail transit will not service Waikiki,
- (4) The rail transportation system is not cost effective because it does not allow express buses to run in a corridor parallel to the rail route to reduce congestion on H-1 during peak hour,
- (5) Rail will not provide relief to increased congestion on H-1 at the H-1/H-1 merge and at Middle St. merge by year 2030. Therefore, rail will not enhance the integration and connectivity of the regional transportation system; will not promote planning, design and construction of transportation facilities and systems to support economic development and vitality; and will not provide major rehabilitation/renewal/modernization of facilities in sufficient magnitude to ensure continued effective operation.
- (6) Rail will cause more vehicles to be stuck in gridlock on H-1 and will therefore exceed noise, air and water quality standards set forth by federal, state and local agencies and energy conservation in transportation because rail will result in 8,000 vehicles per hour being stuck in gridlock on H-1 during the am peak period.
- (7) The elevated rail located downtown be a visual blight downtown and will not preserve Oahu's cultural integrity and sensitive natural resources, including beaches, scenic beauty, and sea and mountain vistas.
- (8) The rail route on Salt Lake Blvd and Dillingham Blvd instead of the H-1 Viaduct and Nimitz Highway will maximize disruption of existing neighborhoods from construction of the transportation system.

Conclusion:

The elevated rail will cause severe traffic congestion on H-1 during peak hour, will force more vehicles to be stuck in gridlock causing worse pollution, less reliability for many commuters at the rail station waiting for commuter room on the fully loaded train and will cause a visual blight downtown.

Recommendation:

The DEIS must add more transit alternatives such as:

- 1) an elevated HOV three-lane transit way from Waikale to downtown Hotel and Alakea Sts as described in Professor Panos Prevedourous Report "Transportation Alternatives Analysis for Mitigating Traffic Congestion between Leeward Oahu and Honolulu, Mar 2008." The full report is available at www.eng.hawaii.edu/~panos/UHCS.pdf.
- 2) BRT proposed by former Mayor Harris in early 2002 or 2003.
- 3) Build two separate, three-lane Flyovers, Nimitz and Kamehameha (between Waiawa Interchange and Halawa Interchange). Note that the

two Flyovers has the capacity to eliminate the bottlenecks on H-1 as shown below ("Transit Alternatives Traffic Capacity").

Transit Alternatives Traffic Capacity

Numbers from Table 3-12 of city 2006 Nov Alternative Analysis (\$10 million report): (Rail DEIS contains insufficient information to determine extent of congestion on H-1 and other highways at Kaluaao (Pearl City).

Rail only: capacity = 6000 commuters per peak hour

H-1 only: rated capacity = 9,500 vehicles per hour (equivalent 15,400 commuters per hour (some commuters are on express buses)

H-1 forecast yr 2030 traffic load = 17,500 vehicles per hour per City AA Table 3-12 (or 8,000 vph overload (on H-1) = 9,600 commuters per hour)

Managed Three-lane HOV Reversible Flyover: capacity = 6,000 high occupancy vehicles per hour (equivalent 21,600 commuters per hour). Capacity based on HOV use on Flyover by 200 express buses per peak hour, car pools, van pools, green cars and HOV2 or HOV3. (commuter capacity = 50 pns per express bus plus 5,800 vph at avge 2 pns per vehicle).

Year 2030 commuter load by City AA Report = Rail (6000) + H-1 overload (9,600) + H-1 capacity (15,400) = 31,000 commuters.

2030 Load = 31,000 commuters per hour

Rail + H-1 = 21,400 commuters per hour

Managed Lane HOV + H-1 = 37,000 commuters per hour

Conclusion: Rail does not have sufficient commuter capacity which will cause 9,600 commuters to be stuck in gridlock on H-1 or stuck at rail stations (especially at stations between Waipahu and Kalihi). Managed Lane HOV Flyover Alternative will eliminate congestion and bottlenecks on H-1.

DEPUTY DIRECTOR

June 11, 2010

RT10/09-336455

Mr. Ben Ramelb
1148 Ala Lilikoi Street
Honolulu, Hawaii 96818

Dear Mr. Ramelb:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal dated December 29, 2008 with subject [Comment on Draft Environmental Impact Statement (DEIS) "Honolulu High-capacity transit corridor Project", Issue: The purpose and goals for the Honolulu High-capacity Transit Corridor Project Draft Environmental Impact Statement (DEIS) do not conform with those of the Oahu Regional Transportation Plan 2030 (ORTP 2030)]:

The Draft EIS does not specify that the fixed guideway project appears in the goals or objectives of the ORTP. However, Section 1.7 of the Final EIS states that the Fixed Guideway Project is specified in the Oahu Regional Transportation Plan (ORTP). Project Number 31 in the ORTP 2030, as amended and approved in May 2007, further states that the City will "plan, design, and construct a fixed guideway system between East Kapolei and Ala Moana."

We will address your findings in the order they were submitted:

1) As shown in Table 3-21 of the Final EIS, roadway travel lanes will not be removed as a result of the Project. In addition, the fixed guideway system is planned to operate with two or three car trains with a capacity of between 325 and 500 passengers each. At three-minute headways during the peak period, that provides capacity for approximately 8,650 passengers per peak direction per peak hour. This capacity figure applies in both directions for a total system capacity of approximately 17,300 passengers per peak hour. In addition, a major benefit of the fixed guideway is that once built, it is flexible enough to accommodate significant growth. For example, the full capacity of the fixed guideway with four-car trains and 90-second headways is over 25,000 passengers per hour per direction, or over 50,000 total. Accordingly, the fixed guideway system will provide sufficient capacity based on travel demand forecasting results. As a result, the fixed guideway system will add substantial capacity to Oahu's transportation network.

2) As stated in Section 7.4 of the Final EIS, cost-effectiveness is one of the key criteria that FTA uses to evaluate projects proposed for Section 5309 New Starts funding. The cost-effectiveness indices for the Project compared to the baseline is within the "medium" range established by FTA for its New Starts ratings, which, along with other considerations, is currently required to qualify for New Starts funding (see Table 7-8 in Final EIS). As shown in Table 6-1 of the Final EIS, the Project will cost \$4.6 billion in 2009 dollars and \$5.5 billion in inflated dollars, including finance charges.

The Managed Lane Alternative was fully evaluated in the Alternatives Analysis. As shown in the Alternatives Analysis Report (DTS 2006b), the Managed Lane Alternative would not eliminate congestion and bottlenecks on the H-1 Freeway. Table 3-12 in the Alternative Analysis Report shows that, under the No Build Alternative, there would be 18,049 vehicles per hour (vph) operating on the H-1 Freeway in 2030. Vehicle volumes rise to 18,327 vph (Two-direction Option) or 18,419 vph (Reversible Option) with the Managed Lane Alternative, while traffic volumes decrease to 17,209 vph with the 20-mile Fixed Guideway Transit Alternative. Accordingly, the Fixed Guideway Transit Alternative will reduce traffic volumes from those projected under the 2030 No Build Alternative.

3) While it is correct that the Project will not extend rail service into Waikiki, the Project will provide improved transit service for many trips to Waikiki as, for example, shown in Figure 3-7 in the Final EIS. The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS. However, the future extensions are not part of this Project; thus, they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation in

the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time.

4) As noted above, the cost-effectiveness indices for the Project compared to the FTA New Starts Baseline Alternative fall within the "medium" range established by FTA for its New Starts ratings. In addition, the fixed guideway system will serve as an express route for most of the system.

5) As stated above in response to Number 2 (above), the Fixed Guideway Alternative will reduce congestion on H-1 whereas the Managed Lane Alternative would not. As noted in Table 3-14 of the Final EIS, the Project will result in decreased daily vehicle miles traveled, daily vehicle hours traveled, and daily vehicle hours of delay in 2030 as compared to the No Build Alternative. Therefore, rail will provide some relief to the level of congestion that would occur in its absence. Further, by providing an option for travelers to avoid congestion, rail will enhance the integration and connectivity of the regional transportation system while also providing transportation facilities and systems to support economic development and vitality.

The Project is focused on the construction and implementation of rail transit service, which is evaluated in the Draft and Final EISs. As discussed in Section 4.19.2 of the Final EIS, transit-oriented development (TOD) is expected to occur in Project station areas as an indirect effect of the Project. The increased mobility and accessibility that the Project may provide may also increase the desirability and value of land near stations, thereby attracting new real estate investment nearby (in the form of TOD). Planning and zoning around station areas will be established by the City's Department of Planning and Permitting under the City's new TOD ordinance. Ridership on the system would be even higher if TOD occurs.

6) As stated previously, the Fixed Guideway Alternative will improve congestion on the H-1 Freeway and will reduce vehicle hours of delay by 18 percent. Noise effects from the Project are detailed in Section 4.10 of the Final EIS. The Project will cause no severe noise impacts. Three receptors will experience moderate impacts, which will occur on the fifth through ninth floors. The Project includes several features to reduce noise from the system. The Project will include an integrated noise-blocking parapet wall at the edge of the guideway structure that extends three feet above the top of the rail and a system specification for vehicles with wheel skirts. Wheel skirts on trains will also increase the benefit of the parapet wall at locations above the elevation of the track. With mitigation, the Project will not generate any noise impacts. Although you might hear the train, the noise it makes will be at a level that is close to what is currently experienced.

As stated in Section 4.9 of the Final EIS, the Project will reduce regional pollutant emissions between 3.9 to 4.6 percent. The Project will also reduce emissions of greenhouse gases. From the Final EIS Section 4.14, Water, "The Project will secure all federal water permits including Section 401 of the CWA, and Section 404." In addition the Project will follow the State of Hawaii's general policy, to maintain or improved existing water quality in all State waters. Coordination with Federal, State, and local

agencies with water-resource expertise and responsibilities has been ongoing to provide input and guidance on the resources, design and construction of the Project. Coordination will continue as appropriate with regulatory agencies throughout final design and construction. In addition, water resources are discussed in Section 4.19.3 Cumulative Effects, Water: As stated in Section 4.11 of the Final EIS, the Project will reduce daily transportation energy demand by 3 percent. These reductions are due largely to the reduction in vehicle miles traveled.

7) The visual and cultural effects of the alternatives are described in Sections 4.8 and 4.16, respectively, of the Final EIS.

The island's unique visual character and scenic beauty were considered in the visual and aesthetic analysis presented in the Draft and Final EISs. As discussed in Section 4.8 of the Final EIS, the Project will be set in an urban context where visual change is expected and differences in scales of structures are typical.

As part of the design process, the City has developed design principles, which are identified in the Honolulu High-Capacity Transit Corridor Project Compendium of Design Criteria (RTD 2009m) that will be implemented in final design to minimize visual effects of the Project. For example, guideway materials and surface textures will be selected in accordance with generally accepted architectural principles to achieve effective integration between the guideway and its surrounding environment. Landscape and streetscape improvements will mitigate potential visual impacts, primarily for street-level views.

Other measures to address visual impacts of the Project are being developed through the station design and planning process. The initial station area plans and design guidelines were first developed with coordination between DTS and the Department of Planning and Permitting (DPP). The next level of transit station design focuses on integrating individual neighborhood characteristics of the communities served by the stations.

The following mitigation framework will be included in the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

- Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
- Coordinate the project design with City TOD planning and DPP.*
- Consult with the communities surrounding each station for input on station design elements.*
- Consider specific sites for landscaping and trees during the final design phase when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will serve to mitigate potential visual impacts.*

Section 4.8.3 of the Final EIS, Design Principles and Mitigation includes information related to the mitigation framework described above. Specifically architecture and landscape design criteria include guidelines regarding site design, materials and finishes, and lighting, which apply to stations, station areas, and the guideway.

8) The construction-related effects of the alternatives are described in Sections 3.6 and 4.18 of the Final EIS. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been identified as the Preferred Alternative as described above. Compared to the other alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly lower impacts to the natural and built environment. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. As a result, the Project will not affect Salt Lake Boulevard.

The congestion, pollution, and visual components of your conclusion have been addressed previously in this response letter. In addition, the Project will completely separate fixed guideway vehicles from roadway traffic operations, and it will provide substantially higher transit service reliability compared to the No Build Alternative. This reliability will not deteriorate over time, even with projected population and employment growth in the study corridor. The reliability of fixed guideway vehicles will be better than the reliability of transit vehicles operating on increasingly congested highways.

Regarding the recommendations in your letter:

1) There could be many other versions of the Managed Lane Alternative with minor adaptations to suit one or another special concern. In the end, the approaches all have similar challenges as a primary solution to Honolulu's transportation problems. They do not reduce congestion, increase the reliability of the transportation system, serve future land use plans, or improve the fairness of and access to the transportation system. They also do not offer an alternative to perpetuating a reliance on limited existing travel modes. For example, localized bypasses would not meet system goals for corridor-wide benefits to mobility, reliability, access, and equity. In sum, they do not address the Purpose and Need of the Project.

2) As stated in Chapter 2 of the Final EIS, prior to selecting an elevated fixed guideway system, a variety of high-capacity transit options were evaluated during the Primary Corridor Transportation Project (1998-2002) and Alternatives Analysis. Options evaluated and rejected include an exclusively at-grade fixed-guideway system using bus rapid transit vehicles. In addition to comments received during the Alternatives Analysis and EIS scoping sessions, these studies provided a critical foundation for the conclusion

that an elevated system would result in the best overall performance and better support of the Purpose and Need for the Project. In addition, the proposed Bus Rapid Transit Alternative, as stated in your letter, is a variation of the Transportation System Management Alternative that was evaluated in the Alternatives Analysis. While this alternative has merit for cost-effectiveness, its overall system benefit would be very low.

3) Localized bypasses would not meet system goals for corridor-wide benefits to mobility, reliability, access, and equity. The Hawaii Department of Transportation, which is responsible for the freeway system, has evaluated needs for the freeway system and identified the highway projects that would be most efficient at reducing congestion on Oahu. The projects, including a Nimitz Flyover, are listed in Table 2-3 of the Draft EIS and included in the analysis for all project alternatives. Effects of the Nimitz Flyover on traffic conditions in 2030 are discussed in Section 3.4.2 of the Final EIS. Travel on the Nimitz Flyover was included for the following travel pairs under the No Build Alternative: Kapolei to Downtown, Ewa to Downtown, and Mililani to Downtown. As shown in Figure 3-7 of the Final EIS, the Nimitz Flyover does improve transit travel times with the No Build Alternative between certain travel pairs (e.g., between Mililani and Downtown) compared to 2007 conditions. However, as also shown in this figure, travel times improve substantially more with the addition of the Project. As a point of clarification, a Final EIS was never prepared for the Nimitz Flyover.

Regarding Transit Alternatives Traffic Capacity:

The comments included items relating to guideway capacity. Since the Draft EIS was published, the travel demand model has been refined by adding an updated air passenger model (which forecasts travel in the corridor related to passengers arriving or departing at Honolulu International Airport), defining more realistic drive access modes (driving alone or car pooling) to project stations and recognizing a more robust off-peak non-home-based direct demand element (trips that do not originate at home) based on travel surveys in Honolulu. These revisions were made based on consultation with FTA. As stated in Chapter 3 of the Final EIS, the travel demand forecasting model predicts a maximum peak direction volume of 14,700 passengers during the a.m. two-hour peak period. As a result of updated ridership forecasts, the operating plan for the fixed guideway system has been revised and the system will have a minimum capacity of approximately 17,300 passengers per direction during the two-hour peak period. The fixed guideway system is planned to operate with two or three car trains with a capacity of between 325 and 500 passengers each. At three-minute headways during the peak period, that provides capacity for approximately 8,650 passengers per peak direction per peak hour. This capacity figure applies in both directions for a total system capacity of approximately 17,300 passengers per peak hour. The numbers presented in your comment understate the capacity of the fixed guideway by a substantial margin.

In addition, a major benefit of the fixed guideway is that once built, it is flexible enough to accommodate significant growth. For example, the full capacity of the fixed guideway with four-car trains and 90-second headways is over 25,000 passengers per hour per direction or over 50,000 in total. Accordingly, the fixed guideway system will provide sufficient capacity based on travel demand forecasting results.

Mr. Ben Ramelb
Page 7

In response to your conclusions, the Managed Lane Alternative would not eliminate congestion and bottlenecks on the H-1 Freeway. Accordingly, the Fixed Guideway Transit Alternative will have the most significant reduction on traffic volumes when compared to the other alternatives studied. With regard to conditions for commuters at guideway stations, as stated above, the fixed guideway system will have sufficient capacity based on travel demand forecasting results.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Subject: Comment on Draft Environmental Impact Statement (DEIS)
"Honolulu High-capacity transit corridor Project",

Issue : The DEIS lacks goal to eliminate or substantially reduce traffic congestion

Discussion:

DEIS Section 1.8 cites needs for Transit improvements but does not include the single and most important reason for building mass transit: To provide TRAFFIC RELIEF during peak hour. The city cit Alternative Analysis and DEIS show that rail transit, despite costing over \$6.0 billion, will not provide traffic relief. In fact, after rail is built and operating, The AA shows that the traffic overload on H-1 (capacity ~ 9,500 vehicles per hour) at Kaluaao will rise from the present 11,000 vph to 17,400 vph!

Therefore rail should NOT be considered as a candidate for Oahu mass transit because it does not accomplish the "MISSION" of mass transit. ALL other reasons for building rail transit are secondary and do NOT justify spending at least \$6.0 Billion of taxpayers dollars.

I have read the City's Alternative Analysis and UH Professor Panos Prevedouras Study "Transportation Alternative Analysis for Mitigating Traffic Congestion between Leeward Oahu and Honolulu." The HOT Lanes outlined in the Professor's study will provide a separate express highway to bypass the known traffic bottlenecks at Pearl City and at Middle Street and will reduce H-1 congestion by 35 percent. HOT will cost of less than \$900 Million (Tampa built a similar 10 mile three-lane HOT for \$320 million in 2005.

Another option is to build two Flyover bypasses around the two major H-1 bottlenecks described as follows:

Nimitz Flyover, Reversible HOV:

The Nimitz HOV Flyover is a 3-mile reversible, elevated, three-lane structure over the Nimitz Highway median from the Airport Viaduct at Keehi Lagoon to Hotel Street and Alakea St/Halekauwila St. The Flyover would be built similar to the Tampa Elevated three-lane Reversible HOV as described in-

<http://www.tollroadsnews.com/node/172> .

One of the three lanes would exit the Flyover at Waikamilo Rd. to provide access to job centers in Kalihi, resulting in the Flyover having only two lanes entering downtown. The downtown terminal connections from the Nimitz HOV Flyover include an elevated busway from Iwilei to

Hotel Street and a single lane underpass to both Alakea St/Halekaiwila Streets. These connections are described in a Managed Lane Study "Transportation Alternatives Analysis for Mitigating Traffic congestion between Leeward Oahu and Honolulu". The full report is available at www.eng.hawaii.edu/~panos/UHCS.pdf.

The initial 2005 cost for the 10 mile Tampa Reversible was \$320 million or \$32 Million per highway mile, however, a geotechnical design error increased the cost to \$420 million or \$42 million per mile. Using a geographic and escalation factor of 100 percent, the 3-mile Nimitz HOV Flyover at \$60 to \$80 million per mile would cost \$180 million to \$240 million.

The "Nimitz Flyover" has an approved Final Environmental Impact Statement which allows for early construction.

Kamehameha Flyover, Reversible HOV:

The Kamehameha HOV Flyover is a 4-mile reversible, elevated, three-lane structure over the median of Kamehameha Highway from the H-1/H-2 merge at the Waiawa Interchange to the Airport Viaduct just diamond head of the Aloha Stadium. The Flyover should be built similar to the Tampa Elevated three-lane Reversible HOV as described in- <http://www.tollroadsnews.com/node/172>.

The Kamehameha Flyover should be connected to H-1, H-2, Kamehameha Highway and Farrington Highway at the west end and to the Airport Viaduct at the east end. These connections are described in a Managed Lane Study "Transportation Alternatives Analysis for Mitigating Traffic congestion between Leeward Oahu and Honolulu". The full report is available at www.eng.hawaii.edu/~panos/UHCS.pdf.

The initial 2005 cost for the 10 mile Tampa Reversible was \$320 million or \$32 Million per highway mile, however, a geotechnical design error increased the cost to \$420 million or \$42 million per mile. Using a geographic and escalation factor of 100 percent, the 4-mile Kamehameha HOV Flyover at \$60 to \$80 million per mile would cost between \$240 million to \$320 million.

The Draft Environmental Impact Statement (DEIS) - Honolulu High-Capacity Transit Corridor Project Nov 2008, shows the rail route over Kamehameha Highway between Pearl City and Aloha Stadium which could conflict with the proposed three-lane "Kamehameha Flyover" route outlined above. If the rail is built, it is suggested that both the Kamehameha Highway "Flyover" and the Rail be built within the elevated Kamehameha Highway corridor. In this case, only a two-lane "Kamehameha Flyover" is needed (instead of three-lanes) to be built alongside and parallel to the Rail transit. The rail with a capacity of 6,000 commuters per hour and the two-lane "Kamehameha Flyover", with a capacity of 4,000 vehicles per hour, should be adequate to substantially reduce the bottleneck at the H-1/H-2 merge and the traffic congestion on H-1 between Pearl City and Aloha Stadium.

Conclusion:

The Kamehameha and Nimitz Flyovers are cost effective alternatives for mass transit.

Recommendation:

Include the Kamehameha Flyover and Nimitz Flyover Alternatives for

mass transit consideration in the DEIS.

Dear Mr. Ramelb:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address your comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal dated December 29, 2008, with subject [Comment on Draft Environmental Impact Statement (DEIS) "Honolulu High-capacity transit corridor Project"]:

Project goals and objectives are discussed in Section 1.8 of the Final EIS. Section 1.8.1 in the Final EIS states that transit improvements are needed to "improve corridor mobility." This section explains that, "Currently, motorists traveling from West Oahu to Downtown experience highly congested traffic during the a.m. peak period. By 2030, after including all the planned roadway improvements in the ORTP, the level of congestion and travel time are projected to increase further.... Expansion of the roadway system between Kapolei and UH Manoa is constrained by physical barriers and by dense urban neighborhoods that abut many existing roadways. Given current and increasing levels of congestion, an alternative method of travel is needed within the study corridor independent of current and projected highway congestion."

As shown in Table 6-1 of the Final EIS, the Project will cost \$4.6 billion in 2009 dollars and \$5.5 billion in inflated dollars, including finance charges.

Traffic volumes in 2030 under any alternative will be higher than those observed under current conditions. Table 3-12 in the Alternative Analysis shows that there will be 18,049 vehicles per hour (vph) operating on the H-1 Freeway in 2030 under No Build conditions.

Vehicle volumes rise to 18,327 vph (Two-direction Option) or 18,419 vph (Reversible Option) with the Managed Lane Alternative. However, traffic volumes decrease to 17,209 vph with the 20-mile Fixed Guideway Transit Alternative. Accordingly, the Fixed Guideway Transit Alternative will have the most significant reduction on traffic volumes when compared to any other alternative studied.

Chapter 3 of the Final EIS shows that the Fixed Guideway Transit Alternative will reduce by 18 percent the vehicle hours of delay that would occur if the guideway were not built. It does reduce congestion in 2030 compared to what would happen if only the highway projects identified in the OahuMPO Regional Transportation Plan and presented in Table 2-4 of the Final EIS were constructed.

The analysis of the Managed Lane Alternative in Honolulu from the Alternatives Analysis Report (DTS 2006b) shows the cost to be \$2.6 billion in 2006 dollars (higher today) for a 16-mile facility. As stated in the City Council's Transit Advisory Task Force Report, a committee was charged with reviewing cost estimates for the two alternatives involving construction (the Managed Lane Alternative and Fixed Guideway Alternative). The report states that "the Task Force agrees with this committee that the Alternatives Analysis' construction cost estimates were fairly and consistently prepared, and that they may be used for both planning and cost comparisons." Information was obtained by the Task Force from the Hawaii Department of Transportation and others familiar with managed lane facilities. It is the only estimate to date that addresses Honolulu conditions. A Managed Lane Alternative would not eliminate congestion and bottlenecks on the H-1 Freeway. See the discussion above regarding information in Table 3-12 of the Alternatives Analysis.

There is no substantiation of the estimate from the Tampa Bay toll facility being applicable in Honolulu. The designer of the Tampa Bay facility herself admitted that to apply such an estimate without detailed consideration of the many differences between the two locations is not reasonable. For clarification, the Tampa Bay elevated toll lanes extend only 5.8 miles within the 10-mile expressway. The costs quoted are from 2002, long before the costs of materials and construction rose dramatically after 2004. Furthermore, the corridor within which the Tampa Bay lanes are built required no right-of-way, had no significant utility conflicts, no major structures or crossings, and was built in much more favorable geotechnical conditions than exist on Oahu. In addition, the Transit Task Force Report dated December 14, 2006, states that "the committee concluded that the projects are sufficiently different (actual costs versus projected costs with contingencies; available, accessible ROW vs. construction in actively used highways; no utilities relocation vs. extensive relocations) as to make the comparison unreasonable." The \$900 million for the facility in Honolulu was calculated without the benefit of a full understanding of the circumstances, according to Linda Figg, the person who made the estimate. The more accurate estimate included in the Alternatives Analysis for a 16-

Mr. Ben Ramelb
Page 3

mile facility was \$2.6 billion and has been vetted by HDOT and other experts familiar with Honolulu.

Localized bypasses would not meet system goals for corridor-wide benefits to mobility, reliability, access, and equity. The Hawaii Department of Transportation, which is responsible for the freeway system, has evaluated needs for the freeway system and identified the highway projects that would be most efficient at reducing congestion on Oahu. The projects, including a Nimitz Flyover, are listed in Table 2-3 of the Draft EIS and included in the analysis for all project alternatives. Effects of the Nimitz Flyover on traffic conditions in 2030 are discussed in Section 3.4.2 of the Final EIS. Travel on the Nimitz Flyover was included for the following travel pairs under the No Build Alternative: Kapolei to Downtown, Ewa to Downtown, and Mililani to Downtown. As shown in Figure 3-7 of the Final EIS, the Nimitz Flyover does improve transit travel times with the No Build Alternative between certain travel pairs (e.g., between Mililani and Downtown) compared to 2007 conditions. However, as also shown in this figure, travel times improve substantially more with the addition of the Project. As a point of clarification, a Final EIS was never prepared for the Nimitz Flyover.

Chapter 3 of the Final EIS shows that the relief provided by the fixed guideway is substantially better than from building the highway improvements in the OahuMPO Regional Transportation Plan only. Any increase in traffic on the H-1 Freeway would be worse in the absence of the fixed guideway. The fixed guideway reduces delay compared to a road-only option. The assumptions on which the analysis is based include projects such as the Nimitz Flyover, the widenings proposed for the H-1 Freeway, and others.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Subject: Comment on Draft Environmental Impact Statement (DEIS)
"Honolulu High-capacity transit corridor Project", Issue : DEIS does not
include Managed Lane alternative as stated in the Notice of Intent (NOI)

Fact:
DEIS Table 3-20 provides existing traffic volumes but does not provide
forecasted volumes with resultant Level of Service (LOS) for each
specific highway.

NEPA violation: The DEIS lacks the Managed Lane Alternative (MLA)
as stated in the Notice of Intent (NOI) dated 7 Dec 2007 (reference (a)),
which states:

"The Federal Transit Administration (FTA) and the City and County of
Honolulu, Department of Transportation Services (DTS) intend to
prepare an EIS (and Alternative Analysis (AA)) on a proposal by the City
and County of Honolulu to implement transit improvements that
potentially include high-capacity transit service in a 25-mile travel
corridor between Kapolei and the University of Hawaii at Manoa and
Waikiki. Alternatives proposed to be considered in the AA and draft EIS
include No Build, Transportation System Management, Managed Lanes,
and Fixed Guideway Transit. Other transit alternatives may be identified
during the scoping process."

Rationale: The process used by the City & County of Honolulu (City) for
assessing the Managed Lane Alternative (MLA) in the City's Alternatives
Analysis (AA) was flawed.

a) A similar length Managed Lane, reversible three-lane transit way was
built for \$320 million in Tampa in year 2005, while the City AA estimated
the similar MLA to cost \$2.6 Billion.

b) Professor Panos Prevedouros published a study for Managed Lanes
(reversible) in March 2008, "Transportation Alternatives Analysis for
Mitigating Traffic Congestion between Leeward Oahu and Honolulu"
which shows the 11 mile three-lane cost estimate to be \$900 million
which is in line with the \$320 million Tampa three-lane reversible
transitway. The professor believes the Plan's costs are accurate based
on cost estimate spreadsheet analysis received from a local heavy
construction estimation expert is \$818,634,000 in 2008 dollars. Again,
this estimate is more in line with the Tampa Transit way estimate and
refutes the AA estimate of \$2.6 Billion. The AA estimate disqualified the
Managed Lane Alternative to be inferior to the Rail Alternative which

cost \$3.7 Billion.

c) 2008 Mayoral Candidate Ann Kobayashi, using the Professor's 4 year Managed Lane study and the former Mayor Harris Administration BRT Study, proposed a similar Managed Lane 15-mile fixed guideway which is estimated at \$1.2 Billion. The estimate is similar to the 11 mile Managed Lane and which should have been used in the AA rather than \$2.6 Billion.

d) Parsons Brinkerhoff (PB) and the City proposed that automobiles with two or more occupants should be allowed toll free on the MLA. This made the current contraflow zipper lane untenable and thus provided the rationale for removing it. The net result was that the additional two lane advantage that the MLA offered to the Corridor was reduced to one lane. They failed to publish their assessment of the option of having all autos pay a toll, which would have resulted in the zipper lane and the two-lane advantage being retained. And they failed to analyze MLA options with higher occupancy thresholds, such as three through five occupants.

e) PB and the City added unnecessary costs to the project by proposing a 16-mile facility while not testing the viability of shorter 10 to 12-mile versions.

f) PB and the City inflated MLA operating costs to make the project appear uncompetitive with the Fixed Guideway Alternative. Just two examples are a) the projection of a totally unnecessary 5,400 parking stalls for the MLA, and b) saddling the MLA with inflated bus operating costs.

g) PB and the City engineered the ingress and egress ramps in a way that could only result in heavy traffic congestion at these points. In fact, the MLA has exit/off ramps along its route for access to job centers other than downtown Honolulu.

h) PB and the City grossly inflated the capital costs of the MLA with the result that, if correct, it would be twice the cost per lane mile of any highway ever built in the U.S. In his letter to the City and copied to FTA, Dr. Panos Prevedourous, Professor of Traffic Engineering at the University of Hawaii, Chair of the Transportation Research Board's Highway Micro-simulations Committee and a member of the Task Force, commented, "the most egregious violation of FTA's rules on alternative specification and analysis was the deliberate underengineering of the Managed Lanes Alternative to a degree that brings ridicule to prevailing planning and engineering principles."

i) The 11 mile, elevated MLA, with three lanes as proposed by Professor Prevedouros, has the future commuter capacity to eliminate the two H-1 bottlenecks at Pearl City and at Middle Street merge. The Rail, according to the AA, table 3-12, will result in 17,500 vehicles per hour on H-1 (H-1 full capacity = 9,500 vph) because the Rail cannot accommodate the full commuter demand in year 2030.

Conclusion: The City's AA wrongly estimated the cost of the Managed Lane alternative and the MLA capacity to eliminate the H-1 bottlenecks on H-1.

Recommendation: It is requested that the Managed Lane Alternative as proposed by Ann Kobayashi's EzWay proposal or the Professor Prevedouros Managed Lane Study be reinstated into the Honolulu's Transit Corridor Draft Environmental Impact Statement

Dear Mr. Rameib:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal dated December 29, 2008 with subject [Comment on Draft Environmental Impact Statement (DEIS) "Honolulu High-capacity transit corridor Project", Issue: DEIS does not include Managed Lane alternative as stated in the Notice of Intent (NOI)]:

The Notice of Intent for the EIS was dated March 15, 2007, and reads: "Alternatives proposed to be considered in the Draft EIS include a No Build and two Fixed Guideway Transit Alternatives."

Table 3-20 in the Draft EIS provides forecasted (2030) traffic volumes for the No Build and Salt Lake Alternatives. This table was updated in the Final EIS to include traffic volumes on individual roadway facilities, maximum volume thresholds, number of lanes, and level-of-service on each roadway and at each screenline for the No Build and Airport Alternative (Tables 3-9 and 3-10). Numbers have been updated for the Final EIS based on the Airport Alternative and refinements to the travel demand forecasting model to account for non-home based direct-demand trips during off-peak periods (trips that do not originate or end at home). In addition, the air passenger model (which forecasts travel in the corridor related to passengers arriving or departing at Honolulu International Airport) was updated to reflect current conditions. These

revisions were made based on FTA direction. The updated results continue to show that traffic, when compared to No Build conditions, will decrease with the addition of the Project.

a) There is no substantiation of the estimate from the Tampa Bay toll facility being applicable in Honolulu. The designer of the Tampa Bay facility herself admitted that to apply such an estimate without detailed consideration of the many differences between the two locations is not reasonable. For clarification, the Tampa Bay elevated toll lanes extend only 5.8 miles within the 10-mile expressway. The costs quoted are from 2002, long before the costs of materials and construction rose dramatically after 2004. Furthermore, the corridor within which the Tampa Bay lanes are built required no right-of-way, had no significant utility conflicts, no major structures or crossings, and was built in much more favorable geotechnical conditions than exist on Oahu. In addition, the Transit Task Force Report dated December 14, 2006, states that "the committee concluded that the projects are sufficiently different (actual costs versus projected costs with contingencies; available, accessible ROW vs. construction in actively used highways; no utilities relocation vs. extensive relocations) as to make the comparison unreasonable."

b) The Managed Lane Alternative was fully evaluated in the Alternatives Analysis. The analysis of the Managed Lane Alternative in Honolulu from the Alternatives Analysis Report (DTS 2006b) shows the cost to be \$2.6 billion in 2006 dollars (higher today) for a 16-mile facility. As stated in the City Council's Transit Advisory Task Force Report, a committee was charged with reviewing cost estimates for the two alternatives involving construction (the Managed Lane Alternative and Fixed Guideway Alternative). The report states that "the Task Force agrees with this committee that the Alternatives Analysis' construction cost estimates were fairly and consistently prepared, and that they may be used for both planning and cost comparisons." Information was obtained by the Task Force from the Hawaii Department of Transportation and others familiar with managed lane facilities. It is the only estimate to date that addresses Honolulu conditions.

c) Ann Kobayashi's proposed EzWay is similar to the Managed Lane Alternative that was thoroughly evaluated in the Alternatives Analysis, which also accommodated both single occupant and transit vehicles. No known cost estimate for the proposal has been prepared or checked by a qualified registered Professional Engineer. As a point of reference, Hawaii's Highway Modernization Plan dated January 22, 2009, estimates the cost of the Nimitz Viaduct at \$600 million for an approximately 2.5-mile elevated highway.

d) As discussed in the Chapter 5, Alternative 3b of the Detailed Definition of Alternatives Report (2006), the reversible lane Managed Lane Alternative provides three managed/HOV lanes in the peak direction, which is sufficient to satisfy the demand for restricted lanes. Eliminating the zipper lane frees up two off-peak direction lanes – one HOV and one general purpose lane. By 2030, the directional transportation demand will be more balanced than it is today. Eliminating the zipper lane while evaluating the Reversible Option for the Managed Lane Alternative provided the greatest benefit to modeled freeway users by increasing capacity in both directions. The system was optimized to balance demand without regard to toll policy. As stated in the Alternatives Analysis, for the Reversible Option, three-person high-occupancy vehicles (HOVs) would

be allowed to use the facility for free while single-occupant and two-person HOVs would have to pay a toll.

e) A shorter system would have resulted in proportionately less benefit. The full system evaluated already would provide substantially less benefit than the Fixed Guideway Alternative. Shortening of the Managed Lane Alternative, whether to 14 miles, 12 miles, or 2 miles, would not have increased the benefits to the traveling public compared to the alternative evaluated.

f) The operating and maintenance costs for all alternatives addressed in the Alternatives Analysis Report, including the Managed Lane Alternative, were estimated in a consistent manner, as described on pages 5-3 and 5-4 of the Alternatives Analysis Report. The supply of park-and-ride stalls assumed for the Managed Lane Alternative was sized to meet forecast demand. The number of parking spaces was reflected in the capital costs of the Managed Lane Alternative, not in the operating and maintenance costs. One purpose of the Project is to improve benefits to transit users. With the Managed Lane Alternative, those benefits could only be provided through improvements to the bus system.

g) The Managed Lane Alternative evaluated in the Alternatives Analysis was designed by experts in such facilities. Access ramps were placed at locations that required direct access to the managed lanes because demand was high. Because of engineering requirements, access ramps require substantial rights-of-way and, as a result, are very costly. More ramps could be added, but it would make the project more expensive and reduce the point-to-point functionality of the system.

h) Please see the answers above to points a. and b.

i) The Managed Lane Alternative would not eliminate congestion and bottlenecks on the H-1 Freeway. Table 3-12 in the Alternative Analysis Report shows that there would be 18,049 vehicles per hour (vph) operating on the H-1 Freeway in 2030 under the No Build Alternative. Vehicle volumes rise to 18,327 vph (Two-direction Option) or 18,419 vph (Reversible Option) with the Managed Lane Alternative, while traffic volumes decrease to 17,209 vph with the 20-mile Fixed Guideway Transit Alternative. Accordingly, the Fixed Guideway Transit Alternative will reduce traffic volumes from those projected under the 2030 No Build Alternative.

As stated in Chapter 3 of the Final EIS, the travel demand forecasting model predicts a maximum peak direction volume of 14,700 passengers during the a.m. two-hour peak period. As a result of updated ridership forecasts, the operating plan for the fixed guideway system has been revised and the system will have a minimum capacity of approximately 17,300 passengers per direction during the two-hour peak period. The fixed guideway system is planned to operate with two or three car trains with a capacity of between 325 and 500 passengers each. At three-minute headways during the peak period, that provides capacity for approximately 8,650 passengers per peak direction per peak hour. This capacity figure applies in both directions for a total system capacity of approximately 17,300 passengers per peak hour.

In addition, a major benefit of the fixed guideway is that once built, it is flexible enough to accommodate significant growth. For example, the full capacity of the fixed guideway with four-car trains and 90-second headways is over 25,000 passengers per hour per direction, or over 50,000 in total. Accordingly, the fixed guideway system will provide sufficient capacity based on travel demand forecasting results.

There could be many other versions of this type of system with minor adaptations to suit one or another special concern. In the end, the above approaches all have similar challenges as a primary solution to Honolulu's transportation problems. They do not reduce congestion, increase the reliability of the transportation system, serve future land use plans, or improve the fairness of and access to the transportation system. While the Managed Lane Alternative would reduce freeway congestion (measured as vehicle hours of delay), it would increase overall system congestion by inducing additional travelers to drive, which would result in increased congestion on arterial and collector facilities accessing the freeways and the managed lane. In addition, once a vehicle leaves the managed lane, that vehicle is still subjected to congestion on surrounding roadways. They also do not offer an alternative to perpetuating a reliance on limited existing travel modes. For example, localized bypasses would not meet system goals for corridor-wide benefits to mobility, reliability, access, and equity. In sum, they do not address the Purpose and Need of the Project.

To address your conclusion and recommendation, the Managed Lane Alternative as proposed by Ann Kobayashi and Professor Prevedourous were evaluated and subsequently eliminated from further consideration. Their proposal is similar to the Managed Lane Alternative that was thoroughly evaluated in the Alternatives Analysis, which also accommodated both single occupant and transit vehicles. As stated previously, there could be many other versions of this type of system with minor adaptations to suit one or another special concern. In the end, the above approaches all have similar challenges as a primary solution to Honolulu's transportation problems. Please see points a. and b. above regarding cost estimates for the Managed Lane Alternative.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Subject: Comment on Draft Environmental Impact Statement (DEIS) "Honolulu High-capacity transit corridor Project"; Issue : The purpose and needs statement of the project in the DEIS is flawed because it does not comply with the Notice of Intent (NOI) dated 7 Nov 2005.

Discussion: DEIS page 1-19 states " The purpose of the Honolulu High Capacity transit Corridor Project is to provide high capacity rapid transit in the highly congested east-west transportation corridor between Kapolei and UH Manoa."

The NOI states that the Federal Transit Administration (FTA) and the City and County of Honolulu, Department of Transportation Services (DTS) intend to prepare an EIS (and Alternative Analysis (AA)) on a proposal by the City and County of Honolulu to implement transit improvements that potentially include high-capacity transit service in a 25-mile travel corridor between Kapolei and the University of Hawaii at Manoa and Waikiki.

The DEIS does not comply with the purpose because the DEIS does not include a route assessment to Waikiki and to UH Manoa.

Conclusion: The purpose and needs statement of the project in the DEIS is flawed because the DEIS does not include a route assessment to Waikiki and to UH Manoa consistent with Notice of Intent (NOI) dated 7 Nov 2005.

Recommendation: Include an environmental impact statement for the full route to include all environmental impacts from Kaeleloa to UH Manoa, to Ala Moana Shopping Center and to Waikiki.

Dear Mr. Ramelb:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal dated December 29, 2008 with subject [Comment on Draft Environmental Impact Statement (DEIS) "Honolulu High-capacity transit corridor Project", Issue: The purpose and needs statement of the project in the DEIS is flawed because it does not comply with the Notice of Intent (NOI) dated 7 Nov 2005]:

The December 2005 Notice of Intent was superseded by the March 2007 Notice of Intent for preparation of the NEPA EIS. The March 2007 Notice of Intent states: "Both alignment alternatives would have a future extension from Downtown Honolulu to UH Manoa with a future branch to Waikiki, and a future extension at the Waianae (western) end to Kalaeloa Boulevard in Kapolei." While the fixed guideway system directly connects East Kapolei to Ala Moana Center, the remainder of the study corridor is served by buses integrated with the system.

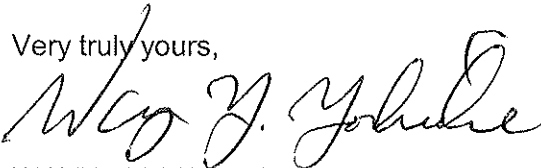

The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The future extensions to West

Mr. Ben Ramelb
Page 2

the City and FTA. If the future extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time.

The December 2005 Notice of Intent was superseded by the March 2007 Notice of Intent for preparation of the NEPA EIS. The March 2007 Notice of Intent states: "Both alignment alternatives would have a future extension from Downtown Honolulu to UH Manoa with a future branch to Waikiki, and a future extension at the Waianae (western) end to Kalaeloa Boulevard in Kapolei." No Notice of Intent for the Project was issued in 2006. While the fixed guideway system directly connects East Kapolei to Ala Moana Center, the remainder of the study corridor is served by buses integrated with the system. Future extensions would be subject to a complete environmental review at the time they are proposed.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Subject: Comment on Draft Environmental Impact Statement (DEIS)
"Honolulu High-capacity transit corridor Project", Issue : Rail will worsen
net transit transportation in West Oahu Corridor despite fact that Rail
will cost over \$6 Billion

Fact: The 7 December 2005 Notice of Intent states "The Federal
Transit Administration (FTA) and the City and County of Honolulu,
Department of Transportation Services (DTS) intend to prepare an EIS
(and Alternative Analysis (AA)) on a proposal by the City and County of
Honolulu to implement transit improvements that potentially include high-
capacity transit service in a 25-mile travel corridor between Kapolei and
the University of Hawaii at Manoa.

Discussion:

1) The City Alternative Analysis , Table 3-12, shows that there will still
be 17,500 vehicles per hour in 2030 on the H-1 (full rated capacity =
9,500 vehicles per hour) at Pearl City AFTER the \$7.0 Billion Rail is built
and operating.

2) The DEIS Screenline Volumes for the 2030 Salt Lake Build
Alternative is shown on Table 3-20, page 3-38.

a) With the Salt Lake Build Alternative AT Screen line "D":
- Kalauao Koko Head bound : Observed (forecast) Volume - AM Peak =
18,910 vehicles per hour (vph)) - Reference: DEIS Table 3-20.
- Facility 2030 Capacity - AM Peak = 14, 650 vph - Reference: Table 3-
12 Alternative Analysis.

Result: There will be 4,260 vph above the facility (H-
1+HOV+Zipper+Kam+ Moanalua) capacity at Kalauao which indicates a
Level of Service (LOS) F AFTER the Salt Lake Rail is built. This
conclusion is consistent with the conclusion using the numbers from the
City's Alternative analysis report. With rail, the above numbers show
congestion will WORSEN after the \$7.0 Billion Full build out Rail is
completed.

b) With the Salt Lake Build Alternative AT Screen line "F":
- Kapalama Canal Koko Head bound : Observed (forecast) Volume -
AM Peak = 20,760 vehicles per hour (vph)) - Reference: Table 3-20.
- Facility 2030 Capacity - AM Peak = 15,300 vph - Reference: Table 3-
12 Alternative Analysis

Result: The traffic volume will be 5,460 vph above the facility (Nimitz, Dillingham, North King, H-1, School St) capacity at Kapalama Canal which indicates a Level of Service (LOS) F AFTER the Salt Lake rail is built. This conclusion is consistent with the conclusion using the numbers from the City's Alternative analysis report. With rail, the above numbers show congestion will WORSE after the \$6.0 Billion Full build out Rail is completed.

Conclusion: The AA and DEIS fail in showing that Rail is a cost effective transit improvement because traffic congestion on H-1 will worsen from the current 11,000 vph to 17,500 vph in year 2030 (Alternative Analysis Table 3-12) despite building the \$6.0 Billion Rail.

Recommendation: Delete Rail transit because it fails to provide "transit improvements" and instead results in worse traffic congestion on H-1 after the \$6.0 Billion rail is built and operating. Consider other cost effective solutions to eliminate traffic congestion on H-1.

Respectfully,

Ben Ramelb P.E.

Dear Mr. Ramelb:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal dated December 29, 2008 with subject [Comment on Draft Environmental Impact Statement (DEIS) "Honolulu High-capacity transit corridor Project", Issue : Rail will worsen net transit transportation in West Oahu Corridor despite fact that Rail will cost over \$6 Billion.

Conditions on the H-1 Freeway will be worse in 2030 under any circumstance and regardless of whether the fixed guideway, managed lane, or more buses are implemented. The Alternatives Analysis stated this. However, these conditions will be even worse if the rail system is not built. As shown in the Alternatives Analysis Report (DTS 2006b), the Managed Lane Alternative would not eliminate congestion and bottlenecks on the H-1 Freeway. Table 3-12 in the Alternative Analysis Report shows that, under the No Build Alternative, there would be 18,049 vehicles per hour (vph) operating on the H-1 Freeway in 2030. Vehicle volumes rise to 18,327 vph (Two-direction Option) or 18,419 vph (Reversible Option) with the Managed Lane Alternative, while traffic volumes decrease to 17,209 vph with the 20-mile Fixed Guideway Transit Alternative. Accordingly, the Fixed Guideway Transit Alternative will reduce traffic volumes from those projected under the 2030 No Build Alternative.

Mr. Ben Ramelb
Page 2

As shown in Table 6-1 of the Final EIS, the Project will cost \$4.6 billion in 2009 dollars and \$5.5 billion in inflated dollars, including finance charges.

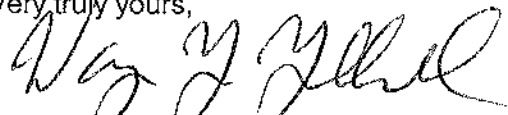

Table 3-20 in the Draft EIS shows 20,800 vehicles per hour (vph) at the Kalauao screenline (virtual lines across the corridor used to measure total travel at that point) in the Koko Head-bound direction during the a.m. peak hour with the No Build Alternative. This number decreases 9 percent with the addition of the Salt Lake Alternative to 18,910 vph. Numbers have been updated for the Final EIS based on the Airport Alternative and refinements to the travel demand forecasting model to account for non-home-based direct-demand trips during off-peak periods. In addition, the air passenger model was updated to reflect current conditions. These revisions were made based on FTA direction. The updated results continue to show that traffic will decrease with the addition of the Project. Tables 3-9 and 3-10 in the Final EIS shows an 11 percent decrease in vph at this screenline during the a.m. peak hour in the Koko Head-bound direction and a 10 percent reduction during the p.m. peak hour in the Ewa-bound direction. This demonstrates that the fixed guideway system will decrease traffic congestion at this location.

Similar results were found at the Kapalama screenline. As shown in Tables 3-9 and 3-10 in the Final EIS, the Project will reduce vph at this screenline by 9 percent during the a.m. peak hour in the Koko Head-bound direction and by 5 percent during the p.m. peak hour in the Ewa-bound direction. Traffic will improve on the H-1 Freeway at this screenline in both directions during the a.m. and p.m. peak hour.

As stated above, the Final EIS shows that traffic volumes on the H-1 Freeway at the Kalauao and Kapalama screenlines will decrease with the addition of the fixed guideway system (Tables 3-9 and 3-10 in the Final EIS). Lastly, as shown in Table 6-1 of the Final EIS, the Project will cost \$4.6 billion in 2009 dollars and \$5.5 billion in inflated dollars, including finance charges.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

650 South King St. 3rd Floor
Honolulu
HI 96813
FAX: (808) 587-6080

Subject: Comment on Draft Environmental Impact Statement (DEIS)
"Honolulu High-capacity transit corridor Project", Issue : False and
misleading DEIS statement on "Improve Corridor Mobility".

Fact:
Para. 1.8, pg. 1-20 states that transit improvements are needed to
improve corridor mobility "because motorists and transit users
experience substantial traffic congestion and delay at most times of the
day.....Average speeds on the H-1 Freeway are currently less than 20
mph..... and will degrade even further by 2030."

Discussion:
The 2006 Alternative Analysis and DEIS propose Rail transit be built
which will worsen traffic congestion on H-1 after the Rail is built. The
City Alternative Analysis, Table 3-12, shows that there will still be
17,500 vehicles per hour in 2030 on the H-1 (full rated capacity = 9,500
vehicles per hour) at Pearl City AFTER the \$7.0 Billion Rail is built and
operating.

The DEIS Screenline Volumes for the 2030 Salt Lake Build Alternative
Table 3-20, shows that with the Salt Lake Build Alternative AT Screen
line "D" :

- Kalauao Koko Head bound : Observed (forecast) Volume - AM Peak =
18,910 vehicles per hour (vph).
- Facility 2030 Capacity - AM Peak = 14, 650 vph - Reference: Table 3-
12 Alternative Analysis.

Result: There will be 4,260 vph above the facility (H-1 + HOV + Zipper +
Kam+ Moanalua) capacity at Kalauao which indicates a Level of Service
(LOS) F AFTER the Salt Lake Rail is built. This conclusion is consistent
with the conclusion using the numbers from the City's Alternative
analysis report. With rail, the above numbers show congestion will
WORSEN after the \$7.0 Billion Full build out Rail is completed.

The \$7.0 Billion Steel wheel on steel rail transit system is NOT a cost
effective means of providing improved mobility. A fully-elevated, steel-
wheel rail transit system can move only 6,000 commuters (4000
standees, 2000 seated) per hour during peak travel periods while the
2030 commuter demand for RAIL will reach 15,600 commuters per hour,
according to Table 3-12 of the Alternative Analysis. Similarly, Table 3-
20 of the DEIS shows traffic overload on H-1 during peak travel periods.

Conclusion: The \$7.0 Billion Steel Rail is not cost effective to substantially reduce or eliminate the bottlenecks on H-1 and will REDUCE MOBILITY which is contrary to the goal of the DEIS.

Recommendation: Reject the Steel Wheel on Steel Rail transit system and select other more cost effective transit systems which will improve mobility. Cost effective transit systems which will have the capacity to eliminate H-1 congestion include Managed Lane Alternative, BRT, EzWay or two highway bypasses around the H-1 bottlenecks at Pearl City and at Middle Street merge.

Mr. Ben Ramelb
1148 Ala Liliiko'i Street
Honolulu, Hawaii 96818

Dear Mr. Ramelb:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal dated December 29, 2008 with subject [Comment on Draft Environmental Impact Statement (DEIS) "Honolulu High-capacity transit corridor Project", Issue: False and misleading DEIS statement on "Improve Corridor Mobility"]:

Conditions on the H-1 Freeway will be worse in 2030 under any circumstance and regardless of whether the fixed guideway, managed lane, or more buses are implemented. The Alternatives Analysis stated this. However, these conditions will be even worse if the rail system is not built. As shown in the Alternatives Analysis Report (DTS 2006b), the Managed Lane Alternative would not eliminate congestion and bottlenecks on the H-1 Freeway. Table 3-12 in the Alternative Analysis Report shows that, under the No Build Alternative, there would be 18,049 vehicles per hour (vph) operating on the H-1 Freeway in 2030. Vehicle volumes rise to 18,327 vph (Two-direction Option) or 18,419 vph (Reversible Option) with the Managed Lane Alternative, while traffic volumes decrease to 17,209 vph with the 20-mile Fixed Guideway

Transit Alternative. Accordingly, the Fixed Guideway Transit Alternative will reduce traffic volumes from those projected under the 2030 No Build Alternative.

As shown in Table 6-1 of the Final EIS, the Project will cost \$4.6 billion in 2009 dollars and \$5.5 billion in inflated dollars, including finance charges.

Table 3-20 in the Draft EIS shows 20,800 vehicles per hour (vph) at the Kalauao screenline (virtual lines across the corridor used to measure total travel at that point) in the Koko Head-bound direction during the a.m. peak hour with the No Build Alternative. This number decreases 9 percent with the addition of the Salt Lake Alternative to 18,910 vph. Numbers have been updated for the Final EIS based on the Airport Alternative and refinements to the travel demand forecasting model to account for non-home-based direct-demand trips (trips that do not originate or end at home) during off-peak periods. In addition, the air passenger model (which forecasts travel in the corridor related to passengers arriving or departing at Honolulu International Airport) was updated to reflect current conditions. These revisions were made based on consultation with FTA. The updated results continue to show that traffic will decrease with the addition of the Project. Tables 3-9 and 3-10 in the Final EIS shows an 11 percent decrease in vph at this screenline during the a.m. peak hour in the Koko Head-bound direction and a 10 percent reduction during the p.m. peak hour in the Ewa-bound direction. This demonstrates that the fixed guideway system will decrease traffic congestion at this location.

As stated in Chapter 3 of the Final EIS, the travel demand forecasting model predicts a maximum peak direction volume of 14,700 passengers during the a.m. two-hour peak period. As a result of updated ridership forecasts, the operating plan for the fixed guideway system has been revised and the system will have a minimum capacity of approximately 17,300 passengers per direction during the two-hour peak period. The fixed guideway system is planned to operate with two- or three-car trains with a capacity of between 325 and 500 passengers each. At three-minute headways during the peak period, that provides capacity for approximately 8,650 passengers per peak direction per peak hour. This capacity figure applies in both directions for a total system capacity of approximately 17,300 passengers per peak hour. The numbers presented in your comment understate the capacity of the fixed guideway by a substantial margin.

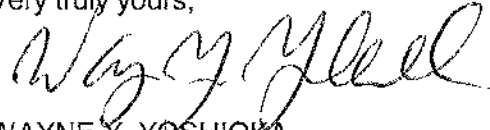

In addition, a major benefit of the fixed guideway is that once built, it is flexible enough to accommodate significant growth. For example, the full capacity of the fixed guideway with four-car trains and 90-second headways is over 25,000 passengers per hour per direction or over 50,000 in total. Accordingly, the fixed guideway system will provide sufficient capacity based on travel demand forecasting results.

As stated in Section 7.4 of the Final EIS, cost-effectiveness is one of the key criteria that FTA uses to evaluate projects proposed for Section 5309 New Starts funding. The cost-effectiveness indices for the Project compared to the baseline is within the "medium" range established by FTA for its New Starts ratings, which, along with other considerations, is currently required to qualify for New Starts funding (see Table 7-8 of the Final EIS). As shown in Table 6-1 of the Final EIS, the Project will cost \$4.6 billion in 2009 dollars and \$5.5 billion in inflated dollars, including finance charges.

Mr. Ben Ramelb

HI 96813
FAX: (808) 587-6080

Subject: Comment on Draft Environmental Impact Statement (DEIS)
"Honolulu High-capacity transit corridor Project", Issue False and misleading DEIS statement on Corridor Travel Reliability.

Fact:
Para. 1.8.2, pg. 1-20 states that "As more roadways become more congested.... because of traffic accidents or heavy rain..... a need exists to provide a more reliable transit system."

Discussion:
A fully-elevated, steel-wheel on steel rail transit system can move only 6,000 commuters (4000 standees, 2000 seated) per hour during peak travel periods while the 2030 commuter demand for RA[L will reach 15,600 commuters per hour, according to Table 3-12 of the Alternative Analysis.

Commuter demand of 15,600 commuters per hour in year 2030 is calculated thus:

City AA, Table 3-12 shows year 2030 forecast volume of 17,500 vph on H-1 (full rated capacity = 9,500 vph) with the rail built and operating. Therefore, there is an overload on H-1 Freeway of 8,000 vph = 9,600 commuters per hour that needs to get on the \$7.0 Billion Rail transit which already carries 6,000 commuters per hour.

The EzWay or Managed Lane alternatives have the capacity to accommodate the total 2030 demand. The Managed Lanes or EzWay will each have three lanes, each lane has a capacity of 2000 vph. For three lanes, the vehicular capacity is 6000 vehicles per hour. The Managed Lane Alternative person capacity is calculated thus:

Projected use of the HOT during peak hour includes:
200 express buses w/~50 pns = 10,000 pns
500 HOV5 (carpool) = 2,500 pns
500 vanpool (~5pns) = 2,500 pns.

Remaining excess capacity available for low occupancy green vehicles:
6,000 vph minus (200 + 500 + 500) = 4,800 vph. 4,800 low occupancy vehicles

Average persons per vehicle = 1.2 pns per vehicle

4,800 vehicles with 1.2 pns = 5700 pns

Summary: Managed Lane persons capacity = 10,000 + 2,500 + 2,500 + 5,700 = - 20,700 pns

Conclusion:

There will be $9,600 + 6,000 = 15,600$ commuters per hour that must get on the train during peak travel period. However, 9,600 commuters per hour will NOT be able to board the train because the train has insufficient commuter capacity during peak travel period. Therefore, the train cannot be considered a RELIABLE form of transit because it has insufficient commuter capacity.

Recommendation: Rail Transit should be eliminated as the preferred alternative because it does not meet the test of Travel Reliability. The DEIS should include cost effective transit systems which will have the capacity to eliminate H-1 congestion include Managed Lane Alternative, BRT, EzWay or two highway bypasses around the H-1 bottlenecks at Pearl City and at Middle Street merge.

Dear Mr. Ramelb:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address your comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal dated December 29, 2008 with subject [Comment on Draft Environmental Impact Statement (DEIS) "Honolulu High-capacity transit corridor Project", Issue False and misleading DEIS statement on Corridor Travel Reliability]:

Since the Draft EIS was published, the travel demand model has been refined by adding an updated air passenger model (which forecasts travel in the corridor related to passengers arriving or departing at Honolulu International Airport), defining more realistic drive access modes (driving alone or car pooling) to project stations and recognizing a more robust off-peak non-home-based direct demand element (trips that do not originate at home) based on travel surveys in Honolulu. These revisions were made in consultation with FTA. As stated in Chapter 3 of the Final EIS, the travel demand forecasting model predicts a maximum peak direction volume of 14,700 passengers during the a.m. two-hour peak period. As a result of updated ridership forecasts, the operating plan for the fixed guideway system has been revised and the system will have a minimum capacity of approximately 17,300 passengers per direction

during the two-hour peak period. The fixed guideway system is planned to operate with two or three car trains with a capacity of between 325 and 500 passengers each. At three-minute headways during the peak period, that provides capacity for approximately 8,650 passengers per peak direction per peak hour. This capacity figure applies in both directions for a total system capacity of approximately 17,300 passengers per peak hour. The numbers presented in your comment understate the capacity of the fixed guideway by a substantial margin.

In addition, a major benefit of the fixed guideway is that once built, it is flexible enough to accommodate significant growth. For example, the full capacity of the fixed guideway with four-car trains and 90-second headways is over 25,000 passengers per hour per direction or over 50,000 in total. Accordingly, the fixed guideway system will provide sufficient capacity based on travel demand forecasting results.

As stated in Chapter 2 of the Final EIS, the Managed Lane Alternative was evaluated for its ability to meet project goals and objectives related to mobility and accessibility, supporting planned growth and economic development, constructability and cost, community and environmental quality, and planning consistency. The Managed Lane Alternative would fail to meet the Project's Purpose and Need, as described in Chapter 1 of this Final EIS, because it fails to moderate anticipated traffic congestion. While this alternative would have reduced congestion on parallel highways, system-wide traffic congestion would have been similar to the No Build Alternative as a result of increased traffic on arterials trying to access the facility. Total islandwide vehicle hours of delay would have increased with the Managed Lane Alternative compared to the No Build Alternative, indicating an increase in system-wide congestion (see Table 2-2 in the Final EIS). It also would be less effective than the Fixed Guideway Alternative at providing a faster and more reliable public transportation service as well as an alternative to private automobile travel. The Managed Lane Alternative would not have supported planned concentrated future population and employment growth because it would not provide concentrations of transit service that would serve as a nucleus for transit-oriented development.

There could be many versions of an EzWay or Managed Lane system with minor adaptations to suit one or another special concern. In the end, the above approaches all have similar challenges as a primary solution to Honolulu's transportation problems. They do not reduce congestion, increase the reliability of the transportation system, serve future land use plans, or improve the fairness of and access to the transportation system. While the Managed Lane Alternative would reduce freeway congestion (measured as vehicle hours of delay), it would increase overall system congestion by inducing additional travelers to drive, which would result in increased congestion on arterial and collector facilities accessing the freeways and the managed lane. In addition, once a vehicle leaves the managed lane, that vehicle is still subjected to congestion on surrounding roadways. They also do not offer an alternative to perpetuating a reliance on limited existing travel modes. For example, localized bypasses would not meet system goals for corridor-wide benefits to mobility, reliability, access, and equity. In sum, they do not address the Purpose and Need of the Project.

After the Alternatives Analysis was completed, several scoping comments were received requesting reconsideration of the Managed Lane Alternative that was considered and rejected during the Alternatives Analysis. Because no new information was provided that would have

Mr. Ben Ramelb
Page 3

changed the findings of the Alternatives Analysis regarding the Managed Lane Alternative, it was not included in the Draft EIS for further consideration.

In response to your conclusion, the fixed guideway system will have sufficient capacity to meet demand, as stated previously. In addition, as stated in Chapter 3 of the Final EIS, the fixed guideway system will be reliable because it will operate in an exclusive right-of-way. This reliability would not deteriorate over time, even with projected population growth and resulting added traffic volumes in the study corridor.

As stated in Section 7.4 of the Final EIS, cost-effectiveness is one of the key criteria that FTA uses to evaluate projects proposed for Section 5309 New Starts funding. The cost-effectiveness indices for the Project compared to the baseline is within the "medium" range established by FTA for its New Starts ratings, which, along with other considerations, is currently required to qualify for New Starts funding (see Table 7-8 in the Final EIS). As shown in Table 6-1 of the Final EIS, the Project will cost \$4.6 billion in 2009 dollars and \$5.5 billion in inflated dollars, including finance charges.

Scoping for the EIS followed the FTA process that provides for a culling of alternatives studied in the EIS through an Alternatives Analysis. The scoping process initiated for the Alternatives Analysis included a variety of highway, bus and fixed guideway options for consideration. During the later scoping effort for the EIS, the public was requested to propose alternatives that would satisfy the purpose and need at less cost or with greater effectiveness, less environmental or community impact and to propose alternatives that were not previously studied and eliminated for good cause. The only alternative that emerged that met these criteria was a fixed-guideway alternative following several alternative alignments. All reasonable alternatives that emerged from these processes were ultimately evaluated in the Draft and Final EISs.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

FAX: (808) 587-6080

Subject: Comment on Draft Environmental Impact Statement (DEIS)
"Honolulu High-capacity transit corridor Project", Issue : DEIS
incorrectly compares rail alternatives with No-Build Alternatives.

Discussion:

DEIS pg. 4-1 states "In this document, the No Build Alternative serves as an environmental baseline to which the impacts of other alternatives are compared."

The DEIS contains only rail alternatives and a "No-build" alternative which wrongfully draws conclusions detrimental to the environment. There are other low-cost alternatives considered superior in providing traffic relief and cost which were wrongfully deleted or not included in the DEIS and Alternative Analysis.

These cost effective transit alternatives include an 11 mile Managed Lane, a 15 Mile EzWay, a BRT fixed Guideway and two highway bypasses around the bottlenecks at Pearl City and at Middle Street Merge. All of these alternatives would cost no more than \$1.2 Billion and would eliminate the bottlenecks at Pearl City and at Middle Street Merge.

Conversely, the Steel wheel on steel rail alternatives included in the DEIS ALL cost no less than \$6.28 Billion (Table 6-2 DEIS). Moreover, after the \$6.28 Billion Rail is built and operating, traffic congestion on H-1 will worsen as shown on table 3-12 of the Alternative Analysis and on DEIS Table 3-20. The AA shows 17,500 vehicles per hour on the H-1 freeway (rated full capacity = 9,500 vph). The DEIS Table 3-20 shows there will be 4,200 vph above the vehicle capacity of the highway facilities heading Koko Head bound during the morning peak period.

Conclusion: If the DEIS Rail alternatives are compared with the other transit alternatives including Managed Lanes, EzWay, BRT, and bypass highways, each rail alternative would be inferior to the "other" transit alternatives, both in terms of cost effectiveness and for providing traffic relief.

Recommendation:

The DEIS must add more transit alternatives such as BRT, Managed Lane, EzWay, and two bypass highways, into the DEIS which can then be compared with the rail alternatives to arrive at a more logical locally

preferred alternative (LPA):

1) an elevated HOV three-lane transit way from Waikale to downtown Hotel and Alakea Sts as described in Professor Panos Prevedouros Report "Transportation Alternatives Analysis for Mitigating Traffic Congestion between Leeward Oahu and Honolulu, Mar 2008." The full report is available at www.eng.hawaii.edu/~panos/UHCS.pdf.
2) BRT proposed by former Mayor Harris in early 2002 or 2003.

3) Build two separate, three-lane Flyovers, Nimitz and Kamehameha (between Waiawa Interchange and Halawa Interchange). Note that the two Flyovers have the capacity to eliminate the bottlenecks on H-1.

Dear Mr. Ramelb:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address your comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal dated December 29, 2008 with subject [Comment on Draft Environmental Impact Statement (DEIS) "Honolulu High-capacity transit corridor Project", Issue: DEIS incorrectly compares rail alternatives with No-Build Alternatives]:

Chapter 2 of the Final EIS summarizes the alternatives screening and selection process. Beginning in the fall of 2005, an initial screening process considered alternatives identified through previous transit studies, a field review of the study corridor, an analysis of current population and employment data for the study corridor, a literature review of technology modes, ongoing work completed as part of the Oahu Regional Transportation Plan 2030 (ORTP) prepared by the Oahu Metropolitan Planning Organization (OahuMPO) (OahuMPO 2007), and public and agency comments received during the formal Alternatives Analysis scoping process.

The screening process is documented in the Honolulu High-Capacity Transit Corridor Project Alternatives Screening Memorandum (DTS 2006a). Three scoping meetings were held during the screening process in December 2005, which included a presentation of initial alternatives to the public, interested agencies, and officials to receive comments on the Purpose

and Need, alternatives, and scope of the Alternatives Analysis. Refinements were made to the alternatives based on the public input during scoping.

After completion of screening in the winter of 2006, the following alternatives were studied in the Alternatives Analysis: No Build Alternative, Transportation System Management (TSM) Alternative, Managed Lane Alternative, and the Fixed Guideway Alternative. After review of the Alternatives Analysis Report and consideration of public comments, the City Council identified a fixed guideway transit system extending from Kapolei to UH Manoa with a connection to Waikiki as the Locally Preferred Alternative. This identification, which eliminated the TSM and Managed Lane Alternatives from further consideration, became Ordinance 07-001 on January 6, 2007. The NEPA process considered a range of alternatives that was consistent with the identified Locally Preferred Alternative. As discussed in Section 2.2, there were no alternatives that had not been previously studied and eliminated for good cause that would satisfy the Purpose and Need at less cost, with greater effectiveness, or less environmental or community impact.

The No Build Alternative is a baseline required as part of the NEPA process. All alternatives studied in both the Alternatives Analysis and EIS used the No Build Alternative as a baseline when analyzing the benefits, costs, and impacts of the projects studied.

As stated in Chapter 2 of the Final EIS, the Managed Lane Alternative was evaluated for its ability to meet project goals and objectives related to mobility and accessibility, supporting planned growth and economic development, constructability and cost, community and environmental quality, and planning consistency. The Managed Lane Alternative would fail to meet the Project's Purpose and Need, as described in Chapter 1 of this Final EIS, because it fails to moderate anticipated traffic congestion. While this alternative would have reduced congestion on parallel highways, systemwide traffic congestion would have been similar to the No Build Alternative as a result of increased traffic on arterials trying to access the facility. Total islandwide vehicle hours of delay would have increased with the Managed Lane Alternative compared to the No Build Alternative, indicating an increase in system-wide congestion (see Table 2-2 in the Final EIS). It also would be less effective than the Fixed Guideway Alternative at providing a faster and more reliable public transportation service as well as an alternative to private automobile travel. The Managed Lane Alternative would not have supported planned concentrated future population and employment growth because it would not provide concentrations of transit service that would serve as a nucleus for transit-oriented development.

The EzWay 15-mile, three-lane viaduct concept was developed as a hybrid of a plan for elevated toll lanes and some form of rubber-tire-on-concrete transit system. It is similar to the Managed Lane Alternative that was thoroughly evaluated in the Alternatives Analysis, which also accommodated both single occupant and transit vehicles. No known cost estimate for the EzWay proposal was prepared or validated by a qualified registered Professional Engineer. Options evaluated and rejected during the Primary Corridor Transportation Project (1998-2002) and Alternatives Analysis include an exclusively at-grade fixed-guideway system using bus rapid transit vehicles. In addition to comments received during the Alternatives Analysis and EIS scoping sessions, these studies provided a critical foundation for the conclusion that an elevated system would result in the best overall performance and better support the Purpose and Need for the Project. In addition, the Bus Rapid Transit Alternative, as stated in your letter, is a variation of the Transportation System Management Alternative that was evaluated in the

Mr. Ben Ramelb
Page 4

and a 10 percent reduction during the p.m. peak hour in the Ewa-bound direction. This demonstrates that the fixed guideway system will decrease traffic congestion at this location.

During the scoping process, several comments were received requesting reconsideration of the Managed Lane Alternative. This was considered and rejected during the Alternatives Analysis process. Because no new information was provided that would have substantially changed the findings of the Alternatives Analysis process regarding the Managed Lane Alternative, this alternative was not included in the Draft or Final EISs.

The Alternatives Analysis fully evaluated the Managed Lane Alternative and documented that it performed poorly compared to the Fixed Guideway Transit Alternative on a broad range of metrics. Any slight changes to the alternative would not result in substantially different findings.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Subject: Comment on Draft Environmental Impact Statement (DEIS)
"Honolulu High-capacity transit corridor Project", Issue : DEIS should
compare environmental impacts between Rail and Managed Lane
Alternative

Discussion:
DEIS pg. 4-1 states "In this document, the No Build Alternative serves as
an environmental baseline to which the impacts of other alternatives are
compared." The DEIS and AA should compare environmental impacts
between Rail and Managed Lane Alternative as follows:

A comparison of Managed Lane Alternative versus Rail:

Cost:

Rail - \$6.0 + Billion

Managed Lane - Less than \$1.0 Billion (Similar length Tampa reversible
three lane elevated expressway cost \$320 million in year 2005)

Length of new elevated fixed guideway:

Rail - 28 miles. Kapolei, Farrington Hwy to Waipahu, Kamehameha Hwy
to

Aiea, Salt Lake Blvd, Mapunapuna, Dillingham, Nimitz, Halekauwila,
Kapiolani, Kona (Ala Moana Shopping Center), Kapiolani, Kalakaua,
Kuhio (Waikiki); Kapiolani,
University Ave. (U.H. Manoa).

Managed Lane - 11 Miles. Over Kam Hwy median (H-1/H-2 Merge to
Pearl Harbor), alongside (mauka) H-1 Viaduct to Keehi Lagoon, over
Nimitz hwy to Iwilei thence to Hotel
Street and underpass to Alakea St and Halekauwila Street. Use King
and Beretania (couplet) on grade.

Traffic congestion:

Rail - Alternative Analysis Table 3-12 shows 17,500 vph on H-1 (full
rated capacity =9,500 vph) at Kalauao. Rail will worsen traffic
congestion on H-1. 9,600 commuters per hour will be stuck in gridlock
on H-1 during am peak hour or delayed in catching mostly fully loaded
train cars at train stations.

Managed Lane - Will reduce congestion on H-1 by 35 percent and has
the traffic capacity to eliminate
H-1 bottlenecks at Pearl City and at Middle St. merge..

Stations:

Rail - Will have 34 four-story or higher rail stations
Managed Lane - Zero bus stations.

Rail Stops:

Rail - Minimum 19 rail stops outside of Honolulu.
Managed Lane - Zero bus stops between community transit center and Honolulu

Transfers:

Rail - At least two transfers, home to bus to rail to another bus in town)
Managed Lane - None. Bus will travel directly from community to destination.

Travel time:

Rail - will not reduce travel time due to required transfers (bus to rail to bus).
Managed Lane - reduce travel time by 34 percent in automobile and bus travel times along the Leeward Corridor from current levels.

Bypass Road

Rail - Railway not available for highway bypass due to accident on H-1
Managed Lane - Reversible highway available 24/7.

Land Acquisition

Rail - Much acquisition needed for Rail stations, vehicular parking lots and rail yards.
Managed Lane - Land required for busyard in Kapolei.

Funding

Rail - GET taxes plus property tax . Fed fund unlikely because Feds recently cut rail funds for Wash. DC to Dulles Airport.
Managed Lane - funded by Feds FHWA, FTA and municipal bonds. GET funds could be made available with change in law.

Visual Blight

Rail - Will be an 28 mile elevated environmental blight on Honolulu. Elevated tracks will be ugly, running through downtown and eventually Waikiki, defacing our beautiful city and damaging our tourist industry.
Managed Lane - 11 mile elevated outside of Honolulu only.

Air pollution

Rail is not Green. Rail uses more energy per passenger mile than our buses or cars. Trains will continue at 10 minute schedule during non-peak hours with few passengers. Rail will not eliminate H-1 bottlenecks at Pearl City which will cause 8000 vehicles per hour stuck in gridlock on H-1 resulting in greater pollution than MLA.
Managed Lane - Has capacity to eliminate H-1 bottlenecks thereby reducing air pollution relative to rail.

Travel Speed

Rail - is slow, averaging 25 mph with 19 rail stops outside of Honolulu. There are no express trains.

Managed Lane – Non-stop 55 mph travel between each community and job destinations from Pearl Harbor and downtown .

Conclusion: If the DEIS Rail alternatives are compared with the other transit alternatives including Managed Lanes, EzWay, BRT, and bypass highways, each rail alternative would be inferior to the "other" transit alternatives, both in terms of cost effectiveness and for providing traffic relief.

Recommendation: The DEIS should include cost effective transit systems which will have the capacity to eliminate H-1 congestion include Managed Lane Alternative, BRT, EzWay or two highway bypasses around the H-1 bottlenecks at Pearl City and at Middle Street merge. These alternatives can then be compared with the rail alternatives to arrive at a more logical preferred alternative.

Dear Mr. Ramelb:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal dated December 29, 2008 with subject [Comment on Draft Environmental Impact Statement (DEIS) "Honolulu High-capacity transit corridor Project", Issue: DEIS should compare environmental impacts between Rail and Managed Lane Alternative]:

The No Build Alternative is a baseline required as part of the NEPA process. All alternatives studied in both the Alternatives Analysis and EIS used the No Build Alternative as a baseline when analyzing the benefits, costs, and impacts of the projects studied.

The engineering cost estimate for a two-lane reversible managed lane facility, which was calculated following the same rigorous cost-estimating process used for the Fixed Guideway Transit Alternatives, was \$2.6 billion in 2006 dollars. As stated in the City Council's Transit Advisory Task Force Report, a committee was charged with reviewing cost estimates for the two Alternatives involving construction (Managed Lane Alternative and Fixed Guideway Alternative). The report states that, "the Task Force agrees with this committee that the Alternatives Analysis'

construction cost estimates were fairly and consistently prepared, and that they may be used for both planning and cost comparisons.” Information was obtained by the Task Force from the Hawaii Department of Transportation and others familiar with managed lane facilities. It is the only estimate to date that addresses Honolulu conditions. The construction cost estimate for the Project is \$4.6 billion in 2009 dollars.

There is no substantiation of the estimate from the Tampa Bay toll facility being applicable in Honolulu. The designer of the Tampa Bay facility herself admitted that to apply such an estimate without detailed consideration of the many differences between the two locations is not reasonable. For clarification, the Tampa Bay elevated toll lanes extend only 5.8 miles within the 10-mile expressway. The costs quoted are from 2002, long before the costs of materials and construction rose dramatically after 2004. Furthermore, the corridor within which the Tampa Bay lanes are built required no right-of-way, had no significant utility conflicts, no major structures or crossings, and was built in much more favorable geotechnical conditions than exist on Oahu. In addition, the Transit Task Force Report dated December 14, 2006, states that “the committee concluded that the projects are sufficiently different (actual costs versus projected costs with contingencies; available, accessible ROW vs. construction in actively used highways; no utilities relocation vs. extensive relocations) as to make the comparison unreasonable.”

In addition, the length of the Project is 20 miles. The length of the Managed Lane Alternative studied during the Alternatives Analysis was 16 miles.

To address your statements about traffic, traffic volumes in 2030 under any alternative will be higher than those observed under current conditions. As shown in the Alternatives Analysis Report (DTS 2006b), the Managed Lane Alternative would not eliminate congestion and bottlenecks on the H-1 Freeway. Table 3-12 in the Alternative Analysis Report shows that, under the No Build Alternative, there would be 18,049 vehicles per hour (vph) operating on the H-1 Freeway in 2030. Vehicle volumes rise to 18,327 vph (Two-direction Option) or 18,419 vph (Reversible Option) with the Managed Lane Alternative, while traffic volumes decrease to 17,209 vph with the 20-mile Fixed Guideway Transit Alternative. Accordingly, the Fixed Guideway Transit Alternative will reduce traffic volumes from those projected under the 2030 No Build Alternative.

We would like to correct several comments in your letter under the headings of stations and rail stops. The Project includes 21 stations that will be various distances above the ground. A trip on the fixed guideway system from East Kapolei to Ala Moana Center would take 42 minutes, including dwell time at stations.

Regarding transfers, as stated in Chapter 3 of the Final EIS, with the Project, the rate of transfers will be higher than under the No Build Alternative due to proposed changes in local bus service to maximize access to the fixed guideway system. However, because of the high frequency of the fixed guideway service (three-minute headways between trains during peak periods), riders transferring from buses to the fixed guideway will experience minimal wait times. Riders transferring from the guideway service to buses will benefit from improved frequencies on existing bus routes serving stations. In addition, several new routes with high frequencies will be provided as feeders to the guideway system. Since these routes will primarily operate in

residential areas, they will provide greater reliability versus routes operating along congested arterials. The travel demand forecasting model includes a time penalty for transfers. Ridership forecasts increase 44 percent over the No Build Alternative despite a higher rate of transfers. While people typically try to minimize transfers on any trip, the more fundamental criterion for making a trip decision is how long the trip takes. Rail will offer people a shorter overall trip time compared to other options, even with the transfers as noted in Section 3.4.2 of the Final EIS.

Regarding travel time, as shown in Table 3-6 of the Alternatives Analysis, in the majority of instances the Managed Lane Alternative would have resulted in substantially greater transit travel times than the Fixed Guideway Transit Alternative. For example, from Waipahu to Downtown transit travel time for the Managed Lane Alternative would have been 52 minutes compared to 41 minutes for the Fixed Guideway Transit Alternative.

Regarding a bypass road, the fixed guideway system would provide an alternative to the H-1 Freeway if the freeway were closed.

To address your statement on land acquisition, property acquisitions are discussed in Section 4.4 of the Final EIS. The Project has been developed with a goal to minimize property takes and the need to relocate businesses and households. The Managed Lane Alternative would have affected up to 49 parcels. Of this total, two parcels were identified as residential, and up to 47 parcels with commercial/office and other uses would be affected. Parcels affected by right-of-way acquisition may include condominium or apartment buildings where multiple dwelling units could be affected, as well as single-family residences.

Your letter also contained comments about project funding that we would like to respond to. The Alternatives Analysis showed after extensive analysis that the other options would be ineffective at addressing the key transportation needs in Honolulu compared to the fixed guideway and at nearly comparable cost. No credible evidence has been developed to justify further consideration of those options. By law, no property tax revenues can be used to construct the Project. All capital costs, including finance charges, will be funded with FTA Section 5307 and FTA Section 5309 New Starts funds and County General Excise and Use Tax surcharge revenues. Regarding the Washington, D.C. to Dulles Airport rail project, FTA is providing \$900 million under a Full Funding Grant Agreement. There has been no indication that the Project will not receive Federal funding.

As stated in Chapter 2 of the Final EIS, the Managed Lane Alternative would not have qualified for local excise and use tax surcharge funding. Because single-occupant vehicles would have been permitted, even if tolled, Federal New Starts funding could not have been used. Because the Managed Lane Alternative would not have met the Project's Purpose and Need, would not have resulted in substantially fewer environmental impacts, and would not have been financially feasible, it is not a practicable alternative.

Regarding visual blight, the island's unique visual character and scenic beauty were considered in the visual and aesthetic analysis presented in the Draft and Final EISs. As discussed in Section 4.8 of the Final EIS, the Project will be set in an urban context where visual change is expected and differences in scales of structures are typical. The following measures

will be included with the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

- *Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
- *Coordinate the project design with the City's transit-oriented development program within the Department of Planning and Permitting.*
- *Consult with the communities surrounding each station for input on station design elements.*
- *Consider specific sites for landscaping and trees during Final Design when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will mitigate potential visual impacts.*

The Project also will provide users, including tourists, with expansive views from several portions of the corridor by elevating riders above highway traffic, street trees, and low structures adjacent to the alignment. In Section 4.8.3 of the Final EIS specific environmental, architectural, and landscape design criteria are listed that will help minimize visual effects of the Project.

The Managed Lane Alternative would have extended a shorter distance, but it would have been more visually intrusive because its elevated structure, with a typical width of between 36 and 46 feet, would have been much wider than that of the Fixed Guideway Alternative.

Likewise, to address your comments on air pollution, an average rail system consumes 2,784 British thermal units (BTUs) of energy per passenger-mile of service. An average passenger vehicle consumes 3,512 BTUs of energy per passenger-mile (USDOE 2008). As discussed in Chapter 4 of the Final EIS, the Project is anticipated to reduce daily transportation energy demand by approximately 3 percent compared to the No Build Alternative. The findings of the Alternatives Analysis demonstrated that the Reversible Option of the Managed Lane Alternative would have resulted in a net increase in transportation energy consumption and air pollution emissions.

As shown in the Alternatives Analysis Report (DTS 2006b), the Managed Lane Alternative would not eliminate congestion and bottlenecks on the H-1 Freeway. Table 3-12 in the Alternative Analysis Report shows that, under the No Build Alternative, there would be 18,049 vehicles per hour (vph) operating on the H-1 Freeway in 2030. Vehicle volumes rise to 18,327 vph (Two-direction Option) or 18,419 vph (Reversible Option) with the Managed Lane Alternative, while traffic volumes decrease to 17,209 vph with the 20-mile Fixed Guideway Transit Alternative. Accordingly, the Fixed Guideway Transit Alternative will reduce traffic volumes from those projected under the 2030 No Build Alternative.

Next, regarding travel speed, the average speed of the fixed guideway system is greater than 30 miles per hour. Travel from one end of the system to the other will take 42 minutes.

To address your conclusion, non-rail alternatives were evaluated in the Alternative Analysis. Scoping for the NEPA process confirmed that no alternatives that had not been previously studied and eliminated for good cause would satisfy the Purpose and Need at less cost, with greater effectiveness, or with less environmental or community impact.

While the Managed Lane Alternative would reduce freeway congestion (measured as vehicle hours of delay), it would also increase overall system congestion by inducing additional travelers to drive, which would increase congestion on arterial and collector facilities accessing the freeways. System-wide congestion will be greater in 2030 than it is today. Spot-congestion in some locations could decrease with the Managed Lane Alternative; however, the Reversible Option of the Managed Lane Alternative would increase systemwide congestion compared to the No Build Alternative, while the Fixed Guideway Transit Alternative will decrease congestion compared to the No Build Alternative.

During the scoping process, several comments were received requesting reconsideration of the Managed Lane Alternative. This alternative was considered and rejected during the Alternatives Analysis process. Because no new information was provided that would have substantially changed the findings of the Alternatives Analysis process regarding the Managed Lane Alternative, this alternative is not included in the Draft or Final EISs.

As stated in Chapter 2 of the Final EIS, prior to selecting an elevated fixed guideway system, a variety of high-capacity transit options were evaluated during the Primary Corridor Transportation Project (1998-2002) and Alternatives Analysis. Options evaluated and rejected include an exclusively at-grade fixed-guideway system using bus rapid transit vehicles. In addition to comments received during the Alternatives Analysis and EIS scoping sessions, these studies provided a critical foundation for the conclusion that an elevated system would result in the best overall performance and better support of the Purpose and Need for the Project. In addition, the proposed Bus Rapid Transit Alternative, as stated in your letter, is a variation of the Transportation System Management Alternative that was evaluated in the Alternatives Analysis. While this alternative has merit for cost-effectiveness, its overall system benefit would be very low.

The EzWay 15-mile, three-lane viaduct concept was developed as a hybrid of a plan for elevated toll lanes and some form of rubber-tire-on-concrete transit system. It is similar to the Managed Lane Alternative that was thoroughly evaluated in the Alternatives Analysis, which also accommodated both single occupant and transit vehicles. No known cost estimate for the EzWay proposal was prepared or validated by a qualified registered professional engineer. As a point of reference, the State of Hawaii's Highway Modernization Plan dated January 22, 2009, estimates the cost of the Nimitz Viaduct at \$600 million for an approximately 2.5-mile elevated highway with two lanes, which equals \$240 million per mile. Using this estimate, a 15-mile facility would cost approximately \$3.6 billion.

Localized bypasses would not meet system goals for corridor-wide benefits to mobility, reliability, access, and equity. The Hawaii Department of Transportation, which is responsible for the freeway system, has evaluated needs for the freeway system and identified the highway projects that would be most efficient at reducing congestion on Oahu. The projects, including a Nimitz Flyover, are listed in Table 2-3 of the Draft EIS and included in the analysis for all project

Mr. Ben Ramelb
Page 6

alternatives. Effects of the Nimitz Flyover on traffic conditions in 2030 are discussed in Section 3.4.2 of the Final EIS. Travel on the Nimitz Flyover was included for the following travel pairs under the No Build Alternative: Kapolei to Downtown, Ewa to Downtown, and Mililani to Downtown. As shown in Figure 3-7 of the Final EIS, the Nimitz Flyover does improve transit travel times with the No Build Alternative between certain travel pairs (e.g., between Mililani and Downtown) compared to 2007 conditions. However, as also shown in this figure, travel times improve substantially more with the addition of the Project. As a point of clarification, a Final EIS was never prepared for the Nimitz Flyover.

Conditions on the highway system will be worse in 2030 under any circumstances and whether the fixed guideway, managed lane, or more buses are implemented. As stated in the Alternatives Analysis Report, the comparison that is key to the Project is that rail service will improve conditions compared to what would occur if it were not provided (as shown in Tables 3-9 and 3-10 of the Final EIS). Accordingly, traffic conditions will be significantly better with the fixed guideway than with any of the other potential solutions studied.

As stated in Section 7.4 of the Final EIS, cost-effectiveness is one of the key criteria that FTA uses to evaluate projects proposed for Section 5309 New Starts funding. The cost-effectiveness indices for the Project compared to the baseline is within the "medium" range established by FTA for its New Starts ratings, which, along with other considerations, is currently required to qualify for New Starts funding (see Table 7-8 of the Final EIS). As shown in Table 6-1 of the Final EIS, the Project will cost \$4.6 billion in 2009 dollars and \$5.5 billion in inflated dollars, including finance charges.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Subject: Comment on Draft Environmental Impact Statement (DEIS)
"Honolulu High-capacity transit corridor Project", Issue : False and misleading DEIS statement to Improve Transportation Equity

Discussion:

Para. 1.8.4, pg. 1-21 states that "Equity is about fair distribution of resources so that no group carries an unfair burden of the negative environmental, social or economic impacts or receives an unfair share of benefits. Many low-income and minority workers who commute to work in the PUC Development Plan area live in the corridor outside of the urban core and thus rely heavily on transit availability. As more roadways become more congested.... because of traffic accidents or heavy rain..... a need exists to provide a more reliable transit system."

Discussion:

A fully-elevated, steel-wheel on steel rail transit system can move only 6,000 commuters (4000 standees, 2000 seated) per hour during peak travel periods while the 2030 commuter demand for RAIL will reach 15,600 commuters per hour, according to Table 3-12 of the Alternative Analysis.

Train commuter demand of 15,600 commuters per hour in year 2030 is calculated thus:

City AA, Table 3-12 shows year 2030 forecast volume of 17,500 vph on H-1 (full rated capacity = 9,500 vph) with the rail built and operating. Therefore, there is a commuter overload on H-1 Freeway of 8,000 vph = 9,600 commuters per hour. The total commuter load in 2030 = H-1 commuter overload plus 6,000 commuters on the Rail = 15,600 commuters per hour during peak.

The EzWay or Managed Lane alternatives each has the capacity to accommodate the total yr 2030 demand. The Managed Lanes or EzWay will each have elevated, reversible, three lanes each lane has a capacity of 2000 vph. For three lanes, the vehicular capacity is 6000 vehicles per hour. The Managed Lane Alternative person capacity is calculated thus:

Projected use of the HOT during peak hour includes:
200 express buses w/~50 pns = 10,000 pns
500 HOV5 (carpool) = 2,500 pns
500 vanpool (~5pns) = 2,500 pns.

Remaining excess capacity available for low occupancy green vehicles:
6,000 vph minus (200 + 500 + 500) = 4,800 vph. 4,800 low occupancy
vehicles

Average persons per vehicle = 1.2 pns per vehicle

4,800 vehicles with 1.2 pns = 5700 pns

Summary: Managed Lane persons capacity = 10,000 + 2,500 + 2,500 +
5,700 = ~ 20,700 pns

Conclusion:

There will be 9,600 + 6,000 = 15,600 commuters per hour that must get
on the train during peak travel period. However, 9,600 commuters per
hour will NOT be able to board the train because the train has
insufficient commuter capacity during peak travel period. Therefore, the
train cannot be considered as a form transit which provides
transportation equity to many low-income and minority workers who
commute to work in the PUC Development Plan area. Rail will impose
an environmental injustice to low-income and minority commuters.

Recommendation: Rail Transit should be eliminated as the preferred
alternative because it does not meet the test of improving transportation
equity. The DEIS should include cost effective transit systems which will
have the capacity to eliminate H-1 congestion include Managed Lane
Alternative, BRT, EzWay or two highway bypasses around the H-1
bottlenecks at Pearl City and at Middle Street merge. These alternatives
can then be compared with the rail alternatives to arrive at a more logical
preferred alternative.

Dear Mr. Ramelb:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal dated December 29, 2008 with subject [Comment on Draft Environmental Impact Statement (DEIS) "Honolulu High-capacity transit corridor Project", Issue: False and misleading DEIS statement to Improve Transportation Equity]:

To address your comments about the capacity of the fixed guideway system and managed lane alternative, since the Draft EIS was published, the travel demand model has been refined by adding an updated air passenger model (which forecasts travel in the corridor related to passengers arriving or departing at Honolulu International Airport), defining more realistic drive access modes (driving alone or car pooling) to project stations and recognizing a more robust off-peak non-home-based direct demand element (trips that do not originate at home) based on travel surveys in Honolulu. These revisions were made based on consultation with FTA. As stated in Chapter 3 of the Final EIS, the travel demand forecasting model predicts a maximum peak direction volume of 14,700 passengers during the a.m. two-hour peak period. As a result of updated ridership forecasts, the operating plan for the fixed guideway system has

been revised and the system will have a minimum capacity of approximately 17,300 passengers per direction during the two-hour peak period. The fixed guideway system is planned to operate with two- or three-car trains with a capacity of between 325 and 500 passengers each. At three-minute headways during the peak period, that provides capacity for approximately 8,650 passengers per peak direction per peak hour. This figure applies in both directions for a total system capacity of approximately 17,300 passengers per peak hour. The numbers presented in your comment understate the capacity of the fixed guideway by a substantial margin.

In addition, a major benefit of the fixed guideway is that once built, it is flexible enough to accommodate significant growth. For example, the full capacity of the fixed guideway with four-car trains and 90-second headways is over 25,000 passengers per hour per direction or over 50,000 in total. Accordingly, the fixed guideway system will provide sufficient capacity based on travel demand forecasting results.

As discussed in Section 4.7 of the Final EIS, the effects of the Project were analyzed in regard to how well the Project will serve the transportation needs of the identified Environmental Justice (EJ) populations and communities of concern relative to all other population groups within the study corridor. Effects of the Project also will result in benefits to transit users. These benefits include increased transit options, improved mobility, proximity to transit links, and access to expanding employment opportunities. As Chapter 3 illustrates, traffic and transit performance will improve within the study corridor, and these benefits can be realized by all populations. There are 21 stations proposed for the Project. Nine are in or adjacent to Oahu Metropolitan Planning Organization (OahuMPO) EJ Areas. Therefore, people living in OahuMPO EJ Areas will have the same opportunity to access the transit and mobility improvements. With the additions to capacity stated above, no specific community will have diminished access or ability to use transit based on capacity. There will be no disproportionately high and adverse effects on residents and businesses in OahuMPO EJ Areas.

In addition, transit travel-time benefits will occur for several communities with high concentrations of transit-dependent households, as well as other defined groups within communities of concern (Figure 3-5 in Final EIS). Data collected and used as indicators for these communities of concern include linguistically isolated households, transit-dependent populations, and areas with public housing and community services. Substantial positive user benefits for communities of concern are shown in or near Waipahu, Pearl Harbor Naval Base, and Ala Moana Center. Overall, many communities of concern receive positive benefits from the Project. No community of concern will experience negative user benefits. Those areas with high transit dependence, such as Waipahu, Pearl City, Aiea, Kalihi, Iwilei, Chinatown, Downtown, Kakaako, Ala Moana, and Waikiki, benefit from more than 35 percent of the total user benefits.

In response to the recommendation and conclusion sections of your letter, as stated in Section 7.4 of the Final EIS, cost-effectiveness is one of the key criteria that FTA uses to evaluate projects proposed for Section 5309 New Starts funding. The cost-effectiveness indices for the Project compared to the baseline is within the "medium" range established by FTA for its New Starts ratings, which, along with other considerations, is currently required to qualify for

Mr. Ben Ramelb
Page 3

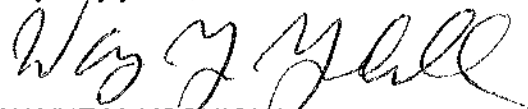

New Starts funding (Table 7-8 of Final EIS). As shown in Table 6-1 of the Final EIS, the Project will cost \$4.6 billion in 2009 dollars and \$5.5 billion in inflated dollars, including finance charges.

The Managed Lane Alternative was fully evaluated in the Alternatives Analysis. As shown in the Alternatives Analysis Report (DTS 2006b), the Managed Lane Alternative would not eliminate congestion and bottlenecks on the H-1 Freeway. Table 3-12 in the Alternative Analysis Report shows that, under the No Build Alternative, there would be 18,049 vehicles per hour (vph) operating on the H-1 Freeway in 2030. Vehicle volumes rise to 18,327 vph (Two-direction Option) or 18,419 vph (Reversible Option) with the Managed Lane Alternative, while traffic volumes decrease to 17,209 vph with the 20-mile Fixed Guideway Transit Alternative. Accordingly, the Fixed Guideway Transit Alternative will reduce traffic volumes from those projected under the 2030 No Build Alternative. The Alternatives Analysis fully evaluated the Managed Lane Alternative and documented that it performed poorly compared to the Fixed Guideway Transit Alternative on a broad range of metrics. Any slight changes to the alternative would not result in substantially different findings.

Non-rail alternatives were evaluated in the Alternative Analysis. Scoping for the NEPA process confirmed that no alternatives that had not been previously studied and eliminated for good cause would satisfy the Purpose and Need at less cost, with greater effectiveness, or with less environmental or community impact.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Subject: Comment on Draft Environmental Impact Statement (DEIS)
"Honolulu High-capacity transit corridor Project", Issue : DEIS should
compare environmental baselines between Rail and other low-cost
transit alternatives such as Managed Lanes, BRT, Ezway and No-build

Discussion:

DEIS pg. 4-1 states "In this document, the No Build Alternative serves as an environmental baseline to which the impacts of other alternatives are compared."

The DEIS contains only rail alternatives and a "No-build" alternative which draws wrong or biased conclusions with respect to the environment. There are other low-cost alternatives considered superior in providing traffic relief and cost which were wrongfully deleted or not included in the DEIS and Alternative Analysis.

Other cost effective transit alternatives include a) an 11 mile elevated three-lane reversible Managed Lane, b) a 15 Mile elevated, three-lane reversible EzWay, c) a BRT fixed Guideway and d) two elevated, three-lane, reversible highway bypasses around the bottlenecks at Pearl City and at Middle Street Merge. Each of these alternatives would cost less no more than \$1.2 Billion and each has the traffic capacity to eliminate the H-1 bottlenecks at Pearl City and at Middle Street Merge.

Conversely, each of the steel wheel fixed guideway alternatives included in the DEIS cost no less than \$6.28 Billion (Table 6-2 DEIS). Moreover, after the \$6.28 Billion Rail is built and operating, traffic congestion on H-1 will worsen as shown on table 3-12 of the Alternative Analysis and on DEIS Table 3-20. The AA year 2030 shows 17,500 vehicles per hour on the H-1 freeway (rated full capacity = 9,500 vph). The DEIS yr 2030 Table 3-20 shows there will be 4,200 vph above the vehicle capacity of the highway facilities heading Koko Head bound during the morning peak period.

Conclusion: If the DEIS Rail alternatives are compared with the other transit alternatives including Managed Lanes, EzWay, BRT, or two Flyovers, each steel wheel fixed guideway alternative would be totally inferior, both in terms of cost effectiveness and for providing traffic relief.

Recommendation: Include a wide range of alternatives as required by law. The DEIS should include cost effective transit systems which will

have the capacity to eliminate H-1 congestion include Managed Lane Alternative, BRT, EzWay or two highway bypasses around the H-1 bottlenecks at Pearl City and at Middle Street merge. These alternatives can then be compared with the rail alternatives to arrive at a more logical preferred alternative.

Dear Mr. Ramelb:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal dated December 29, 2008 with subject [Comment on Draft Environmental Impact Statement (DEIS) "Honolulu High-capacity transit corridor Project", Issue: DEIS should compare environmental baselines between Rail and other low-cost transit alternatives such as Managed Lanes, BRT, Ezway and No-build]:

Chapter 2 of the Final EIS summarizes the alternatives screening and selection process. Beginning in the fall of 2005, an initial screening process considered alternatives identified through previous transit studies, a field review of the study corridor, an analysis of current population and employment data for the study corridor, a literature review of technology modes, ongoing work completed as part of the Oahu Regional Transportation Plan 2030 (ORTP) prepared by the Oahu Metropolitan Planning Organization (OahuMPO) (OahuMPO 2007), and public and agency comments received during the formal Alternatives Analysis scoping process.

The screening process is documented in the Honolulu High-Capacity Transit Corridor Project Alternatives Screening Memorandum (DTS 2006a). Three scoping meetings were held during the screening process in December 2005, which included a presentation of initial alternatives to the public, interested agencies, and officials to receive comments on the Purpose

and Need, alternatives, and scope of the Alternatives Analysis. Refinements were made to the alternatives based on the public input during scoping.

After completion of screening in the winter of 2006, the following alternatives were studied in the Alternatives Analysis: No Build Alternative, Transportation System Management (TSM) Alternative, Managed Lane Alternative, and the Fixed Guideway Alternative. After review of the Alternatives Analysis Report and consideration of public comments, the City Council identified a fixed guideway transit system extending from Kapolei to UH Manoa with a connection to Waikiki as the Locally Preferred Alternative. This identification, which eliminated the TSM and Managed Lane Alternatives from further consideration, became Ordinance 07-001 on January 6, 2007. The NEPA process considered a range of alternatives that was consistent with the identified Locally Preferred Alternative. As discussed in Section 2.2, there were no alternatives that had not been previously studied and eliminated for good cause that would satisfy the Purpose and Need at less cost, with greater effectiveness, or less environmental or community impact.

The No Build Alternative is a baseline required as part of the NEPA process. All alternatives studied in both the Alternatives Analysis and EIS used the No Build Alternative as a baseline when analyzing the benefits, costs, and impacts of the projects studied.

a) The Managed Lane Alternative was fully evaluated in the Alternatives Analysis. While the Managed Lane Alternative would reduce freeway congestion (measured as vehicle hours of delay), it would increase overall system congestion by inducing additional travelers to drive, which would increase congestion on arterial and collector facilities accessing the freeways and the managed lane. In addition, once a vehicle leaves the managed lane, that vehicle is still subjected to congestion on surrounding roadways.

The analysis of the Managed Lane Alternative in Honolulu from the Alternatives Analysis Report (DTS 2006b) shows the cost to be \$2.6 billion in 2006 dollars (higher today) for a 16-mile facility. As stated in the City Council's Transit Advisory Task Force Report, a committee was charged with reviewing cost estimates for the two alternatives involving construction (the Managed Lane Alternative and Fixed Guideway Alternative). The report states that "the Task Force agrees with this committee that the Alternatives Analysis' construction cost estimates were fairly and consistently prepared, and that they may be used for both planning and cost comparisons." Information was obtained by the Task Force from the Hawaii Department of Transportation and others familiar with managed lane facilities. It is the only estimate to date that addresses Honolulu conditions.

b) The EzWay 15-mile, three-lane viaduct concept was developed as a hybrid of a plan for elevated toll lanes and some form of rubber-tire-on-concrete transit system. It is similar to the Managed Lane Alternative that was thoroughly evaluated in the Alternatives Analysis, which also accommodated both single occupant and transit vehicles. No known cost estimate for the EzWay proposal was prepared or validated by a qualified registered professional engineer. As a point of reference, the State of Hawaii's Highway Modernization Plan dated January 22, 2009, estimates the cost of the Nimitz Viaduct at \$600 million for an approximately 2.5-mile elevated highway with two

lanes, which equals \$240 million per mile. Using this estimate, a 15-mile facility would cost approximately \$3.6 billion.

c) As stated in Chapter 2 of the Final EIS, prior to selecting an elevated fixed guideway system, a variety of high-capacity transit options were evaluated during the Primary Corridor Transportation Project (1998-2002) and Alternatives Analysis. Options evaluated and rejected include an exclusively at-grade fixed-guideway system using bus rapid transit vehicles. In addition to comments received during the Alternatives Analysis and EIS scoping sessions, these studies provided a critical foundation for the conclusion that an elevated system would result in the best overall performance and better support of the Purpose and Need for the Project. The proposed Bus Rapid Transit Alternative, as stated in your letter, is a variation of the Transportation System Management Alternative that was evaluated in the Alternatives Analysis. While this alternative has merit for cost-effectiveness, its overall system benefit would be very low.

d) Localized bypasses would not meet system goals for corridor-wide benefits to mobility, reliability, access, and equity. The Hawaii Department of Transportation, which is responsible for the freeway system, has evaluated needs for the freeway system and identified the highway projects that would be most efficient at reducing congestion on Oahu. The projects, including a Nimitz Flyover, are listed in Table 2-3 of the Draft EIS and included in the analysis for all project alternatives. Effects of the Nimitz Flyover on traffic conditions in 2030 are discussed in Section 3.4.2 of the Final EIS. Travel on the Nimitz Flyover was included for the following travel pairs under the No Build Alternative: Kapolei to Downtown, Ewa to Downtown, and Mililani to Downtown. As shown in Figure 3-7 of the Final EIS, the Nimitz Flyover does improve transit travel times with the No Build Alternative between certain travel pairs (e.g., between Mililani and Downtown) compared to 2007 conditions. However, as also shown in this figure, travel times improve substantially more with the addition of the fixed guideway project. As a point of clarification, a Final EIS was never prepared for the Nimitz Flyover.

There could be many other versions of the type of system with minor adaptations to suit one or another special concern. In the end, the above approaches all have similar challenges as a primary solution to Honolulu's transportation problems. They do not reduce congestion, increase the reliability of the transportation system, serve future land use plans, or improve the fairness of and access to the transportation system. They also do not offer an alternative to perpetuating a reliance on limited existing travel modes. For example, localized bypasses would not meet system goals for corridor-wide benefits to mobility, reliability, access, and equity. In sum, they do not address the Purpose and Need of the Project.

Table 6-2 in the Draft EIS estimates the costs for implementing, replacing, rehabilitating, and maintaining the fixed guideway service. This table also includes the costs to restructure and expand TheBus and TheHandi-Van network. As shown in Table 6-1 of the Final EIS, the Project will cost \$4.6 billion in 2009 dollars and \$5.5 billion in inflated dollars, including finance charges.

While the Managed Lane Alternative identified in the Alternatives Analysis would reduce freeway congestion (measured as vehicle hours of delay), it would increase overall system congestion by inducing additional travelers to drive. These additional

travelers, in turn, would increase congestion on arterial and collector facilities accessing the freeways. System-wide congestion will be greater in 2030 than today. While spot-congestion in some locations could decrease with the Managed Lane Alternative, the Reversible Option of the Managed Lane Alternative would increase system-wide congestion compared to the No Build Alternative. Meanwhile, the Fixed Guideway Transit Alternative will decrease congestion compared to the No Build Alternative.

The Managed Lane Alternative was fully evaluated in the Alternatives Analysis. As shown in the Alternatives Analysis Report (DTS 2006b), the Managed Lane Alternative would not eliminate congestion and bottlenecks on the H-1 Freeway. Table 3-12 in the Alternative Analysis Report shows that, under the No Build Alternative, there would be 18,049 vehicles per hour (vph) operating on the H-1 Freeway in 2030. Vehicle volumes rise to 18,327 vph (Two-direction Option) or 18,419 vph (Reversible Option) with the Managed Lane Alternative, while traffic volumes decrease to 17,209 vph with the 20-mile Fixed Guideway Transit Alternative. Accordingly, the Fixed Guideway Transit Alternative will reduce traffic volumes from those projected under the 2030 No Build Alternative.

Table 3-20 in the Draft EIS shows 20,800 vehicles per hour (vph) at the Kalauao screenline (virtual lines across the corridor used to measure total travel at that point) in the Koko Head-bound direction during the a.m. peak hour with the No Build Alternative. This number decreases 9 percent with the addition of the Salt Lake Alternative to 18,910 vph. Numbers have been updated for the Final EIS based on the Airport Alternative and refinements to the travel demand forecasting model to account for non-home-based direct-demand trips (trips that do not originate or end at home) during off-peak periods. In addition, the air passenger model (which forecasts travel in the corridor related to passengers arriving or departing at Honolulu International Airport) was updated to reflect current conditions. These revisions were made based on consultation with FTA. The updated results continue to show that traffic will decrease with the addition of the Project. Tables 3-9 and 3-10 in the Final EIS shows an 11 percent decrease in vph at this screenline during the a.m. peak hour in the Koko Head-bound direction and a 10 percent reduction during the p.m. peak hour in the Ewa-bound direction. This demonstrates that the fixed guideway system will decrease traffic congestion at this location.

As stated in Section 7.4 of the Final EIS, cost-effectiveness is one of the key criteria that FTA uses to evaluate projects proposed for Section 5309 New Starts funding. The cost-effectiveness indices for the Project compared to the baseline is within the "medium" range established by FTA for its New Starts ratings which, along with other considerations, is currently required to qualify for New Starts funding (see Table 7-8 of the Final EIS). As shown in Table 6-1 of the Final EIS, the Project will cost \$4.6 billion in 2009 dollars and \$5.5 billion in inflated dollars, including finance charges.

The scoping process in March 2007 requested that the public propose alternatives that would satisfy the Purpose and Need at less cost or with greater effectiveness or less environmental or community impact and were not previously studied and eliminated for good cause. During the scoping process, several comments were received requesting reconsideration of the Managed Lane Alternative. This was considered and rejected during the Alternatives Analysis process. Because no new

Mr. Ben Ramelb
Page 5

information was provided that would have substantially changed the findings of the Alternatives Analysis process regarding the Managed Lane Alternative, this alternative is not included in the Draft or Final EISs. The only alternative proposed that met this criteria was a Fixed Guideway Transit Alternative following an alternative alignment. All reasonable alternatives that have been identified and that satisfy the Purpose and Need at less cost or with greater effectiveness or less environmental or community impact and were not previously studied and eliminated for good cause have been evaluated in the Draft EIS.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

650 South King St. 3rd Floor
Honolulu
HI 96813
FAX: (808) 587-6080

Subject: Comment on Draft Environmental Impact Statement (DEIS)
"Honolulu High-capacity transit corridor Project", Issue : DEIS traffic
analysis provides incomplete information resulting in arriving at wrong
DEIS findings

Fact:
DEIS Table 3-20 provides existing traffic volumes but does not provide
forecasted volumes with resultant Level of Service (LOS) for each
specific highway.

Discussion:
DEIS Table 3-20 lists a general "facility" highway serving each
transportation corridor. This does not provide sufficient information to
determine which specific highway will continue to have congestion after
the transit alternative is completed and operating. Each "facility" should
be broken down further, i.e. "Kalauao Koko Head bound " should include
H-1 Fwy, H-1 Fwy (HOV), H-1 Fwy (Zipper), Moanalua, Kamehameha
Hwy with appropriate traffic volumes, present and forecast, and Level of
Service for each transit alternative.

The 2006 Alternative Analysis and DEIS show that congestion on H-1 at
Kalauao Kokohead bound and at Kapalama Canal will continue to be at
Level of Service "F" after the steel wheel fixed alternative is built and
operating. Despite this continued congestion, the Alternative Analysis,
and the DEIS accepts, that the steel wheel fixed guideway is the
recommended alternative. This conclusion is totally in error because
both the AA and DEIS do not sufficiently provide traffic volumes, level of
service and specific highways to arrive at a reasonable conclusion. The
fact that rail will worsen congestion alone is enough to disqualify rail as
the preferred transit alternative.

The City Alternative Analysis, Table 3-12, shows that there will still be
17,500 vehicles per hour in 2030 on the H-1 (full rated capacity = 9,500
vehicles per hour) at Pearl City AFTER the \$7.0 Billion Rail is built and
operating.

The DEIS Screenline Volumes for the 2030 Salt Lake Build Alternative
Table 3-20, shows that with the Salt Lake Build Alternative AT Screen
line "D" :
- Kalauao Koko Head bound : Observed (forecast) Volume - AM Peak =
18,910 vehicles per hour (vph).
- Facility 2030 Capacity - AM Peak = 14, 650 vph - Reference: Table 3-

12 Alternative Analysis.

Result: There will be 4,260 vph above the facility capacity (H-1 + HOV + Zipper + Kam+ Moanalua) at Kalauao which indicates a Level of Service (LOS) F AFTER the Salt Lake Rail is built. This conclusion is consistent with the conclusion using the numbers from the City's Alternative analysis report. With rail, the above numbers show congestion will WORSEN after the \$7.0 Billion full build-out Rail is completed.

Conclusion: The DEIS traffic analysis provides incomplete information resulting in arriving at wrong conclusions. Specifically, the detailed Alternative Analysis Table 3-12 and DEIS Table 3-20 show that a rail alternative "worsens" traffic congestion on most highways which rejects the findings that Rail will "improve mobility, reliability, equity and reduced travel times.

Recommendation: 1) Revise DEIS Table 3-20 and other appropriate tables and narrative to include the three-lane reversible MLA, the three-lane EzWay, BRT and two separate Flyovers over Kamehameha Highway and Nimitz Highway and 2) Provide a higher level of detailed analysis which will be similar or better than that provided in the Alternative Analysis Table 3-12.

Dear Mr. Ramelb:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal dated December 29, 2008 with subject [Comment on Draft Environmental Impact Statement (DEIS) "Honolulu High-capacity transit corridor Project", Issue: DEIS traffic analysis provides incomplete information resulting in arriving at wrong DEIS findings]:

Based on your comment, detailed traffic information for each roadway at screenlines (virtual lines across the corridor used to measure total travel at that point), including volumes, maximum thresholds, number of lanes, and level-of-service, is provided in Tables 3-9 and 3-10 in the Final EIS. This table provides information for 2005 and the 2030 No Build Alternative and the Project.

In responding to your conclusion, neither Table 3-12 in the Alternative Analysis report nor Table 3-20 in the Draft EIS show that rail would worsen traffic. Table 3-12 shows that roadway conditions will be worse in 2030 compared to existing conditions. However, traffic conditions will be better with the fixed guideway compared to conditions without the fixed guideway. Table 3-20 in the Draft EIS shows 20,800 vehicles per hour (vph) at the Kaluaao screenline

in the Koko Head-bound direction during the a.m. peak hour with the No Build Alternative. This number decreases 9 percent with the addition of the Salt Lake Alternative to 18,910 vph. Numbers have been updated for the Final EIS based on the Airport Alternative and refinements to the travel demand forecasting model to account for non-home-based direct-demand trips (trips that do not originate or end at home) during off-peak periods. In addition, the air passenger model (which forecasts travel in the corridor related to passengers arriving or departing at Honolulu International Airport) was updated to reflect current conditions. These revisions were made based on consultation with FTA. The updated results continue to show that traffic will decrease with the addition of the Project. Tables 3-9 and 3-10 in the Final EIS shows an 11 percent decrease in vph at this screenline during the a.m. peak hour in the Koko Head-bound direction and a 10 percent reduction during the p.m. peak hour in the Ewa-bound direction. This demonstrates that the fixed guideway system will decrease traffic congestion at this location. Accordingly, as compared to the No Build Alternative, the fixed guideway system will improve mobility, reliability, and equity, as well as reduce travel times.

As shown in Table 6-1 of the Final EIS, the Project will cost \$4.6 billion in 2009 dollars and \$5.5 billion in inflated dollars, including finance charges.

In addition, to address your recommendation, non-rail alternatives were evaluated in the Alternative Analysis. Chapter 2 of the Final EIS summarizes the alternatives screening and selection process. Beginning in the fall of 2005, an initial screening process considered alternatives identified through previous transit studies, a field review of the study corridor, an analysis of current population and employment data for the study corridor, a literature review of technology modes, ongoing work completed as part of the Oahu Regional Transportation Plan 2030 (ORTP) prepared by the Oahu Metropolitan Planning Organization (OahuMPO) (OahuMPO 2007), and public and agency comments received during the formal Alternatives Analysis scoping process.

The screening process is documented in the Honolulu High-Capacity Transit Corridor Project Alternatives Screening Memorandum (DTS 2006a). Three scoping meetings were held during the screening process in December 2005, which included a presentation of initial alternatives to the public, interested agencies, and officials to receive comments on the Purpose and Need, alternatives, and scope of the Alternatives Analysis. Refinements were made to the alternatives based on the public input during scoping.

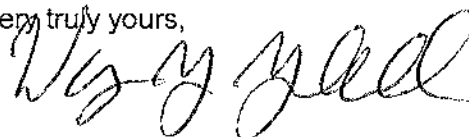

After completion of screening in the winter of 2006, the following alternatives were studied in the Alternatives Analysis: No Build Alternative, Transportation System Management (TSM) Alternative, Managed Lane Alternative, and the Fixed Guideway Alternative. After review of the Alternatives Analysis Report and consideration of public comments, the City Council identified a fixed guideway transit system extending from Kapolei to UH Manoa with a connection to Waikiki as the Locally Preferred Alternative. This identification, which eliminated the TSM and Managed Lane Alternatives from further consideration, became Ordinance 07-001 on January 6, 2007. The NEPA process considered a range of alternatives that was consistent with the identified Locally Preferred Alternative. As discussed in Section 2.2, there were no alternatives that had not been previously studied and eliminated for good cause that would satisfy the Purpose and Need at less cost, with greater effectiveness, or less environmental or community impact.

Mr. Ben Ramelb
Page 3

Accordingly, the three-lane Reversible Option of the Managed Lane Alternative, the three-lane EzWay, Bus Rapid Transit, and separate flyovers for Kamehameha Highway and Nimitz Highway were not included in the Draft or Final EISs.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

FAX: (808) 587-6080

Subject: Comment on Draft Environmental Impact Statement (DEIS)
"Honolulu High-capacity transit corridor Project", Issue: DEIS Summary
of findings on Transportation Conditions and Effects is incorrect

Fact:
DEIS Summary of findings on Transportation Conditions and Effects,
page 3-53, are not consistent with Table 3-20 which indicate that with
rail built and operating, traffic congestion on H-1 and other highways will
WORSEN.

Discussion:
The summary on existing conditions states, inter alia, that:
- "increasing traffic congestion and constrained transit operating
conditions have reduced system reliability and mobility for all travelers."
- Reliability of transit has worsened....Reliability is at level of service "F".
The summary on Effects of the "Build Alternatives" state that transit
service mobility, reliability, equity and access to new development would
improve (if rail is built)." This summary is totally false because the 2006
Alternative Analysis Table 3-12 and DEIS Table 3-20 show that Rail
Transit, if built, will result in WORSE traffic congestion on H-1 and other
highways to level of service "F" in year 2030.

The City Alternative Analysis, Table 3-12, shows that there will still be
17,500 vehicles per hour in 2030 on the H-1 (full rated capacity = 9,500
vehicles per hour) at Pearl City AFTER the \$6.0 Billion Rail is built and
operating.

Result: There will be an 8,000 vph overload on H-1 after Rail is built
which will worsen traffic congestion on H-1 resulting in a level of service
"F".

The DEIS Screenline Volumes for the 2030 Salt Lake Build Alternative
Table 3-20, shows that with the Salt Lake Build Alternative AT Screen
line "D" :
- Kalauao Koko Head bound : Observed (forecast) Volume - AM Peak =
18,910 vehicles per hour (vph).
- Facility 2030 Capacity - AM Peak = 14, 650 vph - Reference: Table 3-
12 Alternative Analysis.
Result: There will be 4,260 vph above the facility capacity (H-1 + HOV +
Zipper + Kam+ Moanalua) at Kalauao which indicates a Level of Service
(LOS) F AFTER the Salt Lake Rail is built. This conclusion is consistent
with the conclusion using the numbers from the City's Alternative

analysis report. With rail, the above numbers show congestion will WORSEN after the \$6.0 Billion full build-out Rail is completed.

The above discussion refutes the DEIS statement that the "Effects of the Build alternatives" will: Improve service mobility, reliability, equity, and access to new development; improve travel times, and improve operating efficiency because after the \$6.0 Billion Rail is built, congestion on H-1 and other highways will WORSEN.

Conclusion: The DEIS Table 3-20 and AA Table 3-12 show that traffic on H-1 and other highways will result in worse traffic congestion in year 2030 AFTER Rail is built and therefore rejects the summary finding that Rail will "improve mobility, reliability, equity and reduced travel times.

Recommendation: It is recommended that :

- 1) Revise the summary of findings on Transportation Conditions and Effects to be consistent with the finding that Rail will NOT improve mobility, reliability, equity and access to new development.
- 2) Revise DEIS Table 3-20 and other appropriate tables and narrative to indicate that Traffic on H-1 will worsen and provide a higher level of detailed analysis which will be similar to that provided in the Alternative Analysis Table 3-12.
- 3) state that traffic with rail will have a net result of worse traffic congestion on H-1 at the H-1/H-2 merge and at the Middle Street merge and
- 4) include in the DEIS other cost-effective transit alternatives such as an 11-mile three-lane reversible MLA for evaluation and comparison with the No Build alternative and the rail alternatives.

Dear Mr. Ramelb:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal dated December 29, 2008 with subject [Comment on Draft Environmental Impact Statement (DEIS) "Honolulu High-capacity transit corridor Project", Issue: DEIS Summary of findings on Transportation Conditions and Effects is incorrect]:

Regarding the comment in your letter under the heading "Fact," the Alternatives Analysis, Draft EIS, and Final EIS all show that conditions on the highways will worsen by 2030 compared to existing conditions whether the fixed guideway, managed lane, or more buses are implemented. The comparison that is key to the Project is that rail will improve conditions compared to what they would be if the rail project were not built, even after all of the proposed highway improvements listed in the Oahu Regional Transportation Plan are completed. Tables 3-9 and 3-10 in the Final EIS show a reduction in traffic congestion at each screenline (virtual lines across the corridor used to measure total travel at that point) with the Project compared to No Build conditions. The "Summary of Transportation Conditions and Effects" has been moved from the back of Chapter 3 to Table 3-1 in the Final EIS. This table has been revised to state that traffic congestion will improve with the Project.

Regarding your comments under the heading "Discussion," as shown in the Alternatives Analysis Report (DTS 2006b), the Managed Lane Alternative would not eliminate congestion and bottlenecks on the H-1 Freeway. Table 3-12 in the Alternative Analysis Report shows that, under the No Build Alternative, there would be 18,049 vehicles per hour (vph) operating on the H-1 Freeway in 2030. Vehicle volumes rise to 18,327 vph (Two-direction Option) or 18,419 vph (Reversible Option) with the Managed Lane Alternative, while traffic volumes decrease to 17,209 vph with the 20-mile Fixed Guideway Transit Alternative. Accordingly, the Fixed Guideway Transit Alternative will reduce traffic volumes from those projected under the 2030 No Build Alternative.

Table 3-20 in the Draft EIS shows 20,800 vehicles per hour (vph) at the Kaluaao screenline (virtual lines across the corridor used to measure total travel at that point) in the Koko Head-bound direction during the a.m. peak hour with the No Build Alternative. This number decreases 9 percent with the addition of the Salt Lake Alternative to 18,910 vph. Numbers have been updated for the Final EIS based on the Airport Alternative and refinements to the travel demand forecasting model to account for non-home-based direct-demand trips during off-peak periods. In addition, the air passenger model was updated to reflect current conditions. These revisions were made based on FTA direction. The updated results continue to show that traffic will decrease with the addition of the Project. Tables 3-9 and 3-10 in the Final EIS shows an 11 percent decrease in vph at this screenline during the a.m. peak hour in the Koko Head-bound direction and a 10 percent reduction during the p.m. peak hour in the Ewa-bound direction. This demonstrates that the fixed guideway system will decrease traffic congestion at this location.

As shown in Table 6-1 of the Final EIS, the Project will cost \$4.6 billion in 2009 dollars and \$5.5 billion in inflated dollars, including finance charges. Chapters 3 and 7 of the Final EIS discuss how the Project will address the four goals listed in Chapter 1. In addition, Chapter 3 discusses the improvements in travel time and operating efficiency that will occur as a result of the Project. The Project will completely separate fixed guideway vehicles from roadway traffic operations and, accordingly, it will provide substantially higher transit-service reliability compared to the No Build Alternative. This reliability will not deteriorate over time, even with projected population and employment growth in the study corridor. The reliability of fixed guideway vehicles will be better than the reliability of transit vehicles operating on increasingly congested highways.

In response to your conclusion, as stated previously, the Project will improve congestion, mobility, reliability, equity, and travel times.

The following points address comments under the heading "Discussion" in your letter:

1) The finding that the Project "will improve mobility, reliability, equity, and access to new development" relates to its ability to improve conditions compared to what they would be without the rail system. It is a fair assessment of the Project's contribution to the four needs/objectives defined in Chapter 1. As a result, the "Summary of Findings on Transportation Conditions and Effects" has not been revised in the Final EIS.

2) Detailed traffic information for each roadway at screenlines, including volumes, maximum thresholds, number of lanes, and level-of-service, is provided in Tables 3-9 and 3-10 in the Final EIS. As shown, congestion on the H-1 Freeway improves with the Project.

3) *There is no basis to conclude that the Project will worsen highway congestion. Conditions at the H-1/H-2 interchange, on the H-1 Freeway, and at the Middle Street merge with rail will be better with the Project than without it.*

4) *The Managed Lane Alternative was studied in the Alternatives Analysis and resulted in worse conditions than other choices, including the fixed guideway (rail). It was only slightly better than the No Build Alternative, so it has little merit as a sole solution in place of the rail project.*

There could be many other versions of the type of system with minor adaptations to suit one or another special concern. In the end, the above approaches all have similar challenges as a primary solution to Honolulu's transportation problems. They do not reduce congestion, increase the reliability of the transportation system, serve future land use plans, or improve the fairness of and access to the transportation system. They also do not offer an alternative to perpetuating a reliance on limited existing travel modes. For example, localized bypasses would not meet system goals for corridor-wide benefits to mobility, reliability, access, and equity. In sum, they do not address the Purpose and Need of the Project.

Chapter 2 of the Final EIS summarizes the alternatives screening and selection process. Beginning in the fall of 2005, an initial screening process considered alternatives identified through previous transit studies, a field review of the study corridor, an analysis of current population and employment data for the study corridor, a literature review of technology modes, ongoing work completed as part of the Oahu Regional Transportation Plan 2030 (ORTP) prepared by the Oahu Metropolitan Planning Organization (OahuMPO) (OahuMPO 2007), and public and agency comments received during the formal Alternatives Analysis scoping process.

The screening process is documented in the Honolulu High-Capacity Transit Corridor Project Alternatives Screening Memorandum (DTS 2006a). Three scoping meetings were held during the screening process in December 2005, which included a presentation of initial alternatives to the public, interested agencies, and officials to receive comments on the Purpose and Need, alternatives, and scope of the Alternatives Analysis. Refinements were made to the alternatives based on the public input during scoping.

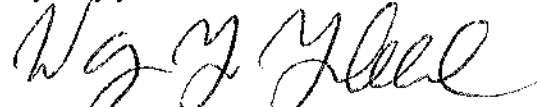

After completion of screening in the winter of 2006, the following alternatives were studied in the Alternatives Analysis: No Build Alternative, Transportation System Management (TSM) Alternative, Managed Lane Alternative, and the Fixed Guideway Alternative. After review of the Alternatives Analysis Report and consideration of public comments, the City Council identified a fixed guideway transit system extending from Kapolei to UH Manoa with a connection to Waikiki as the Locally Preferred Alternative. This identification, which eliminated the TSM and Managed Lane Alternatives from further consideration, became Ordinance 07-001 on January 6, 2007. The NEPA process considered a range of alternatives that was consistent with the identified Locally Preferred Alternative. As discussed in Section 2.2, there were no alternatives that had not been previously studied and eliminated for good cause that would satisfy the Purpose and Need at less cost, with greater effectiveness, or less environmental or community impact.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this

Mr. Ben Ramelb

Honolulu
HI 96813
FAX: (808) 587-6080

Subject: Comment on Draft Environmental Impact Statement (DEIS)
"Honolulu High-capacity transit corridor Project", Issue: DEIS traffic
analysis provides incomplete information

Fact:
DEIS Table 3-12 shows existing and 2030 traffic volumes for No Build
Alternative

DEIS Table 3-20 provides forecasted traffic volumes but do not show
resultant Level of Service (LOS) for each highway (facility) Corridor.

Discussion:
DEIS Table 1-3 and Table 3-20 are incomplete because a) lane
designations are too generalized, b) each highway lacks level of service
information, and c) lacks sufficient non-rail alternatives, i.e. Managed
Lane, BRT, EzWay.

Specific Highway and lane designations should be specific. "Facility"
highways serving each transportation corridor should be broken down
further, i.e. "Kalaauao Koko Head bound " should be broken down into H-
1 Fwy, H-1 Hwy (HOV), H-1 Fwy (Zipper), Moanalua, Kamehameha Hwy
with appropriate traffic volumes, present and forecast, and Level of
Service for each transit alternative.

The 2006 Alternative Analysis and DEIS concludes that Rail transit will
"help reduce congestion" which is very misleading because while rail will
HELP in reducing future congestion, the NET future traffic congestion
on H-1 will substantially INCREASE, primarily because rail will not have
the commuter capacity to transport the net future commuter demand in
year 2030. For example, the City Alternative Analysis, Table 3-12,
shows that there will still be 17,500 vehicles per hour in 2030 on the H-1
(full rated capacity = 9,500 vehicles per hour) at Pearl City AFTER the
\$6.0 Billion Rail is built and operating.

The DEIS Screenline Volumes for the 2030 Salt Lake Build Alternative
Table 3-20, shows that with the Salt Lake Build Alternative AT Screen
line "D" :

- Kalaauao Koko Head bound : Observed (forecast) Volume - AM Peak =
18,910 vehicles per hour (vph).
- Facility 2030 Capacity - AM Peak = 14, 650 vph - Reference: Table 3-
12 Alternative Analysis.

Result: Results from DEIS Table 3-20 show that there will be 4,260 vph above the facility capacity (H-1 + HOV + Zipper + Kam+ Moanalua) at Kalauao which indicates a Level of Service (LOS) F AFTER the Salt Lake Rail is built. This conclusion is consistent with the conclusion using the numbers from the City's Alternative analysis report. With rail, the above numbers show congestion will WORSEN after the \$6.0 Billion full build-out Rail is completed. Therefore, the DEIS Table 3-20 showing a positive change in congestion is MISLEADING because the NET change in traffic congestion will WORSEN.

For example, the forecasted volume for Kalauao Koko Head bound A.M. Peak Hour is 18,910 vph while the rated full capacity of the "facility" is 14,650 vph (reference: AA table 3-12 for facility including H-1 Fwy, H-1 Hwy (HOV), H-1 Fwy (Zipper), Moanalua, Kamehameha Hwy . There will be 4,260 vehicles per hour above the facility rated capacity resulting in a LOS "F". This would contradict the findings on DEIS page 3-53 where mobility, reliability and equity would DECREASE rather than increase.

This makes it all the more reason to include a an 11- mile, elevated, three lane reversible Managed Lane Alternative, a transit system which is lower in cost than rail and will have the capacity to eliminate the LOF "F" on the H-1 freeway.

Conclusion: The DEIS traffic analysis provides incomplete information resulting in arriving at wrong conclusions. Specifically, the detailed Alternative Analysis Table 3-12 and DEIS Table 3-20 show "net result" that a rail alternative "worsens" traffic congestion on most highways which rejects the findings that Rail will "improve mobility, reliability, equity and reduced travel times.

Recommendation: It is recommended that 1) the DEIS Table 3-20 and other appropriate tables and narrative be revised to indicate that Traffic on H-1 will worsen , provide a higher level of detailed analysis which will be similar to that provided in the Alternative Analysis Table 3-12, 2) state that traffic with rail will have a net result of worse traffic congestion on H-1 at the H-1/H-2 merge and at the Middle Street merge and 3) that other low cost-effective transit alternatives be included in the DEIS for evaluation and comparison with the No Build alternative and the rail alternatives.

Dear Mr. Ramelb:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal dated December 29, 2008 with subject [Comment on Draft Environmental Impact Statement (DEIS) "Honolulu High-capacity transit corridor Project", Issue: DEIS traffic analysis provides incomplete information]:

In response to your recommendation, level-of-service, maximum volume thresholds, and number of lanes on individual roadway facilities has been added to Tables 3-9 and 3-10 in the Final EIS. This table shows that traffic on the H-1 Freeway will improve with the Project compared to 2030 No Build conditions.

Traffic volumes in 2030 under any alternative will be higher than those observed under current conditions. As shown in the Alternatives Analysis Report (DTS 2006b), the Managed Lane Alternative would not eliminate congestion and bottlenecks on the H-1 Freeway. Table 3-12 in the Alternative Analysis Report shows that, under the No Build Alternative, there would be 18,049 vehicles per hour (vph) operating on the H-1 Freeway in 2030. Vehicle volumes rise to 18,327 vph (Two-direction Option) or 18,419 vph (Reversible Option) with the Managed Lane Alternative, while traffic volumes decrease to 17,209 vph with the 20-mile Fixed

Guideway Transit Alternative. Accordingly, the Fixed Guideway Transit Alternative will reduce traffic volumes from those projected under the 2030 No Build Alternative.

Table 3-20 in the Draft EIS shows 20,800 vehicles per hour (vph) at the Kalauao screenline (virtual lines across the corridor used to measure total travel at that point) in the Koko Head-bound direction during the a.m. peak hour with the No Build Alternative. This number decreases 9 percent with the addition of the Salt Lake Alternative to 18,910 vph. Numbers have been updated for the Final EIS based on the Airport Alternative and refinements to the travel demand forecasting model to account for non-home-based direct-demand trips during off-peak periods. In addition, the air passenger model was updated to reflect current conditions. These revisions were made based on FTA direction. The updated results continue to show that traffic will decrease with the addition of the Project. Tables 3-9 and 3-10 in the Final EIS shows an 11 percent decrease in vph at this screenline during the a.m. peak hour in the Koko Head-bound direction and a 10 percent reduction during the p.m. peak hour in the Ewa-bound direction. This demonstrates that the fixed guideway system will decrease traffic congestion at this location.

As stated in Chapter 3 of the Final EIS, the travel demand forecasting model predicts a maximum peak direction volume of 14,700 passengers during the a.m. two-hour peak period. As a result of updated ridership forecasts, the operating plan for the fixed guideway system has been revised and the system will have a minimum capacity of approximately 17,300 passengers per direction during the two-hour peak period. The fixed guideway system is planned to operate with two- or three-car trains with a capacity of between 325 and 500 passengers each. At three-minute headways during the peak period, that provides capacity for approximately 8,650 passengers per peak direction per peak hour. This capacity figure applies in both directions for a total system capacity of approximately 17,300 passengers per peak hour.

In addition, a major benefit of the fixed guideway is that once built, it is flexible enough to accommodate significant growth. For example, the full capacity of the fixed guideway with four-car trains and 90-second headways is over 25,000 passengers per hour per direction or over 50,000 in total. Accordingly, the fixed guideway system will provide sufficient capacity based on travel demand forecasting results.

As shown in Table 6-1 of the Final EIS, the Project will cost \$4.6 billion in 2009 dollars and \$5.5 billion in inflated dollars, including finance charges. Chapters 3 and 7 of the Final EIS discuss how the Project will address the four goals listed in Chapter 1. In addition, Chapter 3 discusses the improvements in travel time and operating efficiency that will occur as a result of the Project. The Project will completely separate fixed guideway vehicles from roadway traffic operations and, accordingly, it will provide substantially higher transit-service reliability compared to the No Build Alternative. This reliability will not deteriorate over time, even with projected population and employment growth in the study corridor. The reliability of fixed guideway vehicles will be better than the reliability of transit vehicles operating on increasingly congested highways.

The Managed Lane Alternative was fully evaluated in the Alternatives Analysis. As stated previously, the Managed Lane Alternative did not improve congestion on the H-1 Freeway. There could be many other versions of the type of system with minor adaptations to suit one or another special concern. In the end, the above approaches all have similar challenges as a primary solution to Honolulu's transportation problems. They do not reduce congestion, increase the reliability of the transportation system, serve future land use plans, or

improve the fairness of and access to the transportation system. They also do not offer an alternative to perpetuating a reliance on limited existing travel modes. For example, localized bypasses would not meet system goals for corridor-wide benefits to mobility, reliability, access, and equity. In sum, they do not address the Purpose and Need of the Project.

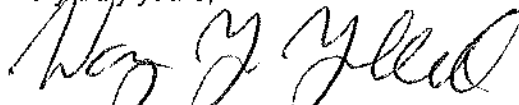

Chapter 2 of the Final EIS summarizes the alternatives screening and selection process. Beginning in the fall of 2005, an initial screening process considered alternatives identified through previous transit studies, a field review of the study corridor, an analysis of current population and employment data for the study corridor, a literature review of technology modes, ongoing work completed as part of the Oahu Regional Transportation Plan 2030 (ORTP) prepared by the Oahu Metropolitan Planning Organization (OahuMPO) (OahuMPO 2007), and public and agency comments received during the formal Alternatives Analysis scoping process.

The screening process is documented in the Honolulu High-Capacity Transit Corridor Project Alternatives Screening Memorandum (DTS 2006a). Three scoping meetings were held during the screening process in December 2005, which included a presentation of initial alternatives to the public, interested agencies, and officials to receive comments on the Purpose and Need, alternatives, and scope of the Alternatives Analysis. Refinements were made to the alternatives based on the public input during scoping.

After completion of screening in the winter of 2006, the following alternatives were studied in the Alternatives Analysis: No Build Alternative, Transportation System Management (TSM) Alternative, Managed Lane Alternative, and the Fixed Guideway Alternative. After review of the Alternatives Analysis Report and consideration of public comments, the City Council identified a fixed guideway transit system extending from Kapolei to UH Manoa with a connection to Waikiki as the Locally Preferred Alternative. This identification, which eliminated the TSM and Managed Lane Alternatives from further consideration, became Ordinance 07-001 on January 6, 2007. The NEPA process considered a range of alternatives that was consistent with the identified Locally Preferred Alternative. As discussed in Section 2.2, there were no alternatives that had not been previously studied and eliminated for good cause that would satisfy the Purpose and Need at less cost, with greater effectiveness, or less environmental or community impact.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Subject: Comment on Draft Environmental Impact Statement (DEIS)
"Honolulu High-capacity transit corridor Project",
Issue: DEIS traffic analysis on Air Quality is incomplete

Fact:
DEIS paragraph 4.8.1 methodology states "Air Quality effects predicted to result from the Project's operation are based on the anticipated vehicle miles traveled (VMT) and average network speed for each alternative."

Discussion:

1) City AA, Table 3-12 shows year 2030 forecast volume of 17,500 vph on H-1 (full rated capacity = 9,500 vph) after the Rail is built and operating. Therefore, there is a commuter overload on H-1 Freeway of 8,000 vph.

Result: There will be an 8,000 vph overload on H-1 after Rail is built which will worsen traffic congestion on H-1 resulting in a level of service "F". These 8,000 vehicles will cause major pollution because the Train cannot carry the full commuter demand for yr 2030. = 9,600 commuters per hour.

2) The DEIS Screenline Volumes for the 2030 Salt Lake Build Alternative Table 3-20, shows that with the Salt Lake Build Alternative AT Screen line "D" :

- Kalauao Koko Head bound: Observed (forecast) Volume - AM Peak = 18,910 vehicles per hour (vph).

- Facility 2030 Capacity - AM Peak = 14, 650 vph - Reference: Table 3-12 Alternative Analysis.

Result: There will be 4,260 vph above the facility capacity (H-1 + HOV + Zipper + Kam Hwy + Moanalua) at Kalauao which indicates a Level of Service (LOS) F AFTER the Salt Lake Rail is built. These 4,260 vehicles will cause major pollution because the Train cannot carry the full commuter demand for yr 2030.

Both AA Table 3-12 and DEIS Table 3-20 show that traffic congestion on H-1 will WORSEN after the \$6.0 Billion Rail is built and operating.

DEIS Table 4-12 , 2030 Regional Pollutant Burdens, do not include the pollutants discharged by 8,000 vehicles per hour (equivalent 9,600 commuters per hour) per the AA or 4,260 vph per the DEIS which will

be gridlocked on H-1 Freeway because the low-capacity train cannot accommodate the 2030 commuter demand.

A three lane Managed Lane reversible will substantially eliminate traffic overload on H-1 during peak travel periods thus:

- Numbers from Table 3-12 of city 2006 Nov Alternative Analysis (\$10 million report):
- Rail only: capacity = 6000 commuters per peak hour (equivalent 5000 vehicles per peak hour.)
- H-1 only: rated capacity = 9,500 vehicles per hour (equivalent 15,400 commuters per hour
- H-1 forecast yr 2030 traffic load = 17,500 vehicles per hour per City AA Table 3-12 (or 8,000 vph overload = 9,600 commuters per hour)

Managed Lane three-Lane HOV Reversible Flyover: capacity = 6,000 high occupancy vehicles per hour (equivalent 21,600 commuters per hour). Capacity based on HOV use on Flyover by 200 express buses per peak hour , car pools, van pools, green cars and HOV2. (50 pns per express bus and 5800 vph at avge 2 pns per vehicle).

Year 2030 commuter load by City AA Report = Rail (6000) + H-1 overload (9,600) + H-1 capacity (15,400) = 31,000 commuters.

2030 Load = 31,000 commuters per hour
Rail + H-1 = 21,400 commuters per hour
Managed Lane HOV + H-1 = 37,000 commuters per hour

Finding: Rail does not have sufficient commuter capacity which will cause 9,600 commuters to be stuck in gridlock on H-1 or stuck at rail stations (especially at stations between Waipahu and Kalihi). Managed Lane HOV Alternative will eliminate congestion and bottlenecks on H-1.

Conclusion:

DEIS Pollutant conclusions on Table 4-12 for the Airport and Salt Lake alternatives are incorrect because they do not include pollutants discharged by the additional 8,000 (4,260) vehicles per hour gridlocked on H-1 according to Table 3-12 of the AA and Table 3-20 of the DEIS.

Recommendation: Revise the DEIS findings regarding Pollutant Burdens based on inclusion of the 8,000vph (or 4,260 vph) "overload on H-1" during peak periods.

Dear Mr. Ramelb:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address your comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal dated December 29, 2008 with subject [Comment on Draft Environmental Impact Statement (DEIS) "Honolulu High-capacity transit corridor Project", Issue: DEIS traffic analysis on Air Quality is incomplete]:

Traffic volumes in 2030 under any alternative will be higher than those observed under current conditions. As shown in the Alternatives Analysis Report (DTS 2006b), the Managed Lane Alternative would not eliminate congestion and bottlenecks on the H-1 Freeway. Table 3-12 in the Alternative Analysis Report shows that, under the No Build Alternative, there would be 18,049 vehicles per hour (vph) operating on the H-1 Freeway in 2030. Vehicle volumes rise to 18,327 vph (Two-direction Option) or 18,419 vph (Reversible Option) with the Managed Lane Alternative, while traffic volumes decrease to 17,209 vph with the 20-mile Fixed Guideway Transit Alternative. Accordingly, the Fixed Guideway Transit Alternative will reduce traffic volumes from those projected under the 2030 No Build Alternative.

You are correct that there will be 18,910 vph at the Kalauao screenline in the Koko Head-direction under 2030 Build conditions; however, Table 3-20 also shows that there will be

20,800 vph at that screenline in the Koko Head direction under the 2030 No Build conditions. Accordingly, the table shows a 9 percent reduction in vph at this screenline as a result of the fixed guideway system. In addition, there will be a 12 percent reduction in traffic at this screenline during the p.m. peak hour in the Ewa direction. Numbers have been updated for the Final EIS based on the Airport Alternative and refinements to the travel demand forecasting model to account for non-home-based direct-demand trips (trips that do not originate or end at home) during off-peak periods. In addition, the air passenger model (which forecasts travel in the corridor related to passengers arriving or departing at Honolulu International Airport) was updated to reflect current conditions. These revisions were made based on consultation with FTA. The updated results continue to show that traffic will decrease with the addition of the Project. Tables 3-9 and 3-10 in the Final EIS shows an 11 percent decrease in vph at this screenline during the a.m. peak hour in the Koko Head-bound direction and a 10 percent reduction during the p.m. peak hour in the Ewa-bound direction. This demonstrates that the fixed guideway system will decrease traffic congestion at this location.

According to Chapter 4 of the Final EIS, it is anticipated that the Project will reduce regional pollutant emissions by between 3 to 5 percent, compared to the No Build Alternative. Table 4-15 in the Final EIS shows the results of the analysis. Air quality effects predicted to result from the Project's operation are based on the anticipated vehicle miles traveled (VMT) and average network speed. Travel-demand forecasting results have been updated since the Alternatives Analysis was completed in 2006.

As stated in Chapter 3 of the Final EIS, the travel demand forecasting model predicts a maximum peak direction volume of 14,700 passengers during the a.m. two-hour peak period. As a result of updated ridership forecasts, the operating plan for the fixed guideway system has been revised and the system will have a minimum capacity of approximately 17,300 passengers per direction during the two-hour peak period. The fixed guideway system is planned to operate with two or three car trains with a capacity of between 325 and 500 passengers each. At three-minute headways during the peak period, that provides capacity for approximately 8,650 passengers per peak direction per peak hour. This figure applies in both directions for a total system capacity of approximately 17,300 passengers per peak hour. The numbers presented in your comment understate the capacity of the fixed guideway by a substantial margin.

In addition, a major benefit of the fixed guideway is that once built, it is flexible enough to accommodate significant growth. For example, the full capacity of the fixed guideway with four-car trains and 90-second headways is over 25,000 passengers per hour per direction or over 50,000 in total. Accordingly, the fixed guideway system will provide sufficient capacity based on travel demand forecasting results.

As shown in Table 6-1 of the Final EIS, the Project will cost \$4.6 billion in 2009 dollars and \$5.5 billion in inflated dollars, including finance charges.

As stated previously, the Managed Lane Alternative would not improve congestion on the H-1 Freeway. In addition, as shown in Table 3-10 in the Alternatives Analysis, the Managed Lane Alternative would have a negligible impact on VMT while the Fixed Guideway Alternative would decrease VMT by 3 percent. The Alternatives Analysis found that the Managed Lane Alternative would have generated the greatest amount of air pollution of the alternatives studied. The calculations included in the Draft and Final EISs consider total daily vehicle miles traveled at

the calculated operating speed. Any under-estimation of emissions would occur for all alternatives. Therefore, if the analysis systematically underestimates emissions from congested conditions, the relative reduction in emissions for the Fixed Guideway Alternative compared to the No Build, Transportation System Management, or Managed Lane Alternatives would be greater than the 0 to 8 percent improvement calculated at the time of the Alternatives Analysis.

Chapter 2 of the Final EIS summarizes the alternatives screening and selection process. Beginning in the fall of 2005, an initial screening process considered alternatives identified through previous transit studies, a field review of the study corridor, an analysis of current population and employment data for the study corridor, a literature review of technology modes, ongoing work completed as part of the Oahu Regional Transportation Plan 2030 (ORTP) prepared by the Oahu Metropolitan Planning Organization (OahuMPO) (OahuMPO 2007), and public and agency comments received during the formal Alternatives Analysis scoping process.

The screening process is documented in the Honolulu High-Capacity Transit Corridor Project Alternatives Screening Memorandum (DTS 2006a). Three scoping meetings were held during the screening process in December 2005, which included a presentation of initial alternatives to the public, interested agencies, and officials to receive comments on the Purpose and Need, alternatives, and scope of the Alternatives Analysis. Refinements were made to the alternatives based on the public input during scoping.

After completion of screening in the winter of 2006, the following alternatives were studied in the Alternatives Analysis: No Build Alternative, Transportation System Management (TSM) Alternative, Managed Lane Alternative, and the Fixed Guideway Alternative. After review of the Alternatives Analysis Report and consideration of public comments, the City Council identified a fixed guideway transit system extending from Kapolei to UH Manoa with a connection to Waikiki as the Locally Preferred Alternative. This identification, which eliminated the TSM and Managed Lane Alternatives from further consideration, became Ordinance 07-001 on January 6, 2007. The NEPA process considered a range of alternatives that was consistent with the identified Locally Preferred Alternative. As discussed in Section 2.2, there were no alternatives that had not been previously studied and eliminated for good cause that would satisfy the Purpose and Need at less cost, with greater effectiveness, or less environmental or community impact.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

FAX: (808) 587-6080

Subject: Comment on Draft Environmental Impact Statement (DEIS)
"Honolulu High-capacity transit corridor Project", Issue: DEIS provides
misleading information on Managed Lane Alternative (MLA)

Fact:

DEIS page 2-5, paragraph 4, states "The Managed Lane Alternative
would have generated the greatest amount of air pollution, required the
greatest amount of energy for transportation...."

Discussion:

1) Table 3-12 of the Alternative Analysis, a.m. peak hour Screenline
Volume at Kalauao, shows that traffic volume on H-1 (full rated capacity
9,500 vph) rises from the current 11,000 vph to 17,400 vph in 2030 after
the \$6.0 Billion Rail is built and operating. Conclusion: After
expenditure of \$6.0 Billion for rail, traffic overload on H-1 will increase
from 1,500 vph to nearly 8,000 vph and will not eliminate the traffic
bottlenecks at the H-1/H-2 merge and at the Middle Street merge.

2) The three-lane MLA has the capacity to eliminate the two major H-1
bottlenecks:

From Table 3-12 of city 2006 Nov Alternative Analysis:

- Rail only: capacity = 6000 commuters per peak hour (equivalent 5000
vehicles per peak hour.)
- H-1 only: rated capacity = 9,500 vehicles per hour (equivalent 15,400
commuters per hour)
- H-1 forecast yr 2030 traffic load = 17,500 vehicles per hour per City
AA Table 3-12 (or 8,000 vph overload = 9,600 commuters per hour)

- Managed Lane three-Lane HOV Reversible Flyover: capacity = 6,000
high occupancy vehicles per hour (equivalent 21,600 commuters per
hour). Capacity based on HOV use on Flyover by 200 express buses
per peak hour, car pools, van pools, green cars and HOV2. (50 pns per
express bus and 5800 vph at avge two persons per vehicle).

- Year 2030 commuter load by City AA Report = Rail (6000) + H-1
overload (9,600) + H-1 capacity (15,400) = 31,000 commuters.

2030 Load = 31,000 commuters per hour

Rail + H-1 = 21,400 commuters per hour

Managed Lane HOV + H-1 = 37,000 commuters per hour

Based on above calculations, rail does not have sufficient commuter
capacity which will cause 9,600 commuters to be stuck in gridlock on H-
1 or stuck at rail stations (especially at stations between Waipahu and

Kalihi). Managed Lane HOV Alternative will eliminate congestion and bottlenecks on H-1.

3) Rail will result in causing 17,400 vph to be stuck in gridlock on H-1 and will thus cause more pollution and more gas used by commuters. Conversely, the MLA will eliminate traffic gridlock on H-1, create more efficient commuter travel and will therefore cause less pollution and energy use than rail transit.

Recommendation:

It is recommended that the DEIS be revised throughout to indicate that the MLA causes less pollution and energy use than rail transit and that the Managed Lane Alternative be reinstated into the DEIS for further consideration as the locally preferred alternative.

Mr. Ben Ramelb
1148 Ala Liliko'i Street
Honolulu, Hawaii 96818

Dear Mr. Ramelb:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal dated December 29, 2008 with subject [Comment on Draft Environmental Impact Statement (DEIS) "Honolulu High-capacity transit corridor Project", Issue: DEIS provides misleading information on Managed Lane Alternative (MLA)]:

Traffic volumes in 2030 under any alternative will be higher than those observed under current conditions. As shown in the Alternatives Analysis Report (DTS 2006b), the Managed Lane Alternative would not eliminate congestion and bottlenecks on the H-1 Freeway. Table 3-12 in the Alternative Analysis Report shows that, under the No Build Alternative, there would be 18,049 vehicles per hour (vph) operating on the H-1 Freeway in 2030. Vehicle volumes rise to 18,327 vph (Two-direction Option) or 18,419 vph (Reversible Option) with the Managed Lane Alternative, while traffic volumes decrease to 17,209 vph with the 20-mile Fixed Guideway Transit Alternative. Accordingly, the Fixed Guideway Transit Alternative will reduce traffic volumes from those projected under the 2030 No Build Alternative.

Since the Draft EIS was published, the travel demand model has been refined by adding an updated air passenger model (which forecasts travel in the corridor related to passengers arriving or departing at Honolulu International Airport), defining more realistic drive access modes (driving alone or car pooling) to project stations and recognizing a more robust off-peak non-home-based direct demand element (trips that do not originate at home) based on travel surveys in Honolulu. These revisions were made based on consultation with FTA. As stated in Chapter 3 of the Final EIS, the travel demand forecasting model predicts a maximum peak direction volume of 14,700 passengers during the a.m. two-hour peak period. As a result of updated ridership forecasts, the operating plan for the fixed guideway system has been revised and the system will have a minimum capacity of approximately 17,300 passengers per direction during the two-hour peak period. The fixed guideway system is planned to operate with two- or three-car trains with a capacity of between 325 and 500 passengers each. At three-minute headways during the peak period, that provides capacity for approximately 8,650 passengers per peak direction per peak hour. This figure applies in both directions for a total system capacity of approximately 17,300 passengers per peak hour. The numbers presented in your comment understate the capacity of the fixed guideway by a substantial margin.

In addition, a major benefit of the fixed guideway is that once built, it is flexible enough to accommodate significant growth. For example, the full capacity of the fixed guideway with four-car trains and 90-second headways is over 25,000 passengers per hour per direction or over 50,000 in total. Accordingly, the fixed guideway system will provide sufficient capacity based on travel demand forecasting results.

To address your recommendation, as detailed in the Alternatives Analysis, the Managed Lane Alternative would result in greater air pollution emissions and energy consumption than the Fixed Guideway Transit Alternative. Air quality effects predicted to result from the Project's operation are based on the anticipated vehicle miles traveled (VMT) and average network speed. As shown in Table 3-10 in the Alternatives Analysis Report, the Managed Lane Alternative would have a negligible impact on VMT while the Fixed Guideway Alternative would decrease VMT by 3 percent. As stated previously, the Managed Lane Alternative will not improve traffic congestion on the H-1 Freeway.

Chapter 2 of the Final EIS summarizes the alternatives screening and selection process. Beginning in the fall of 2005, an initial screening process considered alternatives identified through previous transit studies, a field review of the study corridor, an analysis of current population and employment data for the study corridor, a literature review of technology modes, ongoing work completed as part of the Oahu Regional Transportation Plan 2030 (ORTP) prepared by the Oahu Metropolitan Planning Organization (OahuMPO) (OahuMPO 2007), and public and agency comments received during the formal Alternatives Analysis scoping process.

The screening process is documented in the Honolulu High-Capacity Transit Corridor Project Alternatives Screening Memorandum (DTS 2006a). Three scoping meetings were held during the screening process in December 2005, which included a presentation of initial alternatives to the public, interested agencies, and officials to receive comments on the Purpose and Need, alternatives, and scope of the Alternatives Analysis. Refinements were made to the alternatives based on the public input during scoping.

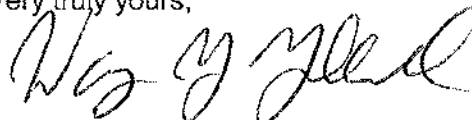

Mr. Ben Ramelb

Page 3

After completion of screening in the winter of 2006, the following alternatives were studied in the Alternatives Analysis: No Build Alternative, Transportation System Management (TSM) Alternative, Managed Lane Alternative, and the Fixed Guideway Alternative. After review of the Alternatives Analysis Report and consideration of public comments, the City Council identified a fixed guideway transit system extending from Kapolei to UH Manoa with a connection to Waikiki as the Locally Preferred Alternative. This identification, which eliminated the TSM and Managed Lane Alternatives from further consideration, became Ordinance 07-001 on January 6, 2007. The NEPA process considered a range of alternatives that was consistent with the identified Locally Preferred Alternative. As discussed in Section 2.2, there were no alternatives that had not been previously studied and eliminated for good cause that would satisfy the Purpose and Need at less cost, with greater effectiveness, or less environmental or community impact.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Subject: Comment on Draft Environmental Impact Statement (DEIS)
"Honolulu High-capacity transit corridor Project", issue: DEIS traffic
analysis shows traffic Congestion could cost Oahu jobs

Fact:

. The City Alternative Analysis, Table 3-12, shows that there will still be 17,500 vehicles per hour in 2030 on the H-1 (full rated capacity = 9,500 vehicles per hour) at Pearl City AFTER the \$7.0 Billion Rail is built and operating.

Result: With rail, the above numbers show congestion will WORSEN after the \$6.2 Billion Minimum operable Segment Rail is completed.

The DEIS Screenline Volumes for the 2030 Salt Lake Build Alternative Table 3-20, shows that with the Salt Lake Build Alternative at Screen line "D" :

- Kalauao Koko Head bound : Observed (forecast) Volume - AM Peak = 18,910 vehicles per hour (vph).
- Facility 2030 Capacity - AM Peak = 14, 650 vph - Reference: Table 3-12 Alternative Analysis.

Result: There will be 4,260 vph above the facility capacity (H-1 + HOV + Zipper + Kam+ Moanalua) at Kalauao which indicates a Level of Service (LOS) F AFTER the Salt Lake Rail is built. This conclusion is consistent with the conclusion using the numbers from the City's Alternative analysis report. With rail, the above numbers show congestion will WORSEN after the \$7.0 Billion full build-out Rail is completed.

Discussion:

Traffic congestion could cost state jobs. See

http://www.ajc.com:80/metro/content/metro/stories/2008/11/13/transportation_study_traffic_economy.html

"Transportation woes could cost Georgia 320,000 potential jobs and \$515 billion in economic benefits over the next 20 years if the state sticks to "continued traffic congestion or business as usual," according to a new state report. Traffic jams and the lack of access to reliable transportation in metro Atlanta will increasingly limit the number of jobs people can commute to, and the number of potential workers an employer can expect to attract, according to the study presented to the state Transportation Board."

Rail will worsen traffic congestion according to City and County of Honolulu DEIS Table 3-20 and AA table 3-12.

Conclusion: The traffic analysis included in the detailed Alternative

Analysis Table 3-12 and DEIS Table 3-20 show that a rail alternative "worsens" traffic congestion on most highways which could cost Oahu jobs.

Recommendation: Include additional cost-effective mass transit alternatives which will substantially reduce or eliminate traffic congestion in the West Oahu Traffic Corridor. These alternatives include BRT, 11 mile three-lane Managed Lane, elevated three-lane, 15 mile EzWay and two highway bypasses around the bottlenecks at Pearl City and at Middle street. Each of these alternatives are estimated to cost less than \$1.2 Billion, much less than the \$6.2 Billion Rail Alternatives which will worsen traffic congestion.

Dear Mr. Ramelb:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal dated December 29, 2008 with subject [Comment on Draft Environmental Impact Statement (DEIS) "Honolulu High-capacity transit corridor Project", Issue: DEIS traffic analysis shows traffic Congestion could cost Oahu jobs]:

Neither Table 3-12 in the Alternative Analysis nor Table 3-20 in the Draft EIS show that rail would worsen traffic. Table 3-12 shows that roadway conditions will be worse in 2030 whether the fixed guideway, managed lane, or more buses are implemented. However, traffic conditions will be better with the fixed guideway compared to conditions without it. As shown in the Alternatives Analysis Report (DTS 2006b), the Managed Lane Alternative would not eliminate congestion and bottlenecks on the H-1 Freeway. Table 3-12 in the Alternative Analysis Report shows that, under the No Build Alternative, there would be 18,049 vehicles per hour (vph) operating on the H-1 Freeway in 2030. Vehicle volumes rise to 18,327 vph (Two-direction Option) or 18,419 vph (Reversible Option) with the Managed Lane Alternative, while traffic volumes decrease to 17,209 vph with the 20-mile Fixed Guideway Transit Alternative. Accordingly, the Fixed Guideway Transit Alternative will reduce traffic volumes from those projected under the 2030 No Build Alternative.

Table 3-20 in the Draft EIS shows 20,800 vehicles per hour (vph) at the Kalauao screenline (virtual lines across the corridor used to measure total travel at that point) in the Koko Head-bound direction during the a.m. peak hour with the No Build Alternative. This number decreases 9 percent with the addition of the Salt Lake Alternative to 18,910 vph. Numbers have been updated for the Final EIS based on the Airport Alternative and refinements to the travel demand forecasting model to account for non-home-based direct-demand trips (trips that do not originate or end at home) during off-peak periods. In addition, the air passenger model (which forecasts travel in the corridor related to passengers arriving or departing at Honolulu International Airport) was updated to reflect current conditions. These revisions were made based on consultation with FTA. The updated results continue to show that traffic will decrease with the addition of the Project. Tables 3-9 and 3-10 in the Final EIS shows an 11 percent decrease in vph at this screenline during the a.m. peak hour in the Koko Head-bound direction and a 10 percent reduction during the p.m. peak hour in the Ewa-bound direction. This demonstrates that the fixed guideway system will decrease traffic congestion at this location.

Regarding your recommendation, non-rail alternatives, including a Managed Lane Alternative, were evaluated in the Alternative Analysis. Scoping carried out under the NEPA process confirmed that the alternatives previously studied and eliminated for good cause would not satisfy the Purpose and Need at less cost, with greater effectiveness, or with less environmental or community impact. During the scoping process, several comments were received requesting reconsideration of the Managed Lane Alternative. These were considered and rejected during the Alternatives Analysis process. Because no new information was provided that would have substantially changed the findings of the Alternatives Analysis process regarding the Managed Lane Alternative, this alternative was not included in the Draft EIS. As a result, the Final EIS has not been revised to include non-rail options.

As stated in Chapter 2 of the Final EIS, prior to selecting an elevated fixed guideway system, a variety of high-capacity transit options were evaluated during the Primary Corridor Transportation Project (1998-2002) and Alternatives Analysis. Options evaluated and rejected include an exclusively at-grade fixed guideway system using bus rapid transit vehicles. In addition to comments received during the Alternatives Analysis and EIS scoping sessions, these studies provided a critical foundation for the conclusion that an elevated system would result in the best overall performance and better support of the Purpose and Need for the Project. In addition, the proposed Bus Rapid Transit Alternative, as stated in your letter, is a variation of the Transportation System Management Alternative that was evaluated in the Alternatives Analysis. While this alternative has merit for cost-effectiveness, its overall system benefit would be very low.

System-wide congestion will be greater in 2030 than today. While the Managed Lane Alternative would reduce spot-congestion (measured as vehicle hours of delay) in some locations, it would also increase overall system congestion by inducing additional travelers to drive, which would increase congestion on arterial and collector facilities accessing the freeways. In addition, once a vehicle leaves the managed lane, that vehicle is still subjected to congestion on surrounding roadways. Meanwhile the Fixed Guideway Transit Alternative will decrease congestion compared to the No Build Alternative.

There could be many other versions of the type of system with minor adaptations to suit one or another special concern. In the end, the above approaches all have similar challenges as a primary solution to Honolulu's transportation problems. They do not reduce congestion, increase the reliability of the transportation system, serve future land use plans, or improve the

fairness of and access to the transportation system. They also do not offer an alternative to perpetuating a reliance on limited existing travel modes. For example, localized bypasses would not meet system goals for corridor-wide benefits to mobility, reliability, access, and equity. In sum, they do not address the Purpose and Need of the Project.

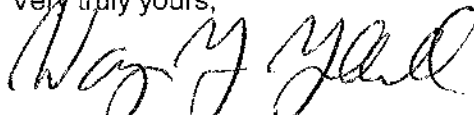

The EzWay 15-mile, three-lane viaduct concept was developed as a hybrid of a plan for elevated toll lanes and some form of rubber-tire-on-concrete transit system. It is similar to the Managed Lane Alternative that was thoroughly evaluated in the Alternatives Analysis, which also accommodated both single occupant and transit vehicles. No known cost estimate for the EzWay proposal was prepared or validated by a qualified registered professional engineer. As a point of reference, the State of Hawaii's Highway Modernization Plan dated January 22, 2009, estimates the cost of the Nimitz Viaduct at \$600 million for an approximately 2.5-mile elevated highway with two lanes, which equals \$240 million per mile. Using this estimate, a 15-mile facility would cost approximately \$3.6 billion.

Localized bypasses would not meet system goals for corridor-wide benefits to mobility, reliability, access, and equity. The Hawaii Department of Transportation, which is responsible for the freeway system, has evaluated needs for the freeway system and identified the highway projects that would be most efficient at reducing congestion on Oahu. The projects, including a Nimitz Flyover, are listed in Table 2-3 of the Draft EIS and included in the analysis for all project alternatives. Effects of the Nimitz Flyover on traffic conditions in 2030 are discussed in Section 3.4.2 of the Final EIS. Travel on the Nimitz Flyover was included for the following travel pairs under the No Build Alternative: Kapolei to Downtown, Ewa to Downtown, and Mililani to Downtown. As shown in Figure 3-7 of the Final EIS, the Nimitz Flyover does improve transit travel times with the No Build Alternative between certain travel pairs (e.g., between Mililani and Downtown) compared to 2007 conditions. However, as also shown in this figure, travel times improve substantially more with the addition of the Project. As a point of clarification, a Final EIS was never prepared for the Nimitz Flyover.

Lastly, as shown in Table 6-1 of the Final EIS, the Project will cost \$4.6 billion in 2009 dollars and \$5.5 billion in inflated dollars, including finance charges.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Subject: Comment on Draft Environmental Impact Statement (DEIS)
"Honolulu High-capacity transit corridor Project", Issue- Project
Construction Phasing will not provide early traffic relief

Fact:

The rail project construction phasing is proposed in four phases as discussed on DEIS page 2-38 and as shown on Figure 2-44 as follows:

- East Kapolei to Pearl Highlands (First Construction Phase)
- Pearl Highlands to Aloha Stadium (Second Construction Phase)
- Aloha Stadium to Middle Street (Third Construction Phase)
- Middle Street to Ala Moana Shopping Center (Fourth and final Construction Phase)

Discussion:

The primary purpose of any mass transit system is to provide traffic relief and to provide relief in the near term. The major West and Central Oahu traffic bottlenecks are at the Middle Street merge and at the H-1/H2 merge. Construction phases for the rail should be prioritized to reduce the traffic bottlenecks at these two locations. Therefore, the project construction phasing shown above should be reversed:

- Middle Street to Ala Moana Shopping Center (First Construction Phase)
- Aloha Stadium to Middle Street (Second Construction Phase)
- Pearl Highlands to Aloha Stadium (Third Construction Phase)
- East Kapolei to Pearl Highlands (Fourth Construction Phase)

This revised project phasing is logical because:

- a) The Middle Street to Ala Moana Shopping Center first phase will provide early traffic relief to the Middle Street bottle neck.
- b) The funding source for the entire 20 mile segment is not guaranteed, recognizing that the General Excise Tax is not meeting projections in revenue due to the expected long term slumping economy. The taxpayer will not tolerate any increase in property tax or GET to fund any rail fund shortfall.
- c) The funding amount from the Federal Transit Authority is not guaranteed.
- d) If rail funds are delayed, providing traffic relief to the traffic bottlenecks on H-1 will be delayed.

e) Each phase for rail will provide the maximum bang for the dollar. The rail will be completely useable and serve the most number of commuters as each phase is completed. Conversely, the Kapolei to Pearl Highlands would serve very few commuters as most commuters will be destined for east of Pearl Harbor and beyond in the easterly direction.

Vehicle Maintenance and Storage Facility for each construction phase can be temporarily established to support each construction phase as modified:

- a) For the Middle Street phase, some 40 acres could be obtained along Lagoon Drive to include portions of Keehi Lagoon Park, Airport vacant areas and commercial businesses including Used Car Lots. At least 10 acres for park and ride can be acquired in the airport area alongside Aolele Street and Lagoon Drive.
- b) For the Aloha Stadium phase, portions of the Aloha Stadium Parking lot can be temporarily used for the Storage Facility and temp facilities for vehicle maintenance.
- c) For the Pearl Highlands Phase, a 43-acre vacant site near Leeward Community College is available (DEIS figure 2-42).
- d) A 41-acre site is identified for the Kapolei phase (DEIS figure 2-41).

Conclusion:

Construction of the Middle Street to Ala Moana Phase as a first priority is consistent with providing near-term traffic relief, will initially serve the most number of commuters, will be completely useable and cost effective, and will not force the taxpayer to pay more taxes to fund additional rail segments should rail funding sources not achieve revenue projections.

Recommendation:

The DEIS should reverse the construction project phasing as discussed above starting with the Middle Street to Ala Moana Shopping Center as the First Phase.

Dear Mr. Ramelb:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal dated December 29, 2008 with subject line [Comment on Draft Environmental Impact Statement (DEIS) "Honolulu High-capacity transit corridor Project", Issue-Project Construction Phasing will not provide early traffic relief]:

As described in Section 2.5.10, Project Phasing, of the Final EIS, to support phased opening of the system, the first construction phase must be connected to a maintenance and storage facility, which requires considerable land. The first phase of the Project must be connected to the maintenance and storage facility because, in addition to maintenance of equipment and ongoing operations, this facility houses the main control center for the entire Project. Accordingly, the required testing and operation of the system could not be completed without access to it. No location has been identified closer to Downtown with sufficient available land to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations*
- *Reduce the time that each area will experience traffic and community disturbances*
- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding*
- *Match the rate of construction to what can be maintained with local workforce and available financial resources*
- *Balance expenditure of funds to minimize borrowing*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

The financial plan is balanced for the entire Project so there will not be a situation in which only a portion of the system will be built. If there is a shortfall, additional revenue sources will be considered. Section 6.6 of the Final EIS discusses risks and uncertainties, as well as potential sources to cover shortfalls.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Subject: Comment on Draft Environmental Impact Statement (DEIS)
"Honolulu High-capacity transit corridor Project", Issue: Displacement of
Homes and Churches should be minimized

Fact:
The DEIS Table 2-6 and Figure 2-20 shows the park and ride facility at
Pearl Highlands to be 11 acres and 1600 vehicular parking spaces. The
11 acres "Banana Patch" contain several family homes, farmland and
church facilities which have been in existence for 30 to 60 years.

Discussion:
It would be considered an environmental injustice to displace the many
families on the 11 acre property because there are better alternatives to
the 11 acre Park-and-Ride facility.

Figure 2-42 shows a 43-acre vacant adjacent to the Leeward
Community College (LCC site). The DEIS states that this 43 acre LCC
site is reserved for potential use for a Vehicle Maintenance and Storage
Area (VMSA). Since only one VMSA is needed for the rail project, there
are three alternative sites for the VMSA:

- 1) At the Honolulu Airport east end, some 40 acres could be acquired
along Lagoon Drive and Aolele Street to include portions of Keahi
Lagoon Park, Airport vacant areas and commercial businesses including
Budget Car Rental
- 2) Portions of the Aloha Stadium Parking lot can be used for the VMSA.
Multi-story vehicular parking structures could be built to accommodate
the loss in sports events parking.
- 3) A 41-acre site for VMSA is identified in Kapotei (DEIS figure 2-41).

A further alternative is to reduce the size of the VMSA at the 43-acre
LCC site by splitting the VMSA facility between the LCC site and one of
the other alternative sites mentioned above.. This area reduction will
allow the reservation of 10 to 15 acres for a park and ride facility on the
LCC site.

The best alternative is to dedicate the entire vacant 43-acre LCC site for
a 23-acre Transit Oriented Development (TOD) and a 20-acre Park-
and-ride facility for 3,000 vehicles for rail commuters.

Conclusion:

- a) The use of the LCC site for Park and Ride instead of the 11-acre "Banana Patch " site will eliminate the need to displace several families, farm land and church facilities.
- b) There are alternative sites for VMSA facilities other than the LCC site.
- c) The LCC site provides a greater amount of parking spaces for rail commuters.

Recommendation:

It is recommended that the LCC site be used for a 23-acre Transit Oriented Development (TOD) and a 20-acre Park-and-ride facility for 3,000 vehicles for rail commuters.

Dear Mr. Ramelb:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal dated December 29, 2008 with subject line [Comment on Draft Environmental Impact Statement (DEIS) "Honolulu High-capacity transit corridor Project", Issue: Displacement of Homes and Churches should be minimized]:

As discussed in Section 4.7.6 of the Final EIS, the City has been coordinating with residents of the Banana Patch community since October 2008. Every household has been visited by City staff, right-of-way staff, and engineering staff to discuss the Project, as well as special needs and relocation assistance for residents who will be displaced. Strategic outreach was conducted for this neighborhood, and it was found the residents were mostly interested in learning more about the right-of-way acquisition process. Residents asked when acquisition might occur, how their property would be appraised, and how soon they might receive compensation. Residents of the community did not object to being relocated to decent, safe, and sanitary housing in compliance with the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act. Nor was there concern expressed about keeping the community intact for relocation purposes.

Mr. Ben Ramelb
Page 2

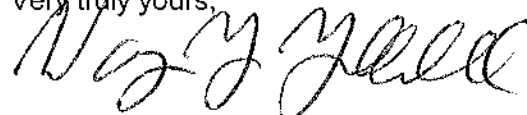

Leeward Community College was evaluated as a site for the park-and-ride facility to avoid displacement of families living in the area of the Pearl Highlands Station. This alternative was evaluated in the Draft EIS as an avoidance alternative in Chapter 5. The analysis concluded that this alternative was not feasible. "Under this alternative, the H-2 Freeway access ramp would need to be re-designed from a one-way ramp to a two-way ramp. This would cost approximately \$50 million more than the ramps that would serve the Pearl Highlands Station. For this location, the access road for Leeward Community College would also require improvement, which would cost approximately \$25 million. In addition, the guideway's crossing of the H-1 Freeway would need to be realigned, costing an additional \$5 million."

In addition to the \$80 million of roadway and guideway improvements discussed above, it would cost an additional \$1 million to acquire right-of-way from the Hawaii Laborers Training Program site Koko Head and makai of the ramp connecting Farrington Highway to Kamehameha Highway, as well as loss of parking for Leeward Community College, which would cost \$30 million to replace. These costs would be offset by approximately \$20 million since the Pearl Highlands Station would not be constructed under this avoidance alternative.

Your letter suggested three alternative sites for the maintenance and storage facility. As stated in Chapter 2 of the Final EIS, the site near Leeward Community College has been identified as the preferred location for the maintenance and storage facility. Your suggestion for sites along Lagoon Drive and Aloha Stadium cannot be used as both Keehi Lagoon Park and Aloha Stadium are recreational facilities that may not be converted to transportation use per Section 4(f) of the Transportation Act of 1966. In addition, splitting the maintenance and storage functions between multiple sites would make the rail operations less efficient, increase both construction and operating costs, and would require more property acquisitions. Your final suggestion to use a 43-acre site near LCC for park-and-ride and transit-oriented development would be difficult to implement due to poor highway access. Furthermore, this site is a potential location for the maintenance and storage facility.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

"Honolulu High-capacity transit corridor Project", Issue: Land Acquisition
should be minimized by routing the fixed guideway over Nimitz Highway
instead of over Dillingham Boulevard.

Fact:

Numerous land acquisitions are required to build the fixed guideway
along Dillingham Blvd which will cause disruption to businesses, homes
and increase traffic congestion on Dillingham Blvd.

A fixed guideway route over Nimitz Highway instead of along Dillingham
Blvd will cause less disruption and result in lower cost for the project.

It is noted that the Oahu Regional Transportation Plan (ORTP) 2030
shows a two lane Nimitz Flyover over the median of Nimitz Highway
which could conflict with the proposed fixed guideway over Nimitz
Highway. If the Nimitz Flyover is built, it is suggested that both the
Nimitz "Flyover" and the fixed guideway be built within the elevated
Nimitz Highway right of way corridor. In this case, the two-lane "Nimitz
HOV Flyover (reversible)" can be built alongside and parallel to the fixed
guideway transit. The fixed guideway with a capacity of 6,000
commuters per hour and the two-lane "Nimitz Flyover", with a capacity of
4,000 vehicles per hour, should be adequate to substantially reduce the
bottleneck at the Middle Street Merge and on Dillingham Blvd between
Keehi Lagoon and downtown Hotel Street.

The Nimitz Flyover (reversible) should be connected to the Airport
Viaduct at Keehi Lagoon to Alakea Street/Halekauwila St via an
underpass and to Hotel Street Mall via an elevated busway. These
connections are described in a Managed Lane Study "Transportation
Alternatives Analysis for Mitigating Traffic congestion between Leeward
Oahu and Honolulu". The full report is available at
www.eng.hawaii.edu/~panos/UHCS.pdf.

The initial 2005 cost for the 10 mile Tampa Reversible was \$320 million
or \$32 Million per highway mile, however, a geotechnical design error
increased the cost to \$420 million or \$42 million per mile. Using a
geographic and escalation factor of 100 percent, the 3-mile Nimitz HOV
Reversible Flyover at \$60 to \$80 million per mile would cost between
\$180 million to \$240 million.

Recommendation:

It is recommended that the fixed guideway route be over Nimitz Highway
instead of Dillingham Blvd to minimize disruption of homes and

businesses and minimize traffic congestion along Dillingham Blvd.

Mr. Ben Ramelb
1148 Ala Lilikoi Street
Honolulu, Hawaii 96818

Dear Mr. Ramelb:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal dated December 29, 2008 with subject line [Comment on Draft Environmental Impact Statement (DEIS) "Honolulu High-capacity transit corridor Project", Issue: Land Acquisition should be minimized by routing the fixed guideway over Nimitz Highway instead of over Dillingham Boulevard]:

Your comments have been noted. As stated in the Honolulu High-Capacity Transit Corridor Project Alternatives Screening Memorandum (DTS 2006a), five alignments between Keehi Interchange and Moanalua Stream to Iwilei Road were studied, including an alignment along Nimitz Highway. The Screening Memorandum concluded that a fixed-guideway alignment along Nimitz Highway would conflict with the elevated high-occupancy vehicle facility proposed in the 2030 Oahu Regional Transportation Plan. The Nimitz Highway alignment would provide employee access to industrial facilities makai of the roadway, but much of the highway in this area has long standing industrial development and does not offer as much opportunity for new development as the Dillingham Boulevard alignment. The projected population and employment

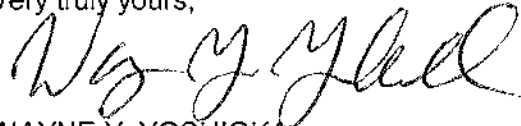

Mr. Ben Ramelb
Page 2

densities along the Nimitz Highway were the lowest of all the alignments in this section. As a result of these findings, the Nimitz Highway alignment was not carried forward into the Alternatives Analysis.

Any comments you may have on the Nimitz Flyover Project should be directed to the Hawaii Department of Transportation. The State of Hawaii's Highway Modernization Plan dated January 22, 2009, estimates the cost of the Nimitz Viaduct at \$600 million for an approximately 2.5-mile elevated highway with two lanes, which equals \$240 million per mile.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is fluid and cursive, written over the typed name.

Subject: Comment on Draft Environmental Impact Statement (DEIS)
"Honolulu High-capacity transit corridor Project", Issue: Fixed Guide
way Alternative is not Cost Effective because it does not provide traffic
relief despite its cost of at least \$6.0 Billion

Facts:

Table 3-12 of the 2006 Alternative Analysis shows that the a.m. Koko
Head Bound at Kalauao Stream traffic volume on H-1 Freeway (volume
capacity = 9,500 vph) will increase from 10,960 vehicles per hour to
17,209 vph in year 2030. This congestion will increase after the \$6.0
Billion Fixed guideway is built and operating. This raises the question:
Why build a \$6.0 Billion rail if it does not eliminated or substantially
reduce the congestion on H-1 at Kalauao Stream? The very high cost of
the rail is certainly not cost effective if it does not reduce the congestion
on H-1 at the H-1/H-2 merge and at the H-1 middle Street merge during
the a.m Koko Head bound peak hour traffic.

Discussion:

A combination of a new Kamehameha Flyover at a cost of \$320 million
and a Nimitz Flyover at a cost of \$240 million is cost effective which will
eliminate the congestion on H-1 at Kalauao Stream and at Middle Street
merge and is a superior alternative to the fixed guideway.

Kamehameha Flyover, Reversible HOV:

The Kamehameha HOV Flyover (Reversible) is a 3-mile reversible,
elevated, three-lane structure over the median of Kamehameha Highway
from the H-1/H-2 merge at the Waiawa Interchange to the Airport
Viaduct just east of the Aloha Stadium. The Flyover would be built
similar to the Tampa Elevated three-lane Reversible HOV as described
in- <http://www.tollroadsnews.com/node/172> .

The Kamehameha Flyover would be connected to H-1, H-2,
Kamehameha Highway and Farrington Highway at the west end and to
the Airport Viaduct at the east end. These connections are described in
a Managed Lane Study "Transportation Alternatives Analysis for
Mitigating Traffic congestion between Leeward Oahu and Honolulu". The
full report is available at www.eng.hawaii.edu/~panos/UHCS.pdf.

The initial 2005 cost for the 10 mile Tampa Reversible was \$320 million
or \$32 Million per highway mile, however, a geotechnical design error
increased the cost to \$420 million or \$42 million per mile. Using a
geographic and escalation factor of 100 percent, the 4-mile
Kamehameha HOV Flyover at \$60 to \$80 million per mile would cost
between \$240 million to \$320 million.

The Kamehameha Three-Lane HOV Reversible Flyover has a capacity
of 6,000 high occupancy vehicles per hour (equivalent 21,600

commuters per hour). This capacity is based on HOV use on Flyover by 200 express buses per peak hour, car pools, van pools, green cars and HOV2. (50 pns per express bus and 5800 vph at avge 2 pns per vehicle).

There is a projected 8,000 vph overload on H-1 during am peak at Kalauao Stream per Table 3-12 of the Alternative Analysis. This 8,000 vph overload equates to 9,600 commuters per hour. Therefore, the three-lane Kamehameha Flyover (cap = 21,600 commuters) has ample capacity to accommodate the H-1 overload (9,600 commuters).

The Draft Environmental Impact Statement (DEIS) - Honolulu High-Capacity Transit Corridor Project Nov 2008, shows the rail route over Kamehameha Highway between Pearl City and Aloha Stadium which could conflict with the proposed three-lane "Kamehameha Flyover" route outlined above. If the rail is built, it is suggested that both the Kamehameha Highway "Flyover" and the Rail be built within the elevated Kamehameha Highway corridor. In this case, only a two-lane "Kamehameha Flyover" is needed (instead of three-lanes) to be built alongside and parallel to the Rail transit. The rail with a capacity of 6,000 commuters per hour and the two-lane "Kamehameha Flyover", with a capacity of 4,000 vehicles per hour, should be adequate to substantially reduce the bottleneck at the H-1/H-2 merge and the traffic congestion on H-1 between Pearl City and Aloha Stadium.

Nimitz Flyover, Reversible HOV:

The Nimitz HOV Flyover is a 3-mile reversible, elevated, three-lane structure over the Nimitz Highway median from the Airport Viaduct at Keeki Lagoon to Hotel Street and Alakea St/Halekiau St. The Flyover would be built similar to the Tampa Elevated three-lane Reversible HOV as described in-

<http://www.tolroadsnews.com/node/172>

One of the three lanes would exit the Flyover at Waikamilo Rd. to provide access to job centers in Kalihi, resulting in the Flyover having only two lanes entering downtown. The downtown terminal connections from the Nimitz HOV Flyover include an elevated busway from Iwii to Hotel Street and a single lane underpass to both Alakea St/Halekiau Streets. These connections are described in a Managed Lane Study "Transportation Alternatives Analysis for Mitigating Traffic congestion between Leeward Oahu and Honolulu". The full report is available at www.eng.hawaii.edu/~panos/UHCS.pdf.

The initial 2005 cost for the 10 mile Tampa Reversible was \$320 million or \$32 Million per highway mile, however, a geotechnical design error increased the cost to \$420 million or \$42 million per mile. Using a geographic and escalation factor of 100 percent, the 3-mile Nimitz HOV Flyover at \$60 to \$80 million per mile would cost \$180 million to \$240 million.

The "Nimitz Flyover" has an approved Final Environmental Impact Statement which allows for early construction.

Conclusion:

The \$6.0 Billion Fixed guideway rail is NOT cost effective because it does not eliminate the congestion at the H-1/H-2 merge and at the H-1 Middle Street merge while the \$320 million Kamehameha Flyover and \$240 million Nimitz Flyover are very cost effective because both have

lower construction cost as compared with the Fixed rail guideway.

Recommendation:

It is recommended that DEIS include a Kamehameha Flyover (reversible three lane elevated) and a Nimitz Flyover (reversible three lane elevated) as a transit Alternative to provide traffic relief.

Dear Mr. Ramelb:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal dated December 29, 2008 with subject line [Comment on Draft Environmental Impact Statement (DEIS) "Honolulu High-capacity transit corridor Project", Issue: Fixed Guide way Alternative is not Cost Effective because it does not provide traffic relief despite its cost of at least \$6.0 Billion]:

Regarding your first point, as described in Section 2.5.10 of the Final EIS, to support phased opening of the system, the first construction phase must be connected to a maintenance and storage facility, which requires considerable land. The first phase of the Project must be connected to the maintenance and storage facility because, in addition to maintenance of equipment and ongoing operations, this facility houses the main control center for the entire Project. Accordingly, the required testing and operation of the system could not be completed without access to it. No location has been identified closer to Downtown with sufficient available land to construct a maintenance and storage facility. Therefore, construction will begin between

Mr. Ben Ramelb
Page 3

for the freeway system, has evaluated needs for the freeway system and identified the highway projects that would be most efficient at reducing congestion on Oahu. The projects, including a Nimitz Flyover, are listed in Table 2-3 of the Draft EIS and included in the analysis for all project alternatives. Effects of the Nimitz Flyover on traffic conditions in 2030 are discussed in Section 3.4.2 of the Final EIS. Travel on the Nimitz Flyover was included for the following travel pairs under the No Build Alternative: Kapolei to Downtown, Ewa to Downtown, and Mililani to Downtown. As shown in Figure 3-7 of the Final EIS, the Nimitz Flyover does improve transit travel times with the No Build Alternative between certain travel pairs (e.g., between Mililani and Downtown) compared to 2007 conditions. However, as also shown in this figure, travel times improve substantially more with the addition of the Project. The important finding in the Final EIS is that conditions on the highway will be better with rail compared to what they would be if the Project were not built even after the Nimitz Flyover, improvements to the H-1 Freeway, and all other projects in the OahuMPO Regional Transportation Plan are built.

As shown in Table 6-1 of the Final EIS, the Project will cost \$4.6 billion in 2009 dollars and \$5.5 billion in inflated dollars, including finance charges. The State of Hawaii's Highway Modernization Plan dated January 22, 2009, estimates the cost of the Nimitz Viaduct at \$600 million for an approximately 2.5-mile elevated highway with two lanes, which equals \$240 million per mile.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

650 South King St. 3rd Floor
Honolulu
HI 96813
FAX: (808) 587-6080

Subject: Comment on Draft Environmental Impact Statement (DEIS)
"Honolulu High-capacity transit corridor Project", Issue: Displacement of
Homes and Churches should be minimized

Fact:
The DEIS Table 2-6 and Figure 2-20 shows the park and ride facility at
Pearl Highlands to be 11 acres and 1600 vehicular parking spaces. The
11 acres "Banana Patch" contain several family homes, farmland and
church facilities which have been in existence for 30 to 60 years.

Discussion:
It would be considered an environmental injustice to displace the many
families on the 11 acre property because there are better alternatives to
the 11 acre Park-and-Ride facility.

Figure 2-42 shows a 43-acre vacant adjacent to the Leeward
Community College (LCC site). The DEIS states that this 43 acre LCC
site is reserved for potential use for a Vehicle Maintenance and Storage
Area (VMSA). Since only one VMSA is needed for the rail project, there
are three alternative sites for the VMSA:

- 1) At the Honolulu Airport east end, some 40 acres could be acquired
along Lagoon Drive and Aolele Street to include portions of Keehi
Lagoon Park, Airport vacant areas and commercial businesses including
Budget Car Rental
- 2) Portions of the Aloha Stadium Parking lot can be used for the VMSA.
Multi-story vehicular parking structures could be built to accommodate
the loss in sports events parking.
- 3) A 41-acre site for VMSA is identified in Kapolei (DEIS figure 2-41).

A further alternative is to reduce the size of the VMSA at the 43-acre
LCC site by splitting the VMSA facility between the LCC site and one of
the other alternative sites mentioned above.. This area reduction will
allow the reservation of 10 to 15 acres for a park and ride facility on the
LCC site.

The best alternative is to dedicate the entire vacant 43-acre LCC site for
a 23-acre Transit Oriented Development (TOD) and a 20-acre Park-
and-ride facility for 3,000 vehicles for rail commuters.

Dear Mr. Ramelb:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal dated December 29, 2008 with subject line [Comment on Draft Environmental Impact Statement (DEIS) "Honolulu High-capacity transit corridor Project", Issue: Displacement of Homes and Churches should be minimized]:

As discussed in Section 4.7.6 of the Final EIS, the City has been coordinating with residents of the Banana Patch community since October 2008. Every household has been visited by City staff, right-of-way staff, and engineering staff to discuss the Project, as well as special needs and relocation assistance for residents who will be displaced. Strategic outreach was conducted for this neighborhood, and it was found the residents were mostly interested in learning more about the right-of-way acquisition process. Residents asked when acquisition might occur, how their property would be appraised, and how soon they might receive compensation. Residents of the community did not object to being relocated to decent, safe, and sanitary housing in compliance with the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act. Nor was there concern expressed about keeping the community intact for relocation purposes.

Leeward Community College was evaluated as a site for the park-and-ride facility to avoid displacement of families living in the area of the Pearl Highlands Station. This alternative was evaluated in the Draft EIS as an avoidance alternative in Chapter 5. The analysis concluded that this alternative was not feasible. "Under this alternative, the H-2 Freeway access ramp would need to be re-designed from a one-way ramp to a two-way ramp. This would cost approximately \$50 million more than the ramps that would serve the Pearl Highlands Station. For this location, the access road for Leeward Community College would also require improvement, which would cost approximately \$25 million. In addition, the guideway's crossing of the H-1 Freeway would need to be realigned, costing an additional \$5 million."

In addition to the \$80 million of roadway and guideway improvements discussed above, it would cost an additional \$1 million to acquire right-of-way from the Hawaii Laborers Training Program site Koko Head and makai of the ramp connecting Farrington Highway to Kamehameha Highway, as well as loss of parking for Leeward Community College, which would cost \$30 million to replace. These costs would be offset by approximately \$20 million since the Pearl Highlands Station would not be constructed under this avoidance alternative.

Your letter suggested three alternative sites for the maintenance and storage facility. As stated in Chapter 2 of the Final EIS, the site near Leeward Community College has been identified as the preferred location for the maintenance and storage facility. Your suggestion for sites along Lagoon Drive and Aloha Stadium cannot be used as both Keehi Lagoon Park and Aloha Stadium are recreational facilities that may not be converted to transportation use per Section 4(f) of the Transportation Act of 1966. In addition, splitting the maintenance and storage functions between multiple sites would make the rail operations less efficient, increase both construction and operating costs, and would require more property acquisitions. Your final suggestion to use a 43-acre site near LCC for park-and-ride and transit-oriented development would be difficult to implement due to poor highway access. Furthermore, this site is a potential location for the maintenance and storage facility.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Subject: Comment on Draft Environmental Impact Statement (DEIS)
"Honolulu High-capacity transit corridor Project", Issue- Project
Construction Phasing will not provide early traffic relief

Fact:

The rail project construction phasing is proposed in four phases as discussed on DEIS page 2-38 and as shown on Figure 2-44 as follows:

- East Kapolei to Pearl Highlands (First Construction Phase)
- Pearl Highlands to Aloha Stadium (Second Construction Phase)
- Aloha Stadium to Middle Street (Third Construction Phase)
- Middle Street to Ala Moana Shopping Center (Fourth and final Construction Phase)

Discussion:

The primary purpose of any mass transit system is to provide traffic relief and to provide relief in the near term. The major West and Central Oahu traffic bottlenecks are at the Middle Street merge and at the H-1/H2 merge. Construction phases for the rail should be prioritized to reduce the traffic bottlenecks at these two locations. Therefore, the project construction phasing shown above should be reversed:

- Middle Street to Ala Moana Shopping Center (First Construction Phase)
- Aloha Stadium to Middle Street (Second Construction Phase)
- Pearl Highlands to Aloha Stadium (Third Construction Phase)
- East Kapolei to Pearl Highlands (Fourth Construction Phase)

This revised project phasing is logical because:

- a) The Middle Street to Ala Moana Shopping Center first phase will provide early traffic relief to the Middle Street bottle neck.
- b) The funding source for the entire 20 mile segment is not guaranteed, recognizing that the General Excise Tax is not meeting projections in revenue due to the expected long term slumping economy. The taxpayer will not tolerate any increase in property tax or GET to fund any rail fund shortfall.
- c) The funding amount from the Federal Transit Authority is not guaranteed.
- d) If rail funds are delayed, providing traffic relief to the traffic bottlenecks on H-1 will be delayed.

e) Each phase for rail will provide the maximum bang for the dollar. The rail will be completely useable and serve the most number of commuters as each phase is completed. Conversely, the Kapolei to Pearl Highlands would serve very few commuters as most commuters will be destined for east of Pearl Harbor and beyond in the easterly direction.

Vehicle Maintenance and Storage Facility for each construction phase can be temporarily established to support each construction phase as modified:

- a) For the Middle Street phase, some 40 acres could be obtained along Lagoon Drive to include portions of Keehi Lagoon Park, Airport vacant areas and commercial businesses including Used Car Lots. At least 10 acres for park and ride can be acquired in the airport area alongside Aolele Street and Lagoon Drive.
- b) For the Aloha Stadium phase, portions of the Aloha Stadium Parking lot can be temporarily used for the Storage Facility and temp facilities for vehicle maintenance.
- c) For the Pearl Highlands Phase, a 43-acre vacant site near Leeward Community College is available (DEIS figure 2-42).
- d) A 41-acre site is identified for the Kapolei phase (DEIS figure 2-41).

Conclusion:

Construction of the Middle Street to Ala Moana Phase as a first priority is consistent with providing near-term traffic relief, will initially serve the most number of commuters, will be completely useable and cost effective, and will not force the taxpayer to pay more taxes to fund additional rail segments should rail funding sources not achieve revenue projections.

Recommendation:

The DEIS should reverse the construction project phasing as discussed above starting with the Middle Street to Ala Moana Shopping Center as the First Phase.

Dear Mr. Ramelb:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal dated December 29, 2008 with subject line [Comment on Draft Environmental Impact Statement (DEIS) "Honolulu High-capacity transit corridor Project", Issue-Project Construction Phasing will not provide early traffic relief]:

As described in Section 2.5.10, Project Phasing, of the Final EIS, to support phased opening of the system, the first construction phase must be connected to a maintenance and storage facility, which requires considerable land. The first phase of the Project must be connected to the maintenance and storage facility because, in addition to maintenance of equipment and ongoing operations, this facility houses the main control center for the entire Project. Accordingly, the required testing and operation of the system could not be completed without access to it. No location has been identified closer to Downtown with sufficient available land to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations*
- *Reduce the time that each area will experience traffic and community disturbances*
- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding*
- *Match the rate of construction to what can be maintained with local workforce and available financial resources*
- *Balance expenditure of funds to minimize borrowing*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kaihi, and finally to Ala Moana Center.

The financial plan is balanced for the entire Project so there will not be a situation in which only a portion of the system will be built. If there is a shortfall, additional revenue sources will be considered. Section 6.6 of the Final EIS discusses risks and uncertainties, as well as potential sources to cover shortfalls.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Nov.25 2008

Mr. Mufi Hannemann
Honolulu Hale
530 S. King Street
Honolulu, HI 96813

Dear Mr. Mufi Hannemann

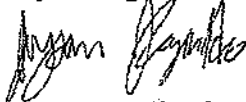

Hi my name is Jayson and I go to Moanalua High School. I am doing a project for a book called Fahrenheit 451, which asks us to identify an issue and take a public stance on it. I chose the public rail transit issue that we have here in Oahu. Our morning and afternoon traffic is a problem here in Oahu, and with the rail it is said to reduce the amount of traffic.

Even though it was agreed to continue on with the project and build the rail transit, there are many people who opposed this decision. I also disagree with the project of building a rail transit here in Oahu. I agree that the transit system would help alleviate the morning and afternoon traffic we have, and the money saving because of the gas prices, but I am skeptical of the amount of people who will actually ride the rail. It was said that the rail will only improve traffic congestion by 3 percent. That is not a big number. You are an excellent mayor of this state, but I believe you are going to fast into this project. First of all, this project is very costly. In 2006 the price was three billion dollars. Now this year it has rose to five. Five billion dollars is a lot of money to spend; why not spend it on our education? With a tax created to pay off the rail transit, it creates more weight on our shoulders financially especially for people who are in bad situations right now. Oahu is a very small island. The rail would make things much more crowded and the fact that businesses and houses will have to move doesn't sound fair. With a transit system here on Oahu, it would ruin the view of Oahu. It would be less considered a paradise. I believe we should stop this project and look more into it.

Maybe this project will help our traffic problem in the future but I am against transit system here on Oahu. There are many reasons why it's a bad idea but it's your decision and I hope you make the right one. Thank you for taking a part of your time to read my letter.

Sincerely,

Jayson Reginaldo

Dear Mr. Reginaldo:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your preference for not building the Project has been noted; however, the No Build Alternative does not address the Project's needs or meet its purpose as established in Sections 1.7 and 1.8 of the EIS.

Ridership projections for the forecast year of 2030 have been developed using the travel demand model used by the Oahu Metropolitan Planning Organization (OahuMPO), which was calibrated against collected traffic and transit ridership information and then validated against recent counts to be sure it properly represents travel activity in the transportation system (Section 3.2.1 of the Final EIS). An on-board transit survey was completed in December 2005 and January 2006, and the latest socioeconomic information available as of October 2008 was incorporated. Traffic counts were collected in 2005, 2007, and 2008. The model is updated

approximately every five years to reflect changes in land use, socioeconomic conditions, and transportation network improvements. The model is approved by the OahuMPO Technical Advisory Committee. The model is based upon a set of realistic input assumptions regarding land use and demographic changes between now and 2030 and expected transportation levels-of-service on both the highway and public transit system. Based upon the model and these key input assumptions, approximately 116,000 trips per day are expected to use the rapid transit system on an average weekday in 2030. Since the Draft EIS was published, the travel demand model has been refined by adding an updated air passenger model (which forecasts travel in the corridor related to passengers arriving or departing at Honolulu International Airport), defining more realistic drive access modes (driving alone or car pooling) to project stations and recognizing a more robust off-peak non-home-based direct demand element (trips that do not originate at home) based on travel surveys in Honolulu.

Regarding traffic congestion, a travel demand forecasting model was used to forecast traffic conditions at six screenlines during the a.m. and p.m. peak hours. The model showed that in 2030, the Project will reduce congestion up to 11 percent during the a.m. peak hour and up to 10 percent during the p.m. peak hour over the No Build Alternative at selected screenlines, as shown in Tables 3-9 and 3-10 in the Final EIS. In addition, roadway congestion, as measured by vehicle hours of delay, will decrease by 18 percent with the Project in 2030 compared to the No Build Alternative (Table 3-14 in the Final EIS).

Concerning your comment about the cost of the Project, the State Legislature authorized the City and County of Honolulu to enact a 0.5 percent surcharge to the General Excise and Use Tax surcharge for the specific purpose of providing operating and capital costs for a Locally Preferred Alternative for a mass transit project. The revenues from this tax surcharge are not available to the City for another use, such as education.

Lastly, those from whom property is to be acquired will be treated according to the requirements of the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act. The Act provides for purchase at fair market value and includes relocation assistance to those affected. It also requires that those in need of relocation be placed in comparable quarters. The City and County of Honolulu will continue its efforts to reduce impacts to residents and businesses whenever possible.

The island's unique visual character and scenic beauty were considered in the visual and aesthetic analysis presented in the Draft and Final EISs. As discussed in Section 4.8 of the Final EIS, the Project will be set in an urban context where visual change is expected and differences in scales of structures are typical. The following measures will be included with the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

- Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
- Coordinate the project design with the City's transit-oriented development program within the Department of Planning and Permitting.*

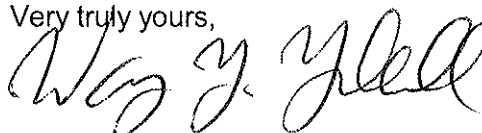

Mr. Jayson Reginaldo
Page 3

- *Consult with the communities surrounding each station for input on station design elements.*
- *Consider specific sites for landscaping and trees during Final Design when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will mitigate potential visual impacts.*

The Project will provide users, including tourists, with expansive views from several portions of the corridor by elevating riders above highway traffic, street trees, and low structures adjacent to the alignment. In Section 4.8.3 of the Final EIS, specific environmental, architectural, and landscape design criteria are listed that will help minimize visual effects of the Project.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Re: Comment on Honolulu Rail Transit Draft Environmental Impact Statement

Dear Mr. Yoshioka:

I am Vice President-Pacific Region, for Reit Management & Research, LLC, the property manager for HRPT Properties Trust ("HRPT"). Through its affiliated companies, HRPT owns the Mapunapuna Industrial Subdivision, including the property bounded by Ahua Street, Nimitz Highway, Puuloa Road, and Pukoloa Street, shown on Figure 2-7 of the Honolulu High-Capacity Transit Corridor Project Draft Environmental Impact Statement ("Draft EIS"). HRPT appreciates the opportunity to comment on the Draft EIS.

HRPT understands that on January 28, 2009, the Honolulu City Council by resolution voted to change the route of the initial segment of the Honolulu rail transit project from the Salt Lake Alternative to the Airport Alternative. HRPT strongly supports the rail transit project, and is not advocating any specific route at this time. Based upon the Draft EIS and the City Council's action, HRPT understands that the City Council in its discretion may in the future add a Salt Lake "spur" to the project or otherwise amend the route to include Salt Lake and Mapunapuna. Should the route be changed to pass through Mapunapuna, HRPT believes a transit station in Mapunapuna would increase system ridership and provide substantial benefits and development opportunities for the surrounding community, businesses and their employees and customers, and the landowners of the property. HRPT therefore respectfully requests that at the appropriate time the City Department of Transportation Services ("DTS") study, place, and construct a transit station in Mapunapuna, if the route is subsequently amended to include a spur or other alignment through Mapunapuna. In that regard, HRPT respectfully requests that DTS consider the following:

1. Technical Feasibility of Transit Station in Mapunapuna—HRPT understands that initially there were some questions as to whether a transit station in Mapunapuna was technically feasible, and that was one of the reasons why a Mapunapuna station was not proposed in the

Office Locations:

Albuquerque, NM • Austin, TX • Kansas City, KS • Los Angeles, CA • Minneapolis, MN • Newton, MA • Philadelphia, PA • San Diego, CA • Syracuse, NY • Washington, DC

Draft EIS for the Salt Lake Alternative. To address those questions, HRPT retained URS Corp. ("URS") to analyze the feasibility of a Mapunapuna transit station. URS has been involved in the design and engineering for numerous transit projects around the country, including systems in Portland, Seattle, and San Diego. For their analysis, engineers from URS' Portland office reviewed conceptual engineering level track plans, profile drawings, and background information for the Honolulu project, and communicated with the Honolulu project lead engineer.

Attached as Exhibit 1 please see a December 24, 2008 opinion letter from Bob Post, senior transit engineer and vice president of URS. Mr. Post writes in relevant part:

Based upon (our) reviews and our own work on similar projects utilizing similar transit technology it is our conclusion that a station could be added to the alignment in the vicinity of Pukoloa and Ahua Streets in the Mapunapuna area. We do not believe making the suggested design changes would result in a negative impact on the project operations or ride quality. Although the addition of a station in this area would add some time to the overall travel time, the impact is lessened in this particular case due to the grades and curves in this segment of the corridor that would already result in reduced speeds.

Based on industry standards, URS concluded that with relatively minor adjustments to the proposed track alignment there are at least three viable options for a transit station in Mapunapuna. As shown on the alignment plans prepared by URS and attached as Exhibit 2, the three potential locations are (1) Option A: Intersection of Pukoloa and Ahua streets, ewa-makai side, flat grade; (2) Option B: Intersection of Pukoloa and Ahua streets, ewa-makai side, 1 percent grade; and (3) Option C: Intersection of Pukoloa and Ahua streets, diamond head-mauka side. Of the three options, Option C is particularly promising, as it is immediately adjacent to a large lot that will become vacant and available in the near future, and would be ideal for transit-oriented development and other amenities to enhance transit ridership.

Option A: Intersection of Pukoloa and Ahua streets, ewa-makai side, flat grade:
In this option, the -4% proposed grade for the track profile would be changed to -5%, which URS considers a reasonable grade for a modern transit vehicle. The -5% grade would transition through a 500 foot vertical curve (beginning at station 1117+33) to a 0% grade, and then back to the originally proposed 4% grade on the diamond head side of Moanaiua Stream. The modified profile would allow a station platform to be located on the ewa side of the intersection of Pukoloa Street and Ahua Street, on a zero percent grade and horizontal tangent. The top of rail elevation would be about 37 feet above existing ground. Since this option would not modify the horizontal alignment, the general structure footprint would be unchanged except for widening in the station area.

Option B: Intersection of Pukoloa and Ahua streets, ewa-makai side, 1 percent grade: This option would use the same horizontal alignment and station location as Option A, but rather than a flat grade a 1% grade would be introduced, which would match back into the original profile sooner and help shorten the transit station structure. Shortening the structure would likely result in some cost savings. URS does not believe the proposed 1% longitudinal slope would be a problem for construction, operations or passenger loading.

Option C: Intersection of Pukoloa and Ahua streets, diamond head-mauka side:
This option could use either of the previous two vertical alignments. The difference would be to reduce the radius of the horizontal curve at Ahua Street to 810 feet, effectively lengthening the

adjacent tangents and enabling a station location approximately 150 to 200 feet further to the east. The elevated transit station would span over Ahua Street and allow access from ground level on both sides of the street, the diamond head side being the existing 7.75-acre "auto auction" lot site. The proposed smaller curve radius would match the original radius proposed at the next curve to the south. Although the smaller radius would slightly lower the potential operating speed through the curve, the presence of a platform would likely be the limiting factor in terms of speed on this section of track in any event.

2. Potential Benefits of a Transit Station in Mapunapuna—Today, many employees of Mapunapuna businesses have to park on the street, sometimes blocks away from where they work. Potential customers are discouraged from even coming to Mapunapuna, because of the congestion and lack of parking. Having a transit station in Mapunapuna would provide a convenient and inexpensive way for both employees and customers to get to and from Mapunapuna, and make Mapunapuna a better place to work and do business.

Furthermore, a transit stop in Mapunapuna would draw riders from nearby residential communities in Moanalua, Tripler, and east Salt Lake, who otherwise would not have convenient access to the transit system with the stations proposed in the Draft EIS. The aerial view of Figure 2-7 of the Draft EIS shows the substantial geographical "gap" between the proposed Ala Lilikoi and Middle Street stations on the Salt Lake Alternative, and all of the additional homes that would be served by a Mapunapuna station. Given the thousands of residents in those communities; the approximately 21,000 people who work at approximately 1,100 businesses in or around Mapunapuna; and the hundreds if not thousands of business customers who visit Mapunapuna every day, HRPT believes that a transit station in Mapunapuna would additionally draw at least if not more than the 1,500 or so daily riders projected for the Ala Lilikoi and Middle Street stations on Figure 3-12 of the Draft EIS.

Finally, a transit station in Mapunapuna would provide exciting opportunities for transit oriented development, particularly on the 7.75-acre lot near the corner of Ahua and Pukoloa streets that will become open and available for development in the next few years. Transit oriented development would bring new amenities, services, and vitality to Mapunapuna, benefiting not only existing but also future businesses and residents in the area.

We look forward to the possibility of working with and assisting the City to develop a transit station in Mapunapuna, should the transit route be amended to include a spur or other alignment through Salt Lake and Mapunapuna in the future.

Mahalo,

Brad Leach

December 24, 2008

Mr. Bradford C. Leach
Vice President - Pacific Region
Reit Management & Research LLC
733 Bishop Street, Suite 1820
Honolulu, HI 96813

RE: Station Feasibility In Mapunapuna

Dear Mr. Leach,

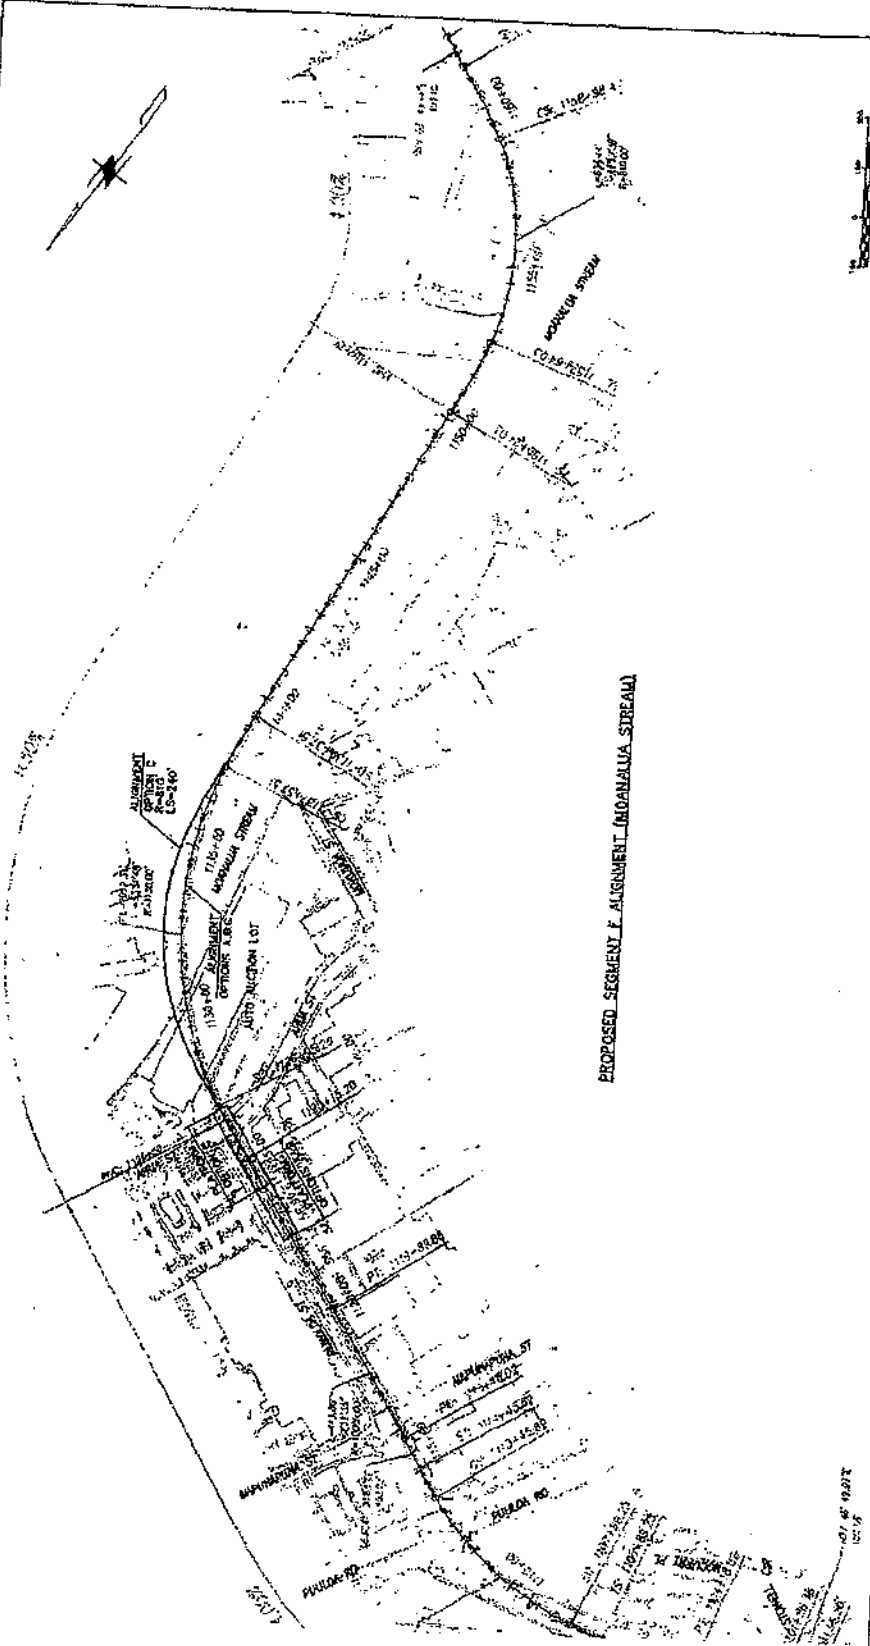

As we have communicated previously, URS has conducted a review of the Honolulu High Capacity Transit Corridor in the Mapunapuna area to determine the technical feasibility of adding a station to the planned Honolulu High-Capacity Transit project. We have reviewed the project design documents provided to us by Reit Management & Research. We have also reviewed the generally accepted industry design standards for horizontal and vertical curves and track grades in station areas for similar projects. Based on the above reviews and our own work on similar projects utilizing similar transit technology it is our conclusion that a station could be added to the alignment in the vicinity of the intersection of Pukoloa and Ahua Streets in the Mapunapuna area. We do not believe making the suggested design changes would result in a negative impact on the project operations or ride quality. Although the addition of a station in this area would add some time to the overall corridor travel time, the impact is lessened in this particular case due to the grades and curves in this segment of the corridor that would already result in reduced operating speeds.

While the drawings previously provided by URS illustrate options that would allow for the addition of a station in the Mapunapuna area and meet generally applied industry standards, we do acknowledge that individual jurisdictions implementing rail transit projects can establish criteria that are more restrictive than the general industry practices.

Sincerely,

Bob Post

Dear Mr. Leach:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that

Mr. Brad Leach
Page 2

specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Aloha Mr. Yoshioka:

RE: Draft Environmental Impact Statement for proposed Oahu train transit system

Please include my comments/questions among those regarding the EIS now underway.

Although I believe that there are a few good reasons to build an elevated rail transit system on Oahu as well as plenty of good economic, cultural and esthetic reasons not to build it, please consider and answer the following questions:

- 1) What happens when the electricity fails island-wide for 10-20 hours as has happened twice in the past two years? Will hundreds or thousands of folks find themselves trapped on trains? Will there be a police or other quick-response force devoted specifically devoted to the transit system crime or mechanical failures as exist elsewhere? Is this need budgeted?
- 2) If the system has backup power capabilities, have these been included in the budget and are these facilities part of the EIS?
- 3) Even with no blackouts, how/where/when will Oahu generate the additional electricity needed to power the trains? (It's my understanding that Oahu already faces problems associated with meeting its peak-load electrical demands.)

Thanks for considering and answering these pertinent questions.

Sincerely,

Michael P. Rethman

Dear Mr. Rethman:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Since trains and rail stations will be electrically powered, the system's infrastructure is being designed to handle service disruptions. For example, trains will draw power from many points along the route, so an outage in a few areas should not disrupt service. If electrical power is lost system-wide, train brakes are designed to stop the rail cars even without power. Lights will stay on in trains and stations; backup batteries will provide lighting for several hours. The train operations center will communicate with passengers via the public address system and intercom and provide guidance.

If power is restored within a short time, service will resume. With a prolonged outage, the operations center will direct passengers to exit the trains and walk along a lighted emergency walkway on the guideway to the nearest station. For those unable to exit rail cars, help will be

Mr. Michael P. Rethman
Page 2

provided by emergency responders and transit staff. Passengers will be met at the train station by a coordinated response from emergency responders and city transportation workers.

The system will not have back-up generating capability; however, communications and power systems shall be redundant and shall have sufficient reserve capacity to accommodate the abnormal operating conditions anticipated in the operational contingency plans.

Lastly, the transit system will require approximately 17.9 MW of electrical power to operate the system. This represents one percent of the existing combined electrical generating capacity on Oahu by Hawaiian Electric Company (HECO) and independent power producers. HECO is currently soliciting proposals for non-firm renewable-energy generating capacity up to 100 MW that would commence operation within the 2010 to 2014 timeframe.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

To: Mayor Mufi Hannemann
Subject: Transportation, Rail and Bike

Dear Mayor Hannemann,

I am a citizen of Moiliili, an elementary school teacher, and a journalism student at UH interested in writing an article about the bike situation here in Honolulu.

I read a quote where you said " The experience of other cities demonstrates that transit systems spur growth, particularly in the areas surrounding the transit stations. We hope that new housing, particularly affordable housing, will spring up along the transit route. We want businesses and leisure activities to be attracted to these hubs. We want to create an environment that supports open space and stimulates walking and bicycling, rather than driving. We want to create neighborhoods where people can live, work, and raise their families."

I support rail, mainly because I born in Washington DC where I used the metro daily. Now that I live in Honolulu, I bike everywhere.

When I read this quote, and that you want to create an environment that supports open spaces and stimulates walking and bicycling rather than driving. As a bicyclist I find it very difficult to navigate outside of the designated bike routes, lanes, and paths. I can get to the University of Hawaii at Manoa from my home with ease (at least once I cross Kapiolani and get on University ave) but I can't go down Kapiolani Boulevard or to Ala Moana with out riding on the sidewalk. I don't even see big strong guys riding their bikes on the street down Kapiolani Boulevard.

I read recently about a proposed Bike Share program by Momentum in the Honolulu Advertiser. If a Bike Share program is installed around the TOD areas, will more designated bike routes be established? How do you feel about more designated bike routes, especially in areas such as Kapiolani Boulevard and Waikiki, where currently I can think of only the Ala Wai and the area around the zoo?

Bicycling is certainly among the most sustainable ways to travel, and a fantastic way to enjoy the beautiful weather of our Hawaii.

I would hate to see tourist fatalities increase because they're being hit by cars while riding their bikes. What do you think about this issue?

Concerned Citizen,

Dear Ms. Reuter:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

Your comments have been noted. The Oahu Bike Plan is currently being updated by the City and County of Honolulu, Department of Transportation Services, and is scheduled to be adopted in 2010. The Draft Master Plan includes a prioritized list of bicycle projects developed using criteria that include access to transit. Several projects that would connect existing or future bicycle facilities to rail transit stations are included in the Draft Master Plan. Each fixed guideway station will have facilities for parking bicycles, and trains will be designed to accommodate bicycles. Use of bicycles on trains will be governed by a bicycle policy that has not yet been developed. The Project is coordinating with City and State agencies to encourage development of enhanced bicycle facilities near the stations, but the actual construction of such facilities is beyond the scope of the Project.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project

Subject: Draft Environmental impact Statement (EIS) for Honolulu HCTP

The Draft Environment Impact Statement for the city's rail transit project is unacceptable because it is written solely for a steel wheel on steel rail system.

There are other forms of fixed rail that may be better and more cost-effective than steel wheels. Please rewrite the EIS to cover the other technologies, such as monorail and maglev, to ensure that the city can and will obtain the best and latest technology at the best price. Unlike the continental US States we don't have a rail system to add to we are starting from scratch, so why not try and get the best for the buck?

Very respectfully,
John Ridings

Dear Mr. Ridings:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

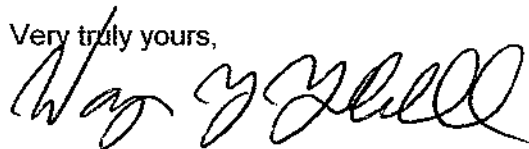

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses comments regarding the above-referenced submittal:

In parallel with the alignment analysis, a five-member panel appointed by the City Council and the Mayor considered the performance, cost, and reliability of the five proposed technologies for the fixed guideway system. The panel twice accepted public comment as part of the review. By a four-to-one vote, the panel selected steel wheel operating on steel rail as the technology for the Project evaluated in the Final EIS. The four panel members selected steel-wheel technology because it is mature, proven, safe, reliable, economical, and non-proprietary. Proprietary technologies, meaning those technologies that would have required all future purchases of vehicles or equipment to be from a single manufacturer, were eliminated because none of the proprietary technologies offered substantial proven performance, cost, and reliability benefits compared to steel wheel operating on steel rail. Selecting a proprietary technology also would have precluded a competitive bidding process, likely resulting in increased overall project costs.

Mr. John Ridings
Page 2

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Issuance of the Record of Decision under NEPA and acceptance of the Final EIS by the Governor of the State of Hawaii are the next anticipated actions and will conclude the environmental review process for this Project.

Very truly yours,

**Submission Content/Notes : COMMENTS ON HONOLULU'S MASS TRANSIT DRAFT EIS
February 6, 2009**

The Draft EIS has several glaring deficiencies. Some of them are:

- A. Too many stations, many of them amateurishly placed two or less blocks from each other.
- B. No public restrooms are shown in the proposed station drawings nor are there any shown cost provisions in the budget section to adequately maintain the necessary public restrooms.
- C. Lack of any mention of security provisions and costs at stations.
- D. No provision in the stations for a by-pass line for EXPRESS trains.
- E. Noise levels of steel wheeled technology in upper floors of towers missing.
- F. Noise levels and properties impacted along the Project Corridor in Convention Center, Waikiki and UH areas is missing.
- G. Visually sensitive Viewpoints within Project Corridor for Convention Center, Waikiki and UH areas missing or what is shown is totally deceptive and unacceptable.
- H. Park and Ride facilities are too small and missing for Ala Moana Area.
- I. Dillingham Blvd Project Corridor unworkable as it fails to consider equipment space needed by HECO to maintain very tall HECO Transmission Power lines.
- J. EIS fails to consider the possibility of using the large room in the area of the track's support structure-bridge as a revenue producing area to place urban utilities.
- K. Locations of Potential Impacts to Ongoing Hazardous Materials Operations missing discussion of Convention Center, Waikiki and UH areas.
- L. Historic Properties in areas of Convention Center, Waikiki and UH not covered.
- M. Alternative Routings to avoid Historic Properties does not cover areas around Convention Center, Waikiki and UH.

**A. TOO MANY STATIONS, MANY OF THEM AMATEURISHLY PLACED
FOUR OR LESS BLOCKS FROM EACH OTHER.**

The stations are placed too close together. Professionally designed mass transit systems locate their stations 1.5 to 3 to 4 miles apart. For example, the proposed Chinatown and Downtown and Civic Center Stations are all located within 6 blocks, all three of them! This is absurd. One MAJOR Station for this compact area will be more than sufficient (at least initially – until more funds become available for all the unnecessary extra stations. People will walk blocks if they know that they are going to get a fast ride home. This might get some of those very obese people to start walking a short distance everyday and improve their health.

Station construction costs are the highest cost items per unit in the project.

Honolulu needs the entire system built including Waikiki and UH to gain

any relief from gridlock on the freeway, and if the number of stations – initially – are limited to 10 MAJOR Stations, there will be enough in the proposed budget to build the entire line.
Page 2-24 in the Draft EIS discusses the bus system "modified to coordinate with fixed Guideway System . . . certain local routes would be rerouted . . . as feeder buses to provide frequent and reliable connections to the nearest fixed guideway station."

And, continues on page 2-36, "Enhanced bus service between the Terminal Stations."

Eliminate the 'nice to have' proposed stations and build the 10 'must have' stations, at least initially.

B. No public restrooms shown in the proposed stations nor cost provisions to adequately maintain them.

Draft EIS, page 2-22, Figure 2-11 and Figure 2-12 show platform station configurations with a concourse. No restroom facilities are shown. Restrooms in each station are a must for the numbers of people using this system. There seems to be no consideration in the financial section for the professional maintenance and up keep of these many public restrooms.

C. Lack of any mention of security provisions and costs at stations.

There is no mention of the security needs for each station, nor the costs of maintaining security at each station (another reason to limit the number of stations).

D. No provision in the stations for a by-pass line for EXPRESS trains.

Figures 2-11 and 2-12 show no provision for a center 'by-pass' track for EXPRESS trains.

E. Noise levels of steel wheeled technology in upper floors of towers missing.

There is no discussion on how much the three foot high barriers are going to AMPLIFY the noise of the steel wheels of the trains and reflect this AMPLIFIED noise upwards to thousands of residents in towers the Glideway passes. This is needed.

F. Noise levels and properties impacted along the Project Corridor in Convention Center, Waikiki and UH areas is missing.

Noise levels in the areas of the Convention Center, Waikiki and UH are totally missing. These must be added to the EIS. See Table 4-16 on page 4-100.

G. Visually sensitive Viewpoints within Project Corridor for Convention Center, Waikiki and UH areas missing or what is shown is totally

deceptive and unacceptable.

Visually sensitive Viewpoints within Project Corridor for Convention Center, Waikiki and UH areas missing or what is shown is totally deceptive and unacceptable, see Figure 4-16.

H. Park and Ride facilities are too small and missing for Ala Moana Area.

Park and Ride facilities along the entire proposed Corridor are too small or are missing altogether – Ala Moana, Convention Center, Waikiki, UH area stations.

I. Dillingham Blvd Project Corridor unworkable as it fails to consider equipment space needed by HECO to maintain very tall HECO Transmission Power lines.

On page 4-63, Table 4-10, HECO's high power transmission lines along Dillingham Blvd are mentioned but there is no discussion there or any where else in the Draft EIS on the problem HECO will have servicing those lines as the Projects Guideway is in the way of the mechanical lifts HECO uses to lift workers up to maintain these very tall poles and power lines.

This Table 4-10 also fails to show the potential Visual Effects of View lines at Ala Moana, Convention Center, Waikiki and UH. These areas must be shown too.

J. EIS fails to consider the possibility of using the large room in the area of the track's support structure-bridge as a revenue producing area to place urban utilities.

Page 2-20, Figures 2-11, and 2-12 show cross sections of the proposed Guideway structure and station configurations. Under the top of the guideway's support structure, as shown in the drawings, which top supports the train tracks, is a room - inside the support structure - which room could easily be divided up lengthwise and leased. The leases could be to:

- ? HECO for High Power Transmission Lines into Waikiki,
- ? Honolulu Department of Environmental Services for back-up force mains, and also
- ? phone and
- ? Cable transmission lines.

These leases would provide extra income to build and maintain the Guideway System.

Putting the community's utilities in the Guideway's support room would save the utilities huge construction costs of digging up our streets for years to put all these new and necessary utilities underground. Those savings could be put into the building costs of the Guideway System.

By doing this the community would greatly benefit by not having our

streets and roads dug up for years to lay all these new under ground utilities.

K. Locations of Potential Impacts to Ongoing Hazardous Materials Operations missing discussion of Convention Center, Waikiki and UH areas.

Figure 4-43 doesn't show any discussion for the Convention Center, Waikiki and UH areas. This must be included.

L. Historic Properties in areas of Convention Center, Waikiki and UH not covered.

These areas must be included in this discussion.

M. Alternative Routings to avoid Historic Properties does not cover areas around Convention Center, Waikiki and UH.

These areas must be included in this discussion in the Draft EIS.

Thank you for your consideration of these important topics and omissions in the proposed Draft EIS for this Project. If you have any questions please call me at 949-2497.

Dear Mr. Rodman:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following addresses your comments regarding the above-referenced submittal:

Our response will address your comments in the same bulleted order as submitted.

A. *Commuter rail stations are typically spaced farther apart. However, most urban systems, such as the one being constructed in Honolulu, have stations that are spaced between ½ mile to 1 mile apart, especially in Downtown areas.*

- 1. The number of stations affects riders in two ways: If stations are too far apart, the system would not be convenient because the distance users must walk would be too long.*
- 2. If stations are too close, the average travel speed is reduced, which also discourages ridership.*

To balance these concerns, the average distance between stations is approximately 1 mile, with shorter distances in dense areas that have greater transit demand—for example, in Downtown Honolulu.

As shown in Table 6-1 in the Final EIS, station costs are comparable to the cost of vehicles and systems, which is substantially less than guideway construction. City Council Resolution 07-039 directed that the first construction project be fiscally constrained by anticipated funding sources and to extend the guideway from East Kapolei to Ala Moana Center. Building only 10 stations could not generate the funding needed to construct the extensions to Waikiki and UH Manoa.

- B. Each station will have a secured public restroom. Patrons will need to ask the station attendant to access the restroom. The cost for maintaining restrooms is included in the operating costs and is based on similar costs from other systems.*
- C. As discussed in the Final EIS Section 2.5.4, Safety and Security Measures, a project-specific Safety and Security Management Plan has been developed in accordance with FTA requirements to define the safety and security activities and methods for identifying, evaluating, and resolving potential safety hazards and security vulnerabilities of the system. It establishes responsibility and accountability for safety and security during the Preliminary Engineering, Final Design, construction, testing, and start-up phases of the Project. The Honolulu Police Department, the Honolulu Fire Department, the Honolulu Department of Emergency Management, and the Honolulu Emergency Services Department have been involved in preparing and will be part of implementing the plan. The plan addresses public safety and security concerns, including threats and hazards associated with the Project, specific issues that were identified through community outreach efforts, and design and architectural details to enhance safety.*

In more detail also discussed in Section 2.5.4 of the Final EIS, all stations, park-and-ride facilities, and vehicles will include security cameras that are monitored at all times of operation, will have audible and visual messaging systems, and an intercom link to the system operations center. Security personnel will also patrol the system; however, security personnel may not be physically located at all stations and on all trains at all times. Interior and safety lighting will be provided at all stations and park-and-ride facilities. As shown in Table 2-7 of the Final EIS, the system will operate between 4:00 a.m. and midnight. The Project's operating cost estimate includes the cost of security for stations and park-and-ride facilities. The cost and financial analysis for the Project is provided in Chapter 6 of the Final EIS.

- D. All trains are planned to stop at all stations. There is no plan to implement express service, but if future operations indicate that it would be beneficial, the system could operate in skip-stop service. Such service could decrease travel time by a few minutes. The system will be capable of fully automated operation. However, Figure 3-7 in the Final EIS shows that the fixed guideway system will provide travel-time benefits without express service. This figure represents travel times from origin to destination. Station-to-station travel time is provided in Table 3-16 in the Final EIS. Trains will operate every three minutes in each direction during peak periods. Once*

on the system, it will take 42 minutes to travel from East Kapolei to Ala Moana Center.

- E. *As stated in Section 4.10.3 of the Final EIS, the Project will cause no severe noise impacts. Moderate impacts will occur at three areas on the fifth through ninth floors of buildings (as shown in Table 4-18 in the Final EIS). With the recommended mitigation in place, the noise analysis indicates that the new noise generated by the rapid transit system will be lower than existing noise levels in most places.*

The Project includes an integrated noise-blocking parapet wall at the edge of the guideway structure that extends 3 feet above the top of the rail and a system specification for vehicles with wheel skirts. The parapet wall will substantially reduce ground-level noise and will not amplify noise for areas above the guideway. Wheel skirts will increase the benefit from the parapet wall at locations above the elevation of the track. The use of sound-absorptive materials below the tracks in the 3 areas that will experience moderate noise impacts will reduce the Project's noise levels from upper floors to below the impact level.

- F. *The noise analysis summarized in Section 4.9 of the Draft EIS and Section 4.10 of the Final EIS presents the results for the East Kapolei to Ala Moana Center segment of the study corridor (i.e., the Project). The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The proposed future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS. The future extensions are not part of this Project; thus, they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time. When the Project is extended to the Convention Center, Waikiki, UH Manoa, and Salt Lake Boulevard, additional noise analyses will be conducted and presented in a separate environmental document.*
- G. *The visual and aesthetic analysis presented in Section 4.7 of the Draft EIS and Section 4.8 of the Final EIS covers the Project, which is from East Kapolei to Ala Moana Center. As stated previously, proposed extensions are anticipated to the Convention Center, Waikiki, UH Manoa, and Salt Lake Boulevard; however, they are not presented in the Final EIS. The impacts associated with the future extensions will be analyzed in separate environmental documentation when those extensions are proposed for implementation and funding has been identified.*

The viewpoints analyzed in this Final EIS Section 4.8 are intended to incorporate a variety of perspectives (e.g., vehicular pedestrian, and elevated) and a wide range of views. Visual simulations of the Project were developed to represent the range of

scale and spatial relationships of project elements to other objects. Some of the simulations are also intended to represent view corridors identified as protected resources in pertinent policy documents. The simulations serve several purposes: they were used to evaluate visual and aesthetic consequences of the Project, demonstrate the potential for mitigation, and provide a means of communicating the findings of the analysis. Generally, simulations were prepared for viewpoints where the Project would have a comparatively greater visual effect. A greater emphasis was placed on identifying views and preparing view simulations toward the Project, because this best represents what most viewers would see and the greater variety of views that would be experienced.

- H. As stated in Section 2.5.7 of the Final EIS, park-and-ride lots will be constructed at stations with the highest demand for drive-to-transit access. The Project will include construction of 4,100 parking spaces at four different stations. Sizing and location of parking facilities are based on results of the travel demand forecasting model for the year 2030. Other stations may experience a demand for commuter parking, but factors such as the existing urban environment, space constraints, and roadway network limitations prevent the inclusion of parking at many locations. These factors prevent the construction of a park-and-ride facility at the Ala Moana Center Station and, accordingly, this station will be primarily accessed by other modes, including passenger drop-offs, bus, bicycle, and walking. The Final EIS discusses the impacts and benefits associated with implementing the Project from East Kapolei to Ala Moana Center. The Convention Center, Waikiki, UH Manoa, and Salt Lake Boulevard Stations are part of proposed extensions, and mode of access information will be analyzed as part of future studies.*
- I. As discussed in Section 4.18.2 of the Final EIS, "Communication and coordination have been initiated with the affected utility agencies and companies and will continue throughout design and construction." Further, "Design criteria will govern all new utility construction outside of buildings, as well as the support, maintenance, relocation, and restoration of utilities encountered and affected by construction of the fixed guideway." In addition, "Along several roadway corridors, most existing overhead utilities in conflict with the guideway and safety clearance requirements will be relocated underground. Existing overhead electrical and communication utilities not in conflict with the aerial guideway and safety clearance requirements will remain overhead. Coordination will occur with emergency services and utility companies to ensure that utility relocations meet their needs and that sufficient clearance is provided. The City will evaluate relocation of utilities that are in conflict with the fixed guideway during preliminary design." Again, the Project terminus is Ala Moana Center. Therefore, the Convention Center, Waikiki, UH Manoa, and Salt Lake Boulevard areas are not discussed. The impacts associated with the future extensions will be analyzed in separate environmental documentation when those extensions are proposed for implementation.*
- J. The concept of using the inside of the guideway has been considered. The open portion of the guideway structure contains tensioning cables and is not available for utilities. In addition, future maintenance access for the utilities would require openings in the structure, which would weaken it. The access would either have to*

Mr. Robert Rodman
Page 5

be provided from below with a lift-truck or require closure of the transit operations from above.

To address your points K, L, and M, as stated above, the Project terminus is Ala Moana Center. Therefore, the Convention Center, Waikiki, UH Manoa, and Salt Lake Boulevard areas are not discussed. The impacts associated with the future extensions will be analyzed in separate environmental documentation when those extensions are proposed for implementation.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is fluid and cursive, with the first name "Wayne" being the most prominent.

Submission Content/Notes : RE: Draft EIS for Honolulu Transit Corridor Project

Missing in the section about ridership is any data about ridership if Waikiki and UH are included in the initial phase of the project. This data needs to be included so we can compare the various build options. If the number of stations are limited to the top 8 ridership stations with one station at each end with a total of 10 MAJOR stations initially, I think there is enough in the budget to build the entire proposed Glideway System, including Waikiki and UH.

Also missing from the Proposed Draft EIS are alternate Glideway routings for the Convention Center, Waikiki, UH areas.

Historical properties, such as the Ala Wai Canal Kalakaua Avenue Bridge and the Kalakaua Avenue median (with its beautiful line of Mahogany Trees) just Diamond Head of the Ala Wai Canal make the proposed alignment of the Waikiki Glideway unworkable.

The Draft EIS should also show this alternate routing through Waikiki to UH:

WAIKIKI ROUTING ALTERNATIVE ONE

from the Ala Moana Station:

Diamond Head on Kona Street, then Diamond Head across Atkinson St and along the towers, across the Ala Wai Canal, transiting Lapeepee Street and Hobron Lane, over HECO's power station and low-rise, across Ala Moana Blvd., across Fort DeRussy and Kalakaua Avenue and down Kuhio Avenue, across the Beach Walk Pumping Station and down either the two small streets that pass through Waikiki between Kalakaua and Kuhio Avenues (going through building which are built over these streets - via condemnation for the right-of-way), then down Liliuokalani Avenue, across the Ala Wai Canal, across the Golf Course and up University Avenue to UH.

Because there is one line from UH to Waikiki (instead of two ends - one starting at UH and one starting in Waikiki which would cut the start trains to every 12 to 15 minutes), this routing has the advantage of a train leaving the stations at both UH and Waikiki every 6 minutes instead of every 12-15 minutes (people are encouraged to take the train if they don't have to wait and wait at the station every time they want to use it and UH and Waikiki will be the heaviest used stations on the System).

WAIKIKI ROUTING ALTERNATIVE TWO

Another alternative routing through Waikiki could be from Kona Street, cross Atkinson Street, pass the towers, and turn along the Convention Center side of the Ala Wai Canal and follow it up to Olohana Street, and cross the Ala Wai Canal and pass into Waikiki on wide Olohana, cross Kuhio Avenue, proceed up Duke's Lane to the International Market Place and curve over and pass through the International Market Place and behind the Kaiulani Hotel and on up Prince Edward Street and then turn Maika on Liliuokalani Avenue, cross the Ala Wai Canal, over the Golf Course and up University to the UH.

Please include these alternative routing options in the Draft EIS.

If there are questions please call me at 949-2497. I've lived in Waikiki for 38 years and the traffic gridlock we experience here is tremendous. 20,000 Waikiki workers spend hours every day caught in traffic due to the gridlock and are not able to spend time with their children as a result. Waikiki needs to be on the initial build of this system.

Dear Mr. Rodman:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred

Mr. Robert Rodman
Page 2

Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The Project has logical termini and independent utility from any extensions that may be constructed in the future. The future extensions to East Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS. However, the future extensions are not part of the Project; thus, they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation at some time in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time. As shown in Table 3-29, ridership would be 28 percent higher with construction of the four extensions compared to the Project (from East Kapolei to Ala Moana Center via the Airport).

The number of stations affects riders in two ways: (1) if stations are too far apart, the system is not convenient because the distance users must walk will be too long; and (2) if stations are too close, the average travel speed is reduced, which also discourages ridership. To balance these concerns, the average distance between stations is approximately 1 mile, with shorter distances in dense areas that have greater transit demand.

City Council Resolution 07-039 directed that the first construction project be fiscally constrained by anticipated funding sources and to extend from East Kapolei to Ala Moana Center. Building only 10 stations could not generate the funding needed to construct the extensions to Waikiki and UH Manoa. Bus service will be enhanced between Ala Moana Center and Waikiki, UH Manoa, and West Kapolei and East Kapolei until the planned extensions are built.

Your ideas for alternative routes through Waikiki have been noted.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Submission Content/Notes : The number of stations should be cut to the bare minimum because they will become another abode of the homeless mentally ill which now inhabit our bus stops. Daily we see such individuals who sit on the bus stop benches while a stream of urine runs down to the concrete under them while they sit above. These same individuals - who - it is easy for anyone to see - live in the same garments for months or years, are seen sitting on the cloth seats on the buses we ride (which cloth seats obviously have never been wet washed since the buses were delivered new to the city).

With this in mind, I can find no mention of scrubable seats planned for the trains in this system in the EIS.

Further, I can find no mention of any plans to keep the station concourses and platforms described starting on page 2-20 and shown in Figures 2-11 & 2-12 clear of homeless campers, or businesses and portable travel desks and chairs which daily now are allowed to block Waikiki's sidewalks near the Market Place.

These issues need to be addressed in the Draft EIS for this Transit Project.

Dear Ms. Rubin and Mr. Rubin:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your preference for the Airport Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. .

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and

Ms. Nancy Rubin
Mr. Errol Rubin
Page 2

Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- *Reduce the time that each area will experience traffic and community disturbances.*
- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*
- *Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- *Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Submission Content/Notes : I don't think the rail system will be widely used, because it will take us too long to get to get where we want to go, and because of the problems with graffiti and vehicle break-ins at the stations.

Time:

If we have to take a bus to get to a station, then take another bus when we get off the train, and the train will make 19 or 21 stops in 20 miles, all that will consume too much time.

Break-ins at the stations:

Oahu is famous for vehicle break-ins and graffiti. Costly security measures will be needed at each of the 19 or 21 stations and on each train.

The total cost for building and maintaining and providing for security for rail is way too much for the benefits gained.

I watched the debates.

Prof. Prevadourous was right. There are other mass transit systems which are better, less costly, and will get us where we want to go faster, than rail.

Mahalo

Dear Mr. Russell:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your concerns about the Project have been noted. As discussed in Chapter 3 of the Final EIS, travel time by rail, including transfers to bus, will be the same as today or less. Under current conditions, travel times via bus or car can vary considerably due to traffic congestion and unpredictability. Future travel times with rail will be highly reliable, in large part because the guideway will be completely separated from roads and highways. Because of the high frequency of the fixed guideway service (every three minutes during peak periods and every six minutes during mid-day periods), riders transferring from buses to the fixed guideway will experience minimal wait times. Riders transferring from the guideway service to buses will also benefit from improved frequencies on existing bus routes serving stations. In addition, several new routes with high frequencies will be provided as feeders to the guideway system. Since these routes will primarily operate in residential areas, they will provide greater reliability versus routes operating along congested arterials. Figure 3-7 in the Final EIS shows that transit travel

times with the Project will be significantly better than travel times without the Project. Travel times are shown from origin to destination and include transfers.

Security, as discussed in the Final EIS Section 2.5.4, Safety and Security Measures, a project-specific Safety and Security Management Plan has been developed in accordance with FTA requirements to define the safety and security activities and methods for identifying, evaluating, and resolving potential safety hazards and security vulnerabilities of the system. It establishes responsibility and accountability for safety and security during the Preliminary Engineering, Final Design, construction, testing, and start-up phases of the Project. The Honolulu Police Department, the Honolulu Fire Department, the Honolulu Department of Emergency Management, and the Honolulu Emergency Services Department have been involved in preparing and will be part of implementing the plan. The plan addresses public safety and security concerns, including threats and hazards associated with the Project, specific issues that were identified through community outreach efforts, and design and architectural details to enhance safety.

Security will be provided during all operating hours. Also discussed in Section 2.5.4 of the Final EIS, all stations, park-and-ride facilities, and vehicles will include security cameras that are monitored at all times of operation, will have audible and visual messaging systems, and an intercom link to the system operations center. Security personnel will also patrol the system; however, security personnel may not be physically located at all stations and on all trains at all times. Interior and safety lighting will be provided at all stations and park-and-ride facilities. As shown in Table 2-7 of the Final EIS, the system will operate between 4:00 a.m. and midnight. The Project's operating cost estimate includes the cost of security for stations and park-and-ride facilities. You can find the cost and financial analysis for the Project in Chapter 6 of the Final EIS.

Lastly, Chapter 2 of the Final EIS summarizes the alternatives screening and selection process. Beginning in the fall of 2005, an initial screening process considered alternatives identified through previous transit studies, a field review of the study corridor, an analysis of current population and employment data for the study corridor, a literature review of technology modes, ongoing work completed as part of the Oahu Regional Transportation Plan 2030 (ORTP) prepared by the Oahu Metropolitan Planning Organization (OahuMPO) (OahuMPO 2007), and public and agency comments received during the formal Alternatives Analysis scoping process.

The screening process is documented in the Honolulu High-Capacity Transit Corridor Project Alternatives Screening Memorandum (DTS 2006a). Three scoping meetings were held during the screening process in December 2005, which included a presentation of initial alternatives to the public, interested agencies, and officials to receive comments on the Purpose and Need, alternatives, and scope of the Alternatives Analysis. Refinements were made to the alternatives based on the public input during scoping.

After completion of screening in the winter of 2006, the following alternatives were studied in the Alternatives Analysis: No Build Alternative, Transportation System Management (TSM) Alternative, Managed Lane Alternative, and the Fixed Guideway Alternative. After review of the Alternatives Analysis Report and consideration of public comments, the City Council identified a fixed guideway transit system extending from Kapolei to UH Manoa with a

Mr. Bill Russell
Page 3

connection to Waikiki as the Locally Preferred Alternative. This identification, which eliminated the TSM and Managed Lane Alternatives from further consideration, became Ordinance 07-001 on January 6, 2007. The NEPA process considered a range of alternatives that was consistent with the identified Locally Preferred Alternative. As discussed in Section 2.2, there were no alternatives that had not been previously studied and eliminated for good cause that would satisfy the Purpose and Need at less cost, with greater effectiveness, or less environmental or community impact.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka", written in a cursive style.

Dear Ms. Ruth:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

Public Storage is currently listed as a partial take as a result of widening of the highway in this location. Project coordination with Public Storage will be ongoing. Access constraints will be evaluated by the design team during Final Design.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka", is written over the typed name.

Submission Content/Notes : I think that the most benefit we can achieve would be to start from downtown out to the Airport and beyond Pearlridge and UH west. If there comes a time where cost might stop or long delay the project, we could use whatever is made and start service from wherever the project is stalled. It would be the optimum way to gain usage of whatever is already made, whatever the delayed portion would be. And at the same time, be an example of what the completion would be like. Thank you for the opportunity to input my opinion.

Dear Mr. Sakamura:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- *Reduce the time that each area will experience traffic and community disturbances.*

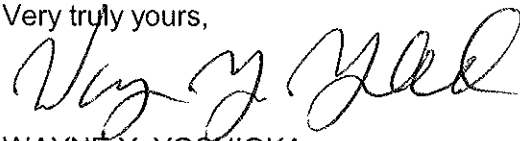

- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*
- *Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- *Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

Chapter 6 of the Final EIS discusses funding sources for the capital costs and the ongoing operating and maintenance costs of the alternatives. City funding for the capital cost of implementing the Project is expected to come from the 0.5 percent County General Excise and Use Tax Surcharge. This surcharge has been in place since January 1, 2007, and will expire December 31, 2022. City subsidy for transit operating and maintenance costs comes from the General Fund and Highway Fund, which receive revenue from a variety of currently existing taxes. Whether any of these taxes will be raised at some time in the future will be decided as part of the City's annual budget process.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this

Dear Mr. Sataraka:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

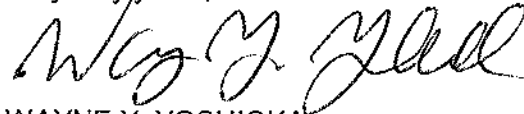

Your preference for a Fixed Guideway Transit Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more

Honolulu, Hawaii 96813

Mr. Yoshioka:

Thank whoever for wasting more of our tax dollars by sending out this piece of garbage of a plan. Maybe this letter will convince whoever is behind this project that someone is making a big mistake with this proposed rail system project. This is not going to totally solve the immediate traffic problem on this island, in fact, it is going to make it worse. Please take into consideration the following, which it seems, no one wants to address, which makes me believe that this whole rail thing is just to line a segment of the populations pockets with a lot of money.

The simple solution to this problem is to understand what is truly at stake here. Take into account the following aspects that are being grossly and negligently under looked:

1. The bus system really works fine. The real problem is too many cars on the island congesting limited major East-West thoroughfares, not lack of mass transit.
2. If the rail project begins, you think you got gridlock now, just wait until construction hits the inner city. People will be cursing the project every day they spend an extra two plus hours creeping inch by inch in traffic, burning gas and this will not be just a one or two year project. And what about when there is a major traffic incident on H-1, the rail does not offer any solutions to that.
3. The tracks will not be extended into the upper lying areas so, you would have to plan for an extra hour or two just to get to and from the stations, which means you will not or hardly ever use it. And, even if it is decided to extend to upper lying areas, can you imagine the gridlock during construction then?
4. Like the poll says, this will only benefit a handful of people, mainly the one's who are to profit.
5. A more advantageous solution is to build a causeway from Waianae to Waimanalo over the water spanning the entire Southern Coast and later, if necessary, continue around the island, or, constructing a freeway along the mountain ranges. After pitching this idea with engineers at the town hall meeting at the Blaisdell, they said "no problem, in engineering we can build anything".

The major consideration for this idea is that H-1 desperately needs a major East-West alternate route. For those of you thinking this would be an eye sore to the coastline or the mountain ranges consider this: If built properly, it would probably enhance the view and in reality is one of two sensible solutions. We need to give up something and giving up the causeway or freeway project to rail would tragically be the wrong choice for the majority if not all of Oahu inhabitants. We must not allow the Offices of the Mayor and their constituents to perpetrate this masochistic behavior on the future of this State.

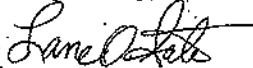

6. The Offices of the Mayor and their constituents have jumped into this project without careful consideration of all practical/reasonable solutions and are drooling at the potential for lining their pockets with a very hasty and ill thought out plan. Look at it this way, they can still line their pockets with the causeway/freeway project which is the smarter solution.

So, to recap, the main problem is too many cars on the island with no alternate East-West freeway relief, not lack of mass transit. This is the major point here. The bus system would work fine with fewer cars jamming limited traffic signaled East-West thoroughfares. As a fellow taxpayer, please be sensible and come to this realization. If built with a well planned scheme, this would benefit Oahu and relieve major traffic stress for years to come. Any other idea would be inviting seriously dire economic, political and social consequences for the future of our keiki and the State.

I hope you can convince the Mayor and his constituents to re-evaluate. I personally prefer the mountain range solution as this would allow cutoffs to service both sides of the island. Either the causeway or the mountain range construction solutions would not severely impair the day to day business operations of the island as the rail project will. Please take this into strong consideration and at least present this to whoever is trying to ram this down our throats. If you cannot provide a favorable response to this issue then do not bother responding. I will assume that you also sold out.

Mr. Matley, if it is within your power, please find a way to save the people of Oahu's future by overturning/disapproving this stupendously horrific project. You are one of the last and probably only resorts left to stop this hastily irrational and ill conceived project.

Respectfully,

Lane O. Sato

Dear Mr. Sato:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

This letter will address your comments in the same manner presented.

Concerning your first paragraph, traffic congestion (as measured by vehicle hours of delay (VHD)) will decrease 18 percent with this Project compared to No Build conditions. The No Build Alternative includes all the highway projects identified for implementation by the City and State by 2030. As shown in Tables 3-9 and 3-10 in the Final EIS, traffic on roadways will improve with this Project compared to No Build conditions.

- 1. As indicated in Chapter 3 of the Final EIS, bus transit speeds have been decreasing (Figure 3-1) while bus service reliability (Figure 3-2) has deteriorated. In 2006, 30 percent of bus system arrivals were more than five minutes late. As a result of longer bus travel times, approximately 128,592 additional revenue*

hours of bus service were needed in 2007 to deliver the same amount of service TheBus provided in 1984. This inefficiency consumed about \$13.5 million in additional annual operating budget expenses in 2007 (in 2007 dollars) without adding new service.

- 2. Of all the alternatives examined, the fixed guideway system is the most effective at reducing congestion on roadways. As shown in Table 2-2 of the Final EIS, a Managed Lane Alternative would reduce VHD by 4 percent and increasing bus service would decrease VHD by 2 percent. As shown in Table 3-14 of the Final EIS, the fixed guideway system will reduce VHD by 18 percent.*

While there is usually some inconvenience during major construction projects, as discussed in Chapter 3 of the Final EIS, a Maintenance of Traffic (MOT) Plan will identify measures to mitigate temporary construction-related effects on transportation. The contractor will develop the MOT with approval from the City and the Hawaii Department of Transportation. The MOT Plan will address roadway closures for streets identified in Table 3-27 of the Final EIS. Temporary lane closures will occur during non-peak hours so that effects on heavy commuter traffic will be minimized.

In addition, the fixed guideway system does provide an alternative if there is an accident on the H-1 Freeway. The fixed guideway system will be a parallel facility and will not be affected by roadway conditions. Thus, if the H-1 Freeway is shut down due to an accident, the fixed guideway system will continue to operate.

- 3. It is not clear what is meant by "upper lying areas." For purpose of this response, it is assumed to mean Central Oahu. Figure 3-7 in the Final EIS represents the time required to complete a trip from origin to destination and assumes that at least a portion of the trip will be made on the fixed guideway system. As shown in this figure, trips from Mililani, which is not along the alignment, to Downtown will decrease from nearly 100 minutes under 2030 No Build conditions to approximately 55 minutes with the fixed guideway system. Since the fixed guideway system is in an exclusive right-of-way, travel times will always be consistent, regardless of roadway conditions. In addition, the fixed guideway system is expandable. A park-and-ride facility will be provided at the Pearl Highlands Station, thereby allowing individuals to drive to access the fixed guideway system, and bus service will be enhanced to coordinate with the system.*
- 4. The fixed guideway system is designed to serve major destinations in the most heavily travelled corridor on Oahu, plus the area with the greatest expected growth. In 2000, 63 percent of Oahu's population and 80 percent of its jobs were located within the study corridor. By 2030, these distributions will increase to 69 percent of the population and 83 percent of the employment. As a result, it is anticipated that the rail transit system will be used by a wide cross-section of the local population. Under the Project, transit travel-time benefits will occur for several communities with high concentrations of transit-dependent households*

(see Figure 3-5 in the Final EIS). There will be substantial travel-time benefits for transit-dependent communities such as Waipahu, West Loch, Waikiki, Chinatown, and Makakilo.

5. *Your preference for a causeway along the southern coast or mountain range solution is noted. As described in Section 1.1 of the Final EIS, a makai freeway was considered during the 1960s and rejected. One of the concepts would have connected from Hawaii Kai to Honolulu Harbor as an offshore freeway. The project was rejected by the Hawaii Department of Transportation around 1970. Any interest in reviving the concept for such a project should be directed to the Hawaii Department of Transportation. Construction of the transit project will not preclude the construction of a causeway.*
6. *Your opposition to the Project is noted. Various highway improvements have been considered for Oahu. The Hawaii Department of Transportation, which is responsible for the freeway system, has evaluated needs for the freeway system and identified the highway projects that would be most efficient at reducing congestion on Oahu. The projects are listed in Table 2-4 of the Final EIS and included in the analysis for all project alternatives.*

Chapter 2 of the Final EIS summarizes the alternatives screening and selection process. Beginning in the fall of 2005, an initial screening process considered alternatives identified through previous transit studies, a field review of the study corridor, an analysis of current population and employment data for the study corridor, a literature review of technology modes, ongoing work completed as part of the Oahu Regional Transportation Plan 2030 (ORTP) prepared by the Oahu Metropolitan Planning Organization (OahuMPO) (OahuMPO 2007), and public and agency comments received during the formal Alternatives Analysis scoping process.

The screening process is documented in the Honolulu High-Capacity Transit Corridor Project Alternatives Screening Memorandum (DTS 2006a). Three scoping meetings were held during the screening process in December 2005, which included a presentation of initial alternatives to the public, interested agencies, and officials to receive comments on the Purpose and Need, alternatives, and scope of the Alternatives Analysis. Refinements were made to the alternatives based on the public input during scoping.

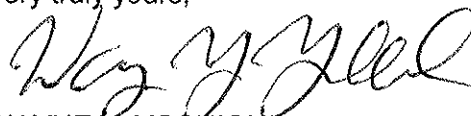

After completion of screening in the winter of 2006, the following alternatives were studied in the Alternatives Analysis: No Build Alternative, Transportation System Management (TSM) Alternative, Managed Lane Alternative, and the Fixed Guideway Alternative. After review of the Alternatives Analysis Report and consideration of public comments, the City Council identified a fixed guideway transit system extending from Kapolei to UH Manoa with a connection to Waikiki as the Locally Preferred Alternative. This identification, which eliminated the TSM and Managed Lane Alternatives from further consideration, became Ordinance 07-001 on January 6, 2007. The NEPA

Mr. Lane O. Sato
Page 4

process considered a range of alternatives that was consistent with the identified Locally Preferred Alternative. As discussed in Section 2.2, there were no alternatives that had not been previously studied and eliminated for good cause that would satisfy the Purpose and Need at less cost, with greater effectiveness, or less environmental or community impact.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Other Submission Method :
Submission Date : 11/02/2008
Submission Content/Notes : I think it is ridiculous for a city the size of Honolulu to attempt this project- it is too costly for the size of our city. Already, annual property tax collections for the past several years have increased several hundred per cent greater than ability of people to pay (cost of living increase). For example, r.p. tax collections for fiscal year 2007-08 increased 23.4% while cost of living went up 4.9%!!! The three previous years the increases were similar. (Tax Foundation of Hawaii figures). How can we possibly take on the high cost of building & maintaining the rail system???? It is all about City politics and satisfying the unions!!!!

Dear Mr. Scott:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

Sections 6.3.2 and 6.3.3 of the Final EIS describe the funding sources anticipated to be used to pay for the capital cost of the Project and the City's overall public transportation system. Capital costs of the Project, including finance charges, are expected to be fully paid for by a combination of Federal Transit Administration (FTA) Section 5307 and 5309 New Starts Funds from the Federal government and revenues from the County General Excise and use Tax (GET) surcharge levied from 2007 through 2022. As discussed in Section 6.4.2, the City's contribution to transit operation and maintenance is currently provided through federal funding, fare revenues, and the City's General and Highway Funds. This funding will be used to fund transit operation and maintenance of the Project. The General Fund includes property tax revenues and other taxes and fees. Property tax revenues are not expected to be used to fund construction of the Project.

Mr. Charles Scott
Page 2

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is fluid and cursive, with the first name "Wayne" and last name "Yoshioka" clearly distinguishable.

Re: Draft Environmental Impact Statement for Proposed Mass Transit

Messrs. Yoshioka and Matley,

As an owner of property and a business at 1212 Kōnā St. in Central Kakaako, it is apparent that the Honolulu High Capacity Transit will have a very direct and substantial impact on our immediate area, and greatly influence our ability to continue operating at this location. There are four areas where the DEIS has insufficient information regarding the impact to our business and the Kakaako community:

1. The impact of Mass Transit on the narrow streets in Central Kakaako, specifically Halekauwila St. and Kona St.
2. The design flaw which is referred to in the DEIS as the "third rail", which will "eventually" go over Ala Moana Shopping Center and connect to the University of Hawaii Manoa and Waikiki.
3. Mass Transit displacing many small light industrial businesses in Kakaako that ultimately will not be able to find a replacement location to service their current customer base.
4. The cost of the Honolulu High Capacity Transit and the City and County of Honolulu's ability to properly fund and pay for building and operations in the current financial situation.

1. Kōnā St., at 40' wide between Piikōi and Pensacola St, and Halekauwila St, at 50' wide, will be dramatically impacted during construction and after completion of the Honolulu High Capacity Transit. None of this is addressed completely in the DEIS.

There will be a loss of parking, especially on Kona St., to accommodate the bridge supports rather than a center column, and access to our building will be blocked. Kona St. between Piikoi and Pensacola, will also be adversely affected by the possible "third rail" that will need to be planned for with wider column supports during the initial construction, necessitating a wider footprint and additional property acquisitions. This was not made public until after the election to approve Mass Transit.

Kona St. is the main access for cars to go from Ala Moana to the Ward area, and building the rail down Kona St. would make an already stressed situation even worse. What will the City do to alleviate this problem during and after construction? Access to our building and others on Kona St. is already a problem with the current level of traffic on one of Kakaako's narrowest streets, a problem that has not been addressed in the DEIS. Relocating the route to Kapiolani Blvd. would clean up what is now a circuitous route through a highly dense Central Kakaako and lessen the impact to an already stressed infrastructure.

2. Prior to the election in 2008, the City and County of Honolulu proudly proclaimed that the Honolulu High Capacity Transit would go from Kapolei to the University of Hawaii Manoa and with a spur to Waikiki. There was never a mention of the line stopping at the Ala Moana Shopping Center with a station 40' high, and a single third rail eventually being built to do a flyover of the Nordstrom extension at the Mall at 100' high, continuing past the center. The DEIS does not address how the city plans on accomplishing this with a station at 40' and another at 100'. How will riders make the transfer? How will the rail cars wind their way past the shopping center through the various high rise buildings past Nordstrom toward Waikiki? Is the 5% grade the train will have to climb from Pensacola to the station at Nordstrom too steep? What will be the effect regarding noise for those businesses and condos in the immediate area?

This is a fatal design flaw that could be addressed with a route change to Kapiolani Blvd. if the City and County of Honolulu truly wanted to go to the University of Hawaii Manoa and Waikiki, something the voters thought they would be getting with a vote for rail.

3. Kakaako is the last light industrial area in Central Honolulu, home to thousands of small businesses serving the main population center of the City and County of Honolulu. This is where most of the displaced properties will come from if rail is built and if there is no route change. What will be the steps the City takes to mitigate the effect on those businesses to relocate elsewhere? Where will the customers that frequent these businesses go if rail goes through Central Kakaako? Is the current infrastructure adequate to accommodate the proposed transit oriented development the City wants to implement should rail become a reality?

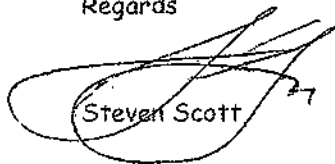

Who will pay for the improvements to the infrastructure when Kakaako is currently mostly unimproved? What is the position of the City and County of Honolulu vis a vis the HCDA, which controls Kakaako Mauka for the State when it comes to improvements and zoning? This should be spelled out in the DEIS and is not. A change of route to Kapiolani Blvd. or King St. would make more sense, preserving the Central Kakaako area to serve the residents of Honolulu.

4. Considering the current economic situation the City and County of Honolulu is in with a shrinking property tax base and declining revenue from the General Excise Tax, how will this Honolulu High Capacity Transit be paid for and operated? There will never be sufficient passengers of rail to pay for its operation, as well as continuing to operate the bus that would be required as a feeder for the rail line. Can the City and County of Honolulu depend on the federal government to continue to cover any shortage in operating costs? Has the City been open about the necessity for a property tax increase to pay for the added costs, and how accurate are the City's projections to operate rail? The General Excise Tax income is set to run out in 2022, and the revenue stream is currently under projections and shrinking each month with the economic downturn in Hawaii, where will the City makeup this shortage? Was this economic downturn anticipated in the DEIS, and shouldn't the City be required to address this in a supplemental DEIS prior to startup?

Will the State of Hawaii's new plans for traffic mitigation on the H1 freeway going east to reduce the bottleneck at Middle Street, and the plans to have a flyover on Nimitz Hwy affect rider ship for the Honolulu High Capacity Transit and thus impact toll box revenue? Will this make obsolete the figures on usage the City used in the current DEIS, and thus change the feasibility of Mass Transit for Honolulu?

The only solution is to have a supplemental draft environmental impact statement that would address these and many other concerns and questions regarding the feasibility of Mass Transit for Honolulu. The current DEIS is so vague on so many issues, and the City's lack of timely disclosures makes it difficult to understand the feasibility for a project of this magnitude in the City and County of Honolulu. Also, it is disingenuous for the City to place any credence in the vote to approve rail when it was not open about the specifics of the rail plan until after the election. Had the voters known about these four issues and others would it still have been approved?

Regards

Steven Scott

With regard to traffic at stations, future conditions at all stations were examined as part of the transportation analysis conducted for the Draft and Final EISs. As indicated in Section 3.4.3 of the Final EIS, the analysis identified potential effects of the Project on local traffic near stations, including an analysis of the effects of column placements on traffic. In addition, intersection analyses were conducted near stations with park-and-ride facilities, kiss-and-ride drop off, stations with anticipated high volumes of local bus access, and near the maintenance and storage facility for guideway vehicles. The analysis considered future traffic volumes and planned transportation facility improvements. The assessment indicated that, with the Project, traffic conditions will operate at acceptable levels-of-service on Kona Street except at the intersection of Kona and Keeaumoku Streets. Section 3.4.7 of the Final EIS identified potential mitigation strategies that would address potential effects.

As indicated in Section 3.5.7 of the Final EIS, a Maintenance of Traffic (MOT) Plan will be prepared by the contractor with approval from the City and/or the Hawaii Department of Transportation, as appropriate. The MOT Plan will identify measures to mitigate temporary construction-related effects on transportation. Table 3-27 in the Final EIS identifies roadways that will be affected during construction.

In the future, a revision to traffic flow planned by others in the area will open Waimanu Street to Ewa-bound traffic, which will provide a direct link to the Ward area along Queen Street and remove a major demand from Kona Street, thereby making it better able to accommodate the fixed guideway and local needs. This was evaluated in the assessment of traffic conditions resulting from the placement of a station at Ala Moana Center. This finding is included in Section 3.4.3 of the Final EIS.

DTS has considered the complexities and interdependencies of the Kakaako district and, overall, the Project is expected to strengthen the district's function as an employment center. The Project also could bring in new customers for businesses and services because of the increased mobility and access the new transit mode will bring to a wider region. An alignment on Kapiolani Boulevard would have substantial adverse effects to the transportation system.

- 2) *The Project has logical termini and independent utility from any extensions that may be constructed in the future. The future extensions to East Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS. The future extensions are not part of the Project; thus, they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time they are not part of the Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation at some time in the future, environmental analysis of the extensions and appropriate*

current economic downturn has been taken into account in the Final EIS. Capital costs of the Project, including finance charges, are expected to be fully paid for by a combination of FTA Section 5309 New Starts Funds from the Federal government and the GET surcharge revenues collected from 2007 through 2022 on Oahu. Operating and maintenance costs will be paid for from the same sources currently used for TheBus: Federal funding, fare revenues, and City revenues from the General and Highway Funds. City funding for transit operating and maintenance costs comes from the General Fund and Highway Fund, which receive revenue from a variety of currently existing taxes. Whether any of these taxes will be raised in the future will be decided as part of the City's annual budget process and would most likely be decided on a variety of issues, not just transit costs. Fixed guideway operation costs will represent between 2 and 3 percent of the City's annual operating budget. As noted in Chapter 6, City policy states that the transit system as a whole must recover between 27 and 33 percent of operating costs from farebox revenue.

A travel demand forecasting model was used to determine fixed guideway ridership in 2030. This model considers all roadway projects listed in the Oahu Regional Transportation Plan (ORTP), including a Nimitz Flyover and mitigation measures on the H-1 Freeway near Middle Street. Table 2-4 in the Final EIS lists committed projects from the ORTP that were included in all modeling results. As a result, ridership numbers presented in the Draft and Final EISs reflect these projects.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

RE: Honolulu High Capacity Transit Corridor Project
Draft Environmental Impact Statement/Section 4(f) Evaluation

Dear Mr. Yoshioka:

Servco Pacific Inc. ("Servco") is the landowner of the following parcels of real property (in Waipahu and Kakaako):

Waipahu: TMK: (1) 9-4-015-014
(1) 9-4-015-015
(1) 9-4-015-022
(1) 9-4-019-055
(1) 9-4-019-061 (1/11th ownership interest)

Kakaako: TMK: (1) 2-1-031-030

which are located adjacent to the contemplated Honolulu High Capacity Transit route (the "*Project*"). Servco has for many years operated automotive facilities at both locations. In addition, the current Conceptual Right of Way Plans show that a portion of one of the Waipahu parcels (TMK: 1-9-4-019-061) and the Kakaako parcel are both designated for partial acquisition as part of the Project.

Consequently, the planned Project has an immediate, direct, and material impact on Servco. Therefore we submit the following comments based on our review of the Draft Environmental Impact Statement for the Honolulu High Capacity Transit Corridor Project dated November 2008.

In general, we are concerned about the adverse impact on our customers, employees, business activities, and automotive facilities which will be caused by the planned construction activities, noise, dust, realigned traffic flow, and modified vehicular access into the Servco properties as work progresses along the Project route in the

Hawaii • Guam • California
Automotive Products • Insurance Services
Consumer Products • Investments

vicinity of the Servco properties. The Draft EIS states that prior to commencement of construction, the contractor will be required to develop a plan to reduce economic hardship for existing businesses along the project alignment during construction activities. However, the draft EIS does not address whether the neighborhood businesses will be informed by the City or the Contractor on construction activities near their properties and if these businesses would be afforded an opportunity to participate and provide input into that plan prior to its adoption into the construction contract. Servco also understands that the Project will likely be constructed in multiple phases and therefore feels that plan to address and reduce economic hardship along the Project alignment should be developed, reviewed and commented on by the neighborhood businesses in phases matched up to the actual construction schedule. Servco feels it is vital for both the Contractor and City to effectively communicate the Project's ongoing construction work and schedule on a regular and weekly basis in order to mitigate and minimize hardships to these neighborhood businesses so unanticipated problems can be addressed promptly and effectively. In our view, the opportunity to submit our input and comments to the Contractor and City on how our operations may be affected by the Project's construction work and the Contractor's mitigation plan is essential. This will allow us a reasonable opportunity to plan our business activities on the Servco properties in anticipation of the construction period and the disruption it will inevitably create.

The Servco properties which will be impacted by the Project are (a) Servco Auto Leeward ("*SAL*"), which includes an automotive showroom, service and parts facility, fronting Farrington Highway at Waipahu Depot Street, and an open parking lot (TMK: 1-9-4-019-061) (the "*Waipahu Property*"), and (b) Motor Imports ("*MI*"), a service and parts facility located in Kakaako on the corner of South Street and Halekauwila Street (the "*South Street Property*"). The Project will run by Servco's SAL dealership along Farrington Highway, and the Waipahu Transit Station will be located on one of the Waipahu parcel that Servco has an ownership interest. Motor Imports in Kakaako will be affected by the construction of the Civic Center Station near and on a portion of the South Street Property. Our comments regarding these specific properties are provided below.

A. Waipahu Property:

1. Due to the 30-foot high fixed guideways in the vicinity of the Waipahu Transit Station the visibility of our SAL dealership will be greatly reduced. Automotive dealerships value high visibility, street frontage, and convenient street access to attract customers for its vehicles for sale and to provide convenient access to service area for vehicles and parts for its customers.
2. The planned Waipahu Transit Station on Farrington Highway is in close proximity to our SAL operation, and construction activities will impact

traffic flow in both directions. In addition, there is The Oahu Regional Transportation Plan 2030 which includes the Farrington Highway widening project to relieve traffic congestion between Golf Course Road and Fort Weaver Road. What is the schedule for these projects? Will construction be phased in such a manner that these projects will not overlap? Will the City be coordinating the Farrington Highway work with the State? Will the City be retaining a consultant for a traffic study for the impact of the Project on the Project's routes?

3. The water table in the Waipahu area is high. What is the potential impact on the surrounding structures due to displacement of groundwater during drilling and installation of the foundation for the light rail system and associated transit stations?
4. There are overhead and underground utility lines along Farrington Highway and the cross streets. Will SAL's utility service be disrupted when these utility lines along Farrington Hwy are relocated?
5. As noted above, Servco has a one-eleventh (1/11th) ownership in TMK: 1-9-4-019-061 in Waipahu. The City has plans for partial acquisition of this property. If traffic is rerouted to the cross streets of Awalu and Mokukaua, this will increase the vehicle traffic to the back of TMK: 1-9-4-019-0'55 which is wholly owned by Servco. As a landowner and business operator, how will we be kept informed of changes and activities affecting both parcels?

B. South Street Property:

1. Servco operates a parts and service facility on the South Street Property (TMK: 1-2-1-031-030). Automotive service operations are very land intensive. Pursuant to the Conceptual Right-of-Way Plans the City plans to acquire a portion of the South Street Property from Servco for the Civic Center Station. According to the Draft EIS, a land area of approximately 40 feet in width by 300 feet in length will be acquired. The proposed acquisition would involve the taking of the land and building housing our existing service bays and facilities, reduce the existing paved area for customer parking and adversely affect the existing South Street entry and exit into the South Street Property. The Draft EIS does not adequately consider a possible added cost to the City's acquisition of a portion of the South Street Property associated with coordinating the relocation of the service bays and facilities and reconfiguration of the South Street Property

so as to minimize disruption with the ongoing business activities on the South Street Property.

2. The Draft EIS does not adequately consider whether it is feasible for the Servco automotive business to continue in a reconfigured set up on the South Street Property after the taking of a portion of the South Street Property, and thus whether the City would have to acquire the entirety of the South Street Property and not just a portion thereof as currently contemplated in the Conceptual Right-of-Way Plan.
3. The Draft EIS does not appear to adequately consider the alternative of designing and building the Civic Center Transit Station on the vacant parcel of land located on the makai side of Halekauwila Street. Such an alternative could greatly minimize and mitigate the adverse impact on the existing Servco automotive facilities on South Street discussed in B.1 above.
4. The existing buildings on the property are older. We are concerned with how pile driving may affect the structural integrity of the buildings and the calibrated readings of automotive equipment used in Servco's automotive service business. Has consideration been given to alternatives that may be available to mitigate such impact?
5. Similar to the Waipahu Property, the water table in Kakaako is also very high. The Draft EIS does not indicate or adequately address how water displacement will be handled so as to protect and preserve the structural integrity of the structures on the South Street Property.
6. Street parking in the Kakaako area is inadequate at present. We are concerned that the influx of construction workers into the area during the course of the Project will make a bad situation even worse, as Servco employees, construction workers, and customers of neighborhood business will all be vying to use the already limited number of parking stalls in Kakaako. This problem will be compounded by lane closures and traffic circulation changes. The Draft EIS does not address how these problems will be mitigated or addressed? Will there be a traffic study on the impact of the Project for the Civic Center Transit Station and Halekauwila Street route?

As noted above partial land acquisition is planned for two Servco parcels, TMKs 1-9-4-019-061 (Waipahu) and 1-2-1-031-030 (Kakaako). The Draft EIS provides

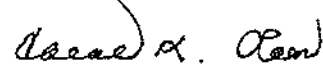

Mr. Wayne Y. Yoshioka, Director
Department of Transportation Services
February 5, 2009
Page 5

insufficient information on the acquisition process and procedure, including without limitation, its timing and manner of determining compensation to affected landowner.

In the process of finalizing its Environmental Impact Statement for the Honolulu High-Capacity Transit Corridor Project, we ask that the City & County of Honolulu prudently address and respond to our questions and concerns.

Sincerely,

SERVCO PACIFIC INC.

Dear Ms. Lam:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

General Comments

The comment about the impact of construction is acknowledged. As indicated in Sections 3.5.7 and 4.18.1 of the Final EIS, a Maintenance of Traffic (MOT) Plan will be developed by the contractor prior to construction and will address temporary effects on access to businesses during construction. Residents and businesses will be informed in advance of construction activities and the times and durations of such activities. Contractors will be required to work with businesses to reduce the impact on their operations. Proposed mitigation to reduce adverse economic hardships for existing businesses along the project alignment during construction activities will include the following:

- *Maintaining access to businesses during construction.*
- *Developing a public involvement plan prior to construction to inform business owners of the construction schedule and activities.*
- *Initiating public information campaigns to reassure people that businesses are open during construction and to encourage their continued patronage.*
- *Minimizing the extent and number of businesses, jobs, and access affected during construction.*
- *Coordinating the timing of temporary facility closures in cooperation with affected businesses to minimize impacts to business activities—especially those related to seasonal or high sales periods—to the extent practicable.*
- *Minimizing the duration of modified or lost access to businesses—as practicable.*
- *Providing signage, lighting, or other information to indicate that businesses are open.*
- *Providing public information (e.g., press releases or newsletters) regarding construction activities and ongoing business activities, including advertisements in print and on television and radio.*
- *Phasing construction in each area so as to maintain access to individual businesses for pedestrians, bicyclists, passenger vehicles, and trucks during business hours and important business seasons.*
- *Providing advance notice if utilities will be disrupted.*
- *Scheduling major utility shut-offs during non-business hours.*

The contractor will select appropriate measures to comply with fugitive dust requirements. The following control measures can substantially reduce fugitive dust:

- *Minimize land disturbance*
- *Use watering trucks to moisten disturbed soil*
- *Use low emission equipment when feasible*
- *Cover loads when hauling dirt*
- *Cover soil stock piles if exposed for long periods of time*
- *Use windbreaks to prevent accidental dust pollution*
- *Limit the number of vehicular paths and stabilize temporary roads*

- *Maintain stabilized construction area ingress/egress areas*
- *Wash or clean trucks prior to leaving construction sites*
- *Minimize unnecessary vehicular activities*

Noise permits will be obtained prior to the construction of each phase of the Project. The permits will regulate construction times and activities and include mitigation commitments. The following measures are examples of what could be included in the permits:

- *Develop a monitoring plan with noise limits*
- *Construct temporary noise barriers or curtains*
- *Equip construction equipment engines with adequate mufflers and intake silencers*
- *Strategically place stationary equipment, such as compressors and generators*

Public information teams will be established for each construction segment consisting of individuals familiar with that project segment. Team members will work with local businesses to inform them of the Project's construction status and upcoming construction activities, as well as address concerns that local businesses may have. Team members will consider establishment of regularly scheduled meetings with individual businesses to provide these updates and address concerns of affected businesses.

A. Waipahu Property

1. Between Waipahu Depot Road and Mokuola Street, the guideway height would vary from 30 to 45 feet above the Farrington Highway median. Column spacing will be about 150 feet on average, allowing for substantial space between supports. As acknowledged in Section 4.8.3 of the Final EIS, "...the guideway...will obstruct some makai and mauka views across the highway..." However, because the alignment is in the roadway median, views of businesses from vehicles traveling on the highway will not be significantly affected and access will not be impaired.

2. As discussed earlier, an MOT Plan will identify measures to mitigate temporary construction-related effects on transportation. The contractor will develop the MOT Plan with approval from the City and the Hawaii Department of Transportation (HDOT). The MOT Plan will address roadway closures for streets identified in Table 3-27 of the Final EIS. The detailed schedule of activities will be part of the contractor's construction planning.

As stated in Section 4.18.1 of Chapter 4 of the Final EIS and discussed above, access to businesses will be maintained during construction and a public involvement

plan will be developed prior to construction to inform business owners of the construction schedule and activities.

The schedule for the Farrington Highway widening project has not yet been established by HDOT. Construction coordination is underway between the City and the State as it relates to the Project and the planned widening of Farrington Highway. Schedules will be coordinated between the City and the State to minimize overall construction disturbance. The City has traffic consultants that have been part of the development of the MOT Plan. Furthermore, both the City and contractors will provide traffic engineering support and will continue to be part of the Project through the construction phase.

The City will also coordinate construction of the Project with other construction projects in the area. A summary of project-related transportation effects, including temporary construction effects, is also included in Section 3.5.3 of Chapter 3 of the Final EIS. Effects could include lane closures and replaced or re-timed traffic signals. As discussed in Section 3.5.7 of the Final EIS, the construction contractors will develop a MOT Plan to address temporary construction-related effects on the transportation network.

3. As discussed in Section 4.14.3 of the Final EIS, the Project will not result in any long-term changes to groundwater levels.

Any ground stabilization methods used during construction will be performed in a manner that protects and maintains existing conditions. Induced settlement or movement of nearby facilities will not be permitted.

4. Section 4.18.2 of the Final EIS explains that construction effects on utilities will be temporary and limited. Businesses, including Servco Pacific, will be provided with advance notice if utilities are to be disrupted. Major utility shut-offs will be scheduled to occur during non-business hours to the extent feasible and will be coordinated with all local businesses.

5. Continued coordination and public outreach will keep business owners informed throughout the project process regarding right-of-way acquisition and project construction. The Project team (City and contractor) has a public information program and public involvement staff that will be in contact with the local community during construction. They will conduct meetings with groups and individual businesses, distribute newsletters about the Project status and progress, distribute fliers to notify businesses of anticipated construction activity, establish a hot line to hear and address concerns as they develop, and sponsor a website to maintain the latest information available to any interested parties.

B. South Street Property

1. As presented in Section 4.4.3 of the Final EIS: "where relocation will occur, compensation will be provided to property owners, businesses, or residents in compliance with all applicable Federal and State laws and will follow the Federal Uniform

Relocation Assistance and Real Property Acquisition Policies Act (49 CFR 24). The City will assist all affected persons in locating suitable replacement housing and business sites within an individual's or business's financial means. The City will provide relocation advisory services to businesses where acquisition of adjacent property may substantially reduce clientele, limit accessibility, or affect a business in other substantial ways." The City will coordinate with the property owner to review access and business activity constraints associated with right-of-way acquisition and construction impacts. Regarding the South Street Servco property, there is no expectation that the business will need to change as a result of the Project. If there are other considerations to the affected business such as an impact to service bays, those will also be part of the discussions between the City and the property owner. Final design will determine the ultimate impact and proper course of action related to each business

2. There is no expectation that Servco will have to revise its operations on the site as a result of the Project. Further engineering work has occurred since the Draft EIS. The current requirement is for a land area of 20 feet by 200 feet and is not expected to impact existing buildings on the Servco property, as reflected in the Final EIS. This revised property impact is not expected to affect the current site configuration.

3. As shown in Figure 2-35 of the Draft and Final EISs, the Civic Center Station will have entrances on both the mauka and makai sides of Halekauwila Street. The makai side of the street is currently a parking lot. This station design was used in all analyses conducted for the Draft and Final EISs, including right-of-way acquisitions and cost, and is reflected throughout the documents. The two entrances are provided to improve access and safety at the station. The City has substantially reduced the size of the property acquisition requirement on the mauka property in the latest design. The current requirement is for a land area of 20 feet by 200 feet and is not expected to impact existing buildings on the Servco property, as reflected in the Final EIS.

4. Construction is anticipated to be completed using drilled-shaft foundations. This method is discussed in Appendix E to the Final EIS. It will not create substantial vibration levels as shown in the analysis of noise and vibration impacts of construction in Section 4.18.5 of the Final EIS. The planned activities are not anticipated to create vibration levels that would affect calibration; however, the City and contractor will work with Servco to address any unanticipated effects.

5. As explained in Section 4.14.3 of the Final EIS, the Project will not result in any long-term changes to groundwater levels. Permanent Best Management Practices will be installed to direct runoff back into the ground to recharge the system.

As stated above regarding the Waipahu area, any ground stabilization method used will be performed in a manner that protects existing conditions. Induced settlement or movement of nearby facilities will not be permitted.

6. Due to the limited amount of parking available to residents and businesses in and around construction sites, construction workers will not be allowed to park their personal vehicles in the public right-of-way. Construction workers will not be allowed to use commercial parking facilities if doing so reduces available parking for customers or

employees of that business. Approval is needed from the business owner before a private lot can be used for construction worker parking.

On-street parking by construction workers will not be permitted near a work site. During the actual hours of work, only those vehicles absolutely necessary for construction will be allowed within the safety zone or allowed to stop or park on the shoulder of the roadway.

Temporary lane closures are identified in Table 3-27 of the Final EIS. As previously discussed, the MOT Plan created by the construction contractor with approval from the City and/or HDOT, will identify treatment and management of construction-related effects on the local transportation system. The long-term effects on the transportation system (e.g., Halekauwila Street) are part of the traffic analysis discussed in Chapter 3 of the Final EIS.

Additional traffic studies are not anticipated as part of the MOT Plan. However, as stated in Section 3.5.6 of Chapter 3 of the Final EIS, access to businesses will be maintained during construction and a public involvement plan will be developed prior to construction to inform business owners of the construction schedule and activities.

Regarding the property acquisition comment, Servco Pacific will be contacted by the City regarding the acquisition of any property required for the Project. All potentially affected property owners have been notified by letter and will be contacted in person to discuss the acquisition process.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Submission Method : Website
Other Submission Method :
Submission Date : 12/26/2008

Submission Content/Notes : I submit the following comments:

The Salt Lake route should be used because:

1. It will get more working citizens off the road since it will run through a high density population,
2. The airport track can be added later. Residents will not use the transit to the airport since they have so much to carry.
3. Tourists from the airport won't even use the transit until the Waikiki track is constructed.
4. Rush hour traffic M-F are mostly single person vehicles. Tour buses and taxis are insignificant.
5. Rush hour traffic on Sat are mostly residents. Tour buses and taxis are insignificant.

The route should run East from Kapolei to Fort Weaver Rd and up to Farrington Hwy because:

1. Again the route would run through a high populated area.
2. With the transit running past LCC, HCC, and UH Manoa there is no need to build a West Oahu College. If West Oahu College is built, then they can provide their own shuttles like UH.

More Stops from Ewa to Kalihi Should be Built because:

1. It will promote more ridership (closer walking/biking distance to stations).
2. There are a lot of businesses in Waipahu, Pearl City, and Mapunapuna where citizens will go to work.

Construction Schedule need to be fast tracked (build outwards from stations) because:

1. If cost is an issue, then it should be built asap.
2. Ridership won't be significant until the downtown tracks are completed.
3. The economy needs help now. Not 10 years from now.

Dear Mr. Shibata:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your preference for the Salt Lake Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more

Mr. Corey Shibata
Page 2

information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The Airport Alternative serves major employment destinations. Visitor ridership accounts for a small percentage of overall ridership. As discussed in Section 3.4.2, 9,900 visitors will use the fixed guideway daily, of which 1,800 will be to or from the airport. Bus service will be enhanced between Ala Moana Center and Waikiki until the planned extension is built.

A Fort Weaver Road alignment was evaluated and rejected in the Alternatives Analysis. It would have been the most expensive option for serving the Ewa area, and no space would have been available to provide park-and-ride and bus transfer facilities.

Regarding your comments about stations, the location of fixed guideway stations was based on land use development plans, bus access, room for the station, and expected modes of access to the station. Many fixed guideway stations are located within a mile of each other. Typically, an individual will walk one-half mile to reach a high-capacity transit station. Accordingly, fixed guideway stations are close enough to each other to promote walking and biking access. The average travel speed of the rail line would be reduced if stations were located closer together.

Lastly, the Project is proceeding as quickly as practical, as illustrated in the schedule presented in Figure 2-42 of the Final EIS.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

A SUGGESTION PROGRAM

If you have a suggestion, idea or complaint, Tell It to the Mayor.

We've received some great ideas from this program - ideas which have saved money and helped us deliver better service.

All suggestions and complaints are confidential. By including your name, address and a daytime phone number, we are able to respond to you, if necessary.

Thanks for helping us serve you better.

Mufi Hannemann, Mayor
City and County of Honolulu
INTERNET: www.honolulu.gov

SUGGESTION: Have the rail system built not steel on steel
because of our salt water air.
Also have one of the first routes from the leeward
and central areas to the University of Hawaii Manoa because
if you have ever seen the improvement in traffic
(currently) it is when the University of Hawaii system
is not in session.

Dear Ms. Shimamura:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The system specifications, like those developed for many modern steel wheel on steel rail systems operating in tropical marine environments around the world, will consider the operating environment.

Corrosion control measures will be applied to the Project's fixed steel facilities and neighboring utility structures to provide proper operation over their lifetime. These measures include:

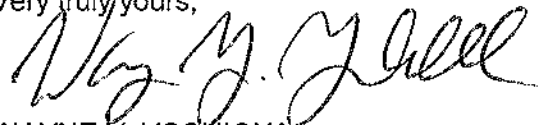

- 1. Protective coating specification for steel aerial structures*
- 2. Coating specification for stations*

3. *Preventive measures against stray current corrosion*
4. *Corrosion control design of transit underground utilities and neighboring utilities owned by others*

The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS; however, the future extensions are not part of this Project. Thus, they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time. Bus service between Ala Moana Center and these destinations will be enhanced until those extensions are built. The Project is anticipated to remove a greater number of automobile trips from the roadway system than the number of UH Manoa-related automobile trips that occur when UH is in session.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

**Honolulu High Capacity Transit Corridor Project
Draft Environmental Impact Statement
Comments**

Aloha:

Thank you for the opportunity to comment. Sierra Club Oahu Group is in general favor of the proposed transit project, but offers the following questions and comments that we feel would strengthen the EIS and, ultimately, provide a better project for Oahu's citizens.

Connectivity

The figures in Chapter 2 do a nice job of illustrating station layouts and entry points. The City and County need to provide maps that illustrate how people get to those entrances. These maps should consider a radius of 1/2-mile from the station. They should clearly indicate sidewalk

 Recycled Content

and bikelane connectivity to the stations. Infrastructure improvements to provide this connectivity should be part of the project, or at the very least a high priority of the City and County. The City and County has a mandate to improve walkability and bikeability in the city. Providing good connections to this transit system would go a long way to achieving that.

Will bikes, surfboards and luggage be allowed on the train? Will there be any restrictions on time of day (i.e. not allowed during commute hours)? What is the size limitation?

What pedestrian and bicycle amenities will be designed and built in or near transit stations?

Aesthetics and Viewplanes

The DEIS provides a thorough discussion on the visual impacts of the project, but provides little in the way of mitigating measures. Many other states utilize attractive concrete art to soften the impact of large highway structures. In addition to softening the visual impact, this strategy also appears to greatly inhibit graffiti. Walls in Arizona and Colorado are effective. In many locales, local artists design motifs that are incorporated in concrete surfaces. See the following link for examples: http://www.concretenetwork.com/annex_balwyn/concrete_walls.htm

Why is the entire transit route elevated? Where geography permits, the transit route should be placed at ground level to reduce cost of construction, energy consumption during construction, and impacts to view planes.

Agricultural land

Prime, unique, and statewide important lands are, by definition, of agricultural importance. Land with such classification is significant, not negligible, regardless of acreage. To trivialize the conversion of such lands on the grounds that only a small amount of it will be sacrificed is not acceptable. Conversion of such lands is, according to the ALISH system that defines these classifications, irreversible and therefore not a decision that should be taken lightly or trivialized because of scale.

Once the rail transit route is in place, it is expected that development will occur along the route, and this Transit-Oriented Development will almost certainly affect important agricultural lands. In order for the final EIS for rail transit to accurately and completely examine the environmental impacts to agricultural lands, the project must include agricultural lands adjacent to project construction boundaries. The Final EIS should include a detailed discussion and mitigation plan for negative environmental impacts to agricultural land affected by this project including an analysis of alternative routes to preserve prime, unique, and/or statewide important agricultural land. If these agricultural lands are part of a planned development corridor, the EIS should describe how City and County planning and zoning measures assure that important agricultural lands outside the planned development corridor are preserved.

The transit system should have a terminus in Waipahu, rather than East Kapolei, and extend into Waikiki and/or up to UH Mānoa instead of extending to East Kapolei where the majority of agricultural lands exist.

Air Quality

According to the DEIS, the methodology for projecting future air quality as a result of the various project alternatives is based on anticipated vehicle miles traveled (VMT) and average network speed for each alternative. The data given in the DEIS indicates that all Build Alternatives yield better air quality than the No Build alternative, which may not be true. Better air quality would only occur if the proposed rail transit system replaces enough cars on the road such that its emissions are less than the collective emissions of the cars it replaces. The EIS should discuss the possibility that the offset may not occur, and discuss measures of mitigation.

Energy

The Project should make every effort to maximize operating efficiency. The final EIS should also give more consideration as to the feasibility of integrating alternative energy technologies into the project as well as an analysis of potential energy conservation measures such as opting to build sections of the route at ground level rather than elevated where feasible.

What are the plans (if any) to run rail on renewable sources of energy (palm oil not included)?

What assumptions regarding ridership, VMT, etc. were made in determining the energy savings of each Build Alternative relative to the No Build Alternative?

Errors

Margins of error for all data, as well as a list of assumptions made, should be provided for clarity.

Cost

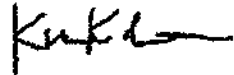

Will fares be subsidized to encourage ridership? If so, what is the target group for those subsidized fares?

What percent of the cost of rail (construction, maintenance and interest paid on bonds) is expected to be paid with fares? What if fares do not meet this percentage? Will fares and/or taxes be raised? By how much?

Please send comment responses to:

Dear Ms. Kido:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Connectivity

Regarding station access, as indicated in the Final EIS Table 3-20 overall access to public transit will be enhanced with the Project. A substantial portion of project riders will access the system by local bus and by walking and biking to the station. Bus, walk, and bike access to stations will account for approximately 90 percent of total trips in the a.m. peak period, 6 a.m. to 8 a.m. Several stations will be located near existing or planned bicycle facilities. As stated in Chapter 3, Section 3.4.5, the Oahu Bike Plan is currently being updated and is scheduled to be adopted in 2010. Maps that show sidewalk and bicycle facilities within a half mile of each fixed guideway station are under development and will be used as part of the station planning process. The draft update includes a prioritized list of bicycle projects developed using criteria that includes access to transit. Several projects that would connect existing or future bicycle facilities to rail transit stations are included in the draft update. Additionally, the City will provide parking facilities at four stations (East Kapolei, UH West Oahu, Pearl Highlands, and Aloha

Stadium). These stations were selected based on results from the travel demand forecasting model, which showed these stations had high drive-to-transit demand.

As shown in Table 3-20 in the Final EIS, 90 percent of fixed guideway riders will walk, bike, or take a bus to reach the stations, while the remaining 10 percent of riders will drive to park-and-ride facilities or be dropped off.

As stated in Section 2.5.5 of the Final EIS design criteria developed for stations place the highest emphasis on walk and bicycle access. The Design Criteria provide specific direction for pedestrian and bicycle access features at stations. For example, the criteria state that adequate pedestrian circulation routes shall be provided with an emphasis on avoiding pedestrian and vehicular conflicts and enabling good visibility to each station entrance. This emphasis will be complemented by distinct and clear graphic signage. For bicycle access, the criteria include language stating that racks shall be placed at the station plaza near the station entrance where public visual surveillance is possible and/or where closed circuit television monitoring is present.

As indicated in the Final EIS Section 4.6.3 ongoing coordination efforts with the public will help develop design measures that will enhance the interface between the transit system and the surrounding community. The extent, nature, and location of these design measures will be determined through these coordination efforts and as part of the station planning and design process. The figures in Chapter 2 of the Final EIS identify the location of new pedestrian facilities, such as the pedestrian bridges at Pearl Highlands shown on Figure 2-23. DTS is working with other City Departments and the Hawaii Department of Transportation to provide adequate facilities for all access modes and to encourage the development of pedestrian and bicycle improvements near stations to coincide with the Project.

Bicycles, luggage, and surfboards will be allowed on trains and regulated by policy to address high demand periods or special conditions. This policy is in development. Several stations will be located near existing or planned bicycle facilities. As stated in Chapter 3, Section 3.4.5, the Oahu Bike Plan is currently being updated and is scheduled to be adopted in 2010. The draft update of the Oahu Bike Plan includes a prioritized list of bicycle projects developed using criteria that includes access to transit. Several projects that would connect existing or future bicycle facilities to rail transit stations are included in the draft update. Additionally, the City will provide parking facilities at four stations (East Kapolei, UH West Oahu, Pearl Highlands, and Aloha Stadium). These stations were selected based on results from the travel demand forecasting model which showed these stations had high drive to transit demand.

Several stations will be at or near existing or planned bicycle facilities. The Final EIS Section 3.4.2 states that each station will have facilities for parking bikes, and each guideway vehicle will be designed to accommodate bicycles. Sidewalks and crosswalks are currently available at stations or will become available as streets and sidewalks are built in developing areas. At many stations, the Project will add new sidewalks or widen or otherwise improve existing ones. While the Project is coordinating with City and State agencies to encourage development of enhanced pedestrian and bicycle facilities near stations, the actual construction of such facilities is beyond the scope of the Project.

In addition, at the Pearl Highlands Station, pedestrian bridges will connect station entrances with nearby residential and commercial areas. The East Kapolei Station will include an enhanced pedestrian link between the park-and-ride facility and station entrances. For the

Honolulu International Airport Station, pedestrian walkways will connect the station to the Interisland and Overseas Terminals.

Aesthetics and Viewplanes

In Section 4.8.3 of the Final EIS, specific environmental, architectural, and landscape design criteria are listed that will help minimize visual effects of the Project. The City will implement the following measures to minimize negative visual effects and enhance the visual and aesthetic opportunities that the Project creates:

- *Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context; examples include:*
 - *Landscaping will be used to screen the traction power substations from sensitive adjacent land uses, such as residential areas.*
 - *Site-specific designs will be created to provide station identity and respond to individual site conditions, including views, trees, sun and wind patterns. Landscaping materials will soften views and help integrate project elements into the urban fabric of the communities it serves. Specialty stations will be treated with historic context and careful design to reinforce the uniqueness of context or use.*
- *Coordinate the project design with the City's transit-oriented development program within the Department of Planning and Permitting.*
- *Conduct public involvement workshops to consult with the communities surrounding each station for input on station design elements.*
- *Consider specific sites for landscaping and trees during Final Design when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will serve to mitigate potential visual impacts.*

As stated in Section 2.2 of the Final EIS, prior to selecting an elevated fixed guideway system, a variety of high-capacity transit options were evaluated during the Primary Corridor Transportation Project (1998—2002) and Alternatives Analysis. Options evaluated and rejected included an exclusively at-grade fixed-guideway system using light-rail or bus rapid transit (BRT) vehicles, as well as a mix of options consisting of both at-grade and grade-separated segments.

The Alternatives Screening Memorandum (DTS 2006a) recognized the visually sensitive areas in Kakaako and Downtown Honolulu, including the Chinatown, Hawaii Capital, and Thomas Square/Honolulu Academy of Arts Special District. To minimize impacts on historic resources, visual aesthetics, and surface traffic, the screening process considered 15 combinations of tunnel, at-grade, or elevated alignments between Iwilei and Ward Avenue. Five different alignments through Downtown Honolulu were advanced for further analysis in the Alternatives Analysis, including an at-grade portion along Hotel Street, a tunnel under King Street, and elevated guideways along Nimitz Highway and Queen Street (Figure 2-4).

The Alternatives Analysis Report (DTS 2006b) evaluated the alignment alternatives based on transportation and overall benefits, environmental and social impacts, and cost considerations. The report found that an at-grade alignment along Hotel Street would require the acquisition of more parcels and could potentially affect more burial sites than any of the other alternatives considered. The alignment with at-grade operation Downtown and a tunnel under King Street, was not selected because of the environmental effects, such as impacts to cultural resources, reduction of street capacity, and property acquisition requirements of the at-grade and tunnel sections, which would cost an additional \$300 million.

The Project's purpose is "to provide high-capacity rapid transit" in the congested east-west travel corridor (see Section 1.7 of the Final EIS). The need for the Project includes improving corridor transit mobility and reliability. The at-grade alignment would not meet the Project's Purpose and Need because it could not satisfy the mobility and reliability objectives of the Project (see bullets below). Some of the technical considerations associated with an at-grade versus elevated alignment through Downtown Honolulu include the following:

- **System Capacity, Speed, and Reliability**—*The short, 200-foot (or less) blocks in Downtown Honolulu would permanently limit the system to two-car trains to prevent stopped trains from blocking vehicular traffic on cross-streets. Under ideal operational circumstances, the capacity of an at-grade system could reach 4,000 passengers per hour per direction, assuming optimistic five minute headways. Based on travel forecasts, the Project should support approximately 8,000 passengers in the peak hour by 2030. Moreover, the Project can be readily expanded to carry over 25,000 in each direction by reducing the interval between trains (headway) to 90 seconds during the peak period. To reach a comparable system capacity, speed, and reliability, an at-grade alignment would require a fenced, segregated right-of-way that would eliminate all obstacles to the train's passage, such as vehicular, pedestrian, or bicycle crossings. Even with transit signal priority, the at-grade speeds would be slower and less reliable than an elevated guideway. An at-grade system would travel at slower speeds due to the shorter blocks, tight and short radius curves in places within the constrained and congested Downtown street network, the need to obey traffic regulations (e.g., traffic signals), and potential conflicts with other at-grade activity, including cars, bicyclists, and pedestrians. These effects mean longer travel times and far less reliability than a fully grade-separated system. None of these factors affects an elevated rail system. The elevated rail can travel at its own speed any time of the day regardless of weather, traffic, or the need to let cross traffic proceed at intersections.*
- **Mixed-Traffic Conflicts**—*The Project will run at three minute headways. However, three-minute headways with an at-grade system would prevent effective coordination of traffic signals in the delicately balanced signal network in downtown Honolulu. A disruption of traffic signal cycle coordination every three minutes would severely affect traffic flow and capacity of cross-streets. Furthermore, there would be no option to increase the capacity of the at-grade rail system by reducing the headway to 90 seconds, which would only exacerbate the signalization problem. An at-grade system would require removal of two or more existing traffic lanes on affected streets. This effect is significant and would exacerbate congestion. Congestion would not be isolated to the streets that cross the at-grade alignment but, instead, would spread throughout Downtown.*

The Final EIS shows that the Project's impact on traffic will be isolated and minimal with the elevated rail, and, in fact will reduce system-wide traffic delay by 18 percent compared to the No Build Alternative (Table 3-14 in the Final EIS). The elevated guideway will require no removal of existing through travel lanes, while providing a reliable travel alternative. When traffic slows, or even stops due to congestion or incidents, the elevated rail transit will continue to operate without delay or interruption.

An at-grade light rail system with continuous tracks in-street would create major impediments to turning movements, many of which would have to be closed to eliminate a crash hazard. Even where turning movements are designed to be accommodated, at-grade systems experience potential collision problems. In addition, mixing at-grade fixed guideway vehicles with cars, bicyclists, and pedestrians presents a much higher potential for conflicts compared to grade-separated conditions. Where pedestrian and automobiles cross the tracks in the street network, particularly in areas of high activity (e.g., station areas or intersections), there is a risk of collisions involving trains that does not exist with an elevated system. There is evidence of crashes between trains and cars and trains and pedestrians on other at-grade systems throughout the country (e.g., Phoenix, Houston, LA). This potential would be high in the Chinatown and Downtown neighborhoods, where the number of pedestrians is high and the aging population presents a particular risk.

- **Construction Impacts**—*Constructing an at-grade rail system could have more effects than an elevated system in a number of ways. The wider and continuous footprint of an at-grade rail system compared to an elevated rail system (which touches the ground only at discrete column foundations, power substations, and station accessways) increases the potential of utility conflicts and impacts to sensitive cultural resources. In addition, the extra roadway lanes utilized by an at-grade system would result in increased congestion or require that additional businesses or homes be taken to widen the roadway through Downtown. Additionally, the duration of short-term construction impacts to the community and environment with an at-grade system would be considerably greater than with an elevated system. Because of differing construction techniques, more lanes would need to be continuously closed for at-grade construction and the closures would last longer than with elevated construction. This would result in a greater disruption to business and residential access, prolonged exposure to construction noise, and traffic impacts.*

Because it is not feasible for an at-grade system through Downtown to move passengers rapidly and reliably without significant detrimental effects on other transportation system elements (e.g., the highway and pedestrian systems, safety, reliability, etc.), an at-grade system would have a negative system-wide impact that would reduce ridership throughout the system. The at-grade system would not meet the Project's Purpose and Need and, therefore, does not require further analysis.

Agricultural Land

The detailed discussion of zoning as the key implementing tool to turn land use planning policies into development is presented in the Honolulu High-Capacity Transit Corridor Project Land Use Technical Report (RTD 2008b) and summarized in Section 4.2.3 in the Final EIS. The technical report can be reviewed at the City and County of Honolulu DTS office or on the Project website (www.honolulustransit.org). The Project's focus is the construction and implementation of rail transit service, and that is what is covered in the Final EIS. However, as mentioned in Section 4.19.2 of the Final EIS, transit-oriented development (TOD) is expected to occur in project station areas as an indirect effect of the Project. The increased mobility and accessibility that the Project may provide will also increase the desirability and value of properties near the stations, thereby attracting new real estate investment nearby (in the form of TOD). In March 2009, the City Council approved and the Mayor of Honolulu signed Bill 10 (2008) (Ordinance 09-4), which defines the City's approach to TOD around fixed guideway stations. New zoning regulations will address parking standards, new density provisions, open space, and affordable housing. Financial incentives could include public-private partnerships, real property tax credits, and infrastructure financing. While the Project includes coordination with City and State agencies to encourage development of enhanced pedestrian and bicycle facilities and other land use changes near stations, the actual construction of such facilities and zoning changes are beyond the scope of the Project. The special districts also encourage public input into the design of TOD neighborhood plans to reflect unique community identities.

As stated in Section 4.2.3 of this Final EIS, the only farmlands that will be acquired for the Project are in the Ewa Plain. The Ewa Development Plan designates areas for dense development while preserving other areas for agriculture. A maximum of 80 acres of prime farmland and 8 acres of statewide-important farmlands will be acquired by the Project, of which 70 acres are actively cultivated. All of the affected properties designated as prime, unique, or of statewide importance and/or actively farmed are owned by individuals, corporations, or agencies that plan to develop them in conformance with the Ewa Development Plan.

The 88 acres of agricultural impacts include land for a maintenance and storage facility. One of the two alternatives for a maintenance and storage facility is in agricultural-related use (Aloun Farms). The other potential maintenance and storage facility is located near Leeward Community College and is the site of a former Navy fuel storage and delivery facility. The Leeward Community College location is the preferred location for the maintenance and storage facility, and the City has been working with the Navy to acquire it. If the Project can acquire this site, only about 47 acres of agricultural land designated prime or of statewide importance will be used for the Project.

As stated in Section 4.2.3 of the Final EIS the 2002 Census of Agriculture (USDA 2004) reported that there are more than 70,000 acres of agricultural land in cultivation on Oahu, including those designated as prime, unique, or of statewide importance. The displacement of agricultural lands as a result of the Project represents less than one-tenth of one percent of available agricultural land. Considering that the amount of affected farmland is such a small proportion of all agricultural lands on Oahu, including those designated as prime, unique, or of statewide importance, the effect will not be substantial and no mitigation is proposed.

The Waipahu area does not provide an available location for park-and-ride facilities to serve Ewa and Waianae traffic. Also, buses would be required to access the terminal station

through congested traffic on Farrington Highway. The savings from shortening the Ewa limit of the project corridor would not be sufficient to connect UH Manoa and Waikiki and would result in substantial traffic impacts in the Waipahu area. The Project serves areas within the Urban Growth Boundary defined by the Ewa Development Plan. By supporting development within the Urban Growth Boundary, further development pressure outside of the boundary will be reduced.

Air Quality

The regional pollutant burdens estimated in Table 4-15 of the Final EIS are based on Vehicle Miles Traveled (VMT) and Vehicle Hours Traveled (VHT) estimates throughout the study area. These estimates are based on regional planning models adopted by the OahuMPO. Emission rates were developed through the use of EPA's MOBILE6.2 Emission Factor program which takes into account vehicle mix, speed, meteorological conditions of the study area, and vehicular registration information. The Regional VMT model is reviewed by the State agencies for accuracy. Additional detail is available in the Transportation and Air Quality Technical Reports for the Project. The reports can be reviewed at the City and County of Honolulu Department of Transportation (DTS) Services office or on the Project website (www.honolulutransit.org). The analysis conducted for the EIS is based on the available information and Environmental Protection Agency (EPA) methodology. Since the analysis found there is no impact to air quality as a result of the Project, no mitigation is proposed.

The results shown in Table 4-15 of the Final EIS reflect mobile source emission burdens. As stated in the text, additional emissions will be generated due to the power requirements of the fixed guideway system. Table 4-21 in the Final EIS indicates that the Project will require 3 percent less overall energy as compared to the No Build Alternative. The Project is expected to result in decreased emissions generated on the roadways along with an increase in power source emissions resulting from fixed guideway energy consumption. However, the overall emission level for the Project is expected to be lower than the No Build Alternative because of anticipated reduced traffic congestion compared to the No Build Alternative (see Section 3.4.1 of the Final EIS).

As summarized in Table 4-21 in the Final EIS, operation of the Project is anticipated to reduce daily transportation energy demand by approximately 3 percent compared to the No Build Alternative. This decrease in energy demand is due to the reduction in VMT that occurs as a result of people switching from automobiles to the fixed guideway system and includes electrical energy required to operate the fixed guideway system.

VMT is the sum of the length of all highway segments multiplied by the number of vehicles that travel on them over the course of a day. The travel forecasting model performs that calculation each time the model is run. The differences in VMT between alternatives in the analyses are based on the differences in the numbers generated by the model. The same is generally true for VHT and VHD. VMT, VHT, and VHD forecasts have been developed using the travel demand model, which was calibrated against collected traffic and transit ridership information and then validated against current counts to be sure it properly represents travel activity in the transportation system (Section 3.2.1 of the Final EIS). An on-board transit survey was completed in December 2005 and January 2006, and the latest socioeconomic information available as of October 2008 was incorporated. Traffic counts were collected in 2005, 2007, and 2008. The model is based upon a set of realistic input assumptions regarding land use and demographic changes, such as updates to population and employment patterns that reflect

planned development on Oahu, between now and 2030 and expected transportation levels-of-service on both the highway and public transit system.

Energy

According to the U.S. Department of Energy, Transportation Energy Data Book, for the year 2006, passenger cars require 3,512 BTUs per passenger mile while transit trains require 2,784 BTUs per passenger mile, and transit buses require 4,235 BTUs per passenger mile. Based upon these figures, transit trains are a more energy efficient mode of transportation compared to passenger cars or transit buses. These figures are influenced by the load factor (persons per vehicle). The Honolulu system currently has the fourth highest load factor of any transit system in the United States and the highest load factor for any transit system without a rail transit system (Table 3-8 in the Final EIS).

Vehicle efficiency is factored into energy calculations based on overall fleet performance. In general, performance is assumed to improve over time consistent with fleet requirements imposed by federal law or set by individual states.

The Project will rely on Hawaiian Electric Company's (HECO) existing grid to provide propulsion for the trains and system operations for the trains. HECO is moving toward renewable energy generation. As that happens, the fixed guideway will also benefit from such new sources of energy. The 21 proposed stations and maintenance and storage facility will incorporate energy efficiency, alternative energy technologies, and other sustainable features into the design to the extent possible. This is being accomplished by including sustainability design criteria into the construction contract documents for the Project. Combined with the State's commitment to renewable electricity production, the system will substantially reduce the consumption of petroleum. Transportation energy use is evaluated in Section 4.11 of the Final EIS.

As shown in Section 4.11 of this Final EIS, the Project will result in reduced transportation energy consumption on Oahu. As stated previously, for at-grade operation, the system would require a fenced right-of-way with no crossings. It is not possible to construct such a system in many parts of the corridor, such as in the Downtown area.

Margins of Error

The preparation of the Draft and Final EISs follows the requirements of the Federal process established by NEPA, as applied by the FTA, and Chapter 343 of the Hawaii Revised Statutes. Further detail, including data assumptions, is available in the supporting technical reports for each of the discipline areas. The FTA-approved forecasting methodology is not a probabilistic analysis and does not inherently provide margins of error.

Cost

Chapter 6 of the Final EIS notes that fares are already subsidized for TheBus and are assumed to be for the Project. This is a typical practice for most transit systems throughout the country. The City Council's current policy is to recover between 27 and 33 percent of the annual cost of operations and maintenance from fares. It applies to all users, although reduced-cost fare categories are available to select groups, such as seniors and students.

Ms. Kim Kido
Page 9

Chapter 6 of the Final EIS notes that the capital costs of the Project will be paid for using the County General Excise Tax Surcharge authorized by the State Legislature and approved by the City Council, and Federal funding from the Federal Transit Administration. Farebox revenues are generally used to pay for ongoing operating and maintenance of the system.

The City Council's current policy is that 27 to 33 percent of operating and maintenance costs be recovered from farebox collections. As costs change, the City Council will adjust fares to meet that requirement. That means fares could rise or fall depending on conditions.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Dear Mr. Smith:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

Section 6.5 of the Final EIS presents the financing for the Project. The analysis concludes that construction of the Project is financially feasible. Sufficient funds are expected from the County's General Excise and Use Tax (GET) Surcharge and Federal funds to cover the capital cost of these alternatives, including finance charges. All General Obligation debt is assumed to mature in FY 2023, corresponding to the last fiscal year of receipt of GET surcharge revenues. Throughout this period, the City is expected to maintain its current high credit rating.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Submission Content/Notes : I have reviewed the Draft EIS. Although I am neither a transportation expert nor environmental expert, the Draft EIS makes sense. The costs and benefits -- economic and social -- look to be realistically stated.
I have experienced the mass transit systems in New York, Atlanta, Paris, Sydney and the San Francisco Bay Area where I grew up. In those areas it is clear that efficient mass transit contributes greatly to good quality of life.
While I am disappointed that the Honolulu rail system will not initially go to Waikiki, UH Manoa and more places in the Ewa Plain, the system is a good start. I applaud the political leadership that recognized that the perfect is the enemy of the good. It appears to me that the big risk in new mass transit is not being ambitious enough. Witness the cost of the BART extension to the San Francisco Airport versus the cost had it been in the original plan.
I am pleased that the Honolulu Airport route appears to be on the way to adoption. I say that not just because I work at the airport, but especially because the airport route will also better serve the airport industrial area and Pearl Harbor which is an important "industry."
Let's get on with it!

Dear Mr. Smith:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your preference for the Airport Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more

Mr. Daniel C. Smith
Page 2

information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The proposed future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of this Final EIS. The future extensions are not part of this Project; thus, they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in this Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time. Additional extensions could be planned or considered over time.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

City Dept. of Transportation
Attn: DEIS Comments

→ Mr. Wayne Yoshioka
Director Department of Transportation Services
City and County of Honolulu
650 South King Street Third Floor
Honolulu, HI 96813

Dear Sir,

Please accept this as a comment concerning the DEIS on the proposed Rail Transit System being considered by the City and County of Honolulu.

1. The DEIS shows that the proposed system bypasses the most heavily congested area on the Leeward Coast-Ewa Beach. The purported purpose of the entire rail system is to provide an alternative for commuters coming from congested areas. The beginning of the rail system is more than 3.7 miles from Ewa Beach requiring us to drive or bus over heavily congested Ft. Weaver Rd. or the yet to be built North/South road. During peak traffic hours it can take 45 minutes to drive from Ewa Beach to H1 Freeway, even with the widening of Ft. Weaver Rd. and building of North/South Rd. it will take 30 minutes from Ewa Beach (end of Ft. Weaver Rd.) to the train station. Development in Ewa Beach will be far greater than in Kapolei or Waipahu yet these communities have their own station. Why does the DEIS not make provisions for including a station in the heart of the traffic congestion making us wait 15-20 years for a Phase II that might not ever be built?
2. The DEIS discloses that a train station is being built in a vacant field that has been bought by developer D R Horton to develop an 11,000 home community called Hoopili. The station is expected to provide significant enhancements to this developers project at great cost to the city and federal governments. Why is the city giving preference to a developer in assigning a station to this location while ignoring developments all ready built or in immediate need of transportation services?

Thank you for your response to my comments.

Dear Mr. Smith:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Several fixed guideway alignments were studied during the Alternatives Analysis, including an alignment along Fort Weaver Road. However, on December 22, 2006, the City Council selected an alignment that extends from Kapolei to UH Manoa with a branch to Waikiki as the Locally Preferred Alternative. Ordinance 07-001 made the City Council's selection law on January 6, 2007. City Council Resolution 07-039 defined the financially feasible Project as extending from East Kapolei to Ala Moana via Salt Lake Boulevard. By Resolution 08-261, the City Council altered a segment of the alignment to serve the Airport rather than Salt Lake Boulevard. While there may still be interest in an extension to Ewa Beach in the future, it is not included in the current project. The most direct access to the project would be to stations in East Kapolei or UH West Oahu along Kualaka'i Road (North-South Road), which will still provide an advantage to Ewa Beach residents by avoiding the severe congestion between the Waiawa interchange and downtown Honolulu..

Mr. Garry P. Smith
Page 2

According to the current plan, a station is located in the future Ho'opili project. The intent of this decision is to support the development of the Kapolei second city as the primary future growth area on the island. This is consistent with the Purpose and Need of the Project described in Section 1.8.3 of the Final EIS, to Improve Access to Planned Development to Support City Policy to Develop a Second Urban Center.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Dear Mr. Smith:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

To answer your question, yes, experience from a broad range of transit systems worldwide, including BART in the San Francisco Bay Area, has been used in the development of this Project.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka", is written over the typed name.

Dear Mr. Smith:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal:

In answer to your comments, the Airport Alternative from East Kapolei to Ala Moana Center has been selected as the Preferred Alternative. The identification of the Airport Alternative as the Preferred Alternative was made by the City to comply with FTA's NEPA regulations that state that the Final EIS should focus on the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative, public input on the Draft EIS, and City Council Resolution 08-261 identifying the Airport Alternative as the Project. The selection of the Airport Alternative is described in Chapter 2 of this Final EIS. The discussion of the alternatives considered is included in Chapter 2 of this Final EIS and the Alternatives Analysis. As discussed in Section 3.4.2 of this Final EIS, the Airport Alternative will carry the most passengers with 116,000 daily passengers and 282,500 daily trips in 2030, thereby resulting in the greatest transit-user benefits. The Airport Alternative will also result in the fewest vehicle miles traveled and vehicle hours of delay, as well as provide

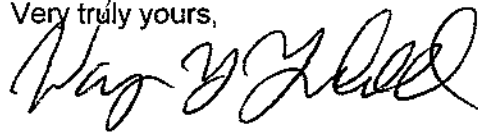

Mr. Kenny Smith
Page 2

access to major employment areas, including Honolulu International Airport, that will have substantially greater ridership than the other alternatives considered.

The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The proposed future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS. The future extensions are not part of this Project; thus, they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in this Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time. A copy of the Final EIS has been included with this letter. In addition, copies are available on the project website at www.honolulustransit.org.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Issuance of the Record of Decision under NEPA and acceptance of the Final EIS by the Governor of the State of Hawaii are the next anticipated actions and will conclude the environmental review process for this Project.

Very truly yours,

WAYNE Y. YOSHIOKA

Submission Content/Notes : I read, a few weeks ago, of a suggestion to start the rail system in Pearl City and develop it to down town. This would give the fastest traffic relief and return on the investment. Believe this idear was nixed because the maintenance yard will be located at the west end of the track in Kapolei. A thought would be to still start and fully develop the system, Pearl City to down town, while symultaneously develop the yard and track only from Kapolei to Pearl City. Have cake and eat it too!

Dear Mr. Smith:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

As described in Section 2.5.10 of the Final EIS, to support phased opening of the system, the first construction phase must be connected to a maintenance and storage facility, which requires considerable land. The first phase of the Project must be connected to the maintenance and storage facility because, in addition to maintenance of equipment and ongoing operations, the maintenance and storage facility houses the main control center for the entire Project, and the required testing and operation of the system could not be completed without access to it. No location has been identified closer to Downtown with sufficient available land to construct a maintenance and storage facility. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations*

Mr. Mike Smith
Page 2

- *Reduce the time that each area will experience traffic and community disturbances*
- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding*
- *Match the rate of construction to what can be maintained with local workforce and resources*
- *Balance expenditure of funds to minimize borrowing*

The portion of the corridor Ewa of Pearl Highlands is less developed than the areas Koko Head. As a result, right-of-way can be obtained more quickly and overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted Koko Head from Pearl Highlands to Aloha Stadium, then Kalihi, and finally to Ala Moana Center. Your suggestion to build the full system is appealing, but not within the financial range of the Project's current revenue sources.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Enclosure

December 5, 2008

To: Mr. Wayne Yoshioka, City director of transportation

From: Pam Smith, 91-321 Pupu Place, ewa beach 96706

I want to make a comment on the Draft environmental Impact statement up for public review at this time. I would like this comment to be answered.

My comment is that with the ^{City} state and national economy sputtering and tax revenues being reduced dramatically the original funding for the rail system won't be enough to now build it. Property taxes are going to go down so the city can't tap into that. The state won't raise the Get another 1/2% so where is the city going to get the difference between the original GET revenue and the new forecasted lower revenue?

In this same area, if property taxes go down because valuations have gone down, how will the city pay for the operating and maintenance expenses on this system which will be substantial?

Please respond with your answers:

Dear Ms. Smith:

**Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement**

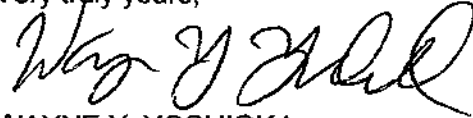

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses comments regarding the above-referenced submittal:

Section 6.3 of the Final EIS describes the financial resources anticipated to be needed to pay for the capital cost of the Project and the City's overall public transportation system. Capital costs of the Project, including finance charges, are expected to be fully paid for by a combination of FTA Section 5307 and FTA Section 5309 New Starts Funds from the Federal government and revenues from the County General Excise and Use Tax Surcharge levied from 2007 through 2022 on Oahu. The analysis takes the current economic downturn into account. Section 6.4 of the Final EIS describes the funding sources to pay for ongoing operations and maintenance costs associated with maintaining the transit system in a state of good repair. Operating and maintenance costs will be paid for from the same sources currently used for TheBus: Federal funding, fare revenues, and subsidies from the City's General and Highway Funds. Section 4.19 of the Final EIS discusses the potential indirect economic effects of new development and redevelopment near the Project alignment and around stations.

Ms. Pam Smith
Page 2

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Issuance of the Record of Decision under NEPA and acceptance of the Final EIS by the Governor of the State of Hawaii are the next anticipated actions and will conclude the environmental review process for this Project.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is fluid and cursive, with a large, sweeping flourish at the end.

URGENT URGENT URGENT

Mayor Mufi Hannemann
Honolulu Hale
530 S. King St.
Honolulu, HI 96813

Dear Mayor Hannemann:

This is to certify to you that **EMINENT DOMAIN SUITS ARE UNNECESSARY, A MAJOR WASTE OF TIME AND TAXPAYER MONEY.**

I SHALL volunteer to assist every homeowner and business affected by the proposed **EMINENT DOMAIN** to provide right-of-way for your elevated rail system and to testify in court to **STOP** plans for such an elevated system.

You know that I have been urging MASS TRANSIT NOW since 1983 and did all I could to help influence voters to vote FOR the steel-on-steel rail system. **Now, I will work TWICE AS HARD to get you, Mayor Mufi, and City Council to reconsider the ONLY LOGICAL AND COMMON SENSE SYSTEM for the 21st Century — 100 % UNDERGROUND steel on steel RAIL.** I will also be bringing pressure to bear from the State Legislature and from Washington. I have already contacted Senator Inouye who, I am sure doubtless voted for funding for the Washington DC UNDERGROUND metro system, and I am urging him to tie Federal funding to UNDERGROUND construction similar to that of the Chunnel. (Please visit <http://www.affordableworldtravelandtours.com/honolulucommonsensetransit/honolulucommonsensetransit.html>.)

I am told, the State of Hawaii may already have used such equipment as was used in the *Chunnel* in building the H-3 tunnels and may still own it.

In past correspondence, I have already given you well over 20 **SOLID, Valid** reasons why **UNDERGROUND** will be less expensive and because only Environmental Impact studies/statements, which would need little modification from your already existing one, and the signing of right-of-way agreements with the State and construction contractors, construction could begin even by the end of this December. If you insist on present elevated routing, Eminent Domain lawsuits and related court injunctions can delay even the signing of contracts for at least many months and possibly several years. This, of course, will cost hundreds of thousands of dollars in additional costs between attorney fees and increased land value, to say nothing of the cost to commuters who will have yet a longer wait for significant traffic congestion relief.

Every argument AGAINST UNDERGROUND RAIL can easily be answered by citing the many instances in which mass transit and even major rail tunnels are beneath the water table, in more earthquake prone zones than Oahu, bored through even granite rock (which is MUCH harder than lava!) as well as through clay and softer rock.

The technology of a huge machine like bored the *Chunnel* makes arguments about the construction

HONOLULU COMMON SENSE TRANSIT

Rev & Mrs Samuel M. Smith & Family
P. O. Box 1015
Kailua, HI 96734 U. S. A.

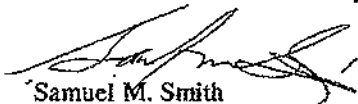

WEB: <http://www.followersofjesuschrist.org>
email: info@up-way-publications.org

problems of the local sewer system, which uses surface construction methods and is relatively shallow totally nonsense. Likewise, reference to the "Big Dig" fiasco in Boston, where surface dig and refill methods were used is not an option. At the VERY BUSIEST TRAFFIC HOUR, the Chunnel-type boring/tunnel building equipment could be boring 40 or 50 feet below the highway or street and nobody would even know that their stop and go surface traffic was immediately above the actively boring equipment.

I do agree that although your proposed elevated rail system doesn't look too bad as an eyesore, and would certainly get people from Point A to Point B far faster and cheaper than by their own cars, even factoring in the taxes to build the system. I would love to show you my copy of the History Channel's Modern Marvels: *The Chunnel* [<http://store.aetv.com/html/product/index.jhtml?id=42739>] DVD so you can see for yourself how practical the underground system would be.

I will not here take the time to revisit the many reasons **for UNDERGROUND AS AGAINST ELEVATED OR SURFACE, NOR THE REASONS WE URGENTLY NEED MASS TRANSIT NOW**. I am leaving most of those reasons as previously mailed to you below. I will also be mailing copies of this letter to you to all possible news media in an effort to raise public consciousness of how many delays and how much additional costs the elevated or surface routing would cause and the total practicality of building entirely underground, as well as several safety factors in which UNDERGROUND is safer.

For a better Honolulu for everyone,

Samuel M. Smith

June 15, 2008 letter is below and includes most of October 25, 2006 letter.

On October 25, 2006, I wrote the below letter to you and you responded and even sent me and my family a Thanksgiving greeting. You also had the Transit Study people send me a great and well-done DVD about the urgency of the need for Mass Transit ASAP. I therefore invested in a copy of the History Channel's Modern Marvels: *The Chunnel* [<http://store.aetv.com/html/product/index.jhtml?id=42739>] DVD which I had intended to get into the hands of then Transportation Chair Nestor Garcia, but somehow never seemed to be able to get it to him.

However, I would rather fight AGAINST the above ground rail than see the city make that major mistake. I HAVE SIGNED THE STOP RAIL NOW petition BUT I WILL DO ALL I CAN TO GET a YES vote to BUILD an UNDERGROUND rail system.

And I call your attention to the MAJOR money being spent by someone to advertise AGAINST ANY rail and ask WHO WOULD SPEND THAT KIND OF MONEY TO STOP RAIL? Now who will benefit from stopping Rail? Petroleum interests, Automobile dealers, Parking lot operators, Garage Mechanics. Now insurance companies will of course seem neutral in the matter, but because higher accident rates will justify higher premiums, they might also benefit by stopping rail.

Please look at the advantages I have already listed in my October 25, 2006 letter below and factor in one more thing that I had not thought about before. IF A 100 PERCENT UNDERGROUND SYSTEM WERE TO BE BUILT THERE WOULD BE MANY THOUSANDS OF CUBIC YARDS OF FILL TO SAFELY EXTEND THE SHORELINE IN A PLANNED LOCATION AND THAT LAND COULD THEN BE SOLD AS WATERFRONT PROPERTY TO OFFSET MUCH OF THE COST OF BUILDING THE RAIL SYSTEM.

And again, in June 2008, I remind you that the construction tie-ups of an above ground system would make present traffic tie-ups look like nothing.

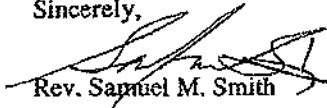

I also remind you of land acquisition costs if you do not build beneath existing roadways using EXISTING equipment that can operate there with NO DISRUPTION of the traffic above. You will have costly and divisive *eminent domain* suits to file for above ground rights of way, court delays and again, who will benefit? Petroleum interests, Automobile dealers, Parking lot operators, so of course they

5

are willing to spend BIG MONEY to stop rail and if YOU, Mayor, do not use my arguments linked to those showing the necessity of Mass Transit that were on the DVD you had the Transit Study people send me, the MISINFORMATION people will both get the issue on the Ballot, but will also get rail voted down. What a tragedy for EVERYONE!

Please, Mayor, I beg of you, reconsider and reevaluate 100 percent UNDERGROUND steel on steel rail. If you persist in the above ground FOOLISHNESS, I will SADLY be adding my voice to the ANTI Rail voices. I believe that at the rate it is now going, the petition will get more than enough signatures to get the issue on the ballot and with the misinformation already being promoted, it will lose. Who is paying the "volunteers" to stand outside Post Offices and other public places with petitions? I believe it is the Petroleum interests, Automobile dealers, Parking lot operators, etc.

Sincerely,

Rev. Samuel M. Smith

October letter follows:

On the 8:00 AM news on KHON TV2, a member of the Kakaako Neighborhood Board correctly and wisely spoke to the issue of the horrendous traffic tie-ups on Kapiolani Boulevard as a result of sewer work and lane closures. I wonder that neither you nor others involved in planning the URGENTLY NEEDED Mass Transit System have glibly overlooked this aspect of building an above ground metro system. Equipment is already in storage that has been tested and very successfully used to build the "Chunnel" between England and France and the BART in California's San Francisco Bay Area. The BART in particular has also already been tested by earthquake, so the evidence is clear that above ground Metro proponents' argument about water, rock and earthquake hazards to the underground system is a smokescreen.

I have previously contacted you on this subject and gave 17 good, valid, common-sense reasons for MASS TRANSIT NOW. If I repeat a few from this new angle please forgive me. (I would welcome a face-to-face debate on the issue before City Council and the media.)

While I URGENTLY support Mass Transit, I equally or with even greater emphasis OPPOSE an above ground system for the following reasons in order of importance:

1. MASSIVE traffic tie-ups during construction that are unavoidable for this type of construction.
2. Delays caused by battles over *eminent domain* rights and causes to acquire the necessary rights-of way.
3. Cost of right of way acquisition.
4. The already protested blockage of portions of Oahu scenery by the additional structures.

Benefits of the UNDERGROUND system are:

1. Construction machinery is available capable of boring the tunnels, creating a steel-reinforced concrete tunnel tube with **NO DISRUPTION OF SURFACE TRAFFIC** or buildings above. Spoil dirt is hauled out at the ends and concrete, steel and other materials needed by the machine are hauled in from the ends.
2. AND 3. No long court battles over *Eminent Domain* rights because virtually all needed right of way already exists beneath present highways, streets and roads. Only terminals or stations might require acquisition of land. Costs for hiring professional tunnel builders and their machinery easily offset by **LACK OF LAND ACQUISITION COST**.
4. No permanent above ground structures obstructing tourist (or our) view of our Native Oahu beauty.

Please do not overlook the URGENT need folks in the entire Leeward area have for MASS TRANSIT NOW!!! But at the same time, please don't overlook the awful gridlock of traffic that buiding an above ground system will unavoidably create. As I have pointed out before, EVERY taxpayer in Leeward Oahu has ALREADY paid FAR more in fuel costs, lost time and vehicle repair and vehicle replacement than the relatively small proposed tax increase that would have already had Mass Transit in place if misguided voters had not rejected the option several years ago.

Finally, our State and Oahu leaders are coming close to agreement that we really DO need MASS TRANSIT NOW. The widening of existing highways and addition of zipper lanes is almost counter productive as more land is gobbled and the fuel consumption and lost time situation is only slightly affected. What about the High Speed Ferry proposal to zoom people from Barbers Point or wherever else in that area that such a landing is decided upon. That is still subject to closing if storm conditions arise, making an even more problematic situation for Leeward residents on such days as people planning to use the ferry suddenly discover at the last minute that they will either have to drive, call a cab or catch a bus. This, I think, is something those pushing for the ferry boat idea seem to forget.

And if a Disneyland style monorail is built, consideration must be given to the disruption of traffic during the construction phase. This, in addition to the fact that it cannot help but at least partially block scenic views. And, since the VAST majority of those most urgently needing MASS TRANSIT NOW are residents needing to get to work on time, they have seen the sights and simply want to leave home as late as possible to arrive at work on time and return home or whatever else they must do with the least lost time commuting from their workplace to home, the UNDERGROUND rail system makes the MOST SENSE. With modern technology, tunnel boring machines such as built the England to France Chunnel and other similar equipment now in storage awaiting a time and place to be used again can easily build earthquake resistant and waterproof systems with only minimal surface support, minimal traffic disruption, no need for additional land, since they can be built beneath existing freeways and other rights-of-way.

For any who question the practicality of and the advantages to the UNDERGROUND mass transit systems for the unique conditions and needs of Oahu and Honolulu, I suggest you secure copies of the titles, Modern Marvels: **Tunnels** [<http://store.aetv.com/html/product/index.html?id=122111>] or Modern Marvels: **The Chunnel** [<http://store.aetv.com/html/product/index.html?id=427391>] and Modern Marvels: **The City Beneath Our Feet** [<http://store.aetv.com/html/product/index.html?id=427381>]. These in order of their significance to Honolulu. Or, I can loan you my copy.

I would welcome a face-to-face debate on the issue before City Council and the media.

Dear Mr. Smith:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

Your comments have been noted. Tunnel options were evaluated and eliminated during the Alternatives Analysis phase of the Project because they would not have been financially feasible. Tunnel costs are two to three higher than elevated systems and the funding is not available for the additional cost.

Section 3.5 of Chapter 3 of the Final EIS discusses the effects of construction on the community and proposes mitigation to help reduce those effects. While there is likely to be some inconvenience during construction of such a major project, maintenance of traffic (MOT) and transit mitigation (TMP) plans are required of all contractors to ensure roadways are accessible and usable during construction and that buses can continue to operate. Property Acquisition, Visual and noise effects of the alternatives are discussed in Sections 4.4, 4.9 and 4.10, respectively, of Chapter 4 of the Final EIS.

Mr. Samuel M. Smith
Page 2

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is written in a cursive, flowing style.

Honolulu, Hawaii 96813.

CITY COUNCIL
HONOLULU, HAWAII

Dear Councilman D'Jou:

I watched your comments on the rail system start point being more sensible from downtown outward and if they insist on the DUMB elevated system, you are completely right. More from the standpoint of traffic being heaviest in the downtown and outward area and daily getting worse on average, though than from having it available for use because until a certain length of trackage is in place there is no real value to putting trains on the track and running them.

But, since you have public exposure, maybe I can show you the common sense that the entire system should be underground. I have between 20 and 25 good, strong, valid reasons why it MUST be built entirely or almost entirely UNDERGROUND.

I am too busy to take the time at the moment to separate and reorganize the letters with the facts into a more concise form, but if you will read the reasons that follow and which I have already been pushing for since 1983, you will see that a great deal of both time and money can be saved and a much better, more safe and secure system achieved. Please note on the envelope and on my web page the Washington DC underground rail system.

Before you begin to make excuses why UNDERGROUND won't work for Honolulu, be aware that I answer EVERY objection to underground and show they are based on misinformation. A totally Modern Marvel technology which has already been used and for which the equipment is available, would begin at the outer ends and work toward the middle BENEATH existing City and State rights of way and could be actively working 50 or so feet below the busiest freeway at the busiest hour without traffic above having any idea what was below them.

It will be to your own benefit and the benefit of every resident of Oahu who commutes frequently, whether from Windward or Leeward, because traffic congestion costs everyone on the island time, fuel and wages, to say nothing of time at home with families or just "kicking back."

Plain common sense will tell you what I am pointing out is correct and the only sensible way to really solve the problem.

For a better Oahu for all of us,

Rev. Samuel M. Smith

URGENT URGENT URGENT

Mayor Mufi Hannemann
Honolulu Hale
530 S. King St.
Honolulu, HI 96813

Dear Mayor Hannemann:

This is to certify to you that **EMINENT DOMAIN SUITS ARE UNNECESSARY, A MAJOR WASTE OF TIME AND TAXPAYER MONEY.**

I SHALL volunteer to assist every homeowner and business affected by the proposed **EMINENT DOMAIN** to provide right-of-way for your elevated rail system and to testify in court to **STOP** plans for such an elevated system.

You know that I have been urging **MASS TRANSIT NOW** since 1983 and did all I could to help influence voters to vote **FOR** the steel-on-steel rail system. **Now, I will work TWICE AS HARD to get you, Mayor Mufi, and City Council to reconsider the ONLY LOGICAL AND COMMON SENSE SYSTEM for the 21st Century — 100 % UNDERGROUND steel on steel RAIL.** I will also be bringing pressure to bear from the State Legislature and from Washington. I have already contacted Senator Inouye who, I am sure doubtless voted for funding for the Washington DC **UNDERGROUND** metro system, and I am urging him to tie Federal funding to **UNDERGROUND** construction similar to that of the *Chunnel*. (Please visit <http://www.affordableworldtravelandtours.com/honolulucommonsensetransit/honolulucommonsensetransit.html>.)

I am told, the State of Hawaii may already have used such equipment as was used in the *Chunnel* in building the H-3 tunnels and may still own it.

In past correspondence, I have already given you well over 20 **SOLID, Valid** reasons why **UNDERGROUND** will be less expensive and because only Environmental Impact studies/statements, which would need little modification from your already existing one, and the signing of right-of-way agreements with the State and construction contractors, construction could begin even by the end of this December. If you insist on present elevated routing, Eminent Domain lawsuits and related court injunctions can delay even the signing of contracts for at least many months and possibly several years. This, of course, will cost hundreds of thousands of dollars in additional costs between attorney fees and increased land value, to say nothing of the cost to commuters who will have yet a longer wait for significant traffic congestion relief.

Every argument AGAINST **UNDERGROUND RAIL** can easily be answered by citing the many instances in which mass transit and even major rail tunnels are beneath the water table, in more earthquake prone zones than Oahu, bored through even granite rock (which is **MUCH** harder than lava!) as well as through clay and softer rock.

The technology of a huge machine like bored the *Chunnel* makes arguments about the construction

are willing to spend BIG MONEY to stop rail and if YOU, Mayor, do not use my arguments linked to those showing the necessity of Mass Transit that were on the DVD you had the Transit Study people send me, the MISINFORMATION people will both get the issue on the Ballot, but will also get rail voted down. What a tragedy for EVERYONE!

Please, Mayor, I beg of you, reconsider and reevaluate 100 percent UNDERGROUND steel on steel rail. If you persist in the above ground FOOLISHNESS, I will SADLY be adding my voice to the ANTI Rail voices. I believe that at the rate it is now going, the petition will get more than enough signatures to get the issue on the ballot and with the misinformation already being promoted, it will lose. Who is paying the "volunteers" to stand outside Post Offices and other public places with petitions? I believe it is the Petroleum interests, Automobile dealers, Parking lot operators, etc.

Sincerely,

Rev. Samuel M. Smith

October letter follows:

On the 8:00 AM news on KHON TV2, a member of the Kakaako Neighborhood Board correctly and wisely spoke to the issue of the horrendous traffic tie-ups on Kapiolani Boulevard as a result of sewer work and lane closures. I wonder that neither you nor others involved in planning the URGENTLY NEEDED Mass Transit System have glibly overlooked this aspect of building an above ground metro system. Equipment is already in storage that has been tested and very successfully used to build the "Chunnel" between England and France and the BART in California's San Francisco Bay Area. The BART in particular has also already been tested by earthquake, so the evidence is clear that above ground Metro proponents' argument about water, rock and earthquake hazards to the underground system is a smokescreen.

I have previously contacted you on this subject and gave 17 good, valid, common-sense reasons for MASS TRANSIT NOW. If I repeat a few from this new angle please forgive me. (I would welcome a face-to-face debate on the issue before City Council and the media.)

While I URGENTLY support Mass Transit, I equally or with even greater emphasis OPPOSE an above ground system for the following reasons in order of importance:

1. MASSIVE traffic tie-ups during construction that are unavoidable for this type of construction.
2. Delays caused by battles over *eminent domain* rights and causes to acquire the necessary rights-of-way.
3. Cost of right of way acquisition.
4. The already protested blockage of portions of Oahu scenery by the additional structures.

Benefits of the UNDERGROUND system are:

1. Construction machinery is available capable of boring the tunnels, creating a steel-reinforced concrete tunnel tube with **NO DISRUPTION OF SURFACE TRAFFIC** or buildings above. Spoil dirt is hauled out at the ends and concrete, steel and other materials needed by the machine are hauled in from the ends.
2. AND 3. No long court battles over *Eminent Domain* rights because virtually all needed right of way already exists beneath present highways, streets and roads. Only terminals or stations might require acquisition of land. Costs for hiring professional tunnel builders and their machinery easily offset by **LACK OF LAND ACQUISITION COST**.
4. No permanent above ground structures obstructing tourist (or our) view of our Native Oahu beauty.

4

Please do not overlook the URGENT need folks in the entire Leeward area have for MASS TRANSIT NOW!!! But at the same time, please don't overlook the awful gridlock of traffic that building an above ground system will unavoidably create. As I have pointed out before, EVERY taxpayer in Leeward Oahu has ALREADY paid FAR more in fuel costs, lost time and vehicle repair and vehicle replacement than the relatively small proposed tax increase that would have already had Mass Transit in place if misguided voters had not rejected the option several years ago.

Finally, our State and Oahu leaders are coming close to agreement that we really DO need MASS TRANSIT NOW. The wideaing of existing highways and addition of zipper lanes is almost counter productive as more land is gobbled and the fuel consumption and lost time situation is only slightly affected. What about the High Speed Ferry proposal to zoom people from Barbers Point or wherever else in that area that such a landing is decided upon. That is still subject to closing if storm conditions arise, making an even more problematic situation for Leeward residents on such days as people planning to use the ferry suddenly discover at the last minute that they will either have to drive, call a cab or catch a bus. This, I think, is something those pushing for the ferry boat idea seem to forget.

And if a Disneyland style monorail is built, consideration must be given to the disruption of traffic during the construction phase. This, in addition to the fact that it cannot help but at least partially block scenic views. And, since the VAST majority of those most urgently needing MASS TRANSIT NOW are residents needing to get to work on time, they have seen the sights and simply want to leave home as late as possible to arrive at work on time and return home or whatever else they must do with the least lost time commuting from their workplace to home, the UNDERGROUND rail system makes the MOST SENSE. With modern technology, tunnel boring machines such as built the England to France Chunnel and other similar equipment now in storage awaiting a time and place to be used again can easily build earthquake resistant and waterproof systems with only minimal surface support, minimal traffic disruption, no need for additional land, since they can be built beneath existing freeways and other rights-of-way.

For any who question the practicality of and the advantages to the UNDERGROUND mass transit systems for the unique conditions and needs of Oahu and Honolulu, I suggest you secure copies of the titles, Modern Marvels: **Tunnels** [<http://store.aetv.com/html/product/index.jhtml?id=12211>] or Modern Marvels: **The Chunnel** [<http://store.aetv.com/html/product/index.jhtml?id=42739>] and Modern Marvels: **The City Beneath Our Feet** [<http://store.aetv.com/html/product/index.jhtml?id=42738>]. These in order of their significance to Honolulu. Or, I can loan you my copy.

I would welcome a face-to-face debate on the issue before City Council and the media.

Dear Reverend Smith:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

As described in Section 2.5.10 of the Final EIS, to support phased opening of the system, the first construction phase must be connected to a maintenance and storage facility, which requires considerable land. The first phase of the Project must be connected to the maintenance and storage facility because, in addition to maintenance of equipment and ongoing operations, the maintenance and storage facility houses the main control center for the entire Project, and the required testing and operation of the system could not be completed without access to it. No location has been identified closer to Downtown, with sufficient available land to construct a maintenance and storage facility. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*

Reverend Samuel M. Smith
Page 2

- *Reduce the time that each area will experience traffic and community disturbances.*
- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*
- *Match the rate of construction to what can be maintained with local workforce and resources.*
- *Balance expenditure of funds to minimize borrowing.*

The portion of the corridor Ewa of Pearl Highlands is less developed than the areas Koko Head. As a result, right-of-way can be obtained more quickly and overall Project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted Koko Head from Pearl Highlands to Aloha Stadium, then Kalihi, and finally to Ala Moana Center.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Dear Ms. Soll:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- *Reduce the time that each area will experience traffic and community disturbances.*

Ms. Linda Soll
Page 2

- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*
- *Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- *Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Submission Content/Notes : I feel that the Honolulu Transit is one of the best transit projects for Oahu. We are only 20 years too late. We need to move forward quickly to make up for all the lost time. We need to meet with other large cities (ex: Portland) to discuss their pros and cons during their development and operations.

We need to focus on moving the masses of people that overflow the H1 and H2. That is our purpose.

Keeping in mind that any mistakes we make today will cost much more to correct tomorrow. So let's petition input from other cities to make sure we limit any possible mistakes during planning and development.

Dear Mr. Sorli:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your support for the Fixed Guideway Transit Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more

Ms. Christian Sorli
Page 2

information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

Your concern for moving traffic on the H-1 and H-2 Freeways is noted. The purpose of the Project is to provide high-capacity rapid transit service in the highly congested Ewa-Koko Head transportation corridor between Kapolei and UH Manoa. The fixed guideway system will reduce traffic congestion on numerous roadways on Oahu, including the H-1 and H-2 Freeways, as shown in Tables 3-9 and 3-10 in the Final EIS. Experience from a broad range of transit systems worldwide has been used in the development of this Project.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

Your preference for the Airport Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more

Ms. Marilyn Stassen-McLaughlin

information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is written in a cursive, flowing style.

Submission Content/Notes : Draft EIS comments regarding Honolulu Rail Transit
Submitted Feb. 6, 2009 by Dennis Callan, co-chair, Stop Rail Now
1011 Prospect St., #702, Honolulu, HI 96822
phone 528-4411 email callan@hawaii.rr.com
Please address each paragraph specifically, and explain why you agree
or disagree.

At the beginning, let me explain that the following document represents a listing of most of the major objections our organization has raised about Honolulu's proposed rail system. While our statements may not specifically refer to particular sections of the EIS, they are all relevant to the big picture of rail, its supposed advantages, its true problems, and the alternatives, and are thus relevant to EIS considerations.

Our concerns have now taken on even greater urgency considering the nation's economic crisis. How has your financial projection changed as a result of these events which transpired subsequent to your initial planning? How can we pay for rail, upwards of \$5 billion of local money, when the state and county are running deficits and the public has lost uncounted billions in home equity and personal savings? Are there not pressing social needs we must fund? Will the state's new highway improvement plan provide a larger, more effective solution than rail? Was the state's new highway improvement plan considered in your studies? If the state's plan were fully implemented how would it affect your numbers about traffic congestion projections? Is it more important to build rail or should state workers be forced to work an additional 10 years before retirement as has just been suggested by the Speaker of the House?

Most grievous of all the many EIS deficiencies listed below is your lack of proper study of the HOT lane alternative. Why was your AA study so superficial and biased?

Because the following issues are so major and have not been properly addressed in your draft EIS, we ask that a supplement EIS be created that will fully deal with these issues. Merely revising your draft is not sufficient. We need a major new study.

In the days before the Nov. 4 election the city made claims that the draft EIS showed that traffic would be reduced by up to 30% by rail, giving the public the misleading impression there would be a reduction from today's levels. Is this what you meant? If not, how could you be so flagrant in trying to mislead and misdirect the voters days before the election? Where in the draft EIS is there any substantiation for those claims?

SECTION 1:

Why rail transit never improves traffic congestion and why relief must come from highway options, such as HOT lanes

1. Since the advent of the Model-T, followed by the first suburban shopping center in 1923, and then the incredible expansion of suburbs after World War II, we have radically changed our means of getting to work. Not only getting there, but also what we do on the way there - and on the way back. We take our children to school, go for exercise, or go shopping and we no longer shop downtown.

2. Nor do we shop at the small local store, but in supermarkets, and lately, even more distant big box stores like Costco. Our children are in larger, more distant, schools whether public or private, and most of us drive them there.

3. As we move to the suburbs from town, say, Kaimuki to Milliani, we find that bus service is now every hour instead of every few minutes, and so we use it less.

4. We have always valued our time but now, because of increasing incomes, our time is more valuable than it used to be. Accordingly, it plays a bigger role in the decision about how we commute.

5. These are some of the factors that have altered the way we live, and why the percentage of commuters using public transportation has declined every decade since the U.S. Census began measuring it in 1960.

6. It is not that we are in love with our automobiles; it is that we value our time.

7. This is the principal reason that public transportation's share of commuters is declining on Oahu, the mainland, Europe and virtually everywhere else. This share is critical.

8. To hold rush hour traffic congestion on Oahu in 2012 at year 2000 levels we would have to keep the number of those commuters who are driving to work in 2012 the same as the year 2000. Given the state's forecast of a 10 percent increase in all commuters for 2000-2012, we would have the result shown in the lower table. As you can see, it tells us that, all else being equal; we would have to double the percentage of commuters using public transportation. How likely is that?

9. Before we go on, let's get our terms straight. We must use Metropolitan Statistical Areas (MSA's or metro areas) rather than cities. It is useless to discuss the city of San Francisco without including Oakland and all the other cities that are contiguous to it. And that is why the federal government's data is usually about metro areas, for example, the San Francisco MSA. Similarly, the city of Portland does not run its public transportation but rather Trimet, the three county contiguous area. San Diego's transit is run by SANDAG, the San Diego Association of Governments.

10. Further, we must discuss combined bus and rail transit use because we cannot, in any sensible way, separate them; the use of one without the other is not reliable. For example, Vancouver, Canada, and many other cities offer passes for bus and rail combined and so there is no accurate data about who is using what. In discussing commuting, the most relevant statistics are those of the U.S. Census and the U.S. Department of Transportation and that is what we use here. We also use the nationally recognized Texas Transportation Institute studies on traffic congestion.

11. U.S. metro areas essentially stopped building rail lines around 1920 as rail transit ridership peaked and the first serious and reliable bus service appeared. From that point on until the 1970s, hundreds of U.S. cities removed their streetcar lines and substituted motor buses because it was so much less expensive.

12. Then starting in the 1970s, U.S. transit agencies projected significant increases in public transportation commuting by re-instating rail transit. It did not work out that way.

13. What happened was that of the 15 metropolitan areas with new rail transit, only one managed to increase the percentage of commuters using public transportation during the 1980 to 2000 period. That was San Diego and it only managed an increase from 3.3 percent to 3.4 percent - hardly earth shattering - all others declined.

14. Note that outside of the New York metro area, the percentage of commuters using public transit is very small; nationally those commuting by automobile are twenty times greater than those using transit.
15. This is why, as we see with the earlier Honolulu example, any significant population growth results in new drivers totally overwhelming new transit users. Without major increases in this percentage, new drivers will always overwhelm new transit users.
16. Nationally, 13 million more commuters resulted in 13 million more drivers and a slight decrease in transit commuters.
17. The Texas Transportation Institute recently divided U.S. metro areas into four groups according to population size with the following results:
18. Very Large: 11 metro areas with over 3 million population all with rail lines except Houston - it had the least increase in traffic congestion of the group.
19. Large: 27 metro areas with 1 to 3 million population, half with rail lines. Aside from those areas with little or no commuter growth, the four best performers had no rail lines.
20. Medium: 30 metro areas with 1/2 to 1 million population including Honolulu. Only Salt Lake City had rail and they had the third worst showing of the 30.
21. Small: less than 1/2 million, none with rail lines.
22. This meant that all U.S. metro areas with significant increases in commuters saw a dramatic worsening of traffic congestion - rail transit had made no difference.
23. Everyone agrees that we have a traffic congestion problem and that the worst on Oahu is that found on the freeways and highways along the Leeward Corridor.
24. However, since rail transit has done nothing to relieve traffic congestion in any other U.S. city, it begs the question, what makes anyone think it will do it here?
25. Instead, we believe that the new high-tech High Occupancy Toll lanes (HOT lanes) have shown such promise and such public acceptance that they may be a far preferable alternative.
26. Our proposal is for a two-lane reversible, elevated HOT lane highway between the H1/H2 merge near Waikale and Pier 16 near Hilo Hatties.
27. Buses and vanpools would have priority and travel free, other vehicles would pay a toll that would be collected electronically by way of a pre-paid smart card, as is quite commonplace on the mainland today. As on the San Diego I-15 HOT lanes, the toll price would be dynamically calculated every few minutes to keep the lanes full, but free flowing.
28. One of the more surprising outcomes of implementing HOT lanes is that they are popular with motorists across all income groups. Even those who use them rarely favor them because it is an option they can use in an emergency.
29. A single highway lane with free-flowing non-stop traffic carries up to 2,000 vehicles per hour and with two lanes that means removing 4,000 vehicles from the existing freeway, or 25 percent of the rush hour traffic now using that corridor.
30. Our projection of the HOT lanes traffic of around 4,000 vehicles does not have to be calculated since we know that rush-hour highways are always fully used; we only have to project the toll price that will keep the HOT lanes full but free-flowing. Judging from San Diego's I-15 and

Orange County's SR-91 the average cost will be about \$4.50 under normal circumstances and up to \$7.75 for special periods such as Friday evenings.

31. A major advantage of HOT lanes is that traffic travels at uncongested freeway speeds of 60mph whereas rail transit can only average 22.5 mph because of stops every half mile. The HOT lane speed enables buses to make two trips in the time it now takes to make one. Further, buses on HOT lanes may travel door-to-door whereas rail nearly always requires transfers. HOT lanes offer both motorists and bus riders a choice of avoiding traffic congestion. The regular freeway is still there and available for free with less congestion than before.

32. The last issue is that of cost. The Mayor and DOT have been using \$2.6 billion for a Kapolei to Iwilei first segment. We have added 15 percent per mile for the difficulty of in-town construction and going over H-1 at University Avenue, and that adds \$1 billion to the cost. Since the federal funding has a practical limit of \$0.5 billion that will leave \$3.1 billion for local funding as shown in the table below.

33. The 1/2 percent increase in the G.E. Tax does not come close to funding this system, especially considering annual losses of \$59 million and making sufficient allowance for bond interest. Our calculations show that in the out years the revenues from the tax will barely cover the operating losses and bond interest leaving little or nothing for capital repayment. In addition, there has been no consideration for cost overruns.

34. When one considers that this rail transit project would entail a local per capita cost five times greater than any other rail system in the U.S., even after allowing for inflation, that alone should give us pause, even if we are under the mistaken impression that a rail system would have benefits.

35. On the other hand, the 10-mile long elevated HOT lanes would have a total cost of \$1 billion, or \$100 million a mile. Rail proponents have said that we cannot build it for that price and that it is too wide to use pedestal construction. The earlier rendering shows the Tampa Expressway now under construction which uses pedestal construction and is three lanes wide. Even though it is 30 percent wider than our proposal, it will open this June 2006 at a cost of \$52 million a mile. Consultants at the 2002 Governor's Conference on Reversible Tollways had initially calculated the cost at \$70 million per mile and later added \$30 million for unforeseen problems and other cost overruns.

36. HOT lanes are eligible for the same federal fixed-guideway funding as the rail proposal, which means that with \$1 billion total cost and \$500 million federal funding, it would only need \$500 million in local funding, there being little or no operating costs.

37. Of this \$500 million, toll revenues of \$20 million annually would pay off \$300 million over 25 years using five percent GO bonds. Another \$13 million annually would pay off the remaining \$200 million balance over 25 years. If we cannot find \$13 million annually from city and state budgets without raising taxes someone is not making an effort.

39. Rail has never improved traffic congestion anywhere,

40. We have a traffic problem - not a transit problem,

41. Tax-free HOT lanes give motorists a choice,

42. Tax-free HOT lanes outperform rail transit easily,

43. We can afford HOT lanes and we cannot afford rail.

Why did you not give proper consideration to the following? Please address each statement specifically, and explain why you agree or disagree.

Section 2

Alternative Solutions:

1. Staggering work and school hours
2. Implement 4/5 day work schedules (one week 4 days, next week 5 days, days off alternate)
3. Implement 4x10 work shifts (four 10 hr shifts 4 days)
4. Change UH class hours to not commence during peak rush hours; possibly only lecture
5. courses before 10:00am which are broadcast over the internet so students can stay at home until after 9:00am
6. Reversible elevated lanes on Nimitz viaduct. The State Transportation Department has already made plans this project, which would be very effective, improving existing traffic needs.
7. Decrease response time to roadway accidents/debris removal/investigations
8. Incentives to businesses for home-based employment (which will become more ubiquitous with technology)
9. Pay at the pump insurance
10. Require developers on the west side to build commercial and industrial space equal to every residential space built
11. Develop a FUNCTIONING traffic management system that can synchronize and control traffic lights to address problem areas. Install more "smart" traffic lights that can read traffic flow/speed.
12. Remove all unregistered cars, cars without insurance or safety stickers from the roads
13. Employees that don't drive cars to work should be credited for not requiring parking
14. stalls (most employers offer parking stalls for employees but DON'T pay them \$200+
15. month or more, which is the cost of parking in town, if they don't need them)
16. Create a better urban plan with higher density housing in the urban core and discourage continued suburban sprawl in suburbs. Change Land Use Ordinance to allow grandfathering of existing higher-density homes, to curb urban sprawl.
17. More dedicated HOV lanes.
18. Install traffic lights at freeway entrances
19. Expanded contraflow lanes (e.g. Dillingham)
20. Fix potholes which cause accidents, tire blowouts, and slow cars down
21. Advanced tow truck deployment system for accidents and stalls
22. Install more bicycle lanes.
23. Free public parking for microcompact cars (e.g. Smart car, et al)
24. Tax credits for developers of commercial and industrial space in West Oahu
25. Expanded carpooling program utilizing hybrid and electric van
26. Build a REAL ferry system (NOT THE BOAT)
27. Provide incentives to encourage use of electric riding vehicles, such as electric mopeds and electric-powered bicycles (e.g. "cages" or lockers for parking)

28. More grade-separated underpasses at critical intersections.
29. More distance learning courses for colleges and high schools
30. Raise parking rates for government workers to market rates

Section 3 BRT Success

Why would these success stories not apply to Honolulu? Please address each paragraph specifically.

1. While early adopters of bus rapid transit, such as Curitiba (whose system opened in 1974), Pittsburgh (1977), and Ottawa (1983), have shown that BRT is an effective transit mode, it is only over the last decade and a half that interest in BRT has skyrocketed to its current level as its ability to serve lower-density neighborhoods and its cost advantages over other modes have become better known. Today, BRT systems operate in 19 countries on five continents, with many more systems being constructed or planned. Interest in the mode has also come from the federal level. Since 1999, when the Federal Transit Administration launched a BRT demonstration program, BRT systems have been implemented in Boston; Eugene-Springfield, Ore.; Santa Clara County, Calif.; and are currently being implemented in Cleveland; Hartford, Conn.; Houston; New York City; Westchester County; and other places.

Las Vegas

2. In 2004, the Regional Transportation Commission of South Nevada introduced MAX (Metropolitan Area Express), a BRT line acting as a supplement to the heavily-used Route 113 bus line in Las Vegas. This service incorporated architecturally pleasing stations, high-capacity European buses with multiple doors, off-vehicle fare payment, dedicated bus lanes on most of the route, signal priority, and level boarding at bus stations. After six months, ridership on the corridor had increased by 25 percent (from 7,800 to 9,800 passengers per day), and 25 percent of MAX riders said they were new to transit.³⁷ MAX cut travel time on the 7.5-mile corridor in half (to 25 minutes) and gained a reputation for reliability and convenience (as measured by passenger surveys).

Los Angeles

3. Los Angeles is often considered the city of the automobile, but it has also engineered two successful experiments in bus rapid transit. In 2000, the city unveiled "Metro Rapid" bus service on two demonstration corridors. Metro Rapid lines incorporated simple routes, frequent service, signal priority, level boarding, and an aggressive branding and marketing campaign; this "BRT-lite" (not incorporating dedicated lanes, high-capacity buses, off-vehicle payment, or multiple-door boarding) service improved travel time on both corridors by more than 20%, increased ridership by about 40% (daily ridership on the two corridors was 77,000 before Metro Rapid service began, and 107,400 after), and was perceived by riders as "a quantum leap in service performance and quality."³⁸ About a third of the increase in ridership was from new transit users. Los Angeles has since created additional Rapid corridors and will have a total of 28 Rapid lines by 2008.

4. In 2005, Los Angeles opened the Orange Line, a full-fledged BRT service which featured a dedicated busway, off-vehicle payment, and the Metro Liner, a 60-foot bus that the LA Metropolitan Transit Authority bills as "the most advanced transit vehicle ever introduced in North America... the biggest leap in style and appearance our industry has

seen in 30 years." During preliminary studies, Los Angeles' MTA projected 22,000 daily boardings on the 14-mile corridor by 2020. The Orange Line averaged 21,828 daily weekday boardings in May 2006, nearly meeting this prediction 14 years ahead of schedule.

TOD

5. In addition to providing commuters with an effective alternative to driving, a cross-corridor transit system like bus rapid transit could afford municipalities the opportunity to pursue transit-oriented development (TOD). TOD is a land-use strategy whereby residential, office, and retail development is concentrated around transit stations. The term also refers to the developments themselves. TODs are typically mixed-use, walkable developments with higher than average density. Compact development oriented around transit stations has been proven to increase transit ridership and increase real estate values around the station.⁴¹ A comprehensive assessment of TOD as practiced in the United States identified many other benefits.⁴² Transit-oriented developments tend to command higher rents than comparable developments not close to transit, yet are also natural locations for affordable housing as residents of TODs do not need to own as many automobiles or use them as often as non-TOD residents. TOD is therefore a strategy that can both revitalize struggling neighborhoods and attract development. Because transit-oriented developments are denser and create less car use than non-TODs, a land-use strategy focusing on TODs preserves open space and reduces the cost of infrastructure such as roads and sewage lines. Reduced car use means reduced traffic congestion and air pollution. Proponents of TOD do not claim that these benefits magically appear through the creation of a transit stop; rather, they accrue from the synergy between transit access, mixed-use development, and density. Maximizing these benefits requires careful design; there is no "one-size-fits-all" TOD blueprint. Project for Public Spaces is one internationally known nonprofit which focuses on what it calls "placemaking," for example. In addition, some private developers specialize in building TODs.

6. In poor market conditions, development is less likely to occur. But when market demand exists, land-use regulations and developer incentives can focus growth around transit stations. For example, New Jersey's Transit Village Initiative provides funding and technical assistance to 19 designated "transit village" municipalities which engage in TOD around NJ Transit rail and bus stations (see left). Boston's TOD-supportive policies include a cap on downtown parking, a requirement that plans for large developments include transportation mitigation, and increased police presence around transit stations considered unsafe.⁴⁴ In many municipalities, zoning regulations must be tweaked to allow for mixed-use developments.

7. It has been argued that developers shy away from bus transit-oriented development because of buses' lack of permanence—unlike a rail line, a bus route can be easily changed, hurting businesses built to take advantage of proximity to transit. This criticism is not particularly relevant to high-end, capital-intensive bus rapid transit systems. BRT may be cheaper to implement than rail, but it still represents a sizeable investment, particularly when dedicated busways are involved. A review of the academic and government literature on bus rapid transit and transit-oriented development concluded that "the argument that fixed rail

infrastructure has more magnitude and permanence compared to busways is weak."

8. In Ottawa, transit-oriented development centered around BRT has been wildly successful. Strong land-use controls have concentrated commercial development around Ottawa's Transitway.⁴⁶ Between 1988 and 1991 alone a billion Canadian dollars of development was built or in the process of being built along the Transitway. Stations anchor office parks, shopping malls, and mixed-use developments; one station is even directly connected to a hospital. More evidence for bus transit-oriented development comes from Pittsburgh's busway system. A 1996 analysis of Pittsburgh's 9.1-mile East Busway found that between 1983 (when the busway opened) and 1996, 59 new developments (including retail, office, residential, and medical complexes) valued at \$302 million had been built within a 6-minute walk of busway stations.⁴⁷ This was despite terrain constraints which limited development opportunities, despite declining population in the communities adjacent to the busway, and despite the absence of Ottawa-style land-use planning.

9. The Port Authority of Allegheny County estimates that another \$203 million in development occurred between 1996 and 2004.⁴⁸ These are not the only successes. Areas as far-flung and different as Seoul, Korea; Curitiba, Brazil; and Boulder, Colorado have had success with bus-centered TOD.⁵⁰ It can happen here as well. At a recent land use charette, the Regional Plan Association identified several spots in the Rockland half of the Tappan Zee corridor that could support transit-oriented development, including Nanuet, Airmont and Montebello, and Suffern. The Westchester Department of Planning has identified Tarrytown, White Plains, and Port Chester as areas primed for downtown density increases.⁵¹ The success of transit-oriented developments depends on multiple factors, including political leadership, government incentives, landuse regulations, the strength of the real estate market, and the level of traffic congestion in the area (which affects demand for transit-oriented living).

10. But it cannot be overemphasized that one of the most critical factors is the effectiveness of the transit system. Only when a transit system effectively connects places does access to transit-the heart of the TOD concept-become a valued commodity. And so the question of which transit mode can best support TOD is inextricably linked to the question of which transit mode is best suited to the development and commuting patterns of a given area.

Section 4 HOT Lanes

Why would these success stories not apply to Honolulu? Please address each paragraph specifically.

1. Mark Muriello discussed the Exclusive Bus Lane (XBL) in New York City. He described the tunnels and bridges operated by the Port Authority of New York and New Jersey, the operation of the Lincoln Tunnel, and the XBL. He also highlighted recent studies examining options for enhancing operation of the tunnel and increasing capacity.
2. The Port Authority of New York and New Jersey operates a number of bridges, tunnels, and terminals in the New York City area. These facilities include the George Washington Bridge, the Bayonne Bridge, the Goethals Bridge, the Holland Tunnel, and the Lincoln Tunnel.
3. The Lincoln tunnel serves the midtown corridor into and out of Manhattan. The tunnel includes three tubes, each with two traffic lanes.

In the morning, two tubes, or four traffic lanes operate in-bound toward Manhattan. In the midday, the middle tube operates with one lane in each direction of travel, providing a total of three lanes inbound and three lanes outbound. In the afternoon, two tubes or four traffic lanes, operate outbound from Manhattan.

4. The XBL provides priority for buses approaching the Lincoln Tunnel in the morning, inbound direction. The XBL is a contraflow lane for buses only on I-495. The XBL uses the inside lane of the westbound freeway for buses. The configuration provides for three general-purpose lanes and the XBL lane in the eastbound direction and two general-purpose lanes in the westbound direction.

5. The XBL is the busiest bus lane in the U.S. Some 1,700 buses use the lanes on a daily basis. These buses serve 62,000 weekday commuters. The XBL serves more commuters to Midtown than PATH, Ferries, or Penn Station commuter rail. The XBL saves commuters 15-20 minutes each day compared to traveling in personal vehicles.

6. The Lincoln Tunnel and the XBL are significant parts of the mass transit system in the New York City area. Buses carry nearly 80 percent of all trips through the Lincoln Tunnel during the 6:00 a.m.-to-10:00 a.m. time period. The XBL alone carries over 50 percent of these commuters. Approximately 55 percent of all bus commuters to the Manhattan CBD arrive via the Lincoln Tunnel.

7. The number of buses using the XBL has increased significantly over the past 25 years. A number of operational improvements have been made to deal with these increases and to enhance bus operations. A new acceleration lane was added to help maintain travel speeds and traffic flow at merge points. The acceleration lane helped increase throughput of the XBL.

8. Capacity shortfalls have also been addressed with operational changes to enhance efficiency. Examples of these operation changes include prohibiting charter buses prior to 9:00 a.m. and prohibiting empty buses at all times. Other examples include the requirement that all XBL buses have E-Z Pass electronic toll payment tags and opening the XBL 15 minutes earlier.

9. Planning is also underway examining the long-term transportation needs in the corridor. A range of options for the corridor are being assessed in partnership with an array of partners. These partners include federal, state, regional, and local agencies. Planning activities include a simulation of the Lincoln Tunnel corridor, and XBL expansion feasibility study, and a West Midtown bus parking and staging study. Other efforts include the Lincoln Tunnel HOT/express bus lane options study and the Lincoln Tunnel HOT/commercial vehicle priority lane options study.

10. The Federal Transit Administration (FTA) is sponsoring a study to evaluate the feasibility of creating a second priority bus lane. The objective of the study is to increase the passenger throughput of the corridor and to enhance the reliability of the XBL. A full array of options are being explored. These options include operational alternatives to improve traffic flow and safety, physical alternatives for lane separation and ramp connections, and capital options to expand capacity. Capital options include the potential of widening the roadway, removing the center piers in the tunnel, and an elevated roadway scheme. Very limited right-of-way and the geometry of the existing facility provides

significant challenges for many of the options.

11. The FHWA's Value Pricing Pilot Program is sponsoring a study of pricing options to manage demand on the XBL with HOT lanes. A second XBL lane would be underutilized initially, so the study is examining the potential to fill some of the available capacity with non-bus HOVs or with non-HOV vehicles. The study is exploring pricing options that balance traffic demand with non-HOVs. Stated preference surveys of motorists are being conducted to help determine the tradeoffs between price and LOS variables, including travel time savings and trip-time reliability.

12. The Lincoln Tunnel HOT lane study will help quantify and address concerns with potential lane conversion. The study will examine the LOS and delay in the remaining two regular travel lanes. It will also assess traffic queuing in the remaining regular travel lanes and the residual impacts on the local street network. The study will consider the need to balance demand for a new managed lane to ensure bus priority treatment and effective capacity utilization.

13. The HOT commercial vehicle priority options study will explore the potential for commercial vehicles to receive priority treatment in a new special-use lane during the shoulders of the morning peak-period. The objective of this study is to find ways to take advantage of the presence of a separated lane to create travel time advantages and reliability improvements for small package and local delivery trucks.

The Evolution of Houston's Express Bus System

14. Jeff Arndt discussed the evolution of the express bus services in Houston associated with the development of the HOV lanes. He described the initial bus services operated with the I-45 contraflow HOV lane demonstration project, the implementation of more extensive services as the HOV lane system developed, and the integrated bus system in operation today.

15. The I-45 North contraflow lane demonstration project was implemented in 1979. The bus service initiated with the contraflow lane focused on downtown Houston. Bus service was constrained by very limited access. There was no direct access to and from park-and-ride lots, which limited service flexibility. The concept of premium service, which included over-the-road coaches and other enhancements, was initiated with the contraflow lane. This initial authorized vehicle lane (AVL) concept with a focus on downtown Houston evolved into an HOV systems approach.

16. Bus services were expanded as other HOV lanes were implemented. The design of the HOV lanes included direct connector ramps from major park-and-ride lots and transit centers. Service was expanded to non-downtown destinations, such as Uptown and Greenway Plaza. Direct service to these areas was provided from some park-and-ride lots, while connecting service from downtown or other transit centers was used in other cases.

17. The continued development of the HOV lane system provided more flexibility in service. Direct non-CBD services continued to be expanded. Commuter route connections at transit centers were also implemented. In addition, a few two-way ramps were developed. Limited off-peak service was provided on some routes.

18. The Houston experience highlights some lessons to be shared with other areas. First, the 2+ occupancy level caused some of the HOV

lanes to become congested, degrading the travel time savings and trip-time reliability for buses and bus riders. Second, the system changed from trained and tested users to any traveler meeting the occupancy requirement. Over time there has been some erosion of transit incentives and vanpooling has diminished. Recently, there has been a focus on new users. The QuickRide program, which allows two-person carpools to use the I-10 West and the US 290 HOV lanes during the 3+ period for a fee, has been in operation for approximately five years.

19. The current transit system in Houston represents a maturing service network. Transit centers provide connections for shuttle services, neighborhood circulation services, and commuter routes using the HOV lanes. There is also a connection to MetroRail, the new LRT line.

20. Currently, some 104 miles of HOV lanes are in operation in six freeway corridors in Houston. The system also includes 25 park-and-ride lots and 17 transit centers. In December 2004, some 37,400 daily vehicle trips were made on the HOV lanes accounting for approximately 116,000 person trips. A total of 32,415 parking spaces were available at the park-and-ride lots, with approximately 17,126 parked vehicles on a daily basis.

Bus Rapid Transit Studies in the State of Maryland

21. Robert Boot discussed BRT studies and projects in Maryland. He described the main characteristics of BRT, summarized current BRT studies and projects in Maryland, and identified potential issues with implementing BRT.

22. There are a number of factors influencing the consideration of BRT in communities throughout the world. BRT has lower upfront costs than other fixed guideway modes and can be implemented relatively quickly. BRT provides the opportunity to take advantage of underutilized rights-of-way. BRT provides operating flexibility and a way to increase transit ridership in select corridors. Local busways can also use portions of the dedicated BRT transitway.

23. BRT is being considered in Maryland to help respond to increases in travel demand, limited resources, and transportation needs. The new governor and his administration examined future transportation needs and options. The study, Bus Rapid Transit: Flexibility by Design, Offering Mobility Options for Maryland, completed by the Maryland Department of Transportation (MDOT) notes that BRT combines the service and quality of rail with the flexibility of buses.

24. The 2004 Maryland Transportation Plan focuses on the goals of efficiency, mobility, safety and security, productivity and quality. The plan includes numerous strategies for addressing mobility needs. Consideration is given to BRT as a viable alternative to provide realistic solutions to customer needs in corridors throughout the state. It includes active consideration of BRT on managed highway lanes to lower vehicle-related emissions and to improve regional air quality while providing viable new transportation alternatives to Maryland's commuters.

25. BRT projects in Maryland include the Red Line in Baltimore, the Green Line in Baltimore, the I-270/US 15 Corridor, and the Bi-County Transitway. Planning for the Red Line in Baltimore started in 2000. The project originated from the first comprehensive planning effort in nearly 40 years. In March 2003, the Baltimore Region Transit Plan was completed and adopted. The plan serves as a guide for the expansion of the Baltimore transit system.

26. A number of issues had to be addressed with the Red Line project. There was community sensitivity related to possible impacts on property values and environmental concerns. Available right-of-way was limited in many parts of the corridor. There were also concerns about operating BRT in downtown Baltimore without taking an existing traffic lane.

27. The Green Line in Baltimore also originated from the 2003 Baltimore Region Transit Plan. Potential issues with the Green Line included the preservation of green space along the roadway, as an existing grass median is the proposed location for the BRT. Determining potential station locations and existing density and ridership are other potential issues.

28. The Corridor Cities Transitway (CCT) is proposed in the I-270/US 15 corridor. The corridor stretches from the Shady Grove Metro Station in the south to Briggs Ford Road in the north. The corridor includes both Montgomery and Frederick Counties. The CCT alignment was identified in county master plans in the 1970s. In 1994, a Major Investment Study (MIS) was initiated. Public meetings and workshops were held in 1995 through 1997 as part of this process. The MIS recommended alternatives for a detailed planning study. Informational public workshops were held in 2001 and focus group meetings were conducted in 2001 and 2002. The Draft Environmental Impact Statement (DEIS) was completed in 2002 and location/design public hearings were held. Public information meetings on express toll lanes (ETLs) were held in 2004 and minimization options refinements were completed.

29. The Bi-County Transitway project was first identified in the Montgomery County Feasibility Studies in the 1980s related to the County's purchase of the Georgetown Branch railroad right-of-way. A transitway/trail was included in the County Master Plans. In 1996 the MTA completed the Georgetown Branch Transitway/Trail MIS/DEIS and the 2002 Capital Beltway/Purple Line Study was conducted. Possible issues with the Bi-County Transitway include potential community and environmental impacts. The jurisdiction in the area has different preferences. Connections with existing Metrorail service may also be a concern.

30. There are some general issues that may need to be addressed with all the BRT projects. The first issue is the public perception of buses, which still seems to be lower than other transit modes. A second potential issue is balancing a quality system with possible impacts, including community impacts related to limited right-of-way. Third, there may be a perception that BRT is not conducive to transit oriented development. There may also be short-term and long-term implementation concerns.

Virtual Exclusive Busways (VEBs)

31. Robert Poole described the virtual exclusive busway concept. He reviewed the early development of HOV lanes, which included a major focus on buses. He discussed how managed lanes and pricing can provide a virtual exclusive busway. He recognized the assistance of Ted Balaker of the Reason Foundation with the study and the presentation.

32. Value pricing makes it feasible to realize the promise of exclusive busways by providing high-speed, high-frequency bus service that is sustainable on a long-term basis. In the real world of limited funding, however, there is a need to re-think how special-purpose lanes are used.

33. Some HOV lanes began as busways. FHWA/UMTA policy in the 1970s supported busways. There are only a few exclusive busways today, however. These facilities include the Lincoln Tunnel XBL, the Pittsburgh busways, the Miami busway, the Seattle bus tunnel, and surface-street busways in Las Vegas and Orlando.

34. Concerns about low use with bus-only lanes led to allowing HOVs. The Shirley Highway busway demonstration project started as buses, vanpools, and 4+ HOVs in 1973. The occupancy requirement was lowered to 3+ in 1989. The Los Angeles El Monte Busway on the San Bernardino Freeway in Los Angeles was opened to 3+ carpools in 1976. The I-10 West HOV lane in Houston began with a carpool definition of 4+. This requirement was lowered to 3+ and then to 2+. Nationwide, the percentage of commuters who carpool has declined since 1980. The lane miles of HOV facilities have increased during this same time period.

35. A significant percentage of carpools are formed with family members. This trend was identified in *Commuting in America II*. Recent surveys in San Francisco, southern California, southeast Wisconsin, and Minneapolis-St. Paul, indicate that family-based carpools account for between 33 percent and 67 percent of total carpools.

36. It appears that vanpooling has been hurt by carpool preference. The time-savings realized by HOVs is reduced when the lanes are filled with 2+ carpools. Also a larger time savings is needed to offset the time cost of assembling a vanpool. Vanpooling is a highly cost-effective mode. The cost recovery ratio of vanpools sponsored by public transportation agencies throughout the country range from a low of 30 percent to a high of 117 percent. The overall average of nine vanpool programs was 80 percent. Vanpools are also energy-efficient. Vanpools have the lowest British Thermal Unit (BTU) per passenger mile of transit modes and personal automobiles.

37. BRT in HOV lanes is not sustainable. At the 2+ vehicle-occupancy level HOV lanes become congested and travel time savings and trip time reliability to transit is lost. There may not be enough demand at a 3+ vehicle-occupancy level and an HOV lane may suffer from the empty-lane syndrome. There is no way to fine tune occupancy as you cannot have a 2.7 vehicle-occupancy requirement.

38. Value pricing offers precise control. The I-15 HOT lane uses quasi-real-time variable pricing. The 91 Express Lanes use a fine-tuned rate schedule, with periodic adjustments. The Express Lanes carry 49 percent of peak traffic with 33 percent of the lane capacity. Both facilities offer reliable high speeds during rush hours.

39. The virtual exclusive busway (VEB) concept would use value-priced lanes or networks. Pre-defined capacity would be reserved for buses and super-HOVs. The remaining capacity would be sold through value pricing.

40. An example of VEB capacity highlights how the concept would work. First, the capacity of a lane is approximately 1,700 vehicles per lane per hour. Second, space would be allocated for 60 buses per hour, which is the equivalent of 120 personal vehicles an hour. The remaining available capacity in the lane is 1,580 vehicles an hour. A percentage of this capacity would be allocated to vanpools and super-HOVs. The remaining capacity would be allocated to paying customers.

41. The managed lanes project on I-10 West in Houston provides a VEB prototype. The project represents a partnership among Houston

METRO, TxDOT, and HCTRA. The four new managed lanes in the center of the expanded freeway will use value pricing. HCTRA is helping fund the lanes and will operate them. METRO is guaranteed 65 buses an hour and 25 percent of capacity for buses and HOVs. A LOS C will be maintained using pricing and occupancy controls.

42. The I-10 West managed lanes highlight the benefits to transit of this approach. Although METRO will not receive any toll revenues, it will be able to operate 65 buses an hour, which is above current service levels. FTA approval was granted based on maintaining a LOS C. A 3+ occupancy requirement will be used for carpools to travel for free. All of these elements are covered in a MOU. A VEB can facilitate region-wide express bus/BRT service. A regional network would require construction of new lanes and flyovers. These major capital costs would be paid out of toll revenues.

43. A VEB network provides a cost-effective approach. The cost of a 500-lane-mile VEB network has been estimated at \$2 billion-to-\$3 billion in the Reason Foundation studies. In comparison, FTA data indicates the cost of a 250 route-mile light rail system is \$31 billion and the cost of a 250 route-mile heavy rail system is \$38 billion. In addition, the VEB guideway would not depend on FTA funding.

44. Managed lanes are being considered in a number of metropolitan areas through the country. Some changes in policies are needed for VEB networks. First, there must be clear FTA policy approving HOV to HOT conversions. Second, managed lanes need to be defined as "guideways" in Section 5302 of Title 49. Third, VEB or VEB networks need to be considered an alternative in new starts evaluations. Finally, VEBs should be made eligible for New Starts funding for buses, stations, and park-and-ride facilities.

45. Exclusive busways are key to competitive express bus/BRT. Exclusive busways are too costly and are wasteful of capacity. VEB is feasible with value pricing and with agency cooperation. VEB can provide a win-win situation for transit agencies, motorists, and state departments of transportation.

Section 5 Why buses are better

Please address each paragraph specifically, and explain why you agree or disagree.

1. There's a missing factor in the formula pushing a 5-billion dollar rail system into our suburbs, and this traffic solution is doomed to fail without it. The simple truth is that a rail transit system requires a dense residential pattern to make it work, which we do not have on Oahu. This crucial relationship between transportation and land use has not yet been properly addressed.

2. The often-cited description of Honolulu conjured up by rail proponents as a dense, linear city ideal for rail is a myth. Our biggest transit problem is that Oahu's settlement pattern of single-family homes in suburban subdivisions is too dispersed for rail to be effective. If we build the rail line and don't change the way we build new housing this system will be a colossal disaster. How many people right now live within walking distance of any likely stations? Not nearly enough to support rail rapid transit.

3. When you look around the world at successful rail transit systems you see they are in cities with medium and high density housing where people can walk to the station and then walk to their work place at the

other end. A global trend in city planning is creation of the urban village, both in the city center and in the fringes with construction of new towns. Such increased housing density could enhance quality of life by developing a village atmosphere and supporting our need for close-knit communities where people interact, unlike today's isolated neighborhoods. Shops, restaurants, entertainment, jobs, schools, mass transit, and other enjoyable urban amenities would be easily accessed in a more dense community if it is properly planned.

4. There is a causal relationship between our problems of unaffordable housing and congested traffic, because we have spent years building the wrong kind of homes in the wrong places, covering our landscape with big, expensive houses, generating suburban sprawl that has produced tremendous traffic problems. These unattended problems will only grow worse if we are distracted with an ineffective, fixed rail pipedream. Jumping into a rail commitment at this point is just not going to work.

5. Consider how someone living in a single-family suburban home would have to get to work on rail: walk to a bus stop, wait for the bus, ride to the rail, walk to the platform, wait, board, ride, walk from the rail to another bus stop, wait, board, ride, walk to work; then do the same thing in reverse going home. Who is going to put up with this? Most who are supporting rail probably would not ride it -- but hope in vain that others will, to make more room on the roads for the rest of us.

6. There are better transportation alternatives which could provide faster relief and perhaps eventually evolve into a rail system. One obvious strategy is to vastly expand our bus system. We need more buses, exclusive lanes, frequent service, additional routes, express lines, better connections and lower fares. Our present bus system is often claimed to be one of the nation's best, which is another myth that stands in the way of true solutions. It can be drastically improved.

7. Extensive road construction will be needed, including some elevated busways, bus stations,

8. underpasses at busy intersections, more use of contraflow and other management improvements. In the future, if bus utilization grows heavy enough, this system of elevated structures and exclusive bus lanes could be converted to rail, which would ultimately have more capacity; but it would be a mistake to attempt a transition directly to rail at this point when we are not yet ready.

9. Why not just build the rail now along with the higher density housing to go with it? That would be nice if we could trust the brilliance of our politicians and private land developers to do the right thing, but with their sorry record of land use planning we must not be gullible. This new kind of housing approach needs to be demonstrated with real results and in the meantime it can be supported with an expanded bus system which can evolve into rail transit.

10. Unfortunately, our misguided state legislature passed a flawed bill last session that prohibits expenditures of new transit revenues on road improvements. How can the city now tell us with a straight face that all transportation alternatives are currently being given fair consideration? This state legislation could be changed, but given past performance, the outlook is bleak.

11. Our former mayor was probably on the right track with his BRT plans using modern buses driving on exclusive lanes and circulating in existing

streets. A well-planned bus service could pick you up near home, bring you to a bus station where one transfer would put you on a bus that is going close to the final destination, riding on exclusive lanes that will be free from traffic. Commuters could also drive to transit stations at regional shopping malls, park for the day and catch an express bus direct to their destination. The whole island can benefit from this approach rather than one narrow leeward corridor. Another promising technology is creation of high-occupancy toll lanes, but the city studies are also ignoring this option.

12. At the same time we can be preparing ourselves for a future rail system by building new housing in well-planned, medium and high-density apartments -- which can be affordable and very beautiful when done right. Clustered villages can be created with a mix of townhouses and highrise apartments that could support neighborhood shopping, entertainment and other urban amenities. These clusters could be developed in the urban core as well as carefully-selected regions of the island. It can happen, but it will require a serious community dialogue and basic transformation in the way we build housing, requiring a prohibition on most new single-family houses and active government involvement in consolidating small private parcels for larger planned communities through aggressive use of eminent domain.

13. Let's not be railroaded into paying for a premature, expensive rail system that will take forever to build at great inconvenience and won't work. At this time and for the foreseeable future rail is a luxury that we are not ready for and cannot afford. Imagine ten years of disruptive construction for a massive elevated train that hardly anyone in our lifetimes is going to use, leaving the rest of us stuck in gridlock and our children permanently unable to find affordable housing. We can do better.

Section 6 Rail Will Fail: HOT Lanes are Better.

Please address each paragraph specifically, and explain why you agree or disagree.

1. ENVIRONMENT: An elevated train running through the heart of our city would be an environmental blight on Honolulu. Elevated tracks would be ugly, running through downtown and eventually Waikiki, defacing our beautiful city and damaging our tourist industry. The elevated guideway will destroy views for tourists and residents, along the way. Managed Lanes would also be elevated through part of the Leeward corridor to avoid the bottlenecks, but would come down to ground level in Iwilei before reaching downtown, and would not cross the heart of town as an elevated monster.

2. The city's own projection is for traffic to be far worse, with rail, than it is today, so since rail will not solve the problem, why should we pay for it, and what should we do instead? Yes, rail transit would have a dedicated right-of-way above the congested traffic, but so would the express bus system on a fixed guideway, or "HOT Lanes," (High-occupancy and toll lanes) which can operate far more efficiently at lower cost than rail, with a mix of express buses, carpools and toll-paying cars, providing faster service from many origins directly to many destinations. Reversible HOT Lanes would be far superior to rail for Oahu for all the following reasons.

3. EXPRESS: Buses can utilize a guideway better than rail because buses can pick people up in our dispersed communities and drive

directly onto the guideway, quickly reaching the destination non-stop and without transfer. Buses do not need stations on the guideway, for they would use regional bus stations that people could easily get to. Train stations will not have such versatile access and will not be close to our dispersed, existing residences.

4. SPEED: Trains stop at every station along the line, like riding an elevator up a 30-story building and stopping at every floor. The city's official speed estimate for Honolulu rail service is an average of 23 mph, which is far less than the 60 mph an express bus can expect on an exclusive elevated lane. Because of higher speed and fewer transfers, bus will attract more riders than rail and more effectively reduce traffic congestion. With this higher bus ridership, the cost per rider of bus would be lower than rail, which will undoubtedly fail to attract any large number of users.

5. TRANSFERS: Rail riders would have to transfer many times on the daily round-trip, as in this likely journey: a) travel from home to a bus stop, wait for the bus, b) ride the bus, c) walk from the bus to rail, wait for the train, d) ride the rail, e) walk from rail to bus, wait for the bus, f) ride the bus, g) walk to reach destination. Then returning, everything is in reverse: h) walk to bus stop, wait for bus, i) ride bus to rail, j) walk from bus to train, wait for train, k) ride train, l) walk from rail to bus, then wait for the bus, m) ride bus, n) travel from bus stop to home. (14 travel segments, including 4 transfers) Studies have shown that people hate to transfer.

6. CONGESTION: Rail service will do nothing to reduce traffic congestion: the city study shows that current over-capacity on H-1 peak hours is 6%, and by 2030 over capacity will be at 31% with the rail in place. Buses and vanpools on free-flowing HOT lanes could reduce traffic by 20-25 percent. The city's own studies show rail would only remove 2% of trips from the roads.

7. UTILIZATION: Extra space on the fixed guideway can be used by other vehicles, particularly vanpools and car-pools. If there is available space, some additional vehicles can pay tolls (collected electronically, without cars having to stop) and the tolls can pay for much or all of the transit system. The amount of traffic would be regulated to allow maximum capacity without congestion, enabling full utilization of the guideway space unlike rail, whose expensive tracks would be empty most of the time. We will get the most bang for our buck.

8. CAPACITY: Surprisingly, an exclusive bus lane can easily carry more passengers than a rail line. Five-hundred buses an hour, carrying 25,000 seated passengers, enter the New York City main bus station daily on one dedicated bus lane. The maximum capacity estimated for Honolulu's proposed rail is 10,000 people per hour. A good bus lane has a maximum capacity of 1,000 buses an hour, carrying 50,000 seated passengers! High-capacity busways on dedicated lanes operate in Newark, Los Angeles, San Diego, Washington, D.C., Curitiba, Bogota, Brisbane, Ottawa, Port-of-Spain and elsewhere, as this technology gains increasing traction.

9. UNIONS: Unionized rail workers can hold the city hostage as shown by recent metro strikes in Paris, London and New York. Bus unions don't have as much leverage because people can ride private buses, use carpools, pay tolls and still drive the HOT lanes. Rail service is provided by a monopoly, while a busway could carry buses of different

companies providing competitive service. Rail construction is by non-bid single-source contract, vulnerable to political manipulation, unlike road-building which is open to many bidders.

10. BREAKDOWNS: Busways can be built more quickly than rail and can readily be repaired in an emergency. Rail structures cannot rapidly be replaced or repaired if damaged. Buses and other vehicles can drive around a disabled bus. All trains come to a halt if there is a disabled train on the track. Busways-HOT can accommodate emergency vehicles and provide an evacuation/alternate route in the event of another September 5th "Black Tuesday" freeway closure.

11. COST: The price of constructing the rail system is astronomical, probably reaching \$6 billion by the time all the cost over-runs are paid for, compared with less than \$1 billion for elevated HOT Lanes, despite the city's absurd claim of nearly \$3 billion for "managed lanes." A similar system in Tampa was built for \$300 million. Rail would end up costing each family of four about \$24,000, even though only a few percent of the population would ever use it. We estimate construction cost per rider at \$120,000 with daily operational subsidy of \$15. The Federal Government Accountability Office has compared operating costs, and the majority of cities have lower operating costs for their Bus Rapid Transit systems than for their light rail systems. HOT Lanes also save money by making better of our existing streets as feeder lanes for high-capacity buses, plus we benefit from free labor and equipment supplied by drivers of HOV vehicles and toll-paying autos. Buses can be more easily replaced as technology improves. There are hybrid and natural gas buses whereas rail hogs electricity, involves large energy transmission losses and will require construction of a new electrical power plant.

12. QUALITY: Some people assume buses provide inferior service, but buses of any quality can readily be bought: Luxury buses can be offered for those who prefer to pay more, less-expensive ones for those who prefer to save money. The main quality consideration for commuters is the time it takes to make the journey -- buses are quicker and easier than rail, plus you are more likely to get a seat rather than stand.

13. TOLLS: Critics claim that toll roads set up a system geared to those who can afford the tolls, and ignore those who cannot. Federal surveys show that in the places with HOT lanes the public approves of them across all income groups. Those with lower incomes approve of them because a) it reduces traffic congestion on nearby freeways at no cost to those not using HOT lanes, and b) it provides reliability to make those important appointments, which we all have regardless of income. If you are running late, paying \$4 to jump on the HOT lanes and get there on time can easily be worth it. Without HOT Lanes, travelers will pay a toll anyway for a ticket if they ride a rail, or in wasted time if they drive stuck in congested freeway lanes. Affordable express bus service will be enhanced.

14. CARS: Some charge that HOT lanes encourage rather than discourage car use, but HOT lanes are not freeways and their toll charges do not encourage auto travel. Adding a lane will not increase the number of cars on the road, for that is controlled by the number of jobs at destinations -- just like adding a maternity hospital does not increase the number of babies, it just makes it easier for them to arrive. HOT Lanes are primarily mass transit for express buses and carpools,

which will lure drivers away from single-occupant cars.

15. DENSITY: Rail transit relies on high-density residential patterns to support it, with most riders living in high-rise apartments along the route, while the HOT lane can be easily reached by people living in more dispersed communities like we have on Oahu. Rail planners envision social engineering on a grand scale to force new housing into dense "TOD" patterns near stations (Transit Oriented Development). Such rail stations are magnets for crime. We do not have this density along the proposed route, nor do we have the population size. The smallest American city with heavy rail, Cleveland, has twice our population. Increased residential densities can make sense for the environment, but they can be better supported by a well-planned bus system that will allow more flexible distribution of settlements. In this way communities can grow in a natural way with different densities in various locations, increasing the opportunities for affordable housing and mixed-use neighborhoods with shops and jobs nearby, rather than congested housing along one narrow rail line. Rail lines are fixed and cannot respond to changes in employment and land use, whereas bus service can be rerouted and shifted over time to correspond with Oahu's changing transportation needs.

16. BIASED STUDIES: The city's Alternatives Analysis failed to provide any examination of the HOT Lane alternative, only vaguely considering "managed lanes" with a superficial and biased approach: The projected costs were grossly exaggerated, provided no access ramps along the route, included 6,200 unnecessary parking stalls, offered dubious ridership forecasts, had excessive \$6 toll, removed the existing HOV zipper lane, resulting in a net of only one new lane, and then added the burden of stations on the busway - but no stations are required.

17. POLITICS: Unfortunately the city administration is completely close-minded about this critical issue and is determined to push rail at all costs. The city administration's biased EIS process is giving no consideration to the HOT Lane option. The city has pretended to listen to the public with superficial community meetings, biased transit symposiums and rigged advisory panels, but all these phony efforts have been a farce that were selling rail and manipulating public opinion rather than honestly listening to alternative viewpoints.

Section 7 transit debate

Please address each paragraph specifically, and explain why you agree or disagree.

1. There is no room on the ground to relieve the Leeward situation -- if you don't accept elevated you are out of the discussion. Buses can utilize this guideway better than rail because: buses can pick people up in our dispersed communities and drive directly onto the guideway without transfer. An expanded bus system would utilize regional bus stations, mostly in existing shopping/parking areas, that people could get to by a) driving, b) walking, c) shuttle bus, d) bicycle or moped. Train stations will not have such versatile access modes, nor will they be as close to our dispersed, existing residences.

2. Modern, express 3-piece articulated buses can carry 150 people. Again, as below, it comes down to ridership -- the bus reaches out to more places so will attract more riders, rail will fail due to lack of

customers, so that rail driver who could be pulling 300 people is stuck on empty, especially in off-peak hours. Bicycles can be easily accommodated on board.

3. Oahu needs considerable provision of new services, based on regional bus stations people can reach as detailed above, and from those stations there will be express buses which drive in from the suburb mixed with reasonable traffic, then enter the guideway at the H1-H2 merge in Waipahu, flying over the congestion non-stop! Please look at the proposed travel times projected for rail-they are worse than driving through the congestion. Don't project current bus conditions into our future, which will be a much different system.

4. The express bus can reach town without stopping every mile at a station, 10 miles in 10 minutes, much faster than rail.---

5. These new buses will be a different mode altogether because they will have true express lanes, so don't compare it to the present situation. Bus = 10 minutes; rail = 60 minutes, Check the city's alternative analysis charts.

6. The biggest rail handicap is transfers. A) leave home, b) travel to rail by bus - no-one lives in walking distance of proposed stations, which will have no parking c) walk from bus to rail station d) ride rail e) depart rail station and probably transfer again to reach destination. Then in the afternoon, f) g) h) i) j) do the same things again to get home.-

7. The big problems are the walk, the climb, the walk, the wait, the walk, etc.

8. Cost difference is a major factor. \$6 billion for rail versus \$2 billion for bus guideway construction. Look to Tampa, which built a 6-mile 3-lane, elevated viaduct for 300 million last year. This is not rocket science. It is just possible that tolls could pay for the whole thing.

9. Many other communities are building HOT lanes for bus, vanpools and toll-paying cars, but comparisons with other places is very misleading and therefore, dangerous. While we can learn many general principles from studying other places, direct equation with cities such as Vancouver, which is often pointed to by our Council and Administration as a model for us, are inappropriate because we are unique and must deal with our special situation in our own way. For example, population in greater Vancouver metropolitan area is 2.1 million people and skyrocketing along at 6.5% annual growth, compared to .9 million in Honolulu, growing at only .7% annually. Furthermore, Vancouver is a leader in "smart growth" with major development of high density housing downtown to the point where nearly as many commuters leave downtown in the morning as arrive.

10. Operational costs that theoretically tip in favor of rail assume that rail succeeds in attracting customers, which I seriously doubt - whereas express buses can, and those bus service levels can be easily adjusted to meet demands, unlike rail where the empty trains must keep on rolling, throwing good money after bad.

11. The old BRT was a ridiculous plan, taking away existing lanes for buses from a city that already is last in the nation for lanes per-capita. BRT was preposterous. Don't compare our current proposals to Harris, or to anywhere else. Those arguments ring hollow and suggest you have no real case if you have to go after straw men.

12. Of course, you realize our electricity comes from fossil fuels, petroleum no less. The rail will be an energy hog, requiring power 20 hours every day. Bus and HOV vehicles are evolving as we speak, soon running on alternative fuels. BTU per-capita of rail versus car is surprisingly close, and with new technology, free-flowing autos will soon pass rail in efficiency -- and again, a well-planned bus system of the type we are suggesting will run energy circles around the empty train. When the bus or vehicle is not in use, zero energy and emissions. Rail, all the time, empty, stopped, or going, is burning and polluting.

13. In addition, there are many other arguments for a HOT lane guideway. It can be utilized by vanpools and carpools. It can also be used by cars paying tolls to help fund it, perhaps only in the early years while HOV occupancy builds. After 5 or 10 years, if HOV service demands, cars could be excluded, but in the meantime tolls have helped pay for the system. All these vehicles can be properly dispersed at the town end with adequate off-ramps and some new parking facilities (connected to work places by shuttle service).

14. Sensible urban planning can devise a settlement pattern of new housing built in medium densities, new towns, that will encourage use of bus transit. Rail, on the hand, would seem to require high-density, high-rise, air-conditioned, expensive, un-Hawaiian housing, the so-called TOD, transit oriented development, which has not been working out well in several mainland communities, including Portland.

15. Getting people to use rail requires major social engineering, changing people's behavior and housing preferences, which is nearly impossible. This new generation of rail riders would either have to live walking distance from a station, in expensive, high-density clusters, or get to the train via transfer, and transfer again at destination. The psychological cost of time spent during transfer is much higher than that of time spent sitting in a vehicle. Less social engineering is needed to get people onto an effective bus or vanpool system, because it can pick them up closer to existing homes and get them to destinations with fewer transfers. New housing of transit-friendly medium density will be more acceptable to people than air-conditioned, expensive, crowded skyscraper condos.

Section 8 City Myths on Rail Transit These are responses to public statements made by city officials:

Please address each paragraph specifically, and explain why you agree or disagree.

1. This memo presents a rebuttal to various incorrect statements made by Honolulu government officials about the supposed advantages of rail. Our basic complaint is that the city keeps claiming rail would better serve our community than alternatives, such as HOT Lanes (High Occupancy and Toll Lanes), using incorrect information that misleads the public.

2. Main myths "Rail, if you compare it to a busway or a bus system, is head and shoulders above something like that (busway) in terms of 1. speed, 2. capacity, 3. reliability, 4. safety, 5&6. capital cost, even, operating and maintenance costs, 7. pollution, there's no comparison, there's no comparison. 8. Honolulu needs to move, I would say, 200 to 300 thousand people a day and only one kind of system would do it and that's a high-speed, high-capacity, rail system and that is why I am so in

favor of it."

3. Speed? The city's alternatives analysis shows that for the 19 miles from Kapolei to Downtown it's going to take 65 minutes by train. That's 20 miles per hour. He's saying 19 miles in 65 minutes. The alternatives analysis, that's the official assessment of what it will take with the rail line. Trains stop at every station, which is like elevators in thirty-story buildings stopping at every floor. This makes the trains quite slow. For example, from Kapolei to Downtown, a distance of 19 miles, the journey by train is forecast by the City's Alternatives Analysis

http://www.honolulustransit.com/more_info/library/files/Alternatives_Analysis_Chapter3_to_End.pdf)

(page 3-11) to take 49 minutes if you drive to the station or 65 minutes if you walk/bus to the station

http://www.honolulustransit.com/more_info/library/files/Alternatives_Analysis_Chapter3_to_End.pdf This agrees with federal government data showing urban transit trains averaging only 23.5 mph. There is no "whoosh" with trains. On the other hand, buses on uncongested High-Occupancy Toll (HOT) lanes will average 60 mph and then 15-20 mph in normal traffic. It does not take much of the journey to be done on the HOT lanes to get an average speed far higher than a train.

4. The capacity of the projected rail line is 6,000 riders per hour in the peak direction with an ability to expand that to 10,000 per hour maximum. We can compare that to New Jersey's I-495 single bus lane carrying 32,600 passengers per hour. In the face of that, it is ridiculous to discuss a two-lane HOT lanes facility, giving priority to buses, not having the capacity of a rail line. The Parson Corp. HOV Facilities Manual says of rail and busways that, "Both modes can serve the person carrying capacity needs of about any corridor in North America." During the non-peak hours there'll be too much capacity if it's a rail. You'll have a 300-person vehicle rumbling through mostly empty every 6-10 minutes, whereas a common express bus can be coming through using far less energy and even more frequently or less frequently, as needed. www.honolulustraffic.com/passperhour.htm

5. Myth 3: Reliability? The biggest problem with rail transit is strikes (and suicides). Strikes are a major headache for rail transit users in the mainland because every so often they go on strike. They'll be out days on end. It takes them so much longer to get ridership back up to where it was after a strike. If you were to put in a rail system, whatever union is controlling the train is going to have an immense amount of power over the city. When a rail car breaks down the entire system will cease functioning, perhaps for days, causing major inconvenience.

6. Myth 4: Safety? Gangs, graffiti and crime around train stations. It's a magnet for this kind of stuff. Safe? All rail systems have to have transit police. Vancouver, San Francisco, Washington, etc...rail systems have transit police. We don't have transit police on our bus system. Are police accounted for in the alternatives analysis as part of the budget? No, they're not mentioned. We've brought that up. It's an issue. It's expensive. When they put in the blue (rail) line in LA the eventual bill turned out to be millions of dollars a year to put in a sufficient transit police in place to hold the crime down.

7. Myth 5: Costs? Saying that the capital cost is less than the HOT lanes option (High Occupancy Toll) is also absurd. It's really laughable to say

that a simple, elevated highway built by the lowest bidder is going to cost more per mile than a non-bid, elevated rail line with trains, computers, transformer stations. Each station is 270 feet long, 50 feet wide with elevators, escalators, stairs and generators to pull the train to the closest station so that the people don't get stranded between stations in a power outage. There can be no comparison. How can they be so off on the cost? Well, they have consultants who boast about being cMythnt-focused. In other words, they'll do whatever the cMythnt wants them to do. And the cMythnt wants them to show that HOT lanes are not competitive with rail.

8. Myth 6: The city has exaggerated the cost for HOT lanes to \$2.6 BILLION. A comparable facility, the Tampa Expressway cost \$400 million. When you've got a facility built for 400 million you cannot justify one for 9 times that amount in Honolulu. The 400 million dollar one in Tampa - how long is it? About 12 miles but it's 3 lanes wide. The one that we propose is 2 lanes wide. The cost per mile of rail in Honolulu is estimated by the City to be the same as the Washington, D.C. Dulles extension. But the cost of a reversible expressway for HOT lanes is estimated by the City to be over five (5) times the actual built cost of an already built system in Tampa, Florida!

9. Myth 7: Pollution? When cars are traveling at uncongested speeds, the pollution emissions are far less than on congested freeways. Speed up the auto traffic and we will get far less pollution.

http://www.itre.ncsu.edu/ITREmain/research/documents/Emissions_Reduction-TrafficMngt.pdf

10. Efficient express buses that circulate in communities then drive onto HOT Lanes would attract more riders than rail, further reducing automobile usage and congestion.

11. Myth 8: 250,000 riders? Currently, 7% of Oahu trips are by public transit. This would need to triple, to 20% to reach 250,000 riders, which has never happened anywhere in the U.S. or Canada. Nationally transit ridership share has been going down, way down, not up. At present only about 75,000 people per day use transit.² It would mean increasing transit users by 300 percent when the population is only forecast to increase by 28 percent for 2005 to 2030. This means increasing transit's market share by 260 percent. Bearing in mind that no metro area in the country has increased the percentage of commuters using transit over any 20 years of Census taking Where is he getting his numbers? (ftp://ftp.abag.ca.gov/pub/mtc/census2000/JTW_Trends/PDF/FullReport.pdf) (p. 4-9).

12. Myth 9: Energy? "Rail is better in terms of the energy consumption." Well-managed HOT Lanes can have a lower "carbon footprint" generating less carbon dioxide, than rail. Bus riders will use a high-occupancy lane going non-stop at 60 mph. Cars on HOT lanes will go faster and take less time on the road. Cars on existing highways will benefit from reduced congestion. Everybody goes faster. Two HOT Lanes carry as many vehicles as four lanes of regular, congested traffic. HOT lanes do not get congested, so the traffic is free-flowing and more efficient. Energy use at 20mph is 25 percent greater than at 55-60 mph. See <http://www.fueleconomy.gov/feg/driveHabits.shtml> for U.S. Dept. of Energy data. Construction of the rail line and huge stations would take an immense amount of energy.

13. Myth 10: Electricity? All of Honolulu's electricity is generated by burning petroleum, by far the highest level in the country, and yet the city's cost estimates for rail do not even include the expense of building a new power plant, let alone plans for one that runs on some new, unnamed technology. Battery-powered cars in the future will be charged overnight when electricity costs are at a minimum, but rail would draw massive power during existing peak periods. The rail system will require huge amounts of electricity 20 hours every day, even if it is running empty. Each station will require its own emergency generator.

14. Myth 11: Vancouver Skytrain is running a profit: "Last year it made 2.72 million dollars."

A profit? Vancouver's Skytrain is integrated financially with their buses, ferries, and other elements of public transportation. Fare revenues for Skytrain cannot be calculated since one ticket allows transfers between trains and buses. Their financial report does not break out separate fare revenues for Skytrain. Total subsidies for Translink were \$236.7 million in 2006. Any talk of Skytrain making a profit is absurd.

15. Myth 12: in Vancouver "last year car usage decreased by 5 billion kilometers (because of Skytrain)." The number of automobiles is actually increasing by 20,000 per year. This automobile growth is creating gridlock on Greater Vancouver's road network, which has had no significant improvements since the 1980s. In Vancouver, rising congestion reduces quality of life and increases costs. Population has grown by 750,000 people in the Vancouver region over the past 20 years and is anticipated to grow to over three million by 2031. With a rapidly growing population twice our size, concentrated in well-planned urban densities, Vancouver makes a very poor comparison. Greater Vancouver residents consistently rate transportation as the number one issue in the region.

16. Myth 13: No bus system can recover all its costs. Where do we start? Buenos Aires' 15,000 buses are privately-owned and profitable. Atlantic City's 190 13-passenger buses are privately owned and profitable. Source:

<http://www.specialtyretail.net/issues/january99/acretail.htm> Not only are Hong Kong's buses profitable and so are those of the rest of China. Source: <http://www1.cei.gov.cn/ca/doc/cen3/200501201828.htm> Throughout Asia and South America profitable bus systems abound. It is only through political choice that our bus system is subsidized by \$140 million annually. In 1971 our bus system was profitable, but then the City took it over and began operating all kinds of unprofitable routes such as a trip completely around the island for \$2.

http://www.honolulutraffic.com/Pickrell_xv.pdf

17. Myth 14 "Let's take Pittsburgh. They did both, an elevated busway and a light rail system. They projected 50,000 passengers a day for the busway. Their actual ridership today after seven years is 9,500 - one fifth of what they projected." The Federal Transit Administration's website shows that Pittsburgh's busways carry 52,000 riders per day - more than twice as much as carried by light rail. Source:

http://www.fta.dot.gov/printer_friendly/research_4289.html

18. "For the light rail system they (Pittsburgh) projected 30,000 passengers. Last year it was up to 27,000 riders, up 9.4 percent from the year before. So people are actually moving from buses to rail."

19. Pittsburgh light rail makes its forecast? The official ridership forecast

was 90,500 riders per average weekday versus the actual ridership achieved of 30,600 - 66 percent less than forecast. Last year the riders were not up to 27,000 but rather down to 23,200, a significant decline from the 30,600 achieved in 1989. (Source: <http://www.apta.com/research/stats/ridership/riderep/documents/06q4lr.pdf>) National Transit Data Program. If we review the disaggregated ridership data for Pittsburgh from 1996, the earliest available from APTA, to 2004, the last official data, we find that bus ridership declined slightly less than rail ridership during this period. More importantly, the U.S. Census shows that in 1980, before Pittsburgh built its new rail lines and busways, 106,200 Pittsburgh workers commuted using public transportation. That declined to 65,500 by the 2000 Census. This data is contained in the U.S. Department of Transportation report, Urban Rail Transit Projects: Forecast versus Actual Ridership and Cost (DOT-T-91-04), which shows the forecast (Source: National Transit Data Program at <http://www.apta.com/research/stats/ridership/riderep/documents/06q4lr.pdf>) As for busways: Source: http://www.fta.dot.gov/printer_friendly/research_4289.html Moving from buses to rail? Source: <http://www.apta.com/research/stats/ridership/> Source: Journey to Work Trends in the U.S. & its Major Metropolitan Areas. (FHWA-EP-03-058) page 4-9.

20. Myth 16: "the public transit use is actually a 30% increase since 1995"

21. But the broad picture, according to U.S. Census data, shows that from 1990 to 2000 there was a decline in people using transit to commute.

22. Myth 17: "We think the new (rail) riders is gonna be in the neighborhood of 30-40,000 riders."

23. This claim is based on ridership forecast by the consulting firm, Parsons Brinkerhoff, whose previous forecast for Honolulu were wildly inaccurate, grossly overestimating increases in bus riders when in reality we have seen ridership decreases.

24. Myth 18: There is a balance of spending for various transportation projects in the coming decades: "we're going to be spending about 3 1/2 billion dollars in the next 25 years on highway improvements as well."

25. But what kind of balance is this, spending nearly 200% more (\$6 Billion) for a rail project that might carry at best 10% of our riders?

26. Myth 19: "We're projecting in some areas commute times to increase to three hours one-way."

27. This is another scare tactic. The city's own Alternative Analysis shows that the worst commute in the year 2030 if nothing is done, the no-build option, from Waianae to UH Manoa, would be 105 minutes, 40% less than Okino's preposterous statement.

28. Myth 20: "In 1990 we did a...study which shows that even with a busway you'd have 60% of the people transferring....It doesn't reduce transfers, it doesn't reduce transfers."

29. This is another red herring. The 1990 busway survey was done as part of the EIS for the 1992 rail proposal, so again, the mayor talked to his myth-focused planning company and told them to make rail look good and buses look bad. They came up with a grossly-over engineered busway designed with elevated stations on it and no ramps

coming down to the ground, so of course riders would have to transfer in such a poorly-designed system. But there is no need for bus stations up on an elevated busway. Instead, these bus stations belong in the community at ground level, perhaps at existing shopping centers and other busy gathering spots. One of the great advantages of an express bus system is that it will take riders from origin to destination with few if any transfers.

30. Myth 21: Busways studied. Unfortunately the city has never included adequate busway ramps in its biased alternative analysis, yet has the nerve to criticize an engineer who has done such studies. Ramps are an important issue that illustrate the advantage of HOT lanes over the railroad. Ramps along a guideway allow buses to drive on or off and directly bring passengers where they are going without a transfer. BEYOND THE MYTHS: PROBLEMS WITH PROCESS and PRELIMINARY ENGINEERING:

31. The city administration is following dangerous, backwards planning techniques by proceeding with Preliminary Engineering before the technology has been chosen and before the Environmental Impact Study has been done. Early in the process the Locally Preferred Alternative was determined by the City Council to be a "Fixed Guideway" without specifying what technology will travel on the guideway. It could be express bus, as some Councilmembers are advocating, or rail, or something else.

32. The city's planning procedure is essentially backwards, conducting preliminary engineering before the EIS is done. Why did we spend millions on preliminary engineering before the environmental impact statement is approved? We are spending a lot of public money without really knowing what the system is and if the system fits. The normal next step after the alternative analysis, which has been partly concluded, is the EIS. Once you have an EIS that is approved and signed by the Governor, the Mayor and the Federal government, then you go into preliminary engineering. If for some reason we reject the EIS, the preliminary engineering could be useless. Thrown out the window.

33. All of the above present serious concerns for Oahu taxpayers, who deserve true information, because we are the ones who would pay for it -- the largest public project in the history of Hawaii by far, costing the typical family of four about \$24,000 to build and many more dollars to operate and maintain. Unfortunately the proposed rail would do little if anything to solve our traffic problems, but there are much better options. Contrary to what the Mayor publicly declares, rail is not a "done deal."

34. Our position is that we should instead build a new elevated structure for HOT lanes from the Leeward side that would be used by a mix of express buses and carpools that ride free, along with some toll-paying automobiles. The city has consistently failed to study HOT Lanes as an alternative, despite their many advantages, which include lower costs and much more efficiency than rail.

Section 9 Rail Transit Daily Journey Segments

Please address each statement specifically, and explain why you agree or disagree.

1. TRAIN TRANSFERS and WAITING: Transit studies have shown that people hate to transfer and wait. Rail riders would have to transfer

many times and stand around waiting on their daily round-trip, which would typically need 20 total daily segments:

2. go to a bus stop
3. wait for the bus
4. ride a bus to the rail
5. walk to the platform
6. wait for train
7. ride the rail making many stops
8. walk from the rail to another bus stop
9. wait
10. ride a bus
11. walk to work;

a. same problems coming home.

12. Even if we grant that some commuters can walk to work from the end station, they still require 14 daily segments.

13. Those workers using a spur line to the airport will still have 20 segments in this typical scenario: add to the 14 segments above the 6 extra r/t segments for an airport worker on the newly-proposed spur: 1) walk to connecting train 2) wait for train (up to 15 minutes wait) 3) ride train, same in reverse.

14. On the other hand, express bus riders do not need many segments: Travel to a regional bus station, wait, ride non-stop to destination, walk to work. 4 components, same coming home.

15. Regarding tourist use of rail: what tourist would ever haul their baggage so far -- to a train, walk a few blocks in a shopping mall to transfer to some trolley, then walk several blocks in Waikiki to their hotel? This mayor is spinning a fantasy right out of Alice in Wonderland. Section 10 Please address each paragraph specifically, and explain why you agree or disagree.

Busway systems have the following advantages:

1. Buses do not need stations on the busway, as they can collect and deposit.

passengers close the origins and destinations of their trips, without passengers having to change modes.

2. Space between buses can be used by other vehicles, particularly taxis and car-pools. If these vehicles pay tolls (which can be collected electronically, without cars having to stop) the tolls can pay for much or all of the transit system.

3. Rail service is provided by a monopoly, generally unionized. A busway can

carry buses of different companies providing competitive service. That unionized rail staff can cause problems is evident from the current rail strike in Paris.

4. Bus systems have superior carrying capacity. Five-hundred buses an hour, carrying 25,000 seated passengers, enter the New York City main bus station daily on one dedicated bus lane. And a good traffic lane can accommodate over

1,000 buses an hour, carrying 50,000 seated passengers! Rail services

cannot

accommodate such high traffic volumes without forcing passengers to stand.

5. Rail services generally stop at each station along the line. Buses utilizing a busway can travel non-stop from passenger origin to destination.

This gives bus service a superiority in door-to-door speed.

6. Busways are robust and can quickly be repaired in an emergency.

Rail

structures cannot quickly be replaced or repaired if damaged.

7. The main disadvantage of all-bus systems is their low cost, so people assume

they give inferior service. But buses of any quality can readily be bought: Luxury buses for those who prefer to pay for luxury, less-expensive ones

for those who prefer to save money. High-capacity busways on

dedicated lanes

operate in Curitiba, Bogota, Brisbane, Ottawa, and Port-of-Spain.

Section 11 Comparisons

Please address each paragraph specifically, and explain why you agree or disagree.

HOT Lanes

Rail

DESCRIPTION

1. 10 mile, elevated 3-lane, reversible, high occupancy highway from the H1-H2 merge to the Iwilei edge of downtown, for express bus, carpool and some toll-paying cars.

2. 28-mile elevated train running from Kapolei eventually to UH Manoa, with 25 stations, some of them 80 feet above ground.

COST

3. Less than \$1 billion. Some of this will be paid by the federal government, some by tolls, with less than half by taxpayers.

4. More than \$6 billion. This amounts to \$24,000 for each family of four on Oahu. There is no guarantee of federal funds.

TRAFFIC CONGESTION

5. HOT Lanes will reduce congestion on H1 by up to 35%. Many drivers will use the new lanes and more commuters will be attracted by high-speed express buses.

6. City official studies show that future traffic congestion with rail will be far worse than it is today, increasing from the current 15% overload to 80% in 2030.

ENERGY SAVINGS

7. HOT Lanes will be more efficient, reducing traffic congestion and energy consumption, encouraging ridership in energy-saving carpools and express buses. New cars will get much better mileage, while the train will never improve.

8. Rail transit uses more energy per passenger mile than the average automobile according to the U.S. Dept. of Energy. For most of the 20 hours a day they run, trains are nearly empty. With rail, autos will be stuck in gridlock, wasting gas.

ENVIRONMENT

9. HOT Lanes would only extend for 10 miles along existing highways, such as Kamehameha Highway in Aiea and Nimitz Highway, not through residential neighborhoods.

10. An elevated train would be an ugly, noisy intrusion running for 34 miles through our neighborhoods (imagine elevated tracks down Kuhio Ave, ruining Waikiki).

RIDERSHIP & CAPACITY

11. An expanded express bus system would attract many more riders. Total passenger capacity would be at least twice as high as rail.

12. With rail transit ridership will only increase by 2%. This is a ridiculously small increase, costing us about \$600,000 for each new rider.

CONVENIENCE

13. Express bus riders: 1) Travel to a regional bus station, 2) wait, 3) ride non-stop to destination (avg speed 50 mph), 4) walk to work. Same coming home. Commuters in cars and carpools would have total convenience and personal control over their daily travels.

14. Rail riders would need up to 20 daily journey segments: 1) go from home to bus stop 2) wait for bus 3) ride bus to rail 4) walk to platform 5) wait for train 6) ride rail making many stops 7) walk from rail to bus stop 8) wait 9) ride bus 10) walk to work; 11-20) same coming home.

LAND DEVELOPMENT

15. HOT Lanes support expanded bus mass transit that will encourage good land use planning with low-rise, medium density communities that would be efficient and very livable. At the same time these lanes provide support for existing housing on most of Oahu, not just a narrow concentrated corridor where few people currently live.

16. Rail will supposedly create high density development around stations, protecting the rest of the island. Such utopian schemes have not been happening with mainland rail systems, and even if they did occur, do we want to force our future population to live in high-rise, air-conditioned buildings crowded along a Leeward corridor?

TAX INCREASE

17. No further tax hikes. \$1 billion for HOT Lanes will be paid by a combination of federal funds, tolls, and some local taxes, much less than public funds for rail.

18. The recent 1/2 percent excise tax increase will not be nearly enough to pay these huge bills, so property taxes will likely increase by 40% and more.

Section 12 The city's Alternative Analysis of Managed Lanes was faulty in several serious ways:

Please address each statement specifically, and explain why you agree or disagree.

-The city estimated Managed Lanes would cost \$2.6 Billion despite the fact that a similar system was built in Tampa Bay for \$320 million in 2005.

-They removed the existing zipper lane, resulting in a net gain of just one new lane rather than the 2 or 3 lanes we are proposing.

-They included bus stations on the lanes, which are totally unnecessary and would add considerable expense.

-They failed to include access ramps along the route so vehicles can enter and exit. Instead they just dropped all the vehicles to street level downtown at a traffic light with no management plan.

Section 13 cost in other places

Please address each statement specifically, and explain why you agree or disagree.

How can you justify such high costs compared to other places?

Light rail costs in comparison to population size in various metro areas:

City	Cost	Population	Per capita cost
Dallas	\$1,067,000,000	5,222,000	\$204
Denver	\$358,000,000	2,582,000	\$139
Portland	\$1,643,000,000	2,265,000	\$725
Sacramento	\$307,000,000	1,797,000	\$171
Salt Lake	\$376,000,000	1,334,000	\$282
St. Louis	\$464,000,000	2,604,000	\$178
Pittsburgh	\$1,051,000,000	2,571,000	\$409
Honolulu	\$6,400,000,000	940,000	\$6,809

We would be the smallest metro area with a rail line and the most expensive. Portland spent the money, has bad congestion, running rail on what had been roads and existing rail beds, and still only 30% of their transit riders use rail the rest are in buses. Share of transit ridership in Portland remained flat from 1980 to 2000.

Section 14 Best Traffic Fix

Please address each paragraph specifically, and explain why you agree or disagree.

1. Traffic congestion for Leeward drivers is so horrible that people are desperate for anything that sounds like a solution. Rail has been pushed so hard and so often by the city that it seems like it should work, but unfortunately, rail would do next to nothing to solve the problem while wasting our precious resources. Here are some highlights of the major alternative to rail, which has received very little coverage in the media.

2. The best solution both to solve the traffic problem and encourage extensive use of mass transit is to construct a ten-mile elevated guideway for express buses, carpools, and perhaps some toll-paying cars. This guideway would leapfrog over the current choke-point between the Leeward bottleneck created at the H1-H2 merge and downtown, and it would come down to street level in Wilei, not run through the heart of our city as an elevated blight like rail. It would provide a simple, elegant solution, cost under \$1 billion and likely produce a 35% reduction in traffic while transporting many more people than a rail line.

3. Managed lanes, also called HOT Lanes, will not dump more cars into downtown as rail-supporters falsely claim, because the main focus is bus and carpool, thereby reducing auto traffic, with several ramps along the route that distribute vehicles to destinations other than downtown.

With this bypass, existing streets can handle the added express buses.

4. This approach would be better and conserve more energy than a train for several reasons:

5. Rail is an energy hog, with energy consumption per passenger about the same as the average new car, based on studies by the federal government. (for more details see our web site: www.stoprailnow.com)

6. Cars and buses are becoming increasingly energy efficient, soon to run on batteries that will be inexpensively recharged overnight when electrical demand is low, while rail is an old technology already at its maximum energy efficiency level and will place heavy demand on electricity during peak periods.

7. HOT lanes will produce tremendous improvements in the bus system at a fraction of the cost of rail, result in a much greater use of mass transit, take cars off the road and benefit everyone.

8. An expanded bus system makes better use of the existing 500 bus stops and adds true express service for ALL COMMUNITIES, while encouraging environmentally-friendly, medium-density development.

9. These lanes do not need to run elevated for 30 miles through the heart of downtown, Waikiki and residential neighborhoods, so they will not create urban blight like rail would.

10. Any commuter on this island could easily travel a short distance to an express bus stop and board a modern vehicle (not today's bus) that features comfortable seats, wi-fi, coffee service, and most importantly, rapid, non-stop delivery to destinations. This efficiency and flexibility cannot be achieved with a rigid, linear rail line going to Kapolei.

Leeward commuters will benefit most of all from this express bus system, reaching town in 30 minutes instead of the 60-minute rail journey requiring multiple transfers.

11. An enhanced bus system would benefit everybody except lobbyists for the construction industry and land-development. How often have we heard about the tremendous financial gains that will result from concentrated development around train stations, along with the massive up-zoning for high-density apartments that most of us don't want to live in?

12. The people of Oahu share common ground with our organization: we want to reduce congestion, encourage mass transit, make other traffic improvements and encourage wise land use development with adequate housing for our future needs. Rail contributes nothing to our common needs, hopes and dreams.

13. Rail would be too expensive, not effective, ugly, and prevent us from developing real solutions. Rail would increase the number of commuters using transit by only 1.3% while morning congestion on H-1 will grow 53% in the next 20 years, according to the city's own studies reported by Sean Hao (Adv. 7/15). With a likely \$6 billion price tag, that pencils out to an expense of nearly \$750,000 for EACH new transit rider, costing every Oahu family of four about \$24,000.

14. In addition, rail would directly serve only the tiny fraction of Oahu's population that is within walking distance from its few proposed Leeward stations -- neighborhoods which currently are sparsely populated. Why does rail have public support at all? Well, the city has been spending millions of dollars for propaganda to mislead the public, leaving us largely uninformed about the pitfalls of rail or the advantages of non-rail alternatives.

15. We are all too familiar with the dilemma: thousands of commuters heading into the sun each morning on the H-1 which is full. And then again, in the afternoon heading back into the sun on H-1 which is full. It

is frustrating, it wastes gas and time every day. West Oahu and Central Oahu cannot be served by one freeway which is already full at rush hour. If this freeway is blocked, there are no alternatives. What about our ambulances, civil defense vehicles, and all the commercial vehicles that are also stuck?

16. New elevated lanes address these problems. It is a pity that rail does not.

Mr. Dennis Callan
Stop Rail Now
1011 Prospect Street, Suite 702
Honolulu, Hawaii 96822

Dear Mr. Callan:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

General Comments

The capital plan for the Project is presented in Section 6.3 of the Final EIS. The capital plan took the economic downturn into account and reduced the anticipated General Excise and Use Tax (GET) surcharge collections to reflect that downturn based on conditions as of the first quarter of fiscal year 2010 using forecasts by the State Council on Revenue. Section 6.6 of the Final EIS also describes risks and uncertainties associated with these funding assumptions, which include changing economic conditions and the possibility of varying levels of revenue collection and project costs. The City will continue to refine revenue forecasts and cost estimates as the Project proceeds through FTA's New Starts process. The capital plan is a dynamic document that will be updated regularly as conditions warrant.

Capital costs of the Project, including finance charges, are expected to be fully paid for by a combination of FTA Section 5309 New Starts and FTA Section 5307 Funds from the Federal government and revenues from the County General Excise Tax Surcharge levied from 2007 through 2022 on Oahu. These sources of revenue are available only for public transportation purposes.

Regarding the Hawaii Department of Transportation's (HDOT) projects, they are not new projects. They are all contained in the latest Oahu Metropolitan Planning Organization (OahuMPO) Regional Transportation Plan (2008), and are the basis of the No Build Alternative used to evaluate the fixed guideway project as described in Chapter 2 of the Final EIS. The No Build Alternative is used as a baseline against which to compare the build alternative (i.e., fixed guideway), as well as being a stand-alone alternative. It is against this backdrop that the results are presented in the EIS. As discussed in Chapter 2 of the Final EIS, the No Build Alternative does not meet the Purpose and Need of the Project. Based on the Project's analysis, rail is needed in addition to all projects contained in the OahuMPO Plan, which includes all the State Projects.

A travel forecasting model was used to forecast roadway conditions in 2030, both with and without the Project. As described in Chapter 2 of the Final EIS, modeling took into account committed transportation projects anticipated to be operational by 2030, which includes the projects identified in the Highway Modernization Plan put forth by HDOT in 2009.

As shown in Tables 3-9 and 3-10 of the Final EIS, roadway conditions without the fixed guideway system would get worse, despite nearly \$3 billion in planned roadway improvements in 2030. However, these tables also show that traffic volumes on the highway system will decrease with the fixed guideway system. As shown in Table 3-14 in the Final EIS, congestion will be worse in 2030 without the Project.

The State of Hawaii's Highway Modernization Plan, dated January 22, 2009, is an accelerated construction schedule for many of the projects listed in Table 2-3 of the Final EIS. These projects were included in the analysis of all alternatives in the Draft EIS, including the No Build Alternative.

The process of analyzing and screening alternatives included the analysis of a Managed Lane Alternative, which is substantially similar to the referenced high-occupancy toll (HOT) alternative. The main difference between the Managed Lane Alternative and the HOT alternative proposed in the comment letter is the configuration of ramps. The HOT facility proposed in the comment letter refers to an undisclosed number of additional access ramps compared to the configuration of the Managed Lane Alternative studied during the Alternatives Analysis phase. The only certain effect of additional ramps is a higher project cost for the added ramps compared to the Managed Lane Alternative. As documented in the Alternatives Analysis Report (DTS 2006b, available under the "Library" tab on the project website www.honolulustransit.org) and explained more fully in Chapter 2 of the Final EIS, two options were considered for the Managed Lane Alternative—a Two-direction Option and a Two-lane Reversible Option. This alternative would have provided a two-lane elevated toll facility between Waipahu and Downtown Honolulu, with variable pricing strategies to maintain free-flow speeds for transit and high-occupancy vehicles (HOVs). The Two-direction Option would have served express buses operating in both directions during the entire day. To maintain free-flow

speeds in the Two-direction Option, it would have been necessary to charge tolls to manage the number of HOVs using the facility. For the Two-lane Reversible Option, three-person HOVs would be allowed to use the facility for free, while single-occupant and two-person HOVs would have to pay a toll. The Two-lane Reversible Option was found to be the optimal of the two alternatives studied. Consideration of a full BRT option was not reasonable as it would have required dedicating a lane to the bus service which would have added substantially to the cost by requiring an added lane or, alternatively, reducing capacity for other vehicles by dedicating one of the two lanes for bus use. It would also not have provided a substantive operational improvement over express bus service functioning in free-flow conditions (presumably operating at preferred rates) maintained by charging a toll to single or low-occupant vehicles.

The findings of the Managed Lanes analysis are summarized in Chapter 2 of the Final EIS as follows: The Managed Lane Alternative was evaluated for its ability to meet project goals and objectives related to mobility and accessibility, supporting planned growth and economic development, constructability and cost, community and environmental quality, planning consistency and ultimately, to meet the requirements of the available funding in the form of the City's GET Surcharge program and, potentially, the FTA New Starts Program. While this alternative would have reduced congestion on parallel highways, system-wide traffic congestion would have been similar to the No Build Alternative as a result of increased traffic on arterials trying to access the facility. Total islandwide vehicle hours of delay would have increased with the Managed Lane Alternative compared to the No Build Alternative, indicating an increase in system-wide congestion (Table 2-2 of the Final EIS).

The Managed Lane Alternative would not have supported planned concentrated future population and employment growth because it would not provide concentrations of transit service that would serve as a nucleus for a more compact and efficient development plan. The Managed Lane Alternative would have provided little transit benefit at a high cost. As discussed in Chapter 6 of the Alternatives Analysis Report, the cost-per-hour of transit-user benefits for the Managed Lane Alternative would have been two to three times higher than that for the Fixed Guideway Alternative. Similar to the Transportation System Management (TSM) Alternative, the Managed Lane Alternative would not have substantially improved service or access to transit for transit-dependent communities. No dedicated funding sources were identified for the Managed Lane Alternative. Neither the County GET Surcharge imposed by the City Council in 2006 nor the FTA New Starts Program provide funding for Managed Lanes as they do for fixed guideway. Other funding sources are available for roadways, but none are currently identified for a managed lane project in Honolulu. Funding sources are identified for the fixed guideway. Toll revenues from the Managed Lane Alternative would pay for ongoing operations and maintenance while remaining revenues would be used to repay debt incurred to construct the system.

As stated in the Summary of the Alternatives Analysis Report, the Managed Lane Alternative would have generated the greatest amount of air pollution, required the greatest amount of energy for transportation use, and would have resulted in the largest number of transportation noise impacts of all the alternatives evaluated. Because the Managed Lane Alternative would have served a shorter portion of the study corridor (approximately 16 miles compared to the 20 miles served by the fixed guideway), it would have resulted in fewer displacements and would have impacted fewer archaeological, cultural, and historic resources than the Fixed Guideway Alternative. The Managed Lane Alternative would not have affected

any farmlands. Visually, the elevated structure would have extended a shorter distance, but it would have been more visually intrusive because its elevated structure, with a typical width of between 36 and 46 feet, would have been much wider than the Fixed Guideway Alternative.

After the Alternatives Analysis phase was completed, scoping was held to provide the public and agencies the opportunity to comment on March 28 and March 29, 2007, per 40 C.F.R. Part 1501.7. Several scoping comments were received requesting reconsideration of the Managed Lane Alternative that was considered and rejected during the Alternatives Analysis phase based on the information in Chapter 6 of the Alternatives Analysis and in the form of City Council action on December 6, 2007 to adopt the Fixed Guideway Alternative as the Locally Preferred Alternative (LPA) in Ordinance 07-001. Because no new information was provided that would have changed the findings of the Alternatives Analysis regarding the Managed Lane Alternative, it was not included in the Draft EIS for further consideration. Specifically, the discussion of BRT in the proposed reconsideration was similar to the bus operation studied in the Alternatives Analysis.

According to 23 CFR § 771.130, a Supplemental EIS is prepared when the Administration determines that:

- (1) Changes to the proposed action would result in significant environmental impacts that were not evaluated in the EIS; or
- (2) New information or circumstances relevant to environmental concerns and bearing on the proposed action or its impacts would result in significant environmental impacts not evaluated in the EIS.

Neither of these instances are applicable to the Honolulu High-Capacity Transit Corridor Project or demonstrated in the comment letter.

The Draft EIS does not reference a 30-percent decrease in congestion. As shown in Table 3-14 of the Draft EIS, there is approximately a 20-percent reduction in vehicle hours of delay (VHD) when comparing Build Alternatives to the No Build Alternative. (VHD is the time lost in congested conditions compared to the time it would take to travel without congestion.) The travel demand forecasting model has been refined since the Draft EIS to include non-home-based direct demand trips (trips that do not originate at home) during off-peak hours. The air passenger model, which forecasts travel in the corridor related to passengers arriving or departing at Honolulu International Airport, was also updated to reflect current conditions. Table 3-14 in the Final EIS shows an 18-percent reduction in VHD with the Project versus the No Build Alternative. With respect to traffic reductions, the Draft EIS reflects the results of the analysis conducted with the Project compared to the No Build Alternative. The figures have been updated for the Final EIS based on selection of the Airport Alternative and refinements to the travel demand forecasting model (e.g., non-home-based direct-demand trips during off-peak periods, air passenger model). In addition, the air passenger model was updated to reflect current conditions. The updated results continue to show that traffic will decrease with the addition of the Project compared to 2030 No Build conditions. The Final EIS includes the latest information.

Section 1

1–2. *These comments provide information and are not related to the environmental analysis of the Project.*

3. *This comment is not related to the environmental analysis of the Project. As stated in Section 3.3.2 of the Final EIS, “With increasing traffic congestion over the last 20 years, scheduled trip times for bus routes have been lengthened to reflect the additional time each bus trip takes.” The implementation of the fixed guideway system will allow for the redistribution of bus service hours to add service to the growing areas of Central, West, and East Oahu.*

4. *This comment is not related to the environmental analysis of the Project. Figure 3-7 in the Final EIS shows that transit travel times will be substantially shorter with the fixed guideway system than with the No Build Alternative.*

5. *This comment is not related to the environmental analysis of the Project. National trends show increasing transit ridership, and last year (2008) recorded the highest demand for public transportation in 52 years (APTA 2008 Ridership Report). National transit ridership has grown 18 percent over the past 10 years (2007 National Transit Summaries and Trends, National Transit Database). Honolulu transit ridership has grown over the past several years, recovering from three fare increases (July 1, 2001, July 1, 2003, October 1, 2003) and a month-long strike bus strike (FY 2004).*

6. *This comment is not related to the environmental analysis of the Project. As stated previously, Figure 3-7 in the Final EIS shows that transit travel times will be substantially shorter with the fixed guideway system than with the No Build Alternative. Table 3-14 of the Final EIS shows that VHD decreases 18 percent with the Project versus the No Build Alternative.*

7. *As noted above, national trends show transit ridership increases. Honolulu transit ridership has also increased over the past several years.*

8. *An analysis of congestion on the highway system is undertaken in the environmental review of the Project and is presented throughout Chapter 3 of the Final EIS. In addition, the relevance of the 2012 compared to 2000 data in your letter is unclear. There is no requirement to maintain congestion at 2000 levels. There are other ways to decrease or maintain traffic congestion, including increasing the number of people per vehicle. The fixed guideway project, as currently planned, would carry a minimum of 8,500 people per hour per direction during peak periods, thus reducing traffic congestion as compared to the No Build Alternative. It is unclear what is meant by the “lower table” in the comment letter (no tables are found in the comment letter).*

9. *Your planned use of terminology is noted.*

10. *The Final EIS discusses both bus and rail transit. As noted in Section 2.5.6 of the Final EIS, “bus service will be enhanced and the bus network will be modified to coordinate with the fixed guideway system.”*

11-14. *These comments are not related to the environmental analysis of the Project.*

Preferred Alternative (LPA) in Ordinance 07-001 While there are minor differences in access locations in the proposal mentioned in the comment compared to the design addressed in the Alternatives Analysis, they add substantially to the cost of the system and afford negligible benefit to a comparatively ineffective Managed Lane Alternative. Moreover, the variation proposed does not reflect a substantive departure from the studied concept. Therefore, it has not been considered as a project alternative in the Draft or Final EISs.

28. *The Draft and Final EISs do not consider HOT lanes, as those were eliminated as noted in the previous response during the Alternatives Analysis process, as discussed in Chapter 2 of the Final EIS. As mentioned earlier in the "General Comments" section, while this alternative would have reduced congestion on parallel highways, system-wide traffic congestion would have been similar to the No Build Alternative as a result of increased traffic on arterials trying to access the facility. Total islandwide vehicle hours of delay would have increased with this alternative compared to the No Build Alternative, indicating an increase in system-wide congestion (Table 2-2 of the Final EIS). This alternative would not have supported planned concentrated future population and employment growth because it would not provide concentrations of transit service that would serve as a nucleus for a more compact and efficient development plan. This alternative would have provided little transit benefit at a high cost and would not have substantially improved service or access to transit for transit-dependent communities. For these reasons, this alternative did not meet the Project Purpose and Need and was eliminated from further consideration.*

29. *See previous explanations about why HOT lanes were not included in the Draft or Final EISs. While the BRT/HOT alternative would have reduced congestion on parallel highways, system-wide traffic congestion would have been similar to the No Build Alternative as a result of increased traffic on arterials trying to access the facility. Total islandwide VHD would have increased with the Managed Lane Alternative compared to the No Build Alternative, indicating an increase in systemwide congestion (Table 2-2 of the Final EIS); the same result is anticipated for the BRT/HOT alternative.*

30. *As stated previously, two options were considered for the Managed Lane Alternative—Two-direction and Two-lane Reversible. This alternative "would have provided a two-lane elevated toll facility between Waipahu and Downtown Honolulu, with variable pricing strategies to maintain free-flow speeds for transit and high-occupancy vehicles (HOVs)." The Alternatives Analysis phase found that this alternative had inferior performance compared to the fixed guideway alternative for reasons previously explained (as discussed previously under the "General Comments" section of this letter).*

31. *The Alternatives Analysis Report indicated that transit reliability would not have been improved except for express bus service operation in the managed lanes. While this alternative would have slightly reduced congestion on parallel highways, system-wide traffic congestion would have been similar to the No Build Alternative as a result of increased traffic on arterials trying to access the facility. Total islandwide VHD would have increased with the Managed Lane Alternative compared to the No Build Alternative, indicating an increase in system-wide congestion. As stated in Section 2.5.1 of the Final EIS, the rail system will achieve an average of 30 mph or greater, including dwell times at stations. The managed lane option would allow favorable speeds on the facility itself if free flow conditions could be maintained (such as through imposition of a high enough variable toll), but the alternative suffers at either*

end and in travel to and from the facility, leading to overall system speeds that are slower than the fixed guideway.

32. The capital plan for the Project is presented in Section 6.3 of the Final EIS, including a description of the amount of funding anticipated from various sources. Section 6.6 of the Final EIS describes risks and uncertainties associated with these funding assumptions. To clarify, the reference to first-phase construction segments is inconsistent with the information in the Final EIS in Chapter 2, and the crossing of the H-1 Freeway at University Avenue is not a part of the Final EIS Project but is a potential future extension, which will be evaluated separately at a later date if the extension is pursued.

33. As stated above, Section 6.3 of the Final EIS describes the anticipated funding sources for the capital cost of the Project. Capital costs of the Project, including finance charges, are expected to be fully paid by a combination of FTA Section 5309 New Starts Funds and FTA Section 5307 Funds from the Federal government and the revenues from the County General Excise Tax (GET) Surcharge levied from 2007 through 2022. As a note regarding cost overruns, the capital cost estimate includes over \$1 billion in 2009 dollars in contingencies to account for such events. Section 6.4 of the Final EIS describes the funding sources for ongoing operations and maintenance anticipated for the Project. Operating and maintenance costs will utilize the same funding sources currently used for TheBus—Federal funding, fare revenues, and subsidies from the City's General and Highway Funds.

34. As stated in Responses 32 and 33 above, Sections 6.3 and 6.4 of the Final EIS describe anticipated funding sources for capital costs and for operating and maintenance costs, respectively.

35. The analysis of the HOT facility in Honolulu from the Alternatives Analysis Report shows the cost for the HOT lanes alternative to be \$2.6 billion in 2006 dollars (the figure would be higher today because of inflation, however, as the Managed Lane Alternative was examined during the Alternatives Analysis phase conducted in 2006, costs in 2006 dollars are used when discussing the managed lane). As stated in the Transit Task Force Report, a committee was charged with reviewing cost estimates for the two Alternatives involving construction (Managed Lane Alternative and Fixed Guideway Alternative). The report states that "the Task Force agrees with this committee that the Alternatives Analysis' construction cost estimates were fairly and consistently prepared, and that they may be used for both planning and cost comparisons." Information was obtained by the Transit Task Force from HDOT and others familiar with HOT facilities. It is the only estimate to date that addresses Honolulu conditions.

There is no substantiation of the estimate from the Tampa Bay toll facility being applicable in Honolulu. Regarding the comparison of the Tampa Bay facility, the Transit Task Force report states that "the committee concluded that the projects are sufficiently different (actual costs versus projected costs with contingencies; available, accessible [rights-of-way] vs. construction in actively used highways; no utilities relocation vs. extensive relocations) as to make the comparison unreasonable."

36. HOT Lanes are not eligible for FTA New Starts funding.

37. *The Alternatives Analysis Report shows that the estimated cost of HOT Lanes is \$2.6 billion (2006 dollars), which would be higher now. As stated in response to Comment 35 (above), this cost has been reviewed by HDOT and others.*

38. *Comment is missing from your letter.*

39. *This comment is not related to the environmental analysis of the Project. Rail has reduced traffic congestion within the corridor within which it is built (see Salt Lake City, Dallas, etc.). The travel forecasting model used in the environmental analysis of the Project uses guidelines established by FTA and, according to modeling done for the Project, the fixed guideway system will relieve traffic congestion compared to the No Build Alternative. Table 3-14 in the Final EIS shows an 18-percent reduction in VHD in 2030 with the Project as compared to the No Build Alternative.*

40. *As discussed above, a Managed Lane Alternative was studied in the Alternatives Analysis phase. This alternative was rejected for the reasons discussed above. Traffic conditions will be worse in 2030 under any circumstances and regardless of whether the fixed guideway, managed lane, or more buses are implemented. With the fixed guideway system, total islandwide congestion (as measured by VHD) would decrease by 18 percent as compared to the No Build Alternative (Table 3-14 in the Final EIS). In addition, traffic volumes were studied at various screenlines in the study corridor. The travel demand forecasting model was used to forecast traffic volumes at these screenlines in 2030, both with and without the Project. Analysis revealed that traffic volumes at these screenlines would decrease up to 11 percent with the Project during the a.m. peak hour (Table 3-9 in the Final EIS). Accordingly, traffic conditions will be substantially better with the fixed guideway than compared to the No Build Alternative. By contrast, in the Alternatives Analysis, the Managed Lane alternative showed a 1 percent reduction in VHD.*

41. *The fixed guideway project will provide an alternative to the private automobile.*

42. *As discussed above, the Managed Lane Alternative was fully evaluated in the Alternatives Analysis phase and demonstrated to be less effective than a Fixed Guideway Alternative for reasons previously stated in this letter.*

43. *As noted above, a Managed Lane Alternative meeting this general description was fully evaluated in the Alternatives Analysis phase and demonstrated to be less effective than a Fixed Guideway Alternative. The HOT facility was not only less effective in meeting the Project's Purpose and Need, but it was also financially unrealistic because it does not qualify for the GET Surcharge funds or Federal New Starts funding. Tolls would also have to be high to pay for the cost of the elevated lanes at \$6.60 during the peak period. Tolls would still only generate less than a quarter of the capital funding needed to build the system. This toll rate is comparable to similar systems where tolls are as high as \$10.00 during peak times (e.g., Orange County, CA—SR 91 HOT lanes).*

Section 2

1-3. *These comments are not related to the environmental analysis of the Project. These options may have application in the right time and the right place in conjunction with the*

fixed guideway project. The Project does not preclude these activities from occurring; however, they are not within the control of the City.

4-5. This comment is not related to the environmental analysis of the Project. As noted above, regarding school hours, this option may have application in the right time and the right place in conjunction with the fixed guideway project. The Project does not preclude these activities from occurring; however, they are not within the control of the City.

6. The State of Hawaii's Highway Modernization Plan, dated January 22, 2009, includes the \$600 million Nimitz Viaduct project. It would complement the transit project and is included in the modeling conducted for both the No Build and Project Alternatives. As presented in the Highway Modernization Plan, the Nimitz Viaduct project does not include reversible lanes.

7. This comment is not related to the environmental analysis of the Project. The Project does not preclude improving response times for accidents.

8. This comment is not related to the environmental analysis of the Project. This option may have application in the right time and the right place in addition to the fixed guideway project. The Project does not preclude it from happening. This alternative is not within the control of the City.

9. This comment is not related to the environmental analysis of the Project. However, the Project does not preclude pay-as-you-go insurance from happening.

10. This comment is not related to the environmental analysis of the Project. The Project does not preclude this from happening.

11. This comment is not related to the environmental analysis of the Project. The City has a program to modernize the traffic signal system. It is in addition to and independent of the Project.

12-15. These comments are not related to the environmental analysis of the Project. These options may have application in the right time and the right place in addition to the fixed guideway project. The Project does not preclude it from occurring.

16. This comment is not related to the environmental analysis of the Project. This option may have application in the right time and the right place in addition to the fixed guideway project. The Project does not preclude this from happening. As mentioned in Section 4.19.2 of the Final EIS, TOD is expected to occur in project station areas as an indirect effect of the Project. In March 2009, the City Council approved and the Mayor of Honolulu signed Bill 10 (Ordinance 09-4), which defines the City's approach to TOD around fixed guideway stations. Zoning regulations, which will be developed in 2010, will address parking standards, new density provisions, open spaces, and affordable housing. While the Project is coordinating with City and State agencies to encourage development of enhanced pedestrian and bicycle facilities and other land use changes near the stations, the actual construction of such facilities and zoning changes are outside the scope of the Project. For reference, the Ewa Development Plan provides a thorough overview of the concept for future development in the Ewa Plain.

17-30. *These comments are not related to the environmental analysis of the Project. However, the Project does not preclude these activities from happening.*

Section 3

1. *A variety of bus-related alternatives were examined during the Alternatives Analysis phase. BRT was also studied in the Primary Corridor Study in 2002. The alternatives in these analyses covered a variety of options, including increasing frequency of operations on an elevated bus facility. The Alternatives Analysis revealed that the fixed guideway system was more effective at reducing congestion on the existing roadways (11 percent reduction in VHD in AA) than an enhanced bus transit system (2 percent reduction in VHD).*

2. *The information on the South Nevada Metropolitan Area Express (MAX) system has been noted. The Alternatives Analysis showed that transit reliability would not have been improved except for express bus service operation while in the managed lanes. While this alternative would have slightly reduced congestion on parallel highways, system-wide traffic congestion (1 percent reduction in VHD) would have been similar to the No Build Alternative as a result of increased traffic on arterials trying to access the facility. Total islandwide VHD would have increased with the Managed Lane Alternative as compared to the No Build Alternative, indicating an increase in systemwide congestion as shown in Table 2-2 in the Final EIS.*

3. *The information on the Los Angeles Metro Rapid system has been noted. The Metro Rapid system relies primarily on non-exclusive right-of-way on existing roadways. As discussed in Section 3.4.2 of the Final EIS, there are no available options in Honolulu for improved bus service on existing roadways that are not already subject to high levels of congestion during peak travel times, which hinder reliability and level of service. The development of an exclusive right-of-way option for buses, such as the Orange Line in LA, was evaluated as part of the Managed Lane Alternative in the Alternatives Analysis phase (please see the response provided under the "General Comments" section in this response letter).*

4. *The information on the Los Angeles Orange Line system has been noted. Please see the previous response (Section 3, Response 3).*

5. *Information about TOD development has been noted. As stated in Section 4.19.2 of the Final EIS, TOD development could occur near station areas as an indirect effect of the Project. In March 2009, the City Council approved and the Mayor of Honolulu signed Bill 10 (Ordinance 09-4), which defines the City's approach to TOD around fixed guideway stations. Future zoning regulations will address parking standards, new density provisions, open spaces, and affordable housing. Financial incentives could include public-private partnerships, real property tax credits, and infrastructure financing. While the Project team is coordinating with City and State agencies to encourage development of enhanced pedestrian and bicycle facilities and other land use changes near the stations, the actual construction of such facilities and zoning changes are beyond the scope of the Project. The TOD effort will encourage public input into the design of TOD neighborhood plans to reflect unique community identities. TOD planning would occur before the fixed guideway stations are constructed.*

6. *Information about the NJ Transit Village Initiative and Boston's TOD policies on parking, transportation mitigation, and security has been noted. A Maintenance of Traffic (MOT)*

and a Transit Mitigation Plan (TMP) will identify measures to mitigate temporary construction-related effects on transportation. Additionally, the MOT Plan will address effects on streets and highways, transit, businesses and residences, pedestrians and bicyclists, and parking as mentioned in Section 3.5.7 of the Final EIS. A Safety and Security Management Plan will be developed in accordance with FTA requirements to mitigate potential effects on community services as mentioned in Section 4.5.2 of the Final EIS. In general, zoning changes are determined by the local government (e.g., Ordinance 09-4).

7. This comment is not related to the environmental analysis of the Project.

8. Information regarding Ottawa and Pittsburgh BRT TOD has been noted. This comment is not related to the environmental analysis of the Project.

9. This comment is not related to the environmental analysis of the Project. Information on the success of TOD developments worldwide has been noted. For more information about TOD as it relates to the Project, see Section 3, Response 5 (above).

10. This comment is not related to the environmental analysis of the Project. The information on the relationship between connecting TOD to transit has been noted.

Section 4

1. This comment is not related to the environmental analysis of the Project. The information on Mark Muiello and the New York Exclusive Bus Lane (XBL) has been noted.

2-7. These comments are not related to the environmental analysis of the Project. The information on New York Port Authority bridges and tunnels has been noted.

8. This comment is not related to the environmental analysis of the Project. The information on operational changes of the NY XBL has been noted.

9-10. These comments are not related to the environmental analysis of the Project. The information on planning activities, including their alternatives, and partnerships for the New York area has been noted.

11. This comment is not related to the environmental analysis of the Project. The information on the pricing pilot program has been noted.

12. This comment is not related to the environmental analysis of the Project. The information on the Lincoln Tunnel HOT lane study has been noted.

13. This comment is not related to the environmental analysis of the Project. The information on the study of the NY Commercial vehicle priority has been noted.

14-18. These comments are not related to the environmental analysis of the Project. The information on the evolution of the Houston contraflow and HOV lanes has been noted.

19-20. *These comments are not related to the environmental analysis of the Project. Information on Houston's HOV system connection to the Metro Rail system, parking capacity, and trips has been noted.*

21-27. *This comment is not related to the environmental analysis of the Project. Information on studies pertaining to BRT in Maryland has been noted. Please note the Red Line Project in Maryland is a Light Rail Transit project, not a BRT project.*

28. *This comment is not related to the environmental analysis of the Project. Information on the Corridor Cities Transitway in Maryland has been noted.*

29. *This comment is not related to the environmental analysis of the Project. Information on the Bi-County Transitway project has been noted.*

30. *This comment is not related to the environmental analysis of the Project. Information on the issues with BRT projects has been noted.*

31. *This comment is not related to the environmental analysis of the Project. Information on Robert Poole and virtual exclusive busways via Managed Lanes and pricing has been noted.*

32. *This comment is not related to the environmental analysis of the Project. Information on value pricing has been noted.*

33-36. *These comments are not related to the environmental analysis of the Project. Information about the history of HOV lanes, including carpool and vanpool information, has been noted.*

37. *This comment is not related to the environmental analysis of the Project. Information about the sustainability of BRT in HOV lanes has been noted.*

38. *Information about the I-15 HOT lanes and the 91 Express lanes has been noted. The concept of HOT was considered as part of the Alternatives Analysis phase but did not perform as well as the fixed guideway in terms of travel time or delay as noted in Chapter 2 of the Final EIS. The Alternatives Analysis does not dismiss the validity of HOT lanes in the appropriate application; however, they did not perform as well as the fixed guideway for this project.*

39-40. *See the previous response (Section 4, Response 38). Information about virtual exclusive busway (VEB) concepts, capacity, pricing, cost, and individual opinion to be recognized by the FTA as a viable alternative has been noted.*

41. *See the previous response (Section 4, Response 38). Information about VEB in Houston has been noted.*

42. *See the previous responses (Section 4, Response 38). Information about VEB concepts, capacity, pricing, cost, and individual opinion to be recognized by the FTA as a viable alternative has been noted.*

43. See the previous responses (Section 4, Response 38). Information about VEB concepts and their cost has been noted.

44. It is agreed that managed lanes are being considered in a number of locations in the U.S. and that policy changes could make them acceptable to more applications through various forms of funding. As stated earlier, the validity of managed lanes is not questioned as an effective transportation alternative, but it does not perform as well as the fixed guideway in Honolulu based on the Alternatives Analysis Report findings and the information contained in Chapter 2 of the Final EIS. It is worth noting that a VEB would not be eligible for the local GET Surcharge funds available to the fixed guideway.

45. This comment is not related to the environmental analysis of the Project.

Section 5

1. Project goals include supporting planned development. In addition to the number of trips served, which is related to the population density, planning also considers the length of trips served. For instance, there is a better opportunity for travel time savings on longer the trips, which increases the potential benefit received from improvements to the system. Potential Transit Markets are discussed in Section 1.6 of the Final EIS, which provides a summary of population projections, locations of employment growth, current and future transit dependent households, and resident and tourist transit markets.

2. As indicated in Section 3.4.2 of the Final EIS, overall access to public transit would be enhanced with the Project. More than 25 percent of the population lives within one half mile of a fixed guideway station. Substantial Project ridership will be provided by local bus and people walking to the station. Bus and walk access to stations will account for "approximately 90 percent of total trips in the a.m. peak period" (Final EIS, Section 3.4.2, Access to Fixed Guideway Stations). Access to stations will be enhanced by accommodating bicyclists and pedestrians. Several stations will be located near existing or planned bicycle facilities. In addition, bus access will be enhanced to coordinate with the fixed guideway system. Lastly, park-and-ride facilities will be provided at stations with the highest demand for drive-to-transit access.

3. These comments are not related to the environmental analysis of the Project.

4. Ordinance 09-4 to establish a TOD program for the City and County of Honolulu provides for the development of the close knit communities mentioned in the comment. The Project further enhances accessibility within and among those communities.

5. With the Project, as stated in Chapter 3 of the Final EIS, the rate of transfers will be higher than under the No Build Alternative due to proposed changes in local bus service to maximize access to the fixed guideway system. However, because of the high frequency of the fixed guideway service (e.g., three-minute headways between trains during peak periods), riders transferring from buses to the fixed guideway will experience minimal wait times. Riders transferring from the guideway service to buses will benefit from improved frequencies on existing bus routes serving stations. Also, several new routes with high frequencies will be provided as feeders to the guideway system. Since these routes will primarily operate in

residential areas, they will provide greater reliability versus routes operating along congested arterials. Using these systems in the proposed complementary fashion, ridership forecasts are 116,000 trips daily on the Project as noted in Chapters 2 and 3 of the Final EIS. This is higher than any of the options evaluated in the Alternatives Analysis phase or in the Draft EIS.

6. Chapter 3 of the Final EIS states that adding substantial passenger capacity with more buses is not feasible in some locations along the system because of roadway capacity constraints. Choke points occur in Downtown Honolulu during the a.m. peak period, (weekday morning one-hour period of highest traffic; aka morning rush hour) especially at the merger of North Beretania, North King, and Liliha Streets and Dillingham Boulevard and along Hotel Street. King Street has been used to introduce new service in recent years due to the capacity limitation of Hotel Street; however, choke points occur at the Chinatown bus stops and at the Punchbowl Street and King Street stops. Buses often must wait to move into an open and safe boarding position. Continuing to add additional service to King Street without physical improvements would add to the gridlock in this corridor, deteriorate transit service, and complicate pedestrian and traffic safety issues. Choke points occur along Beretania Street, Hotel Street, Nimitz Highway, and Ala Moana Boulevard in the Downtown area.

Several routes, including CountryExpress! Routes C, D, and E, are projected to be overloaded in 2030. Increasing frequency would require headways of five minutes or less. Further, the Downtown street network cannot support the number of buses that would be required to meet projected demand. These system capacity limitations are a major obstacle to an effective addition of bus service in the corridor. The Alternatives Analysis Report showed that an enhancement to the bus system would provide minimal benefit because it is subject to the same congestion impediments that already exist on the highway system.

7-8. These comments are not related to the environmental analysis of the Project. The improvements you have proposed could be part of a comprehensive program of transportation improvements. They offer additional benefit, but do not replace the need for the fixed guideway.

9. This comment is not related to the environmental analysis of the Project. The Project provides the opportunity for the development of TOD and the support of the City's land use plans to grow in a manageable way, which is expected as an indirect effect of the Project. As stated in Chapter 1 of the Final EIS, the purpose and need for the project includes: improved corridor mobility, improved corridor reliability, improved access to planned development and improved transportation equity.

10-12. These comments are not related to the environmental analysis of the Project. Please see previous responses regarding buses, HOT lanes, and TOD.

13. As noted in Chapter 2 of the Final EIS, many other alternative approaches were evaluated in the Alternatives Analysis phase and rejected because they do not offer the capacity and other benefits of the elevated rail system proposed for the City of Honolulu.

Section 6

1. The island's unique visual character and scenic beauty were considered in the visual and aesthetic analysis presented in Section 4.8 of the Final EIS. The Project will be set in an

urban context where visual change is expected and differences in scales of structures are typical. The following measures will be included with the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

- *Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
- *Coordinate the project design with City's TOD program within the Department of Planning and Permitting.*
- *Consult with the communities surrounding each station for input on station design elements.*
- *Consider specific sites for landscaping and trees during the final design phase when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will serve to mitigate potential visual impacts.*

It should also be noted that the Project will provide users, including tourists, with expansive views from several portions of the corridor by elevating riders above highway traffic, street trees, and low structures adjacent to the alignment. In Section 4.8.3 of the Final EIS under the heading Design Principals and Mitigation, specific environmental, architecture and landscape design criteria are listed (e.g., textured guideway or columns, tall plantings where it can screen features of the project, control of lighting to prevent intrusion into neighborhoods, etc., that will help minimize visual effects of the Project.

2. The highways will carry more vehicles in 2030 under any circumstances and regardless of which solution is applied. 2005 traffic volume data for the H-1 Freeway reports 10,140 vehicles per hour (vph) at the Kalauao screenline in the Koko Head-bound direction during the a.m. peak hour. This number is predicted to increase to 13,160 vph under 2030 No Build conditions; however, this number is lower with the fixed guideway (12,190 vph). The Alternatives Analysis Report showed that reduction in daily vehicles trips was higher for the fixed guideway (48,000) than for the managed lanes (14,900). Accordingly, traffic conditions will be better with the fixed guideway than any of the other potential solutions studied, including managed lanes and additional bus service.

3. Screened alternatives included a No Build Alternative, a Transportation System Management Alternative (TSM) (enhanced bus service), and a number of Build Alternatives. The comparison of alternatives presented in the Alternatives Analysis Report concluded that the TSM Alternative would provide little benefit at a relatively low cost. A brief description of the TSM Alternative is provided in Section 2.1.2 of the Draft EIS. The comment makes the assumption that because they are not bound by a guideway, buses will travel from origin to destination. That is typically not the case as most long trips require a transfer to connect the two ends of a trip. The fixed guideway offers similar connections, but at a higher level of service.

4. Based on the detailed operations modeling completed for the Project, which uses a speed of travel between stations consistent with what the design of the guideway can safely

support and which includes the time of acceleration and deceleration, the train will travel from one end of the line to the other in 42 minutes, including stops at all stations. That is about 30 mph on average and can be delivered regardless of the time of day or the conditions on the highways. As shown in Section 2.2.2 of the Final EIS, transit reliability would not have been improved in any of the other options evaluated in the Alternatives Analysis phase or the Draft EIS except for express bus service operation in the managed lanes during the time the bus is actually within the lanes. While this alternative would have slightly reduced congestion on parallel highways, systemwide traffic congestion would have been similar to the No Build Alternative as a result of increased traffic on arterials trying to access the facility. The TSM Alternative would have generated fewer hours of transit-user benefits than either the Managed Lane or Fixed Guideway Alternative. Since most buses would still operate in mixed traffic, the TSM Alternative would have done little to improve corridor mobility and travel reliability. The Alternatives Analysis further showed that the annualized cost per rider compared to the TSM Alternative was \$102.74 for the managed lane option and \$22.75 for the fixed guideway.

5. With the Project, as stated in Chapter 3 of the Final EIS, the rate of transfers will be higher than under the No Build Alternative due to proposed changes in local bus service to maximize access to the fixed guideway system. However, because of the high frequency of the fixed guideway service (three-minute headways between trains during peak periods), riders transferring from buses to the fixed guideway will experience minimal wait times. Riders transferring from the guideway service to buses will benefit from improved frequencies on existing bus routes serving stations. Also, several new routes with high frequencies will be provided as feeders to the guideway system. Since these routes will primarily operate in residential areas, they will provide greater reliability versus routes operating along congested arterials. The travel demand forecasting model includes a time penalty for transfers. With these characteristics in place, the transit system with the Project would still have ridership levels 44 percent higher than the No Build Alternative (i.e., continuation of present practices regarding bus service).

6. The highways will carry more vehicles in 2030 under any circumstances and regardless of which solution is applied, though the fixed guideway will offset those numbers. Traffic volume data for the H-1 Freeway reports 10,960 vph at the Kalauao screenline in the Koko Head-bound direction during the a.m. peak hour. This number is predicted to increase to 18,049 vph under 2030 No Build conditions; however, this number is lower with the fixed guideway (17,209 vph). Accordingly, traffic conditions will be better with the fixed guideway than any of the other potential solutions studied, including managed lanes (18,419 vph) and additional bus service (17,897 vph). In addition, the Alternatives Analysis did not show an improvement in traffic congestion on the H-1 Freeway with the Managed Lane Alternative compared to the No Build Alternative as evidenced in the previously mentioned reductions in vehicle hours of delay which drop by 18 percent for the fixed guideway compared to 1 percent for the Managed Lane Alternative.

7. This analysis was included in the evaluation of the Managed Lane Alternative in the Alternatives Analysis. It accommodated toll-free travel for buses and HOVs and a toll for single-occupant vehicles. However, this alternative was not selected. The proposed fixed guideway system will not share space with other vehicles due to safety concerns.

The amount of service provided on the fixed guideway will be scaled to match the demand. If the service attracts fewer riders than expected, then less service may be provided, by adjusting headways or train length, thereby resulting in lower operating and maintenance costs than currently projected. There is no plan to offer free ridership on the fixed guideway system.

8. As discussed previously in Section 3, Comment 1, adding substantial passenger capacity with more buses is not feasible in various locations along the system because of roadway capacity constraints, as shown in Section 3.4.2 of the Final EIS.

9. Overall system reliability, considering all factors, for a fully grade-separated transit system is substantially greater than for any system operating in mixed-flow conditions. In Honolulu, there is no practical difference between the proposed rail system and TheBus regarding labor considerations. The same is true for the Project or any other system, such as the Managed Lane Alternative. The comment regarding non-bid, single source-source contract is inaccurate. The City adheres to strict procurement rules that encourage bidding by as many firms as possible.

10. There is no indication that damage to a fixed guideway would be more difficult to repair than an elevated roadway. The chance of a transit vehicle being stopped by a disabled vehicle is greater in any form of mixed traffic flow, such as managed lanes, than in an exclusive right-of-way carrying only routinely maintained rail vehicles.

11. Section 6.3 of the Final EIS describes the anticipated financial resources needed to pay for the capital cost of the Project, including finance charges. Capital costs are expected to be fully paid for by a combination of FTA Section 5309 New Starts and FTA Section 5307 Funds from the Federal government and revenues from the County General Excise Tax Surcharge levied from 2007 through 2022 on Oahu. The Managed Lane Alternative cost estimate was \$2.6 billion in 2006 dollars. It provides less benefit per dollar spent than the Project (the annualized additional cost per rider is \$103 for managed lane and \$22.75 for fixed guideway compared to TSM) as indicated in the Alternative Analysis and in Chapter 2 of the Final EIS.

As stated in Section 4.11.3 of the Final EIS, as a result of a reduction in Vehicle Miles Traveled (VMT), the total transportation energy demand for transit and highway vehicles will be 3 percent lower with the Project when compared to the No Build Alternative. This decrease in energy demand is due to the reduction in VMT that occurs as a result of people switching from automobiles to the fixed guideway system and includes electrical energy required to operate the fixed guideway system. (The energy demand compares the use of energy from gasoline or electricity in common terms.) The Project will consume approximately 1 to 2 percent of the total projected electricity generated on Oahu in 2030. According to the Hawaiian Electric Company (HECO), the planned electricity generation capacity on Oahu will be sufficient to support the transit system, but the electricity distribution system will require various upgrades to support the system. HECO is moving toward renewable energy generation. As that happens, the fixed guideway will also benefit from such new sources of energy. Construction of the Project will use more energy than the No Build Alternative as indicated in Section 4.18.6 of the Final EIS. This will be true of any similar construction effort. The combination of daily use reductions and amount of construction energy needed could, over the short term, result in the expenditure of more energy than the No Build.

12. *This comment is not related to the environmental analysis of the Project. Information about the quality of buses has been noted. As shown in Figure 3-7 of the Final EIS, transit travel with the Project will be substantially faster than transit travel under No Build conditions. This travel time includes transfers. As stated in Section 3.4.2, operation of the fixed guideway in exclusive right-of-way will improve convenience. For riders who stand, the guideway service will also provide increased safety (e.g., ease of acceleration/deceleration, low floor access, etc.).*

13. *The EIS does not address tolling because the Project does not include any tolled facilities. Tolls were considered during the Alternatives Analysis phase for the Managed Lane Alternative. Tolls of \$6.60 during the peak period were used and able to fund only 25 percent of the capital cost of the elevated lane project. In other places, such as Orange County, California, the SR-91 tolls rise to \$10 during the peak times of the week. Similar costs are forecast for the HOT lanes on the Dulles Expressway. Such high tolls were anticipated to be prohibitive for Honolulu users and would have impaired the project's ability to meet Purpose and Need regarding equitable transportation.*

14. *Implementation of the Managed Lane Alternative would have resulted in increased automobile use on Oahu relative to all other alternatives evaluated in the Alternatives Analysis phase (for more information, see Table 6-3 of the Alternatives Analysis).*

15. *Project goals include supporting planned development. The objective of this goal is to avoid the dispersal of development which will lead to more sprawl in parts of the island unable to support it. In addition to the number of trips served, which is related to the population density, planning of the system considers the length of trips served. A fixed guideway system has the advantage of providing a permanent mode of transportation that provides assurance to developers the investment will be there for the long term, which is necessary to support planned development. This allows for longer term planning without the concern that the system can change easily over time, which could be the case with a bus network. The Project will help shape future development. Jobs and housing are more likely to locate closer to each other with the Project based on the experience in all other rail projects over the past 20 years (e.g., Portland, OR, Seattle, WA, Houston, TX, etc).*

The Project has developed plans to prevent safety and security problems at stations and will provide police staffing at stations to support those plans. The stations are also being designed according to the precepts of Crime Prevention Through Environmental Design (CPTED) which ensures that spaces are visible, open, well-lit and observable to minimize crime. Ridership forecasts, on the other hand, are made without the benefit of speculation about what type of land uses might locate near transit stations. The FTA only allows approved development or imminent plans to be considered in planning the system.

16. *The Final EIS does not consider HOT lanes, as those were eliminated during the Alternatives Analysis process, as discussed in Chapter 2 of the Final EIS. Costs for the Managed Lanes Alternative in the Alternatives Analysis were developed using the same principles, procedures and unit costs used for the fixed guideway alternative (as described in Chapter 5 of the Alternatives Analysis). The costs were further reviewed and agreed to by HDOT.*

17. *The Managed Lane Alternative was fully evaluated in the Alternatives Analysis phase and demonstrated to be less effective than a Fixed Guideway Alternative. The engineering cost estimate for a two-lane reversible managed lane facility, which was calculated following the same rigorous cost estimating process used for the Fixed Guideway Alternatives, was \$2.6 billion in 2006 dollars. The zipper lane was eliminated in evaluation of the reversible facility because with the additional lanes, the demand and capacity would be better balanced without the zipper lane. Implementation of the zipper lane results in the loss of two lanes of capacity in the reverse direction. By 2030, the directional transportation demand will be more balanced than it is today. Eliminating the zipper lane, while evaluating the reversible Managed Lane Alternative, provided the greatest benefit to modeled freeway users by increasing capacity in both directions. Access ramps were provided at several locations. Park-and-ride facilities and bus stops were included to maximize transit use, providing the alternative the greatest opportunity to generate transit user benefits.*

The City Council's Transit Advisory Task Force, which reviewed the Alternatives Analysis, concluded in their report of December 14, 2006, that the assessment of each alternative was "fair and accurate" and that capital cost estimates were compiled using the same methodology and unit cost and that the construction cost estimates were fairly and consistently prepared.

The Managed Lane Alternative was evaluated in the Alternatives Analysis and demonstrated to be less effective than a Fixed Guideway Alternative. The findings are summarized in Chapter 2 of the Final EIS as follows:

The Managed Lane Alternative was evaluated for its ability to meet project goals and objectives related to mobility and accessibility, supporting planned growth and economic development, constructability and cost, community and environmental quality, and planning consistency. VMT would have increased compared to any of the other alternatives. While this alternative would have reduced congestion on parallel highways, system-wide traffic congestion would have been similar to the No Build Alternative as a result of increased traffic on arterials trying to access the facility. Total islandwide VHD would have increased with the Two-lane Reversible Option as compared to the No Build Alternative, indicating an increase in system-wide congestion. Transit reliability would not have been improved except for express bus service operating in the managed lanes. The Managed Lane Alternative would not have supported planned concentrated future population and employment growth because it would not provide concentrations of transit service that would serve as a nucleus for TOD. The Managed Lane Alternative would have provided little transit benefit at a high cost. The cost-per-hour of transit-user benefits for the Managed Lane Alternative would have been two to three times higher than that for the Fixed Guideway Alternative. Similar to the TSM Alternative, the Managed Lane Alternative would not have substantially improved service or access to transit for transit-dependent communities.

All meetings and materials supporting meetings were prepared according to the practices required by NEPA and the FTA. The objective of meetings was to obtain input on the Project and shape the project to be compatible with the community's needs. The information contained in the Final EIS was added or modified as a result of responses from the meetings and comments shared by the general public.

Section 7

1. Adding buses and elevated HOT Lanes were evaluated in the Alternatives Analysis phase and eliminated because they did not perform as well as the fixed guideway, as described in Chapter 2 of the Final EIS. In addition, riders will be able to access the fixed guideway system by all the modes listed in this comment.

2. Adding substantial passenger capacity with more buses, even larger buses, is not feasible in some locations along the system because of roadway capacity constraints as shown in Section 3.4.2 of the Final EIS. Even with the fixed guideway, buses will continue to carry the largest portion of transit users (about 78 percent). The difference is TheBus will be operated in support of the fixed guideway and that intermodal linkage provides a more efficient trip. Bicycles will be accommodated on the rail vehicles. A policy is in development regarding bicycle accommodation on rail vehicles. The primary focus will be on ensuring that bicycles can be safely carried on vehicles. This may require consideration of passenger loads during heavy travel periods on the trains to make sure riders are not displaced by bicycles.

3. As mentioned in Chapter 2 of the Final EIS, transit reliability would not have been improved except for express bus service operation in the managed lanes. While the Managed Lanes Alternative would have slightly reduced congestion on parallel highways, system-wide traffic congestion would have been similar to the No Build Alternative as a result of increased traffic on arterials trying to access the facility. Transit travel times for the Project compared to Existing Conditions and the No Build Alternative are shown in Figure 3-7, and travel speeds in Table 3-15 of the Final EIS. In all cases, the transit performance is improved with the Project.

4. As shown in Chapter 2 of the Final EIS, even using a managed lane for part of the trip, most buses still operate primarily in mixed traffic. That results in little improvement in corridor mobility and travel reliability even though the portion in the special lanes improves. Buses can travel at reasonable speeds in the special lanes but still may need to negotiate congested access points which obviate much of the benefit of the concept. This prevents the buses from achieving the travel time identified in the comment.

5. As noted in Chapter 2 of the Final EIS, adding buses and HOT lanes were studied in the Alternatives Analysis phase and eliminated because those options did not perform as well as the fixed guideway, which is the subject of the Final EIS.

6. With the Project, as stated previously (see Section 5, Response 5), the rate of transfers will be higher than under the No Build Alternative due to proposed changes in local bus service to maximize access to the fixed guideway system. However, because of the high frequency of the fixed guideway service (three-minute headways between trains during peak periods), riders transferring from buses to the fixed guideway will experience minimal wait times. Riders transferring from the guideway service to buses will benefit from improved frequencies on existing bus routes serving stations. Also, several new routes with high frequencies will be provided as feeders to the guideway system. Since these routes will primarily operate in residential areas, they will provide greater reliability versus routes operating along congested arterials.

The travel demand forecasting model includes a time penalty for transfers. With these characteristics in place, the transit system with the Project will still have ridership levels 44 percent higher than the No Build Alternative due to the fixed guideway, feeder bus routes, and TheBus routes. In addition, as stated in Section 1.2 of the Final EIS, 63 percent of Oahu population and 80 percent of employment are located within the study corridor. By 2030, these distributions will increase to 69 percent and 83 percent, respectively. Lastly, the fixed guideway system provides park-and-ride lots at the stations with the highest projected drive-to-transit demand. While people typically try to minimize transfers on any trip, the more fundamental criterion for making a trip decision is how long the trip takes. Rail will offer people a shorter overall trip time compared to other options even with the transfers, as noted in Section 3.4.2 of the Final EIS.

7. As stated in response to a previous comment (Section 5, Response 5), those transferring to the rail from TheBus will experience minimal wait times. Riders transferring from the guideway service to buses will benefit from improved frequencies on bus routes serving stations where the shorter routing of many bus lines in the vicinity of stations will allow for shorter headways. As stated in Chapter 3 of the Final EIS, all stations will be equipped with escalators and elevators. Stations will also have covered waiting areas.

8. As stated in Response 33-36 under Section 4, the Alternatives Analysis Report showed the cost of the Managed Lane Alternative to be \$2.6 billion (vetted by HDOT and other experts familiar with Hawaii's building conditions and requirements), compared to the fixed guideway at \$3.5 billion, and had little benefit to users compared to the fixed guideway. The Tampa Bay experience is not typical and could not be duplicated in Honolulu. There are many differences between the two locations that need to be considered (e.g., the Tampa Bay project required almost no rights-of-way to be acquired; the Tampa Bay project did not need to relocate major utilities along the corridor; the Tampa Bay project did not need to span major facilities such as freeway; and finally, construction costs in Tampa Bay are substantially lower than in Honolulu).

9. This comment is not related to the environmental analysis of the Project. Information about other cities building HOT lanes and population numbers has been noted. Recognizing each city is unique, no other single city has been used as a model for Honolulu in developing the characteristics of the rail system.

10. The Alternatives Analysis phase evaluated an expanded bus system (TSM Alternative) and showed it did not perform in a satisfactory manner compared to the fixed guideway. This is discussed in Chapter 2 of the Final EIS. Ridership for the TSM Alternative increases to 7 percent over the No Build Alternative compared to 38 percent for the Project over the No Build. As stated previously, the amount of service provided will be scaled to generally match the demand.

11. This comment is not related to the environmental analysis of the Project. Prior BRT planning programs, such as addressed in the Primary Corridor Project, are not part of the current Project or EIS.

12. As stated previously, the Project will consume 1 to 2 percent of the total projected electricity generated on Oahu in 2030. The Final EIS indicates that the Project will reduce

energy consumption by about 2,000 MBTUs over the No Build. This represents about 15,000 gallons of fuel saved per day. Alternative energy sources, such as photo-voltaic cells, can be built into the rail system as the development of alternative energy sources continues. The Project will still rely on HECO for energy, but the planned electricity generation capacity on Oahu will be sufficient to support the transit system.

13. As presented in the Alternatives Analysis Report and summarized in Chapter 2 of the Final EIS, the cost for a two-lane reversible managed lane facility is \$2.6 billion in 2006 dollars. The fixed guideway alternatives were calculated following the same cost estimating process. Toll revenue would pay for less than 25 percent of the cost, based on a \$6.60 toll. The construction of numerous off-ramps and parking facilities would require acquisition of property and displacement of current businesses and residents, all of which are included in cost estimates, when applicable.

14. The Project consists of the construction and implementation of rail transit service (analyzed in the Final EIS). As mentioned in Section 4.19.2 of the Final EIS, TOD is anticipated in project station areas as an indirect effect of the Project. The increased mobility and accessibility that the Project may provide will also increase the desirability and value of land near the stations, thereby attracting new real estate investment (in the form of TOD). Planning and zoning around station areas is the responsibility of the City's Department of Planning and Permitting in compliance with the City's TOD Ordinance 09-4.

15. The Project provides a variety of ways to access the fixed guideway and does not account for the possibility of TOD in the forecasts of ridership. If riders live nearby, they can walk or bike, and if they live further away, they can drive and park or take the bus. Bicycle/pedestrian facilities, as well as park-and-ride facilities are included in the Project. Chapter 3 of the Final EIS details ridership characteristics and system usage on a station-by-station basis, which shows ridership is not impeded by the planned station locations.

Section 8

1. The Managed Lane Alternative was evaluated in the Alternatives Analysis phase and demonstrated to be less effective than a Fixed Guideway Alternative. The findings are summarized in Chapter 2 of the Final EIS.

2. Regarding "main myths," in the case of the Honolulu system, rail performs better overall in the measures listed, including construction costs, if the bus system requires that a new guideway be built. The Alternatives Analysis phase compared an expansion of the bus system against the fixed guideway. Unlike the Project, while the bus expansion is less costly, it provides no measurable benefit compared to the No Build Alternative. As discussed in Chapter 2 of the Final EIS, the Managed Lane Alternative would have generated the greatest amount of air pollution, required the greatest amount of energy for transportation use, and resulted in the largest number of transportation noise impacts of all the alternatives evaluated.

3. Regarding speed, most buses still operate in mixed traffic, resulting in less improvement in corridor mobility and travel reliability than the fixed guideway system. As shown in the Alternatives Analysis Report and Section 2.2.2 of the Final EIS, transit reliability would not have been improved except for express bus service operation in the managed lanes. According

to the Alternatives Analysis Report, while a Managed Lane Alternative would have reduced congestion on parallel highways, leading to a 4 percent reduction in vehicle hours of delay for the two-direction managed lane option over all, system-wide traffic congestion would have been similar to the No Build Alternative as a result of increased traffic on arterials trying to access the facility. As shown in Chapter 3 of the Final EIS, travel time by rail from East Kapolei to Ala Moana Center will take 42 minutes with the Project, regardless of the time of day or conditions on surrounding roadways. As shown in Figure 3-7, transit travel time during the a.m. peak period from Kapolei to Downtown will take approximately 55 minutes door to door compared to approximately 90 minutes on the freeway.

4. Chapters 2 and 3 of the Final EIS state that the system will have a minimum capacity exceeding 17,300 passengers per direction during the two-hour peak period. If demand warrants, the system can expand to a four-car train and run at 90-second intervals, increasing capacity by over 100 percent. Also, like a bus system, during the off-peak periods, the service level is reduced to use equipment and other resources efficiently.

5. Regarding "Myth 3", overall system reliability for a fully grade-separated transit system is greater than for any system operating in mixed-flow conditions (meaning all vehicles can operate on the facility as opposed to restrictions based on numbers of riders, separate bus lanes or other restrictive limits on usage.) Breakdowns do not affect the operation of the system beyond removal of the defective equipment. The system is designed to allow trains to continue functioning even if there is an obstruction in the line by providing cross-over tracks at strategic locations throughout the corridor. Though transit strikes in Honolulu have been infrequent, labor unions can be expected to be part of the operation of the system, so there is the possibility of a work stoppage under some circumstances. That does not obviate the benefit of the Project. Though strikes can be disruptive, the Project would provide service well over 99 percent of the time based on the past ten years of transit labor history on Oahu. There has been one one-month long strike during that period (August 2003).

6. Regarding "Myth 4", according to the FTA's Safety Management Information Statistics for 1997, the most recent data available in the Transportation Research Board (TRB) Report, Improving Transit Security, there was one serious offense for every one million passenger miles carried on rail. There is a need for security on transit systems, just as there is a need for police and other security with other transportation modes (e.g., airports and ports), but there is no evidence that crime rates associated with transit are any higher than for society in general. Crime rates on transit systems are correlated closely with crime rates in the neighborhoods within which the stations are located (e.g., "Crime in public transit systems: An environmental design perspective", Adele Pearlstein and Martin Wachs).

The costs of security are included in the operating costs for the Project. DTS, with assistance from the Honolulu Police Department, is developing a security plan for transit facilities, including park-and-ride lots. Security, including cameras, will be provided at all stations and park-and-ride facilities.

7. Regarding "Myth 5", information about the cost of the Managed Lane Alternative versus the Fixed Guideway is shown in the Alternatives Analysis Report. The Project is more expensive than the Managed Lane Alternative but provides benefits in terms of reliability, mobility, access to planned development, and transportation system equity compared to the No

Build Alternative. The Project is subject to the same bidding process that would be applied to the construction of an elevated managed lane facility.

8. Regarding "Myth 6", the Managed Lane Alternative was evaluated in the Alternatives Analysis phase and eliminated because it did not perform as effectively as the Fixed Guideway Alternative, as noted in Chapter 2 of the Final EIS. Details in the comment regarding other locations are inconsistent with the findings of a comprehensive analysis completed in the Alternatives Analysis for Honolulu. As stated in Response 35 under Section 1, the Tampa Bay example is unique and not duplicable for the same costs in Honolulu due to items such as those mentioned in Section 7, Response 8. The estimate for construction of the Managed Lane in Honolulu was reviewed by HDOT and others during the Alternatives Analysis process and found to be consistent with cost experience in Hawaii.

9. Regarding "Myth 7", while it may be true that auto pollution is less when cars are traveling on uncongested roadways, this comment is not related to the project alternatives or effects.

10. As shown in the Alternatives Analysis Report, both the TSM and Managed Lane Alternatives showed small increases in transit ridership compared to the No Build Alternative while the Fixed Guideway Alternative showed substantial increases in ridership. The Project will provide feeder bus service to surrounding communities.

11. Regarding "Myth 8", as shown in Table 3-7 in the Transportation Technical Report, ridership on TheBus (including TheHandi-Van) has been increasing. The increase in resident daily transit trips from 166,400 in 2007 to 255,500 (Table 3-13 of the Final EIS) in 2030 with the Project represents a 53.5-percent increase for this 23-year period. This represents a compound annual growth rate of less than 2 percent. This is a reasonable expectation with the addition of a grade-separated fixed guideway line to the transportation system. Increases of this magnitude are not uncommon in other U.S. transit systems (e.g., Portland, OR with 40 percent growth between 1990 and 1997).

12. Regarding "Myth 9", as stated above, the Final EIS indicates that the Project will reduce energy consumption over the No Build. Table 4-21 of the Final EIS shows that operation of the Project will reduce energy consumption for transportation by 3 percent compared to the No Build Alternative. The construction of the Project is anticipated to consume approximately 7.5 million MBTUs. Construction projects of similar magnitude would be expected to use a similar amount of energy.

13. Regarding "Myth 10", according to information provided by HECO, transportation (e.g., cars, trucks and buses) accounts for 63 percent of Hawaii's imported oil while electrical generation consumes 30 percent of the imported oil. Currently, 11 percent of the electricity on Oahu is generated by renewable resources. HECO is currently soliciting proposals for 100 MW of renewable-energy generating capacity to be in service between 2010 and 2014.

The transit system will allow for a decrease in automobile use, thereby reducing the amount of oil required for transportation while only using about 1 to 2 percent of the electrical generating capacity through HECO and other independent power producers in 2030. The Project does not require the construction of a new power plant. Emergency generators will be

provided at stations, but they are a safety and security requirement for stations. They do not draw additional electrical energy unless in use.

14. Regarding "Myth 11", this comment is not related to the environmental analysis of the Project. Information regarding the Vancouver Skytrain is noted. However, similar to Vancouver's Skytrain, the Honolulu fixed guideway system will be integrated with the buses, including a single fare system.

15. Regarding "Myth 12", this comment is not related to the environmental analysis of the Project. Information regarding the Vancouver transportation system is noted.

16. Regarding "Myth 13", this comment is not related to the environmental analysis of the Project. Information regarding Buenos Aires, Atlantic City, Hong Kong, and Asia is noted. All systems in the U.S. require subsidies as currently configured. Until general practices change in this country, the same will apply to Honolulu. The information about annual subsidies is presented in Section 6.4.2 of Chapter 6 of the Final EIS

17. Regarding "Myth 14", this comment is not related to the environmental analysis of the Project. Information regarding transit ridership trends in Pittsburgh is noted.

18-19. These comments are not related to the environmental analysis of the Project. Information regarding transit ridership trends in Pittsburgh is noted.

20-21. Regarding "Myth 16", the American Public Transportation Association's 2008 Public Transportation Fact Book states: "Since 1995, public transportation ridership in the U.S. grew by more than 32 percent, faster than highway travel or the U.S. population." Data from the American Public Transportation Association is based on information reported by transit agencies regarding various aspects of transit ridership. Census data is based on more general information and does not adequately reflect transit trends; the Census data cited in the comment letter is regarding people using transit to commute only.

22-23. Regarding "Myth 17", the ridership forecast for the fixed guideway project is over 116,000 boardings a day in 2030 (Table 3-18 of the Final EIS). As stated in Section 3.4.2 of the Final EIS, of the 116,000 boardings a day, approximately 40,000 are riders who, in the absence of the fixed guideway, would have had use a car on the freeways and highways of the island. Travel forecasting models and methodologies are developed in consultation with FTA. The forecasts in the Final EIS have been reviewed and approved by the FTA.

24. Regarding "Myth 18", this comment is not related to the environmental analysis of the Project.

25. This comment is not related to the environmental analysis of the Project. The Project is expected to carry approximately 26 percent of all transit riders on a daily basis (116,300 out of a total of 453,400).

26. Regarding "Myth 19", this statement does not appear in the Draft or Final EISs.

27. Table 7-2 of the Final EIS shows that a transit trip from Waianae to UH Manoa will take 121 minutes (two hours) with one transfer in 2030 without the Project (No Build Alternative), and 93 minutes (with two transfers) for the Project.

28. Regarding "Myth 20", it is not clear what the source of your comment is, but the intent appears to be a concern about an increase in transfers. There will be an increase in transfers with the fixed guideway, but even with the transfers, overall travel times will be substantially shorter as noted in Figure 3-7 of the Final EIS, and noted in Section 8, Response 27.

29. This comment is not related to the environmental analysis of the Project. The Primary Corridor Transportation Project (1998-2002) evaluated at-grade BRT busways in the corridor showing substantially lower ridership and overall performance than the Fixed Guideway. For the Managed Lane Alternative, placing the bus stops at grade and requiring buses to exit the facility at each location would have added significant time to a trip as well as a substantial cost for interchanges. The concept for bus service in the Managed Lane Alternative was a line-haul service (fast service with few stops and very short boarding and alighting times) that relied on well-coordinated transfers at critical stations, much like a rail system.

30. Regarding "Myth 21", the evaluated Managed Lane Alternative from the Alternatives Analysis phase includes ramps at several locations, including Aloha Stadium and Middle Street. Any increase in the number of access points to the facility will result in additional right-of-way requirements and additional costs beyond the estimate of \$2.6 billion in 2006 dollars.

31. As described in Chapter 2 of the Final EIS, the City has selected steel wheels operating on steel rail transit. There will be an uninterruptible power supply (UPS) at each station, with capability to energize critical systems, such as lighting and communications, for a few hours in the case of a temporary power outage. There will also be a UPS backup for the Operations Control Center (OCC) and a backup diesel generator for long-term backup of the OCC. There will also be a special connection at each station to allow for a portable generator to be used in case of a longer-term outage affecting a single station. The FTA requires that a project begin Preliminary Engineering before the Final EIS is completed. Information from Preliminary Engineering is required to assess all significant impacts that would result from project implementation.

32. In order to identify potential impacts and alternatives for the NEPA process, some level of engineering is necessary. This helps planners and FTA to identify items such as the footprint for stations and the alignment, affects on historic properties, archaeological resources, and wetlands, and noise and vibration impacts. However, this level of engineering is limited to approximately only 10 percent of the total level of engineering that would be required for a project to enter construction. The reason that more engineering is not completed until after the environmental process is to not preclude the consideration of other alternatives.

33. Chapter 6 of the Final EIS describes the needed financial resources anticipated to pay for the capital cost of the Project and for ongoing operating and maintenance costs. Capital costs of the Project, including finance charges, are expected to be fully paid for by a combination of FTA Sections 5307 and 5309 New Starts Funds from the Federal government and the GET surcharge revenues collected from 2007 through 2022 on Oahu. Operating and

maintenance costs will be paid for using the same sources currently used for TheBus—Federal funding, fare revenues, and City revenues from the General and Highway Funds.

34. *As described above, the Managed Lane Alternative was evaluated in the Alternatives Analysis Phase and demonstrated to be less effective than a Fixed Guideway Alternative.*

Section 9

1-11 and a. *With the Project, as stated in Chapter 3 of the Final EIS, the rate of transfers would be higher than under the No Build Alternative due to proposed changes in local bus service to maximize access to the fixed guideway system. However, because of the high frequency of the fixed guideway service (three-minute headways between trains during peak periods), riders transferring from buses to the fixed guideway will experience minimal wait times. Riders transferring from the guideway service to buses will benefit from improved frequencies on existing bus routes serving stations. Also, several new routes with high frequencies will be provided as feeders to the guideway system. Since these routes will primarily operate in residential areas, they will provide greater reliability versus routes operating along congested arterials. The travel demand forecasting model includes a time penalty for transfers. Ridership forecasts increase 44 percent over the No Build Alternative despite a higher rate of transfers. While people typically try to minimize transfers on any trip, the more fundamental criterion for making a trip decision is how long the trip takes. Rail will offer people a shorter overall trip time compared to other options even with the transfers, as noted in Section 3.4.2 of the Final EIS.*

12. *As stated in Section 3.4.2 of the Final EIS, for those leaving stations in the a.m. two-hour peak period (usually around 7 a.m. to 9 a.m.), most people walk, particularly at stations with large employment concentrations. Table 3-20 of the Final EIS shows the mode of access information for each fixed guideway station.*

13. *The fixed guideway system will directly serve the Airport. As shown in Table 2-7 of the Final EIS, trains will serve stations every 3 minutes during peak periods and up to every 10 minutes during off-peak periods.*

14. *As stated in the Alternatives Analysis Report and Section 2.2.2 of the Final EIS, enhanced bus service was examined during the Alternatives Analysis and rejected because this alternative would not have improved roadway congestion.*

15. *Tourist use of rail with luggage is estimated to be very low. Other tourist use, such as shopping or visiting sites of interest, would represent about 7 percent of total usage. As stated in Chapter 3 of the Final EIS, approximately 9,900 visitors will use the fixed guideway daily of which 1,800 are to or from the airport.*

Section 10

1. *This comment is not related to the environmental analysis of the Project.*

2. *The Managed Lane Alternative was evaluated in the Alternatives Analysis phase and demonstrated to be less effective than a Fixed Guideway Alternative for reasons previously*

explained. Reduced traffic congestion as a result of the fixed guideway compared to the No Build Alternative will result in improved operations for roadway users.

3. Rail transit will be provided by DTS or their selected operator. As stated previously, though transit strikes in Honolulu have been infrequent, labor unions can be expected to be part of the operation of the system, so there is the possibility of a work stoppage. However, that does not obviate the benefit of the Project.

4. An increase in the bus fleet was addressed in the Alternatives Analysis Phase under the TSM Alternative, as noted in Chapter 2 of the Final EIS. It did not improve conditions because of existing congestion on the highway system and was eliminated from further consideration in favor of the fixed guideway that is the subject of the Final EIS.

5. Such express bus service fails to serve any intermediate points. Additionally, if any portion of the bus trip is within mixed traffic flow, travel time reliability is less than an exclusive right-of-way fixed guideway system.

6. There is no indication that damage to a fixed guideway would be any more difficult to repair than to an elevated roadway/busway.

7. For a high-volume transit system, operating costs are higher per passenger for bus compared to rail service. The greatest cost of transit is the labor cost, which is higher for buses than rail. Rail systems are less expensive to operate than bus systems on a per-passenger-mile basis according to the Transportation Energy Data Book of the Department of Energy.

Section 11

Description

1. The HOT lanes were addressed in the Alternatives Analysis Phase (described as the Managed Lane Alternative) and rejected as providing less benefit as compared to the fixed guideway. The summary of that finding is presented in Chapter 2 of the Final EIS, and is addressed in General Comments of this letter.

2. The Project is a 20-mile fixed-guideway system that extends from East Kapolei to Ala Moana Center and includes points in-between.

Cost

3. The Final EIS analyzes the fixed guideway project. The HOT lanes were addressed in the Alternatives Analysis (described as the Managed Lane Alternative) and rejected because it provided less benefit compared to the fixed guideway. The summary of that finding is presented in Chapter 2 of the Final EIS. The \$1 billion construction cost figure is not consistent with the results of the Alternatives Analysis. The Alternatives Analysis estimated the cost of the managed lane in Honolulu at \$2.6 billion. This cost was verified by HDOT and others familiar with Hawaii and HOT projects. The HOT facility could qualify for some Federal funding from highway sources, but it is not eligible for the funds available to the fixed guideway project.

4. The capital plan for the Project is presented in Section 6.3 of the Final EIS, including a description of the amount of funding anticipated from various sources. Section 6.6 of the Final EIS describes risks and uncertainties associated with these funding assumptions. While Federal funds are not guaranteed until Congress acts to allocate them, the completion of the environmental process and approval of a Record of Decision indicates that a project may be eligible for Federal funding, if it meets the specific requirements as identified in the Safe, Accountable, Flexible, Efficient Transportation Equity Act, a Legacy for Users (SAFETEA-LU). FTA has given no indication that they will not fund the Project at the levels requested.

Traffic

5. While managed lanes would have reduced congestion on parallel highways, system-wide traffic congestion would have been similar to the No Build Alternative as a result of increased traffic on arterials trying to access the facility. Total islandwide VHD would have increased with the Managed Lane Alternative as compared to the No Build Alternative, indicating an increase in system-wide congestion as shown in Chapter 2 of the Final EIS.

6. Conditions on the highways will be worse in 2030 under any circumstances, regardless of which solution is applied. Vehicle Hours of Delay is expected to increase from 71,800 in 2009 to 104,700 in 2030 under the No Build Alternative. With the fixed guideway system, total islandwide congestion (as measured by VHD) would decrease by 18 percent to 85,800, compared to the No Build Alternative (Figure 3-14 in the Final EIS). In addition, traffic volumes were studied at various screenlines in the study corridor. The travel demand forecasting model was used to forecast traffic volumes at these screenlines in 2030, both with and without the Project. Analysis revealed that traffic volumes at these screenlines will decrease up to 11 percent with the Project during the a.m. peak hour (Tables 3-9 and 3-10 of the Final EIS). These tables show an improvement in conditions on the H-1 Freeway with the Project compared to No Build conditions.

Energy Savings

7. As stated in the Alternatives Analysis Report and Chapter 2 of the Final EIS, energy consumption would have been the highest with the Managed Lane Alternative. The higher energy use is due to the additional vehicle trips that would occur with this Alternative.

8. As stated before, the Final EIS indicates that the Project will reduce energy consumption by about 2,000 MBTUs over the No Build. The result is also noted in Section 4.11 of the Final EIS. This represents about 15,000 gallons of fuel saved per day. Alternative energy sources, such as photo-voltaic cells, can be built into the rail system at stations and facilities. As the development of alternative energy sources evolves on the island, HECO will generate more electric power from renewable sources, which will contribute to a greener use of energy by the Project.

Environment

9. The Managed Lane Alternative was fully evaluated in the Alternatives Analysis and demonstrated to be less effective than a Fixed Guideway Alternative. All alternatives, including the No Build Alternative, include trade-offs between benefits and impacts. As stated in

Chapter 2 of the Final EIS, the Managed Lane Alternative would have generated the greatest amount of air pollution, required the greatest amount of energy for transportation use, and would have resulted in the largest number of transportation noise impacts of all the alternatives evaluated.

10. To paraphrase from Section 4.6.3 of the Final EIS: The transit facility is not expected to be a visual or physical barrier in most neighborhoods; the Project will not substantially change development patterns, although it may change the character of development along the alignment. The Project will provide a reliable and efficient travel mode for accessing the region's current and future jobs, shopping, and social resources, particularly those in Kapolei and Downtown. This increase in mobility for neighborhood residents will generally improve the quality of life, especially those with limited financial resources and those who may be transit dependent.

The Project is a little over 20 miles long, and noise levels are lower than for a bus 50 feet away from a sensitive noise receptor (see Section 4.10 of the Final EIS). In most of the corridor, noise levels as a result of the Project are lower than existing ambient levels. There is also recognition of the visual effect of the Project in the Final EIS. The island's unique visual character and scenic beauty was considered in the visual and aesthetic analysis presented in the Final EIS. The Project will be set in an urban context where visual change is expected and differences in scales of structures are typical. The measures included with the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates can be found in Section 4.8.3 of the Final EIS under the heading Design Principles and Mitigation. Specific environmental, architecture and landscape design criteria are listed and include various treatments of the guideway and columns, landscaping, etc.

Ridership and Capacity

11. The TSM Alternative had a larger number of daily transit trips (243,100) than the No Build Alternative (232,100) and less than the Fixed Guideway Alternative (281,900), as shown in Table 2-2 of the Final EIS.

12. Figure 3-11 of the Final EIS shows that the fixed guideway will increase the transit mode share for home-based work trips during the a.m. two-hour peak period (approximately, 6 a.m. to 8 a.m.). As shown in Figure 3-11, for many travel markets, the transit share of trips under the Project will double or triple the share occurring under the No Build Alternative. For example, the commute-to-work transit share of the Kapolei to Downtown Honolulu travel market would increase from 23 percent under the No Build Alternative to 60 percent under the Project. In other words, more than half of the people going from Kapolei to Downtown to work in the morning would use transit with the Project, compared to only a quarter without the Project.

Convenience

13. HOT lanes were evaluated during the Alternatives Analysis phase as part of the Managed Lane Alternative and rejected because they did not reduce congestion as compared to other alternatives considered. As noted earlier in Section 5, Response 5, there will be more transfers with the fixed guideway, but overall travel times will be shorter because of frequency of service.

14. *With the Project, as stated in Chapter 3 of the Final EIS, the rate of transfers will be higher than under the No Build Alternative due to proposed changes in local bus service to maximize access to the fixed guideway system. However, because of the high frequency of the fixed guideway service (three-minute headways between trains during peak periods), riders transferring from buses to the fixed guideway will experience minimal wait times. Riders transferring from the guideway service to buses will benefit from improved frequencies on existing bus routes serving stations. Also, several new routes with high frequencies will be provided as feeders to the guideway system. Since these routes will primarily operate in residential areas, they will provide greater reliability versus routes operating along congested arterials. The travel demand forecasting model includes a time penalty for transfers. Ridership forecasts show an increase of 44 percent over the No Build Alternative despite a higher rate of transfers. While people typically try to minimize transfers on any trip, the more fundamental criterion for making a trip decision is how long the trip takes. Rail will offer people a shorter overall trip time compared to other options even with the transfers as noted in Section 3.4.2 of the Final EIS.*

Land Development

15. *The Project will include enhanced bus service integrated with the fixed guideway system. Alternatives that relied only on bus transit were evaluated during the Alternatives Analysis and were shown to be less effective than the Fixed Guideway Alternative. Chapter 2 of the Final EIS summarizes those findings.*

16. *Population growth is expected regardless of the Project. However, because of the Project, more development and growth is expected around station locations. From Section 4.19.2 of the Final EIS, the increased mobility and accessibility that the Project may provide would also increase the desirability and value of land near the stations, thereby attracting new real estate investment nearby. Therefore, the Project's primary indirect effect would be higher densities than presently planned or could otherwise be developed near transit stations. These land use effects could take the form of TOD or transit-supportive development (TSD). In March 2009, the City Council approved and the Mayor of Honolulu signed Bill 10 (2008) (Ordinance 09-4), which defines the City's approach to TOD around fixed guideway stations. Zoning regulations will address parking standards, new density provisions, open spaces, and affordable housing. Financial incentives could include public-private partnerships, real property tax credits, and infrastructure financing. While the Project is being coordinated with City and State agencies to encourage development of enhanced pedestrian and bicycle facilities and other land use changes near the stations, the actual construction of such facilities and zoning changes are beyond the scope of the Project. The special districts also encourage public input into the design of TOD neighborhood plans to reflect unique community identities.*

Taxes

17. *The \$1 billion construction cost figure is not consistent with the results of the Alternatives Analysis. The Alternatives Analysis estimated the cost of the managed lane in Honolulu at \$2.6 billion. This cost was verified by HDOT and others familiar with Hawaii and HOT projects during the Transit Task Force review. The HOT facility could qualify for some Federal funding from highway sources, but it is not eligible for the funds available to the fixed guideway project.*

18. Section 6.3 of the Final EIS describes the financial resources (i.e., Federal funds and General Excise Tax Surcharge) anticipated to pay for the capital cost of the Project, including finance charges. Ordinance 07-001 prohibits using real property tax revenues to pay for capital costs.

Section 12

The engineering cost estimate for a two-lane reversible managed lane facility, which was calculated following the same cost estimating process used for the Fixed Guideway Alternatives, was \$2.6 billion in 2006 dollars. The City Council's Transit Advisory Task Force reviewed the Alternatives Analysis and concluded in their report of December 14, 2006, that the assessment of each alternative was "fair and accurate" and that capital cost estimates were compiled using the same methodology and unit cost and that the construction cost estimates were fairly and consistently prepared. The Task Force also concluded that the Honolulu project is not comparable to the referenced Tampa tollway. As a point of reference, the State of Hawaii's Highway Modernization Plan, dated January 22, 2009, estimates the cost of the Nimitz Viaduct at \$600 million for a less-than 2.5-mile elevated highway.

The zipper lane was eliminated in evaluation of the reversible facility because with the additional lanes, the demand and capacity would be better balanced without the zipper lane. Implementation of the zipper lane results in the loss of two lanes of capacity in the reverse direction. By 2030, the directional transportation demand will be more balanced than it is today. Eliminating the zipper lane when evaluating the reversible Managed Lane Alternative provided the greatest benefit to modeled freeway users by increasing capacity in both directions. Stations were provided at important transfer points to maximize the benefit to transit users with destinations other than on the elevated lanes.

As described above, access ramps were provided at several locations, including Aloha Stadium and Middle Street.

Bus stations were included to provide convenient transit access to neighborhoods through which the facility would pass. Adding additional ramps to serve ground level bus stations would have dramatically increased the cost and impacts of the facility and would have reduced performance of both the facility and surrounding streets.

Section 13

As shown in Table 6-1 of the Final EIS, the estimated cost for the Project is \$4.6 billion in 2009 dollars or and \$5.5 billion in inflated dollars. The other system costs are noted. Because the costs included in your comment are not adjusted for inflation (they include costs that are more than 20 years old), a direct comparison cannot be made to the other projects mentioned in your comment.

Section 14

1. A travel forecasting model was used to forecast traffic volumes during the a.m. and p.m. peak hours in 2030, both with and without the fixed guideway system. Six screenlines (virtual lines across the corridor used to measure total travel at that point) were identified to

compare changes in traffic conditions in the corridor at the six locations. As seen in Tables 3-9 and 3-10 of the Final EIS, traffic volumes in 2030 will be better with the Project compared to the No Build Alternative. For instance, with the fixed guideway system, there is an 11 percent reduction in traffic at the Kalauao screenline in the Koko Head-bound direction during the a.m. peak hour and a 10-percent reduction in the Ewa-bound direction during the p.m. peak hour when compared to conditions without the fixed guideway.

2. In "Chapter 2—Alternatives Considered" of the Alternative Analysis report, November 2006 and summarized in the Final EIS—two options were considered for the Managed Lane Alternative: a Two-direction Option and a Two-lane Reversible Option. Both Managed Lane Alternatives "would have provided a two-lane elevated toll facility between Waipahu and Downtown Honolulu, with variable pricing strategies for single or low occupant vehicles to maintain free-flow speeds for transit and high-occupancy vehicles (HOVs)." The Two-direction Option would have served express buses operating in both directions during the entire day. To maintain free-flow speeds in the Two-direction Option, it may be necessary to charge tolls to manage the number of HOVs using the facility. For the Two-lane Reversible Option, three-person HOVs would be allowed to use the facility for free, while single-occupant and two-person HOVs would have to pay a toll. The Two-lane Reversible Option was found to be the most optimal of the Managed Lanes Alternative options, but it was shown not to be the best alternative when compared to the fixed guideway.

3. As stated in Chapter 2 of the Final EIS, while this alternative would have reduced congestion on parallel highways, system-wide traffic congestion would have been similar to the No Build Alternative as a result of increased traffic on arterials trying to access the facility. Total islandwide VHD would have increased with the Managed Lane Alternative compared to the No Build Alternative, indicating an increase in system-wide congestion (Table 2-2 of the Final EIS).

4-6. As stated previously, energy use would be the highest with the Managed Lane Alternative. HECO is moving toward renewable energy generation. As that happens, the fixed guideway will also benefit from such new sources of energy. In addition, the Department of Energy publishes statistics for average transit rail energy consumption (2,784 BTUs per passenger mile), cars (3,512 BTUs per passenger mile), and transit buses (4,235 BTUs per passenger mile). Based upon these figures, transit trains are a more energy-efficient mode of transportation than passenger cars or transit buses. As the Department of Energy advises, great care should be taken when comparing modal energy intensity data among modes. Because of the inherent differences among the transportation modes in the nature of services, routes available, and other additional factors, it is not possible to obtain truly comparable national energy intensities among modes. These values are averages, and there is variability within modes.

7-9. As mentioned in Chapter 2 of the Final EIS, transit reliability would not have been improved except for express bus service operation in the managed lanes. While this alternative would have slightly reduced congestion on parallel highways, system-wide traffic congestion would have been similar to the No Build Alternative as a result of increased traffic on arterials trying to access the facility. Total islandwide VHD would have increased with the Managed Lane Alternative as compared to the No Build Alternative, indicating an increase in system-wide congestion (Table 2-2 of the Final EIS). Furthermore, the managed lanes alternative would not

have been significantly less costly than fixed guideway and would have been unable to encourage the type of compact growth desired in the corridor.

10. *As mentioned in the Executive Summary and Chapter 2 of the Final EIS, the Managed Lane Alternative would have provided less of a transit benefit at a higher cost than the Fixed Guideway Alternative. The Fixed Guideway Alternative will be more cost effective in the long run. In the "Summary—Funding Options" section, funding sources for the capital investments associated with the fixed guideway include a State GET surcharge, City general obligation bonds, and FTA funds. Only the Fixed Guideway Alternative could be funded with the GET surcharge. As noted in Chapter 6 of the Final EIS, the GET is expected to generate \$3.5 billion through 2022 and the FTA has agreed to consider at least \$1.55 billion for the Federal contribution to the Project through the New Starts program for the Fixed Guideway. The Alternatives Analysis indicates that toll revenues from the Managed Lanes Alternative, if high enough, would pay for ongoing operations and maintenance while any remaining toll revenues, supplemented by other revenues, would be used to repay debt incurred to construct the system.*

11. *As shown in Chapter 2 of the Final EIS, November 2008, the Managed Lane Alternative would have provided little community benefit, as it would not have resulted in substantially improved transit access in the corridor. This alternative also would not have supported planned concentrated future population and employment growth because it would not provide concentrations of transit service that would serve as a nucleus for TOD.*

12. *The purpose of the Project, as established in Section 1.8 of the Final EIS, is to provide high-capacity rapid transit in the highly congested east-west transportation corridor between Kapolei and UH Manoa. In Section 1.9, goals include: improve corridor mobility, corridor travel reliability, access to planned development, and transportation equity.*

13. *Chapter 6 of the Final EIS describes the financial resources anticipated to pay for the capital cost of the Project and for ongoing operating and maintenance costs. Capital costs of the Project, including finance charges, are anticipated to be fully paid for by a combination of FTA Section 5309 New Starts and FTA Section 5307 Funds from the Federal government and revenues from the County General Excise Tax Surcharge levied from 2007 through 2022 on Oahu. Section 6.6 of the Final EIS describes risks and uncertainties associated with these funding assumptions. Chapters 3 and 4 of the Final EIS discuss the effects of the Project on the transportation system and natural and built environment.*

14. *Chapter 1 of the Final EIS indicates that 69 percent of the islandwide population and 83 percent of employment will be located within the corridor in 2030. Many are much closer than that. Ridership forecasts of over 116,000 trips a day indicate service will reach a broad base of the population and carry high percentages of trips during the peak travel times when it is most needed. For example, over 30 percent of work trips to Downtown Honolulu will use transit with the implementation of the Project. NEPA (40 C.F.R. Part 1506.6) requires public involvement as part of the environmental impact statement process. The public involvement program is designed, as required by NEPA, to engage the public in as many ways as practical. This program for the Project has been comprehensive in sharing information with as many people as possible. Other assertions about travel behavior in your comment are inconsistent with the findings in Chapter 3 of the Final EIS related to transit ridership.*

Mr. Dennis Callan
Page 36

15. *The Project provides an alternative to the travel condition noted in your comment. The fixed guideway does not require driving into the sun in either direction. The Project would result in decreased congestion compared to the No Build Alternative, making travel more reliable for emergency vehicles than with the No Build Alternative.*

16. *Your preference for elevated lanes is noted.*

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Submission Content/Notes : The reason so few have input at this stage is because our voices will not be heard. This administration is arrogant and a bully and has demonstrated this from day one regarding the rail. Mufi's "my way or the highway" prevails and no amount of discussion will change that. That is why he did not get my vote or ever will for that matter. The rail cost is too expensive for the few taxpayers of this island. No one in their correct mind has ever started a rail system from its' farthest point out in the hopes it would someday reach the city. Absolutely amazing and ridiculous. The mayors' reply? "There are too many potential lawsuits in Waikiki" and so these will magically disappear by starting at the opposite end? Zero logic, zero sense. No connection to the airport? Again, what modern city did not connect their rail to the airport and/or train stations? Now this administration has gained full control over the bidding, so as in the beginning, all of the mayor's friends, family, and campaign contributors will get the contracts and we the taxpayers will foot the bill. It smells of corruption. This boondoggle will not be completed on time nor on budget nor do Hawaii's workers have the training, talent, or desire to build this with quality. It took DOT 12 months to identify one single buried cable near Pearl Harbor that cost an additional \$1 million dollars to the taxpayers. One cable, one year. By comparison, St. Paul MN rebuilt their massive multilane bridge over the Mississippi in 13 months. Here, 12 months just to identify one cable. At that rate this rail should be done by the next century. Track record? Look at H-3... I believe that short stretch of highway took 37 years. Not exactly speedy construction histories for Hawaii. Electricity? How is this administration going to keep the electric cables in the ground when according to DOT, they presently cannot figure out how to keep the wiring for the lighting for H1 in the ground. It is going on 3 years now and H1 is still dark. Is the rail going to sit for 3 years too without electric while DOT does nothing? And you wonder why no one bothers giving you folks input...what would be the point? What is needed is an in depth Federal investigation and oversight into this Administration, its' bidding processes, and the rail planning or lack of it. There is no other label for this project than boondoggle. Period.

Dear J. Such:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As described in Section 2.5.10 of the Final EIS, to support phased opening of the system, the first construction phase must be connected to a maintenance and storage facility, which requires considerable land. The first phase of the Project must be connected to the maintenance and storage facility because, in addition to maintenance of equipment and ongoing operations, the maintenance and storage facility houses the main control center for the entire Project, and the required testing and operation of the system could not be completed without access to it. No location has been identified closer to Downtown with sufficient available land to construct a maintenance and storage facility. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations*
- *Reduce the time that each area will experience traffic and community disturbances*

- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding*
- *Match the rate of construction to what can be maintained with local workforce and resources*
- *Balance expenditure of funds to minimize borrowing*

The portion of the corridor Ewa of Pearl Highlands is less developed than the areas Koko Head. Right-of-way can be obtained more quickly; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted Koko Head from Pearl Highlands to Aloha Stadium, then Kalihi, and finally to Ala Moana Center.

The Preferred Alternative includes a connection to the Airport. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS.

Lastly, in answer to your concern about electric cables in the ground, the power coupling to the vehicles will be via a third rail located on the elevated guideway. The third rail will not be accessible to the public. The Federal Transit Administration is providing project management oversight, as indicated in Figure 2-1 of the Final EIS.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Submission Content/Notes : I thought about it for quite some time and considered input from friends, neighbors, and strangers. This project should have been started years ago. There remains a problem, the route is impractical, it should be changed before time and money are wasted. Thousands of commuters travel from areas like Waianae and Kahuku travel as far a Honolulu to work. The routes should at least start in these locations and end a practical transit area outside of Honolulu where a major "Bus" depot is. Another idea is to connect Ewa Beach to Honolulu.(build a &#x26; bridge) If national security is an issue then at least ask the Government. All they can say is no.

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As outlined in Section 1.1 of the Final EIS, there have been several prior attempts to develop a rail transit system in Honolulu. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were

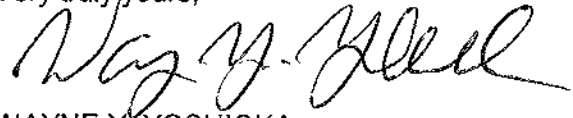

in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The areas listed in the comment will be served by local feeder bus service that will integrate with the fixed guideway system. Waianae and Kahuku will be served by local feeder bus service that will integrate with the fixed guideway system. Appendix D of the Final EIS presents information on future bus routes and frequencies.

As described in Chapter 2, a Pearl Harbor crossing was evaluated and eliminated by the Oahu Metropolitan Planning Organization (OahuMPO) as part of the regional planning process.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Submission Content/Notes : I have been commuting from Mililani to town for the last 25 years. Although I am against the rail and voted accordingly, if the City does move forward, I believe that the first segment should NOT be from Kapolei to Waipahu. This is the most stupidest thinking I have seen yet. What were the transportation planners thinking!!! The route should be from the center core Honolulu outward. For there to be any significant impact in the early stages, it is to take traffic out of the Pearl City to Honolulu segment. How the planners cannot think of this logical aspect is astounding! What will the Kapolei to Waipahu segment buy us, when everyone is trying to get into town? Do you expect the leeward folks to ride the rail from Kapolei to Waipahu and then catch the BUS into town? Come on, where is the logical thinking on this. Lets do whats right and not do the stupid thing just because it was planned that way. The City should think smarter with our tax dollars.

Dear Mr. Suwa:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- *Reduce the time that each area will experience traffic and community disturbances.*

- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*
- *Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- *Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

The Airport Alternative is the Preferred Alternative in the Final EIS. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses comments regarding the above-referenced submittal:

As stated in Chapter 3 of the Final EIS, each station will have facilities for parking bicycles. Bicycles will also be allowed on trains, as regulated by a bicycle policy. This policy will be determined at a later time prior to the opening of the fixed guideway system.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Issuance of the Record of Decision under NEPA and acceptance of the Final EIS by the Governor of the State of Hawaii are the next anticipated actions and will conclude the environmental review process for this Project.

Very truly yours,

Submission Content/Notes : Aloha,

Even though I do not live on the leeward side of Oahu, I support the Draft EIS in its entirety and feel the steel on steel rail transit system should be built as soon as possible from Kapolei through the airport to Ala Moana Center.

I can see myself catching the bus to Ala Moana Center and riding the rail transit to Kapolei and back in the event I get a job or move out to that area.

Thank you for your time.

Aloha,
Paulette A. Tam

Dear Ms. Tam:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

Your preference for the Airport Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more

Re: Salt Lake vs. Airport routes.

08 NOV 24 P1 31
DTS
RAPID TRANSIT

1. Go to both places.

a. There are supporters for both routes. Enough to say support justifies spending 1/2 \$ Billion. or whatever to cost.

b. Go cost less if you go both places in the same phase instead of later as a spur.

2. Get one uddah reason. To change, go Airport and tell Pomy and Salt Lake Tough shit go convince more of us to not trust Mufi and his cabinet. Even the guys who stay stuck selling this outrageously expensive project. Who are civil Service.

3. How long you think people go accept governments telling us "Life is not fair, suck it up and shut up"?
RoyalKenna
NO MO DBUS SERVICE! Now we gotta pay even more taxes to get NO SERVICE?! (For Rail)

COMMENTS OF MARK TAYLOR ON
DRAFT ENVIRONMENTAL IMPACT STATEMENT
FOR HONOLULU RAIL TRANSIT PROJECT
December 9, 2008

Thank you for the opportunity to submit comments on the Draft EIS for the Honolulu Rail Transit Project. My name is Mark Taylor. I reside in the Salt Lake neighborhood of Honolulu and served from 1993 to 2007 as an elected member of the Aliamanu-Salt Lake-Foster Village Neighborhood Board.

I have three comments on the Draft EIS.

First, the opening paragraph of section 6.4.2 of the Draft EIS (entitled "Project Cash Flow") states that both the "Salt Lake and Airport Alternatives would be financially feasible." Yet this same paragraph states that the Airport Alternative would require \$1.4 billion in Federal funding, and that the FTA "has not been approached to consider the \$1.4 billion for the Airport Alternative."

Given that there is no indication that Federal funding at the \$1.4 billion level will even be considered by the FTA, how can the Draft EIS state conclusively that the Airport Alternative is "financially feasible"? Unless and until the FTA indicates in writing that it is willing to consider providing \$1.4 billion, the EIS should state that the Airport Alternative has not been shown to be financially feasible. To do otherwise is misleading and invites a fiscally imprudent policy decision on the initial transit alignment.

Second, Table 7-2 of the Draft EIS (entitled "Effectiveness of Alternatives in Improving Corridor Mobility") contains figures that appear questionable, if not incorrect.

- The table indicates that Transit Ridership in 2030 will be only 1% higher for the Airport Alternative than for the Salt Lake Alternative. Yet, it also indicates that Transit User Benefits will be 5% higher for the Airport Alternative than for the Salt Lake Alternative. This significant inconsistency should be either corrected or fully explained.
- The Airport Alternative's purported 5% advantage in Transit User Benefits equates to reduced travel time for all transit users of 800,000 hours per year compared to the Salt Lake Alternative. Yet, the Draft EIS indicates the Airport rail route actually takes longer to traverse than the Salt Lake rail route. In fact, assuming half of projected daily rail trips in 2030 include the portion of the system between Aloha Stadium and Middle Street, the Airport Alternative will increase travel time for rail users by over 500,000 hours per year¹. How can the Airport Alternative *decrease* travel time for *all* transit users by 800,000 hours per year when it *increases* travel time for *rail* transit users by 500,000 hours per year? Again, this significant inconsistency should be either corrected or fully explained.

Third, Table 7-7 of the Draft EIS (entitled "Cost-effectiveness of the Build Alternatives") indicates the Salt Lake Alternative is more cost-effective than the Airport Alternative, but only by a small margin. The figures in this table are derived by dividing the cost of the system under each build alternative by the number of hours of Transit User Benefits it produces. Therefore, if in fact there are any revisions to the Transit User Benefits in Table 7-2 in light of the discrepancies identified above, Table 7-7 should also be revised to reflect the impact on the relative cost-effectiveness of each build alternative.

Thank you again for the opportunity to comment.

¹ 90,000 projected daily trips multiplied by 1/2, multiplied by 2 minutes longer per trip, multiplied by 365 days per year, divided by 60 minutes per hour, equals 547,500 hours.

Dear Mr. Taylor:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The statement in the Draft EIS was correct at the time it was written, namely that "FTA has agreed to consider a funding request of \$1.2 billion but has not been approached regarding a higher level." FTA has now been approached about a higher funding level recognizing the Airport Alternative's higher cost. The higher number of \$1.55 billion is reflected in Chapter 6 of the Final EIS. The level of Federal funding described in the Final EIS is based on discussions with FTA about a reasonable level of support. While indications are positive, an official FTA commitment cannot be made until Congress acts to approve the Project's appropriation in a Full Funding Grant Agreement. Section 6.6 of the Final EIS describes the risks and uncertainties associated with project funding.

Transit-user benefits, which are a measure of time and costs saved, include both those that accrue to new riders as well as those that accrue to existing riders. Because the majority of

Mr. Mark Taylor
Page 2

benefits accrue to existing riders, the ratio of total user benefits for the Airport Alternative compared to the Salt Lake Alternative is greater than the ratio of total transit riders for the Airport

Alternative compared to the Salt Lake Alternative. There are more people using the fixed guideway destined to the activity centers on the Airport Alternative alignment (mostly employees) than there are people starting in the Salt Lake area (mostly residents).

All transit users are not equally affected by the differences between the Salt Lake and Airport alignments. The rail in-vehicle time for a trip from East Kapolei to Ala Moana Center is two minutes longer for the Airport Alternative than for the Salt Lake Alternative. Thus, transit travelers making that trip lose time benefits with the Airport Alternative as compared to the Salt Lake Alternative. In addition, because of the longer travel time, there are somewhat fewer transit trips forecast between, for instance, Kapolei and Ala Moana Center for the Airport Alternative than for the Salt Lake Alternative (compare Tables 3-25 and 3-39 in the Travel Forecasting Results Report). However, the Airport Alternative serves other markets substantially better than the Salt Lake Alternative, such as Ewa or Kapolei to Pearl Harbor or the Airport, resulting both in more transit riders and shorter travel times for existing transit riders. In summary, the Airport Alternative, even though it has a slightly longer rail travel time from end to end than the Salt Lake Alternative, results in forecast increases in total transit trips (of 1 percent) and in fixed guideway riders (of 8 percent) because it serves different markets.

User benefits presented in the Draft EIS are correct. There is no change in the relationship between the Salt Lake and Airport Alternatives cost-effectiveness ratios. Further refinement to the travel forecast model since the Draft EIS was published has lowered the cost-effectiveness ratio for the Airport Alternative in the Final EIS.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

5
Fiji: *next page. Apart from that, Happy Holidays,

A Leaderless Rall to Nowhere

Mufi says his electric train set is better than Ann's Lego-bus-bridge, a bridge that creates an bus-exclusive new H4, like H3 with no exits, from Ewa to Downtown. When will our elected leaders give us leadership with insight, rather than propose compromised either/or choices on the issue of transportation?

Dean Uchida in last Sunday's opinion piece (Star-Bulletin, p. E3) states, "the underlying issue is growth, not traffic." More specifically, it's land use, not traffic.

What makes the issue so compromised results from the fact that the O'ahu land holders come in two main categories: (1) Individual ownership in fee simple and (2) Trust ownership held exclusively by trustees for the common use of others (Federal Lands) and/or parceled out for individual use through leaseholds (Kamehameha Schools Trust, O.H.A., Public Lands). The first relates to lands that most would call, "private property" where the owners can sell it, like any other commodity to anyone else they please. The second form of land holding *in toto*, consists of property held in common for the benefit of a group of people and cannot be privatized to individuals by sale except under circumstances defined in the trust.

Nine percent of the level, arable land in the state of Hawai'i remains in the control of the Kamehameha Schools' Trust (The heir of Bernice Bishop's conveyance of all the "Royal Lands" to the benefit of the native Hawaiian peoples and their descendants.) Add to this the Office of Hawaiian Affairs lands, and those held by the State and the City and County of Honolulu, we can see that much, if not most all of the land in Hawai'i is held as a public trust for everyone or for all Hawaiian descendants and their *ohanas* collectively. Therefore, in no small measure, the common good of the Hawaiian people and the other citizens of the State and City and County of Honolulu should determine the optimal form of public transportation. Instead, they shift its cost to the tax base and declare it a universal benefit to all residents.

What confuses the matter are the large royal tracts of land that king's conveyed to relatives or retainers for exceptional service to the crown.

Unlike Mr. Bishop, who re-conveyed all of the remaining Royal Lands into a trust for the benefit of the native Hawaiians upon his wife's death and returned to live out his remaining years in San Francisco, others did not follow his example.

The beneficiaries of the Campbell Estate, for example, who had intermarried and became descendants of Prince Kuhio, held on to their large West O'ahu land holdings in a trust until 2007 when it was converted in a private family-owned corporation.

When it became no longer profitable to cultivate sugar cane and pineapple on these plantation plots, the beneficiaries sought to make the most of their privatized inheritance by converting the lands into residential housing sites. They pulled out the cash crops and planted individual fee simple single family homes that created a huge cash return and the suburban sprawl we now see from Waipahu to Kapolei.

To get past the federal lands held exclusively by the U.S. military in Pearl Harbor and south from Wahiawa, a narrow corridor of concrete was paved, and then expanded into the H1 freeway. Access to West O'ahu was assured. Development could move forward.

With the admission of Hawai'i in the United States as a state, the large landed estates became anomalies in the fee simple world of U.S. real estate. With the death of James Campbell's last surviving daughter, Beatrice Wrigley in 1987, the estate had twenty years, according to Campbell's will, to dissolve the trust and redistribute itself to its surviving heirs. The Campbell Estate thus expired in 2007. Rather than kill "the goose that laid the golden eggs," it was incorporated into the James Campbell Co. LLC. Most of the beneficiaries, thirty-one family members, became shareholders in the new company. Now the problem compounds. The new company secured \$645 million in debt financing in 2007 to create the new company and to fund its future investments.

From 1987 to 2007 the rush was on to develop more residential housing leaving it to the new owners to create the infrastructure as the needs arose. Now the company faces a cloudy financial picture given the collapse of the national financial system and the freezing of credit for housing. They hold a lot of debt with

a reduced income stream and a large chunk of undeveloped land that must be sold to have value.

To cover its maturing debts and to protect its developed assets in a depressed housing market devoid of easy credit, the company will probably have to sell a lot of raw land to just cover its current debt obligations in an attempt to realize its master development plan. The free market may cause the re-conveyance of these privatized lands to those who still have the cash and the duty to serve the common good: the Kamehameha Schools' Trust, the O.H.A., and the State of Hawai'i (We can buy Turtle Bay, can't we?) and the City and County of Honolulu (How much do we plan to pay for rail right-a-ways?).

Let the market set the price and, therefore, the tax rate on the land. With a little patience and with regular purchases, these four agencies should be able to acquire large tracts of undeveloped land in West O'ahu by 2010. The general public should be rewarded with a combined total of thousands of acres of new lands that can be converted to agricultural use and greater food independence (if not total self-sufficiency) without having to use the right of eminent domain to acquire them. (Energy independence is not our only common need.)

Now, all this raises the question: What would our transportation system look like given these new circumstances:

1. We have a lot of West O'ahu homeowners living in devalued homes with special needs that we need to accommodate.
2. We need to design a diversified crop and fruit tree development that can yield three harvests annually for all available lands.
3. We need to bring workers directly--non-stop--to their places of work at low cost and reduce road traffic congestion.
4. East O'ahu homeowners also suffer from unmet transportation and infrastructure needs as West O'ahu, we must identify and equitably resolve these urban dysfunctions.

Rather than explain and expand on my own perspectives, however, I want my elected and wanna-be leaders to focus on and to respond to these four areas of concern. If they cannot: Do Not Vote for them.

If you are as frustrated as I am by the ineptitude to act insightfully and to resolve pressing social needs, may be you and I should start talking with our friends and neighbors to craft our own solutions and cause our elected leaders to follow our lead.

2008, as it turned out, is a Jubilee Year. Those with integrity, ethical insight and compassion for strangers will be rewarded whenever their proposals practically and for the better resolve some of our most currently compromised needs.

We should do that and not try to say an electric train solves these problems nor a non-stop bus ride to Downtown makes life better for all in O'ahu. It's inadequate leadership on a rail.

CHRISTMAS 2008

Married at 30; still together at 70.

After the completion of the condo remodel--an even more trying joint-venture--we pulled ourselves together and set off to celebrate our 40th wedding anniversary where it all began. This time, we returned to visit persons and places as members of the senior generation: Time had not stood still.

At the end of May, we left Lars (34), our youngest son, the Academy of Art guard, in Honolulu and commenced our two-month odyssey into our shared past. We started with our most recent memories among friends in Petaluma, CA; classmates at Princeton, NJ, and former roommates in the Washington, D.C. area. Then back to Europe and our families' origins.

First, to Paris, our honeymoon destination, among friends and family and on to Holland among Dutch friends and Feldbrugge cousins. (Breaking the pattern, we made a five-day detour among strangers to Prague.)

We picked up the family trail again in Sweden among the Tellander family cousins before returning to Boston where Erik (37), our oldest son, the architect [Wm. Rawn, Boston], picked us up and drove to his "new" (1801 A.D.) colonial manse on the Common in Amherst, NH. Here we got reacquainted with our grandchildren, Maja (5) and Nils (3) and our daughter-in-law, Lisa (37) and her visiting Housman parents, Ted and Margaret (Cape Cod), and sister, Karen (Singapore). (All of these members of our immediate and extended family will be coming to Honolulu for this Christmas and NEW year.)

We flew from New York City in separate airplanes: Marlise to Honolulu and Bob to Los Angeles, CA to visit his brother, Jack (75), in his nursing home in Santa Monica, CA and then home to Honolulu.

To see glimpses of what we saw, come visit us in Hawaii so you can show us what we missed while we were away from you. Let's have a happy NEW year! With all those we still know and love.

Mr. Robert Tellander
2015 Ala Wai Boulevard
Apartment 8C
Honolulu, Hawaii 96815

Dear Mr. Tellander:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

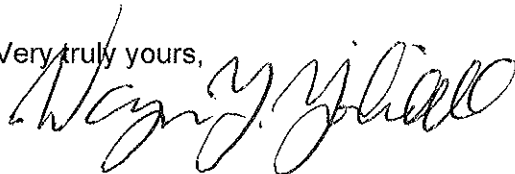

Your comments have been noted. The Project will provide direct transit access to several major employment areas in Honolulu. As indicated in Figure 3-7 in the Final EIS, transit travel times will be considerably less with the Project during commute periods (a.m. peak period) compared to existing conditions and future 2030 conditions without the Project.

As indicated in Section 1.7 of the Final EIS, the purpose of the Project is to provide high-capacity rapid transit in the transportation corridor between Kapolei and UH Manoa. The Project described in Chapter 2 of the Final EIS will serve the corridor between East Kapolei and Ala Moana Center via the Airport. Communities in East Honolulu will still benefit with the added local bus service that will be provided to the Ala Moana Station.

Mr. Robert Tellander
Page 2

Lastly, the goals of the Project correspond to the need for transit improvements, as described in Section 1.8 of the Final EIS. Although important issues in their own right, West Oahu home values, special needs, and diversified crops are not the focus of this study. Improving transportation equity is a goal of the Project. Section 1.8 of the Final EIS includes a summary that includes workers and other commuters that need access to reliable and affordable transportation.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Subject: Honolulu City Rail Proposal

Mr. Wayne Y. Yoshioka
Department of Transportation Services
City and County of Honolulu
Honolulu Hale, 3rd Floor
Honolulu, HI 96813

Dear Wayne Yoshioka:

Thank you for taking time to read this taxpayer's view of the City's rail proposal.

As you know, this heavy rail project is the most controversial project ever undertaken in Honolulu since Hawaii became a State. And when a project is so controversial and costly (inspite of a maneuvered vote of approval) it will be plagued by unalterable problems and cost overruns FOREVER.

This Island is a fragile eco-system that should not be completely covered over in cement or it will die. The heavy rail system is designed

1/23/2009

to do just that. Each mile of it will lead an unending plethora of cement structures from one end of the route to the other. This is not right for people, land, animals, flora and fauna, or LIFE ITSELF ON THIS ISLAND.

A light rail system would suffice and not be as obtrusive, controversial, costly or destructive. Please do not bail out the unions at the expense of our fragile eco-system. Fifty years of living here tells me heavy rail is not right at all.

UA MAU KE EA O KA 'AINA I KA PONO. (The life of the land is preserved in righteousness.)

Very truly yours,

Suzanne Teller
(Mrs. Albert Teller)

Dear Ms. Teller:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

To answer your comments, each mile of guideway will include the construction of one mile of elevated structure approximately 30 feet wide and any associated stations. The majority of the area crossed is already paved, and in those locations the Project will not increase impervious surface.

The Alternatives Screening Memorandum (DTS 2006a) recognized the visually sensitive areas in Kakaako and Downtown Honolulu, including the Chinatown, Hawaii Capital, and Thomas Square/Honolulu Academy of Arts Special District. To minimize impacts on historic resources, visual aesthetics, and surface traffic, the screening process considered 15 combinations of tunnel, at-grade, or elevated alignments between Iwilei and Ward Avenue. Five different alignments through Downtown Honolulu were advanced for further analysis in the Alternatives Analysis, including an at-grade portion along Hotel Street, a tunnel under King

Street, and elevated guideways along Nimitz Highway and Queen Street (Figure 2-4).

The Alternatives Analysis Report (DTS 2006b) evaluated the alignment alternatives based on transportation and overall benefits, environmental and social impacts, and cost considerations. The report found that an at-grade alignment along Hotel Street would require the acquisition of more parcels and could potentially affect more burial sites than any of the other alternatives considered. The alignment with at-grade operation Downtown and a tunnel under King Street, was not selected because of the environmental effects, such as impacts to cultural resources, reduction of street capacity, and property acquisition requirements of the at-grade and tunnel sections, which would cost an additional \$300 million.

The Project's purpose is "to provide high-capacity rapid transit" in the congested east-west travel corridor (see Section 1.7 of the Final EIS). The need for the Project includes improving corridor transit mobility and reliability. The at-grade alignment would not meet the Project's Purpose and Need because it could not satisfy the mobility and reliability objectives of the Project (see bullets below). Some of the technical considerations associated with an at-grade versus elevated alignment through Downtown Honolulu include the following:

- **System Capacity, Speed, and Reliability**—*The short, 200-foot (or less) blocks in Downtown Honolulu would permanently limit the system to two-car trains to prevent stopped trains from blocking vehicular traffic on cross-streets. Under ideal operational circumstances, the capacity of an at-grade system could reach 4,000 passengers per hour per direction, assuming optimistic five minute headways. Based on travel forecasts, the Project should support approximately 8,000 passengers in the peak hour by 2030. Moreover, the Project can be readily expanded to carry over 25,000 in each direction by reducing the interval between trains (headway) to 90 seconds during the peak period. To reach a comparable system capacity, speed, and reliability, an at-grade alignment would require a fenced, segregated right-of-way that would eliminate all obstacles to the train's passage, such as vehicular, pedestrian, or bicycle crossings. Even with transit signal priority, the at-grade speeds would be slower and less reliable than an elevated guideway. An at-grade system would travel at slower speeds due to the shorter blocks, tight and short radius curves in places within the constrained and congested Downtown street network, the need to obey traffic regulations (e.g., traffic signals), and potential conflicts with other at-grade activity, including cars, bicyclists, and pedestrians. These effects mean longer travel times and far less reliability than a fully grade-separated system. None of these factors affects an elevated rail system. The elevated rail can travel at its own speed any time of the day regardless of weather, traffic, or the need to let cross traffic proceed at intersections.*
- **Mixed-Traffic Conflicts**—*The Project will run at three minute headways. However, three-minute headways with an at-grade system would prevent effective coordination of traffic signals in the delicately balanced signal network in downtown Honolulu. A disruption of traffic signal cycle coordination every three minutes would severely affect traffic flow and capacity of cross-streets. Furthermore, there would be no option to increase the capacity of the at-grade rail*

system by reducing the headway to 90 seconds, which would only exacerbate the signalization problem. An at-grade system would require removal of two or more existing traffic lanes on affected streets. This effect is significant and would exacerbate congestion. Congestion would not be isolated to the streets that cross the at-grade alignment but, instead, would spread throughout Downtown. The Final EIS shows that the Project's impact on traffic will be isolated and minimal with the elevated rail, and, in fact will reduce system-wide traffic delay by 18 percent compared to the No Build Alternative (Table 3-14 in the Final EIS). The elevated guideway will require no removal of existing through travel lanes, while providing a reliable travel alternative. When traffic slows, or even stops due to congestion or incidents, the elevated rail transit will continue to operate without delay or interruption.

An at-grade light rail system with continuous tracks in-street would create major impediments to turning movements, many of which would have to be closed to eliminate a crash hazard. Even where turning movements are designed to be accommodated, at-grade systems experience potential collision problems. In addition, mixing at-grade fixed guideway vehicles with cars, bicyclists, and pedestrians presents a much higher potential for conflicts compared to grade-separated conditions. Where pedestrian and automobiles cross the tracks in the street network, particularly in areas of high activity (e.g., station areas or intersections), there is a risk of collisions involving trains that does not exist with an elevated system. There is evidence of crashes between trains and cars and trains and pedestrians on other at-grade systems throughout the country (e.g., Phoenix, Houston, LA). This potential would be high in the Chinatown and Downtown neighborhoods, where the number of pedestrians is high and the aging population presents a particular risk.

- **Construction Impacts**—Constructing an at-grade rail system could have more effects than an elevated system in a number of ways. The wider and continuous footprint of an at-grade rail system compared to an elevated rail system (which touches the ground only at discrete column foundations, power substations, and station accessways) increases the potential of utility conflicts and impacts to sensitive cultural resources. In addition, the extra roadway lanes utilized by an at-grade system would result in increased congestion or require that additional businesses or homes be taken to widen the roadway through Downtown. Additionally, the duration of short-term construction impacts to the community and environment with an at-grade system would be considerably greater than with an elevated system. Because of differing construction techniques, more lanes would need to be continuously closed for at-grade construction and the closures would last longer than with elevated construction. This would result in a greater disruption to business and residential access, prolonged exposure to construction noise, and traffic impacts.

Because it is not feasible for an at-grade system through Downtown to move passengers rapidly and reliably without significant detrimental effects on other transportation system elements (e.g., the highway and pedestrian systems, safety, reliability, etc.), an at-grade system

Ms. Suzanne Teller
Page 4

would have a negative system-wide impact that would reduce ridership throughout the system. The at-grade system would not meet the Project's Purpose and Need and, therefore, does not require further analysis.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Mr. Lawson Teshima
650 Iwilei Road, Suite 415
Honolulu, Hawaii 96817

Dear Mr. Techima:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The Final EIS identifies the Airport Alternative as the Preferred Alternative. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the

Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The following paragraphs address the comments contained in your submittal:

There is, at this point, no commitment from the FTA for a specific amount of federal funding. The \$1.2 billion has been discussed in the past and now \$1.55 billion has been identified in the Final EIS and reflected in FTA's approval for the Project to enter Preliminary Engineering. These amounts have not raised major concerns from the FTA. It is a requirement for the Project to identify an anticipated federal amount in its pro forma cost analyses. The FTA will only commit the funding once the full environmental and New Starts processes have been completed. For the Project, because the percentage of local matching funds (75 percent or more) is so high compared to the average of less than 50 percent, the additional \$200 million is still well within a reasonable request.

No election-related advertising was funded by the City. Expenditure of taxpayer funds has been limited to providing factual information about the Project. Guidelines set forth by NEPA and Chapter 343 of the Hawaii Revised Statutes stipulate that public involvement be carried out on large-scale projects such as the rail project. As one of the largest infrastructure projects ever to be constructed on Oahu, the City felt that it was important to disseminate information to as many people as possible. Thus, a broad range of print and visual media was necessary to reach different population segments. Project funds paid for the public involvement activities that are listed in Chapter 8 of the Final EIS.

Chapter 6 of the Final EIS presents the current estimate of the amount of the County General Excise and Use Tax (GET) Surcharge and discusses the uncertainties associated with the estimate. The GET forecast presented in the Final EIS takes the current economic downturn into account, including lower projections of tourism over the next several years, and slower growth projections in services, contracting, and rentals. The forecast assumes that GET surcharge revenues will grow from current levels as Oahu's population and economic activity increases, and as a function of inflation over the period. The financial plan is a dynamic document that will be updated as conditions warrant. DTS will continue to monitor and update the revenue forecasts and refine the financial plan as the Project proceeds through FTA's New Starts process. As stated in Chapter 6 of the Final EIS, GET collections will raise \$3.5 billion by 2022. The Project as presented in the Final EIS does not include any proposals to exempt certain industries from taxes currently in place.

The Project as presented in the Final EIS is a rail line from East Kapolei to Ala Moana Center via Honolulu International Airport. The Project does not include rail service into Waikiki. As stated in Chapter 2 of the EIS, future extensions are planned from Ala Moana Center to UH Manoa and Waikiki. The future extensions are not part of the Project; thus, they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a federal agency. Here, because the future extensions are not proposed for implementation at this time,

Mr. Lawson Teshima
Page 3

they are not part of the Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. When the future extensions are proposed for implementation at some time in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time.

As shown in Chapter 3 of the Final EIS, the number of visitors who will use the fixed guideway is relatively small compared to other users. For example, approximately 10,000 of the 116,000 daily fixed guideway boardings will be made by visitors. Further, as shown in Table 3-12 in the Final EIS, effects on tour operators because of the Project are expected to be minimal.

The City intends to comply with 49 U.S.C. § 5323(d), which limits charter service provided by federally assisted public transportation operators. FTA regulations specify these limitations in 49 CFR Part 604, Charter Service. The City cannot engage in charter service unless permitted by FTA charter service regulations. See Circular C-9300.1B, Capital Investment Program Guidance and Application Instructions issued, November 1, 2008.

The City has no authority to dictate how the federal government chooses to award federal grant monies. Grant programs overseen by the FTA are subject to its own rules and regulations. For example, according to FTA Circular C-9300.1B, the Bus and Bus-Related Facilities portion of the Capital Investment Program (Bus Program) is available to states and local governments, as well as sub-recipients, such as public agencies, private companies engaged in public transportation, and private non-profit organizations, are eligible to receive funds under the Bus Program. Whether Polynesian Hospitality qualifies for the Bus Program would depend on whether it meets these and other requirements under appropriate federal rules and regulations.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

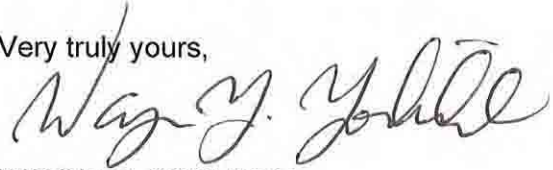

Chapter 6 of the Final EIS describes the funding sources anticipated to be used to pay for the capital costs of the Project and the City's overall public transportation system. Capital costs of the Project, including finance charges, are expected to be fully paid for by a combination of FTA Section 5307 and FTA Section 5309 New Starts funds from the Federal government and the County's General Excise and Use Tax Surcharge levied from 2007 through 2022. Section 6.4 of the Final EIS describes the funding sources to pay for ongoing operations and maintenance costs associated with maintaining the transit system in a state of good repair. Operating and maintenance costs will be paid for from the same sources currently used for TheBus, which includes Federal funding, fare revenues, and subsidies from the General and Highway Funds.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the

Mr. Robert Thomas
Page 2

Project website at www.honolulustransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Submission Content/Notes : Dear Sir or Madam,

I am a 23-year old student writing you from Bremen, Germany, where I study geography at the local university.

I think it is excellent that the Honolulu rail transit project has been approved by the voters.

I lived and went to high school (McKinley) in Honolulu for a total of 1,5 years. So I am well aware of the traffic problems the city and residents have to face everyday.

Being an experienced rail-rider and a fan of rail-based mass-transit, I strongly believe that bringing rail transit to Oahu will be a successful project.

This Christmas I will be in Honolulu for a period of three weeks. And my question is now, if is any opportunity to some volunteer-work at your agency while I am there.

That would be a great way for me to gain some experience abroad as plan to make my living later on by promoting and planning rail-based transit in the US.

And may be you could even benefit from me being an experienced rail-rider.

Mahalo for taking the time to read my message.

Your sincerely
Daniel Tiedge

Dear Mr. Tiedge:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

Your preference for a Fixed Guideway Transit Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the

Mr. Daniel W. Tiedge
Page 2

alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Subject: RAIL PHASING

Charles,

Thank you for looking into the logic of the currently announced phasing of the rail. The only logic supporting constructing the first phase of the rail in the country is to make available jobs sooner than would be if work starts in town. Think of it as to who would be using a system that starts in Ewa and ends in Aiea? People are not going to drive to Ewa, leave their cars there, ride the rail to Aiea, and then take some other means to travel into town, which will mean that the ridership counts will be way down, which then fuels the fire from people not favoring rapid transit about stopping future phases since nobody is using the system. San Francisco, and all the other cities that have built rapid transit systems all sequence the phasing to start in town and then extend the system into the suburbs as use increases. All these locations have done so even though the downtown section is more difficult and costly.

Please continue to pursue the re-phasing as it just does not make any sense.

Thanks

Steve Timpson

Dear Mr. Timpson:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses comments regarding the above-referenced submittal:

As described in Section 2.5.10 of the Final EIS, to support phased opening of the system, the first construction phase must be connected to a maintenance and storage facility, which requires considerable land. The first phase of the Project must be connected to the maintenance and storage facility because, in addition to maintenance of equipment and ongoing operations, the maintenance and storage facility houses the main control center for the entire Project, and the required testing and operation of the system could not be completed without access to it. No location has been identified closer to Downtown with sufficient available land to construct a maintenance and storage facility. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations*

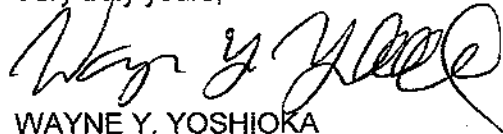

Mr. Steve Timpson
Page 2

- *Reduce the time that each area will experience traffic and community disturbances*
- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding*
- *Match the rate of construction to what can be maintained with local workforce and resources*
- *Balance expenditure of funds to minimize borrowing*

The portion of the corridor Ewa of Pearl Highlands is less developed than the areas Koko Head. Right-of-way can be obtained more quickly; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted Koko Head from Pearl Highlands to Aloha Stadium, then Kalihi, and finally to Ala Moana Center.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Issuance of the Record of Decision under NEPA and acceptance of the Final EIS by the Governor of the State of Hawaii are the next anticipated actions and will conclude the environmental review process for this Project.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Submission Content/Notes : My concern regarding the DEIS is that there is no updated revenue information. In 2006, the economy was strong, and Parsons Brinckerhoff used three numbers, a "conservative" estimate, and two fifteen-year projections using information from the Hawaii Council on Revenues, despite the CoR only making predictions for a few years in the future.

In the two years (2007, 2008) following the release of the Alternatives Analysis, the 0.5% GET transit tax has not met even the lowest revenue forecasts, shown in table 5-4 in the AA. Despite this, the DEIS uses the middle forecast to estimate the total revenue available to the rail project.

Even in 2007, before the economic downturn of 2008, revenues were far below their predicted values. It seems clear both that the original estimates were far too optimistic, and that the projections need to be reevaluated due to the current economic climate.

Dear Mr. Tokishi:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

The General Excise and Use Tax (GET) surcharge revenue estimate presented in the Draft EIS was based on information available at the time the Draft EIS was prepared. It was an updated forecast compared to the forecasts prepared for the Alternatives Analysis, and it reflected the actual receipts of surcharge monies that had been received at the time the Draft EIS was prepared. The Final EIS reflects more recent information about costs and revenues based on the latest forecasts from the spring of 2009. Specifically, in Chapter 6 of the Final EIS, the GET surcharge revenues have been adjusted downward to show the effect of the flagging economy on revenue collections. The City will continue to monitor and update the revenue forecasts as the Project proceeds through FTA's New Starts process.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and

Do you really think rail will cost only 4.8 Billion? I expect my grandchildren will pay dearly and will not benefit since they will not be riders and will not work in construction or food service, which I envision to be the main jobs created.

How many City projects have com in on time and in budget? What is the usual cost overrun? Do you expect cost over estimates for Rail?

I voted againt rail because I think it is too costly but I don't know what the answer is to traffic. By the way, I suspect your estimate of the fix to traffic is way over because I don't think rail will ease traffic except in rush hour and only for the residents of Kapolei and Ewa beach - otherwise the train will be empty and there isn't much traffic then anyway.

Dear Ms. Tom:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your opposition to the Fixed Guideway Transit Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been identified as the Preferred Alternative as described above. Compared to the other alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly lower impacts to the natural and built environment. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative.

Ms. Barbara Tom
Page 2

The Project is expected to benefit Oahu residents by meeting the following purpose and need of the Project of: improving corridor mobility, travel reliability, access to planned development to support City policy to develop a second urban center, and transportation equity. The total cost of the Project, including finance charges, is \$4.6 billion in 2009 dollars and \$5.5 in inflated dollars. Of this amount, about \$1.3 billion is a contingency to cover unforeseen cost increases. Chapter 6 of the Final EIS provides a cost and financial analysis of the Project. The Final EIS does not contain information about other City projects as they are not related to the Project.

Analysis of traffic impacts employs a travel demand forecasting model used by the Oahu Metropolitan Planning Organization (OahuMPO). The OahuMPO's existing model was reviewed, enhanced, recalibrated, and validated to be consistent with current FTA guidelines. The approach has proven to be effective in estimating traffic impacts in other cities. The model-generated analysis shows a reduction in total congestion by 18 percent in 2030 (measured in vehicles hours of delay) when comparing the Project to the No Build Alternative (Table 3-14 of the Final EIS). Traffic reductions will be seen on major roadways throughout the corridor and will be most pronounced in Aiea and Waipahu, in addition to the Ewa area (Tables 3-9 and 3-10 of the Final EIS). With the Project, transit ridership levels will be influenced by factors such as improved transit travel times in peak periods, as compared to the No Build Alternative.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Dear Ms. Tomihama:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your preference for the No Build Alternative has been noted. The No Build Alternative does not address the project needs or meet the purpose of the Project as established in Sections 1.7 and 1.8 of the EIS. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative.

Ms. Beatrice Tomihama
Page 2

Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

Next, your second comment has been noted.

To address your third comment, as identified in Section 3.2.1 of the Final EIS, transit ridership forecasts for rail and bus service are based on a travel demand forecasting model used by the Oahu Metropolitan Transportation Organization (OahuMPO) for the Oahu Regional Transportation Plan. The OahuMPO model is based on "best practices" for urban travel models in the U.S. The model is updated approximately every five years to reflect changes in land use, socioeconomic conditions, and transportation network improvements. The model is approved by the OahuMPO Technical Advisory Committee. As indicated in the Final EIS, this modeling approach has proven to be effective in estimating ridership levels in other areas such as Los Angeles County, Salt Lake City, and the Denver region in the last 10 years. The model is based on guidelines established by the FTA. The model is based upon a set of realistic input assumptions regarding land use and demographic changes between now and 2030 and expected transportation levels-of-service on both the highway and public transit system.

Regarding your last comment, as stated in Section 3.3.2 of the Final EIS, TheBus system serves more than 80 percent of Oahu's developed areas and has about 252,200 boardings on an average weekday. Honolulu has the fourth highest load factor for bus service in the U.S. It is a very well-used system and provides a good indication that ridership forecasts for the fixed guideway are reasonable. Buses that are not in service are either on their way to start a route or returning from a route. Such status is not related to how many people ride transit when in service.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

In response to your first bulleted comment, the connection of UH Manoa and Kalaeloa would require completion of the system between those points, which would include Ala Moana Center. The system must be connected to a maintenance and storage facility, which has considerable land requirements that cannot be met in the Primary Urban Center. The Ala Moana area is a major employment center. The extensions of the line to UH Manoa and Waikiki will also start from the Ala Moana terminus when funding becomes available. Those are also major generators of trips such as Ala Moana.

Regarding your second bullet point, your preference for the Airport Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in

the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

Regarding your third bullet point, the details of the cost of maintenance for the guideway system are provided in Section 6.4 of the Final EIS. Operating and maintenance costs will be paid for from the same funding sources currently used for TheBus: Federal funding, fare revenues, and subsidies from the City's General and Highway Funds. Funding for guideway maintenance will be covered in the City's annual budgeting process and amounts to between 2 percent and 3 percent of the City's annual operating budget. Projected operating and maintenance costs for the transit system (the fixed guideway, TheBus, and TheHandi-Van) can be found in Figure 6-2 of the Final EIS.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE V. YOSHIOKA
Director

Submission Content/Notes : Election Day is Coming up and I've taken my time to make my decision. Right now I'm very much against Rail Transit because, based on both Stop Rail and Support Rail advertisements, I believe that the people in charge of the project have no clue what they're really doing.

This mainly stems from the fact that the Support Rail advertisements don't address some of the more serious issues, such as space usage and environmental concerns. All the Support Rail advertisements (As well as their website) really say is "Anti-Rail Protesters are wrong because Rail technology works in Seattle".

After reviewing this site I've gotten a much clearer image of what the Rail project will be like. I approve of the idea of using elevated railways, that being the only practical way I believe it will work. However I am very concerned about how you plan on integrating more eco-friendly alternative energy sources into the project itself.

Many Advertisements claim that Rail will reduce our dependence on foreign oil because it will run on electricity, and claim that it will use solar, wind, and biofuel. However all sources I've been able to locate don't say HOW the alternative energy sources will be integrated.

As this is the case, I must assume that they will not infact be integrated and the rail system will have to rely on HECO who, as I understand it, still generate the majority of Hawaii's Electricity through traditional Oil Burning means. Am I wrong?

I'm also curious as to:

- Why you have not made the specifics about the Rail Technology being considered available to the public.
- How we can be sure that the government is going to promptly enact any promises they make.
- Why you are planning to break ground in 2009, possibly before you are approved to receive funding.
- Where the money is going to come from if construction begins in 2009 and we can only get government funding by 2011.

Mr. Matthew Toyama
gensuke@hawaii.rr.com

Dear Mr. Toyama:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The public involvement materials used until November 2008 contained project-related information that was available at the time of publication. However, since the beginning of the Alternatives Analysis and environmental processes, many details regarding your concerns of space usage and environmental impacts were evaluated in the Draft and Final EIS.

The Final EIS (Section 4.11.3) indicates that the Project will reduce energy consumption by about 3 percent compared to the No Build Alternative. During Final Design, energy-efficient design and methodologies will be incorporated into the Maintenance and Storage Facility, the stations, and other structures where practical. The extent of photovoltaic and other energy-reduction and generation features could be included at that time. The Project will still rely heavily on Hawaiian Electric Company (HECO) for energy to power the system. As described in the Final EIS Section 4.11.3, HECO's planned electricity generation on Oahu will be sufficient to

Mr. Matthew Toyama
Page 2

support the Project with various upgrades. Please refer to Chapter 4 of the Final EIS for the analysis of environmental impacts.

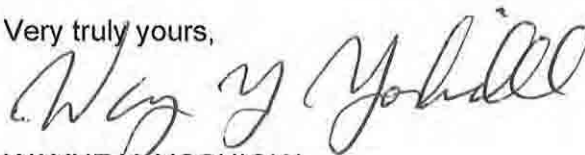

Regarding your comment about transit vehicles, a specific vehicle has not been selected for the system. The RTD has established vehicle specifications that are summarized in Chapter 2 of the Final EIS. As noted in Chapter 2, the selected transit technology will be electrically powered, industry-standard steel wheel on steel rail powered from a third-rail system. The selected vehicle will be capable of a top speed greater than 50 mph. The vehicles could either be manually operated by a driver or fully automated (driverless).

Any commitments made in the Final EIS and Record of Decision become project requirements. These will be incorporated into the project specifications and City staff will be tasked with ensuring these commitments are carried out.

Lastly, local funding through a surcharge to the General Excise and Use Tax (GET) was approved in 2005. Construction of a project of this magnitude requires a substantial period of time to complete and the earlier that this Project is completed the earlier the benefits may be realized. In addition, inflation increases project costs with time, and the earlier that construction can be undertaken, the better that costs can be controlled. As discussed in Chapter 7 of the Final EIS, the Project is proceeding through the Federal project development process. Current indications are that the Project will be rated favorably to receive Federal funds.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Submission Content/Notes : I have several suggestions for the rail transit system. It's better to start the first phase from downtown honolulu to Pearl City first. I heard that the rail system will be intergrated with TheBus , TheBoat. Hybrid buses will also be use in this project instead of diesel buses. The reason why is that the buses will reduce greenhouse gases.

Dear Mr. Tse:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*

Mr. Paul Tse
Page 2

- *Reduce the time that each area will experience traffic and community disturbances.*
- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*
- *Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- *Balance expenditure of funds to minimize borrowing.*

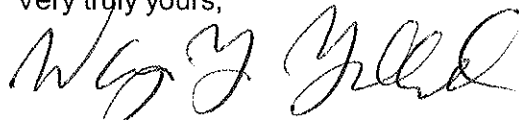

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

The fixed guideway system will be integrated with other transit modes. Appendix D of the Final EIS provides information on future bus routes and frequencies with the Project. How those modes are fueled is independent of the fixed guideway system.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Dear Ms. Tuia:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses comments regarding the above-referenced submittal:

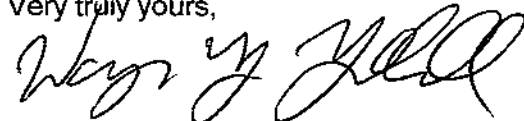

While each of the alternatives includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana Center has been selected as the Preferred Alternative. The identification of the Airport Alternative as the Preferred Alternative was made by the City to comply with FTA's NEPA regulations that state that the Final EIS should focus on the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative, public input on the Draft EIS, and City Council Resolution 08-261 identifying the Airport Alternative as the Project. The selection of the Airport Alternative is described in Chapter 2 of this Final EIS. The discussion of the alternatives considered is included in Chapter 2 of this Final EIS and the Alternatives Analysis. As discussed in Section 3.4.2 of this Final EIS, the Airport Alternative will carry the most passengers with 116,000 daily passengers and 282,500 daily trips in 2030, thereby resulting in the greatest transit-user benefits. The Airport Alternative will also result in the fewest vehicle miles traveled and vehicle

Ms. Veronica Tuia
Page 2

hours of delay, as well as provide access to major employment areas, including Honolulu International Airport, that will have substantially greater ridership than the other alternatives considered. The Project is proceeding as quickly as practical, as illustrated in the schedule presented in Chapter 2 of the Final EIS.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Issuance of the Record of Decision under NEPA and acceptance of the Final EIS by the Governor of the State of Hawaii are the next anticipated actions and will conclude the environmental review process for this Project.

Very truly yours,

From Ralph Rosenberg
Court Reporters

The purpose of the DEIS is to provide the City and County, the FTA, and the public with the information necessary to make an informed decision, based on a full and open analysis of costs, benefits, and environmental impacts of alternatives considered. However, it seems that in some respects, the DEIS is aimed at convincing the public and the FTA of the benefits of the Project, rather than inform the public.

One example is in the cost-effectiveness of the project. The FTA's cost-effectiveness index is a ratio formed by adding an alternative's annualized capital cost to its year 2030 operating and maintenance cost, and the total is divided by user benefits, in hours saved. The key criteria for determining the cost-effective index are annualized cost of the project, ridership estimates, and the time benefits realized by the riders.

Any proposed New Starts project receiving less than a "Medium" cost-effectiveness index rating will not be recommended for funding by the FTA. The threshold between a rating of "Medium" and "Medium-Low" is \$22.99 per user benefit expressed in dollars per hour of user benefit.

In the Alternatives Analysis, the cost-effectiveness index for the 20-mile alignment from East Kapolei to Ala Moana Center is stated as \$21.34; and for the full project from West Kapolei to UH Manoa with an extension to Waikiki as \$27.05. Thus, the 20-mile segment meets the threshold of \$22.99, but the full project does not.

City ordinance 07-001 recommended the North-South Road/Airport option as the preferred minimum operational segment (MOS) for several reasons, one of which being that the cost-effectiveness index of \$22.56 is below FTA's threshold.

Now, in the DEIS, the cost-effectiveness index has markedly improved to a point that is significantly below the FTA threshold of \$22.99: \$17.53 for the Salt Lake Alternative, \$17.78 for the Airport Alternative, and \$22.86 for the combined Salt Lake/Airport Alternative. Information for the full project with extensions is conspicuously absent in the DEIS although it was available in the AA.

We know that the capital cost and O&M costs have not reduced, so that the only explanation is that the user benefits have increased significantly. If one digs further into the DEIS, you will find the following statement: "Research indicates that positive attributes (both perceived and real) are associated with the use of a fixed guideway system, which make the system more attractive than general bus transit. These benefits include such things as improved safety, security, visibility, ease of use, comfort, and reliability. These factors or attributes are not captured by the standard travel demand forecasting process. To account for these attributes in this user benefit analysis, FTA has approved an additional factor equivalent to a 14.5-minute savings of in-vehicle time. The

Richard Ubersax
Waimanalo
HONOLULU, HAWAII

factor was incorporated for riders taking the fixed guideway only. A 5.5-minute savings of in-vehicle time was incorporated for riders taking feeder buses to the fixed guideway."

Basically what this indicates is that 14.5 minutes is subtracted from every guideway trip made, and 5.5 minutes from every feeder-bus trip to end up with the "time" benefit for guideway trips that is now artificially more favorable. Assuming ~90,000 fixed guideway trips each day, fed by ~63,000 bus trips, this fudge factor adds up to a 22,000-hour time credit for fixed guideway use and a 6,000-hour time credit for feeder-bus use for a total credit of 28,000 hours each day of user benefit ...or over 5 million hours each year of "user benefit". Although the DEIS does not say so out rightly, this is probably a major factor in the much lower cost-effectiveness index.

Thus, it seems that the City and Parsons Brinkerhoff, with or without collusion by the FTA has decided to apply a new subjective measure to the determination of "user benefits", which is not incorporated in the transit models. The application of this change is never clearly explained in the DEIS nor any of the publicly available supporting references.

This issue and the exclusion of the complete project (MOS with all extensions) from the cost-effectiveness analysis need to be scrutinized thoroughly by the FTA.

Dear Mr. Ubersax:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The Draft EIS only reports estimates of cost-effectiveness for those Build Alternatives addressed in the document, namely three fixed-guideway alternatives that would extend from East Kapolei to Ala Moana Center. The Project has logical termini and independent utility from any extensions that may be constructed in the future. The future extensions to East Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS; however, the future extensions are not part of the Project. Thus, they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and

Mr. Richard Ubersax
Page 2

FTA. If the future extensions are proposed for implementation at some time in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time.

The cost-effectiveness calculation is closely scrutinized by FTA. The calculation itself is specified by the FTA according to the factors it considers representative of travel behavior from experience gained on many projects across the country. The analysis steps that led to the numbers in Chapter 7 of the Draft and Final EISs are defined by the FTA. Over the course of a refinement in the model application, there are many things that change. Many elements make up the user-benefit calculation. Some are related to travel time or cost savings; others are related to the overall improvement in transportation system performance that will be derived from the Project. User benefits, for example, could change if there is a change in ridership resulting from new information incorporated into the model. Cost-effectiveness for the other options evaluated did not rise to the level of the fixed guideway, despite their lower overall project costs. The incorporation of "non-included attributes" in the calculation of user benefits is fully consistent with FTA guidance.

The Final EIS meets the requirements of NEPA and the FTA. The public has been continuously informed about progress on the Project since it started over three years ago. The analysis completed shows a significant difference in the ability of the various alternatives tested to meet the various objectives set forth in the Final EIS. The fixed guideway was by far the most responsive to the identified Purpose and Need. These assessments were completed using the procedures specified by the FTA.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

RE: General Comments on DEIS

Dear Mr. Yoshioka:

I am by no means an expert on transportation planning and engineering, but as an R&D director (now retired) in a multibillion-dollar high-tech company, do have considerable experience in evaluating complex and risky technology projects, including evaluation of alternative technologies and approaches, assessing technical feasibility of proposed approaches, and evaluating outcome probabilities and economic risks. Surprisingly, the principles and methodologies for evaluating the Honolulu rail transit project are very similar. In both cases an informed decision to proceed (or not) is based on reliable input (existing and projected) and objective analysis based on experience, good judgment, and benchmarking against comparable projects. After initiation of approved projects, similar methodologies are applied to measure progress as new information (results) becomes available.

Based on my analysis of the DEIS and supporting documentation, and researching project history and benchmark information, I have serious reservations about whether the City has made an objective evaluation of all of the alternatives against the key criteria, but rather has conducted the process and presented data and analysis to achieve a predetermined result. The magnitude of the cost of the project and the long-term implications that the wrong choice will have on the aesthetic, environmental, economic, and social welfare of the community is cause to pause and reassess the validity of the whole process.

Each Administration has had its own "pet" transit program (just look at the history over the last 20 years), which has resulted in vacillation and delay in moving forward. This has created chaos in the selection process and confusion among the people. The current Administration (and Council) terminated the past Administration's BRT project within days of attaining office and instantly the current program was elevated to the top of the agenda.

I think we all recognize the need for an efficient and cost-effective transit system for the island of Oahu, but we must resist emotional or predetermined decisions and political agendas to dominate the process – rather than a pristinely objective process.

The following examples and discussion are meant to show where I believe there are flaws in the process, data, interpretation of the data, and arguments in favor of the case. There are numerous other examples I could use, but for lack of time and brevity, I have focused on the ones presented. Please take this discourse constructively, even though it may appear highly critical. Please contact me with any questions.

Respectfully yours,

A handwritten signature in cursive script that reads "Richard W. Ubersax".

Richard W. Ubersax

P.S.: I have also sent you an electronic copy in .pdf format.

The purpose of the DEIS is to provide the City and County of Honolulu, the FTA, and the public with information necessary to make an informed decision, based on a full and open analysis of costs, benefits, and environmental impacts of all of the alternatives considered. This project is probably one of the most complex and costly projects ever undertaken in the state of Hawaii; so it is critical for the City administrators and the public to have sufficient and objective information to make informed judgments about the various aspects of the project, distill the information to assess the merits of potential alternatives, and determine how it will affect the island and their personal lives. However, it seems that in some respects, the DEIS is aimed at convincing the public (and the FTA) of the benefits of the "Project", rather than to objectively inform about both the benefits and downsides.

The DEIS and the accompanying Technical Reports certainly contain a plethora of information, but there are many areas where important information is missing or difficult to find, where significant changes have been made from the Alternatives Analysis without sufficient explanation, where the validity of data is in serious doubt, and where decisions and choices have been made and rationalized with incredulous explanation. As a result, the credibility of the entire document and process is compromised.

The Administration, FTA, and Oahu taxpayers should be wary of spending over \$5 billion on a Project that has been selected on the basis bias, questionable data and judgment, where the risks have not been fully evaluated, and where significant impacts have been summarily dismissed.

In its present form, the DEIS does not meet the criteria set forth in the first sentence of this page. In fact, the City should step back, assess whether they have objectively met all of the criteria and requirements of NEPA and SAFTEA-LU, make the appropriate modifications to ensure compliance, inform the public of their intentions and plan, and then move forward. It is better to take the time now rather than regret unintended consequences in the future.

The following discussion is meant to provide examples where – based on my interpretation and analysis of the information provided in the DEIS, supporting references, and other documentation developed throughout the process – I find that incomplete or ambiguous data has been presented, inappropriate conclusions have been drawn, and/or questionable decisions made.

A. Selection and Evaluation of Alternatives

The DEIS defines the "Project" as a fixed guideway transit system from East Kapolei to Ala Moana Center. Planned extensions are anticipated to West Kapolei, UH Manoa, and Waikiki. The Locally Preferred Alternative selected by City Council includes the Project and the planned extensions. The DEIS considers the following "four" alternatives:

- 1) No-Build Alternative and
- 2) Build between East Kapolei and Ala Moana Center, with three variations:
 - a) Salt Lake Alternative
 - b) Airport Alternative
 - c) Salt Lake + Airport Alternative combined

Actually, these distill to two alternatives – No Build and Build. The three "Build" alternatives described in the DEIS are so similar in terms of environmental impact, benefits accrued, and economics that they cannot be truly classified as distinctly different alternatives; to the skeptic, it appears that they were structured as distinct alternatives in the DEIS to satisfy the legal

requirement of due diligence for the selection and evaluation among all reasonable alternatives. If they were truly distinct, City Council would never have been able to make the switch from the Salt Lake Alternative to the Airport Alternative by a simple Council vote without considerable public input.

It is clearly stated in 40CFR1502.14:

The Environmental Impact statement *"should present the environmental impacts of the proposal and the alternatives in comparative form, thus sharply defining the issues and providing a clear basis for choice among options by the decision maker and the public. In this section agencies shall:*

(a) Rigorously explore and objectively evaluate all reasonable alternatives, and for alternatives that were eliminated from detailed study, briefly discuss the reasons for their having been eliminated.

(b) Devote substantial treatment to each alternative considered in detail including the proposed action so that reviewers may evaluate their comparative merits.

(c) Include reasonable alternatives not within the jurisdiction of the lead agency.

(d) Include the alternative of no action.

(e) Identify the agency's preferred alternative or alternatives, if one or more exists, in the draft statement and identify such alternative in the final statement unless another law prohibits the expression of such a preference.

(f) Include appropriate mitigation measures not already included in the proposed action or alternatives."

It is clear that since reincarnation of rail transit in 2005, there has been bias towards steel-on-steel rail as the preferred transit mode; other potentially viable alternatives have not been considered seriously, or they have been systematically eliminated during preliminary evaluation. The Locally Preferred Alternative (LPA) from Kapolei to UH Manoa with an extension to Waikiki was selected because the end-points make sense and the route passes through the highly populated east-west corridor where traffic relief is badly needed. When it was realized that the cost of this route was significantly higher than the City could afford, the expedient solution was simply to shorten the route, with the intent to complete the LPA at a later time. Other alternatives, which could be as equally effective – and perhaps lower-cost – appear to have been summarily dismissed without comprehensive, objective evaluation. The explanation of why alternatives were not feasible was based on flawed analysis and on the argument that they did not meet FTA or State criteria for funding. In reality, there are alternative federal funding sources, and the State could easily amend HB 1309 to accommodate other Alternatives. It is clear that the political will was – and continues to be – focused on rail (note restrictions in HB 1309 for counties with population of greater than 500,000), and thus has limited the scope of selection of Alternatives.

The current design of the fixed guideway will cause irreparable disruption of views through and across its path; it would ruin the aesthetics neighborhoods and important historical sites. These visual impacts would be impossible to mitigate. The noise of trains passing every 1.5 to 5 minutes will be physically and emotionally distressing, especially during night-time hours along tight corridors. The FTA guidelines are for exterior noise, and do not consider the open window and door lifestyle of our residents. Many of the receptor sites evaluated in the DEIS would shift

from “no impact” to “moderate impact”, or from “moderate impact” to “severe impact” if the criteria were adjusted for our lifestyle. The assessment in the DEIS downplays the severity of noise impacts by not considering L_{max} for instantaneous noise as recommended by FTA guidelines. At present, there are no City or State statutes that regulate noise from mobile sources. Hawaii HAR 11-46 [not HAR 11-16] regulates stationary noise sources. It is imperative that such statutes be legislated to protect the peaceful environment to which we are accustomed.

All things considered, we need to step back and objectively evaluate alternatives that could be more cost-effective than elevated rail and could bring lesser environmental impact along its path. The following are examples that should be considered:

- a) A more environmentally-friendly rail system. The greatest concerns with an elevated guideway, steel-on-steel rail system is the high cost of the elevated guideway (~3-4 times that of at-grade systems) and significant visual, aesthetic, and noise impacts along the guideway. A potential solution would be to build the system at grade through rural areas where possible for lower cost, and through sensitive urban areas (where noise, visual, and aesthetic impacts are problematical), to build at-grade or underground. Fixed Guideway Alternative 4a (Kapolei Parkway/Kamokila Boulevard/Salt Lake Boulevard/King Street/Hotel Street/Alakea Street/Kapi’olani Boulevard/UH Manoa) from the *Alternatives Screening Memo, October 24, 2006* apparently attempted to do this but was eliminated from consideration late in the evaluation process. It (or optimizations thereof) should be revisited, and perhaps with shortened routes (e.g., an MOS from East Kapolei to Ala Moana Center) for greater affordability.

This alternative would be expected to have lesser noise and visual impacts east of Iwilei Road since it descends to grade on Hotel Street and goes underground at Alakea Street to Waimanu Street. The cost of this alternative is expected to be less than or comparable to the DEIS Salt Lake Alternative.

- b) A bus rapid transit (BRT) system similar to that described in the “*Primary Corridor Transportation Project*” FEIS, July 2003 and “*Honolulu BRT Project Evaluation*”, January 2006. The system began operation in November 2004, but was discontinued in June 2005, supposedly due to poor performance (and coincidental with change in City administration).

A conclusion of the 2006 “Evaluation” report is: “*Greater benefits in terms of improving ridership, customer satisfaction, capital and operating cost effectiveness, transit supportive land use, and environmental quality may be possible with more significant investments in dedicated running ways, advanced vehicles, stations, ITS elements, and fare collection.*” BRT has been proven successful in many U.S. and foreign cities, and could be successful in Honolulu if given the chance. This alternative should be revived and given the necessary planning and engineering resources to make an objective evaluation.

- c) A BRT / Managed Lane Alternative (MLA) hybrid, similar to the EZ-Way proposal by Professor Panos Prevedouros and Councilwoman Ann Kobayashi during her mayoral campaign. A major deficiency in the evaluation of the MLA in the Alternatives Analysis is that the design developed by the City did not provide sufficient egress points along the route to enable uncongested flow at exit ramps. This was a major reason for its dismissal from further consideration. However, it is anticipated that with improved design to

overcome this deficiency, the EZ-Way proposal would ascend to become a viable alternative.

All of the above alternatives would be expected to lessen the environmental impacts that a fixed-guideway elevated system will bring to the highly populated urban center of Honolulu.

Finally on the point of objectivity versus political will: the City Administration, City Council, and entire selection process have lost credibility over the Salt Lake Alternative versus Airport Alternative debacle. The initial selection of the Salt Lake Alternative was politically motivated; the change to the Airport Alternative was proposed the week after the election. The net result is that the whole process is now tainted. Let's take the appropriate steps to restore that credibility by giving all potentially viable alternatives an objective assessment. Yes, it will delay the project; but we "can not afford not to do it".

B. Transit User Benefits and Cost Effectiveness of the Project

a) User Benefits:

This is an area where major change has been made in the DEIS versus the AA without sufficient explanation. To most readers of the DEIS, the change probably went unnoticed because of how the DEIS is structured.

"Transit user benefits represent the amount of transit travel-time savings a user would experience with a given transit alternative compared to the No Build Alternative." (DEIS p. 3-36).

Table 3-19 lists the transit-time savings for various transit markets for the three Build Alternatives compared to the No Build Alternative. These represent future projections calculated by the travel demand-forecasting model. The model predicts that the time saved each day for users of the Project will be approximately 50,000 hours per day or 15-16 million hours per year.

During the period between the AA and DEIS, the FTA allowed an additional benefit to transit users – again expressed in terms of time saved (Federal Register Vol. 72, No. 106. June 4, 2007):

"FTA adopts as final its proposal to allow project sponsors that seek to introduce a new transit mode to an area to claim credits (implemented through what is commonly called a mode specific constant) for the user benefits caused by attributes of that mode beyond the travel time and cost measures currently available in the local travel model. FTA will continue to work closely with sponsors of projects that have calibrated mode-specific constants to ensure that they are using constants that are generally consistent with the methods and values permitted for sponsors of projects which are new to an area."

"FTA will assign credits for characteristics in three categories: (1) Guideway-like characteristics (equivalent to a maximum of eight minutes of travel time savings); (2) span of good service (up to three minutes); and (3) passenger amenities (up to four minutes). Further, FTA will define a discount of up to 20 percent on the weight applied to time spent on the transit vehicle. These credits and discount are applied to the calculation of user benefits only; ridership forecasts will not be affected."

This was superficially disclosed in the DEIS on p. 3-36:

"Research indicates that positive attributes (both perceived and real) are associated with the use of a fixed guideway system, which make the system more attractive than general bus transit. These benefits include such things as improved safety, security, visibility, ease of use, comfort, and reliability. These factors or attributes are not captured by the standard travel demand forecasting process. To account for these attributes in this user benefit analysis, FTA has approved an additional factor equivalent to a 14.5-minute savings of in-vehicle time. The factor was incorporated for riders taking the fixed guideway only. A 5.5-minute savings of in-vehicle time was incorporated for riders taking feeder buses to the fixed guideway."

Basically what this indicates is that 14.5 minutes is credited to every guideway trip made, and 5.5 minutes to every feeder-bus trip, to end up with an inflated "time" benefit for guideway trips. These "savings" are then multiplied by ridership estimates. Assuming ~90,000 fixed guideway trips each day [Table 3-18], fed by ~63,000 bus trips, this additional factor adds up to a 22,000-hour time credit for fixed guideway use and a 6,000-hour time credit for feeder-bus use – for a **total credit of 28,000 hours each day** of user benefit – or over 8.6 million hours each year. The total user benefit has now increased 56% to approximately 78,000 hours each day. This total amount is nowhere disclosed in the DEIS or Technical Reports. At first glance, this might appear as an innocuous adjustment; but it becomes significant in the calculation of the "Cost-Effectiveness Index" – one of the most significant criteria in the FDA's rating of the Project versus competing projects.

The mode-specific constants are intended to be applied to account for attributes (such as safety, security, reliability, ease of use, etc.) above and beyond the time-savings predicted in the local travel model. However, these factors are subjective and arbitrary, unless they can be validated versus other operating transit systems. The derivation of the values in the DEIS are not explained at all, so appear to be strictly arbitrary values, or values negotiated with FTA. A full and open analysis is certainly missing, and needs to be included: What data supports the claim that trains are safer than other modes? Users of the Project will need to make more transfers than with the No-Build Alternative; does this really improve ease of use?

The Washington Metropolitan Area Transit Authority reports that the incidence of crime is approximately three times greater for train transport than bus:

Crime rate per Million Riders	2004	2005	2006	2007	2008
Rail	1.76	1.65	1.69	2.17	2.76
Parking Lot	4.28	3.55	3.97	4.38	4.40
Bus	0.60	0.68	0.79	0.79	0.95

Reference: http://www.wmata.com/about_metro/transit_police/mtpd_crime_stats03.cfm

Thus, if one assumes a similar trend in Honolulu, the modal-specific constant adjustment for "safety" should be zero or negative. The point is that the modal-specific constants use in the analysis need to be thoroughly explained in the DEIS.

b) Cost-Effectiveness Index:

According to the DEIS (p. 7-9): *"Cost-effectiveness is one of the key criteria that FTA uses to evaluate projects proposed for Section 5309 New Starts funding. The FTA's cost effectiveness*

index is a ratio formed by adding an alternative's annualized capital cost to its year 2030 operating and maintenance cost, and the total is divided by user benefits", in hours saved. Further "The cost-effectiveness indices for the Build Alternatives compared to the baseline fall within the "medium" range established by FTA for its New Starts ratings, which, along with other considerations, is currently required to qualify for New Starts funding." The key criteria for determining the cost-effective index are annualized cost of the project, ridership estimates, and the time benefits realized by the riders.

Any proposed New Starts project receiving less than a "Medium" cost-effectiveness index rating will not be recommended for funding by the FTA. The threshold between a rating of "Medium" and "Medium-Low" is \$22.99 per user benefit expressed in dollars per hour of user benefit.

According to the Alternatives Analysis, the cost-effectiveness index for the 20-mile alignment from East Kapolei to Ala Moana Center is \$21.34; and for the full project from West Kapolei to UH Manoa with an extension to Waikiki as \$27.05. Thus, the full project would not meet the threshold requirement of \$22.99, but the 20-mile alignment would.

City ordinance 07-001 defined a Locally Preferred Alternative for a fixed guideway transit system and authorized development of a minimum operable segment (MOS). The North-South Road/Airport option was recommended by Council in the ordinance for several reasons, one of which being that the cost-effectiveness index of \$22.56 was below FTA's threshold for receiving the necessary "Medium" or better cost-effectiveness rating needed to qualify for FTA's recommendation for funding. Note again that the threshold is \$22.99.

Now, in the DEIS, the cost-effectiveness index has markedly improved to a point that is significantly below the FTA threshold of \$22.99: **\$17.53** for the Salt Lake Alternative, **\$17.78** for the Airport Alternative, and **\$22.86** for the combined Salt Lake/Airport Alternative (DEIS Table 7-7). Information for the full project with extensions is not available in the DEIS.

We know that the capital cost and O&M costs have not reduced (perhaps have increased slightly), so that the only explanation is that the user benefits have increased significantly. As discussed above, the user benefits have increased significantly because of application of the subjective "mode-specific" time adjustment to the actual time saved. Thus, if one adds the *annualized capital cost to its year 2030 operating and maintenance costs*, and divides the total by the user benefits (in hours saved), the result is a number that is significantly less than reported in the AA; e.g. \$21.34 in the AA (20-mile alignment) versus \$17.53 in the DEIS (Salt Lake Alternative).

The application of this change is never clearly explained in the DEIS nor any of the supporting references. In fact, the level of detail in the DEIS on the Cost-effectiveness Index is restricted to Table 7-7. This certainly does not meet the requirement of a full and open analysis so that the public is able to make an informed decision. To the contrary, the City has disguised and concealed this information so that it is difficult to comprehend how Cost-effectiveness Index was calculated.

There is a disclaimer to the validity of the Cost-effectiveness Index calculations in the DEIS as follows:

"FTA is currently reviewing the estimates made for ridership and user benefits, operating and maintenance costs, and capital costs for the Build Alternatives. If these results hold up through

subsequent phases of project development, along with other FTA considerations, the Project would be in the competitive range for funding consideration.” (DEIS p. 7-9)

It is imperative that this whole area be scrutinized by the FTA, so that the merits of the project are accurately determined prior to issuance of an ROD.

It is also noteworthy that the City has not included any discussion of the Cost-effectiveness Index of the Full Project as was done in the AA. One can surmise that it would be significantly higher than for the Project, and was intentionally excluded since it still might exceed the FTA threshold of \$22.99 (my estimation is that it would be between \$22 and \$24).

One final note on Cost-effectiveness Index: Since the Honolulu Project utilizes an elevated guideway along the entire length it would be expected to cost 3 to 4 times as much as an “at-grade” system. Operations and Maintenance costs are expected to be higher than an at-grade system because of the higher infrastructure cost. User benefits (time saved) are expected to be the same as any rail transit system of similar size. Thus, with the significantly higher cost of the elevated system, it is difficult to rationalize how the Honolulu Project could have a Cost-effectiveness Index that is competitive with other projects on the FTA docket.

The discussion in the DEIS needs be expanded to elaborate the derivation of User Benefits data and Cost-effectiveness Index – in detail at least as extensive as in the Alternatives Analysis. The dramatic reduction in the Cost-effectiveness Index reported in the DEIS versus in the AA needs comprehensive explanation, and how this change will influence the FTA’s evaluation of the Project. The FTA should explain how this project could be competitive with other projects with respect to this important rating criterion, considering its extremely high capital cost.

C. Validity of Model Predictions and Interpretation:

Many of the conclusions drawn throughout the evaluation process are based on predictive transit and traffic models commonly used for such evaluations. They are commonly used by most large cities for transit planning, and are usually tailored for the specific city or area. It is impossible for the layman to understand the operation of these models and their inputs and outputs (e.g., screenline analysis, vehicle miles traveled, vehicle hours traveled, vehicle hours of delay, transit ridership, transit time saved, etc), so we must rely on what is reported by the users of the models.

In the DEIS, these model predictions are reported as the gospel truth; the results are not reported as ranges, but as specific values; no probabilities are assigned concerning the confidence of the values reported. It is unreasonable that we should be expected to accept these predictions at face value. At a minimum, the DEIS should at least disclose that there is uncertainty around predictive model outputs, and report a range of probable output values that reflects the range of reasonable inputs into the model, and assign a probability of confidence to the values or ranges reported. Within the DEIS and supporting references, the discussion around confidence level or uncertainty around the values is conspicuously absent.

The disparity between model predictions and actual transit ridership validates the need to report model predictions as ranges or to assign confidence probabilities. For the majority of rail transit systems put into operation within the last 30 years, actual ridership has not met ridership predictions; a few have exceeded prediction. For many of these cases, actual ridership might fall within a predicted range, and thus give greater credibility to the entire process.

The “*Honolulu High-Capacity Transit Corridor Project Alternatives Analysis Travel Demand Forecasting Results Report*” (RTD 2008t, October 2008) addresses changes made in the Travel Demand model, but does not address validation of the model. In fact the Report is elusive in describing details. For example in the section on Adjustment of the Mode Choice Model, it says “*The mode choice model was re-calibrated as part of the Draft EIS process; however, the details of it are not discussed in this report*” (p. 1-3). Regarding calibration and validation of the model, the Report states: “*The 2005 model was calibrated as a result of all of the changes discussed. Calibration Target Values were assigned and applied to the model. Details regarding the calibration and validation process, including the specific Calibration Target Values, can be found in the Honolulu High-Capacity Transit Corridor Project Travel Forecasting Methodology Report (RTD 2006)*” (p. 1-5).

There are several examples from the DEIS that prompt one to question the validity of these models or whether the data is being reported accurately:

a) Ridership Model:

DEIS Table 3-17 shows Fixed Guideway ridership for the three Alternatives. It seems inconsistent that ridership for the “Airport & Salt Lake” Alternative (92,710 daily boardings) is less than for the “Air Port” Alternative (95,310). One would certainly think that the Airport & Salt Lake Alternative, with one additional station than the Airport Alternative, would have greater ridership than the Airport Alternative alone. Perhaps there is good rationale for this, but it is certainly not disclosed in the DEIS.

It is also curious that the data in Tables 4-21, 4-22, and 4-23 of the *Travel Demand Forecasting Results Report* (RTD 2008t) are significantly greater than reported in the DEIS (although the data in Appendix A of the Forecasting Results Report (RTD 2008t) are the same).

	DEIS Table 3-17	RTD 2008t Tables 4-21, 22, 23	RTD 2008t Appendix A
Salt Lake:	87,570	102,174	87,571
Airport:	95,310	120,231	95,305
SL & AP	92,710	108,179	92,707

Perhaps there are explanations (that are not obvious to the reader) for this “curious” data, but they are not discussed in the DEIS or Technical report (RTD 2008t).

Side note: As a point of reporting accuracy, there is obviously a gross error in Table 4-11 of the *Travel Demand Forecasting Results Report* (total AM peak hour volume of 93,410 appears to be off by factor of ~10). Perhaps the wrong spreadsheet was inserted.

b) Calculation and Interpretation of Congestion Data:

The *Oahu MPO* Travel Demand Forecasting Model is the primary tool for predicting future traffic patterns and transportation-related effects. The tables below show data extracted from the DEIS for Vehicle Miles Traveled per day (VMT/d), Vehicle Hours Traveled per day (VHT/d), and Vehicle Hours of Delay per day (VHD/d). A primary measure of traffic congestion in the DEIS (and AA) is based on “Vehicle Hours of Delay” (VHD) for each

transportation scenario. It is not clear from the DEIS how VHD is calculated in the model; nonetheless, if we take the data at face value, the following can be concluded:

- In 2030, if the Project were not built, VHD would be 43.2% greater than in 2007 (even with planned roadway improvements); e.g., "congestion" would be 43.2% greater.
- In the build scenarios, congestion in 2030 would be 10.8-13.5% greater than today
- In the build scenarios, congestion in 2030 would be 20.8-22.6% less than the 2030 No Build scenario.

From DEIS Tables 3-9 and 3-14

				% Change from 2007		
	VMТ/d	VHT/d	VHD/d	VMТ/d	VHT/d	VHD/d
2007	11,581,000	334,000	74,000			
2030 no-Build	13,583,000	415,000	106,000	17.3%	24.3%	43.2%
2030 Salt Lake	13,096,000	385,000	84,000	13.1%	15.3%	13.5%
2030 Airport	13,086,000	385,000	82,000	13.0%	15.3%	10.8%
2030 Both	13,103,000	386,000	83,000	13.1%	15.6%	12.2%
% Change from 2030 no build						
2030 Salt Lake				-3.6%	-7.2%	-20.8%
2030 Airport				-3.7%	-7.2%	-22.6%
2030 Both				-3.5%	-7.0%	-21.7%

Similar data is presented in the AA (below).

From AA Table 3-10

				% change from 2005		
	VMТ/d	VHT/d	VHD/d	VMТ/d	VHT/d	VHD/d
2005	11,206,000	305,000	57,000			
2030 no-Build	13,971,000	395,000	82,000	24.7%	29.5%	43.9%
2030 20-Mile	13,539,000	376,000	73,500	20.8%	23.3%	28.9%
2030 MLA Rev	14,034,000	397,000	82,500	25.2%	30.1%	44.7%
2030 MLA* Rev	14,050,000	387,000	72,500	25.4%	26.9%	27.2%
% Change from No Build						
				VMТ/d	VHT/d	VHD/d
2030 20-Mile				-3.1%	-4.8%	-10.4%
2030 MLA Reverse				+0.5%	+0.5%	+0.6%
2030 MLA* Rev				0.6%	-2.0%	-11.6%

*MLA reversible case with H-I zipper in place (estimated)

Comparing the DEIS data with the AA data, the following differences stand out:

- VHD for the 2030 No Build case in the DEIS is 29% greater than the 2030 No Build case in the AA (106,000/82000); although VHD for the 2030 Build cases are only ~13% greater than for the 2030 20-mile alternative in the AA (~83,000/73,500).

- Existing condition (2005 or 2007) VHD is 30% greater in the DEIS than in the AA, although VMT is only 3% greater. One would think that the increase in VHD would be much smaller for a 3% increase in cars on the road (VMT).

Ultimately the Build Alternatives provide congestion relief (improvement in VHD) when compared with the No Build Alternatives of 10.4% in the AA and ~21-23% in the DEIS.....or to put it in the Administration's words: "a 100% improvement in congestion." Lacking good explanation in the DEIS, this sudden improvement is difficult to rationalize or understand. The impression that was left with the public is that the benefits of the Build Alternatives are much greater than previously anticipated – just what the Administration intended. Nothing was said about the accuracy or calibration of the models as a possible explanation.

The underlying uncertainty is whether the travel models are providing reliable data. Predictive models calculate future conditions based on the model's algorithms (mathematical manipulations via equations) and input data (including from other models). Algorithms can be optimized to try to better suit local conditions. Overall, getting a predictive model to make accurate predictions (validated) is an extremely difficult undertaking. If the assumptions that go into the model are not validated, the accuracy of the output can be in question. An obvious validation point lies in the comparison of 2005 traffic data (actually measured existing condition) with that predicted for 2007. Unfortunately, I do not believe that "actual" 2007 data has been gathered, and thus, validation is not possible.

To demonstrate the point that it is an easy matter to achieve an entirely different outcome from small, and explainable differences in input data, I have added an "new" alternative into the AA Alternatives evaluation: a Managed Lane Alternative with the reversible lane option, but using the H-1 zipper lane as an added lane (H-1 zipper was not used for the reversible MLA option). I have assumed a reduction in daily delay of 10,000 hours; which is equivalent to a 2.4-minute savings for each of the 250,000 cars that would benefit from this option. This option is included at the bottom of the above table (in gray font). Isn't it amazing that this option reduces congestion 11.6% versus 10.4% for the 20-mile AA Build Alternative! If I had access to the model, I could just as easily have "optimized" inputs and algorithms to get a similar result.

The main point in this example is that even small differences in model predictions can influence data used in making key decisions. In this case, the MLA Alternative looks considerably better than originally portrayed in the AA. Is the congestion relief quoted in the DEIS really 100% greater than in the AA? Certainly not; it is only 12% better (23% minus 11%).....or maybe not even that.....I really do not know because the accuracy of the model has not been validated!

The magnitude of this Project requires that the City demonstrate through substantive assessment and analysis that all of the information used in the evaluation and selection of alternatives is accurate and can be validated within reasonable confidence levels.

D. Project Risks and Uncertainties

Section 6.5 of the DEIS (Risks and Uncertainties) is designed to explain the financial "risks" associated with the Project; but in reality, it is more a compilation of "uncertainties" rather than a comprehensive analysis of the risks and potential consequences of these uncertainties, and a plan to mitigate their impacts on the Project. As a result, the reader (and thus general public) is

unaware of the impact these financial uncertainties could have on the Project and on the financial stability of the City.

With respect to FTA's *"Risk Analysis Methodologies and Procedures"*, June 2004, it appears that the City has completed the first two "Prepare" and "Identify" steps of the risk analysis process, but has neglected to "Quantify" or "Assess" the magnitude of the risks, or established a plan to "Mitigate" the risks). Rather, the City has reserved a large "contingency" in the Project budget to cover the risks and uncertainties. The FTA discourages this approach, and suggests that a comprehensive risk analysis is a tool for better communication and more cost-effective project management, and thus minimizes the need for large contingencies.

The risk assessment should anticipate the following events and a plan to mitigate their consequences:

- GET surcharge fund plus New Starts funding is not sufficient to meet Project capital costs (including interest costs). Right now there is no assurance that the GET revenues will meet the anticipated \$4.054 Billion, or New Starts funding will meet expectations. The DEIS states that additional funding would be possible to fund the capital needs of the Project, but does not specifically identify the source except by reference to "complemented by local assistance" (Section 6.2.2). Does this mean local taxes (State and City) will increase to cover the gap? Will the GET be extended beyond 2022? Will funds be transferred from the General and Highway funds (at the expense of other infrastructure projects)? Will the project be stopped short of Ala Moana Center? How will the Extensions be financed?

The City needs to be more specific in defining sources of additional funds, and if in the form of General Revenue Bonds or "borrowed" from other City funds, how they will be repaid.

- Fare revenues are not sufficient to cover 27 to 33% of O&M costs or total transit subsidies exceed 15% of General and Highway fund revenues. What will be the source of additional funds?
- Construction delays or stoppage by discovery of Archaeological and Cultural Resources; construction impediments caused by concerned groups. Virtually every major construction project on Oahu has been either stopped or significantly delayed because of anticipated or actual discovery of Archaeological Resources. There will be no exception for this project. The City should expect construction delays of uncertain length. The impact of this scenario needs to be addressed in the financial Risk Analysis.
- Operating risks. In addition to those mentioned in the DEIS there is a risk that speeds will have to be reduced or headways extended for a variety of reasons: e.g., longer stops needed at stations, too noisy in sensitive residential neighborhoods. This will have a definite impact on cost. The financial implications of these situations on operating costs and/or cost of mitigation need to be assessed.

A major concern of many residents is the impact that cost over-runs (either capital or operational) will have on quality-of-life programs for the benefit of the general public, such as: parks, recreational facilities, road quality. This concern extends to the impact that higher taxes will have on disposable income, and thus quality-of-life on a daily basis for each individual and family.

FTA guidelines indicate that a comprehensive Risk Analysis has the potential to increase efficiency and reduce project costs. It is imperative the risks associated with this Project be addressed in much greater detail in the SEIS or FEIS.

E. Economic Impact

The DEIS must meet the requirements of both Federal and State EIS standards. It is clear from Hawaii Revised Statutes Chapter 343 that the DEIS should disclose "*the environmental effects of a proposed action, effects of a proposed action on the economic welfare, social welfare, and cultural practices of the community and State, effects of the economic activities arising out of the proposed action, measures proposed to minimize adverse effects, and alternatives to the action and their environmental effects.*"

Section 4.2 of the DEIS (*Economic Activity*) assesses the impact of the Project on specific economic elements in the study corridor, but fails to consider the more global economic impacts on the economic welfare and social welfare of the community (island of Oahu) either in this section or in cumulative effects. It covers the impact on employment, and the positive and negative impacts the Project will have on property values and tax revenues for properties near the guideway. But it fails to address the Project's impact on property taxes for all property owners on Oahu.

It also fails to assess the impact that capital costs of the Project will have on the long-term *economic and social welfare* of the people, or on other infrastructure projects (e.g., roads, sewers, parks) and social programs. Financing of the Project capital cost via the GET surcharge costs each individual on Oahu ~\$125-150 each year (~\$500-600 per family) and will continue for 16 years through 2022. In total, each family will contribute ~\$20K (YOE \$s) towards the capital cost of the project. The 0.5% GET surcharge has already impacted the lives of many residents, and could impact many more because of the economic downturn in the local and national economy. The GET is a regressive tax and thus impacts the economic (and social) welfare of lower-income families more than higher-income families. There is no mention of these effects in the DEIS or supporting references.

Any shortfalls in Operating and Maintenance costs are "*assumed to be funded through City subsidies from its General and Highway Funds*" (DEIS p. 6-10). Today, Operating and Maintenance subsidies represent ~10% of the County's General Fund (which is 70% funded by property tax revenues) and are expected to increase to 14-15% in 2018 (DEIS Fig. 6.3). This translates to an increase of ~\$40M to \$50M (2008 \$), or ~\$44 to \$55 for each resident each year (~\$170 to 220 per family), which will have to be funded by an increase in property tax of ~5 to 6% (despite the Administration's denial that there will be a need to increase property taxes for this purpose).

Note to correct misstatement in DEIS: To rationalize the curve in Figure 6-3 (resulting in a concomitant lower O&M cost as % of General Fund since 2002), it is stated in the DEIS, p.6-7, that "City revenues have increased, as a result of large increases in real estate values on O'ahu". This is a statement that the City has used repeatedly to rationalize why real estate taxes (revenues) have increased dramatically over the past five years. The corollary to this statement must also apply: *City revenues will decrease as a result in decreases in real estate value.* But this corollary will prove to be incorrect because of City statute. In reality, real estate revenues have increased because of increases in the City's operating budget (and thus need for additional revenues) proposed by the Administration and approved by City Council; real property taxes, according to the City's ROH Sec. 8-11.1, are determined by the product of real property values times the tax rate – and not real property values alone. In fact if real property values decreased during the same period, statute requires that the tax rate increase to provide sufficient revenue to support the budget.

The City's share of project cost of \$4.2 billion (YOE) will be irretrievably lost from other projects (e.g., sewer repair and maintenance, sewage facility upgrades, H-power waste-to-energy expansion, landfill expansion/relocation, road repair and maintenance, etc.), and the community may not have the resources to fund both the Project and these other necessary projects. There should be no dispute that the Project will have a significant impact on the economic and social welfare of residents of Oahu. It is critical that the EIS evaluate these impacts.

F. Omission of Extensions from detailed discussion in the DEIS

The thesis on the first page of this discourse is amplified by the omission of the three "planned extensions" (to West Kapolei, University of Hawaii at Manoa, and Waikiki) from detailed analysis and discussion in the DEIS. The extensions are covered superficially as "cumulative" effects; even though the latter two extensions have greater potential impact on the environment (and cost) than the defined "Project" (Minimum Operable Segment). The Locally Preferred Alternative should not have been segmented into the "Project" plus three extensions for this EIS, but evaluated in its entirety. To cover the extensions as "cumulative" effectiveness does injustice to the process and the public. The use of the term "First Project" to describe the "Project" indicates full intention to complete the Locally Preferred Alternative at some point. Admittedly, inclusion of the extensions might change the overall conclusions of the DEIS – which is all the more reason for including them.

G. Air Quality (Section 4.8)

This section compares "regional [Oahu] mobile source pollutant burdens" for the three Build Alternates and the No Build.

"Air quality effects predicted to result from the Project's operation are based on the anticipated vehicle miles traveled (VMT) and average network speed for each alternative." (p. 4-94)

"If the electricity used to operate any one of the Build Alternatives is generated by combustion, this may produce additional emissions. However, these emissions would be offset in whole or part by the reductions generated by reduced VMT. Furthermore, power plant emissions may be much more easily controlled than emissions from individual automobiles." (p. 4-95)

These two statements indicate that pollution burdens of the four Alternatives have been calculated based solely on VMT, and that pollution caused by generation of electricity used by the Project is not included. The most audacious and ludicrous statement is that "power plant

emissions may be much more easily controlled than emissions from individual automobiles.” At the present time there is no cost-effective process to do this, and none is foreseen in the immediate future.

To the best of my knowledge, electricity from the project will come from HECO; 90% of whose energy comes from combustion of fossil fuels and trash. It is unlikely that this situation will change significantly in the future. If one considers this additional pollution source, the pollution generated by all four Alternatives is essentially the same, making the following statement false:

“It is anticipated that the Project would reduce regional pollutant emissions by between 3.2 to 4.0 percent (varying by Build Alternative) compared to the No Build Alternative (Table 4-12)” (p. 4-95)

In addition, the analysis does not reflect or even consider the impact of improved automobile efficiency (which is guaranteed to happen).

H. Downtown Station Location (a curious situation)

The Dillingham Transportation Building is one of the most architecturally and historically significant buildings in downtown Honolulu; it is on the Hawaii Register of Historic Places. Yet, the current plan is to locate the entrance to the Downtown Station in full view of (and partially encroaching into) the building’s courtyard. Several alternatives have been considered, but all have been dismissed for a variety of reasons.

However, one of the alternatives requires comment. The “Fort Street” location would move the whole station in the Ewa direction to Fort Street with an entrance at either Walker Park or the Fort Street Mall on the mauka side of Nimitz and an entrance in Irwin Memorial Park on the makai side. A modification to this plan would be to place the mauka entrance *Koko Head* side of Walker Park on private TMK parcel 21013006. This alternative would completely avoid affecting the Dillingham Transportation Building and Walker Park. What is most interesting in the DEIS are the explanations on why this location is not feasible:

“However, this station location would require a 250-foot curve radius to maintain a minimum distance between the edge of the station platform and end of curve. A 250-foot curve radius is substantially less than the Project’s design criteria of 500 feet. Such a tight radius would necessitate reducing speeds to 5 to 10 miles per hour, which is substantially below the Project’s design speed of 30 miles per hour. This would result in increased travel time and a substantial decrease in user benefits.” (p. 5-34) First, the current design radius is 600 feet, and with only slight changes in alignment on Nimitz Avenue, a radius of 500 feet could be maintained. Secondly, this curve is right at the entrance/exit to the station, and all trains should be going less than 10 miles per hour at that point.

“Additionally, placing an entrance makai of Nimitz Highway would impact Section-4(f)-protected Irwin Memorial Park, and a mauka entrance would block either the Fort Street Mall or Walker Park, another Section 4(f) resource.” As discussed above locating the entrance on private property on the mauka side of Nimitz eliminates the 4(f) concern there, and even though location of the makai entrance in Irwin Park represents a 4(f) impact, it has less historical and architectural significance than locating it next to the Dillingham Transportation Building.

Thus, this location seems to be pretty attractive. One wonders what the real reason is for locating the station in front of the Dillingham Transportation Building with an entrance in the adjacent courtyard.

Waimanalo, Hawaii 96795

Dear Mr. Ubersax:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

A. Selection and Evaluation of Alternatives

The Build Alternatives included in the Draft EIS are all similar, in that they have been developed through FTA's Project Development Process and meet the Purpose and Need for the Project. As described in Chapter 2 of the Final EIS, the process, as outlined in FTA guidance, has been followed to evaluate a broad range of alternatives and identify the Preferred Alternative. During the Draft EIS scoping process, the public and agencies were requested to comment on the alternatives that resulted from the Alternatives Analysis and were proposed to be carried forward into the Draft EIS and to identify any other reasonable alternatives that would meet Purpose and Need at lower cost or with fewer environmental impacts. No such alternatives were identified, aside for

the ones included in the Draft EIS. The Draft EIS precisely addresses the requirements of 40 CFR § 1502.14.

For further information, Chapter 2 of the Final EIS summarizes the alternatives screening and selection process. Beginning in the fall of 2005, an initial screening process considered alternatives identified through previous transit studies, a field review of the study corridor, an analysis of current population and employment data for the study corridor, a literature review of technology modes, ongoing work completed as part of the Oahu Regional Transportation Plan 2030 (ORTP) prepared by the Oahu Metropolitan Planning Organization (OahuMPO) (OahuMPO 2007), and public and agency comments received during the formal Alternatives Analysis scoping process.

The screening process is documented in the Honolulu High-Capacity Transit Corridor Project Alternatives Screening Memorandum (DTS 2006a). Three scoping meetings were held during the screening process in December 2005, which included a presentation of initial alternatives to the public, interested agencies, and officials to receive comments on the Purpose and Need, alternatives, and scope of the Alternatives Analysis. Refinements were made to the alternatives based on the public input during scoping.

After completion of screening in the winter of 2006, the following alternatives were studied in the Alternatives Analysis: No Build Alternative, Transportation System Management (TSM) Alternative, Managed Lane Alternative, and the Fixed Guideway Alternative. After review of the Alternatives Analysis Report and consideration of public comments, the City Council identified a fixed guideway transit system extending from Kapolei to UH Manoa with a connection to Waikiki as the Locally Preferred Alternative. This identification, which eliminated the TSM and Managed Lane Alternatives from further consideration, became Ordinance 07-001 on January 6, 2007. The NEPA process considered a range of alternatives that was consistent with the identified Locally Preferred Alternative. As discussed in Section 2.2, there were no alternatives that had not been previously studied and eliminated for good cause that would satisfy the Purpose and Need at less cost, with greater effectiveness, or less environmental or community impact.

Regarding your comments on visual impacts, the assessment of visual effect due to the Project as described in Section 4.8.3 of the Final EIS considers changes to the visual landscape and viewer responses to those changes. This includes the existing development along the Project alignment. Within the Project corridor the environment changes from rural at the Wai'anae end of the corridor to dense high-rise development at the Koko Head end.

As part of the design process, the City has developed design principles, which are identified in the Honolulu High-Capacity Transit Corridor Project Compendium of Design Criteria (RTD 2009m) that will be implemented in final design to minimize visual effects of the Project. For example, guideway materials and surface textures will be selected in accordance with generally accepted architectural principles to achieve effective integration between the guideway and its surrounding environment. Landscape

and streetscape improvements will mitigate potential visual impacts, primarily for street-level views.

Other measures to address visual impacts of the Project are being developed through the station design and planning process. The initial station area plans and design guidelines were first developed with coordination between DTS and the Department of Planning and Permitting (DPP). The next level of transit station design focuses on integrating individual neighborhood characteristics of the communities served by the stations.

The following mitigation framework will be included in the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

- Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
- Coordinate the project design with City TOD planning and DPP.*
- Consult with the communities surrounding each station for input on station design elements.*
- Consider specific sites for landscaping and trees during the final design phase when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will serve to mitigate potential visual impacts.*

Section 4.8.3 of the Final EIS, Design Principles and Mitigation includes information related to the mitigation framework described above. Specifically architecture and landscape design criteria include guidelines regarding site design, materials and finishes, and lighting, which apply to stations, station areas, and the guideway.

The Project's effects on historic sites are discussed in Section 4.16 of the Final EIS. Under Section 106, the City has complied the requirements to identify and address any impacts to historic properties. These have been further reviewed through an extensive consultation process including private and public historic and agency interests such as the State Historic Preservation Division, National Park Service, Advisory Council on Historic Preservation, etc. in addition to the Federal Transit Administration..

Regarding your concerns about noise, according to the FTA Manual (Section 2.5.7), "The Lmax descriptor is not recommended for transit noise impact assessment..." Separately described maximum noise levels are not necessary to the calculation of the Day Night Average Sound Level (Ldn), which is the prescribed metric (sound descriptor) to be used in an FTA noise impact analysis for residential uses or the Equivalent Sound Level (Leq), which is used for sensitive uses without a "sleeping" component. The maximum sound level is included in the Sound Exposure Level descriptor of rail transit noise that was used to calculate future project operational Ldn

and Leq noise levels. The information provided in Appendices E and F of the FTA Guidelines may be used to calculate the Lmax if desired.

a) The Alternatives Screening Memorandum (DTS 2006a) recognized the visually sensitive areas in Kakaako and Downtown Honolulu, including the Chinatown, Hawaii Capital, and Thomas Square/Honolulu Academy of Arts Special District. To minimize impacts on historic resources, visual aesthetics, and surface traffic, the screening process considered 15 combinations of tunnel, at-grade, or elevated alignments between Iwilei and Ward Avenue. Five different alignments through Downtown Honolulu were advanced for further analysis in the Alternatives Analysis, including an at-grade portion along Hotel Street, a tunnel under King Street, and elevated guideways along Nimitz Highway and Queen Street (Figure 2-4).

The Alternatives Analysis Report (DTS 2006b) evaluated the alignment alternatives based on transportation and overall benefits, environmental and social impacts, and cost considerations. The report found that an at-grade alignment along Hotel Street would require the acquisition of more parcels and could potentially affect more burial sites than any of the other alternatives considered. The alignment with at-grade operation Downtown and a tunnel under King Street, was not selected because of the environmental effects, such as impacts to cultural resources, reduction of street capacity, and property acquisition requirements of the at-grade and tunnel sections, which would cost an additional \$300 million.

The Project's purpose is "to provide high-capacity rapid transit" in the congested east-west travel corridor (see Section 1.7 of the Final EIS). The need for the Project includes improving corridor transit mobility and reliability. The at-grade alignment would not meet the Project's Purpose and Need because it could not satisfy the mobility and reliability objectives of the Project (see bullets below). Some of the technical considerations associated with an at-grade versus elevated alignment through Downtown Honolulu include the following:

- **System Capacity, Speed, and Reliability**—The short, 200-foot (or less) blocks in Downtown Honolulu would permanently limit the system to two-car trains to prevent stopped trains from blocking vehicular traffic on cross-streets. Under ideal operational circumstances, the capacity of an at-grade system could reach 4,000 passengers per hour per direction, assuming optimistic five minute headways. Based on travel forecasts, the Project should support approximately 8,000 passengers in the peak hour by 2030. Moreover, the Project can be readily expanded to carry over 25,000 in each direction by reducing the interval between trains (headway) to 90 seconds during the peak period. To reach a comparable system capacity, speed, and reliability, an at-grade alignment would require a fenced, segregated right-of-way that would eliminate all obstacles to the train's passage, such as vehicular, pedestrian, or bicycle crossings. Even with transit signal priority, the at-grade speeds would be slower and less reliable than an elevated guideway. An at-grade system would travel at slower speeds due to the

shorter blocks, tight and short radius curves in places within the constrained and congested Downtown street network, the need to obey traffic regulations (e.g., traffic signals), and potential conflicts with other at-grade activity, including cars, bicyclists, and pedestrians. These effects mean longer travel times and far less reliability than a fully grade-separated system. None of these factors affects an elevated rail system. The elevated rail can travel at its own speed any time of the day regardless of weather, traffic, or the need to let cross traffic proceed at intersections.

- **Mixed-Traffic Conflicts**— *The Project will run at three minute headways. However, three-minute headways with an at-grade system would prevent effective coordination of traffic signals in the delicately balanced signal network in downtown Honolulu. A disruption of traffic signal cycle coordination every three minutes would severely affect traffic flow and capacity of cross-streets. Furthermore, there would be no option to increase the capacity of the at-grade rail system by reducing the headway to 90 seconds, which would only exacerbate the signalization problem. An at-grade system would require removal of two or more existing traffic lanes on affected streets. This effect is significant and would exacerbate congestion. Congestion would not be isolated to the streets that cross the at-grade alignment but, instead, would spread throughout Downtown. The Final EIS shows that the Project's impact on traffic will be isolated and minimal with the elevated rail, and, in fact will reduce system-wide traffic delay by 18 percent compared to the No Build Alternative (Table 3-14 in the Final EIS). The elevated guideway will require no removal of existing through travel lanes, while providing a reliable travel alternative. When traffic slows, or even stops due to congestion or incidents, the elevated rail transit will continue to operate without delay or interruption.*

An at-grade light rail system with continuous tracks in-street would create major impediments to turning movements, many of which would have to be closed to eliminate a crash hazard. Even where turning movements are designed to be accommodated, at-grade systems experience potential collision problems. In addition, mixing at-grade fixed guideway vehicles with cars, bicyclists, and pedestrians presents a much higher potential for conflicts compared to grade-separated conditions. Where pedestrian and automobiles cross the tracks in the street network, particularly in areas of high activity (e.g., station areas or intersections), there is a risk of collisions involving trains that does not exist with an elevated system. There is evidence of crashes between trains and cars and trains and pedestrians on other at-grade systems throughout the country (e.g., Phoenix, Houston, LA). This potential would be high in the Chinatown and Downtown neighborhoods, where the number of pedestrians is high and the aging population presents a particular risk.

- **Construction Impacts**— *Constructing an at-grade rail system could have more effects than an elevated system in a number of ways. The wider and continuous footprint of an at-grade rail system compared to an elevated rail system (which touches the ground only at discrete column foundations, power*

substations, and station accessways) increases the potential of utility conflicts and impacts to sensitive cultural resources. In addition, the extra roadway lanes utilized by an at-grade system would result in increased congestion or require that additional businesses or homes be taken to widen the roadway through Downtown. Additionally, the duration of short-term construction impacts to the community and environment with an at-grade system would be considerably greater than with an elevated system. Because of differing construction techniques, more lanes would need to be continuously closed for at-grade construction and the closures would last longer than with elevated construction. This would result in a greater disruption to business and residential access, prolonged exposure to construction noise, and traffic impacts.

Because it is not feasible for an at-grade system through Downtown to move passengers rapidly and reliably without significant detrimental effects on other transportation system elements (e.g., the highway and pedestrian systems, safety, reliability, etc.), an at-grade system would have a negative system-wide impact that would reduce ridership throughout the system. The at-grade system would not meet the Project's Purpose and Need and, therefore, does not require further analysis.

b) Bus-based transit was evaluated during the Alternatives Analysis in two forms. The Transportation System Management (TSM) Alternative evaluated buses operating within the current system with minor system upgrades. The Managed Lane Alternative considered construction of a semi-exclusive guideway. As described in Chapter 2 of the Final EIS, neither of these alternatives was as effective at meeting the goals of the Project as is the Fixed Guideway Alternative. Furthermore, the fixed guideway relies on the bus system to support its operation, so there is significant consideration of bus in the Project. The performance of any bus-only system, even a BRT-based bus system, cannot approach the performance of the Project because it will continue to be exposed to the vagaries on daily congestion.

c) In "Chapter 2 – Alternatives Considered" of the Alternatives Analysis Report, November 2007, as well as in "Chapter 2 – Alternatives Considered" of the Final EIS, two options were considered for the Managed Lane Alternative: Two-direction and Reversible. This alternative would have provided a two-lane elevated toll facility between Waipahu and Downtown Honolulu, with variable pricing strategies to maintain free-flow speeds for transit and high-occupancy vehicles (HOVs).

The Two-direction Option would have served express buses operating in both directions during the entire day. To maintain free-flow speeds in the Two-direction Option, it may have been necessary to charge tolls to manage the number of HOVs using the facility. For the Reversible Option, three-person HOVs would have been allowed to use the facility for free, while single-occupant and two-person HOVs would have had to pay a toll. Of the two options studied, the Reversible Option was found be preferable.

As also discussed in Chapter 2 of the Final EIS, transit reliability would not have been improved except for express bus service operation in the managed lanes. While this alternative would have slightly reduced congestion on parallel highways, system-wide traffic congestion would have been similar to the No Build Alternative as a result of increased traffic on arterials trying to access the facility. Total islandwide vehicle hours of delay (VHD) would have increased with the Managed Lane Alternative compared to the No Build Alternative, indicating an increase in systemwide congestion (see Table 2-2 of Final EIS).

The Alternatives Analysis did address the Managed Lane Alternative in detail, including ramps at key locations. It did not perform as well as the fixed guideway and was, as a consequence, eliminated from further consideration. There is a trade-off between, the number of access points and the performance of the facility. More ramps means improved accessibility from more locations, but it can have a detrimental effect on traffic flow compared to the longer stretches of unimpeded operation. More ramps also significantly adds to the cost of the facility, which was not covered in the EZWay concept. Each ramp requires about 1000 feet (including transitions) for safe access to the exit and the equivalent for an on-ramp merging move. That means about 2000 additional feet of structure at least 12 feet wider than the mainline width at each ramp location. In addition, there is the effect of the ramps on properties in the communities in which they are placed. The only certain effect of additional ramps is a higher project cost for the added ramps compared to the Managed Lane Alternative as well as access for more vehicles would likely mean higher tolls to maintain free-flow operation. Tolls needed to be about \$6.40 using the configuration in the Alternatives Analysis.

While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been identified as the Preferred Alternative as described above. Compared to the other alternatives discussed in the Draft EIS, the Airport Alternative will carry more passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly lower impacts to the natural and built environment. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative.

The Alternatives Analysis phase, which as noted earlier, preceded the EIS process, is documented in Chapter 2 of the Final EIS. It evaluated a range of modal and general alignment alternatives, in terms of their costs, benefits, and impacts. The scoping process for the Alternatives Analysis involved a presentation of the viable alternatives to the public and interested public agencies and officials to receive comments on the Purpose and Need, alternatives, and
