scope of the analysis. Scoping for the EIS followed the FTA process that provides for a culling of alternatives studied in the EIS through an Alternatives Analysis. The scoping process initiated for the Alternatives Analysis included a variety of highway, bus and fixed guideway options for consideration. During the later scoping effort for the EIS, the public was requested to propose alternatives that would satisfy the purpose and need at less cost or with greater effectiveness, less environmental or community impact and to propose alternatives that were not previously studied and eliminated for good cause. The only alternative that emerged that met these criteria was a fixed-guideway alternative following several alternative alignments. All reasonable alternatives that emerged from these processes were ultimately evaluated in the Draft and Final EISs.

Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts, and mitigation commitments.

The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the FTA's NEPA regulations that state that the Final EIS should focus on the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative, public input on the Draft EIS, and City Council Resolution 08-261 identifying the Airport Alternative as the Project.

B. Transit-User Benefits and Cost-Effectiveness of the Project

a) User Benefits - User benefit information is discussed in Addendum 01 to the Travel Demand Forecasting Results Report and Travel Forecasting Results and Uncertainties Report, available on the project website (www.honolulutransit.org). The values used in the development of travel demand information and user benefits are not arbitrary or negotiated. FTA approves them based on evidence derived from systems in operation throughout the country for systems comparable to the type being developed for Honolulu. The analysis steps that led to the numbers in Chapter 7 of the Draft and Final EISs are defined by the FTA. Over the course of refinement in the model application, many things change. Many elements comprise the user-benefit calculation. Some are related to travel time or cost savings; others are related to the overall improvement in transportation-system performance derived from the Project. The user benefits, for example, could change if there is a change in ridership resulting from new information incorporated into the model. Cost-effectiveness for the other options evaluated did not rise to the level of the fixed guideway despite their lower overall project costs. The incorporation of "non-included attributes" in the calculation of user benefits is fully consistent with FTA guidance.

The question of safety is presented in Section 2.5.4 of the Final EIS as a benefit of the planned system and is corroborated by Bureau of Transportation Statistics (BTS) data that show the vast majority of rail-related collisions occur at grade crossings. (There are no grade crossings in the proposed system.) The convenience and ease of use of the fixed guideway is related to visibility (it is easy to find), understandability of travel options (the guideway connects origins and destinations in a single line), minimal headways (no waiting), travel comfort (smoother acceleration or deceleration than typical buses), and reduced travel time.

As stated in Chapter 3 of the Final EIS, with the Project, the rate of transfers will be higher than under the No Build Alternative because of changes in local bus service to maximize access to the fixed guideway system. However, because of the high frequency of the fixed guideway service (three-minute headways between trains during peak periods), riders transferring from buses to the fixed guideway will experience minimal wait times. Riders transferring from the guideway service to buses will benefit from improved frequencies on existing bus routes serving stations. In addition, several new routes with high frequencies will be provided as feeders to the guideway system. Since these routes will primarily operate in residential areas, they will provide greater reliability versus routes operating along congested arterials. The travel demand forecasting model includes a time penalty for transfers. With these characteristics in place, the transit system with the Project would still have ridership levels 44 percent higher than the No Build Alternative. While people typically try to minimize transfers on any trip, the more fundamental criterion for making a trip decision is how long the trip takes. Rail will offer people a shorter overall trip time compared to other options, even with the transfers, as noted in Figure 3-7 of the Final EIS.

As discussed in Chapter 2 of the Final EIS, the design of stations and public areas will apply Crime Prevention through Environmental Design principles to minimize the incidence of crime. These measures have proven effective with other systems.

b) Cost-Effectiveness Index - Extensions of the fixed guideway are not part of the Preferred Alternative in the Final EIS. Cost-effectiveness consists primarily of calculating the benefit derived by users of the system in terms of time saved and cost as required by the FTA. The FTA specifies how these factors are to be used and how they must be reported to arrive at the cost-effectiveness index that will be reported for the Project. The same procedure is used for all projects reviewed by the FTA.

The cost effectiveness index (CEI) is a measure of the project's ability to meet FTA qualifications for Federal funding. The CEI compares the benefits that accrue to users as a result of the fixed guideway system being in place compared to the annualized costs (operating and capital) of the Project. The changes in the CEI are the result of more comprehensive development of both costs and user benefits and review by the FTA. Since the Alternatives Analysis, ridership

projections for the system have increased while the costs are comparatively the same.

As indicated in Table 7-7 of the Draft EIS, the Airport Alternative has a CEI of \$17.78/hour. This is well below the \$24.99/hour level currently required by FTA for a project to be cost-effective. Ridership and cost estimates are based on the best information available and have been developed consistent with FTA guidance and under FTA scrutiny. Even at lower ridership levels or higher costs, the Project would still qualify under FTA's CEI criterion.

Since the Draft EIS was published, the travel demand model has been refined by adding an updated air passenger model (which forecasts travel in the corridor related to passengers arriving or departing at Honolulu International Airport), defining more realistic drive access modes to project stations (driving alone or carpooling), and recognizing a more robust off-peak non-home-based direct-demand element (trips that do not begin or end at home) based on travel surveys in Honolulu. The ridership and user-benefit forecasts presented in the Final EIS have been reviewed and approved by the FTA. The cost-effectiveness index of the Project, as shown in Table 7-8 of the Final EIS, is \$16.24/hour.

An elevated, fully automated transit system has lower operating and maintenance costs compared to an at-grade system operated by drivers. User benefits are higher because the performance of the elevated system is substantially higher than an at-grade system. This has been evidenced by grade-separated systems throughout the U.S.

The cost-effectiveness of the full LPA is not germane to the Project as it is not part of the project for which finding is being requested. At a future time, when the planned extensions are considered, new information about costs will be developed and evaluated, including a cost-effectiveness index of that project.

C. Modal Predictions

All model applications must conform to the requirements imposed on such work by the FTA. The FTA reviews, comments, and ultimately approves the model forecasts, including ridership numbers, to be used in all analyses. The FTA understands that an element of risk exists in model-generated travel forecasts. The FTA establishes the required practice and the ongoing review procedures with that in mind. The reports prepared as a result of the process discuss the risk elements and the steps taken to minimize them in the use of the numbers resulting from the application of the model. While ranges are not part of the FTA's current requirements, uncertainty analysis conducted for the Project show that the limits for ridership are between 105,000 and 130,000 riders a day, bracketing the official forecast of 116,000 riders a day used for all calculations. Chapter 3 in the Final EIS has been revised and now discusses the uncertainty analysis conducted for the Project and the anticipated limits for guideway ridership. The model has been validated and calibrated against the on-board survey conducted in 2005 and traffic ground counts taken in 2005, 2007 and 2008. Validation

and calibration are discussed in the Model Development, Calibration, and Validation Report, available on the project website (www.honolulutransit.org).

a) Ridership Model - As stated in Section 3.4.2 of the Draft EIS, "service frequency would be lower on the Airport & Salt Lake Alternative where the two lines are parallel, so slightly fewer fixed guideway boardings are projected for this alternative." For the analysis, the operation of the system is assumed to "split" the train trips between the Airport alignment and the Salt Lake alignment in the Airport & Salt Lake Alternative. As a result, headways on the parallel portions of the track will be approximately twice as long as headways on the other parts of the track (East Kapolei to Aloha Stadium and Middle Street to Ala Moana Center). This maintains the overall frequency of the system. In effect, the system would approximately average the number of trips between the two branches. Hence, the number of passengers should be between the Airport and the Salt Lake levels, as noted in Chapter 3.

Mahalo for bringing your next points to our attention. This error did not have any effect on the information presented in the Draft or Final EISs. Table 4-11 has been corrected in the Addendum 01 to the Travel Demand Forecasting Results Report.

b) Calculation and Interpretation of Congestion Data - The travel demand model used in the analyses for the Alternatives Analysis and the Draft and Final EISs was calibrated and validated based on the latest information available at the time. There are revisions that result from land use policy changes, demographic trends, and travel behavior, among others. For example, the model was recalibrated and validated after the Alternatives Analysis to incorporate information collected from surveys of bus users. It also incorporated changes in land use information throughout the corridor. The model will be updated periodically and the changes will be reflected in documents prepared at different times. The results are still the best information available and the basis for comparing the options under consideration. This is consistent with requirements imposed by the FTA which evaluates travel demand models very closely to avoid unreasonable forecasts. The model shows that a small decrease in cars can cause dramatic decreases in delay.

Validation of the travel forecasting model was done using 2005 traffic data and transit ridership information. This information is presented in the Model Development, Calibration, and Validation Report available on the project website (www.honolulutransit.org). Any increase or decrease in results is generated by the model in response to external variables such as land use data and travel information. The Managed Lane Alternative was analyzed in the Alternatives Analysis using the same tool used to analyze the fixed guideway and did not produce comparatively favorable results. As a consequence, it was eliminated from further consideration. The issue with the alternative proposed in the comment letter is that the time savings was "assumed". In other words, it was exogenously developed. In the travel demand model, that number is developed

internally in the model based on the network and socio-economic data inputs. The model does not "select" a time savings to arrive at a particular outcome. As stated above, the same approach was used for all alternatives studied throughout the project development process.

D. Project Risks and Uncertainties

The FTA specifies contingencies based on the stage of a project. Contingencies increase before Preliminary Engineering and decrease as contract documents are prepared based on Final Design. FTA has performed an independent risk analysis on the Project's cost estimates and found them within the appropriate risk range for this stage of the Project. Further evaluations of risk will be completed before the project receives final federal approval.

Section 6.3 of the Final EIS describes the funding sources anticipated to be used to pay for the capital costs of the Project and the City's overall public transportation system. Capital costs of the Project, including finance charges, are expected to be fully paid for by a combination of FTA Section 5309 New Starts Funds and FTA Section 5307 Funds from the Federal government and the Count General Excise and Use Tax (GET) surcharge levied from 2007 through 2022.

In addition, Section 6.4 of the Final EIS describes the funding sources to pay for ongoing operating and maintenance costs associated with maintaining the resulting transit system in a state of good repair. Operating and maintenance costs will be paid for from the same sources currently used for TheBus: Federal funding, fare revenues, and subsidies from the City's General and Highway Funds.

The capital plan for the Project is presented in Section 6.3 of the Final EIS and includes a description of the amount of funding anticipated from various sources. This section also describes risks and uncertainties associated with these funding assumptions. It is worth noting that the amount to be derived from the GET Surcharge in the Final EIS is \$3.5 billion to reflect the effect of the slower economy.

Regarding fare cost recovery, it is the City Council's current policy to maintain fare cost recovery at a level between 27 and 33 percent of total system operating costs. If costs rise, policy provides for an increase in fares, which has been implemented in the past.

Your letter also addresses concerns about encountering iwi kupuna (Hawaiian burials). Section 4.16 of the Final EIS notes the likelihood of encountering iwi kupuna during construction. The City is working closely with the Oahu Island Burial Council to develop a plan to sample the corridor far in advance of construction to allow more time to resolve any questions or concerns that may arise as a result of finding burial remains along the route. This will also allow time to take appropriate action in keeping with affected lineal or cultural descendants wishes and State law.

The operating risks are incorporated in the operations planning work being done for the Project. Assumptions used in developing the plans have been reviewed by FTA third-party experts to ensure consistency with other guideway systems' operating practices.

FTA imposes strict guidelines for estimating costs to prevent concerns, such as the potential overruns mentioned in the comment. Cost estimates are thoroughly scrutinized by various FTA third party representatives, and risks and uncertainties are considered in developing financial plans for the Project. Chapter 6 of the Final EIS discusses this, along with other financial information.

The financial elements of the Final EIS are based on the August 2009 Financial Plan which is a more advanced level of analysis than was available in the Draft EIS.

E. Economic Impact

Beyond collection of property taxes that fund City operations, for which the City develops rates on an annual basis and part of which will fund transit services, there is no anticipated impact to property taxes for Oahu residents. Fixed guideway operation costs will represent between 2 and 3 percent of the City's annual operating budget.

The GET surcharge that funds the capital costs of the Project is a dedicated revenue source that the City Council adopted to pay for a priority concern of the community. Each of the other long-term issues mentioned in the comment will be addressed by the Council in an appropriate manner. Your other comments about the GET surcharge are noted but do not pertain to the project alternatives or effects. As indicated above and in Section 6.4 of the Final EIS, the operating and maintenance costs for the fixed guideway represent between 2 and 3 percent of the City's operating budget.

For further information on economic effects, Section 4.3 of the Final EIS addresses economic impacts, and Section 4.7 of the Final EIS discusses social welfare.

F. Extensions

The Project has logical termini and independent utility from any extensions that may be constructed in the future. The future extensions to East Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS. The future extensions are not part of the Project, thus they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in the Final EIS and the City has not requested funding from the FTA for their construction. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the extensions are proposed for implementation in the

future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time.

G. Air Quality

As stated in Section 4.9.3 of the Final EIS, if the electricity used to operate the Project is generated by combustion, this may produce additional emissions. However, these emissions will be offset in whole or part by the reductions generated by reduced vehicle miles traveled (VMT), as indicated in Table 4-15. Furthermore, power plant emissions may be more easily controlled than emissions from individual automobiles.

Concerning the question about vehicle efficiency, the Project did take that into account. In addition, there would be a greater level of automobile use if the Project were not built (see Greenhouse Gases in Section 4.9.3 of the Final EIS).

The title of Table 4-12 in the Draft EIS was changed from "2030 Regional Pollutant Burdens (kg/day)" to "2030 Mobile Source Regional Transportation Pollutant Burden (kg/day)" in the Final EIS.

The Section 4.9 of the Final EIS was revised to state, "However, these emissions will be offset in whole or part by the reductions generated by reduced VMT, as indicated in Table 4-15."

Emission factors were developed using EPA's MOBILE6.2 Emission Factor program. Regulated fuel-efficiency rates, at the time of analysis, were incorporated into the program. Future fuel efficiency was not included in the analysis.

Also worth noting is the effort to replace fossil fuels with renewable sources of energy by HECO. As stated in the comment, this could take a long time, but as the sources of energy become "greener", so too will the Project.

H. Downtown Station Location

To maintain a 500-foot radius curve in that location would require realignment of Nimitz Highway farther into the harbor, reconfiguration of Nimitz Highway with fewer Koko Head-bound lanes, or construction of several large straddle-bent structures over the Koko Head-bound lanes of Nimitz Highway. This is not a practical alternative.

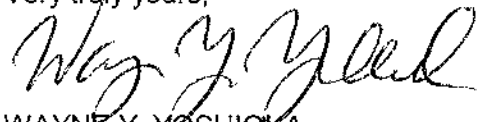

Under this avoidance alternative, the entrances would be in Irwin Memorial Park on the makai side and either Walker Park or Fort Street Mall on the mauka side. However, this station location would require a 250-foot curve radius to maintain a minimum distance between the edge of the station platform and end of curve. A 250-foot curve radius is less than the Project's design criteria of 500 feet. This tight radius would necessitate reducing speeds to 5 to 10 miles per hour, which is below the Project's design speed of 30 miles per hour. This would result in increased travel time and a decrease in user benefits. Additionally, placing an entrance makai of Nimitz Highway would impact Irwin Memorial Park, and a mauka entrance would block either the Fort

Mr. Richard W. Ubersax
Page 15

Street Mall or Walker Park, which are all Section 4(f) protected resources under the U.S. Department of Transportation Act of 1966.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is written in a cursive, flowing style.

Comments on Draft EIS Chapter 4.9 (Noise and Vibration) and Technical Report RTD 2008f
(Honolulu High-Capacity Transit Corridor Project Noise and Vibration Technical Report, October 2008)

Dear Mr. Yoshioka:

I have broken my comments into three separate areas with respect to Chapter on Noise:

- I. The DEIS and Technical Report do not meet the full-disclosure requirements specified in FTA's "Transit Noise and Vibration Impact Assessment" Manual (FTA-VA-90-1003-06, May 2006). It is imperative that modifications to the DEIS be made or included in a Supplementary EIS to satisfy these requirements.
- II. The noise impact criteria methodology used in the DEIS does not adequately address noise impacts for all situations along the guideway. The City should review each of the areas cited in these comments and address them accordingly in the Final EIS or SEIS.
- III. Lack of accountability for operating within noise standards. Since there are no City or State statutes for regulation of noise from mobile sources, objectionable noise from Project operation will be difficult control. It is imperative that appropriate statutes be adopted prior to start-up of any segment of the First Project.

Each of these areas is discussed in detail below. If you have any questions, please feel free to contact me by phone or email.

Respectfully yours,

Richard W. Ubersax

P.S.: I have also sent an electronic copy to you via email.

CONCLUSION:

It will be evident from the discussion that follows that the DEIS has not adequately analyzed noise along the guideway and has grossly underestimated the impact that noise generated by the Project will have on the quality of life of residents living close to the guideway. The DEIS "Summary of Environmental Effects" (DEIS Table 4-1) relating to noise indicates that there will be numerous "Moderate Impact" locations along the guideway, and that *"no feasible and reasonable mitigation is available to reduce moderate noise impacts that remain"*. The number of impacted sites would be much higher, and the level of impact would be more severe if the assessment:

- a) followed the guidelines and recommendations in the FTA "Transit Noise and Vibration Impact Assessment" Manual
- b) considered the open door and window lifestyle of our people, and
- c) extended the study to include the instantaneous noise from each passing train

The ultimate message one gets from the DEIS is that there will be objectionable noise – although grossly understated – and that the City expects us to live with it or deal with it later. The time to deal with it is now, and not later.

It is understandable that the City has tried to gloss over the negatives of the Project; but it is unacceptable to push the Project forward while knowing the problems – and expect the people to accept it. If there is no way to mitigate the impact of noise (or other environmental effects) along sections of the guideway, a new design or route needs to be devised. Anything less is a gross injustice to the people. None of the three Build Alternatives is acceptable in their current form.

I. The DEIS and accompanying Technical Report do not satisfy the "full disclosure" requirements of NEPA.

Although the DEIS and Technical Report RTD 2008f provide much useful information on the fundamentals of noise generation, measurement, assessment criteria, impacts, and mitigation, they do not provide all of the information recommended by the FTA in the "Transit Noise and Vibration Impact Assessment" Manual (FTA-VA-90-1003-06, May 2006).

With respect to recommendations provided in the FTA Manual:

A. General

"To be effective, the noise and vibration analysis must be presented to the public in a clear, yet comprehensive manner. The mass of technical data and information necessary to withstand scrutiny in the environmental review process must be documented in a way that remains intelligible to the public. Justification for all assumptions used in the analysis, such as selection of representative measurement sites and all baseline conditions, must be presented for review." (FTA Manual page 13-1)

Although the Technical Report provides significantly greater detail than the DEIS, it does not provide sufficient detail to withstand "scrutiny" by the informed reader. There are remaining questions regarding the protocol used for determining existing noise, estimating project noise, evaluating noise impact at specific locations, and validation of mitigation measures.

There is also concern about the Project's planned extensions to UH Manoa and Waikiki not being covered in detail in the DEIS.

The Technical Report addresses this issue in the Preface:

"Therefore, the focus of the Draft EIS is on the "First Project," a fundable approximately 20-mile section between East Kapolei and Ala Moana Center. The First Project is identified as "the Project" for the purpose of the Draft EIS.

This technical report documents the detailed analysis completed for the Full Project, which includes the planned extensions, related transit stations, and construction phasing. The planned extensions and related construction planning have not been fully evaluated in the Draft EIS and are qualitatively discussed in the Cumulative Effects section of the Draft EIS as a foreseeable future project(s). Once funding is identified for these extensions, a full environmental evaluation will be completed in a separate environmental study (or studies), as appropriate."

The extensions are an integral part of the ORTP 2030 plan and should be assessed with the same degree of detail in the DEIS as the three Project "alternatives" (Salt Lake alternative, Airport Alternative, and Airport & Salt Lake alternative), especially since the noise impacts of these extensions are expected to be greater and more difficult to mitigate than for the Project. The fact that the DEIS uses the term "First Project" as a descriptor for the "Project" fully indicates that the City's intent is to complete the Full Project, and thus the extensions should be treated with the same level of detail in the DEIS as the Project.

B. Existing Noise

"Measurement procedures should be fully described. Tables of measurement instruments should include manufacturer, type, serial number and date of most recent calibration by authorized testing laboratory. Measurement periods, including time of day and length of time at each site should be shown to demonstrate adequate representation of the ambient conditions. The measurement data should be presented in well organized form in tables and figures." (FTA Manual p. 13-2)

Neither the DEIS nor Technical Report adequately describe details of the methods used for measuring the ambient sound levels at each receptor site. The following information should be included:

- detailed description of measurement instruments and calibration documentation
- precise location of receptor sites (exact coordinates including elevation); location of identified sensitive sites relative to each receptor site (including elevation); location of sensitive sites relative to guideway
- precise time of measurement including day of week, time of day, length of time
- assumptions made in calculations of L_{max} , L_{eq} , L_{dn} , etc.
- unusual occurrences and treatment thereof

C. Prediction of Future Project Noise

"The prediction model used for estimating future project conditions should be fully described and referenced. Any changes or extensions to the models recommended in this manual should be fully described so that the validity of the adjustments can be confirmed. Specific data used as input to the models should be listed. Computed levels should be tabulated and illustrated by contours, cross-sections or shaded mapping. It

is important to illustrate noise/vibration impacts with base maps at a scale with enough detail to provide location reference for the reader." (FTA Manual p. 13-2)

Neither the DEIS nor Technical Report describe the methodology used for estimating project noise. The following information should be included:

- detailed description of prediction model, and if different from that recommended in FTA-VA-90-1003-06, the justification for deviation; any adjustments to the model should be described in detail.
- specific data used as input to the model should be described including:
 - source reference noise level (unmitigated and mitigated) with supporting details (i.e., vehicle configuration, vehicle speed); details of mitigation techniques and comprehensive justification of mitigated levels (i.e., effect of skirts and parapet wall independently, and combined effect)
- tabulated results for each specific receptor (and relevant impacted sensitive sites) with all assumptions disclosed
- precise distance between receptor and source
- location of receptors (and sensitive sites) relative to source (i.e., distance above/below source)

It is not clear from the DEIS or Technical Report whether the noise impact of vehicles on opposite tracks are treated the same, or whether converging trains are treated. The distance of the train from the receptor, and mitigation by the intervening parapet wall (and thus the noise impact) will be different depending on train direction. This situation should be analyzed and treated appropriately (with explanation) in the FEIS/Technical Report.

Similarly, the DEIS and Technical Report do not address the impact of reflection of sound energy at locations where the guideway traverses in close proximity to buildings on both sides (e.g., Halekauwila Street, etc., UH Manoa extension, Waikiki extension). If it is determined that reflection is inconsequential, it should be stated with appropriate justification. If not, it should be addressed in the assessment.

The DEIS and Technical Report depict noise impact data as distinct individual points along the guideway at ground-floor elevations (except in locations that included buildings of four or more stories). In the FTA manual, it is recommended that impacts be presented in the form contour maps. It would be highly desirable to represent these contours as a function of distance from the guideway as well as overlays to represent elevations above and below the guideway. The maps should be presented in a scale with enough detail to precisely determine distance of each contour line from the guideway. A format similar to DEIS Appendix A would be acceptable, but at 1" = 100' scale).

D. Mitigation

"The mitigation section of the technical report should begin with a summary of all treatments considered, even if some are not carried to final consideration. Final candidate mitigation treatments should be considered separately with description of the features of the treatment, costs, expected benefit in reducing impacts, locations where the benefit would be realized and discussion of practicality of implementing alternative treatments. With respect to noise impacts, enough information is to be included to allow the project sponsor and FTA to reach decisions on mitigation prior to issuance of the final environmental document." (FTA Manual p. 13-3)

The project already includes an integrated noise-blocking 3'-high parapet wall on each side of the guideway and a system specification for vehicles with wheel skirts. The parapet wall is expected to reduce noise at or below track level, and the skirts to reduce noise at or above track level. Each data point in the DEIS represents the noise impact with the wall and skirt mitigation measures in place; while Appendix A of the Technical Report, provides project noise impacts with and without these mitigation measures. From Appendix A, it is clear that project noise would be "severe" or "moderate" at most receptor sites without the prescribed mitigation measures. Since the proposed mitigation methods provide only an estimate of actual noise attenuation, it is possible that many of the sites listed as "no impact" could actually be "moderate impact" and sites listed as "moderate impact" could actually be "severe impact".

In situations where noise-sensitive sites exist above the guideway, additional mitigation measures might be needed because of reflection from the guideway surface and lower efficiency of the parapet walls. These sites should be identified and additional mitigation measures identified. The DEIS and Technical Report address this issue to some degree, but it would be highly desirable to include specific recommendations and supporting data to support the recommendations.

The FTA Manual recommends that a summary of "all" treatments considered. Although the Technical Report mentions two additional measures, there are numerous others available (such as an additional wall on the centerline of the guideway). These should be described in detail (along with the benefit expected).

The FTA Manual discusses operational restrictions as a means to mitigate noise, but does not impose them because of their impact on system efficiencies, economics, etc.

"Two changes in operations that can mitigate noise are the lowering of speed and the reduction of nighttime (10 pm to 7 am) operations. Because noise from most transit vehicles depends on speed, a reduction of speed results in lower noise levels. The effect can be considerable. For example, the speed dependency of steel-wheel/steel-rail systems for L_{eq} and L_{dn} (see Table 6-4) results in a 6 dB reduction for a halving of the speed. Complete elimination of nighttime operations has a strong effect on reducing the L_{dn} , because nighttime noise is increased by 10 decibels when calculating L_{dn} ." (FTA Manual p.6-41).

The City should anticipate reducing speed in noise-sensitive areas (below the 45 mph initially planned), and incorporate this scenario in the financial risk analysis section of the DEIS.

The maximum acceptable limits for project noise should be specified in the FDIS (or SEIS), along the length of the guideway (depending on noise impact sensitivity). Shortly after commencement of system operation, detailed measurements should be made to ensure compliance with these limits.

To further ensure that noise from the project is within acceptable limits, City Council (or if necessary, State Legislature) should legislate noise limits along the guideway. Prior to issuance of the FEIS, a written commitment from the City (or State) should be made to pass legislation prior to start up of the project that specifies maximum noise allowed at residential building setbacks and requires a reduction in speed if Project noise level exceeds specification until other mitigation measures can be implemented.

II. The DEIS noise impact criteria methodology does not adequately address noise impacts in all situations:

A. FTA criteria underestimate actual noise impact by use of L_{dn} or the L_{eq}

The FTA criteria incorporate average noise measurements and de-emphasize short-term noise occurrences. However, in some cases, the use of L_{max} , or the maximum noise recorded over a short time interval, is a more meaningful measure of unacceptable noise level, as explained in the FTA Manual:

The assessment of noise impact in this manual utilizes either the L_{dn} or the L_{eq} descriptor. As such, in determining impact it is not necessary to determine and tabulate the maximum levels (L_{max}). However, it is often desirable to include computations of L_{max} in environmental documents, particularly for rail projects, because the noise from an individual train pass by is quite distinguishable from the existing background noise. The L_{max} is also the descriptor used in vehicle specifications. Because L_{max} represents the sound level heard during a transportation vehicle pass by, people can relate this metric with other noise experienced in the environment. Particularly with rail transit projects, it is representative of what people hear at any particular instant and can be measured with a sound level meter. "Thus, although L_{max} is not used in this manual as a basis for assessing noise impact, it can provide people with a more complete description of the noise effects of a proposed project and should be reported in environmental documents." (FTA Manual p.6-29)

"Although the maximum noise level (L_{max}) is not used in this manual as the basis for the noise impact criteria for transit projects, it is a useful metric for providing a fuller understanding of the noise impact from some transit operations. Specifically, rail transit characteristically produces high intermittent noise levels, which may be objectionable depending on the distance from the alignment. Thus, it is recommended that L_{max} information be provided in environmental documents to supplement the noise impact assessment and to help satisfy the "full disclosure" requirements of NEPA." (FTA Manual p. 3-9)

This is an especially critical issue in residential areas that are in close proximity to the guideway (<100 feet). In many cases, transit vehicles will pass well within 100 feet, and in some cases as close as 30 feet of windows in residential areas. In these situations, L_{max} would be a more meaningful noise descriptor.

In Hawaii's tropical climate, it is often necessary to keep windows and doors open for personal comfort since many residences do not have air conditioning. In this case, the actual noise of the passing train, L_{max} , is the best measure for judging the real-life impact of the event. Although the FTA noise impact classification might be "No Impact" or "Moderate Impact", affected residents will perceive it as being "Severe Impact". Air conditioning as a mitigation measure would not be accepted by the tropical culture, and would increase the electrical burden of the public.

Neither the DEIS nor Technical Report address this issue even though many residential properties will be severely affected. It is imperative that these issues be addressed in the FEIS or SEIS.

B. FTA criteria underestimate actual noise impact by applying criteria "outside" of residential building locations

"For residential land use, the noise criteria are to be applied outside the building locations at noise-sensitive areas with frequent human use including outdoor patios, decks, pools, and play areas. If none, the criteria should be applied near building doors and windows." (FTA Manual p. 3-10)

As discussed above, the nature of the climate and lifestyle require windows and doors to be open, in some cases year-round. In typical residential construction (double-pane windows and doors), noise can be mitigated by as much as 25 dB; but in Hawaii, with doors and windows open most of the time, the actual noise can be much louder than indicated by the FTA criteria, and thus, although classified as “No Impact” or “Moderate Impact”, should actually be classified as “Moderate Impact” or “Severe Impact”.

Neither the DEIS nor Technical Report address this issue even though many residential properties will be adversely affected. It is imperative it be addressed in the FEIS or SEIS.

C. FTA criteria underestimate actual noise impact by referencing to ambient noise

The FTA criteria for project noise impact is based on average project noise levels compared to average background (ambient) noise levels: higher project noise is permitted at higher ambient noise levels. However, in many cases, the absolute total noise level (sum of ambient and project) should be used to establish the impact of the project on noise severity as described in the FTA Manual:

“Ambient levels above 65 dB (L_{dn}) are considered “normally unsatisfactory” for residential land use by the Department of Housing and Urban Development. Thus there is a stronger need for mitigation if a project is proposed in an area currently experiencing high noise levels from surface transportation. An example would be a project where additional commuter tracks are added to a very busy rail corridor. If this project were placed in a less noisy environment, the impact assessment might show a Severe Impact, but when the project is overlaid on an existing noisy environment, the result could be Moderate Impact or, possibly, No Impact. However, in this situation the new cumulative noise environment may be very objectionable because people will not be compartmentalizing the existing noise versus the new noise and reacting only to the new noise. In this circumstance impacts predicted in the Moderate range should be treated as if they were Severe. (FTA Manual p. 3-12)

In the FEIS or SEIS, every receptor site should be assessed to determine how application of this criterion would affect the noise impact rating.

D. FTA criteria underestimate actual noise impact by time averaging technique

Ambient L_{dn} is averaged over the full 24-hour day, and remains the same whether the Project is operating or not. Noise generated by the Project (L_{dn}) is also a 24-hour average, but the Project is not expected to operate during the nighttime hours of midnight to 4 AM. During this period, project noise is “zero”, so the calculated Project L_{dn} is lower than if trains were running through the night. This calculated L_{dn} could result in a reduction in noise impact from “Severe Impact” to “Moderate Impact” (or “Moderate Impact” to “No Impact”) even though the instantaneous impact (L_{max}) for each train passing is the same, independent of pass-by frequency.

The same effect would be realized if the frequency of passing a specific receptor site were to be reduced, e.g., by increasing headway. Illustrative of this concept is in the comparison of common receptor sites along the Salt Lake Alternative versus the Salt Lake & Airport Alternative. The frequency of passing trains along Salt Lake Blvd for the Salt Lake & Airport Alternative will be one-half of that for the Salt Lake Alternative. Thus, the calculated project noise levels (L_{dn}) for receptors along Salt Lake Blvd for the Salt Lake & Airport Alternative are significantly lower than

for the Salt Lake Alternative. The consequence is that the five high-rise apartments along Salt Lake Blvd (receptors O and 16) are reduced in noise impact from “Moderate” to “No Impact” in the Salt Lake & Airport Alternative, even though the actual noise from each passing train is the same in either case.

These factors should be explained in the FEIS or SEIS so that the general public – especially those living close to the guideway– has a fuller understanding of the adverse impacts of the Project.

III. Accountability

At the present time, there are no State or County statutes for regulation of noise resulting from transit operations on the guideway. Without these statutes, it is virtually impossible for residents to force mitigation through legal channels. The City has no incentive for mitigation; in fact, it has a disincentive in that any mitigation will result in higher capital and/or operating cost. It is imperative that such statutes be enacted (with full involvement of the public) prior to commencement of service. Such legislation should require reduction in speed as an interim mitigation measure until permanent physical mitigation can be implemented.

(Note: HAR 11-46 is the correct statute for stationary noise listed on DEIS p. 4-98, and not 11-16)

It is unsettling that the City and its consultants have not addressed the noise issue – or other potential negative impacts of the project – more seriously; nor considered the reaction of the public after implementation. It’s as if the attitude is to forge ahead and face the consequences later. For a project that has such a large environmental and economic impact, this is behavior is irresponsible, and should be accounted for.

Waimanalo, Hawaii 96796

Dear Mr. Ubersax:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The Honolulu High-Capacity Transit Corridor Project Noise and Vibration Technical Report and Addendum include the methodology for the noise analysis, including the types of noise meters used for all measurements and the times of measurement. The technical report can be obtained from DTS and on the project website (www.honolulustransit.org). The exact site locations are not relevant to the overall impact analysis because, per FTA methodology, all measurements were taken in representative locations that are typical of noise-sensitive uses in the vicinity of the measurements.

FTA does not recommend use of contour maps. Section 13.2.1 of the FTA Noise and Vibration Manual specifies that locations where impacts are expected to occur should be described. These locations are shown in Figures 4-53 through 4-56 of the Final EIS.

The project design includes an integrated parapet wall at the edge of the guideway structure that extends three feet above the top of the rail. The parapet wall will substantially reduce ground-level noise.

In areas with high-rise apartments and hotels that have lanais above the elevation of and facing the rail, the parapet wall will have a limited benefit (less than a 3-dBA noise reduction) at floors above the level of the guideway. Wheel skirts will increase the benefit from the parapet wall at locations above the elevation of the track. Project noise levels without wheel skirts are provided in Addendum 01 to the Noise and Vibration Technical Report.

The use of sound-absorptive materials below the tracks in the three areas that will experience moderate noise impacts will reduce the Project noise levels from the upper floors to below the impact level. As a result, there will be no unmitigated noise impacts. System operations will not be compromised.

Because other mitigation will eliminate noise impacts, operating changes that would reduce system benefits are not being considered.

The appropriate noise impact criteria at each site along the project alignment are shown in Figures 4-53 through 4-56 of the Final EIS.

According to Section 2.5.7 of the FTA Manual, "The Lmax descriptor is not recommended for a transit noise impact assessment..." Separately described maximum noise levels are not necessary to the calculation of the Day Night Average Sound Level (Ldn), which is the prescribed metric (sound descriptor) to be used in an FTA noise impact analysis for residential uses, or the Equivalent Sound Level (Leq), which is used for sensitive uses without a "sleeping" component. While Lmax does reflect the maximum noise from a single event, it does not describe either the frequency or duration of the noise event. Lmax is not used in transit noise assessment because it would not differentiate the impact of a single transit vehicle occurring once during the daytime from a constant flow of vehicles occurring over all daytime and nighttime hours. The maximum sound level is included in the Sound Exposure Level descriptor of rail transit noise that was used to calculate future project operational Ldn and Leq noise levels. The information provided in Appendices E and F of the FTA Guidelines may be used to calculate the Lmax if desired.

As described above, Lmax is not an appropriate descriptor for transit noise impact analysis.

Figure 4-37 of the Draft EIS provided Lmax for a train pass-by at 50 feet (approximately 68 to 70 dBA for the Project).

Because the Project will not cause any adverse noise impacts, with the proposed mitigation, air conditioning equipment will not be necessary or installed.

The FTA analysis methodology addresses noise impacts based on change in exterior noise levels caused by the Project.

Mr. Richard W. Ubersax
Page 3

Current FTA guidance is to use Ldn or Leq to address noise impacts. The consideration of Lmax is discussed above.

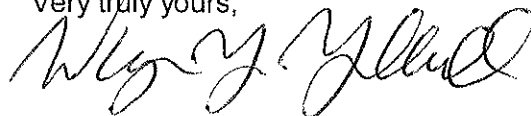

Concern regarding noise ordinances and legislation related to fixed guideway noise is noted.

Proposed changes in noise statutes should be addressed to the State legislature. All noise impacts have been evaluated, and mitigation measures have been developed to eliminate the impacts.

HAR 11-46 is not intended to be used for transportation projects. As the purpose states, "It is the purpose of this chapter to define the maximum permissible sound levels and to provide for the prevention, control, and abatement of noise pollution in the State from the following excessive noise sources: stationary noise sources; and equipment related to agricultural, construction, and industrial activities. It is also the purpose of this chapter to establish noise quality standards to protect public health and welfare, and to prevent the significant degradation of the environment and quality of life."

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Enclosure

Is it possible to solve traffic congestion and keep Honolulu beautiful?

I believe that in the very near future that newer technology will make use of rail obsolete; that new technology use will make vehicles cleaner and environmentally friendlier than rail. Just look at how technology has improved our quality of life by making things run better and more efficiently. Electric autos, hydrogen fuel cell powered magnet guided buses and the sky tran using meglev will change the way we travel and protect our environment. Fossil fuel use in Hawaii drop significantly and be supplanted by the creation of energy using natural sources of energy found in abundance here aided by the efforts of the federal government and our governor.

Mass transportation using the Phileas magnetic guided bus for example uses GPS and magnets embedded in roads to guide buses on a concise path like rail automatically without need for steering. The bus will open with wide doors with its platform level with the curb height and within an inch of the curb to allow for wheelchair and children tram access without stepping into the street or need to climb stairs like conventional buses. This vehicle is currently being road tested by Caltran in California and is predicted one day to be operational in California and Oregon. It has been operational since 2004 in Denmark and is being used in Turkey. Japan and South Korea are also considering using this bus. This same bus company came to present this technology to the city council, but was prevented from doing so by the pro-rail council.

Governor Linda Lingle has given permission for a private company based in California to bring electric cars to Hawaii and be the first state in use this technology. It is her goal to make Hawaii 40% energy sufficient by 2030 and eventually an energy exporter, using Hawaii's natural resources of wind, ocean (wave energy and thermal energy), geothermal, and solar energies. We need the Governor to help provide traffic relief for H-1. Which is under the State's jurisdiction. The Governor believes that a non biased panel should assess whether rail is cost effective and the best solution available.

The skytran is experimental vehicle that merits consideration for use in Honolulu. It offers the potential of moving single passengers in small pods traveling via a sky grid using meglev technology for propulsion. This system is currently being tested in L.A. and has seems to have the potential

Michael Uechi

of moving people intracity and between cities. Like the meglev rail it has the ability to move people rapidly over long distances. This system uses commonly used materials found in all locales and easily assembled and cost effective. The grid system appears to be small and visually unobtrusive.

Michael Uechi

What is wrong with rail?

I envision delays especially eastward of Iwilei where Hawaiian burial sites or iwi, will alter rail's route and result in prolonged construction delays affecting businesses and traffic. The visual blight of rail in downtown Honolulu, especially the huge station on Bishop Street will be not only be an eye sore but a reminder of the asinine short sightedness of our city planners as the heavy rail screeches on during the day and late into the night.

Rail is old technology and hindered by extremely high capital costs and maintenance costs which will be the responsibility of our residents for generations. What will happen when the obsolete rail needs parts for repair? What happens to the white elephant if funds run out? What happens if there is poor ridership and we can no longer afford upkeep? What happens to rail and stations when they become perfect places for druggies, for graffiti artists, pan handlers, women of the night to conduct their business? Our city's maintenance of infrastructure is so poor, one has to wonder how the city will manage maintaining the rail.

The added expenditure of this costly project that will only increase traffic congestion to our already congested city streets and not provide traffic relief for our leeward and central Oahu commuters should be put to rest. Rail will not only be a detriment to our environment but be a detriment to our quality of life. By using the moneys for rail we will further neglect our (1) aging sewers that are leaking "brown waste" that contaminates our beaches during heavy rains, (2) secondary treatment plants that continue to dump improperly treated sewage into our ocean, (3) waste management, (4) landfill and (5) "pot hole" roads and freeways. Our parks and recreational facilities also reflect our city's neglect of taking care of city property.

We wonder how this city will be able to manage a complex rail system when it has proven to be woefully incompetent in managing its infrastructure.

MIKE UECHI

How was the public duped into choosing rail?

The current city administration from its inception choose not to use public deliberation to discuss rail alternatives. I have attended almost all of the community outreach meetings and can testify that there was no meaningful intercourse between the pro rail city appointed panelists and the opposition group. From the inception the City administration had chosen to ram rail down our throats with no consideration for any meaningful deliberation with the public. An advertisement extravaganza by the Mayor using taxpayers money, some 3 million plus dollars, to dupe the public into believing in the merits of rail allowed rail to narrowly defeat no rail in the general election. The mayor stated that the feds mandated that the city promote rail through advertisements.. An inquiry by Hawaii Reporter proved this to be untrue. The Mayor used taxpayers money under a false premise. The Mayor also stated that he would stop the actions of StopRailNow, a citizens group formed to allow the people to vote on whether to choose rail. The citizens right to use initiative as prescribed by the City Charter was being publically attacked by the Mayor. These are examples of the Mayor's heavy hand in promoting only rail and nothing else.

As a result of the dictatorial, non democratic ,unrestricted whims of the city administration and a non bid rail process that proceeded without any oversight we end up with a rail project that according to the rail propaganda will be solely financed by federal and state .5% excise tax. Nothing could be further from the truth as the price tag of rail has been increasing exponentially in price from 2.7 billion in 2004 to 5.3 billion in 2008 (Advertiser and Star Bulletin newspaper 12/2008).

To add to the insult rail was never intended to solve traffic congestion on our only major highway H-1. Congestion will worsen by 70% by 2030).

As a physician we use a phrase called curb side consultation to seek solutions to problems. I find that the most prudent way to reach a reasonable solution to any problem is to consult with others, better yet with others that have opinions different than mine to learn of new teachings and technology for my patients well being. We are trained to defend our position until someone else has a better solution. We then work with the better solution and bury the older obsolete method or system. We should bury rail, for there are many more better solutions.

M. UECHE

Summary

With the recent state's highway modernization project which will significantly reduce commute time, as well as be constructed much sooner and with significantly less cost to the public, the introduction of rail, which by comparison is definitely a very poor alternative.

Dear Mr. Uechi:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal:

Comments on Chapter 2 of the Draft EIS: Alternatives Considered

Technology related to transportation continues to evolve. Improvements to all modes, including transit and single-occupant vehicles, will make those modes safer and more efficient. The changes mentioned in the comment may make the internal combustion engine used in automobiles today obsolete; however, they would enhance the attractiveness of an electrically-powered rail system, which already consumes less energy per passenger-mile carried than automobiles, as is illustrated by the reduced energy demand shown in Section 4.11 of the Final EIS. Furthermore, none of the technologies mentioned in the comment letter (Mag-Lev; Sky-Tran and the Phileas system) are available for broad application at this time. They are all experimental or in demonstration modes.

As discussed in Chapter 2 of the Final EIS, additional alternatives, including other technologies, were evaluated during the Alternatives Analysis phase of the Project (2005 to 2006). The Alternatives Analysis phase evaluated a range of transit mode and general alignment alternatives in terms of their costs, benefits, and impacts. An initial screening process (fall of 2005 to winter of 2006) considered alternatives identified through previous transit studies, a field review of the study corridor, an analysis of current population and employment data for the study corridor, a literature review of technology modes, work completed for the Oahu Regional Transportation Plan 2030 (ORTP) prepared by the Oahu Metropolitan Planning Organization (OahuMPO) (OahuMPO 2007), and public and agency comments received during the formal Alternatives Analysis scoping process. The alternatives screening process is documented in the Honolulu High-Capacity Transit Corridor Project Alternatives Screening Memorandum (DTS 2006a).

Three scoping meetings were held as part of the screening process in December 2005 with the purpose of presenting alternatives to the public, interested agencies, and officials and receiving comments on the Purpose and Need, alternatives, and scope of the Alternatives Analysis:

- December 13, 2005: Neal S. Blaisdell Center, Pikake Room at 777 Ward Avenue in Downtown Honolulu from 2:00 pm to 4:00 pm (agency scoping meeting)*
- December 13, 2005: Neal S. Blaisdell Center, Pikake Room, at 777 Ward Avenue in Downtown Honolulu from 5:00 p.m. to 8:00 p.m. (open to the public)*
- December 14, 2005: Kapolei Middle School Cafeteria at 91-5335 Kapolei Parkway in Kapolei from 7:00 p.m. to 9:00 p.m. (open to the public)*

Refinements were made to the alternatives as a result of public comments. The comments received during scoping meetings are provided in Appendix G of this Final EIS.

After completion of screening in the winter of 2006, the following alternatives were studied in the Alternatives Analysis: No Build Alternative, Transportation System Management (TSM) Alternative, Managed Lane Alternative, and the Fixed Guideway Alternative. After review of the Alternatives Analysis Report and consideration of public comments, the City Council identified a fixed guideway transit system extending from Kapolei to UH Manoa with a connection to Waikiki as the Locally Preferred Alternative. This identification, which eliminated the TSM and Managed Lane Alternatives from further consideration, became Ordinance 07-001 on January 6, 2007. The NEPA process considered a range of alternatives that was consistent with the identified Locally Preferred Alternative. As discussed in Section 2.2.2, there were no alternatives that had not been previously studied and eliminated for good cause that would satisfy the Purpose and Need at less cost, with greater effectiveness, or less environmental or community impact.

As stated in Section 2.2.3 of this Final EIS, the NEPA Notice of Intent requested input on five transit technologies. A technical review process included the opportunity for public comment and was used in parallel with the alternatives analysis to select a transit technology. The process included a broad request for information that was publicized to the transit industry. Transit vehicle manufacturers submitted 12 responses covering all of the technologies listed in the Notice of Intent. An independent five-member technology panel composed of four transit experts and a transportation academic appointed by the City Council evaluated guided rubber-

tire-on-concrete systems (e.g., Phileas bus system and VAL-type systems), monorail (which is a variation on rubber-tyred technology), steel-wheel-on-steel-rail systems, (e.g., light rail and rapid rail), and magnetic levitation (MAGLEV). The panel considered the performance, cost, and reliability of the proposed technologies.

Proprietary technologies, meaning those technologies that would have required all future purchases of vehicles or equipment to be from a single manufacturer, were eliminated because none of the proprietary technologies offered substantial proven performance, cost, and reliability benefits compared to steel wheel operating on steel rail.

The panel accepted public comment twice as part of its review. By a four-to-one vote, the panel chose a steel wheel vehicle operating on steel rail system because it was considered safe, reliable, economical, and non-proprietary. Those results are documented in the panel's report to the City Council dated February 22, 2008 entitled "Independent Technology Selection Panel Report".

Comments on Chapter 4 of the Draft EIS: Environmental Analysis, Consequences, and Mitigation

Regarding construction delays, FTA and the City have developed a Programmatic Agreement in consultation with the State Historic Preservation Division and other consulting parties to address any affected Native Hawaiian burials or other historical or archaeological resources. The Programmatic Agreement is included in Appendix H to the Final EIS. The Project may be subject to compliance with the Native American Graves Protection and Repatriation Act (NAGPRA) (25 USC 3001) where it crosses lands controlled or owned by the Federal Government. Any human remains found on lands owned or controlled by the Federal government will be addressed in accordance with NAGPRA and 43 CFR 10—the regulations that define the process and procedures of NAGPRA.

The Programmatic Agreement requires the completion of archaeological inventory surveys prior to construction of project elements. During the archaeological survey, any Native Hawaiian burials that are identified will be managed in compliance with applicable laws. This will include consultation with project proponents, the Oahu Island Burial Council, SHPD, and recognized lineal and/or cultural descendants to develop burial treatment plans. Although the goal of the archaeological sampling will be to identify all burials and treat them appropriately prior to the start of construction in a particular area, the possibility exists that additional previously undiscovered burials will be encountered during construction. In addition, protection zones will be created around resources that are identified prior to construction. The Programmatic Agreement stipulates that the treatment of burials discovered during construction will follow state law, which includes a timeline to address inadvertent discoveries of burials during construction and to avoid substantial project delays.

The Project is a Fixed Guideway Transit system. The system will use steel-wheel-on-steel-rail technology. Current versions of steel wheel on steel rail technology are quieter than a bus at the same distance. Noise and vibration effects from the Project were evaluated following FTA guidance and are detailed in Section 4.10 of the Final EIS. The Project will cause no severe noise impacts. Moderate impacts will occur at upper floors of a few high-rise buildings

(as shown in Table 4-18 in the Final EIS). With the committed mitigation in place (sound absorbing material and wheel skirts), the noise analysis indicates that the new noise generated by the Project will be lower than the existing noise levels in most places. The project design includes an integrated noise-blocking parapet wall at the edge of the guideway structure that extends three feet above the top of the rail. The parapet wall will substantially reduce ground-level noise.

As committed to in the Final EIS, wheel skirts will increase the benefit from the parapet wall at locations above the elevation of the track. The use of sound-absorptive materials below the tracks in the areas that will experience moderate noise impacts will reduce the Project noise levels from the upper floors to below the impact level. Once the Project is operating, noise levels will be re-measured to confirm that there are no noise impacts from the Project.

The island's unique visual character and scenic beauty was considered in the visual and aesthetic analysis presented in the Draft and Final EISs. As discussed in Section 4.8 of the Final EIS, the Project will be set in an urban context where visual change is expected and differences in scales of structures are typical. The following measures will be included with the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

- Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
- Coordinate the project design with the City transit-oriented development program within the Department of Planning and Permitting.*
- Consult with the communities surrounding each station for input on station design elements.*
- Consider specific sites for landscaping and trees during the final design phase when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will serve to mitigate potential visual impacts.*

It should also be noted that the Project will provide users, including tourists, with expansive views from several portions of the corridor by elevating riders above highway traffic, street trees, and low structures adjacent to the alignment. In Section 4.8.3 of the Final EIS under the heading Design Principals and Mitigation, specific environmental, architecture and landscape design criteria are listed that will help minimize visual effects of the Project.

The fact that this will be the only island with high-capacity transit, with an efficient airport connector, may in fact attract more tourists who value the convenience, potential cost savings, and decreased travel time between various tourist destination spots along the Project's alignment.

Rail, as a technology, predates the automobile by a few years. It is a well-established technology with a long track-record of good performance and continued technological

development. The rail options considered for Honolulu are modern, quiet systems that are more fuel efficient per passenger than the automobile and which can easily carry large volumes of people. Please refer to the discussion on the technology selection process that was discussed earlier in this response.

Ridership forecasts are over 116,000 per day in 2030 as noted in Chapter 3 of the Final EIS. The Project's financial plan described in Chapter 6 of the Final EIS includes ongoing operation and maintenance funding for the Project. One of the factors cited in the selection of steel wheel technology was standardization, so that replacement vehicles and other system elements would be available from multiple sources. Stations will accommodate an attendant to help prevent the types of vandalism and nuisances described in your comment. Section 2.5.4 of the Final EIS describes security measures that will be implemented with the Project.

Table 3-14 of the Final EIS shows that implementation of the fixed guideway alternative is forecast to result in an 18 percent decrease in traffic delay and congestion compared to the No Build Alternative or the other alternatives that do not include a fixed guideway system. The local and federal New Starts funds anticipated to be used for constructing the Project are available only for the specific purpose of building a fixed guideway system. They cannot be used for sewer, solid waste, or highway projects. Chapter 6 of the Final EIS contains a detailed discussion of the financial analysis prepared for the Project and the availability of the proposed funding sources for the Project.

Comments on Chapter 8 of the Draft EIS: Comments and Coordination

The overall public information program has been continuous since the beginning of the Project in 2005 and has met the requirements of SAFETEA-LU Section 6002. The Alternatives Analysis phase evaluated a range of transit mode and general alignment alternatives in terms of their costs, benefits, and impacts. During the fall of 2005 and winter of 2006, the City and County of Honolulu completed the alternatives screening process that is documented in the Honolulu High-Capacity Transit Corridor Project Alternatives Screening Memorandum. As detailed in Chapter 8 of the Final EIS, scoping meetings were held, which included a presentation of alternatives to the public and interested agencies and officials to receive comments on the Purpose and Need, alternatives, and scope of the analysis for the Alternatives Analysis. Refinements were made to alternatives based on the public input during scoping.

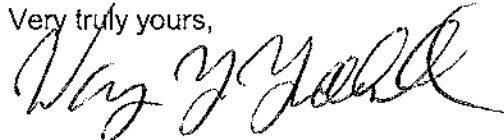

Guidelines set forth by NEPA, as amended, and Chapter 343 of the Hawaii Revised Statutes stipulate that public involvement be carried out on large-scale projects such as the rail project. As a large infrastructure project, the City felt it was important to disseminate information to as many people as possible. Thus, a broad range of print and visual media and community outreach were necessary to reach different population segments. Project funds were used for the public involvement activities listed in Chapter 8 of the Final EIS as required by NEPA. In addition, all testimony and comments received during the public hearings were answered and a written or electronic letter was sent when the Final EIS was issued. Questions and comments have been taken and addressed from all members of the public. Information presented about the Project in public presentations has been reviewed to ensure that information presented is accurate. All individuals have been provided equal opportunity to express their opinions within

Mr. Mike Uechi
Page 6

an established time limit. Dates and times for meetings and discussions held under the public involvement process are presented in Chapter 8 of the Final EIS.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Re: Comments on the Draft Environmental Impact Statement (DEIS)/Section 4(f) Evaluation for the Honolulu High-Capacity Transit Corridor Project

Dear Messrs. Matley and Yoshioka:

UltraSystems Environmental (UltraSystems) was retained by Kamehameha Schools (KS) to conduct an independent review of the subject DEIS and companion technical reports, and to prepare the following findings and comments. (KS is preparing its own comments and sending them in a separate letter.) UltraSystems is one of the leading environmental planning and consulting firms in the western United States, and has extensive experience in preparing technical studies and environmental documents. Its services include environmental analyses, air and noise impact studies, transportation, biology and wetlands, Phase I and II environmental site assessments, hazardous materials management, and land use studies.

UltraSystems has a distinguished track record in preparing high-quality environmental documents for residential, commercial, industrial, institutional, transit, transportation, and infrastructure-related projects for public and private sector clients throughout California and the western United States. Each of our six principals brings more than 30 years of experience in the preparation and peer review of environmental documents.

Besides reviewing the DEIS, UltraSystems reviewed the guidance provided by the Federal Transit Administration on preparing project Environmental Impact Statements;¹ the *Honolulu High-Capacity Transit Corridor Project Alternatives Analysis Report, City and County of Honolulu*; Hawaii Revised Statutes, Chapter 343 (Environmental Impact Statements), Hawaii Revised Statutes, Chapter 344 (State Environmental Policy); and the *City and County of Honolulu Land Use Ordinance* to gain a better understanding of the planning process being followed on the proposed Project and the local land use rules and regulations that will come into play on lands impacted by the Project.

The following comments summarize Project-related issues and questions that UltraSystems identified during its investigations. For your ease in consideration of the comments, they are organized into nine topics. The presentation of each topic includes a general comment, followed by specific concerns.

A. Transportation

The Honolulu High-Capacity Transit Corridor project may create significant construction and operational traffic, roadway and parking impacts on adjacent KS-owned land that have not been adequately quantified and the proposed mitigation measures lack specificity or evidence that they will effectively reduce impacts to property owners and businesses.

Concern #A-1: Planned Parking Appears to be Insufficient and May Result in "Spillover" to Adjacent Commercial Properties

- The proposed Pearl Highlands Station would have a 1,600-space park-and-ride facility (DEIS, Page 2-27). Should additional parking be needed in the future, will sufficient space be available to expand the park-and-ride lot? If insufficient parking is provided, those driving to this station will be forced to seek parking elsewhere.
- Dedicated kiss-and-ride pullouts (passenger drop off) or parking spaces are planned at many stations to facilitate drop-off and pick-up (DEIS, Page 2-36). No additional parking is shown for the Kapalama Station (DEIS, Page 2-31, Figure 2-31). Given that there appear to be no residences within the standard quarter-mile walking radius, it is reasonable to assume that riders will drive to this station—and need parking—or that few riders are expected at this station because it may be easier to simply drive into town from there. Please confirm if this station is intended to have fewer than average riders. If it is expected to have average per-station ridership, then please explain how parking demand will be handled if the City plans on drawing many riders from this area. If off-street parking is planned for this station, then please provide the parking report for public review. If off-street parking is not planned for this station, then please provide a report explaining the reasons for the expected low ridership at this station—and which stations are expected to carry the heavier rider loads. When showing the heavier rider loads please include in the report the number of riders expected there and the number of parking spaces required. Also, if people do end up riding from this station and parking, please provide a written plan showing how they will be accommodated so as to not have a negative impact on commercial tenants near this station.
- Twenty-six off-street parking spaces would be lost on Dillingham Boulevard between McNeill Street and Waiakamilo Road due to fixed guideway column placement in the median (Transportation Technical Report, Table 5-54, page 5-114). Commercial properties a few blocks west of the proposed Kapalama transit station will be affected.
- Ten off-street parking spaces would be lost on Dillingham Boulevard between Waiakamilo Road and Kohou Street due to fixed guideway column placement on the side (Transportation Technical Report, Table 5-54, page 5-114). The loss of off-street parking could impact customer and employee parking at Waiakamilo Shopping Center and buildings on both sides of Dillingham. (KS-owned land is on both sides of this section - McNeill to Kohou). What impact would the loss of these off-street parking spaces have on the commercial uses along Dillingham Boulevard?
- For the Kaka'ako station, 16 on-street Mauka and 22 on-street Makai parking spaces would be lost on Halekauwila Street between Keawe Street and Coral Street due to fixed guideway column placement on the side (Transportation Technical Report, Table 5-54, page 5-114; see also DEIS Page 2-32, Figure 2-35). Please describe the impact from the loss of these on-street parking spaces on businesses located on KS-

owned properties and where those spaces could be replaced? This site is likely to be an a.m. net destination station more likely to have less parking demand than a net ride generating station.

- The *Transportation Technical Report* states that park-and-ride usage would be free (Section 5.6.2, page 5-86). It is a common experience throughout California that parking at transit stations is underestimated, and consequently, additional parking is often required after the initial construction, to meet the increased demand. This was certainly the case at UltraSystems' home base of Irvine, California, where a three-story parking garage was recently built for the Irvine Amtrak/Metrolink station, after the capacity of the original surface parking lot was exceeded. Based on this premise, land for more parking would likely have to be acquired. The Final Environmental Impact Statement (FEIS) for the Project should address the question of how the construction and maintenance costs for these additional facilities would be paid for. The FEIS' cash flow and budget should address this.
- The following additional mitigation measures for parking impacts should be included in the FEIS:
 - ✓ The foundations of parking garages for transit and bus patron parking shall be designed and constructed so that additional floors could be added as needed in the future.
 - ✓ Where parking structures are not planned to be built, enough land shall be acquired by the City and County of Honolulu so that surface lots can be expanded as necessary to handle future increases in parking requirements. It will be less costly to reserve the land now, rather than when the demand becomes acute.

Concern #A-2: Elimination or Narrowing of Existing Traffic Lanes May Result in Safety Problems

- In some cases, widening the existing street median to accommodate the columns for the fixed guideway would require reducing lane widths slightly. Table 3-21 (Column Placement Effects on Streets and Highways – page 3-39 of the DEIS) shows where columns would be placed and the new widths of traffic lanes on certain street segments. However, with only one exception, the table does not report the widths of the traffic lanes under the No Build Alternative.² Therefore, the extent of change in lane widths is not known. Although the transportation technical report reports historical accident rates, it and the DEIS are silent on the issue of impacts of lane width changes on road safety. UltraSystems requests that a fully documented analysis of the effect (if any) of lane width reduction on traffic accident rates be included in the FEIS.
- The FEIS should address the issue that the narrower lanes are likely to affect the operation of larger vehicles such as semi trucks and buses and create safety hazards. Operating large vehicles in 10 foot wide lanes may create an unreasonable risk of automobile accidents in these lanes and of risk to people and business near these rights-of-way.
- Along three street segments (Dillingham from McNeill to Waiakamilo, Halekauwila from Keawe to Coral, and Halekauwila from Punchbowl to South Street), sidewalks will be narrowed by one to five feet (DEIS, Table 5-57). Narrowed sidewalks can reduce bicycle and pedestrian safety, as sidewalk users would be moved closer to automobile traffic.

² Information on existing lane widths is also lacking in the transportation technical report.

Concern #A-3: *The impacts on traffic near the park-and-ride facility at the Pearl Highlands Station may not be sufficiently mitigated by the measures proposed in the DEIS.*

Table 3-22 (Effects on Traffic near Park-and-Ride Lots – 2030 No Build and Build Alternatives) shows that the level of service (LOS) will remain at F for two intersections near the Pearl Highlands Station under the No Build and Build Alternatives. At a third intersection (Farrington Highway and Waiawa Street), the p.m. peak hour LOS will decline from D under the No Build Alternative to F under the Build Alternatives. Except for one instance (p.m. peak hour at Kamehameha Highway and Kuala Street), delays at all the intersection will be greater under the Build Alternative than under the No Build Alternative. According to the DEIS, potential mitigation measures include widening existing roads, signalizing intersections, and “other treatments.” This raises some questions that need answering in the FEIS:

- What is the approximate amount of mitigation (in seconds of delay, for example) that would be expected from road widening and signalizing intersections?
- The term “other treatments” is too vague; what are some of them, and how effective would they be?
- Could the incorporation of feeder buses in the project design provide additional mitigation?

B. Safety and Security

Construction and operation of the transit project will create significant safety and security problems at the proposed Pearlridge Center, Kapalama and Kaka’ako transit stations to be constructed near or adjacent to KS-owned lands. It is not clear from the DEIS how these problems would be addressed. Project safety features should be reviewed to determine whether they are adequate to ensure the safety of transit passengers at these stations.

C. Land Use

Construction and operation of the transit project will impact a number of KS-owned lands near or adjacent to the Pearlridge Center and Kapalama stations and along Dillingham Boulevard, particularly in the Dillingham Plaza Area. The reduction in the size of KS owned parcels in these areas may result in the creation of existing, non-conforming uses that may hinder future redevelopment of these lands.

Concern #C-1: *The loss of ten feet of land in front of commercial properties along Dillingham Boulevard, particularly in the area of Dillingham Plaza, will make land uses non-conforming and hinder future redevelopment.*

- The loss of 10 feet of land in front of KS commercial-use properties will result in the loss of most of the landscaped area in front of these businesses and a number of existing mature street trees that are required by the City and County of Honolulu Land Use Ordinance.³ Existing sidewalks in these areas will also be removed, with the sidewalks being moved back to the new edge of Dillingham Boulevard. This will result in a sidewalk/landscape area adjacent to the remaining businesses on these lands. It is assumed at this time that the loss of required lot size and landscaping will make all of these lots non-conforming, and subject to the constraints prescribed by Section 21-4.110 (Nonconformities) of the Ordinance. This may make the redevelopment of the commercial land uses on KS properties more difficult if these uses have to be brought up to the current City’s current Land Use Ordinance at the time that they are developed. The FEIS should address this question and resolve it by more than providing perpetual variances, since this is also a matter of lost business opportunities caused by the impact of the Project.

³ See Sections 21-3.110-1 (Business uses and development standards), 21-3.120-2 (Business mixed use district uses and development standards), and 21-4.70 (Landscaping and screening).

- Loss of land along Dillingham Boulevard may also impact the landscaping for off-street parking, the size of parking spaces and the loading areas for the commercial uses along this street. These changes may make these lots non-conforming due to the lack of adequate landscaping for parking and loading areas.⁴ Again, future redevelopment of the commercial use along Dillingham Boulevard may be impacted, with these lots and uses considered. This is a particular concern for the Boulevard Saimin Restaurant (1425 Dillingham Boulevard), which has only twelve parking spaces, two of which potentially will be lost due to the widening of Dillingham Boulevard.

Concern #C-2: The DEIS' focus on the impacts of full acquisition of properties (i.e., change in land use, need for relocation) fails to acknowledge the impacts of partial acquisitions.

The DEIS notes (page 4-20) that "Based on the relatively small number of parcels affected by full acquisition, the effects on different types of land uses in the study corridor would be minimal. No mitigation measures would be needed." As documented in the *Land Use Technical Report* (Pages 4-9 through 4-15), KS expressed its concern that the proposed Project's land acquisitions, including multiple partial acquisitions, may limit KS' ability to maximize the development potential of its properties.

Concern #C-3: The DEIS fails to consider sufficiently the impacts of the Project on documented future developments.

- The *Land Use Technical Report's* discussion of transit station land use impacts (pages 5-2 to 5-11) acknowledges that KS owns many properties near the proposed Kalihi, Kapalama, Kaka'ako, and Mo'ili'ili stations and has major redevelopment plans when current leases expire. **The potential impacts of the proposed transit project on these documented plans for redevelopment are not analyzed in either the Technical Report or the DEIS. This is a serious deficiency, which should be corrected in the FEIS.**
- Table A-17 of the *Land Use Technical Report*, which summarizes land use issues associated with the proposed Kalihi transit station, states that the City would "coordinate with Kamehameha Schools regarding redevelopment plans." The City should address these issues with KS prior to completion of the FEIS. Until such coordination is concluded, the City cannot claim that it has mitigated specific land use issues at least with respect to communities where KS owns substantial acreage at or near the proposed rail line.
- Table A-18 of the *Land Use Technical Report*, which summarizes land use issues associated with the proposed Kapalama station, acknowledges that "Kamehameha Schools owns much property west of" Honolulu Community College (HCC), and that "redevelopment possibilities exist a few blocks east and west." Section 3 of Table A-18, under *Refinements to Plans to Improve TOD*, states that "Coordination with Honolulu Community College (HCC) will be necessary to create strong pedestrian connection to College buildings to enhance ridership." **To not include coordination with Kamehameha Schools is a serious deficiency. KS owns over 105 acres of land in Kapalama and has ownership of land on either side of Dillingham from Waikamilo Road to Kohou.**
- Table A-28 of the *Land Use Technical Report*, which summarizes land use issues associated with the proposed Mo'ili'ili station, acknowledges that KS is concerned that the height of the station will be at the 6th story of its planned building. The table also states that the City needs to coordinate with KS so the station and KS' plans "are compatible, particularly regarding pedestrian facilities." **Therefore, it is requested that the following mitigation measure be included in the FEIS:**

⁴ See City and County of Honolulu Land Use Ordinance, Sections 21-6.10 through 21-6.140.

Dear Ms. Lindsay:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal:

A. *Transportation*

Comment A-1: Parking

- *The Pearl Highlands park-and-ride facility could be expanded upward with additional floors if more parking spaces are needed. This would be decided after the entire Project is in operation and if demand warrants the additional parking spaces at this facility. While there are 4,100 spaces identified as part of the Project, the experience with park-and-ride facilities in Honolulu to date is limited. They have been generally underused. The facilities contained in the Project are located toward the Ewa end of the route and are based on consideration of parking demand using the travel demand*

forecasting model for the year 2030. Further, the projected mode of access shares was compared to observed data from several Mainland areas, notably San Diego.

- *Given the history of park-and-ride use on the island, it seems prudent to evaluate any need for additional or larger facilities on the basis of empirical experience rather than commit substantial additional funding now. The Kapalama Station will have relatively low ridership when compared to the guideway system average (as shown in Figure 3-10 in the Draft EIS). This station is primarily a destination and, accordingly, more people will get off the train at this station during the a.m. two-hour peak period than board. The travel demand forecasting model has been refined since the Draft EIS was published to account for non-home-based direct-demand trips (trips that do not originate or end at home) during off-peak periods. In addition, the air passenger model (which forecasts travel in the corridor related to passengers arriving or departing at Honolulu International Airport) was updated to reflect current conditions. Figure 3-9 in the Final EIS presents the revised peak-period ridership numbers for each station. As noted in Chapter 2, Section 2.5.7 of the Final EIS, a park-and-ride facility will not be included at the Kapalama Station. As stated in this section, park-and-ride facilities will be constructed at stations with the highest demand for drive-to-transit access. As shown in Table 3-22 in the Final EIS, the Kapalama station does not have high projected parking demand. Given the high quality service and passenger facilities provided at stations, the potential walk market is within one-half mile of the station as compared to the one-quarter mile noted in the comment. Most demand is expected to occur by walking, biking, or taking the bus to the station (as seen in Table 3-20 in the Final EIS). Less than 1 percent of mode of access to this station will require parking. As noted in Section 3.4.4 of the Final EIS, actual spillover parking at stations will be affected by several factors, such as availability of parking, changing conditions that will affect actual access to stations, and future development in station areas. As shown in Table 3-22 in the Final EIS, the projected demand for spillover parking at Kapalama Station is very low. Mitigation measures will be proposed at that time to alleviate the effects of spillover parking in station areas if it develops.*
- *Section 3.4.4 and Table 3-24 of the Final EIS identified potential effects of the Project on parking, including the 26 off-street parking spaces that will be lost on Dillingham Boulevard between McNeill Street and Waiakamilo Road. Section 3.4.7 of the Final EIS states that private, off-street parking spaces will be purchased for the Project as part of right-of-way needed along the length of the corridor in accordance with the requirements of the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970. All landowners will be paid fair-market value for the land, including the value of the parking spaces. Where landscaping, sidewalks, and driveway access will be affected by the Project, coordination will occur with the landowner, and these property features will be replaced and/or the property owner will be compensated in accordance with the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act. The City does not plan to generally replace all of the private, off-street parking purchased and removed for construction of the Project. However, with the Project the need for such parking demand is reduced.*

- *Section 3.4.4 and Table 3-24 of the Final EIS identified potential effects of the Project on parking, including the 10 off-street parking spaces that will be lost on Dillingham Boulevard between Waiakamilo Road and Kohou Street. Section 3.4.7 of the Final EIS states that private, off-street parking spaces will be purchased for the Project as part of right-of-way needed along the length of the corridor in accordance with the requirements of the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act. All landowners will be paid fair-market value for the land, including the value of the parking spaces. The City does not plan to generally replace all of the private, off-street parking purchased and removed for construction of the Project. As stated above, the need for such parking will be reduced with the Project.*
- *Table 3-24 of the Final EIS identifies effects of the Project on parking, including on-street spaces that will be lost on Halekauwila Street. Please note that the Project no longer plans to remove any parking between Keawe and Coral Streets. Section 3.4.7 of the Final EIS states that in locations where parking will be removed by the Project, other parking capacity generally exists nearby to accommodate demand. The cumulative and indirect effect of removing parking spaces to accommodate the Project will be that some people who parked in those spaces will either use another space nearby, will choose another mode to reach their destination, or will not make the trip.*
- *As stated previously, the experience with park-and-ride facilities in Honolulu to date is limited. They have been generally underused. Given the history of park-and-ride use on the island, it seems prudent to evaluate any need for additional or larger facilities on the basis of empirical experience rather than commit substantial additional funding now. Any need for additional parking at the four stations with park-and-ride facilities would best be determined once experience is gained about their use. Regarding the facilities that are identified, Chapter 6 of the Final EIS includes standard cost categories for the Project, including stations, stops, terminals, and site work and special conditions. Cost estimates for park-and-ride facilities are included in the sitework and special conditions category shown in Table 6-1 in the Final EIS. Ongoing operating and maintenance costs include park-and-ride facilities at stations (see Section 6.4 of the Final EIS). Any funding needed for future park-and-ride extensions would be identified at the time those extensions are constructed.*
- *Your comments on additional mitigation measures for parking have been noted. The park-and-ride structures can be designed to accommodate upward expansion if needed. The Project will not acquire more property than what is needed. Given the history of park-and-ride usage, the purchase of additional land is not warranted until there is a verifiable need.*

Comment A-2: Traffic Lane Width

- *While Table 3-21 in the Draft EIS does not report the specific width of travel lanes under the No Build Alternative, the width of traffic lanes was considered as an information item in the level-of-service analysis. With regard to potential safety-*

related effects of reduced lane widths, a USDOT study found slightly higher accident rates associated with narrower travel lanes and shoulders¹. However, all roadway widths will meet the standards of the American Association of State Highway and Transportation Officials (AASHTO), the Hawaii Department of Transportation (HDOT), and the City.

- *Truck traffic volumes will be considered during Final Design when determining lane widths. As discussed in Section 3.4.3 of the Final EIS, in some cases, lane widths that are wider than indicated in Table 3-21 in the Final EIS may need to be provided, although 11-foot through lanes and 10-foot turn lanes are commonly used throughout the U.S. Under any circumstances, the proposed lane widths meet AASHTO and HDOT standards and will not be a hazard for larger trucks.*
- *As stated in Section 3.4.3, during Final Design the relationship of travel lanes, shoulders, sidewalks, and horizontal clearances to obstructions such as columns will be considered together in determining the final widths of each item. As noted earlier, some lane widths could increase from what is shown in Table 3-21 in the Final EIS. Permits for construction will not be approved unless a roadway facility that is safe and acceptable to the responsible transportation agency is provided. Sidewalks will meet Americans with Disabilities Act (ADA) requirements and provide a safe travel environment for users.*

Comment A-3: Park-and-ride Effects

- *With the Project, deterioration of level-of-service (LOS) will occur near some station areas. Project mitigation measures are designed to reduce the negative impact to a level that meets or surpasses 2030 No Build conditions. For example, Table 3-23 in the Final EIS shows that the level-of-service at Kamehameha Highway and Kuala Street is projected to remain at LOS F under the No Build Alternative and the Project. With mitigation measures to be implemented with the Project, including street widening and installation of signals, this intersection is projected to remain at LOS F during the p.m. peak hour and improve to LOS B during the a.m. peak hour. The average delay in seconds during the p.m. peak hour with this mitigation will be lower than that of the No Build Alternative. An impact is considered mitigated if the delay and level-of-service are improved or will be the same as the No Build Alternative. As shown in Table 3-23 in the Final EIS, the p.m. peak hour level-of-service at Farrington Highway (Ewa-bound) and Waiawa Street would decline from LOS D under the No Build Alternative to LOS F with the Project. At this location, mitigation measures include installation of signals, which will be synchronized with adjacent signals at Farrington Highway (Koko Head-bound) and Waiawa Street. With mitigation, this intersection is projected to operate at LOS B. The mitigation measures identified in Section 3.4.7 of the Final EIS and incorporated into the Project will fully mitigate the identified traffic impacts; therefore, additional mitigation measures will not be required.*

¹U.S. Department of Transportation, December 2000, Prediction of the expected safety performance of rural two-lane highways.

- *As discussed in Section 3.4.3 and 3.4.7 of the Final EIS, mitigation measures for intersections near the Pearl Highlands station include widening Kamehameha Highway and modifying signal timings, and improved access to the H-2 Freeway near the Pearl Highlands Station. As shown in Table 3-23 of the Final EIS, these mitigation measures will reduce the delay at the intersections around Pearl Highlands.*
- *As stated in Section 5.4.5 of the Honolulu High-Capacity Transit Corridor Project Transportation Technical Report (RTD 2008) and Addendum 02 to the Transportation Technical Report, new bus connection service will be provided to Central Oahu and North Shore communities as part of the design for the Pearl Highlands Station. Service will include feeder buses to Koa Ridge, Waiawa, and other enhanced limited-stop and peak-period express services serving Central Oahu and the North Shore. Appendix D in the Final EIS includes information on future bus routes and frequencies with the Project. These new feeder bus services are planned to provide alternative access to the guideway system. Additional mitigation measures are not needed because all project-related impacts will be fully mitigated by the measures outlined in the Final EIS and incorporated into the Project.*

B. Safety and Security

According to the FTA's Safety Management Information Statistics for 1997, the most recent data available in the Transportation Research Board's Report, Improving Transit Security, there was one serious offense for every one million passenger miles carried on rail. There is a need for security on transit systems, just as there is a need for police and other security in all aspects of modern society, but there is no evidence that crime rates associated with transit are any higher than for society in general and no indication that any particular issues will be created in the areas listed.

Stations will be patrolled by police, transit staff, and/or private security and will be closed at night when the system is not in operation (between midnight and 4:00 a.m.). Additionally, as stated in Section 2.5.4, of the Final EIS, security cameras that are monitored at all times of operation, audible and visual messaging systems, and an intercom link to the system operations center will also be included at all stations, park-and-ride facilities, and vehicles. The system will also include park-and-ride facilities with security and lighting. The City is working with the Honolulu Police Department to develop the system's safety and security program. As discussed in this section, security measures will include Crime Prevention through Environmental Design (CPTED) principles, which is a theory that proper design and effective use of the built and natural environments can reduce the fear and incidence of crime as well as improve the quality of life. CPTED measures ensures that spaces are visible, open, well-lit and observable to minimize crime and will be incorporated at all stations. The City will provide maintenance to the guideway and transit facilities.

As further stated in Section 2.5.4, a project-specific Safety and Security Management Plan has been developed in accordance with FTA requirements to define the safety and security activities and methods for identifying, evaluating, and resolving potential safety

hazards and security vulnerabilities of these systems. It establishes responsibility and accountability for safety and security during the Preliminary Engineering, Final Design, construction, testing, and start-up phases of the Project. The Honolulu Police Department, the Honolulu Fire Department, the Department of Emergency Management, and the Honolulu Emergency Services Department have been involved in preparing and implementing the plan.

C. Land Use

Comment C-1: Dillingham Boulevard

- *As stated in Section 4.4.3 of the Final EIS, "Where relocations (either full or partial) will occur, compensation will be provided to affected property owners, businesses, or residents in compliance with all applicable Federal and State laws and will follow the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act." DTS will work with land owners if nonconformities occur as a result of acquisitions. For instance, minimum requirements on existing or future uses (i.e., parking requirements or setbacks) could be reduced if nonconformities occur. DTS will work with the property owner to address these concerns.*
- *As mentioned above, off-street parking on Dillingham Boulevard will be affected by the Project, as documented in Table 3-24 in the Final EIS. The City does not plan to generally replace private, off-street parking purchased and removed for construction of the Project. The City does not plan to generally replace all of the private, off-street parking purchased and removed for construction of the Project. As mentioned above, the Project will help reduce the need for such parking.*

Comment C-2: Partial Acquisitions

Please see the response for the item above. In addition, Section 4.4 of the Final EIS addresses both full and partial acquisitions.

Comment C-3: Future Development

- *The planned and reasonably foreseeable actions in the study corridor are provided in Table 4-36, in Chapter 4 of the Draft EIS and as Table 4-39 in the Final EIS and in Figure 4-2 of the Final EIS. Table 4-29 in the Final EIS includes Kamehameha Schools redevelopment plans. The assessment of their impacts, both indirect and cumulative, is presented in Sections 4.18.2 and 4.18.3 of the Draft EIS and Section 4.19 of the Final EIS. The assessment of cumulative impacts followed Federal guidance, specifically the Council on Environmental Quality's Considering Cumulative Effects under NEPA.*
- *As presented in Section 4.2.3 of the Final EIS, "Based on the relatively small number of parcels affected by full acquisition, the effects on different types of land uses in the study corridor will be minimal. No mitigation measures would be needed." Project staff met with Kamehameha Schools on December 8, 2008 to discuss effects of the*

Project on all Kamehameha Schools' owned properties, including those near the Kalihi and Kapalama stations. As a result of the December 8, 2008 meeting, a follow up presentation was held for Kamehameha Schools and their tenants on December 18, 2008. City staff has continued communication with Kamehameha Schools, Commercial Assets Division regarding right-of-way impacts and the EIS. Coordination between the City and Kamehameha Schools will continue during project design and construction. Any mitigation required as a result of Kamehameha Schools' redevelopment plans will be developed during their redevelopment-specific impact analysis that would be performed prior to redevelopment.

- *Please see the previous response regarding coordination between the City and Kamehameha Schools regarding redevelopment plans at the Kapalama Station. As stated previously, coordination will continue.*
- *The Project includes construction of an elevated fixed guideway from East Kapolei to Ala Moana Center. A station at Moiliili could be constructed as part of future extensions. Coordination with Kamehameha Schools would occur when planning for that station occurs.*

D. *Visual/Aesthetics/Street Trees*

Comment D-1: Viewer Groups

The definition and description of viewer groups is provided in Section 3.1.4 of the Honolulu High-capacity Transit Corridor Project Visual and Aesthetic Resources Technical Report (RTD 2008). The following is an explanation of the terms "viewer exposure" and "sensitivity." Viewer exposure refers to the view groups' physical location, the relative number of people exposed to the view, and the duration of their view. This includes transit and highway users and people in the surrounding area. Viewer sensitivity refers to a group's expectations relative to a particular visual setting in a particular area. It is also the extent to which visual elements are important to the viewer group. Viewer sensitivity is affected by a variety of factors, including the activities a viewer is engaged in; the visual context; and their values, expectations, and interests. The assessment of visual effects in Section 4.8 of the Final EIS has considered that each viewer group, including business owners, customers, and employees, are important (see "Viewer Groups," in Section 4.8.2 of the Final EIS). The methodology for the visual assessment is detailed in Section 4.8.1 of the Final EIS. In addition, each viewer group's characteristics were considered in the assessment of visual effects for each of the viewpoints described in Table 4-9 in Section 4.8 of the Final EIS. The effects, which are noted as low, moderate, or significant, also consider each viewer group's location, duration, and distance. As stated in Section 4.8.3 of the Final EIS, in response to the viewer groups' responses, received during the Draft EIS comment period, further analysis of views and vistas has been done and the visual effects of several key views have been reevaluated.

Comment D-2: Views from Adjacent Buildings

- *Your letter accurately summarizes the visual impacts of the Project on adjacent property owners. The Project has selected a landscape architect that has prepared landscape architecture design criteria. Included in the design criteria are four color palettes that correspond to the four major geographic areas along the project alignment: Plains, Pearl Harbor Basin, Airport, and Coastal.*
- *Further, the City and County of Honolulu is conducting workshops with communities that will have rail stations. The purpose of the workshops is to engage the public about rail stations and provide opportunities to residents to contribute ideas about the appearance of station entryways in their areas. Ideas generated at the workshops will be incorporated into the station planning process. For more information and to get involved in this process, please visit the project website at www.honolulutransit.org.*

Comment D-3: Mitigation

The assessment of visual effect due to the Project as described in Section 4.8.3 of the Final EIS considers changes to the visual landscape and viewer responses to those changes. This includes the existing development along the Project alignment. Within the Project corridor the environment changes from rural at the Waianae end of the corridor to dense high-rise development at the Koko Head end.

As part of the design process, the City has developed design principles, which are identified in the Honolulu High-Capacity Transit Corridor Project Compendium of Design Criteria (RTD 2009m) that will be implemented in final design to minimize visual effects of the Project. For example, guideway materials and surface textures will be selected in accordance with generally accepted architectural principles to achieve effective integration between the guideway and its surrounding environment. Landscape and streetscape improvements will mitigate potential visual impacts, primarily for street-level views.

Other measures to address visual impacts of the Project are being developed through the station design and planning process. The initial station area plans and design guidelines were first developed with coordination between DTS and the Department of Planning and Permitting (DPP). The next level of transit station design focuses on integrating individual neighborhood characteristics of the communities served by the stations.

The following mitigation framework will be included in the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

- *Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
- *Coordinate the project design with City TOD planning and DPP.*
- *Consult with the communities surrounding each station for input on station design elements.*
- *Consider specific sites for landscaping and trees during the final design phase when*

plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will serve to mitigate potential visual impacts.

Section 4.8.3 of the Final EIS, Design Principles and Mitigation includes information related to the mitigation framework described above. Specifically architecture and landscape design criteria include guidelines regarding site design, materials and finishes, and lighting, which apply to stations, station areas, and the guideway.

Even with mitigation measures, some obstruction and changes to views will result in a high level of visual impact, or, a significant impact, and changes to some views will be unavoidable. These effects will be most noticeable where the guideway and stations are nearby or in the foreground of views.

The following bullets correspond to those in your letter under Comment D-3:

- Regarding TOD, the Project is focused exclusively on the construction and implementation of rail transit service, which is analyzed in the Draft and Final EISs. However, as discussed in Section 4.19.2 of the Final EIS, transit-oriented development (TOD) is expected to occur in station areas as an indirect effect of the Project. The increased mobility and accessibility that the Project will provide will also increase the desirability and value of land near stations, thereby attracting new real estate investment nearby (in the form of TOD). Planning and zoning around station areas will be established and conducted by DPP under a process covered by the City's new TOD Ordinance 09-4. The TOD special districts will encourage public input into the design of TOD neighborhood plans to reflect unique community identities. Information on the TOD process is available on DPP's website (<http://honolulu.dpp.org/planning>).*
- The Design Pattern Guidebook is a design document, not an environmental analysis document, and is therefore not included in the Final EIS. It is available for review at the DTS office. The Guidebook reflects the sense of place in Hawaii. The guidebook is intended to create a design that is aesthetically appropriate as well as functional.*
- DTS has developed specifications and design criteria to address the City's requirements for the Project. Guideway materials and surface textures will be selected in accordance with generally accepted architectural principles to achieve effective integration between the guideway and its surrounding environment. Landscaping and streetscape improvements will mitigate potential visual impacts.*
- The station area planning process will include public design workshops for each station area, as stated above.*
- As stated previously, the specifications and design criteria developed by DTS address the scale and character of the Project. In addition, the ongoing station area planning process involves numerous aspects of transit system design. The planning process addresses design and planning issues in an integrated manner and focuses on the characteristics and preferences of the communities adjacent to each station.*

- *As stated in Section 2.5.5 of the Final EIS design criteria developed for stations place the highest emphasis on walk and bicycle access. The Design Criteria provide specific direction for pedestrian and bicycle access features at stations. For example, the criteria state that adequate pedestrian circulation routes shall be provided with an emphasis on avoiding pedestrian and vehicular conflicts and enabling good visibility to each station entrance. This emphasis will be complemented by distinct and clear graphic signage. For bicycle access, the criteria include language stating that racks shall be placed at the station plaza near the station entrance where public visual surveillance is possible and/or where closed circuit television monitoring is present.*
- *The Project's landscape architect has prepared the landscape architecture design criteria. Included in the design criteria are four color palettes that correspond to the four major geographic areas along the project alignment: Plains, Pearl Harbor Basin, Airport, and Coastal. Topography is included in the visual landscape. The Project will include design features, including building materials and landscaping, that will allow the Project to fit the topography and visual setting of the area. For instance, Section 4.8.3 of the Final EIS states that "Stations and park-and-ride facilities will be designed in a manner that is compatible with the surroundings."*
- *Chapter 25 of the design criteria is dedicated to the safety and security of the system. Guideway materials and surface textures will be selected in accordance with generally accepted architectural principles to achieve effected integration between the guideway and its surrounding environment. Where the guideway columns fall within curbed areas, vines will be trained onto columns to reduce the possibility of graffiti and to soften the appearance of the structures.*
- *The design criteria also address materials that reflect Hawaiian culture. Specialty stations will be designed with respect to historic context and careful design to reinforce the uniqueness of context or use (e.g., the Kapalama Station might have a special planting of true kamani trees). The physical form of the project stations and support facilities will embody Honolulu and Hawaii's rich cultural heritage.*
- *The Project's landscape architect has prepared the landscape architecture design criteria, which includes the following goal regarding trees: "Transplant as many trees as possible displaced by the guideway to other areas of the Project that will be part of the first phase of construction or will otherwise not be disturbed by later construction." The design criteria also require the following: "Street tree planting or transplanting will occur adjacent to the station area and along the alignment where the existing streetscape is affected. Trees should be placed every 50 feet where adjacent to residential areas and every 40 feet where adjacent to commercial areas. Tree species, sizes, and details must conform to City standards." Street tree pruning, removal and planting will comply with City ordinances and will require that a certified arborist manage the pruning of any Exceptional trees.*
- *The station design goals include the following regarding the reduction of light pollution:*

1. *Minimize light trespass from the building and site; reduce sky-glow to increase night sky access; improve nighttime visibility through glare reduction; and reduce development impacts on nocturnal environments.*

2. *Only provide lighting for areas that is required for safety and comfort; all non-emergency interior lighting shall be automatically controlled to turn off during non-business hours; provide manual override capability for after-hours use.*

- *Criteria have been developed that will guide design of project elements. As indicated in Section 4.6.3 of the Final EIS, ongoing coordination efforts with the public will help develop design measures that will enhance the interface between the transit system and the surrounding community. The extent, nature, and location of these design measures will be determined through these coordination efforts.*
- *The measures listed in D-3 under the “construction-related mitigation” bullet of your letter are generally included in DTS’s Standard Specifications for construction.*
- *It is acknowledged that the guideway and stations will noticeably contrast with smaller-sized buildings and change the character of some areas. In addition, some views Downtown and in other areas, including protected views, will be blocked, and some views will change substantially. However, the design criteria discussed in Section 4.8.3 of the Final EIS states that station designs will be context-sensitive, functionally integrated, and culturally expressive of their specific locations and where there is an opportunity, the guideway design will incorporate materials, landscaping etc. to enhance the visual environment. Overall, the Project will be set in an urban context where visual change is expected and differences in scales of structures are typical. Noticeable changes to views will occur where project elements are near existing views or in the foreground of these views.*

Comment D-4: Street Trees

- *Street trees along the project alignment are discussed in Section 4.15 of the Final EIS. Effects to street trees will be mitigated by transplanting existing trees to areas as close to their original location as feasible or planting new ones. More detail on mitigation measures is discussed in Section 4.15.3 of the Final EIS. Specific sites for relocating trees will be considered during Final Design when plans for new plantings are prepared by a landscape architect.*
- *In addition to transplanting existing trees, plans for new plantings will be prepared by a landscape architect during Final Design to further mitigate effects to street trees. To mitigate any substantial effects in areas that require tree removal, special attention will be given to developing landscaping plans so that new plantings will provide similar advantages to the community. If new plantings will not offer equitable mitigation (e.g., older mature trees that are removed), additional younger trees could be planted that will, in time, develop similar benefits.*

- *Trees that do not successfully transplant will be replaced by the contractor according to the terms of the construction contract documents. Monitoring requirements for successful restoration will be in the landscaping plan set; the responsibility is typically shared between the contractor and the owner.*
- *The details regarding specific trees planted in specific geographic areas are controlled by the landscape architecture design criteria. As indicated in Section 4.15 mitigation effects to street trees will be mitigated by transplanting existing trees to areas as close to their original location as feasible or planting new ones. Among the trees that require removal but could be transplanted are most of the trees along Farrington Highway. The location where street trees will be transplanted will be selected based on project specific criteria that could include the following:*
 - *Areas where existing landscaping will be lost along the study corridor*
 - *Areas where opportunities exist for enhancing existing streetscapes near the study corridor*
 - *Areas where stations and parking lots will be constructed*
 - *Areas where shared benefits will be accomplished, such as areas adjacent to parks or historic sites*

Street tree pruning, removal, and planting will comply with City ordinances and will require that a certified arborist manage the pruning of any Exceptional trees. Trees suitable for transplanting displaced by construction will be relocated to a City project nursery until they can be transplanted to another part of the project area. The City will coordinate with HDOT's highway landscape architect. In addition to transplanting existing trees, plans for new plantings will be prepared by a landscape architect during final design to further mitigate effects to street trees. To mitigate any substantial effects in areas that require tree removal, special attention will be given to developing landscaping plans so that new plantings will provide similar advantages to the community. If new plantings will not offer equitable mitigation (e.g., older mature trees that are removed), additional younger trees could be planted that will, in time, develop similar benefits.

E. *Noise and Vibration*

Comment E-1: Noise Analysis

The noise analysis followed FTA guidance and is documented in the [Honolulu High-capacity Transit Corridor Project Noise and Vibration Technical Report](#) (RTD 2008). The results of the predicted project noise exposure levels are presented in Appendix A of this technical report. The technical report is available at libraries, from DTS, and on the project website at www.honolulutransit.org.

The methodology followed and the identification of sensitive noise receptors does not include commercial land uses as they are not noise-sensitive receptors. The FTA Noise Impact Criteria group noise-sensitive land uses into the following three categories:

Category 1: Buildings or parks where quiet is an essential element of their purpose.

Category 2: Residences and buildings where people normally sleep. This includes residences, hospitals, and hotels where nighttime sensitivity is assumed to be of utmost importance.

Category 3: Institutional land uses with primarily daytime and evening use. This category includes schools, libraries, theaters, and churches where quiet is important.

Comment E-2: Commercial Land Uses

Impacts were evaluated to resources in these categories. Industrial and many commercial uses are not noise-sensitive. State of California guidelines are not applicable to projects in Hawaii.

Comment E-3: Noise Mitigation

As discussed in Section 4.9.1 of the Draft EIS, "Moderate noise impacts also require consideration and adoption of mitigation measures when it is reasonable." During Preliminary Engineering additional measures were evaluated. As stated in Section 4.10.3 of the Final EIS, with the recommended mitigation in place (sound absorbing material and wheel skirts), the noise analysis indicates that the new noise generated by the Project will be lower than the existing noise levels in most places. The use of these materials will mitigate all anticipated noise impacts, including those at upper building floors.

F. Construction Impacts

Comment F-1: Farrington Highway

As discussed in Chapter 3, Section 3.5.7 of the Final EIS, a Maintenance of Traffic Plan (MOT) will identify measures to mitigate temporary construction-related effects on transportation. The contractor will develop the MOT Plan with approval from the City and the Hawaii Department of Transportation. The MOT Plan will address roadway closures for streets identified in Table 3-27 of the Final EIS, including those listed in your letter (specifically Farrington Highway between Makamaka Place and Waipahu Deport Road). An analysis of the impacts on local businesses is not anticipated as part of the MOT Plan. However, as stated in Section 4.18 of the Final EIS, access to businesses will be maintained during construction and a public involvement plan will be developed prior to construction to inform business owners and the public of the construction schedule and activities.

Comment F-2: Access to Residences and Businesses

The Final EIS includes commitments to maintain business access during construction. Requirements on the contractors to maintain access will be established through contract specifications. These measures will be considered during the development of the specifications.

The mitigation measures proposed on pages 10-13 of your letter, unless specified otherwise below, will be utilized as part of the Project and contained within contract documents and special provisions.

- *The City will not provide direct financial assistance to mitigate temporary impacts during construction to businesses. Where acquisition of property will occur, compensation will be provided to affected property owners, businesses, or residents in compliance with all applicable Federal and State laws and will follow the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act.*
- *DTS developed a community involvement plan for the Project that includes community-based staff that will work with neighborhood groups, residents, and businesses in each segment of the Project corridor. Representatives will visit businesses in each area to discuss the Project and take comments and answer questions. The MOT Plan and other construction-related plans will also be developed to minimize the impact construction will have on businesses.*
- *Every public involvement activity referenced in your letter will be undertaken during construction. An overall community involvement plan has been developed for the Project that details communications between the Project and the public. In addition, contractors hired for each construction segment will have a field office and will be required to meet with residents and businesses in the community and report to the DTS. The DTS and its contractor will jointly form a neighborhood-based plan of action to engage businesses throughout the process. The DTS sends monthly updates to the FTA regarding public involvement activities, which will continue throughout construction.*
- *The Final EIS includes commitments for community information during construction. The community information program will work with the individually affected communities. Some elements suggested for the Business Disruption Mitigation Plan, such as having a staff person work directly with the public and property owners to resolve construction-related problems, will be part of the MOT Plan or public information program. The DTS will work with all adjacent property owners and their tenants during construction to minimize disruption to local businesses.*
- *The Final EIS includes commitments to maintain business access during construction. Requirements on the contractors to maintain access will be established through contract specifications.*
- *Project construction does not entail cut and cover segments. As a result, the mitigation proposed in your letter for cut and cover activity is not applicable.*
- *As stated in Chapter 3, Section 3.5.5 of the Final EIS, access to existing bicycle and pedestrian facilities will be maintained during all phases of construction as safety allows. Warning and/or notification signs of modification to bicycle and pedestrian facilities during construction will be provided. Proposed pedestrian detours will be submitted to the City for review and approval to ensure they are reasonable for all*

pedestrians and meet ADA regulations. Sidewalk widths after construction is completed are shown in Table 3-25 of the Final EIS. All sidewalk widths will comply with minimum width requirements or better.

Comment F-3: Safety and Security Plan

The City has prepared a Construction Safety and Security Manual that requires the contractor to adhere to safe construction practices. Each contractor will be required to develop a Safety and Security Plan for areas within their responsibility. The Plan will be reviewed and accepted by the City. The Safety and Security Plan will include the costs associated with those security measures.

Comment F-4: Traffic Control

Traffic control during construction is the responsibility of the contractor. The contractor will follow the MOT Plan during construction. The MOT Plan is prepared through close coordination with the City and the Hawaii Department of Transportation. As stated in Section 4.18.2 of the Final EIS, construction in high-volume traffic and pedestrian areas could employ police support to direct and control traffic and pedestrian movements to lessen effects on mobility. Safety and Security plans have been developed in coordination with Honolulu Police Department (HPD) and HPD has provided assurances that they have sufficient staff to control and direct traffic when needed. This would be funded by the Project.

Comment F-5: Electric Power and Telephone Service

As presented in Section 4.18.2 of the Final EIS, "Design criteria will govern all new utility construction outside of buildings, as well as the support, maintenance, relocation, and restoration of utilities encountered or affected by project construction." HDOT will be involved with utility coordination for utility work in state roadways and roadway rights-of-way. The design criteria for utilities are currently contained within Chapter 8 of the Design Criteria prepared as part of the contract documents. In addition, the General Conditions require coordination with property owners regarding, but not be limited to, underground utility service connections, access or driveway reconstruction, utility disruption, water service, grounding work, demolition, landscape protection, landscape restoration, fencing, mail delivery, and garbage collection. This includes notifying and working with adjacent property owners regarding non-state roadways and roadway rights-of-way.

Comment F-6: Vertical Clearance on Dillingham Boulevard

The City has been working with Hawaii Electric Company (HECO) from the beginning of the planning and design work for this Project. All parts of the Project, including those on Dillingham Boulevard, will meet all clearance requirements for construction and maintenance of overhead cables. Given that construction will use overhead gantry systems for placement of the guideway, it will reduce the need for tall cranes. All construction systems will be properly insulated to ensure against any possible mishap.

Comment F-7: Air Quality during Construction

For the purposes of disclosure in the Final EIS, the air quality mitigation measures in Section 4.18.4 are sufficiently descriptive. As specified in this section, the Project must comply with the State of Hawaii's fugitive dust regulations, HAR 11-60.1-33, which provide more specific examples of mitigation measures. The contractor will select appropriate measures to comply with fugitive dust requirements. The following control measures will be considered to substantially reduce fugitive dust:

- o Minimize land disturbance*
- o Use watering trucks to moisten disturbed soil*
- o Use low emission equipment when feasible*
- o Cover loads when hauling dirt*
- o Cover soil stock piles if exposed for long periods of time*
- o Use windbreaks to prevent accidental dust pollution*
- o Limit the number of vehicular paths and stabilize temporary roads*

Comment F-8: Noise Mitigation during Construction

There will be temporary noise and vibration impacts during construction, as presented in Section 4.18.5 of the Final EIS. For the purposes of disclosure in the Final EIS, the noise and vibration mitigation measures presented in Section 4.18.5 are sufficiently descriptive. As stated in this section, the Project must obtain from the Hawaii Department of Health an approved community noise variance. The detailed mitigation commitments will be included in the community noise variance application and may include the measures proposed in the comment. The Hawaii Department of Health includes public involvement in establishing variance requirements.

G. Indirect and Cumulative Effects

As noted in Section 3.4.4 of the Final EIS, station areas with the highest estimated demands for spillover parking were at West Loch, Pearlridge, Iwilei, and Ala Moana Center. Table 3-22 in the Final EIS shows projected spillover parking demand near each guideway station. The Final EIS also notes that actual spillover parking at guideway stations will be influenced by several factors, such as availability of parking, changing conditions that will affect actual access to stations, and future development in station areas. As also noted in Section 3.4.2 of the Final EIS, ridership information for the Project is based on demand projections for 2030. The sizing of the system, including park-and-ride facilities, is based on this estimated long-term demand. When the Project is implemented, access to stations will be monitored. If park-and-ride access is higher than estimated, overall access will be reviewed, including approaches to increasing shares of other modes, such as local transit.

H. Section 4(f) Analysis

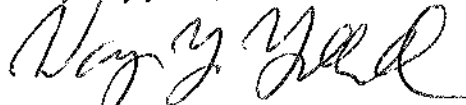

One parking space will be lost on the Boulevard Saimin parcel as a result of the Project. Kamehameha Schools will be compensated for this space in accordance with the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act.

I. *Mitigation Measures*

- *All mitigation commitments will be in the Final EIS, the Record of Decision, and permits (as appropriate), and will be incorporated into the Project's Final Design.*
- *DTS and the construction contractor will prepare a schedule for implementation of the environmental commitments. DTS's Environmental Compliance Manager will ensure that the environmental commitments are adhered to during construction.*
- *Mitigation measures required during construction of the Project will be included in the Record of Decision and included as requirements in the appropriate construction contract documents.*
- *As the City must approve the contractors' work, the City will ensure that contractors comply with all construction and mitigation requirements.*

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Enclosure

The City and County of Honolulu shall coordinate with KS on the latter's plans to redevelop its lands near the Mo'ili'i station in regards to the station's pedestrian facilities. Construction of this station shall not begin until this coordination has been completed and the appropriate pedestrian facilities have been included in the station's design.

D. Visual/Aesthetics/Street Trees

Construction of the transit project will create visual impacts on a number of KS-owned lands. It will also result in the removal of a number of significant street trees and other ornamental vegetation on KS lands, which will diminish the value of KS property and create significant aesthetic impacts due to changes in perception of KS property, loss of shade, screening from adjacent land uses, etc. Operation of the transit project will also create visual impacts on a number of KS tenants who will have views of the transit way and transit support columns.

Concern #D-1: The Visual and Aesthetics Resources Technical Report does not contain sufficient detail on the evaluation of impacts by "viewer groups."

The *Visual and Aesthetics Resources Technical Report* utilized the methodology of the Federal Highway Administration's (FHWA's) *Visual Impact Assessment for Highway Projects*,⁵ for the proposed project since it is a linear transportation facility comparable to a highway, has a similar range of issues, and because the FTA has not issued comparable guidance. The FHWA guidelines (Page 7) state:

"The major components of this process include establishing the visual environment of the project, assessing the visual resources of the project area, and identifying viewer response to those resources. These components define the existing conditions. We can then assess the resource change that would be introduced by the project and the associated viewer response; these allow us to determine the degree of visual impact."

The *Visual and Aesthetics Resources Technical Report* (Page 3-2), discusses how viewer groups have been categorized (i.e. residents, commuter, etc.) and indicates that viewer response to change is impacted by viewer exposure and viewer sensitivity. However, the analysis provided in Section 5.0 (Consequences) of the technical report contains few to no details regarding user group exposure to project alternatives for different user groups, including such factors as location, duration, and distance. Please provide additional clarification regarding viewer exposure and viewer sensitivity for the selected view points.

Concern #D-2: Numerous KS properties located adjacent to, or near the proposed fixed guideway system and stations would have their views impacted.

The Build Alternatives would have an elevated guideway and elevated stations throughout the study corridor. The support columns would range from 3 to 8 feet in diameter. All stations would have similar design elements, platforms that would be between 270 and 300 feet long, and a minimum of 10 feet wide. The Station height would be about 20 feet taller than the guideway. "As a result, the stations would be dominant visual elements in their settings and would noticeably change views. Systems elements for all technologies being considered would introduce new visual elements that may contrast with the existing environment's scale and character" (DEIS, Pages 4-93, 6-1 and 6-2).

- The *Visual and Aesthetics Resources Technical Report* (Page 6-1) recommends that, as a mitigation measure, project design should "incorporate elements of the Design Language Pattern Book being developed by the Project Team." KS would like to be consulted during development of the pattern book to help ensure that new stations and landscaping are compatible with existing land uses adjacent to the transit project. Therefore, it is requested that the following mitigation measure be included in the FEIS:

⁵ Publication No. FHWA HI-88-054.

The City and County of Honolulu shall consult with KS in the development of the pattern book that will be used in designing stations and landscaping.

Page 6-1 of the *Visual and Aesthetics Resources Technical Report* notes that impacts associated with the Build Alternative could include:

- Removal or relocation of Exceptional Trees;
- Changes in the settings of historic or cultural sites or Section 4(f) resources;
- Alteration of mauka-makai views;
- Introduction of project components that are out of scale or character with their setting;
- Moderate to high viewer response to project changes;
- Introduction of new light sources in sensitive areas; and
- Inconsistency with policy documents.

Views of the Pearlridge and Kapalama stations from KS properties are of particular concern. Tenants of KS-owned lands near or adjacent to these stations will see stations looming over them. In addition, the stations may create shading problems on adjacent lands.

Concern #D-3: The mitigation measures for visual effects lack specifics.

FHWA's visual impact assessment guidelines state, "To be relevant, visual mitigation measures must address the specific visual impacts or problems caused by project alternatives." The currently proposed mitigation in the DEIS (Page 4-93) is very general and lacks specifics as to how the mitigation measures would reduce or minimize specific visual impacts. The discussion of mitigation fails to provide a nexus as to how mitigation would address the specific visual impacts from the proposed project. In addition, the mitigation identified in the Draft EIS does not indicate any measures to mitigate construction-related visual impacts. However, the *Visual and Aesthetics Resources Technical Report* does provide greater detail regarding principles to minimize, reduce, or mitigate impacts, including those related to construction. The FEIS should include no less than the following measures:

- The City and County of Honolulu shall integrate transit-oriented development policies and principles with station designs, in consultation with developers and City, County, and State agencies before any station designs are completed;
- The City and County of Honolulu shall, in the FEIS, include a copy of the Design Language Pattern Book being developed by the Project Team and incorporate the applicable elements of the Design Language Pattern Book into the design of transit stations and landscaping;
- The City and County of Honolulu shall ensure that the final project design is aesthetically appropriate—as well as being functional;
- The City and County of Honolulu shall consult with the communities surrounding each station for input on station design elements and shall reach an agreement with all stakeholders before finalizing the station design;
- The City and County of Honolulu shall create a project design that is appropriate in scale and character to its setting;
- The City and County of Honolulu shall incorporate project design components that help create a human-scale and pedestrian-friendly environment;
- The City and County of Honolulu shall use project design features with materials and shapes that fit the topography and visual setting;
- The City and County of Honolulu shall look for opportunities to use materials that minimize the potential for vandalism;

- The City and County of Honolulu shall look for opportunities to use materials that reflect the Hawaiian culture;
- The City and County of Honolulu shall retain or replace existing street trees along sidewalks and in medians, and plant new vegetation to help soften the visual appearance of project elements (e.g., stations, guideway columns, and TPSSs);
- The City and County of Honolulu shall use source shielding in exterior lighting at stations and ancillary facilities such as the maintenance and storage facility and park-and-ride lots, to ensure that light sources (such as bulbs) would not be directly visible from residences, streets, and highways, and to limit spillover light and glare in residential areas;
- The City and County of Honolulu shall work with relevant adjacent land owners and developers to integrate project elements with area redevelopment plans as appropriate, particularly at stations; and
- Construction-related mitigation shall include the following:
 - Removing visibly obtrusive erosion-control devices (e.g., silt fences, plastic ground cover, and straw bales) as soon as an area has been stabilized;
 - Replacing street trees and other vegetation that must be removed with appropriately sized vegetation;
 - Keeping roadways as clean as possible by using street sweepers and wheel washers to minimize off-site tracking;
 - During dry periods, applying water to exposed soils to minimize airborne sediment;
 - Properly maintaining construction equipment to minimize unnecessary exhaust; and
 - Locating stockpile areas in less visibly-sensitive areas and, wherever possible, placing them in areas that are not visible from the road, or by residents and businesses.

The FEIS should provide site-specific mitigation measures for non-high-rise areas due to relatively higher visual impacts in order to adequately mitigate such impacts. This is particularly important for the Pearlridge and Kapalama stations, which would be developed near or adjacent to KS-owned lands.

Concern #D-4: The mitigation measures for removal of street trees are vague and inadequate.

The DEIS indicates that numerous street trees that would be pruned, removed, or transplanted as a result of any of the Build Alternatives. Of particular concern is the number of street trees that would be removed, including the 28 "notable" true kamani trees along Dillingham Boulevard, and how their removal would be mitigated. The mitigation provided on page 4-138 of the DEIS is vague and lacks specifics on this matter. Should street tree work such as pruning, removal or transplanting, not be done correctly, trees may become disfigured or die, creating a significant aesthetic impact on the project area, along with a need for corrective measures and their attendant costs.

- According to the DEIS, effects on street trees would be mitigated by transplanting existing trees or planting new ones. While relocating a street tree would retain the tree, the relocation of that tree would change its original environment. Therefore, more specific mitigation for areas to which existing trees would be relocated or removed is needed to ensure that these locations are appropriately mitigated. Specifically, areas adjacent to and/or near KS properties requiring tree relocation or removal should be adequately mitigated.
- What would happen in cases where the transplanted tree dies, as not all the proposed tree relocations may be successful? The mitigation on page 4-138 of the DEIS does not prescribe any post-transplant monitoring of relocated trees, nor does it provide any provisions for relocated trees that do not survive the transplant process.
- The DEIS contains little information on how mitigation would be determined in cases where tree removal would be required. As indicated on page 4-138 of the DEIS, "To mitigate any substantial effects in the areas that require removal, special attention would be given to developing landscape plans so that new

plantings would provide similar advantages to the community. If new plantings would not offer equitable mitigation (e.g., older mature trees that are removed), additional younger trees could be planted that would, in time, develop similar benefits.” Would younger trees be planted at a 1:1 ratio but older more mature trees at a higher ratio? Based on the information provided in the Draft EIS, it is unclear as to what criteria would be used to determine adequate quantities of new plantings to mitigate tree removal. The mitigation measures also do not indicate any monitoring of new plantings, or identify provisions should any of the new plantings die.

E. Noise and Vibration

The noise and vibration impact analysis in the DEIS and associated technical report is not adequately documented and does not address potentially important impacts upon commercial properties.

Concern #E-1: The noise analysis is not adequately documented.

Neither the DEIS nor the supporting technical report discusses the method by which noise levels due to the Project were calculated. It is likely that methods prescribed in FTA's *Transit Noise and Vibration Impact Assessment manual*⁶ were used. Furthermore, the assumptions used to estimate noise attenuation due to the parapet wall and the wheel skirts for receptors higher than the guideway are not reported. **The noise analysis in the FEIS needs to be fully documented and the assumptions and calculations need to be provided in an appendix, so that they may be checked.**

Concern #E-2: The noise analysis does not address potential impacts upon commercial land uses.

The DEIS uses the aforementioned FTA guidance's noise impact criteria as the standard against which to evaluate noise exposures due to the Project. The FTA criteria apply only for exposures to three categories of "sensitive" receptors. Category 1 includes land uses where quiet is essential, such as outdoor amphitheatres and recording studios. Category 2 includes residences and other places where people sleep. Category 3 is for "institutional land uses with primarily daytime and evening use," including schools, libraries, theaters, churches, historical sites, and parks. None of these category definitions includes, explicitly or implicitly, commercial operations. Furthermore, Hawaii State and local plans and regulations do not have standards for exposure of commercial receptors to transit noise. For this reason, the DEIS analysis did not consider impacts to commercial receptors. However, noise impacts to commercial receptors may be important in certain cases. This fact is recognized, for example, by the State of California in its *General Plan Guidelines*,⁷ which include ranges of acceptable exposures for "office buildings, business commercial and professional" land uses. **It is requested that the FEIS consider the issue of noise impacts upon commercial land uses.**

Concern #E-3: The discussion of mitigation measures for noise impacts to sensitive receptors higher than the guideway is inadequate.

The noise analysis conducted for the DEIS found that "moderate" impacts (as defined by the Federal Transit Administration) would occur at several sensitive receptor locations, including some residences that are at higher elevations than the guideway (DEIS, Table 4-16). The DEIS does not specify any mitigation measures. Instead it says that "measures to reduce noise levels above the track elevation ... would be evaluated during preliminary engineering of the Project. Once the Project is operating, noise levels will be measured to determine the actual extent of project noise impacts." (DEIS, pp. 4-101 and 4-107) The nearly complete deferral of the description of mitigation measures to the project engineering design stage is not acceptable under NEPA. Although it is true that Project design information is needed to determine the best mitigation measure for each predicted impact, it is

⁶ U. S. Department of Transportation. 2006. Federal Transit Administration. *Transit Noise and Vibration Impact Assessment*. FTA-VA-90-1003-06. May.

⁷ State of California, *General Plan Guidelines*. Governor's Office of Planning and Research, Sacramento, California (2003).

possible now to present at least a list of mitigation options that can reduce exposures to 45 or 50 dBA Ldn or below. A list of mitigation options should be included in the FEIS.

F. Construction Impacts

Construction of the transit project will create a number of impacts on KS lands along the transit corridor including interruption and/or temporary loss of access to businesses, potential temporary loss of utilities to businesses, temporary and/or permanent loss of on and off-street parking at KS businesses.

Concern #F-1: The DEIS does not adequately address left-turn closures on Farrington Highway in Waipahu during construction.

The DEIS (Page 4-153) states that left-turn lanes on Farrington Highway in Waipahu would be closed during construction. There are KS owned properties at the intersection of Farrington Highway and Waipahu Depot Road. The DEIS does not discuss the impact of the lane closures on traffic levels of the surrounding roads. It is believed that motorists will avoid the lane closure by using other alternate routes. The FEIS should include an analysis of the impacts on local businesses and KS tenants created by the closure of left-turn lanes on Farrington Highway in the Waipahu area, including the impacts of by-pass traffic. Mitigation, if necessary, should also be included in this analysis and included in the FEIS.

Concern #F-2: Proposed measures for maintaining auto access to residences and businesses during all phases of construction need to be made more specific. Additional measures are needed.

The ten mitigation measures to reduce adverse economic hardships for existing businesses along the project alignment during construction activities that are listed on page 4-154 of the DEIS should be included in the Maintenance of Traffic (MOT) Plan that would be developed by the Project construction contractor prior to construction of the Project. However, as currently written in the DEIS, these measures are very vague and do not clearly indicate who will be responsible for implementing them. These measures should be revised to be no less than the following—and be included in the project FEIS:

- The City and County of Honolulu, in concert with the project construction contractors, shall ensure by any necessary means that access to businesses in the project area shall be maintained during project construction activities.
- The City and County of Honolulu shall develop a public involvement plan prior to the beginning of project construction to inform business owners of the project construction schedule and activities throughout the project construction phase.
- The City and County of Honolulu shall initiate public information campaigns to reassure people that businesses are open during project construction activities to encourage their continued patronage throughout the project construction phase.
- The City and County of Honolulu shall minimize the extent and number of businesses, jobs, and access affected during project construction, by any means deemed feasible, throughout the project construction phase.
- The City and County of Honolulu, to the extent practicable, shall coordinate the timing of temporary facility closures to minimize impacts to business activities in the project area – especially those related to seasonal or high sales periods.
- The City and County of Honolulu shall minimize, as practical, the duration of modified or lost access to businesses in the project area, throughout the project construction phase.
- The City and County of Honolulu shall provide signage, lighting, or other information to indicate that businesses in the project area are open throughout the project construction phase.

- The City and County of Honolulu shall provide public information (e.g., press releases or newsletters) regarding construction activities and ongoing business activities, including advertisements in print and on television and radio on the Island of O'ahu during the project construction period.
- The City and County of Honolulu shall coordinate with the project construction contractors the phasing of construction in each project construction area so as to maintain access to individual businesses for pedestrians, bicyclists, passenger vehicles, and trucks during business hours and important business seasons, throughout the project construction phase.
- The City and County of Honolulu, in concert with the project contractor, shall provide advance notice if utilities would be disrupted, during regular business hours and schedule major utility shut-offs during non-business hours.

The following additional mitigation measures to reduce this Project's impact on business access should be included in the Project FEIS.

- Prior to and during construction of the East Kapolei-Ala Moana Center Segment, the FTA and the City and County of Honolulu, Transportation Services, Rapid Transit Division (RTD) shall contact and interview individual businesses potentially affected by construction activities, and maintain appropriate records. Interviews with commercial establishments will provide FTA and RTD staff knowledge and understanding of how these businesses carry out their work, and will identify business usage, delivery, and shipping patterns and critical times of the day and year for business activities. Data gathered from these interviews will also assist the FTA and RTD as it works with the City & County of Honolulu Department of Facility Maintenance to develop the Worksite Traffic Control plans. Among other elements, these plans will identify alternate access routes to maintain critical business activities.
- The FTA and RTD shall establish a "Public Affairs Program" that will be responsible for implementing the following actions:
 - ✓ Convey construction information to the community in a timely manner so as to minimize the potential disruption to businesses.
 - ✓ Develop a process that will enable the community to "speak" to the FTA and RTD during construction that includes a specific mechanism for responding to community concerns in a timely manner.
 - ✓ All FTA and RTD responses to community concerns shall be coordinated with the construction team.
- The FTA and RTD shall work with community residents, elected officials, local businesses, and community organizations to tailor the mitigation program to meet community needs in an East Kapolei-Ala Moana Center Segment Business Disruption Mitigation Plan (BDMP) prepared by FTA and RTD staff prior to the commencement of construction activities. A copy of the East Kapolei-Ala Moana Center Segment BDMP shall be placed in the East Kapolei-Ala Moana Center Project Information Field Office for public viewing. FTA and RTD shall inform the public of its progress in implementing the measures identified through a quarterly program of auditing, monitoring, and reporting. A quarterly status report shall be made available to the public. FTA and RTD shall appoint a staff person to work directly with the public to resolve construction-related problems.

The following mitigation measures should be minimum elements of the East Kapolei-Ala Moana Center BDMP:

1. It may be necessary to temporarily relocate immediately affected owners and occupants of businesses or provide a rent subsidy if, for example, access to the business could not be maintained or the business could not be operated in a normal manner. These options shall be explored by FTA and RTD staff if the need arises.

2. During construction of the project, FTA and RTD staff shall establish a project information field office located along the East Kapolei-Aia Moana Center Segment. The field office, in conjunction with other FTA and RTD staff, will serve multiple purposes, including:
 - ✓ Respond to and address community and business needs during the construction period,
 - ✓ Respond to complaints lodged by the public and construction claims,
 - ✓ Allow FTA and RTD to participate in local events in an effort to promote public awareness of the project,
 - ✓ Manage construction-related matters pertaining to the public,
 - ✓ Notify property owners, residences, and businesses of major construction activities,
 - ✓ Provide literature to the public and press,
 - ✓ Promote and provide presentations on the project via FTA and RTD's Speaker Bureau,
 - ✓ Respond to phone inquiries,
 - ✓ Coordinate business outreach programs,
 - ✓ Schedule promotional displays, and
 - ✓ Participate in community committees.
3. The project information offices shall be open various days of the work week for the duration of the construction period. A schedule shall be developed before project construction begins, shall be included in the East Kapolei-Aia Moana Center Segment Business Disruption Plan and shall be reported in the quarterly Mitigation Measures Status Report provided to the FTA.
4. An information and voice mail telephone line shall be available to provide community members and businesses the opportunity to express their views regarding construction. Calls received shall be reviewed by FTA and RTD staff and will, as appropriate, be forwarded to the necessary party for action (e.g., utility company, fire department, Resident Engineer in charge of construction operations). Information available from the telephone line shall include current project schedule, dates for upcoming community meetings, notice of construction impacts, individual problem solving, construction complaints, and general information.
5. The FTA and RTD shall provide multilingual advertisements for local print and radio for affected businesses, throughout the project construction phase. In addition, a multilingual construction update shall be available regularly throughout the community at least once a quarter. The languages for translation shall include, but not be limited to, English, Hawaiian, Tagalog, Japanese, Chinese, Korean, Ilokano, and Spanish.
6. The FTA and RTD shall provide affected businesses with the support needed to implement promotions to help maintain their customary level of business throughout the project construction phase.
7. The FTA and RTD shall work with establishments affected by the East Kapolei-Aia Moana Center Segment construction activities. Appropriate signage shall be developed and displayed by the FTA and RTD to direct both pedestrian and vehicular traffic to businesses via alternate routes.
8. Traffic management plans to maintain access to all businesses shall be prepared for all project construction areas.
9. Contractors shall clean work areas daily for the duration of the project construction phase.
10. Provisions shall be contained in project construction contracts to require the maintenance of driveway access to businesses to the extent feasible.

11. To the extent feasible, in the East Kapolei-Ala Moana Center project segment, concrete decking along the cut-and-cover segments shall be installed flush with the existing street or sidewalk levels.
12. Wherever feasible, sidewalks shall be maintained at their current widths during project construction. Where a sidewalk must be temporarily narrowed during construction (e.g., deck installation), it shall be restored to its current width during the majority of the construction period. Each sidewalk design will be of good quality and be approved by the FTA and RTD Resident Engineer prior to construction. Handicapped access shall be maintained during construction where feasible. If handicapped access is not feasible during project construction, then alternative handicapped access shall be provided as necessary or signs indicating that such access is temporarily unavailable shall be displayed. Handicapped access that is temporarily closed due to particular project construction activities shall be reopened as soon as possible after those construction activities have been completed.
13. Construction site fencing shall be of good quality, capable of supporting the accidental application of the weight of an adult without collapse or major deformation. Fence designs or samples shall be submitted to the FTA and RTD Resident Engineer for approval prior to installation. Where major boulevards must be fenced, business owners shall be offered the opportunity to request covered walkways in lieu of chain-link fencing. Where covered walkways or solid surface fences are installed, a program shall be implemented to allow for art work (e.g., by local students) on the surface(s). Where used, chain link fences shall have slats that will be maintained in good repair.
14. The project construction site shall be maintained in a neat manner, with all trash collected daily, all wood and pipes stacked neatly, and all small parts stored in closed containers.

Concern #F-3: A detailed Safety and Security Plan during construction is needed.

The DEIS (Page 4-155) states, "...During development of the Construction Safety and Security plans, measures would be identified to minimize effects on communities and their resources that address specific consequences anticipated at each location with the various communities, as well as ensure the safety of the public and environment." However, no measures are described in the DEIS. The FEIS should include a detailed Safety and Security Plan that fully explains measures that will be taken to minimize the Project's effects on communities, their resources and how the safety of the public will be ensured during Project Construction activities.

For example:

- Assuming each contractor has its own construction supplies security force, please show where the costs for such security are estimated.
- Each contractor should prepare and implement a security plan to minimize risks of creating an attractive nuisance and of theft of material and equipment—especially dangerous construction equipment.

Concern #F-4: Does the Honolulu Police Department have adequate resources to control traffic during construction?

The DEIS (Page 4-155) also states that police services could be used to control and direct traffic. How would this impact Honolulu Police Department (HPD) resources? Can HPD provide the necessary staff? What would be the impact on higher priority law enforcement activities if HPD is used to manage traffic control throughout construction? The FEIS should include an analysis of existing staffing levels of the HPD and their ability to provide staff to control and direct traffic during project construction activities and how this impacts overall staffing at HPD for other law enforcement activities.

Concern #F-5: Electric power and/or telephone service may be lost during construction.

There might be an unanticipated loss of power/telephone service to commercial properties should an unknown power or telephone line be severed during project construction activities. What assurances can be given that this will not occur and what recourse for damages will be provided should a power or telephone outage occur?

Concern #F-6: Will sufficient vertical clearance be available along Dillingham Boulevard in the Dillingham Plaza area to provide to construct the elevated transit way?

The DEIS does not address whether sufficient clearance is currently available along Dillingham Boulevard in the Dillingham Plaza area to provide for enough space to construct the elevated transit way. Dillingham Boulevard in this area is very narrow. How can cranes safely operate in this area without hitting high voltage power lines that are located on both sides of this street?

Concern #F-7: Proposed mitigation measures for air pollution during construction should be made more specific.

The control measures for air quality listed on Page 4-157 of the DEIS should be revised and expanded as follows:

- Minimize land disturbance in any one area by project construction activities.
- Use watering trucks on exposed soil surfaces to minimize dust from project construction areas at least twice a day. Watering may be required more often if any visible plume of dust drifts off any project construction site.
- Use low-emission construction equipment when feasible.
- Cover all loads when hauling soil from project construction sites.
- Cover soil stockpiles if exposed for more than seven days at a time.
- Use windbreaks to prevent accidental dust pollution, especially when construction activities are located near sensitive uses (hospitals, schools or residential areas) or near commercial areas.
- Limit the number of project construction vehicle paths and stabilize temporary roads with water or soil binders.
- Maintain stabilized project construction area ingress/egress areas.
- Wash or clean trucks prior to leaving project construction sites. Install wheel washers if necessary. Soil tracked onto streets adjacent to construction sites shall be swept once a day to remove soil tracked onto them by project construction or delivery vehicles.
- Minimize unnecessary vehicular activities, and limit vehicle traffic to 15 miles per hour on project construction haul roads.

Concern #F-8: Proposed mitigation measures for noise during construction should be made more specific.

Project construction noise will temporarily impact existing land uses on KS owned properties. Therefore, it is requested that the noise measures listed on page 4-158 of the DEIS be modified as follows in the project FEIS:

- Develop a project monitoring plan with noise limits consistent with the construction contractor's noise permit.
- Construct temporary noise barriers or curtains to shield sensitive noise receptors from project construction activities.
- Equip project construction equipment engines with adequate mufflers and intake silencers.
- Strategically place stationary equipment, such as compressors and generators as far away from sensitive noise receptors (hospitals, schools and single/multiple family residences) as possible.

G. Indirect and Cumulative Effects

UltraSystems does not believe that the transit project DEIS adequately analyzes the Project's indirect and cumulative impacts on KS-owned lands along the transit corridor.

The DEIS lacks an adequate discussion in regards to the cumulative impact of parking around transit stations and its effect on available area parking. Given that Transit Oriented Development projects will be underway near transit stations, parking could be an issue and should be discussed in the Project FEIS. KS properties may be affected by the placement of parking near stations. If parking needs are underestimated, then parking will have to be increased at a later time to accommodate the additional parking spaces needed. Since the Pearlridge and Kapalana stations are near or adjacent to KS-owned properties, the planned parking and potential future expansion of parking could impact KS-owned properties and additional full or partial takes may be needed. These cumulative impacts should be discussed in the Project FEIS.

H. Section 4(f) Analysis

The Boulevard Saimin Restaurant, a cultural resource, is located on KS-owned property fronting on Dillingham Boulevard. The Boulevard Saimin parcel would be affected by the widening of Dillingham Boulevard (by approximately 10 feet) to accommodate the fixed guideway in the median in Dillingham Boulevard. A total of 696 square feet of parking area would be necessary to allow for the construction of the Project on this street. This take of a parking area qualifies as a direct use under Section 4(f). The City's acquisition of a portion of the parking area at the Restaurant will not only have impacts on the Restaurant parking, but also parking that is used for those patronizing the many stores that are co-located in the two-story building that houses the Restaurant. It appears that two of the twelve parking spaces provided for restaurant patrons will be lost as a result of the widening of Dillingham Boulevard. What provisions can be made to compensate for the lost parking spaces that would be taken as a result of the land take? If sufficient parking cannot be provided on or off the building site, will the whole building need to be taken, resulting in the loss of the Restaurant and the other businesses housed in this building?

I. General Comments on Project Mitigation Measures

UltraSystems' general comment on the mitigation measures included in the Project DEIS is that many of these measures are so vague that it will be difficult to implement them. To remedy this problem, a stand-alone mitigation monitoring and reporting program (MMRP) should be prepared for the proposed as part of the FEIS. The MMRP would include the following:

- All the mitigation measures included in the FEIS;
- When these measures are to be implemented (e.g. during Project planning and design/Project construction/during Project operation);
- Who is responsible to see that these measures are implemented; and
- A place for a City and County of Honolulu staff member to sign-off that the measure has been completed.

UltraSystems believes that the City and County of Honolulu should appoint a monitor or monitors whose responsibility would be to ensure that the MMRP is being implemented as project construction takes place. This could be a City/County staff member. The City/County staff member could work with the Project Construction Contractor to implement Project mitigation measures. A report should be prepared annually on the status of the MMRP and what measures were implemented, including evidence that they were implemented (copies of required

permits etc.); changes to measures that were implemented; and what measures were not implemented and why they were not. The status report on the MMRP would be presented to the Honolulu City Council annually for approval.

UltraSystems has found that for mitigation measures to be implemented they must be located in a stand-alone document and be easily understandable by all parties responsible for their implementation. A commitment by a public agency is also necessary to implement all project mitigation measures, with follow up by elected officials to see that the MMRP has been implemented.

Should you have any questions concerning UltraSystems' comments in this letter on the DEIS, please call me or Bob Rusby, UltraSystems Senior Project Manager, at your convenience at 949-788-4900 or email Bob at rusby@ultrasystems.com.

Sincerely,

ULTRASYSTEMS ENVIRONMENTAL INCORPORATED

Dear Mr. van der Leest:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

Your interest in the Project has been noted. You can keep up-to-date with the Project through the Project's website at www.honolulustransit.org. You can find out about available job positions through the City and County's main website at www.honolulu.gov.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka", is written over a white background.

Dear Mr. Vaspra:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

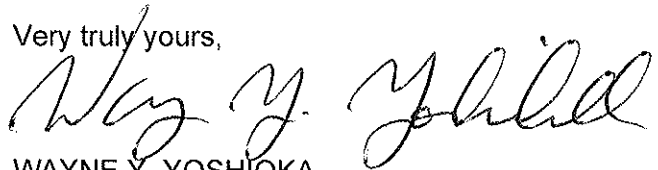

Your preference for the Airport Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more

Mr. Steven Vaspra
Page 2

information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Subject: Comments on the Draft Environmental Impact Statement
for the Honolulu High-Capacity Transit Corridor Project

Dear Mr. Yoshioka,

Thank you for the opportunity to provide comments on the Draft Environmental Impact Statement (DEIS) for the Honolulu High-Capacity Transit Corridor Project (HHCTCP).

The Waikiki Improvement Association continues to follow with great interest how the Honolulu High-Capacity Transit Corridor Project will improve the ability of people to move in the highly congested east-west corridor from Kapiolani to the University of Hawaii at Manoa and Waikiki. We continue to support the Project.

We have taken a keen interest in carefully examining the Project's impacts as documented in the DEIS. Our evaluation is based upon identifying needed commitments to assure the HHCTCP supports the facts and findings of the DEIS and the achievement of the Waikiki Transportation Strategy to the maximum degree possible.

Our comments on the last three pages of the attached document address the following three areas: 1) the need for a high quality transit link between the Ala Moana Center station and Waikiki, 2) the need for implementation of pedestrian and bicycle connections as recommended in the City's Waikiki Livable Community Project, and 3) further definition of an off-street transit center at the Ala Moana Center station designed to accommodate the enormous travel demands anticipated at this location.

The Waikiki Improvement Association appreciates the opportunity to offer comments on the HHCTCP DEIS.

Sincerely,

Rick Egged, President

Attached: Waikiki Improvement Association Comments On The Honolulu High-Capacity Transit Corridor Project Draft Environmental Impact Statement (DEIS) / Section 4(f) Evaluation, November 2008.

Waikiki Improvement Association

Comments On The

Honolulu High-Capacity Transit Corridor Project
Draft Environmental Impact Statement (DEIS) / Section 4(f) Evaluation
November 2008

Introduction

The Waikiki Improvement Association (WIA) has reviewed the Honolulu High-Capacity Transit Corridor Project (HHCTCP) Draft Environmental Impact Statement (DEIS) dated November 2008. Comments are preceded by highlighting the references to Waikiki in the DEIS and summarizing the Waikiki Transportation Strategy. Comments focus on identifying commitments needed to assure the HHCTCP supports the facts and findings in the DEIS and the achievement of the Waikiki Transportation Strategy to the maximum degree possible.

HHCTCP DEIS Facts and Findings

The DEIS acknowledges Waikiki's prominent position as a major transit travel market with the following statements:

- "Overall, the largest share of TheBus riders' trips originate in Waikiki." (page 1-13)
- "In 2007, O'ahu hosted 4.6 million visitors (DBEDT 2008), who take more than 17,000 transit trips daily. Many of these visitors stay in the Waikiki area and travel to points of interest outside of Waikiki, including many of the activity centers in the study corridor. (page 1-19)
- The DEIS identifies "Visitor trips from Waikiki" and "Work trips to Waikiki" as "Key Transit Markets" with "Estimated Transit User Benefits Resulting from 2030 Build Alternatives (Hours per Day)". (page 3-36)

The DEIS identifies transportation problems justifying the HHCTCP as a preferred solution. Many of these identified transportation problems feature references to Waikiki transportation issues:

- Waikiki bus service has reliability problems. Route 42 has the largest reliability problem (as depicted by schedule increase) over the 1992 to 2008 period of those routes included in Figure

1-11. Route 42 travels from Ewa Beach to Waikiki, is "...part of the system's backbone..." with the second highest number of boardings of the selected routes included in Table 3-5. (pages 1-18 and 3-9).

- Waikiki has traffic problems, but Waikiki is not included in the list of committed congestion-relief projects in the O'ahu Regional Transportation Plan. (page 2-13)
- Waikiki has parking problems. "On- and off-street parking facilities are heavily used in Downtown Honolulu, Waikiki, and along University Avenue...Inadequate parking supply has been a long-term problem in this portion of the study corridor." (page 3-15)

The DEIS concludes that the HHCTCP will benefit Waikiki with the following:

- "Bus and fixed guideway departures and arrivals would be coordinated and predictable to minimize transfer time..." (page 2-36)
- "Substantial increases in transit share would also occur...the Waipahu to Waikiki market would increase from 8 percent ... to 26 percent..." (page 3-33)

The DEIS identifies several important unresolved issues potentially significant to Waikiki:

- Funding sources for an extension to Waikiki are not identified. "...planned extensions, would be constructed once additional funding is secured." No potential sources of funding for extensions are identified in the DEIS. (pages 2-38 and 6-1 to 6-11)
- Transit center details are characterized, but not specified. "Bus transfers would be made at off-street transit centers adjacent to fixed guideway stations at ... Ala Moana Center." No Ala Moana off-street transit center is illustrated in the DEIS. (page 2-36)
- Transit service details are characterized, but not specified. "Enhanced bus service would be provided between the terminal stations of the Project and the planned extensions of the fixed guideway system. System improvements, including traffic signal priority, automated vehicle identification, and off-vehicle fare

collection, would complement frequent bus service at ... Ala Moana Center Station." No specific service frequency intervals are identified in the DEIS. (page 2-36)

- Transit demand entering Ala Moana Center in 2030 is 18,750 to 19,180, roughly three times higher than any other station. No specific analysis is included in the DEIS to accommodate this extraordinary volume of passengers. (Figure 3-12, page 3-31)
- Transit travel time between Honolulu International Airport and Waikiki is a determining factor for supporting the 2030 Airport Alternative. Section 7.5, Important Trade-offs, should include these important destinations in the comparisons presented (Figure 7-9, page 7-11).

Waikiki Transportation Strategy

The DEIS review was conducted in the context of the Waikiki Transportation Strategy. This strategy is founded upon the 1999 report "Recapturing the Magic of Waikiki" and its following expectation:

"In Waikiki the pedestrian, visitor and resident alike, will come first. Waikiki will be a pedestrian-oriented resort and a pedestrian-oriented residential area. Walking will be the primary mode of getting around within Waikiki and it will be a pleasurable way to enjoy Waikiki."

The problem encountered with seeing this expectation achieved is that too much traffic in Waikiki conflicts with pedestrians. It is unclear how future actions to implement the HHCTCP may help to solve Waikiki's transportation problems. It is reasonable to expect that safer and more direct pedestrian connections than exist today must be investigated with rail terminating at Ala Moana Center.

Waikiki needs to immediately achieve the expectation of a "Pedestrian First" policy to retain and strengthen its standing as one of the world's premier destinations, to maintain its Hawaiian sense of place and to invigorate its economic vitality. To do this, Waikiki requires the highest quality multi-modal transportation system possible.

Waikiki's multi-modal transportation system needs to keep pace with its continuing transformation. Waikiki needs to evolve from a typical vehicle traffic congested urban atmosphere into a more appealing pedestrian-oriented environment reflective of its unique heritage. Waikiki's transportation infrastructure and services need proper prioritization and reorientation to respond to the "Pedestrian First" policy.

Solutions Required

The Transportation Strategy builds upon previous efforts to update and advocate for the highest priority transportation solutions. Actions are drawn from past work completed by the City and County of Honolulu with the full involvement of the public such as the Waikiki Livable Community Project (December 2003). Three of the five solution elements directly relate to comments on the HHCTCP DEIS. These three elements are summarized as follows:

1. **Create High Quality Transit Link.** The Waikiki Livable Community Project (WLCP) included an analysis and set of recommendations predicated upon the creation of a high quality transit link to Ala Moana Center, downtown Honolulu and other nodes along the primary urban corridor. Such a link is needed now more than ever to the future rail station at Ala Moana Center.
 - a. Direct Transit Link -- The transit route alignment must be quickly and easily understood. This is achieved using the most direct connection possible with Ala Moana Center.
 - b. Vehicle Types -- The transit alignment will be operated with advanced design vehicles that are environmentally progressive and reflective of Waikiki's standing as a major international resort destination with emphasis on safety, comfort and cleanliness.
 - c. System Improvements -- The transit operation will feature advanced technology passenger information system displays to make it very easy for people to identify how the link operates and how to use it.
 - d. Traffic Priority -- The transit operation must be given the highest priority at intersections except where pedestrians and bicyclists are given higher priority. General purpose traffic should be given lowest priority.
 - e. Service Frequency -- The transit connection must have service intervals between departures equal to, or more frequent than, the rail operation at Ala Moana Center.
2. **Create Safe Pedestrian and Bicycle Connections.** The Waikiki Livable Community Project included a set of pedestrian and bicycle recommendations. These require immediate implementation before rail becomes operational at Ala Moana Center with added network elements to offer a high quality link to Waikiki.

- a. Wider Sidewalks – Construct projects as identified in the WLCP.
 - b. Ala Wai Pedestrian-Bicycle Bridges – High quality connections are essential between the termination of rail at Ala Moana Center and Waikiki.
 - c. Intersection Re-orientation – Priority must be given to pedestrians and cyclists. Traffic signal wait times for pedestrians must be reduced.
3. **Locate Strategic Parking Capacity.** Parking facilities are needed to replace on street parking to allow many of the proposals outlined to proceed. Parking facilities are needed to replace displaced off street parking and offset future development needs.
- a. Candidate Sites Have Been Identified:
 - i. Central location – Fort DeRussy. National Defense Authorization Act for Fiscal Year 2002 (sec. 2832). Authorizes the Secretary of the Army to enter into a lease with the City and County of Honolulu to allow the City to construct and operate a parking facility.
 - ii. Central location – Residential. Two sites have been identified primarily for residential, long-term parking:
 - 1. Kuhio-Kaiolu. Increase the 72 current municipal parking spaces up to 525 spaces with a four-level parking structure.
 - 2. Aloha Street. Three-level parking structure.
 - iii. Peripheral location – Kapahulu Corridor. An undeveloped site owned by DLNR may be available through the lease holder. The property (0.57 acres) is surrounded by the Prudential Locations building to the north, the Ala Wai Golf Course to the west and a Board of Water Supply booster station to the south. Adjacent sites may be available. Other sites in the corridor might warrant exploration.
 - iv. Peripheral location – Kapiolani Corridor. Several undeveloped sites (owned privately) are situated between Kona and Kapiolani Boulevard in close proximity to the proposed Ala Moana terminal rail station. Some of these sites have potential for a combined parking and bus terminal. Other sites along Kapiolani might warrant exploration.

- b. Financial Approach Is Viable. Construction could be funded with municipal bonds repaid through parking revenues and in lieu of parking payments.

HHCTCP DEIS Comments

WIA supports the HHCTCP DEIS and the implementation of the Project. WIA concludes that the intent of the Project is substantially supportive of the intent of the WIA Transportation Strategy. WIA seeks further clarity to be offered in the Final Environmental Impact Statement (FEIS). In consideration of the facts and findings in the HHCTCP DEIS and WIA's Transportation Strategy the following comments are offered:

1. A high quality transit link as outlined in the WIA Transportation Strategy is essential. Figure 2-8 on page 2-18 of the DEIS includes an extension into Waikiki from Kapiolani Boulevard along Kalakaua Avenue to Kuhio Avenue with stations at the Hawaii Convention Center, the vicinity of Kalaimoku Street and Kuhio Avenue as well as a terminal stop near Liliuokalani Avenue and Kuhio Avenue.

The Waikiki Improvement Association appreciates the need to guarantee access for not only our visitors but employees and residents as well. We believe that Waikiki is well served by the City's award winning bus system. WIA's primary concern with the High-Capacity Transit Corridor Project Waikiki spur proposal is the loss of street capacity created by locating an overhead line down Kalakaua and Kuhio Avenues.

We have concerns over the aesthetic and physical density issues of locating the overhead track in a resort and residential area. The Waikiki Improvement Association urges the City and County of Honolulu to continue to serve the area by bus transit or some other high quality transit link rather than add an overhead fixed guideway into Waikiki.

The high quality transit link must provide the minimum elapsed travel time possible not just between Waikiki and Ala Moana Center, but other important destinations as well such as the Honolulu international Airport. Therefore, we strongly endorse the alternatives including the Airport alignment.

The DEIS confirms that "Overall, the largest share of TheBus riders' trips originate in Waikiki" and many of these riders will likely be those forecast to be entering the Ala Moana Center station by other modes. This will constitute, by far, the highest passenger volume accessing the

rail system. More specificity is needed in the FEIS. The FEIS should identify:

- a. A transit route alignment linking Ala Moana Center with Waikiki and preferably follow the one developed for the WIA's Transportation Strategy.
 - b. The types of buses intended to be used for the most important transit routes, such as between the Ala Moana Center station and Waikiki.
 - c. The specifics of the featured system improvements such as advanced technology passenger information system displays, traffic signal priority, automated vehicle identification, and off-vehicle fare collection.
 - d. Specific intersections along the most important bus shuttle transit links where the bus will be given highest priority at intersections except where pedestrians and bicyclists are given higher priority.
 - e. The service intervals for high priority transit connections. The FEIS should identify the link to Waikiki with a service interval between bus departures equal to, or more frequent than, the rail operation at Ala Moana Center.
2. Pedestrian and bicycle connections, as outlined in the WIA Transportation Strategy, should be identified in the FEIS. The Waikiki Livable Community Project included a set of pedestrian and bicycle recommendations. These require immediate implementation before rail becomes operational at Ala Moana Center with added pedestrian and bicycle network elements to offer a high quality multi-modal transportation links to Waikiki. The FEIS should identify:
- a. The need to construct the projects as identified in the WLCP to support the HHCTCP.
 - b. The need to construct high quality pedestrian and bicycle connections between the termination of rail at the Ala Moana Center station and Waikiki to support the HHCTCP.
 - c. The need to give priority to pedestrians and cyclists. Traffic signal wait times for pedestrians at key intersections must be reduced to support the termination of the Project at Ala Moana Center station.

3. An Ala Moana Transit Center station transit center should be identified in the FEIS. The DEIS states: "Bus transfers would be made at off-street transit centers adjacent to fixed guideway stations at ... Ala Moana Center." The WIA Transportation Strategy includes locating strategic parking capacity. The Ala Moana Transit Center station transit center and the WIA Transportation Strategy represent a consistent opportunity for a private-public partnership at this location. The FEIS should include further definition of the needs to accommodate the enormous travel demands at an off-street transit center at the Ala Moana station.

Honolulu, Hawaii 96815

Dear Mr. Egged:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

To address issues identified at the bottom of page 2 in your letter,

- *Funding sources for rail extensions have not been identified, although the capital costs of the extensions would likely be funded from a combination of Local and Federal sources. The planned extensions are not part of the Federal action covered in the Final EIS.*
- *To answer your next point, transfers will continue to occur at Kona Street (a private street) and at the off-street bus stop on Ala Moana Boulevard. Text in*

Chapter 3 of the Final EIS has been clarified to state that transfers at Ala Moana Center will continue to occur on Kona Street.

- *Existing and future bus routes, including route numbers and frequency, are provided as Appendix D in the Final EIS.*
- *Ala Moana Center Station, like all stations, is being designed to accommodate expected passenger volumes, including the number of pedestrians, bicyclists, bus transfers, and passenger drop-offs that will occur at the station. Station components, including platforms, stairways, escalators, and elevators, are all designed to accommodate passenger volumes anticipated in the year 2055 (achieved by applying a standard growth factor to the 2030 forecast volumes).*

In addition, the Ala Moana Center Station was one of five selected for additional traffic analysis due to the large volume of bus transfers and pedestrian activity anticipated. As shown in Table 3-23 in the Final EIS, the traffic analysis found a potential future effect at the intersection of Kona Street and Keeaumoku Street. To mitigate this effect, the Project will signalize this intersection.

- *Transit travel time between Honolulu International Airport and Waikiki is an important factor for supporting the Airport Alternative and, accordingly, Figure 3-7 in the Final EIS has been revised to include this travel pair. As shown in this figure, transit travel time from the Airport to Waikiki will take 40 minutes with the Project compared to approximately 70 minutes without the Project. Table 7-9 in the Draft EIS compared the No Build Alternative and the three fixed guideway alternatives. While each of the alternatives includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana Center has been selected as the Preferred Alternative. The identification of the Airport Alternative as the Preferred Alternative was made by the City to comply with FTA's NEPA regulations that state that the Final EIS should focus on the Preferred Alternative (23 CFR § 771.125 (a)(1)). Table 7-9 has been removed from the Final EIS.*

Your letter next had a section titled "Waikiki Transportation Strategy," which is addressed below.

The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS. The future extensions are not part of this Project; thus, they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because

they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time. The Project does not preclude bicycle or pedestrian improvements from occurring in Waikiki, although such improvements are not part of the Project.

Figure 3-7 in the Final EIS shows travel time from Waipahu to Waikiki and from the Airport to Waikiki. As shown in this figure, travel times for both pairs improve with the Project compared to the No Build Alternative.

As stated in Section 2.5.5 of the Final EIS, design criteria developed for project stations place highest emphasis on walk and bicycle access. Pedestrian access to stations, including accessible routes, will be given first priority for reasons of safety. The design criteria also state that, as a non-motorized mode, bicycles will be given second priority and will be placed over all motorized vehicular access to project stations.

One of the major effects of the Project has a direct bearing on efforts to attain a "pedestrian first" environment in Waikiki. As indicated in Section 3.4.2 of the Final EIS, the Project will result in higher shares of travel by transit and less by automobiles as compared to the No Build Alternative. The Final EIS specifically noted that, for the Waipahu to Waikiki market, the transit share of home-based work trips in the a.m. peak period will increase from 8 percent under the No Build Alternative to 36 percent with the Project.

A "pedestrian first" policy will also be supported by the type of access that is expected for the project system. The Final EIS noted that, with the Project, overall accessibility to transit will be enhanced. As shown in Table 3-20 of the Final EIS, bus and walk/bike access to stations will account for approximately 90 percent of total daily trips.

Your letter next had a section titled "Solutions Required," which is addressed below:

- 1. As identified in Section 3.4.2 of the Final EIS, enhanced bus service will be provided between the terminal stations of the Project and future extensions of the entire fixed guideway system. System improvements, including traffic signal priority, automated vehicle identification, and off-vehicle fare collections, will complement frequent bus service at Ala Moana Center Station. Bus and fixed guideway departures and arrivals will be coordinated and predictable to minimize transfer time and total trip time.*
- 2. The Project does not preclude bicycle or pedestrian improvements from occurring in Waikiki in advance of any extensions, although such improvements are not part of the Project.*
- 3. The Project does not affect on-street or off-street parking in Waikiki. Potential spillover parking may occur as a result of the Project at the Ala Moana Center*

Station area. Approaches to mitigating the effects of spillover parking will be unique to each station area. The City will conduct surveys to determine the extent of spillover parking near stations and implement mitigation strategies as needed. Strategies to be used include, but are not limited to, parking restrictions (where parking causes safety or congestion problems) and shared parking arrangements (at locations where parking is available but dedicated to another purpose such as retail centers, office uses, or places of worship). Implemented strategies will be monitored and necessary adjustments will be made as needed.

Finally, your comments in the section titled "HHCTCP DEIS Comments" are addressed below.

- 1. The Draft and Final EISs evaluate the Project, which is defined as extending from East Kapolei to Ala Moana Center. The Project does not include construction of any elevated or at-grade structures in Waikiki. Accordingly, there will not be any loss of street capacity in Waikiki. A detailed environmental review would be conducted when the extensions proposed for implementation are implemented.*

Your preference for the Airport Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

As stated previously, Figure 3-7 in the Final EIS shows that transit travel times from the Airport to Waikiki improve substantially with the Project compared to the No Build Alternative.

- a. Frequent bus service will connect Ala Moana Center Station and Waikiki. A detailed description of bus routes, including route numbers and frequency, is provided in Appendix D of the Final EIS.*

b. *The types of buses used in a given service area are selected based on need. If the demand is high, TheBus typically assigns longer, higher-capacity articulated buses to serve a route as long as the route can accommodate them. For smaller demands, shorter buses are used. The demand is forecast to be high so the expectation will be for articulated buses to be used, but a final decision will only be made at the time the service is implemented. Under any circumstances, TheBus will continue to operate between Ala Moana Center and Waikiki, and bus service will be enhanced to provide a reliable link between Ala Moana Center and Waikiki.*

c. *The Project will provide passenger system information, automated vehicle identification, and off-vehicle fare collection for the fixed guideway system. Specific designs and requirements for these systems will be developed during Final Design of the transit vehicle and systems portions of the Project.*

d. *The Project will provide passenger system information, automated vehicle identification, and off-vehicle fare collection to complement frequent bus service at Ala Moana Center Station. As stated in the previous response, specific designs for these systems will be developed during Final Design.*

e. *Existing and future bus routes, including route numbers and frequency, are provided in Appendix D in the Final EIS.*

2. *Regarding pedestrian and bicycle connections:*

a. *The bicycle and pedestrian recommendations of the Waikiki Livable Community Project planning study are acknowledged. However, the Project scope does not include improvements beyond station and guideway facilities. Ongoing coordination efforts with the public and information from studies will help formulate design measures that will enhance the interface between the transit system and the surrounding community.*

b. *The scope and resulting Draft EIS for the Project did not include improvements beyond stations and guideway facilities. However, as indicated in Section 4.6.3 of the Final EIS, ongoing coordination efforts with the public will help develop design measures that will enhance the interface between the transit system and the surrounding community.*

c. *The Project does not generally include improvements beyond stations and guideway facilities. However, as shown in Chapter 3 of the Final EIS, signalization of the intersection of Kona Street and Keeaumoku Street will be included as mitigation. That will improve pedestrian and bicycle access and safety near the station. In addition, as indicated in Section 4.6.3 of the Final EIS, ongoing coordination efforts with the public will help develop design measures that will enhance the interface between the transit system and the surrounding community. These measures could include traffic operations, such as signal modifications.*

Mr. Rick Egged, President
Page 6

- 3. Concerning the Ala Moana Transit Center, as identified in Section 3.4.2 of the Final EIS, enhanced bus service will be provided between the terminal stations of the Project and planned extensions of the system. At Ala Moana Center Station, bus connections will be provided along Kona Street, which serves as a bus transit facility. With planned improvements, such as signalization at Keeaumoku Street, Kona Street will have adequate capacity to serve the projected volume and frequency of bus traffic.*

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Issuance of the Record of Decision under NEPA and acceptance of the Final EIS by the Governor of the State of Hawaii are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is fluid and cursive, with the first name "Wayne" being the most prominent.

RE: Honolulu High-Capacity Transit Corridor Project (Draft EIS)

Thank you for the chance to comment. As a property owner on Oahu, I support the general concept presented. I will rely not only on experiences gained from a career as a transportation engineer, but my current status as the interim chair of the Hawai'i County Transportation Commission and a proponent for balanced transportation, smart growth and more livable communities to offer additional comments and recommendations.

As one of several transportation alternatives that would be acceptable solutions for the Honolulu environment, this decision will guide us how to prioritize all of our transportation options. The future remains shrouded and it is truly impossible to determine from the study alone how successful the transit system will become. It will, however, be substantial enough that the government, residents, and visitors will have the resources and ability to steer the system towards ultimate success.

The project as proposed will also help determine how we allocate our valuable and limited energy resources. This may be just as crucial of a decision. Sustainable energy systems will play an increasing role in our island State. Fixed generation from natural or renewable resources will likely play an important role. When fuel sources and generators are not required on board, energy consumption and capacity improve.

This project will also provide us with lifestyle opportunities and options on how we as residents and guests choose to move around. Balancing our time and how productively we use it are important considerations for all of us. How we access our transportation options are also important considerations that will impact our lifestyles. In light of the above comments, I offer the following recommendations for consideration during planning, design, and construction.

RECEIVED
JAN 9 12:41
REGIONS SERVICE
HAWAIIAN
OFFICE SERVICES

RECOMMENDATIONS:

FIRST. Including direct access to Honolulu International Airport is absolutely essential. This is one of the largest origins and destinations in the State. This is our primary link to the mainland and international markets. It is also a critical portal for interisland travel fulfilling commuting, medical, recreational, and personal needs.

SECOND. Construction must start from the Ala Moana end. This is already a major transit terminal and is an existing TOD providing direct access to shopping, accommodations, recreation, and the convention center. This would also be the physical foundation to advance the planning forward on both additional routes. If financial, environmental, or unknown setbacks occur, a viable transit core remains available.

THIRD. The design must include considerations for accommodating utilities and other facilities. Mounting points and potential loadings should be incorporated in the design to avoid unnecessary future costs and disruptions. The upfront costs would be minor. The large support structure could also carry electric lines, street lighting, communications, architectural lighting, and even replacement water lines. Perhaps the most desirable facility that could be added in the future is an elevated bikeway. Bicyclist would benefit from the same conditions as elevated transit, no intersections. Bicycle usage is increasing and a bikeway would provide additional commuting options, transit access, and a very unique tourism attraction, unparalleled in the world.

Thank you for your consideration,

Robert Ward

Dear Mr. Ward:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

To address your first recommendation, your preference for the Airport Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the

Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- Reduce the time that each area will experience traffic and community disturbances.*
- Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*
- Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

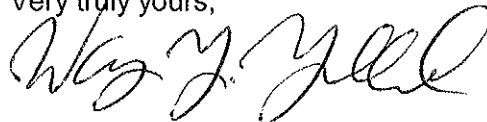

As discussed in Section 4.18.2 of the Final EIS, "Communication and coordination have been initiated with the affected utility agencies and companies and will continue throughout design and construction." Further, "Design criteria will govern all new utility construction outside of buildings, as well as the support, maintenance, relocation, and restoration of utilities encountered and affected by construction of the fixed guideway." In addition, "Along several roadway corridors, most existing overhead utilities in conflict with the guideway and safety clearance requirements will be relocated underground." Existing overhead electrical and communication utilities not in conflict with the aerial guideway and safety clearance requirements will remain overhead. Coordination will occur with emergency services and utility companies to

Mr. Robert Ward
Page 3

ensure that utility relocations meet their needs and that sufficient clearance is provided. The City will evaluate relocation of utilities that are in conflict with the fixed guideway during preliminary design. An elevated bikeway is outside the scope of the EIS.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is fluid and cursive, with the first name "Wayne" being the most prominent.

Submission Content/Notes : I find it appalling that you will still consider this rail system with our economy so bad and the GET collection is low. Instead of breaking up our island, I have never seen anyone try to close one lane for more busses to be able to bypass the traffic during peak hours. This would eliminate the danger of crazy cars cutting off busses and would give riders a faster ride to their destinations. We are on a beautiful island and ruining its beauty with a rail system is the most ridiculous thing I have ever heard of. Having additional jobs for these union workers and our county go into bankruptcy is STUPID!!! With the gas high I already see a cut in cars on the road. People love their cars and to cut down the roads they can drive on is STUPID! Unless you stop more cars from coming in, drivers will drive. The little ridership on this rail doesn't warrant the expense in building it or maintaining it. Both the state and county are cutting back in the budgets. We have much more pressing problems in this state and county. Wasting billions on rail instead of focusing on getting solar energy going in county and state offices or giving more to the education of our young is a much better way to spend our monies.

Dear Ms. Warren:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your preference for the No Build Alternative has been noted. However, the No Build Alternative does not address the project needs or meet the purpose of the project, as established in Sections 1.7 and 1.8 of the EIS. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been

Ms. Mary Warren
Page 2

advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

Under the No Build and Build Alternatives, the travel forecasting model has assumed several transportation projects, including congestion-relief items for Oahu streets and highways, would be in place in 2030. These projects are detailed in Table 2-4 of the Final EIS. As identified in Table 3-14 of the Final EIS, the Project will reduce vehicle delay by 18 percent compared to the No Build Alternative. This reduction in delay is attributable to shifts in travel demand from automobile to transit.

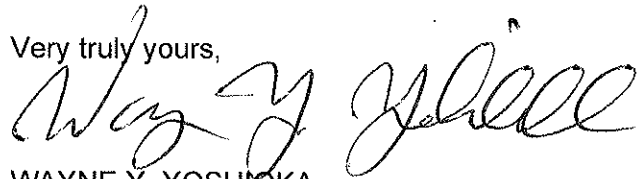

As noted in Section 3.2.1 of the Final EIS, the estimates for transit ridership were derived from a travel demand forecasting model used by the Oahu Metropolitan Planning Organization for the Oahu Regional Transportation Plan 2030. The model is based on "best practices" for urban travel models in the U.S. and guidelines established by FTA. As shown in Table 3-18 of the Final EIS, the travel demand forecasting model forecast 116,300 daily fixed guideway boardings. In addition, total daily transit boardings (bus and rail) will increase 44 percent compared to the No Build Alternative.

Capital costs of the Project, including finance charges, are expected to be fully paid for by a combination of FTA Section 5309 New Starts and FTA Section 5307 funds from the Federal government and from the County's General Excise Tax and Use (GET) surcharge levied from 2007 through 2022. Capital costs are discussed in Chapter 6 of the Final EIS.

Enabling legislation for the County's GET Surcharge and Ordinance 07-001 preclude the use of the collected funds for education or purposes other than a fixed guideway system.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Dear Mr. Wasnich:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*

- *Reduce the time that each area will experience traffic and community disturbances.*
- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*
- *Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- *Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

Lastly, it should be noted that project construction will be paid for with the local General Excise and Use Tax (GET) surcharge and Federal funding, as stated in Section 6.4.2 of the Final EIS. Revenue generated from ridership will be used to fund operating and maintenance costs.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Dear Dot:

The draft EIS is another step toward bankruptcy. No one has completely explained who is going to pay for this white elephant and how long our great grandchildren will have to pay for but never ride.

Serious budget cuts are now going on. What has happened to common sense?
Bottom line: Billions of tax dollars down a rat hole while our sewer systems deteriorate and other needs await funding. This will be Hawaii's "Big Dig"

Sincerely yours,

Max H. Watson

Submission Content/Notes : Yes, I am in favor of the proposed rail system. I would think it more practical to start in downtown Honolulu and build out rather than starting in the west and building in.
I lived in Portland, Oregon for 30 years. During that time the MAX lightrail system was built and expanded. It is a wonderful addition to city transportation. I remember when it was started in downtown as I was working there. It was a mess, but we all survived. And over the years additional spurs have been added. So from my experience in Portland and riding light rail in other cities I enthusiastically support light rail.
Claudia L. Webster--have lived in Kailua for almost 2 years now.

Submission Content/Notes : I would like to express my strong support for the rail line to include a stop at the airport. As a neighbor island resident who visits Oahu occasionally, it would mean a lot to me to be able to get to either Kapolei or to the Ala Moana Shopping center directly from the airport, without having to rent a car or take a taxi, both of which would add an additional vehicle to the traffic.

I am disappointed that a more modern bullet-train type of system was not chosen instead of steel rail, but I consider steel rail better than no rail. Honolulu could have used this opportunity to step into the 21st Century of transportation; a bullet-train or similar technological system could also be a tourist attraction as well as transportation for residents. But I support the plan as long as it includes a stop at the airport.

information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

Your preference for a more modern bullet train is noted; however, high-speed bullet trains are only appropriate for long-distance travel between cities. Because the train will stop approximately every mile, high-speed trains would not be able to accelerate to full speed then stop at the next station.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is fluid and cursive, with a large initial "W" and "Y".

Re: Professor Prevedouros' Letter in the 2 Dec 2008 Star Bulletin (enclosed)

Dear Mr. Yoshioka,

The referenced letter poses sixteen points which should be answered by your Department. I anticipate your response in the Star Bulletin.

In addition to the Professors' points would you also tell us where the rail yard and maintenance shops will be located? Will the yard and shops require additional condemnations? Also, will HECO be the sole provider of power or will there be a dedicated power source? If there is a dedicated power source (or perhaps a back-up source) will it be dependent upon fossil fuel? Will the rail cars have batteries so that they can "creep" to the next station in case of loss of primary power?

Sincerely,

Cc: Councilman Apo

Make sure you get the rail system you want

GATHERING PLACE

Panos Prevedouras

Regardless of whether you are for or against rail, the Draft Environmental Impact Statement (DEIS) is the document that should provide answers to all reasonable impacts. Does it? Here is a sample of questions:

>> The bus routes will change. What happens to your route? What happens to express buses?

>> Lanes will be taken away, some temporarily for construction and some permanently. Where are those lane closures and what's their duration? Are there traffic rerouting plans?

>> Will bikes, surfboards or luggage be allowed on the train? What about large items purchased at a big box retailer? What's the size limitation?

>> Will there be washrooms at the stations? How about convenience stores, vending machines? Will the platforms have seats? How many?

>> The plan calls for Aloun farms to relocate. Is that possible? Where will they go?

>> Sewer upgrades in Kailua and Kapiolani led to the loss of businesses and jobs. Are details provided about similar effects during the construction of the rail?

>> Rail construction involves unique skills and certifications that Hawaii construction workers do not have. How will this be addressed?

>> The city has declared that in many cases only a portion of a parcel needs to be condemned. Can the business survive with the remaining portion? Isn't this mandatory downsizing and fewer jobs?

>> There are 16 schools adjacent to the route. Will the over-

head structure, the continuous high current exposure and the intermittent noise and vibration affect the learning environment? Would it be prudent to relocate these schools?

>> Does rail fit our Hawaiian sense of place? How was the impact to tourism and local quality of life by a large elevated structure through town been assessed?

>> Does the DEIS address the affected vistas and scenery? Are the aesthetics of the structure and each station explained and presented adequately?

>> What will happen in the event of a hurricane? Will the train operate? Light rail in Houston was shut down for 10 days due to Hurricane Ike.

>> BART in the Bay Area uses rail cars made of aluminum to combat corrosion. Is the city's position that corrosion is not an issue?

>> It appears that general excise tax surcharge proceeds for rail will be much lower than expected for at least four years in a row. How is this deficit going to be made up?

>> If ridership turns out to be much lower than forecast, then what? If the city is forced to provide free train rides like in Puerto Rico, how is the shortfall going to be covered?

>> Is there a detailed plan for the effect of rail construction on water, sewer, gas and electric utilities? Will there be disruptions of service? Does the budget cover all these?

I urge you to review the DEIS and seek answers to the questions that are important to you. Write to the city director of transportation with your questions and concerns and send copies to the City Council and the governor.

Regardless of whether you want rail or not, if the city builds the rail system, then make sure that it is done in a way that satisfies your needs and concerns.

Panos D. Prevedouras is a professor of transportation engineering at the University of Hawaii-Manoa. He ran an unsuccessful campaign for mayor as an anti-rail candidate.

Dear Mr. Wickens

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

To address your questions, the potential locations of the maintenance and storage facility are shown in Figures 2-8 and 2-9 of the Final EIS. As stated in Section 4.17 of the Final EIS, two locations are being considered for the maintenance and storage facility: a 41-acre site in the proposed Hoopili development in Ewa and a 44-acre vacant site in Waipahu near Leeward Community College. Maps of these locations are provided in Figures 4-3 and 4-4 in the Final EIS. Depending on which location is used, property will need to be purchased. Right-of-way coordination will be ongoing with affected property owners.

The transit system will obtain electricity from the grid on Oahu and will be a customer of HECO. The transit system will require approximately 17.9 megawatts (MW) of electrical power to operate. This represents 1 percent of the existing combined electrical-generating capacity on Oahu by HECO and independent power producers. Renewable sources of electricity account

for 11 percent of the total electrical generation on the island. HECO is currently soliciting proposals for non-firm renewable-energy generating capacity of up to 100 MW that would be available between 2010 and 2014.

Since trains and rail stations will be electrically powered, the system's infrastructure is being designed to handle service disruptions. For example, trains will draw power from many points along the route so an outage in a few areas should not disrupt service. If electrical power is lost system-wide, then train brakes are designed to stop the rail cars even without power. Lights will stay on in trains and stations; backup batteries will provide lighting for several hours. The train operations center will communicate with passengers via the public address system and intercom to provide guidance. If power is restored within a short time, service will resume. With a prolonged outage, the operations center will direct passengers to exit the trains and walk along a lighted emergency walkway on the guideway to the nearest station. For those unable to exit rail cars, help will be provided by emergency responders and transit staff. Passengers will be met at the train station by a coordinated response from emergency responders and City transportation workers.

The following responses address comments from the article attached to your letter.

1) Changes to existing bus routes and description of new bus routes are included as Appendix D in the Final EIS. As noted in Section 2.5.6, of the Final EIS, bus service will be enhanced and the bus network will be modified to coordinate with the fixed guideway system. Some existing bus routes, including peak-period express buses, will be altered or eliminated to reduce duplication of services provided by the fixed guideway system.

2) As discussed in Section 3.5.7 of the Final EIS, a Maintenance of Traffic (MOT) Plan will be developed in advance by the contractor with approval from the City and the Hawaii Department of Transportation. The MOT Plan will identify measures to mitigate temporary construction-related effects on transportation and will address roadway closures for streets identified in Table 3-27 of the Final EIS. Unless unforeseen circumstances dictate, no designated major or secondary highway will be closed to vehicular or pedestrian traffic.

There will be no lanes lost to the Project at completion. One of the benefits of the elevated guideway is that it can be accommodated within the roadway median with relatively minor adjustments to the roadway to maintain traffic lanes as they are. Some lane widths will be reduced to accommodate column placement; however, this will not affect roadway capacity. Table 3-21 of the Final EIS presents information regarding the effects of column placement on streets and highways.

3) Rail vehicles will be designed to accommodate luggage, bicycles, and surfboards that do not interfere with the safety or comfort of other passengers and will be regulated by a policy to be developed by the City. Purchases from big-box stores and size limitations have not been specifically addressed at this time.

4) Each station will have a secured public restroom. Patrons will ask the station attendant for access to the restroom. DTS does not intend to compete with private enterprise by placing retail within stations. Final internal configurations of stations, including the location and amount of seating, will be completed as station planning is finalized.

5) The majority of the acres considered prime, unique, or of statewide importance are located at one of the two alternatives for a maintenance and storage facility. The other site, near Leeward Community College, is the site of a former Navy fuel drumming operation. This is the preferred site, and the City is working with the Navy and Department of Hawaiian Homelands to acquire it.

6) An analysis of the impacts to businesses during construction is provided in Section 4.18.1 of the Final EIS and in Section 5.2.2 of the Economics Technical Report. This report is available at the City and County of Honolulu and the Department of Transportation Services offices and on the project website at www.honolulutransit.org. The primary impacts are anticipated to result from inconveniences and disruptions to adjacent residents, businesses, and business customers that are inherent in any major construction project, which include the following:

- Presence of construction workers and materials
- Temporary road closures and traffic diversions
- Temporary reductions in parking availability
- Airborne dust, noise, and vibrations
- Businesses' loss of visibility to their customers

Section 4.18.1 of the Final EIS states that proposed mitigation to reduce adverse economic hardships for existing businesses along the project alignment during construction activities may include the following:

- Coordinate construction planning and phasing with nearby property owners and businesses
- Develop a public involvement plan prior to construction to inform business owners of the construction schedule and activities
- Minimize the extent and number of businesses, jobs, and access affected during construction
- To the extent practicable, coordinate the timing of temporary facility closures to minimize impacts to business activities, especially those related to seasonal or high sales periods

- *Minimize, as practical, the duration of modified or lost access to businesses*
- *Provide signage, lighting, or other information to indicate that businesses are open*
- *Provide public information (press releases, newsletters) regarding construction activities and ongoing business activities, including advertisements in print and on television and radio*
- *Phase construction in each area so as to maintain access to individual businesses for pedestrians, bicyclists, passenger vehicles, and trucks during business hours and important business seasons*
- *Provide advance notice if utilities will be disrupted and schedule major utility shutoffs during non-business hours*

Overall, the Project is projected to increase jobs in the nine years of construction to an average of about 10,000 per year (see Table 4-35 in Chapter 4).

7) Construction activities for the majority of the transit system are similar to roadway and building construction. Appendix E of the Final EIS details construction methods that are widely used for both rail transit and elevated highway construction and were employed on the H-3 Freeway. Experienced labor is locally available. A limited number of specialists will be needed to work with locally available labor in certain areas, such as transit power and signaling specialists working with local electricians to install system equipment.

8) It is true that in many locations, only partial property acquisitions are necessary. Every property acquisition is unique and will be addressed on a case-by-case basis. All property acquisitions will be conducted consistent with Federal and State regulations. Section 4.4.3 of the Final EIS 4.4.3 states: a partial acquisition typically is either a narrow strip of land or a more substantial portion of a large parcel. It is assumed that for the properties that will be partially acquired, existing land uses will not change.

9) There will be no noise impacts to schools for the Airport Alternative. The Project will have an integrated noise-blocking parapet wall at the edge of the guideway structure that extends for three feet above the top of the rail and a system specification for vehicles with wheel skirts.

10) The ongoing station area planning process involves numerous aspects of transit system design. The process addresses design and planning issues in an integrated manner and focuses on the characteristics and preferences of the communities adjacent to each station. The City is also conducting workshops with communities that will have rail stations. The purpose of the workshops is to engage the public about rail stations and provide opportunities to residents to

contribute ideas about the appearance of station entryways in their areas. Ideas generated at the workshops will be incorporated into the station planning process. For more information and to get involved in this process, please visit the project website at www.honolulutransit.org

11) The assessment of visual effect due to the Project as described in Section 4.8.3 of the Final EIS considers changes to the visual landscape and viewer responses to those changes. This includes the existing development along the Project alignment. Within the Project corridor the environment changes from rural at the Wai'anae end of the corridor to dense high-rise development at the Koko Head end.

As part of the design process, the City has developed design principles, which are identified in the Honolulu High-Capacity Transit Corridor Project Compendium of Design Criteria (RTD 2009m) that will be implemented in final design to minimize visual effects of the Project. For example, guideway materials and surface textures will be selected in accordance with generally accepted architectural principles to achieve effective integration between the guideway and its surrounding environment. Landscape and streetscape improvements will mitigate potential visual impacts, primarily for street-level views.

Other measures to address visual impacts of the Project are being developed through the station design and planning process. The initial station area plans and design guidelines were first developed with coordination between DTS and the Department of Planning and Permitting (DPP). The next level of transit station design focuses on integrating individual neighborhood characteristics of the communities served by the stations. The following mitigation framework will be included in the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

- Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
- Coordinate the project design with City TOD planning and DPP.*
- Consult with the communities surrounding each station for input on station design elements.*
- Consider specific sites for landscaping and trees during the final design phase when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will serve to mitigate potential visual impacts.*

Section 4.8.3 of the Final EIS, Design Principles and Mitigation includes information related to the mitigation framework described above. Specifically architecture and landscape design criteria include guidelines regarding site

design, materials and finishes, and lighting, which apply to stations, station areas, and the guideway.

12) The system will have an upper limit on operating wind speed. Vehicles will be stored during events that exceed the operating limit.

13) Transit vehicle specifications are being developed that are consistent with environmental considerations in Hawaii.

14) The financial discussions in the Final EIS address concerns about the uncertainties associated with financial markets. The capital plan for the Project is presented in Section 6.3 of the Final EIS, including a description of the amount of funding anticipated from various sources. The capital plan takes the current economic downturn into account. Section 6.6 of the Final EIS describes risks and uncertainties associated with these funding assumptions. The financial plan is a dynamic document that will be updated as conditions warrant.

15) Ridership discussions in the Final EIS address concerns about the uncertainties associated with ridership. Ridership projections for the forecast year of 2030 have been developed using the travel demand model, which was calibrated against collected traffic and transit ridership information and then validated against recent counts to be sure it properly represents travel activity in the transportation system (Section 3.2.1 of the Final EIS). An on-board transit survey was completed in December 2005 and January 2006, and the latest socioeconomic information available as of October 2008 was incorporated. Traffic counts were collected in 2005, 2007, and 2008. The model is based upon a set of realistic input assumptions regarding land use and demographic changes between now and 2030 and expected transportation levels-of-service on both the highway and public transit system. Based upon the model and these key input assumptions, approximately 116,300 trips per day are expected to use the rapid transit system on an average weekday in 2030. Since the Draft EIS was published, the travel demand model has been refined by adding an updated air passenger model (which forecasts travel in the corridor related to passengers arriving or departing at Honolulu International Airport), defining more realistic drive access modes (driving alone or car pooling) to project stations and recognizing a more robust off-peak non-home-based direct demand element (trips that do not originate at home) based on travel surveys in Honolulu.

The Project is one of the first in the country to design and undertake an uncertainty analysis of this type of travel forecast. The uncertainty analysis evaluates the variability of the forecast by establishing probabilistic upper and lower limits of ridership projections. FTA has worked closely with the City during this effort. A variety of factors was considered in the uncertainty analysis. Given all the factors considered, the anticipated limits for guideway ridership in 2030 is expected to be between 105,000 to 130,000 trips per day, bracketing the official forecast of 116,000 riders a day used for all calculations. A unified fare structure is planned, similar to the current structure for TheBus.

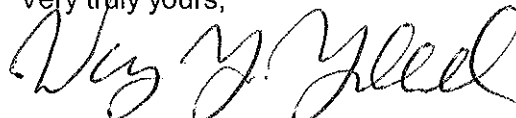

By City Council's current policy, ridership on the entire transit system is expected to pay for between 27 and 33 percent of the annual operating and maintenance costs. The City Council will adjust the fare to maintain that level of revenue. The balance of the operations costs will be part of the City's annual budget, which includes sources currently used for TheBus: Federal funding and subsidies from the City's General and Highway funds.

The amount of service provided will be scaled to generally match the demand. If the service attracts fewer riders than expected, then less service may be provided by adjusting headways or train length, resulting in lower-than-expected operating and maintenance costs. There is no plan to offer free ridership on the fixed guideway system.

16) Communication and coordination have been initiated with the affected utilities and will continue throughout design and construction. Part of the contractor's work plan will include the relocation of utilities when and where necessary, which will be included in the cost of the Project. Close and ongoing utility coordination will ensure that construction of transit facilities will proceed without disruption of utility service.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

RE: Draft Environmental Impact Statement (DEIS)

Dear Sir or Madam:

As CPA's, we support viable and affordable traffic solutions for the City and County of Honolulu. We find several flaws regarding funding for the proposed rail project currently estimated to cost \$5.5 billion for the airport route adopted on January 28, 2009 and summarized in Section 6 of the Draft Environmental Impact Statement (DEIS). We believe these flaws are of such magnitudes that not only will this project be neither viable nor affordable; this project will jeopardize our City and County's financial health and sustainability.

How realistic are the funding assumptions?

The basis for funding the proposed rail system is a 1/2% excise surcharge assessed on county transactions from January 1, 2007 to December 31, 2021. Using the City's figures provided in Section 6 of the DEIS, this surcharge needs to generate a minimum of \$4.1 billion. The cash flow statement of the DEIS includes surcharge tax collections through 2023, two years past the 2021 collection expiration date provided by law. When the taxes for the additional two years are deleted from the City's projection, the required collections are short by \$473.5 million [Exhibit A].

The collections from January 2007 to December 2008, total \$294 million, substantially below the City's projections. It would require a minimum tax growth rate of 9.46% every year for thirteen [13] years [Exhibit B]. Based on the Honolulu's economic history and the current global economy, this growth rate is unattainable.

What do the economists say?

The Council on Revenues [the economic board that provide forecasts of tax revenues to the Governor and State Legislators] issued new tax collection forecasts on January 12, 2009 [Exhibit C.] The forecast for growth in Hawaii tax revenues for 2009 through 2015 are -3.1%, 1%, 3.5%, 5.3%, 6%, 6.5%, and 6.5%. Using these forecasts, it would require an increase, compounded annually; in collections of 25.29% from 2016 to 2021 [Exhibit D]. These forecasts do not include the additional cost for borrowing funds due to the shortfall in surcharge tax collections. This rate of required growth in tax collections is unattainable based on our economic history.

The funding should be based on the economic realities and reasonable factors:

1. 2007 and 2008: The actual surcharge collections
2. 2009 through 2015: The Council on Revenues forecasts
3. 2016 through 2021: Using a 6.5% growth rate of collections

Based on the above assumptions, the City will experience a **\$1.26 billion shortfall** by the year 2021 [Exhibit E].

How much will the federal government contribute?

The DEIS estimates this rail project will cost approximately \$5.5 billion, with \$ 1.4 billion to be provided by the U.S. Department of Transportation. The federal funds are to be paid through their "New Starts" grants in the amount \$200 million per year for seven [7] consecutive years. The 2009 budget for "new starts" is \$1.475 billion for 30 grants that were selected from mass transit program applications from municipalities nationwide. The average grant is \$47 million with two-thirds [2/3] of the grants going to cities with populations averaging 5.4 times the size of Honolulu. The average grant for smaller cities such as Honolulu is \$23.5 million. There is great competition for these grants. The DEIS assumption that Honolulu will successfully obtain 1/7 of the country's mass transit budget for seven consecutive years is unrealistic and not viable.

What are the risks?

- Honolulu could have a rail system that is never completed. With no monies available to complete the project, the useless concrete pillars will be a monument to an irresponsible act that will mar our landscape for years to come.
- Honolulu's credit rating could plummet resulting in higher unbudgeted costs for interest on borrowed funds.
- Residents could face tax increases to pay for the shortage that will put undue economic pressure on them and future generations.
- Honolulu could be bankrupt due to all the debt that even future generations cannot service.

The City and County of Honolulu has a duty to its residents and taxpayers to act appropriately and prudently when committing our resources to traffic solutions. **The solutions must be viable and affordable.** We await your response to our concerns.

Dear Mr. Wikoff:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The Final EIS includes General Excise and Use Tax (GET) surcharge collections through December 31, 2022, in accordance with City Ordinance 05-027 which established the 0.5 percent County surcharge on the GET through this date. As shown in Table 6-4 in the Final EIS, the net GET surcharge revenue will equal \$3,524 million (YOE \$). The analysis in Chapter 6 of the Final EIS takes the current economic downturn into account.

Section 6.6 of the Final EIS discusses risks and uncertainties associated with the funding assumptions for the Project. A subsection under Section 6.6.3 has been added since the Draft EIS was published to address the Council on Revenues' forecasts. As stated in this section, in the short-term, GET surcharge revenues are subject to uncertainties related to the magnitude and timing of the economic recovery on Oahu. Over the long-term, GET surcharge revenues on Oahu depend on a variety of underlying economic factors outside of the City's control that may result in a higher or lower projection than the one used in this EIS.

Mr. Joe Wikoff
Page 2

While GET surcharge collections have gone down, so too have the costs of the Project. However, if GET surcharge revenues and/or Federal funding are not sufficient to meet the cash-flow requirement to cover capital expenditures, other potential revenue sources will be developed to close the funding gap.

The financial plan is balanced for the entire Project so there will not be a situation in which only a portion of the system will be built. If there is a shortfall, additional revenue sources will be identified. As noted above, Section 6.6 of the Final EIS discusses risks and uncertainties, as well as the potential sources to cover shortfalls.

The magnitude and timing of Federal funding is one source of risk that is discussed in Chapter 6 of the Final EIS. Density and transit use in the corridor are among the highest in the nation and higher than most areas that have qualified for New Starts funding in recent years. This Project has been developed in coordination with FTA since its inception. There is no indication to suggest that the Project will not qualify for the Federal funding requested.

The financial plan was developed in consideration of safeguarding the City's credit rating in light of the likelihood of General Obligation bond sales required to bridge any year-by-year funding shortfalls, with all debt service costs paid with GET surcharge revenues, because FTA Section 5309 will pay for some financing costs. The New Starts funds are also proposed for a significant increase in the latest Federal budget proposal. Further, there has been no indication from the FTA that the requested amount is unreasonable or unrealistic.

As discussed in Section 6.4.2 of the Final EIS, the City's contribution to transit operation and maintenance is currently funded through Federal funding, fare revenues, and the City's General and Highway Funds. This funding will be used to fund operating and maintenance costs of the Project. The General Fund includes property tax revenues and other taxes and fees. Beyond collection of property taxes that fund City operations, for which the City develops rates on an annual basis and part of which will fund transit services, there is no anticipated impact to property taxes. Fixed guideway operation costs will represent between 2 and 3 percent of the City's annual operating budget. Property tax revenues are not expected to be used to fund construction of the Project.

The financial plan is structured to ensure Honolulu will not go bankrupt. The debt amount is a minor part of the Project at less than 10 percent.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Submission Content/Notes : Noise Impacts:

It is unclear if you are using Cylindrical or Point Sources for noise calculations. Distance attenuation is significantly different for each (point source is 6dB per doubling, vs 3dB cylindrical). A train passing by a residence is cylindrical source. Please clarify this in the document. (The equivalent "sound of a leaf-blower" is not pleasant at 4 am.)

Where to start / MOS

The Draft EIS makes it clear that the majority of ridership will be between home and school or work, and the vast majority of this is in the urban core between Waikiki and Pearl City, with the downtown area being the most common destination, and one which has severe parking limitations. So clearly, this is the area which would have the most ridership and should be built first, but the need to have space for a baseyard sways the development toward the Ewa end, where the intention is to spend years constructing a segment which is almost useless as a stand-alone.

- Please discuss the areas which would generate the most immediate usage (and revenue).
- Please discuss economic collapse considerations, and how a partially-built rail system (e.g., East Kapolei to Waipahu) would be used if construction were to be halted if the project ran out of money.
- Please discuss the minimum segment which could operate as stand-alone (e.g., Airport, downtown, and Ala Moana)

Please discuss the most fiscally cautious build-out which would allow operation of working segments, considering both dedicated (rail) options and flexible (elevated guideway for multi-purpose vehicles, which could accommodate bus-type vehicles and could allow conversion to rail once the complete system is in place.

Alternatives Analysis

- The public needs to be fully informed about the possible alternatives before proceeding, and the most attractive and realistic alternative was intentionally excluded from consideration, which makes the draft EIS unacceptable. Panos (and others) have provided articulate arguments for a drive-on, drive-off elevated guideway which provides multiple benefits.
- The system could bus-oriented and at-grade from Waianae or Haleiwa or Laie and then drive up on to the elevated guideway segment to bypass central corridor / downtown congestion, and continue at grade from Ala Moana to Waikiki or UH, which are the most heavily accessed end eastern end points. This means a single route from these origin and destination points can be easily managed, and express routes over such distances. Why is this not considered?
- Such a system would also allow door-to-door service for Handivan (ADA) service for the disabled and elderly, for emergency vehicles (ambulance, fire, police, rapid-response, military, etc.)
- The risk assessment should consider that this elevated roadway is not locked into one single technology, and even if the transit system fails completely, this system can be used by any busses, and competing technologies.

Failure Modes and Downtime

- An essential part of the discussion is failure modes. How could this go down?
- An elevated rail system is inherently a brittle technology, and if a segment of line goes down, the system could be totally out of commission. We are also proposing TOD to get people into car-free lifestyles, so people need to be able to feel they can rely on the system. We need a serious discussion of worker strikes, seismic events, terrorism, power failures, cost over-runs leading to the bankruptcy of the system, and other issues which could lead to a failure of the system. That is, a complete risk assessment for this and competing technologies. (Please do not say "that can't happen"; things do happen. Cost over-runs are extremely common, and this could become embroiled in lengthy litigation over cultural resources or burials, etc. (Look up "The Big Dig" for Boston's example))

What else can we get for our money?

The scenic vistas from many segments of an elevated guideway will be breathtaking.

Imagine the value of utilizing the service access route on the elevated guideway as a cross-town, no intersections bicycle route. People would want to bicycle to work. Imagine using this so you could walk or run across town without fear of traffic, with a breeze blowing across you, and clean air to breathe above the street-level traffic.

Imagine using this to get tourists to scenic areas at off-peak times.

Imagine using this to get visitors swiftly to and from the airport, seeing panoramic vistas from the Waianae mountains to Diamond Head along the way, instead of the freeway or Nimitz industrial corridor.

Imagine using this for a segment of the Honolulu Marathon, or bike races, or triathalons. Imagine Wide World of Sports following the leaders on live TV, with the beauty of the south O'ahu coastline behind them. Talk about massive free advertising for tourism! What wonderful events to run in the winter, when football season is over, and we can get TV coverage for beautiful Hawai'i weather while mainlanders are snowed in.

Imagine being able to rent a bicycle with a credit card swipe at transit stations and conveniently bike to wherever you want to go, and then relock it in the rental station closest to your destination, saving time, carrying items you purchased along the way – all without ever needing to own a bicycle.

Imagine a day off when the clouds are rolling toward your beach, so you hop on a train and pick up a bicycle to get to a sunny beach on the other side of the island.

This investment is something we will be using and paying for for over 50 years, perhaps 100. Please take your time and get this right, as it will shape the development of this island for generations.

Thank you for considering these options.

Honolulu, Hawaii 96813

Dear C.E. Willson:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

This letter will address your comments in the same manner as your letter.

Noise Impacts:

The FTA Transit Noise Spreadsheet was used to calculate noise levels of the Project. The transit source is a linear noise source and will have a 3-dB distance attenuation per doubling of distance.

Project Limits:

The a.m. peak period and daily ridership information is forecasted for 2030 and shown in Figures 3-9 and 3-10 in the Final EIS. Figure 3-10 in the Final EIS shows boardings and alightings per station and indicates that the Ala Moana Station will have the highest daily

ridership on the system, followed by Pearl Highlands and East Kapolei. It is reasonable to assume that the stations with the highest ridership will also generate the highest revenue.

Regarding your second bullet point, the capital plan for the Project is presented in Section 6.3 of the Final EIS, including a description of the amount of funding anticipated from various sources. The capital plan takes the current economic downturn into account. Section 6.6 of the Final EIS describes risks and uncertainties associated with these funding assumptions. The financial plan is a dynamic document that will be updated as conditions warrant.

Regarding your third bullet point, the financial plan is balanced for the entire Project so there will not be a situation in which only a portion of the system will be built. If there is a shortfall, additional revenue sources will be considered. Section 6.6 of the Final EIS discusses risks and uncertainties, as well as potential sources to cover shortfalls.

Alternatives Analysis:

Chapter 2 of the Final EIS summarizes the alternatives screening and selection process. Beginning in the fall of 2005, an initial screening process considered alternatives identified through previous transit studies, a field review of the study corridor, an analysis of current population and employment data for the study corridor, a literature review of technology modes, ongoing work completed as part of the Oahu Regional Transportation Plan 2030 (ORTP) prepared by the Oahu Metropolitan Planning Organization (OahuMPO) (OahuMPO 2007), and public and agency comments received during the formal Alternatives Analysis scoping process.

The screening process is documented in the Honolulu High-Capacity Transit Corridor Project Alternatives Screening Memorandum (DTS 2006a). Three scoping meetings were held during the screening process in December 2005, which included a presentation of initial alternatives to the public, interested agencies, and officials to receive comments on the Purpose and Need, alternatives, and scope of the Alternatives Analysis. Refinements were made to the alternatives based on the public input during scoping.

After completion of screening in the winter of 2006, the following alternatives were studied in the Alternatives Analysis: No Build Alternative, Transportation System Management (TSM) Alternative, Managed Lane Alternative, and the Fixed Guideway Alternative. After review of the Alternatives Analysis Report and consideration of public comments, the City Council identified a fixed guideway transit system extending from Kapolei to UH Manoa with a connection to Waikiki as the Locally Preferred Alternative. This identification, which eliminated the TSM and Managed Lane Alternatives from further consideration, became Ordinance 07-001 on January 6, 2007. The NEPA process considered a range of alternatives that was consistent with the identified Locally Preferred Alternative. As discussed in Section 2.2, there were no alternatives that had not been previously studied and eliminated for good cause that would satisfy the Purpose and Need at less cost, with greater effectiveness, or less environmental or community impact.

The express-bus service described in your second bullet point does not serve any intermediate points. Also, if any portion of the bus trip is within mixed traffic flow, travel time reliability is less than for an exclusive right-of-way fixed guideway system.

As discussed in Chapter 2 of the Draft EIS, transit reliability would not have been improved except for express bus service operation in the managed lanes. While this alternative would have reduced congestion on parallel highways, system-wide traffic congestion would have been similar to the No Build Alternative as a result of increased traffic on arterials trying to access the facility. Total islandwide vehicle hours of delay (VHD) would have increased with the Managed Lane Alternative compared to the No Build Alternative, indicating an increase in system-wide congestion (Table 2-1 of the Final EIS). Therefore, TheHandiVan service, despite going door to door, would not have been improved with the Managed Lane Alternative.

Overall system reliability, considering all factors, for a fully grade-separated transit system is greater than for any system operating in mixed-flow conditions. System planning has considered power outages and other risks that could disable the system. The chance of a transit vehicle being stopped by a disabled vehicle is much greater in mixed-traffic flow, such as managed lanes, than in an exclusive right-of-way carrying only routinely maintained rail vehicles. In the event of a closure to the H-1 Freeway, a greater number of people will be accommodated by a fixed guideway transit system than in two highway lanes being used to detour traffic.

Other:

As discussed in the prior response, system planning has considered power outages and other risks that could disable the system. The Project does have a Safety and Security Committee that works on issues such as those raised in your letter. The elevated technology referred to is in place in a number of cities throughout the U.S. and around the world. It has operated with few problems, in some cases for over 100 years. The Bay Area Rapid Transit (BART) system in California, for example, functions in a much more active seismic environment than exists on Oahu and has withstood serious earthquakes with little, if any, disruption. In fact, it was BART that offered continued service during a time in 1989 when the I-880 freeway collapsed as a result of an earthquake. Elevated rail, like any rail system, is designed with enough redundancy to guard against most predictable events. That includes the design as well as operational elements of the Project.

The potential of worker strikes is a possible issue, but they can only be resolved with knowledge of the facts at the time of the occurrence. Since trains and rail stations will be electrically powered, the system's infrastructure is being designed to handle service disruptions. For example, trains will draw power from many points along the route, so an outage in a few areas should not disrupt service to other parts of the system. If electrical power is lost system-wide, then train brakes are designed to stop the rail cars even without power. Lights will stay on in trains and stations; backup batteries will provide lighting for several hours. The train operations center will communicate with passengers via the public address system and intercom to provide guidance. If power is restored within a short time, service will resume. With a prolonged outage, the operations center will direct passengers to exit the trains and walk along a lighted emergency walkway on the guideway to the nearest station. For those unable to exit rail cars, help will be provided by emergency responders and transit staff. Passengers will be met at the train station by a coordinated response from emergency responders and city transportation workers.

The Project is being designed to address concerns about seismic activity that could occur on the island. In addition, the Project is working closely with first responders regarding security. The system's safety and security program is under development, although it will be finalized before the fixed guideway system begins operation.

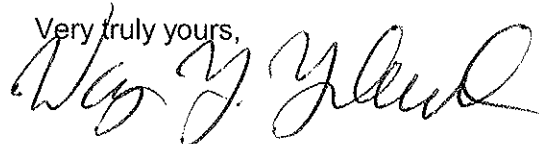

Cost overruns on transit projects have been curtailed dramatically over the past 10 to 15 years through a number of safeguards imposed by the FTA to prevent such problems. There is no guarantee that problems will not occur, but the process has been structured so as to prevent problems or identify them quickly if they do occur so that a solution can be provided and the Project can avoid the issues that other projects have faced.

The treatment of burial remains is being addressed currently to ensure that if iwi kupuna (Hawaiian burials) are found in advance of construction, they can be identified and protected or relocated before construction. This will provide better opportunity for families to provide for their ancestors and also help prevent project delays. This effort is being undertaken in cooperation with the Oahu Island Burial Council.

Lastly, a service access route will not be used as a bicycle facility. Bicycles will be allowed on trains, as regulated by a bicycle policy. In addition, every station will have racks where bicycles can be locked.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

November 15, 2008

SALT LAKE VS AIRPORT ROUTE (REAL SERVICE TO REAL COMMUTER USERS)

I wish you would listen to the Salt Lake/Ali'manu/Foster Village neighborhood board members testimony. They have spent a lot of effort to work with Romy C

History

For 18 years (1977 to 1996) I was a resident of Salt Lake. Back in the 70' and 80' Councilperson Donna Mercado Kim vastly improved the bus line #12 (Presently the #3.) Due to these great improvements, the Moanalua/Salt Lake/Ali'amanu communities improved real service to real commuter users. I have used mass transit for 14 years now. The service is excellent.

Airport/Hickam/Pearl Harbor History

We've always had poor bus service to this area. Only Nimitz and Kam highway service is used. Bus #19 to Airport/Hickam travels every hour. To enter Hickam the rider must have a US Government ID on the bus. Bus #9 provides hourly service to Nimitz Gate only (Big deal). Bus #9 goes on the base only during the regular commute hours and must also have a Government ID.

The #20 and #42, plus the Kam highway routes go by the airport and Pearl Harbor, provide spotty airport visitor bus service. Luggage service on all busses is discouraged (restricted). Will visitors with luggage be allowed on hub and spoke bus service from Ala Moana Shopping Center to Waikiki hotels?

Market Analysis

I really think the survey which says that 7,000 more riders will use the Airport Route is flawed. I would think the Salt Lake corridor would be 7,000 more ridership than the

Airport route. Customers from Halawa Heights, Red Hill, Foster Village, Moanalua Valley, Salt Lake and Ma'punapuna would utilize the hub and spoke bus service to the Salt Lake Blvd rail corridor. They will not drive to Pearl Harbor or Damon Track (Airport) areas. What makes the high speed rail work is high speed between terminals and limited stops. I really think 19 stops are too many.

If you are going to have a hub and spoke bus service with "park and ride" facilities at the stations, you can cut back 5 – 6 stops, so that the 40 minute ride becomes a 30 or 35 minute commute to the bus transfer stations. Start to stop xxxxx Kapolei to AMC

Remember Express Route A. The original UH (Sinclair Library) to Kalihi Transit Center provided limited stops, every 10 minutes. This system worked real well. They then added the Waipahu final destination and put stops at McCully Kamakee, Kokea, Gulick streets slowing the service down. That really screwed up the A Express Route. Once again we need limited stops and high speed. The new rail route would be from Aloha Stadium to Iwilei is much faster than the airport.

Be real when it comes to moving the masses with speed

The successful mass transit systems should move all customers with speed. Why else have an expensive system. Proven good service will change most car riders to consider alternative forms of transportation.

Mr. Leonard Withington, Jr.
1326 Piikoi Street, #202
Honolulu, Hawaii 96814

Dear Mr. Withington:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Per your first comment, all correspondence received on the Draft EIS has been reviewed and considered. Also, your preference for the Salt Lake Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that

Mr. Leonard Withington, Jr.
Page 2

specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

Regarding allowing luggage onto the system, no change to luggage policy on TheBus is proposed at this time. The fixed guideway system will allow luggage, surfboards, and bicycles, subject to policies to be developed.

Under your topic of Market Analysis, you made several points which this letter will address. Figure 3-12 in the Draft EIS shows daily boardings and alightings at each station. As shown, the stations along the Airport Alternative will attract higher ridership than those along the Salt Lake Boulevard Alignment. The Airport Alternative will serve major employment destinations, such as Pearl Harbor, Hickham Air Force Base, and the Airport. The number of stations affects riders in two ways. If stations are too far apart, the system is not convenient as users would need to walk too long of a distance. If they are too near, the average travel speed is reduced. To balance these concerns, the average distance between stations is approximately one mile, with shorter distances in dense areas that have greater transit demand. The Project is designed to maximize transit travel time savings and reliability. Table 3-16 in the Final EIS provides station-to-station travel times. Since the fixed guideway system will operate independently from traffic, travel times will be the same at all times of the day, every day.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Dear Ms. Wong:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

You opposition to the Fixed Guideway Transit Alternative is noted. Regarding construction, the Project is scheduled to open in phases beginning in 2012. As each segment is opened, the transportation benefits of the Project will increase. The completed 20-mile Project is anticipated to be fully operational by early 2019, as shown in Figure 2-42, Project Schedule, in the Final EIS.

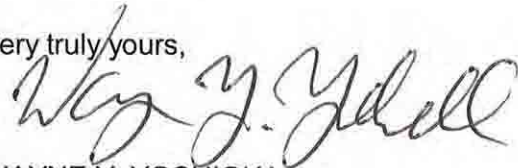

This is a federally and locally funded project. The Project is following the Federal New Starts process in anticipation of receiving substantial Federal funds for construction. Federal funds have been appropriated for the Project. The General Excise and Use Tax (GET) surcharge enacted by the City Council will provide the remaining funds. On Oahu, the local funds raised by the GET surcharge can only be used for construction and operation of a fixed guideway project. The law forbids using the GET surcharge revenues to fund public schools or

Ms. Taryn Wong
Page 2

any other purpose. While the State authorized the surcharge, the City imposes the surcharge. Please refer to Chapter 6 of the Final EIS for information regarding Project funding.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is written in a cursive style with a large, sweeping initial "W".

Submission Content/Notes : To Whom It May Concern:

My concerns for the transit project are not so much with the rail itself, but rather the effects the rail will have on mixed-income development in its surrounding areas.

It is my understanding that government officials are looking to Hope VI projects to model our own mixed income redevelopment. In places like Oakland, Seattle, and across the country, this mixed income redevelopment has been paired with transit rail development. In Oakland for example, every station stop has become a site for mixed income redevelopment.

This has impacted low income residents in nearby areas tremendously. Oakland Coliseum's mixed income development displaced 178 families, and only 4 families returned. This is consistent with Hope VI national statistics.

So I'd like to know what steps are being taken by the transit project to insure that this doesn't become the case on Oahu, especially in high-density areas like Kalihi-Pajama. I urge you to consider these solutions:

1. Remove barriers for low-income residents to return to housing near the rail redevelopments
2. Ban no-fault evictions and criminal history disqualifications in areas near the rail
3. Ensure that the timing of the rail is not disruptive to existing residents
4. Ensure case management and social services attached to relocation counseling
5. Guarantee no net loss of affordable housing units in areas near the rail
6. Maintain rental affordability at current levels in areas near the rail
7. Ensure family and culturally appropriate amenities in all redevelopments connected to the rail

Dear Mr. Wong:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As discussed in Section 4.6 of the Draft EIS, the effects of the Project on identified OahuMPO Environmental Justice (EJ) areas were analyzed in regard to how well the Project will serve the transportation needs of the identified EJ populations and communities of concern in comparison to all other population groups within the study corridor. No specific community will have diminished access or ability to use transit.

Planning and zoning around station areas will be established by the City's Department of Planning and Permitting (DPP) in compliance with the City's new transit-oriented development (TOD) ordinance 09-4. Reestablishment of affordable housing is the responsibility of the City. No affordable housing is removed due to the Project.

Mr. Thomas Wong
Page 2

Your letter contained several considerations regarding no-fault evictions, criminal history disqualifications, and the ability for low-income residents to return to housing near potential rail development. Unfortunately, these requests are beyond the control of the DTS. In addition, the real estate market is affected by market forces beyond the scope of this Project.

However, to address your comment about disruption to existing residents, Section 4.17.2 of the Draft EIS discusses the construction-related effects on Communities and Neighborhoods. Effects will be temporary and could include dust, noise, and traffic disruption and diversion, as well as limited or temporarily lost access and parking to residences and businesses. Coordination and communication with affected communities and neighborhoods will continue throughout the construction process.

As discussed in Section 8.4 of the Final EIS, the City is conducting workshops with communities that will have rail stations. This is independent of the City's DPP TOD work. The purpose of the workshops is to engage the public about rail stations and provide residents opportunities to contribute ideas about the appearance of station entryways in their areas. Ideas generated at the workshops will be incorporated into the station planning process. For more information and to get involved in this process, please visit the project website at www.honolulustransit.org.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Submission Date : 01/22/2009
Submission Content/Notes : I support the development of rapid transit for Honolulu.

In my opinion:

1. the train should connect to the airport.
2. construction start with the Pearl City to Honolulu segment and then build out. You'll get more riders immediately.
3. all stations should have elevators or ramps for wheel chairs and bikes.
4. all trains should have bike storage areas.
5. all new transit oriented development zoning changes should support pedestrian and bike access.

Good luck.

Dear Ms. Wood:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments in the order listed regarding the above-referenced submittal:

- 1. Your preference for the Airport Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport*

Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

2. *As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:*
 - *Match the anticipated schedule for right-of-way acquisition and utility relocations.*
 - *Reduce the time that each area will experience traffic and community disturbances.*
 - *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*
 - *Match the rate of construction to what can be maintained with local workforce and available financial resources.*
 - *Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

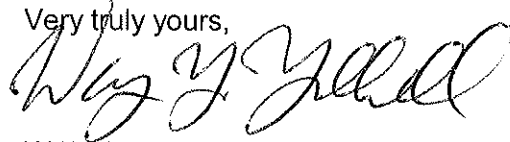

3. *Access to all stations will meet Americans with Disabilities Act requirements, including elevators and escalators.*
4. *Bicycles will be allowed and accommodated on the system and regulated by a bicycle policy. In addition, all stations will have parking areas for bicycles.*

Ms. Betty Wood
Page 3

5. *The Honolulu High-Capacity Transit Corridor Project (the Project) is focused exclusively on the construction and implementation of rail transit service, and that is what is covered in the Final EIS. As stated in Chapter 4, Section 4.19.2 of the Final EIS, transit oriented development (TOD) will be expected to occur in project station areas as an indirect effect of the Project. Planning and zoning around station areas will be conducted by the City's Department of Planning and Permitting under a process covered by the City's new TOD ordinance.*

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Honolulu, HI 96813

Dear Mayor of Honolulu: 12/6/08

It is time that the State took a position on the economic feasibility of rail rapid transit.

The bill for elevated transit became law without the signature of the Governor.

The public vote on rail was close, and forecast future dissension. Subsequently, the visitor count has gone down, while the estimated cost of rail transit has gone up.

The State has the responsibility to consider the impact of these developments on the future of rail transit, and to report to the

public,

The Govenor must take a position on the economic feasibility of rail transit before he can sign the draft Environmental Impact Statement into law. Please tell him so, orally or in writing, and that the former State Director of Transportation for Govenors Burns and Ariyoshi said so.

I have been a Democrat for 99.8 years

Sincerely, *E. Alvey Wright*

Submission Content/Notes : Instead of building a rail, we should use the funds for education, fixing, improving roads and higher capacity or more buses to make it more convenient for riders.
Why gamble and spend so much money for rail without knowing the results. What if you don't have the desired results? You are stuck with a white elephant. Get more buses on the routes and make it so convenient that people will gladly ride it. If it does not work you won't have a white elephant to deal with. Residents on Oahu are very used to convenience and they won't ride the rail if they have to run errands or drop their children off at school, etc.
We need to invest in our keiki and give them the chance to succeed. Fix our terrible roads.
Please give this some thought. Mahalo.

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

You comments regarding how the City should use the General Excise and Use Tax (GET) funds is noted; however, the enabling legislation for the GET Surcharge precludes the use of the collected funds for anything other than a new transit system. In addition, the enabling legislation for the GET also precludes the use of the collected funds for education or other child-related issues. However, the Project will provide additional travel options for children and enhance mobility throughout the corridor, helping to create access for educational and employment opportunities for the community

Your comments regarding the system have been noted. As stated in Chapter 3 of the Final EIS, "Adding substantial passenger capacity with more buses is not feasible in some key locations along the system because of roadway capacity constraints. Choke points occur in Downtown Honolulu during the a.m. peak period, especially at the merger of North Beretania,

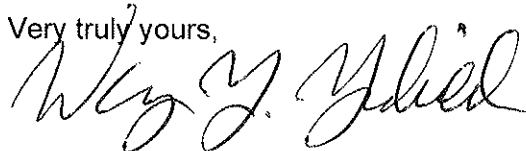

Mr. Earl Yamasaki
Page 2

North King, and Liliha Streets, and Dillingham Boulevard and along Hotel Street. King Street has been used to introduce new service in recent years due to the capacity limitation of Hotel Street; however, choke points occur at the Chinatown bus stops and at the Punchbowl Street and King Street stops. Buses often must wait to move into an open and safe boarding position. Continuing to add additional service to King Street without major physical improvements would add to the gridlock in this corridor, deteriorate transit service, and complicate pedestrian and traffic safety issues. In the p.m. peak period, choke points occur along Beretania Street, Hotel Street, Nimitz Highway, and Ala Moana Boulevard in the Downtown area." For buses operating on the remainder of the island, most of the service will be in mixed traffic that will be subject to increased delays. This compares with the rail service that will be operating on an exclusive guideway completely separated from traffic.

With the Project, bus service will be enhanced and modified to coordinate with the fixed guideway system. Some existing bus routes will be altered or eliminated to reduce duplication of services provided by the fixed guideway system. Buses removed from service in the study corridor will be shifted to service in other parts of the island. Certain local routes will be rerouted to provide frequent and reliable connections to the nearest fixed guideway station. Existing and future routes, including route numbers and frequency, are included in Appendix D of the Final EIS.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Dear Mr. Yoshida:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been identified as the Preferred Alternative as described above. Compared to the other alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly lower impacts to the natural and built environment. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative.

Mr. Kenneth Yoshida
Page 2

The Alternatives Analysis phase, which preceded the EIS process, is documented in Chapter 2 of the Final EIS. It evaluated a range of modal and general alignment alternatives, in terms of their costs, benefits, and impacts. The scoping process for the Alternatives Analysis involved a presentation of the viable alternatives to the public and interested public agencies and officials to receive comments on the Purpose and Need, alternatives, and scope of the analysis.

Scoping for the EIS followed the FTA process that provides for a culling of alternatives studied in the EIS through an Alternatives Analysis. The scoping process initiated for the Alternatives Analysis included a variety of highway, bus and fixed guideway options for consideration. During the later scoping effort for the EIS, the public was requested to propose alternatives that would satisfy the purpose and need at less cost or with greater effectiveness, less environmental or community impact and to propose alternatives that were not previously studied and eliminated for good cause. The only alternative that emerged that met these criteria was a fixed-guideway alternative following several alternative alignments. All reasonable alternatives that emerged from these processes were ultimately evaluated in the Draft and Final EISs.

Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts, and mitigation commitments.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses comments regarding the above-referenced submittal:

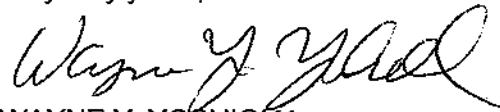

Several alignments were considered during the Alternatives Analysis, including an alignment serving both the Airport and Salt Lake areas. Challenging issues associated with directly serving the Airport, including crossing U.S. Department of the Navy property and crossing the H-1 Freeway, made such options impractical. Also, crossing Navy property was rejected by the Navy.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Issuance of the Record of Decision under NEPA and acceptance of the Final EIS by the

Mr. Kenneth Yoshida
Page 2

Governor of the State of Hawaii are the next anticipated actions and will conclude the environmental review process for this Project.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is fluid and cursive, with the first name "Wayne" and the last name "Yoshioka" clearly distinguishable.

Submission Content/Notes : I think routing the initial rail line to the Airport instead of through Salt Lake is unwise. I would imagine that riders going to/from the airport would have luggage/baggage, so traveling by rail (or other public transportation) would be cumbersome and difficult, and people would be less willing to take public transportation to the Airport. (For instance, whenever I travel to New York City, Boston, or Washington, DC, I never take the subway/T/metro from the airport because with luggage it is just too much of a hassle!) I believe a route through Salt Lake would be more beneficial initially to service the numerous residents there, and expansions to include the (more expensive) Airport route could be decided at a later time.

Dear Josalyne:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your preference for the Salt Lake Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has

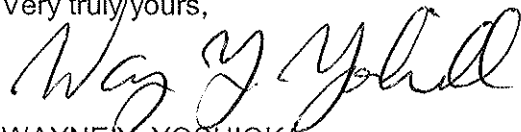

Josalynne
Page 2

been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The travel demand forecasting model for the Project did have an air passenger component. As shown in Table 3-12 of the Final EIS, there will be about 103,900 daily trips by air passengers in 2030 of which 3,500 (3.4 percent) will use transit (bus and rail). Without the Project, only 1,200 daily trips by air passengers would have used transit to travel to or from the airport (or 1.2 percent).

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is written in a cursive, flowing style.

Submission Content/Notes : The referendum passed, so take the time to plan the most critical and cost efficient lines/stations for the economic and environmental health of Honolulu. Include the airport, UH - Manoa, and Waikiki in the first tranche of construction. The taxpayers will reap the best return for their investments in terms of ridership and increased tourist dollars. The allure of rapid transit from the POE (airport) to the final destination (Waikiki) for visitors can not be underestimated. A spur to UH - Manoa is also a no-brainer. Students crave fast, affordable transportation, with the benefit of no parking hassles. Build this transit system the right way - from the start!

Dear Concerned Citizen:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- *Reduce the time that each area will experience traffic and community disturbances.*

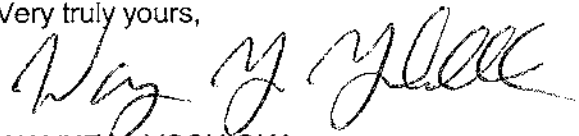

- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*
- *Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- *Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Dear Concerned Citizen:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

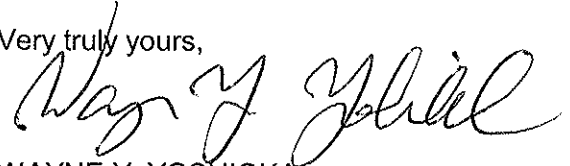

Your opinion has been noted. The roadway system will continue to experience congestion in 2030, but it will be substantially less than if the Project were not built. Based upon the analysis contained within the Final EIS, the Project will reduce island-wide congestion compared to the No Build Alternative by 18 percent as measured by daily vehicle hours of delay (as shown in Table 3-14 of the Final EIS). The proposed measures of changing the driving age or limiting the number of cars per family do not address the desire for individual mobility. The proposed measures are also beyond the scope of the authority of the Project and not within the authority of the City and County of Honolulu Department of Transportation Services Rapid Transit Division.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299.

Dear Steven:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Once the fixed guideway system is completed and open for revenue service in 2019, Route C will operate between Makaha and Kapolei serving the East Kapolei and UH West Oahu stations. Existing and future bus routes, including route numbers and frequencies, are presented in Appendix D of the Final EIS.

Travel time by rail, including transfers to bus, will be the same as today or less. Under current conditions, travel times via bus can vary considerably due to traffic congestion and unpredictability. Longer-distance buses (such as Route C) are predicted to take longer in the future due to worsening traffic conditions.

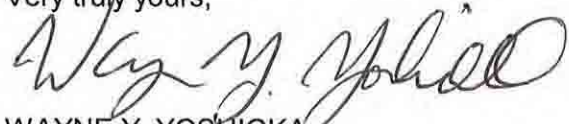

Future travel times with rail will be highly reliable. The rail system will operate in its own right-of-way every three minutes during peak periods and every six minutes during mid-day. Route C currently operates every 30 minutes during peak and mid-day periods. Three bus routes will provide connections between the UH West Oahu Station and the Kapolei Transit

Steven
Page 2

Center, and five bus routes will provide service between the East Kapolei Station and the Kapolei Transit Center. As stated in Section 3.4.2 of the Final EIS, because of the high frequency of the fixed guideway service, riders transferring from buses to the fixed guideway will experience minimal wait times. Riders transferring from rail-to-bus will benefit from coordinated transfers between trains and buses, thereby minimizing wait times.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is fluid and cursive, with a large, stylized initial "W".

Dear Anonymous:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your preference for the Airport Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been identified as the Preferred Alternative as described above. Compared to the other alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly lower impacts to the natural and built environment. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative.

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- *Reduce the time that each area will experience traffic and community disturbances.*
- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*
- *Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- *Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project..

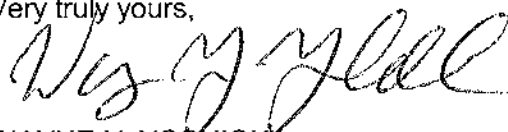

As discussed in the Final EIS Section 2.5.4 Safety and Security Measures, a project-specific Safety and Security Management Plan has been developed in accordance with FTA requirements to define the safety and security activities and methods for identifying, evaluating, and resolving potential safety hazards and security vulnerabilities of the system. It establishes responsibility and accountability for safety and security during the Preliminary Engineering, Final Design, construction, testing, and start-up phases of the Project. The Honolulu Police Department, the Honolulu Fire Department, the Honolulu Department of Emergency Management, and the Honolulu Emergency Services Department have been involved in preparing and will be part of implementing the plan. The plan addresses public safety and security concerns, including threats and hazards associated with the Project, specific issues that were identified through community outreach efforts, and design and architectural details to enhance safety.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulustransit.org. You may request a DVD of the Final EIS and additional

Anonymous
Page 3

content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is written in a cursive style with a large, sweeping initial "W".

Mr. Daren D.
cooldster@hotmail.com

Dear Mr. Daren D.:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

In parallel with the alignment analysis, as stated in Section 2.2.3 of this Final EIS, the NEPA Notice of Intent requested input on five transit technologies. A technical review process included the opportunity for public comment and was used in parallel with the alternatives analysis to select a transit technology. The process included a broad request for information that was publicized to the transit industry. Transit vehicle manufacturers submitted 12 responses covering all of the technologies listed in the Notice of Intent. An independent five-member technology panel composed of four transit experts and a transportation academic appointed by the City Council evaluated guided rubber-tire-on-concrete systems (e.g., Phileas bus system and VAL-type systems), monorail (which is a variation on rubber-tired technology), steel-wheel-on-steel-rail systems, (e.g., light rail and rapid rail), and magnetic levitation (MAGLEV). The panel considered the performance, cost, and reliability of the proposed technologies.

Proprietary technologies, meaning those technologies that would have required all future purchases of vehicles or equipment to be from a single manufacturer, were eliminated because none of the proprietary technologies offered substantial proven performance, cost, and reliability benefits compared to steel wheel operating on steel rail.

The panel accepted public comment twice as part of its review. By a four-to-one vote, the panel chose a steel wheel vehicle operating on steel rail system because it was considered safe, reliable, economical, and non-proprietary. Those results are documented in the panel's report to the City Council dated February 22, 2008 entitled "Independent Technology Selection Panel Report".

The assessment of visual effect due to the Project as described in Section 4.8.3 of the Final EIS considers changes to the visual landscape and viewer responses to those changes. This includes the existing development along the Project alignment. Within the Project corridor the environment changes from rural at the Wai'anae end of the corridor to dense high-rise development at the Koko Head end.

As part of the design process, the City has developed design principles, which are identified in the Honolulu High-Capacity Transit Corridor Project Compendium of Design Criteria (RTD 2009m) that will be implemented in final design to minimize visual effects of the Project. For example, guideway materials and surface textures will be selected in accordance with generally accepted architectural principles to achieve effective integration between the guideway and its surrounding environment. Landscape and streetscape improvements will mitigate potential visual impacts, primarily for street-level views.

Other measures to address visual impacts of the Project are being developed through the station design and planning process. The initial station area plans and design guidelines were first developed with coordination between DTS and the Department of Planning and Permitting (DPP). The next level of transit station design focuses on integrating individual neighborhood characteristics of the communities served by the stations.

The following mitigation framework will be included in the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

- Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
- Coordinate the project design with City TOD planning and DPP.*
- Consult with the communities surrounding each station for input on station design elements.*
- Consider specific sites for landscaping and trees during the final design phase when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will serve to mitigate potential visual impacts.*

Section 4.8.3 of the Final EIS, Design Principles and Mitigation includes information related to the mitigation framework described above. Specifically architecture and landscape design criteria include guidelines regarding site design, materials and finishes, and lighting, which apply to stations, station areas, and the guideway.

Mr. Daren D.

Submission Content/Notes : For the rail system to actually achieve its stated purpose of alleviating traffic from the West side, the main line MUST include in its initial build stops at Oahu's 2 major employers (Pearl Harbor & Waikiki) and 2 major destinations (Airport & Ala Moana Center). However, the current plan only includes Ala Moana Center. So you're not actually moving the people to where they actually want to go. And you're not actually going to take that many cars off the road.

The same thing goes for the continuing argument that UH Manoa needs to be connected by rail. First, you'd take more cars off the road at much less expense by actually building UH West, which has been waiting for a permanent campus since the 1970s.

Secondly, by 2030, we will no longer actually need to move people to the universities. We'll be able to move the universities into people's living rooms. In fact, UH already has a instructional telecommunication network linking students at other campuses to UH Manoa.

Likewise, closing the State government's Militani telecommuting center -- instead of opening new ones in other communities -- was equally short-sighted and backward-thinking. Some people actually need to show up at work -- (like Pearl Harbor and Waikiki). But work that CAN be done offsite SHOULD be done offsite. THAT would take more cars off the road than any train would. But, again, the government is still trying to move people to their jobs instead of moving their jobs to the people.

We're already living in the Information Age. So why does it seem like our planning is still being done by cavemen?

I don't have a problem with building a rail system. While it's not a perfect or complete solution, I still think it's a good start. I just have a problem with being stupid about it.

The "Locally Preferred Alternative" (the Salt Lake route), which doesn't include Pearl Harbor, the airport and Waikiki, will not achieve your stated goal of reducing traffic from the West side. Which begs the question, just which "locals" actually "preferred" this alternative? And what is your TRUE objective here?

Concerned Citizen
jhm245@yahoo.com

Dear Concerned Citizen:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The fixed guideway system extends from East Kapolei to Ala Moana Center and points in-between. The travel demand forecasting model for the Project did have an air passenger component. As shown in Table 3-12 of the Final EIS, there will be about 103,900 daily trips by air passengers in 2030 of which 3,500 (3.4 percent) will use transit (bus and rail). Without the Project, only 1,200 daily trips by air passengers would have used transit to travel to or from the airport (or 1.2 percent).

While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives

addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS; however the future extensions are not part of this Project, thus they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time. Connection to UH Manoa and Waikiki will be served by buses integrated with the system. The Draft EIS reflects this operation.

Chapter 3 of the Final EIS includes system ridership numbers in Table 3-12. In 2030, over 55,000 more person trips will be made on transit per day with the Project compared to the No Build Alternative. This will result in a daily reduction in vehicle trips of 51,200 and in vehicle miles traveled of 574,100 miles on the Island of Oahu. The Project is being constructed in coordination with UH West Oahu. A substantial portion of trips to the campus will be completed on rail. As shown in Figure 3-11, the transit mode share of trips from Ala Moana Center to UH West Oahu increases significantly with the addition of the Project compared to No Build conditions.

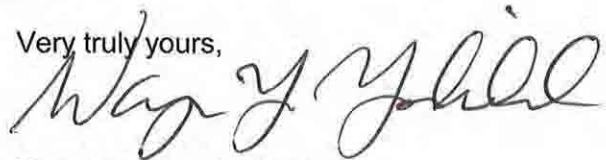

One clarification is appropriate. While the Airport, Pearl Harbor, and Ala Moana Center are major employment centers, the Project, as currently being designed, does serve Downtown Honolulu, which is one of the largest employment centers on Oahu. It also makes provisions for growth planned in the Kapolei area as a future major employment core, which will allow for the establishment of a transit-based commuting pattern as the area evolves rather than after commuters have adopted the car for such trips, as has been the case elsewhere.

The comments regarding travel in the "Information Age" are beyond the scope of the Draft and Final EISs. One general note, however, is that telecommuting has its applications in some industries and in some cities but has not been effective at reducing to any substantial degree the aggregate trip-making in a region. An emphasis on telecommuting is not a government decision but mostly a private-sector work choice that is made available by

employers and agreed to between employers and employees. Until such changes are adopted by a larger segment of the workforce, physical travel solutions are still needed to address travel demand. Any emphasis on telecommuting that provides access to education, work, or other activities should be encouraged as part of an overall travel-reduction strategy. However, while information technology has enabled people to remain connected from any location, it has not eliminated the need or desire of people to travel on the island. Agencies and businesses may allow their workers to work from home, which can assist in reducing congestion; however, there will continue to be a need to travel, and the Project will provide an additional travel option.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Dear J. C.:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your position is noted, but waiting ten years does not address the Project's needs or meet the purpose of the Project, as discussed in Sections 1.7 and 1.8 of the Final EIS. While each of the alternatives includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative. The identification of the Airport Alternative as the Preferred Alternative was made by the City to comply with the FTA's NEPA regulations that state the Final EIS should identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection is detailed in Section 2.4 of the Final EIS and was based on consideration of the benefits of each alternative, public input on the Draft EIS, and City Council Resolution 08-261 identifying the Airport Alternative as the Project. Further, FTA's NEPA regulations for projects proposed to be funded with major capital investment funds, the level of detail necessarily increases between the Draft EIS and the Final EIS through preliminary engineering work (23 CFR 771.123 (j)).

As noted in Chapter 2 of the Final EIS, in parallel with the alignment analysis, a five-member panel appointed by the City Council and the Mayor considered the performance, cost, and reliability of the five proposed technologies for the fixed guideway system. The panel twice accepted public comment as part of this review. By a four-to-one vote, the panel selected steel wheel operating on steel rail as the technology for the Project evaluated in the Final EIS. The four panel members selected steel-wheel technology because it is mature, proven, safe, reliable, economical, and non-proprietary. Proprietary technologies, meaning those technologies that would have required all future purchases of vehicles or equipment to be from a single manufacturer, were eliminated because none of the proprietary technologies offered substantial proven performance, cost, and reliability benefits compared to steel wheel operating on steel rail. Selecting a proprietary technology also would have precluded a competitive bidding process, likely resulting in increased overall project costs.

The assessment of visual effect due to the Project as described in Section 4.8.3 of the Final EIS considers changes to the visual landscape and viewer responses to those changes. This includes the existing development along the Project alignment. Within the Project corridor the environment changes from rural at the Wai'anae end of the corridor to dense high-rise development at the Koko Head end.

As part of the design process, the City has developed design principles, which are identified in the Honolulu High-Capacity Transit Corridor Project Compendium of Design Criteria (RTD 2009m) that will be implemented in final design to minimize visual effects of the Project. For example, guideway materials and surface textures will be selected in accordance with generally accepted architectural principles to achieve effective integration between the guideway and its surrounding environment. Landscape and streetscape improvements will mitigate potential visual impacts, primarily for street-level views.

Other measures to address visual impacts of the Project are being developed through the station design and planning process. The initial station area plans and design guidelines were first developed with coordination between DTS and the Department of Planning and Permitting (DPP). The next level of transit station design focuses on integrating individual neighborhood characteristics of the communities served by the stations.

The following mitigation framework will be included in the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

- Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
- Coordinate the project design with City TOD planning and DPP.*
- Consult with the communities surrounding each station for input on station design elements.*
- Consider specific sites for landscaping and trees during the final design phase when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will serve to mitigate potential visual impacts.*

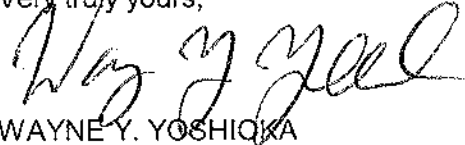

Section 4.8.3 of the Final EIS, Design Principles and Mitigation includes information related to the mitigation framework described above. Specifically architecture and landscape design

criteria include guidelines regarding site design, materials and finishes, and lighting, which apply to stations, station areas, and the guideway.

Lastly, Chapter 6 of the Final EIS describes the financial resources anticipated to be needed to pay for the capital costs of the Project and for ongoing operating and maintenance costs. Capital costs, including finance charges, are expected to be fully paid for by a combination of funds from the Federal government and the General Excise and Use Tax surcharge revenues collected from 2007 through 2022 on Oahu. Operating and maintenance costs will be paid for from the same sources currently used for TheBus: Federal funding, fare revenues, and City revenues from the General and Highway Funds. These funding assumptions are subject to a number of risks and uncertainties, as described in Section 6.6.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka", written in a cursive style.

WAYNE Y. YOSHIOKA
Director

Enclosure

These are just a list of some concerns over the City & County of Honolulu's proposed Light Rail Transit system. Many of these have been mentioned in various discussions, but none of the answers have been adequately answered by the City Transportation Director, Mayor, nor the Council.

1. Building costs are understated, future increases in construction, labor, and material costs are not reported nor mentioned. Also, some of the City's plans for the terminals/terminus are incomplete, missing substructures, rails, handi-access, etc. Was this to artificially deflate the reportable costs? If so the City's entire plan is flawed, and fraudulent.
2. No mention is made of a turn-around or depot. There will undoubtedly be a maintenance yard or some related facility to take the tram down for repairs. This is not mentioned.
3. The Administration has made repeated assurances that the project will be done with minimal impact to neighboring areas, residents, businesses. This cannot be the case. Building and construction guidelines are very specific, requiring x amount of relief space, and will require shutdown of adjoining lots, properties, streets and roads.
4. Many of the people who realized their properties will be (eventually) condemned via eminent domain are under the absolutely mistaken impression that they will be receiving the (at future time) full market value (fmv) of their properties. This is not the case. Research into the City's sojourns into exercising eminent domain muscle reveals that they set aside a lump sum amount, to be paid to defendants served with the Order Putting Plaintiff in Possession (i.e. City). Wording is usually like this: "The sum of \$xx,xxx deposited with the Chief Clerk of this Court by the Plaintiff as estimated just compensation..." Usually the award is a few pennies on the dollar of the actual value of the condemned and claimed property. The defendant usually has no recourse. Waianae residents were notified last July that they were losing portions of their property, after construction had already begun for the emergency access road.
5. Regarding property, it is likely the rail system will negatively affect property values. Cities have trended that property values drop near an existing commuter or rail line. The noise negates, for most people, the benefit of proximity to a transit line. Many cities found that rail ridership decreased, in favor of buses, bicycles, and scooters.
6. I personally believe most people would favor a scooter over inconvenience of driving to a depot yard and park their car with thousands of others, to catch a rail to work.
7. The lifespan of a typical rail system is about 30 years. Thereafter, it must be 100% wholly replaced at full value at that future time. It's simply a matter of infrastructure breakdown.
8. The lifespan of a typical tram system (light rail) is about 15 years. Thereafter, it must be 100% wholly replaced, or else repaired to the point where it's economically unfeasible.
9. The mathematics of the City's plan to take 50,000 drivers off the road is not practical nor possible. Let's assume the City is extremely aggressive and forward-thinking in their planning. Let's say they build two rail systems, one that begins in point A (Kapolei area) and the other begins in point B (Downtown). Let's say there are 12 cars to a train (no longer considered light rail), each holding 200 passengers, which is 2,400 passengers total capacity per train, going a single way, or 4,800 passengers for the entire system. Let's say the trains will cross each other in the middle, so there is always a train going and coming in both directions. In order to meet the Administration's goal to take an approximate 50,000 drivers off the road at that future time, the trains will have to travel about 77 miles per hour, nonstop, in order to make the approximate 10 round trips each train will have to make, in an hours' time. This oversimplified math problem underlies the fatal flaw in the plan. The City's plan for light rail does not have the capacity for 4,800 total passengers at any given time. This would be rush hour in the morning, from 5:30AM to 8:30AM, and 3:30PM to 6:30PM. It is not mathematically possible to do it with the above configuration, nor with the City's proposed version, which is much smaller passenger capacity. This may be decried by the Administration as "Mickey Mouse Math" but the figures cannot be doubted. The rail will not accomplish what it is envisioned to.
10. The City's proposed 6,000+ jobs to directly or indirectly support the rail system, operations, maintenance, support services, administration, and vendor services, is not economically sustainable. The vendors have the best bet, at least people will stop on the way to buy coffee,

pastries, morning paper, etc. But wait, they can't because the system has to run without stops to make its rush hour quotas.

11. The City's Transportation Department has in effect given their current employees a potential for higher-paying and more executive jobs, "fresh" and new. The current employees are capped where they are at, but the Rapid Transit Division (the most expensive and largest Division by staff and dollars) is a way for them to move up. See their presentation here: <http://www.honolulu.gov/dts/dts+fy2008+operating+budget+request.pdf> If you scroll down to page 7, you will see "Rapid Transit Division", 35 proposed executive and administrative support positions, costing a whopping \$2,338,644 in staff costs, dwarfing their next largest Division by over \$500,000, but has only 1 position more. This indicates that, given civil service positions and current pay scales, these are much higher and more executive positions, possibly (POSSIBLY) created this way by the Transportation Department to give their currently ceiling'd staff someplace to go, and retire happily with a healthy retirement pay.
12. No amount of ridership fees could make up the construction, maintenance, and daily operations costs of the entire rail system. Notwithstanding the payroll costs. The majority of the costs will become personnel-related, such as 41+% fringe rate, immediate salaries plus vacation payouts and other benefits. Throw in maintenance? That's also a personnel cost, with OT attached, at City & County rates. You know, 12 maintenance workers scheduled to perform upkeep, each files OT requests, however only 1 or 2 actually do majority of the work. A recent audit found many road crews operate in this fashion. However the audit was for City internal use only.
13. No amount of taxes can make up the total cost plus ongoing upkeep. The burden on the taxpayers of the state would be astronomical, it could not possibly be estimated.
14. People who voted "YES" did not realize, they were not really indebting themselves, but their progeny, to a lifetime of debt service to this system. It cannot possibly be completed before, say, 2025 or 2030, when most of those who voted will be at or nearing retirement, and it will no longer make a difference for them. Many people simply jumped on the bandwagon without really thinking things through.
15. A raised rail system lumbering many stories above buildings and 1-2 storey homes and apartments in the proposed areas would ruin not just the overall landscape, but many people's enjoyment of the view looking out not to the ocean, but the SKY.
16. The Administration's claim is that if they get this project going now, they can jumpstart the state's economy and provide much-needed jobs through construction. This is short-term a truth, however if there exists no money to begin with, and the Council on Revenue's forecast shows a current year deficit, with factors of debt in the out-years, where is the funding going to come from? It reminds me of a very ambitious building project in Downtown, that sat for many years until another investor came by. Only the Federal Gov't can deficit spend. How can you ambitiously plan alternate and future routes (as the Council is debating now) without having any up-front direct revenues, investor venture capital, bond interest, or other form of monies on hand to even "break ground"?
17. Construction costs are years away, when materials, labor, and rates will be much higher. Final completion costs can be many times the \$5 Billion thrown in front of the hapless public. And, once construction begins, final completion can be upwards of 20 years away, including the various legal battles and hurdles the City will no doubt face, in battling hundreds of home and landowners, businesses, and action groups. It will be unprecedented in our State's history, and will likely bring embarrassment to us nationally.
18. Speaking of attention, it is likely that people will prefer (as they do now) places such as Tahiti, Fiji, Thailand, and New Zealand, over Oahu anyway. Many tourists surveyed by the HTA recently said they'd never come back if the beaches eroded. What happens if (i.e. by the year 2030) the beach in Waikiki is a memory, hotels are literally flooded, AND there is a lumbering, leviathan, hulking, clackety, metallic silver worm snaking its way through Downtown? Realistically, do you think any tourists would come to Honolulu, except to use it as a springboard from the Mainland USA to their exotic destination in the far Pacific or Asia?
19. Other states that the Administration quoted as having successful rail systems have something that Hawaii will never have, regardless of how much development we want to create - land space. If anything, Hawaii - due to current erosion - can do nothing but lose land space, at least

in Honolulu County. In order for the rail to be plopped down, people who are already there have to make way. As our proud and defiant mayor has proclaimed in various ways, "...anyone opposing this will have to just get out of the way..." The first time he said it on TV, we passed it off to his frustration and lack of self-control. Thereafter, it is a clear indication of absolute superciliousness, self-love, and hubris which I do not ever recall seeing in any of our recent mayors of my memory. The sign of a bad publican is to - even modestly - threaten to shove it down the peoples' collective throats when his way is challenged, and his personal progress slowed.

20. The Administration does not inform the public of the following: Chicago Mass Transit (Chicago Transit Authority), one of the original models for an earlier proposed transit system, is bankrupt. If not yet, pretty darn near. The cost of doing business has long overrun the intake due to ridership, which has decreased over the last 30 years. Even their bus ridership is down, largely due to increased crime in poverty-stricken areas near the center of town. Unfortunately for us, Pearl City & Mililani are becoming what Kalihi and Liliha have long been - our native slum.
21. Sound is a pressure wave that emanates radially outward from its source, decreasing as the inverse square of that distance the listener is from it. The City's contention that erecting short walls, combined with the raised platform, will decrease noise to a minimal level, is preposterous beyond laughable. Any system, even a rolling wheeled vehicle, creates a significant amount of noise, and particularly at night. Anyone who lives near the University or along the H-1 between McCully through Pearl City knows this. Even if it is no louder than a small grass whip, it will be noticed, and people will be driven out. I used to live in a small apartment on Thurston Avenue in Makiki, and the simple act of the bus rolling at 11 at night was enough to jolt this young child - at that time - awake from a light sleep.
22. A research paper by Randal O'Toole from the Cato Institute, "Does Rail Transit Save Energy or Reduce Greenhouse Gas Emissions?" (<http://www.cato.org/pubs/pas/pa-615.pdf>) asserts that the following would be more cost-effective and reduce greenhouse emissions than rail transit:
 - Powering buses with hybrid-electric motors, biofuels, and non-fossil sourced electricity
 - Concentrating the major load of bus service to heavy-load routes, and smaller buses for off-peak and lower demand areas
 - Building new toll systems and coordinating traffic signals to relieve highway congestion that contributes to the waste of over 3 billion gallons of fuel annually
 - Encourage people to purchase fuel-efficient cars. Get 1% of commuters to switch to hybrid cars costs less and saves more energy than trying to get 1% to switch to public transit, and most of those keeping their cars. After all, the rail only runs on one side of the island.
23. This same research paper by Mr. O'Toole reveals the average light rail system of those studied, requires over 4,000 BTU and generates almost .7 pounds of CO2 PER PASSENGER MILE. To traverse the estimated 26-30 mile rail stretch, one way per trip (not per day) would require an average of 104,000 - 120,000 BTU in energy and generate 18 - 21 pounds of CO2, more than average of city buses running for one hour.
24. This same research paper asserts that the mere construction, over many years, of the system itself, would generate more CO2 and cost more in energy and fuel consumption, than the rail, and may "never be recovered by the savings (of constructing the rail in the first place).
25. Due to Homeland Security regulations involving public transportation, the City & County would have to establish, and integrate into the Honolulu Police Department, a separate Honolulu Rapid Transit Police force, or else divert current - or future - officers to that duty. Security screens may be necessary at depots as well, adding to delays (but wait, they can't stop right?).
26. The Administration claims that the economy will be stimulated, looking at (i.e.) Denver, Portland, and San Jose light rail development, don't realize that those systems were supported by large tax or other subsidies, something dramatically lacking in Hawaii's economy. Even the current tax collected for transit is far short of proposed levels they would have to be at for the system to be a reality.
27. Finally, no mention is made as to whether this light rail system can accommodate passengers (i.e. from the airport) with large luggage, or whether stowage space is or can be provided for safety, comfort, and security of others?

Dear Anonymous:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal in the same way as submitted:

- 1) *Chapter 6 of the Final EIS addresses your concern.*
- 2) *Chapter 2 of the Final EIS provides details about the maintenance and storage facility, and Section 4.17 of the Final EIS provides details about the environmental effects of the maintenance and storage facility options.*
- 3) *Construction activities will occur and be contained within the study corridor as much as possible. The general mitigation measures related to acquisitions, displacements, and relocations are presented in Section 4.4.3 of the Final EIS. For those partial acquisitions, defined in Section 4.4.1 of the Final EIS, "For commercial properties, including situations where the commercial property could lose its function, full acquisition was considered." DTS's right-of-way managers will be working with individual property owners to provide relocation services, "...to all affected business and residential property owners and tenants without discrimination;*

persons, businesses, or organizations that are displaced as a result of the Project will be treated fairly and equitably" (Section 4.4.3). Temporary construction easements will be negotiated on a case-by-case basis.

4) As stated previously in response to No. 3, the City's right-of-way staff will work with individual property owners to provide relocation services, "...to all affected business and residential property owners and tenants." Because the City will use Federal funds to finance the Project, it must comply with policies and procedures that conform to the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970, as amended, and 49 CFR Part 24 implementing regulations (collectively "the Uniform Act"), as well as FTA Circular 5010.1 C and applicable implementation guidelines. 49 CFR Section 24.102 (d) states the amount of just compensation "shall not be less than the approved appraisal of the market value of the property..."

5) The Project will include an integrated noise-blocking parapet wall at the edge of the guideway structure that extends three feet above the top of the rail. The parapet wall will substantially reduce ground-level noise. With the recommended mitigation in place (sound absorbing material and wheel skirts), the noise analysis indicates that the new noise generated by the Project will be lower than the existing noise levels in most places. Wheel skirts will increase the benefit from the parapet wall at locations above the elevation of the track. The use of sound-absorptive materials below the tracks in the areas that will experience moderate noise impacts will reduce the Project noise levels from the upper floors to below the impact level. Once the Project is operating, noise levels will be re-measured to confirm that there are no noise impacts from the Project. Section 4.3 of the Final EIS did not include an evaluation of the direct impact of the Project on property values, as those values are subject to economic forces outside the direct control of the Project. Section 4.19.2 of the Final EIS did consider changes in property values as an indirect effect. This section states that "changes in property values that will result from construction of the transit system will have an indirect effect. Research based on New York and other cities has shown that residential property values can increase close to a transit station (Table 4-38)." Section 4.19.2 also acknowledges the potential for nuisance effects on property values, but notes that these negative effects are offset by the positive effect of decreased travel times and the desirability of properties near transit stations.

6) Use of a scooter is a matter of choice to individuals.

7) The design lifetime of the Project is 50 years. After that period, substantial renewal of the system is anticipated.

8) The design lifetime of the Project is 50 years.

9) As stated in Chapter 3 of the Final EIS, peak direction volume during the a.m. two-hour peak period will be below the fixed guideway system's currently planned minimum capacity. Should higher volumes be realized, the system is expandable to accommodate longer trains and to reduce the headways between trains from 3 minutes to 90 seconds, thereby increasing capacity by 100 percent. As also discussed in Section 3.4.2 of the Final EIS, the model predicted the maximum peak direction volume during the a.m. two-hour peak period will be about 14,700 passengers. The operating plan for the fixed guideway system has been

revised, and the system will have a minimum capacity exceeding 17,300 passengers per direction during the two-hour peak period. Table 3-12 in the Final EIS also identifies the estimated reduction in automobile trips resulting from implementation of the fixed guideway system. However, this reduction in automobile trips will occur over the span of one day and not just during the peak hour.

10) The employment numbers quoted by the commenter are for the construction period. The Final EIS did not present estimates for labor for the operation of the transit system. Not all of the induced labor during operation will be employees of the transit agency.

11) Staffing is defined around the needs of the division, and salaries are appropriate compared to similar transit operations in other cities.

12) The City's fare policy is to recover between 27 and 33 percent of operating costs from fares. Assuming continuation of that policy, the City will raise fares to maintain the required percentage of costs. The other 70 percent or so of the costs is the subsidy of the transit system and will be handled during the City's annual budgeting process. Operating and maintenance costs will be paid for from the same sources currently used for TheBus: Federal funding, fare revenues, and City subsidy from the General and Highway Funds.

13) The Financial Plan is balanced using currently identified sources, including the General Excise and Use (GET) surcharge, Federal funding for capital costs, farebox revenue, and other sources of revenue that support the City's operating budget for operating expenses.

14) The funding sources for the construction and operation of the transit facility are presented in Section 6.3.2 of the Final EIS; this includes City General Obligation (GO) Bonds. As presented in Section 6.5.1, "All GO debt is assumed to mature in FY2023..." The completion date for construction work is 2018.

15) Shadowing and views of the sky may only be affected for those low-lying buildings immediately adjacent to the elevated guideway; however, this is partially mitigated by placing the elevated guideway within roadway right-of-way such that skyward views by vehicle occupants are the only viewers typically affected. Refer to Figure 4-21 of the Final EIS.

16) The Financial Plan is balanced and includes capital and operating costs. Moreover, the Plan has been adjusted for lower GET surcharge collection consistent with Council on Revenue's forecasts. The Project will generate 7,500 jobs per year during construction, which will have a positive impact on the economy.

17) As presented in Section 6.2.1 of the Final EIS, "Estimated costs for each standard cost category were increased in accordance with FTA guidance for estimates developed prior to Preliminary Engineering to account for unknown but expected additional expenses."

18) Section 4.3 of the Final EIS indicates that tourism will continue to be the largest industry and job generator on Oahu. The fixed guideway will offer an alternative not currently available for those who travel within the highly developed and congested Honolulu corridor. The corridor itself is now the site of major residential and employment activity, as noted in Section 4.2

of the Final EIS. The Project will not affect beach erosion rates because it is located away from the shoreline.

19) Limited available right-of-way is a major factor in the decision to construct an elevated system within existing street rights-of-way wherever possible.

20) The financial health of the Chicago transit system is not related to the Project.

21) As presented in Section 4.10.1 of the Final EIS, "Noise impacts from transit projects are evaluated using criteria established by the FTA, which are based on community reaction to environmental noise exposure."

22) The paper cited is not project-specific. The statements are general and are not applicable to this Project.

23) As stated in Section 4.9.3 of the Final EIS, the Project will result in a reduction of 171 metric tons of carbon monoxide daily from transportation, including the energy generation to power the rail.

24) While the Draft EIS does not analyze the energy payback period for energy consumed during construction of the transit system, the commenter does acknowledge that there is an energy payback period for transit. The same cannot be said for highway construction that would be needed to accommodate the growth in vehicle miles traveled on Oahu.

25) As discussed in Section 2.5.4 of the Final EIS, all stations, park-and-ride facilities, and vehicles will include security cameras that are monitored at all times of operation, will have audible and visual messaging systems, and an intercom link to the system's operations center. Security personnel will also patrol the system; however, security personnel may not be physically located at all stations and on all trains at all times. Transit security will be provided by the Honolulu Police Department.

26) The capital plan for the Project is presented in Section 6.3 of the Final EIS, including a description of the amount of funding anticipated from various sources. Section 6.6 of the Final EIS describes risks and uncertainties associated with these funding assumptions. In this section, the amount to be generated from the two primary sources of funding from the GET surcharge and the FTA New Starts funds is detailed. The financial plan is balanced, and it will continue to be updated over time as local and national economic conditions change. The updated capital plan presented in Section 6.3 of the Final EIS takes the current economic downturn into account.

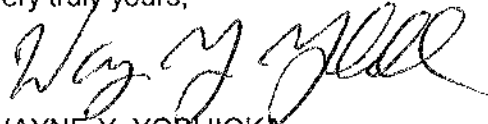

27) Rail vehicles will be designed to accommodate luggage that does not interfere with the safety or comfort of other passengers and will be regulated according to a policy to be developed.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulustransit.org. You may request a DVD of the Final EIS and additional

Anonymous
Page 5

content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Submission Content/Notes : I have no been a fan of Charles Djou, but I agree with him that construction on the rail project should begin in town. It is folly for us to begin it in West Oahu. Based on letters that have been published in the newspapers as well, there doesn't seem to be much disagreement on this issue. I can understand that construction will cause a lot more headaches in town than it will in West Oahu, but it is just common sense to start the construction in town. The rail will not be needed in West Oahu if it never gets to town and rail will definitely be a waste of taxpayer's money then!

Dear Anonymous:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

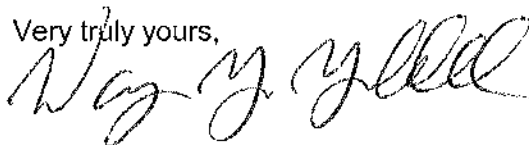

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- *Reduce the time that each area will experience traffic and community disturbances.*

- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*
- *Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- *Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Subject: Honolulu High Capacity Transit Corridor Project
City and County of Honolulu
Draft Environmental Impact Statement/4(f) Evaluation
November 2008

Dear Messrs. Matley and Yoshioka:

As long time residents of the Ala Moana-Sheridan neighborhood, we read with interest the Draft EIS for Honolulu's High Capacity Transit project dated November 2008.

We participated in the City and County of Honolulu's preparation of the draft Sheridan community plan in 2006, and appreciated how the vision is consistent with the City and County of Honolulu's Primary Urban Center Development Plan's designation of the Sheridan and Kaheka neighborhoods as In-Town Residential Neighborhoods. In Ala Moana-Sheridan, over 20% of the population is over 65 years old, and the proportion of elderly is steadily increasing (Draft Ala Moana-Sheridan Community Plan, 2006). In light of this fact, the 2006 draft Plan discusses how public roads and facilities in and around our neighborhood need to be more pedestrian friendly to the elderly, general pedestrians and bicyclists. Therefore, we reviewed the Transit DEIS for a description and analysis of how access to the Transit Corridor Project would be pedestrian friendly for the Ala-Moana-Sheridan neighborhoods.

Instead, we found the Transit Corridor Project DEIS to be heading in the opposite direction making the area more congested with traffic and in turn creating a more rushed environment. The DEIS directly comments that the proposed TOD in the area will change the feel of the area, presumably making it more urban, "Because Kaka'ako has been designated a redevelopment area, changes in land uses to TOD is likely, which may result in a change in character along the alignment, especially near stations...(DEIS, p. 4-45). While we understand change is inevitable, the Transit DEIS does not even discuss basic project features such as access to the Ala Moana transit station for the affected neighborhood. Since safe and secure pedestrian access to and from the Ala Moana transit station is not discussed or analyzed in the Transit DEIS, we assume no design studies or even serious consideration has been devoted to this, the City and County of Honolulu's major public infrastructure project.

Please revise and expand the Transit DEIS to include detailed descriptions and analyses of the range of pedestrian and bicycle access ways to and from the Ala Moana station. If no consideration has yet been devoted to this project element for the Ala Moana-Sheridan community, we submit the DEIS is deficient and is not yet a complete Draft EIS.

Sincerely, *Doris Nakamura*

Dear Resident:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

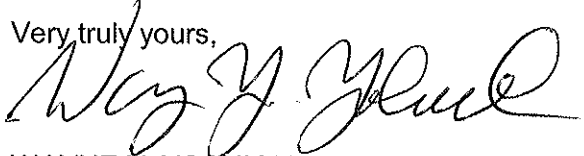

Many pedestrians currently use the network of sidewalks in the Ala Moana-Sheridan neighborhood. The pedestrian volume in the neighborhood will continue to grow with or without the Project. Those walking to the station from surrounding areas will use the existing network of sidewalks. As stated in Section 2.5.5 of the Final EIS, design criteria developed for stations place highest emphasis on walk and bicycle access. Pedestrian access to stations, including accessible routes, shall be given first priority for reasons of safety.

It is estimated that most passengers using this station will transfer to or from buses directly on Kona Street. Those walking to the station from surrounding areas will use the existing network of sidewalks. Bicyclists will access the station via existing streets and/or sidewalks in the area. The station will be designed to accommodate the expected volume of pedestrians and will provide parking for bicycles.

Resident
Page 2

As indicated in Section 4.6.3 of the Final EIS, ongoing coordination efforts with the public will help develop design measures to enhance the interface between the transit system and the surrounding community. The extent, nature, and location of these design measures will be determined in Final Design through these coordination efforts.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

CITY COUNCIL
HONOLULU, HAWAII

Dear Councilman Dijon:

I applaud your brave stance by openly stating an obvious thing of the rail in town outward make more common sense than the Engineering Co. plan.

As a Waipahu resident its very obvious to us that going from Waipahu to Kapolei does not solve the problem of going to town.

The bus system could move to Kapolei since they use roads. The bus barn ^{can} ~~and~~ be used as the train yard for rail cars. The bus barn is in Halawa or wherever it is in Aiea - Pearl city area.

We shouldn't hold our breaths, no common sense decisions are ever made in Hawaii government.* I say it as an retired state worker.

Aloha
Alex

* maybe no common sense decision is ever made by any government?

Dear Alex:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. The first phase of the Project must be connected to the maintenance and storage facility because, in addition to maintenance of equipment and ongoing operations, the maintenance and storage facility houses the main control center for the entire Project, and the required testing and operation of the system could not be completed without access to it. No location has been identified closer to Downtown with sufficient available land to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations*

- *Reduce the time that each area will experience traffic and community disturbances*
- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding*
- *Match the rate of construction to what can be maintained with local workforce and available financial resources*
- *Balance expenditure of funds to minimize borrowing*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

HEARING OFFICER HAMAYASU: Good morning. I'm Toru Hamayasu, the 2nd Deputy Director of the City and County of Honolulu, Department of Transportation Services. I am the hearing officer for this public hearing for the Draft Environmental Impact Statement for the Honolulu High-Capacity Transit Corridor Project.

The purpose of this public hearing is to collect comments related to the proposed transit project regarding the Draft EIS; Section 106 of the National Historic Preservation Act process; Section 4(f) of the U.S. Department of Transportation Act; Right-of-way acquisition; and floodplains affected by the project.

Public input can be made in four ways:

1) Public spoken testimony to me here, in the Public Hearing Room.

2) If you do not wish to speak in public, an individual spoken testimony for the record can be made to the hearing recorder, who is

near the Public Involvement station in the Project Information Area.

3) Written testimony may be deposited in the black comment box at the meeting, delivered to the Department of Transportation Services office, or mailed or faxed [(808)523-4730] to DTS by January 7, 2009.

4) And finally, testimony can be submitted online by January 7, 2009, at www.honolulutransit.org.

All comments and responses will be included in the Final EIS. Revisions to the EIS will be made as appropriate, based on comments.

The hearing procedures are as follows:

1. Elected and public officials will be heard first. Persons desiring to testify should register at the entrance to the hearing room, and will be called in order of registration.

2. Any individual may appear and speak for him or herself, or if duly authorized, for any local civic group, organization, club or association, subject to the rules provided herein. Speakers should give their name and address. If representing a group, this information should also be given.

3. Speakers must limit their statements to three minutes. Additional prepared statements or literature, pertaining to the project, may be submitted at this hearing or by 4:30 p.m., January 7, 2009 to Department of Transportation Services. These statements will be made part of the official record if they include a legible name and address.

4. For these hearings, all statements, oral or written, should be directed to the hearing officer and must be related to the subject matter of the hearing.

5. Each person speaking before the audience must do so at the floor microphone. We will call testifiers in groups of three to facilitate orderly progress. Please ensure you are in the hearing area at the time your name is called. A court stenographer will record and transcribe the hearing proceedings. If required, I will announce any other specific rules governing this hearing.

6. As part of this public hearing process, the Honolulu Rail Transit Project Team is not allowed to respond to any questions or concerns raised by the speaker. The Project Team will be available to address your questions in the

Project Information Area outside of this hearing venue.

It is now 9:07 a.m. At this time, I would like to begin the public testimony. The first testifier, I think you were given No. 1, Testifier, please come to the microphone.

-oOo-

REPRESENTATIVE KIMBERLY PINE: Good morning. I am Representative Kimberly Pine, and I represent District 43, Ewa Beach, at the State Capitol, in the House of Representatives. First, I'm excited to be here. I'm glad that the voters have spoken and we can now move on to the real thing, so thank you for having me here. We will have more thorough written documentation of our comments before the January 7th deadline, but I first do want to express some feelings brought to me by some Ewa residents. We do feel strongly that the route should go to the airport, and that that shouldn't be changed, so we hope that that does happen. In our private poll, we discovered that

about 25 percent of the citizens in my district do work at Pearl Harbor, and so that does not include those that work at the airport, so it will increase the number of people using the facility if the route goes to the airport.

According to what we have reviewed so far -- we're still reading that 400-page document, but we do not see anything defined in terms of baggage use. If we do change the route to the airport, we should include something that's more defined that would allow people to bring multiple baggage. Also, we did not see in the document that we read so far, that there is nothing to accommodate bicycles, and so we really believe to encourage all types of connectivity, that that should be more thoroughly defined. Definitely, we believe that there should be a more thorough planning in terms of the connectivity with the colleges. Definitely, U.H. West Oahu is in there, and we're definitely pushing for the U.H. Manoa connection.

In terms of emergency evacuation procedures, my district is concerned about something being more defined in terms of power failure and evacuation procedures for safety reasons. But that's it for now. Thank you so much for having

me, and we will have a written document to you very shortly. Mahalo.

-oOo-

HEARING OFFICER HAMAYASU: Please, No. 2.

RODLYN BROWN: My name is Rodlyn Brown, and I'm from Waianae. First thing is, I am in favor of the train. But being from Waianae, with one road, we have a very difficult time getting here or getting home. Yesterday, it took the people two hours to get from Kapolei to Waianae, after the roads had been cleared of construction work. So if this group wants to help and have our support from the Waianae Coast, they have to do something about the second road out of Waianae.

There is no alternative. We are the only location on the entire island that has no way in or out, except for Farrington Highway.

And we need to get to the train just like everybody else does, and we are supportive of the train, in every way, but we need this group to be supportive of us. So if you would please consider the fact that federal funds are for all the people, not some of the people, and that more and more residents are coming to Kapolei and Makakilo, and from Kapolei, all the way to Makaha, and our commute just from Kapolei, home, two hours now, three hours next year, six hours out of our day, every day, please, please, support our needs, as we will support yours. Thank you.

-oOo-

HEARING OFFICER HAMAYASU: No. 3, please step up, and if No. 4 person can come forward and take the seat.

FRANK GENADIO: Frank Genadio, Makakilo. The city administration has apparently taken the selection of the transit technology from the City Council, which killed the ballot question for a fixed guideway, instead passed one with steel wheels wording. Approval of steel wheels on the

ballot does not eliminate other suppliers from the competition, but the EIS brushes off three technologies by using a recommendation from a so-called expert panel. This limiting of alternatives was referred to in the state's review of the EIS as troubling.

I am here to support the HSST urban mag-lev system. EIS Chapter 02 covers Alternatives Considered. In Section 2.1.3, magnetic levitation is listed as a proprietary system unproven in the U.S. Because it is not in the U.S., does not make it unproven. Using this rationale would leave us still traveling in covered wagons. The Federal Transit Administration calls the HSST a mature technology, and the system has been in highly reliable revenue service in Japan since early 2005.

The EIS states that "none of the proprietary technologies offered substantial proven performance, cost, and reliability benefits compared to steel wheel operating on steel rail." For the mag-lev, that statement is false. It is faster, much quieter, and safer because of its wrap-around-the-beam configuration. Its guideway is 20 percent cheaper to build. This is important

when one examines guideway length for the three alternatives and compares costs in Chapter 06 with expected sources of funds.

The city has funding for a 20-mile MOS, but in Section 2.2.2 shows a combined airport and Salt Lake alternative of 25 miles. This not only places the project over projected budgets, but excludes any extension to the UH-Manoa campus. Personally, I favor the airport routing, over Salt Lake. If, however, the HSST were to win the transit competition, it could satisfy most requirements.

If labor and materials planned for the MOS were applied to the mag-lev, five added miles of guideway could be built within the MOS budget and timelines, accommodating an airport alignment, extension to UH-Manoa, and spurs into Salt Lake, as well as Waikiki. The only way to take advantage of such costs savings is to ensure that guideway specifications are left open.

Figure 2-9 shows a guideway of 28 to 32 feet, as well as a wall for noise mitigation. The HSST uses two beams with open space between the beams and a cross-section of 21 feet, with no need for noise walls. The mag-lev's narrower

guideway -- (3-minute time limit) -- coupled with the much lower sound level of the system, will result in less impact on homes and businesses along the route. Figure 2-9 should be deleted and kept...

HEARING OFFICER HAMAYASU: Please summarize.

FRANK GENADIO: I just have a couple.

HEARING OFFICER HAMAYASU: Okay.

FRANK GENADIO: ...should be deleted and kept out of the RFP.

O&M costs also for mag-lev, \$12-to-18 million less per year than the steel wheel. Prevent the mag-lev from competing and we pay more for what may be an inferior system. If the city is so certain that steel on steel is superior, modify this EIS appropriately and keep specifications general enough to enable all suppliers to have a chance. After I testified to Council the other day, someone came up to me and said that adding...

HEARING OFFICER HAMAYASU: Please summarize.

FRANK GENADIO: I just have the one sentence.

HEARING OFFICER HAMAYASU: Go on.

FRANK GENADIO: ...adding \$1.5 million to EIS, that's one 36,000th of the cost of the project.

This would be money well spent. Thank you.

-oOo-

HEARING OFFICER HAMAYASU: Please, No. 4, step forward.

MICHAEL GOLOJUCH, JR.: Michael Golojuch, Jr.,

Makakilo resident. I'm here today to testify in favor of the steel on steel rail, with the airport route. It doesn't make any sense that we would not have included the airport in the first time around. We know Romy Cachola used his little power, got what we wanted and now he's -- then he decided that he didn't really want to support rail. So I do come out here today to ask that we do move forward, we do move forward with keeping it in the original, starting off in Kapolei and moving forward. By building it and starting in Pearl City, you are going to displace more people, you are going to cause more people to lose their homes and businesses quickly, without giving them chance to really relocate. It doesn't make any sense. We could start off by building the base yard here, on Kapolei, where there's plenty of space and we can move forward. That's basically it. Thank you.

-oOo-

MICHAEL GOLOJUCH: Good morning. I'm Michael Golojuch. I am the Vice Chair and the Transportation Chair of the Makakilo/Kapolei/Honokai Hale Neighborhood Board. We support the rail system and we support the MOS, with the airport route. Eventually, we would like to see the rail system expanded, but we know we gotta get the MOS built first, 'cause we want it to go to U.H. I'd like to see it go to Waianae and I'd like to see it go to other locations, too. And some day, I would like to go to the U.H. game by getting on the bus, coming down, getting on the rail, then getting off by the stadium.

We really believe that we need this system. There are some things -- Maeda Timson, the Chair, could not be here because she's on a trip. We will be submitting written testimony, as well as just my verbal support today. As an individual, I know it's important to get this done. It's important to start with Kapolei, where there's less problems, to start, and get it going and moving it fast, and finding out where there may be problems in the construction, so by the time it gets through Waipahu, Pearl City, et cetera, and through town, that will be done. Plus

we'll have the base yard. We have the area, and the lands are already being designated from the Draft EIS for that, and we won't have to disturb, as previously mentioned, as many residents and/or businesses to get that first segment built up, in the Kapolei area. And I strongly support that, and don't let the political part get in there for people running for different offices just to use this now as another pay, getting their ploys.

So, again, support the system, and on specifics and things, and as mentioned, there is a need for people to carry luggage. Maybe not a lot of luggage 'cause I really see the people going by the airport, the business people coming in and not more than tourists, but there still needs to be that capability for both to use the rail system. Thank you.

-oOo-

HEARING OFFICER HAMAYASU: No. 6. Do you have the name of the person?

UNIDENTIFIED SPEAKER: She cancelled.

HEARING OFFICER HAMAYASU: Okay. No. 7?

No. 8, please step forward and take the seat in the front.

PAT PATTERSON: Aloha. I'm Pat Patterson from Makaha Valley, a member of AARP and of Concerned Elders of Waianae. I have three issues. First of all, I really resent all my taxpayer money that was spent on the slick stuff to get people to vote for the rail steel on steel. I think the vote was so close, that it should not have been counted yea.

No. 2. I really respect Jim Brewer and Renee Ing for having gone to Europe and tried out the Phileas Magnet-Rail, brought back and shown on Olelo, how wonderful that is, with the bus-train moving only on magnets in the pavement. That would be very, very inexpensive, would be done quickly, would use a lot of our workers and be much more compatible with our island.

And No. 3. If you really want rail, why don't you restore the old OR&L, all the way to Kaena Point, and give the Waianae-Makaha residents access to what's going to be way beyond, and we are people who have to work in town. We really need something. The 93 bus is wonderful, the country express is good as far as it goes, but think about restoring OR&L, all the way to the end of the island on the southwest end. Mahalo.

-oOo-

HEARING OFFICER HAMAYASU: No. 8.

TESHA MALAMA: My name is Tesha Malama. I am an Ewa Beach resident and also responsible for the Kalaeloa District. I am speaking in favor of the rail project, the minimum operating segment, and also with the alignment through to the airport. As an Ewa Beach resident, if we had the leadership and commitment to do these types of projects 10 years ago for the widening of Fort Weaver Road, and 15 years ago, to bring in the North-South Road, we would not be in the hell we live in now, in Ewa Beach. This rail project will add to the multi-motor approach that we need, as a county, to move people around this entire island. I think one of the integral parts of the rail will be how TheBus system links up to the rail centers and getting the community involved in planning the rail center points.

And so we need, No. 1, the infrastructure money that it's going to bring in, so people have

immediate jobs during this time of the economic system. Being responsible for Kalaeloa, I need to have that type of commitment and funding that it will bring into the district. As we build out Kalaeloa, access for Ewa Beach residents to the rail center will be less than five minutes from every household in Ewa Beach. We need everything, we need it now, and I say whoever is going to get on the rail late, they should really move aside, so we can get this project done. Thank you.

-oOo-

HEARING OFFICER HAMAYASU: No. 9.

JOHN HIGGINS: Good morning. My name is John Higgins, I'm an Ewa Beach resident. I'm here to support the rail system and going through the airport route. I think that we should have a firm commitment on federal money. I know that that's been given to us, but in speaking to people next door, there was no indication of when the federal money would actually come, and with the economic situation the way it is, I think we should have a firm commitment from the next administration in Washington, that we're going to get this money. Now, we got great senators, and congressmen, and Democratic president, which would bow to having us get the money, but we need a firm commitment. That money, if the federal money doesn't come, this project will stop dead in its tracks.

The other thing is, too, that the people that we see in the newspaper, talking about this project, Charles Djou, Romy Cachola, and the Mayor or one of his representatives are not here. They should be at every single one of these things for the two hours thereon to speak to the people. They've been spending millions of dollars to promote this, which I agree with, it should be done. But these politicians should be here to answer questions, to talk to us and let us talk to them. And that's my statement. Thank you.

-oOo-

HEARING OFFICER HAMAYASU: No. 10.

REPRESENTATIVE SHARON HAR: Thank you. Good morning. I'm Representative Sharon Har. I am the State Representative for the 40th District, which is comprised of Kapolei, Makakilo, Royal Kunia, and Kalaeloa. I am one of those politicians who is here today, and while the rail is not a State issue, it is a City and County issue. I do know that we have the firm commitment of our Mayor, as well as our council representatives on this side of the island. We do have the Mayor's representatives here, but I am here on behalf of myself as a private citizen and representative of Kapolei.

First of all, as the Chair of the 2007

Interim Task Force on Smart Growth Development, I am an ardent supporter of the rail's first segment, beginning here, in East Kapolei. Because one of the basic principles of smart growth development is transit-oriented development. With all the development that we have occurring out here in our great new city and on the west side of the island, you must have transit beginning here, so that we can build smart growth projects. Smart growth projects basically incorporate transit around them, and it's one of the most effective tools to prevent urban sprawl. And that is my biggest concern, as we continue to develop on this side of the island. If government has decided that all of the development is going to happen on the west side of the island, then we must build under the principles of smart growth development, and transit-oriented development is one of the basic ten principles of smart growth.

Secondly, one of the issues that came up in the Draft Environmental Impact Statement, was the fact that the two proposed base yards are located on the Leeward side of Oahu. In order for the transit to be developed, you have to have a base yard. And if the two proposed sites are out

here, then, accordingly, you have to have the beginning segments out here, where the base yards are located.

Finally, my last point is that, again, to begin out on the west side of the island is imperative because you have to have construction in an area that's relatively undeveloped. There is so much built, you can't develop anymore in Aiea or in the urban core. It makes sense to build out here, when you have relatively least amount of development, and then as we build more houses, we build around transit, so that, again, we're promoting the principles of smart growth.

So, I do have copies of my testimony, as well. I thank you for this opportunity to testify.

-oOo-

HEARING OFFICER HAMAYASU: No. 11.

ROSITA SIPIROK-SIREGR: Good morning, panel. My name is Rosita, and I am a resident of Makakilo. I'm here to testify just as a regular resident who has been catching the bus every day for 20 years. My concern is not really that I'm going to miss my express bus, but it takes only 30 minutes from Kapolei, Makakilo to Dillingham, and it takes 25 minutes from Dillingham to downtown. So I would support the first, the new idea of

starting the system in downtown because if something ever happened, at least it will alleviate the traffic in downtown first, and not stuck here in the middle of the island. That's my first concern.

My second concern is, is the system going to have an express system during the rush hours, during the morning and in the afternoon? Thank you.

-oOo-

HEARING OFFICER HAMAYASU: No. 12. That's it?

Is anybody else present who would like to provide a comment on the project issue?

UNIDENTIFIED SPEAKER: Can I ask questions?

HEARING OFFICER HAMAYASU: If there are questions, there are people in the next room.

UNIDENTIFIED SPEAKER: Can I make an additional comment?

HEARING OFFICER HAMAYASU: I'm sorry, no. You can submit your written testimony later, with additional comments.

With nobody else interested in providing comment, I conclude this hearing at 9:31. Thank you for your time and interest in the Project.

(Session concluded at 9:31 a.m.)

The Honorable Kymberly Pine
House of Representatives
State Capitol
Honolulu, Hawaii 96813

Dear Representative Pine:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your preference for the Airport Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

In response to your questions regarding luggage and bicycle concerns, luggage that does not interfere with the safety or comfort of other passengers will be allowed on the train. Bicycles will be allowed on the system and regulated by a bicycle policy to be developed. To better accommodate bicyclists, many of the rail stations also will be located at or near existing or planned bicycle facilities. Each station will have facilities for parking bikes.

The fixed guideway system extends from East Kapolei to Ala Moana Center and points in-between. The Project includes stations at UH West Oahu, Leeward Community College, and Honolulu Community College. The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS; however the future extensions are not part of this Project, thus they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time. Connection to UH Manoa and Waikiki will be served by buses integrated with the system.

Lastly, to address your concern regarding safety issues during possible power failures. Since trains and rail stations will be electrically powered, the system's infrastructure is being designed to handle service disruptions. For example, trains will draw power from many points along the route, so an outage in a few areas should not disrupt service. If electrical power is lost systemwide, then train brakes are designed to stop the rail cars even without power. Lights will stay on in trains and stations; backup batteries will provide lighting for several hours. The train operations center will communicate with passengers via the public address system and intercom and provide guidance. If power is restored within a short time, service will resume. With a prolonged outage, the operations center will direct passengers to exit the trains and walk along a lighted emergency walkway on the guideway to the nearest station. For those unable to exit rail cars, help will be provided by emergency responders and transit staff. Passengers will be met at the train station by a coordinated response from emergency responders and City transportation workers.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Dear Mr. Genadio:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal:

As stated in Section 2.2.3 of this Final EIS, the NEPA Notice of Intent requested input on five transit technologies. A technical review process included the opportunity for public comment and was used in parallel with the alternatives analysis to select a transit technology. The process included a broad request for information that was publicized to the transit industry. Transit vehicle manufacturers submitted 12 responses covering all of the technologies listed in the Notice of Intent. An independent five-member technology panel composed of four transit experts and a transportation academic appointed by the City Council evaluated guided rubber-tire-on-concrete systems (e.g., Phileas bus system and VAL-type systems), monorail (which is a variation on rubber-tyred technology), steel-wheel-on-steel-rail systems, (e.g., light rail and rapid rail), and magnetic levitation (MAGLEV). The panel considered the performance, cost, and reliability of the proposed technologies.

Proprietary technologies, meaning those technologies that would have required all future purchases of vehicles or equipment to be from a single manufacturer, were eliminated because none of the proprietary technologies offered substantial proven performance, cost, and reliability benefits compared to steel wheel operating on steel rail.

The panel accepted public comment twice as part of its review. By a four-to-one vote, the panel

chose a steel wheel vehicle operating on steel rail system because it was considered safe, reliable, economical, and non-proprietary. Those results are documented in the panel's report to the City Council dated February 22, 2008 entitled "Independent Technology Selection Panel Report".

There is one operating urban magnetic levitation system in the world, and it has less than five years of operating record. The single operating system has a maximum speed of 100 kilometers per hour (62 miles per hour), which is similar to the maximum operating speeds of 50 to 60 miles per hour common for steel wheel systems. While the system is quieter, other systems may be designed to match the noise level of magnetic levitation when in operation. There are no specific safety improvements from the traction design. The assumed visual benefits for beam-track vehicles would not apply in the U.S. because of requirements to include an emergency egress walkway. In addition, the smaller structures proposed in the comment result in shorter span lengths, which increases the number of columns required and the percentage of views blocked by the support structure, which would result in higher costs.

In addition, the magnetic levitation system would not provide a net benefit or proven cost savings. To date, the High Speed Surface Transport system operators have declined to make operating expenses available. No comparative maglev project has ever been built within the U.S. Therefore, no data are available to support a cost estimate. With no comparative data available to support an operating cost estimate, there are no means to verify this statement regarding maglev's operating and maintenance costs compared to a steel wheel system. The demonstrated operating speed of 100 kilometers per hour for urban magnetic levitation is similar to that of steel wheel systems.

The capital plan for the Project is presented in Section 6.3 of the Final EIS, which includes a description of the amount of funding anticipated from various sources. The capital plan takes the current economic downturn into account. Section 6.6 discusses the risks and uncertainties associated with the financial analysis prepared for the Project, including risks related to changes in project scope. If the Project is over budget, other sources of revenue have been identified in 6.3.3 and 6.6.3, which could include private funds (i.e., contributions toward the cost of building stations) or airport funds; however, \$1.3 billion in year-of-expenditure dollars is included in the project budget as contingency for just such eventualities.

Magnetic levitation requires a different guideway design that would have different impacts from a steel-wheel system, as presented in the above discussion. The guideway design is being completed only for the technology that will be used for the Project.

Section 2.2.2 of the Draft EIS discusses the four alternatives evaluated as part of the Draft EIS and included a No Build Alternative and three Build Alternatives (Salt Lake Alternative, Airport Alternative, and the Airport and Salt Lake Alternative). Your preference for the Airport Alternative has been noted. While each of the alternatives includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana Center has been selected as the Preferred Alternative.

Your preference for the Airport Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been identified as the Preferred Alternative as described above. Compared to the other alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly lower impacts to the natural and built environment. During the public comment period on the Draft EIS, the public overwhelmingly supported

the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative.

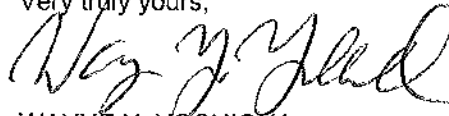

The selection of the Airport Alternative as the Project is described in Chapter 2 of this Final EIS. Also, as discussed in Section 3.4.2 of this Final EIS, the Airport Alternative will carry the most passengers with 116,000 daily passengers and 282,500 daily trips in 2030, thereby resulting in the greatest transit-user benefits. Compared to the other alternatives considered, the Airport Alternative will also result in the fewest vehicle miles traveled and vehicle hours of delay, as well as provide access to major employment areas including Honolulu International Airport, and will have substantially greater ridership than the other alternatives considered in the Draft EIS.

23 CFR 771.111(f) states "The action evaluated in each EIS...shall not restrict consideration of alternatives for any other reasonable foreseeable transportation improvements". Future transit improvements, including an extension to the U.H. Manoa campus will not be precluded by the implementation of the Project.

As described above, steel wheel technology has been selected for the Project and proposed changes to the Final EIS that are not consistent with the selected technology, including removal of the figure showing guideway cross-section, have not been made. As previously explained, there is no available data to support the estimated costs included in the comment.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Dear Mr. Golojuch:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your preference for steel wheel on steel rail and the Airport Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and

Mr. Michael Golojuch, Jr.
Page 2

agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- Match the anticipated schedule for right-of-way acquisition and utility relocations.
- Reduce the time that each area will experience traffic and community disturbances.
- Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.
- Match the rate of construction to what can be maintained with local workforce and available financial resources.
- Balance expenditure of funds to minimize borrowing.

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Waianae, Hawaii 96792

Dear Ms. Patterson:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your concerns have been noted. Guidelines set forth by the NEPA of 1966, as amended, and also Chapter 343 of the Hawaii Revised Statutes stipulate that public involvement be carried out on large scale projects such as the rail project. As one of the largest infrastructure projects ever to be constructed on Oahu, the City felt that it was important to disseminate information to as many people as possible. Thus, a broad range of print and visual media was necessary to reach different population segments. Project funds paid for the public involvement activities listed in Chapter 8 of the Final EIS.

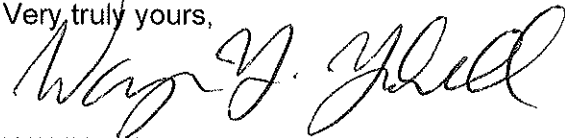

In regards to your second issue, alternatives that relied only on bus transit were evaluated during the Alternatives Analysis phase and shown to be less effective than the Fixed Guideway Transit Alternative. Chapter 2 of the Final EIS summarizes those findings.

Ms. Pat Patterson
Page 2

Lastly, as also described in Chapter 2 of the Final EIS, several alignments were evaluated during the Alternatives Analysis phase. One evaluated alignment was the historic OR&L line. A combination of issues, including utilities that have been placed in the right-of-way, poor location in several places, and the previous loss of the right-of-way in several locations, all contributed to the elimination of that option. The Project is fully grade-separated to eliminate potential conflicts with traffic and eliminate the effects of congestion and incidents on the system. Placing any part of the system at-grade would affect reliability of the entire system. The limits of the study corridor are explained in Chapter 1 of the Final EIS.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Dear Ms. Malama:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your preference for the Airport Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly

Ms. Tesha Malama
Page 2

supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

Local bus service will be rerouted as needed to provide access to the rail system. Bus transit centers will be located at some of the stations, and many of the bus routes serving rail stations will have increased frequencies. A description of existing and future bus routes, including frequency, is included in Appendix D, Bus Transit Routes, in the Final EIS. As the Project undergoes more detailed design, the public will have additional opportunities to be involved in the process. The station area planning process includes conducting workshops with communities that will have rail stations. For more information and to get involved in this process, please visit the Project website at www.honolulutransit.org.

Your support for the Project has been noted.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

The Honorable Sharon E. Har
House of Representatives
State Capitol
Honolulu, Hawaii 96813

Dear Representative Har:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your support for smart growth and the proposed phasing of construction is noted. The Project is focused exclusively on the construction and implementation of rail transit service, and that is what is covered in the Final EIS. However, as mentioned in Section 4.19.2 of the Final EIS, transit-oriented development (TOD) is expected to occur in project station areas as an indirect effect of the Project. The increased mobility and accessibility that the Project may provide will also increase the desirability and value of properties near the stations, thereby attracting new real estate investment nearby (in the form of TOD). Planning and zoning around station areas will be developed in the future by the City's Department of Planning and Permitting under a process covered by the City's new TOD Ordinance (09-4).

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase

must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- *Reduce the time that each area will experience traffic and community disturbances.*
- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*
- *Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- *Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Dear Ms. Sipirok-Siregr:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As described in Section 2.5.10 of the Final EIS, to support phased opening of the system, the first construction phase must be connected to a maintenance and storage facility, which requires considerable land. The first phase of the Project must be connected to the maintenance and storage facility because, in addition to maintenance of equipment and ongoing operations, the maintenance and storage facility houses the main control center for the entire Project, and the required testing and operation of the system could not be completed without access to it. No location has been identified closer to Downtown with sufficient available land to construct a maintenance and storage facility. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations*

- *Reduce the time that each area will experience traffic and community disturbances*
- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding*
- *Match the rate of construction to what can be maintained with local workforce and resources*
- *Balance expenditure of funds to minimize borrowing*

The portion of the corridor Ewa of Pearl Highlands is less developed than the areas Koko Head. As a result, right-of-way can be obtained more quickly and overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted Koko Head from Pearl Highlands to Aloha Stadium, then Kalihi, and finally to Ala Moana Center.

Trains will operate every three minutes in each direction during peak periods (6:00 a.m. to 9:00 a.m. and 3:00 p.m. to 6:00 p.m.). Trains during other times of the day will operate every 6 minutes or 10 minutes depending on the time of day. All trains are anticipated to stop at all stations.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

HEARING OFFICER HAMAYASU: Good evening. I am Toru Hamayasu, the 2nd Deputy Director of the City and County of Honolulu Department of Transportation Services. I am the hearing officer for this public hearing for the Draft Environmental Impact Statement for the Honolulu High-Capacity Transit Corridor Project.

The purpose of this public hearing is to collect comments related to the proposed transit project, including the Draft EIS; Section 106 of National Historic Preservation Act process; Section 4(f) of the U.S. Department of Transportation Act; Right-of-way acquisition; and floodplains affected by the project.

Public input can be made in four ways:

1. Public spoken testimony to me here, in the Public Hearing Room.

2. If you do not wish to speak in public, an individual spoken testimony for the record can be made to the hearing recorder, who is near the Public Involvement station in the Project Information Area.

3. Written testimony may be deposited in the black comment box at the meeting, delivered to the Department of Transportation Services office, or mailed or faxed [(808)523-4730] to DTS by January 7, 2009.

And finally, 4. Testimony can be submitted online by January 7, 2009 at www.honolululutransit.org.

All comments and responses will be included in the Final EIS. Revisions to the EIS will be made as appropriate, based on comments.

The hearing procedures are as follows:

1. Elected and public officials will be heard first. Persons desiring to testify should register at the entrance to the hearing room. Names will be called in the order of the registration.

2. Any individual may appear and speak for him or herself, or if duly authorized, for any local civic group, organization, club or

association, subject to the rules provided herein. Speakers should give their name and address. If representing a group, this information should also be given.

3. Speakers must limit their statements to three minutes. When the red light appears, there is one minute remaining for speaker's statement. When the buzzer sounds, the three minutes' period is over. Additional prepared statements or literature, pertaining to the project, may be submitted at this hearing by 4:30 p.m., January 7, 2009 to Department of Transportation Services. These statements will be made part of the official record if they include a legible name and address.

4. For these hearings, all statements, oral or written, should be directed to the Hearing Officer and must be related to the subject matter of the hearing.

5. Each person speaking before the audience must do so at the floor microphone. Please ensure you are in the hearing area at the time your name is called. A court stenographer will record and transcribe the hearing proceedings. If required, I will announce any

other specific rules governing this hearing.

6. As part of this public hearing process, the Honolulu Rail Transit Project Team is not allowed to respond to any questions or concerns raised by the speaker. The Project Team will be available to address your questions in the Project Information Area outside this hearing venue.

It is now 6:14. At this time, I would like to begin the public testimony. The first testifier is Mr. Bob Loy, followed by Mr. Fred Abe and John Kato.

-oOo-

BOB LOY: My name is Bob Loy. I am testifying on behalf of Na Leo Pohai, the public policy affiliate of The Outdoor Circle, Honolulu, Hawaii. The Honolulu transit project is destined to become the singlemost visually dominant, intrusive, obstructive, and destructive construction project in the history of Hawaii. While its ability to ease traffic problems on Oahu has been the subject of lengthy debate. Its negative impact on the

visual environment of this island is beyond any denial, and is virtually immeasurable.

I'm going to take you on a trip along the route, and I'm going to use as the words of the impacts, words that had been taken directly from the Draft Environmental Impact Statement. It will change the open and end of all character of the Ewa Plain, substantially change views in Salt Lake city because of the size of the station and the rail line, obstruct views of East Lot in Pearl Harbor, in Pearl City. In Kahili, the dominant features will be -- the views of this project will be the dominant features down Dillingham Boulevard. In Chinatown, it becomes an esthetic disaster. The blocked makai views and will be out of character with the pedestrian-oriented environment in one of the most historic and sensitive neighborhoods on the island. Passing through and going to downtown, it will be the dominant feature of the views on Nimitz Highway. It will contrast substantially with the pedestrian character in the streetscape and substantially affect the visual setting of Dillingham Transportation Building in Irwin Park. It will block makai views for numerous residents.

Overall, visual effects would be high.

Going through and down towards Ala Moana Center, blocked views in the 4th and 5th floor residences, increased light and glare on upper-story residences. Throughout this part of the city, the project will block protected mauka-makai views of the Koolau mountains, Waianae mountains, Pacific Ocean, Honolulu Harbor, Diamond Head, Punchbowl, and Aliamanu Craters. Overall, the effects will be high.

But for all the destructive and negative impacts on view plains spelled out in the DEIS, there are virtually no details about how these substantial damages will be mitigated. The document contains broad promises of designing various elements to minimize negative visual effects. The lack of specific descriptions of how to overcome the visual misery that will be heaped upon the Oahu landscape, leaves our organization with little confidence that damage to the visual environment can or will be mitigated as the project moves forward.

We also have great concerns about the trees, particularly the kamani trees on Dillingham Boulevard and the monkey-pod trees on Kapiolani

(3-minute limit).

HEARING OFFICER HAMAYASU: Please summarize.

BOB LOY: That's the end. Thank you.

-oOo-

HEARING OFFICER HAMAYASU: Thank you.

Next, Mr. Fred Abe, John Kato, and Sidney
Char.

FRED ABE: My name is Fred Abe. I'm an

inactive attorney. I was born in Honolulu, and I lived in Makaha from 1971 to 2007. I will never catch the transit if I was still living in Makaha. The transit does not address the basic problem. The basic problem is to eliminate 50 percent of the commuters that go to and from work, and I'm proposing instead, that all buses be used, and I'm talking about the whole island, not just 20 miles from Kapolei to Honolulu. All buses will be free during that three-hour period in the morning and in the afternoon.

2. The electric buses instead of diesels. And the reason for that, every bus should be enough so that everybody has a seat, whether you're catching the bus in Kahuku, Kailua, Waimanalo, even Hawaii Kai and Kapolei. Right now, between H-1 and the H-2, the Mililani group, including the people from Wahiawa and those from Mililani, if they can catch a bus and free air-condition and they have a seat, I think we can have the people address -- might be able to divorce themselves from riding the cars. Financially, I think it would work.

According to the Honolulu Advertiser of November 23, 2008, it says that we cost 525 buses.

I think we can get a thousand buses on the road, and only during that peak three hours in the morning and three hours in the afternoon. It takes \$160 million to operate the buses now, of which the City and County subsidized it by 130 million. I'm suggesting that we will spend maybe 200 million, and instead of an annual subsidy of 130 -- (3-minute limit) -- now, I have more testimony, but the basic thing is how we can get the 50 percent of the cars off of the road. That's the conclusion, and I think it can be done. Thank you.

HEARING OFFICER HAMAYASU: Thank you.

-oOo-

HEARING OFFICER HAMAYASU: Next is John Kato.

JOHN KATO: My name is John Kato, and I'm speaking as a private citizen. I'm a former chair of McCully/Moilili Neighborhood Board No. 8, and I'm speaking in favor of the fixed rail system. I believe the fixed rail system will be a benefit to the members of the community. I believe that a common nature of a transit rail development will be of great use for the people in the community who are property owners. In any rate, that concludes my presentation.

HEARING OFFICER HAMAYASU: Thank you.

-oOo-

HEARING OFFICER HAMAYASU: Next speaker is Sidney Char, followed by Ralph Bruinsslot and Herb Rothouse.

SIDNEY CHAR: Good evening. My name is Sidney Char. I'm the current president of the American Institute of Architects, Honolulu Chapter, and my comments, here, represents the majority viewpoint of our membership and our Transit Task Force. We have submitted written testimony, but I will highlight some of the key points of the testimony.

First of all, for the record, we support the concept and the implementation of a fixed guideway system of the steel-on-steel rail. However, we believe that the Draft EIS does not address several points of concern for us.

Firstly, integration of social and economic approach of resources, we believe that stronger community-planning objective should be described to create better and desirable living communities, such as they did in Portland, Salt Lake, and Sacramento. We believe that the Draft EIS focuses primarily heavily on just the transportation aspects of this system. We believe that the Draft EIS does not respond to Honolulu's

Primary Urban Center Development Planning, which mandates that guidelines to preserve the mauka-makai view corridors along major collector streets be preserved. We believe that the elevated structures along Nimitz include historic Chinatown and even going up into Manoa violates that policy. Mitigation of the negative impacts of our panoramic mountain and ocean waterfront views are not well explained or adequately illustrated. Other major cities such as San Francisco and Boston have removed such large similar structures on their waterfront, and even Seattle is considering and exploring ways of taking down their Alaskan viaduct.

Secondly, the AIA advocates creation of safe, healthy, and easily accessible environments for the transit passengers. We believe that the EIS has not described how to mitigate undesirable environments under the elevated guideway areas.

Third, the AIA promotes sustainable planning, design, and operation of transit systems. And we note that the Draft EIS says it will take over seven times the energy to construct the elevated guideway as compared to an at-grade system. We believe that the life cycle cost of

the comparison of the elevated system to an at-grade system should be explored. We are not convinced that the elevated system is the most cost effective (3-minute limit).

Lastly, the AIA urges the city to consider a more flexible rail technology, which will allow transit to be at grade, below grade, or above grade, as conditions require. Flexibility will allow us to be more easily adaptable --

HEARING OFFICER HAMAYASU: Please summarize.

SIDNEY CHAR: Thank you.

-oOo-

HEARING OFFICER HAMAYASU: Ralph Bruinsslot, followed by Herb Rothouse and Leslie Among.

RALPH BRUINSSLOT: I'm Ralph Bruinsslot, a licensed architect in Hawaii. I totally endorse what the AIA has put forth as their guidelines. I would like to share with and put on record my experience of living in San Francisco and working in San Francisco, and watching them build a raised highway along the waterfront, later to abandon it and tear it down. I actually worked with my window facing where they were part of the freeway that they were tearing down, and with the cost, it had to exceed three times the cost of putting it up. And that was because of the outrage of the citizens of San Francisco, to the visual damage that it did on the waterfront.

Now, they have replaced that with an on-grade transit system. They've developed that area very effectively, and the combination of ferries from the outside lined area coming in, I

watched it. I lived in Sonoma County and Marin County, and it started out 45 minutes, 35 miles, now it's two hours, if you can get there in two hours. So the mitigation they have taken is ferries, transit, and trying to move the transit system on up a hundred miles north of San Francisco. So it would be my encouragement to pay very close attention to the esthetics of installing above-grade transit system wherever possible, where it's feasible, it works, but when you're talking about downtown and areas that are very sensitive to structures, the backlash could be tremendous. Thank you.

-oOo-

HEARING OFFICER HAMAYASU: Next is Herb Rothouse, followed by Leslie Among, and Richard Ubersax.

HERB ROTHOUSE: Thank you. My name is Herb Rothouse, retired, and I live in Waikiki. The first speaker and the second speaker, I agree with, entirely, and I support their premise. I was against the rail from the very beginning, for several reasons. I won't go into all the reasons, but I will address two things. Number one, the cost. I compare to what happened in Washington, D.C. recently, where a visitor said, who was opened up to Congress, originally budgeted for 300-, end up costing almost 800 million. So I doubt very much the figures that we have been given, first 3 and a half billion for the rail, 4 billion for the rail, it would come no surprise to me if it ends up at 8 billion. I just cannot

trust government figures when it comes to estimates of projects, they've never been on the mark so far.

Secondly, great deal of money has been spent so far, many people here may realize already, close to \$100 million, I understand from what I read in The Advertiser, has been spent on consultants and attorneys for this program. \$100 million dollars. When I think of TheBus system, which certainly needs help, as the second speaker pointed out, if you look on Route 14, on Kapahulu, the bus runs one bus an hour. One an hour. On the 23 route, that runs one bus an hour. \$100 million on consultants, and yet we have a bus system that runs one bus an hour? I mean, that's a disgrace. That's a disgrace, absolute disgrace.

You want to get people off the roads? Well, how are you going to get them off the roads, when you don't have adequate buses? You look at the TV in the morning shows H-1 highway, where are the buses? You could double, double the number of buses we have, with the money spent on consultants, bringing in the bus service to areas that get no service whatsoever, right now, and increasing where it's one an hour, make it three

an hour. You want people to give up, not use their cars? Well, provide proper bus service, frequently, available, and people will not use their cars like they do. That's all I have to say. Thank you.

-oOo-

HEARING OFFICER HAMAYASU: Next is Leslie Among, followed by Richard Ubersax and Chris Dolph.

LESLIE AMONG: Aloha and good evening. My name is Leslie Among. I'm with the Waikiki Neighborhood Board, District 9. Recently, our board has voted against the mass transit, but the election that people have spoken and most of the people showed that they want the mass transit. I ask, as a neighborhood board member, that we have a responsible EIS draft for the residents and the people of Waikiki. And as far as the route, it leads from Ala Moana, down towards McCully, down

Kapiolani and then it turns off to University Avenue, the residents in that district have come down and spoken to some of the members on our board, and fear that the space and infrastructures, that doesn't provide the room for the transit.

Recently, I proposed an idea on the board, with some of the engineers that came and were so gracious to come and address some of the issues of the transit, that the route be changed and be put alongside the Ala Wai Canal, as it snakes its way toward the golf course, to the Manoa and Palolo Streams. As it snakes it up that way, it will go all the way up to the U.H. campus, by Kalele Road, in back of where the U.H. baseball field is. This looks like a very responsible place to put up mass transit, in the light of issues such as eminent domain, litigations, and people being displaced by the project, some have opposed.

What I ask is a more responsible approach, and I do believe that the propose I told to my board and to the engineers that night, that a good route for the transit would be from Ala Moana, and to snake its way, up the Ala Wai Canal,

on the mauka side, and make its way up the Palolo Stream and the Manoa Stream. There will be less mishaps with eminent domain issues and people being misplaced, as I said, and I really feel that, you know, the inconvenience is on a lot of the people that are living there. I know some people feel like the inconvenience is on the project, on the other side, but I happen to feel that there should be a common ground where that would be a great route to take.

And to add another note to that, recently, Hard Rock Cafe has moved into Waikiki, so the Hard Rock property will be available maybe for a station on the gateway of Waikiki for the mass transit, or some stop or something, that property should be available (3-minute limit).

Thank you so much. In closing, I just would like to say, we're looking for a responsible approach to this EIS, and the capacity and the effects it will have on the people in our districts in Waikiki and there, on University Avenue, and McCully area and the U.H. Thank you so much.

HEARING OFFICER HAMAYASU: Okay. Richard Ubersax, followed by Chris Dolph and Steve Scott.

RICHARD UBERSAX: My name is Richard Ubersax. The purpose of the DEIS is to provide the City and County, the FTA, and the public with the information necessary to make an informed

decision, based on a full and open analysis of costs, benefits, and environmental impacts of the alternatives considered. However, it seems that in some respects, the DEIS is aimed at convincing the public and the FTA of the benefits of the Project, rather than inform the public completely.

One example is in the cost-effectiveness of the project. The FTA's cost-effectiveness index is a ratio formed by adding an alternative's annualized capital cost to its year 2030 operating and maintenance cost, and the total is divided by user benefits, in hour saves.

Any proposed New Starts project receiving less than a "Medium" cost-effectiveness index rating will not be recommended for funding by the FTA. The threshold between a rating of "Medium" and "Medium-Low" is \$22.99 for user benefit expressed in dollars per hour of user benefit.

In the Alternatives Analysis, the cost-effectiveness index for the 20-mile alignment from East Kapolei to Ala Moana Center is stated as \$21.34; and for the full project from West Kapolei to UH Manoa with an extension to Waikiki as \$27.05. Thus, the 20-mile segment meets the threshold of \$22.99, but the full project does

not.

City ordinance 07-001 recommended the North-South Road/Airport option as the preferred minimum operational segment for several reasons, one of which being that the cost-effectiveness index of \$22.56 is below the FTA's threshold of \$22.99.

Now, in the DEIS, the cost-effectiveness index has markedly improved to a point that is significantly below the FTA threshold of \$22.99: \$17.53 for the Salt Lake Alternative, \$17.78 for the Airport Alternative, \$22.86 for the combined Salt Lake/Airport Alternative. Information for the full project with extensions is conspicuously absent in the DEIS although it was available in the AA.

We know that the capital cost and operational and maintenance costs have not reduced, so that the only explanation is that the user benefits have increased significantly (3-minute limit).

In conclusion, this issue of user benefits and the exclusion and the conspicuous absence of including the three extensions in the overall analysis need to be scrutinized thoroughly

by the FTA. Thank you.

-oOo-

HEARING OFFICER HAMAYASU: Chris Dolph, Steve

Scott, followed by Bryan Hoernig.

CHRIS DOLPH: Hi, my name is Chris Dolph from Waikiki. My concern is, basically, during this tough economic times, whether it's really wise for us to be spending so much money on a project, that it is the most expensive project the state has taken on. We already have in effect, HOV lanes, carpool lanes, contraflow lanes, and I was wondering what's the possibility of us using those also as toll lanes. Many people have had experience with toll lanes and how they alleviate traffic. This would generate money for the state instead of spending money. I'm concerned about how our tax will be used, and the people who would be utilizing the toll lanes are, well, I see them as being the people who need it; and the people who don't need it, would not have to pay for this expensive project.

I'm a total fan of what this fellow is suggesting here, increasing the buses, the bus routes, and I'd like to see some initiative in encouraging people to use the public transit, and I love that suggestion about making them free during these rush hour times. A previous testimony that I had heard was of one lady who was

speaking about she won't even be able to ride the transit unless she gets on the bus to get to the transit, and then get off the transit and ride another bus to the destination. Just staying on the bus the entire way would work. I think it's a great system. Even though I do have a car now, my wife and I chose to live for five years without a car, here in Honolulu, and TheBus system worked great for us. If it were improved, I could easily go back to living without a car. So that's it.

Thank you.

-oOo-

HEARING OFFICER HAMAYASU: Next is Steve Scott, followed by Bryan Hoernig, and Terry Conlan.

STEVE SCOTT: Hi, I'm Steve Scott, with Scott Hawaii. We have property on Kona Street. I have a couple points that, for me, are a concern. The first is, as the mass transit goes through Kakaako, it goes through a very dense area with regards to property, with regards to businesses, and it's going to impact, especially on Kona Street, almost every property from Queen Street all the way to Piikoi. My biggest concern there, is just the cost. Just in that one corner of Pensacola and Kona Street, you have approximately \$25 million, which is, I understand it would be about one-quarter of the total land acquisition on one corner.

So my big problem is, all of the projections that the city had with regard to land acquisitions have to be totally inadequate. I've read in the EIS, that you have about 95 to \$100 million allocated. How can you possibly spend on

one corner, \$25 million?

The second concern I have, is with regards to the route, as it goes down Kona Street. In the EIS when it first came out, prior to the election, there was never any notification that this was not going to go past Ala Moana Center. Right now, that I just saw, there was an engineering drawing, only, that shows a third rail that's going to go over Nordstrom. The existing -- the initial construction was going to end, dead-end into Ala Moana Building, at 40 feet. Then they plan on putting a third rail, one line that is going to go over supposedly Nordstrom there. When that goes in, you're taking more property. The route is going to be wider and you're going to take more property than you need to, initially.

So why wasn't this in the alternatives analysis? Why wasn't this made known to the public? Basically, you're telling, by what you've put on the EIS, the Draft EIS, that you're not going to build past Ala Moana, because there's no way that you can build one rail, one line that goes over Ala Moana and that's going to serve the U.H. and Waikiki. This was never made known to

anyone prior to just a couple weeks ago, when the city came out with the Draft EIS, and even then, this drawing wasn't on that. So the city and Parsons & Brinckerhoff have been totally disingenuous with regards to making all this information available so that people can make an informed decision from vote prior to the general election in November. Thank you.

-oOo-

HEARING OFFICER HAMAYASU: Bryan Hoernig, Terry Conlan, Amy Kimura.

BRYAN HOERNIG: Good evening. My name is Bryan Hoernig, and I also own a property on Kona Street. On Kona Street, like Mr. Scott says, is very dense and is displaying a lot of people. By condemning what I'm in now on a condemnation list, at this point, by just condemning my property, you're not just condemning my property. You're condemning by business, my livelihood, and that of my employees. I can only pray at this point, that you guys can reconsider how many people you are going to be displacing by this transit system.

I don't understand why we are put on late notice of this. I mean, it's just like coming

home tonight and saying, well, we got a note, here, and it says that we're not going to be able to own our property anymore, you're just going to be thrown out. And that's how I felt about it. I didn't get any notice, I didn't get anything. All I got was a letter that says I'm on a condemnation list. So I'm put on notice that I don't have a business anymore, I don't have -- you know, for my employees and everything else, and I think it's been handled very poorly. Thank you.

-oOo-

HEARING OFFICER HAMAYASU: Terry Conlan, Amy Kimura, and Tom Heinrich.

TERRY CONLAN: Good evening. My name is Terrence Conlan, and I'm speaking as a private citizen. It's obvious that a lot of work has been done on this, so far. It's also obvious that there is tremendous amount of work yet to be done. One of the biggest criticisms I have of this study, is that it does not contain a defined measurable criteria for ultimately evaluating the success or failure of this project. It has a lot of general statements but nothing really measurable. So when we get to the end, we won't know if we made it or not.

I agree with Councilman Djou, that we need to start at either Salt Lake or the stadium, and come to town, so that we can begin generating revenue immediately, to help fund the rest of the system and begin to pay off the initial costs. If we start at Kapolei, it will be a long time before we get any money back.

I think we should use the Oahu rail line, which the state already owns, instead of trying to buy up new property. Everyone who lives along that corridor has always known that there was a rail right-of-way there, and their properties reflect that.

I do not believe that there are enough park-and-rides except in Kapolei, where there may be too many. If we want people to use this system, we have to provide park-and-rides that are convenient for them to drive their cars to the stations, in addition to those riding the bus.

I also question whether or not this rail system has any plans to allow people to bring luggage with them. If we're going to go to the airport and service the airport, then we have to provide for a way for them to transport their luggage; otherwise, it will do them no go.

Finally, I think that the EIS has a long ways to go. There are a lot of questions that haven't been answered, and a lot more work needs to go into that. Thank you.

-oOo-

HEARING OFFICER HAMAYASU: Amy Kimura, Tom Heinrich, followed by Charles Carole.

AMY KIMURA: Good evening. I'm Amy Kimura. I testify tonight as an ordinary citizen who rides public transit wherever I've lived and traveled and who likes it, for the most part. I enjoyed commuting on the subways in New York City and Japan. As a traveler, I've ridden on trains and buses in Europe, Canada, and the United States. I list these because many people think everyone who is against the proposed Honolulu rail dislikes mass transit, rail in particular. On the

contrary, rail in the places that I've used them has been fast, convenient, efficient, and usually reasonably priced. But the populations served by them have been from two times to more than ten times Honolulu's population and could more easily support their operation and maintenance.

One place it was not so reasonably priced was Vancouver, Canada. The SkyTrain was clean, convenient, and efficient, but way more expensive than Honolulu's bus system. A monthly adult pass cost \$73 to \$136, depending on the number of zones covered. That's about two to three times the \$40 cost here. What would that do to transit-dependent riders here, people with no auto?

In Vancouver, the monthly pass for seniors is \$42, more than the yearly cost of \$30 for seniors in Honolulu. What would that kind of cost do to seniors on limited and moderate incomes? For students, monthly passes in Vancouver are also \$42, twice as much as the \$20-a-month charged by TheBus.

Transit-dependent adult riders, the elderly and children will be greatly affected. Will the city be willing and able to greatly

increase its subsidy of transit to keep down the prices of the transit passes for them? If not, how will that affect the quality of life of seniors of moderate or limited means? How about families of low, moderate, and even middle incomes? If not, how will that attract motorists out of their cars and onto the fixed guideway? If yes, how will that affect property tax rates for everyone?

If commuter passes increase in price, the choice riders are TheBus, those who have an available vehicle to ride but choose to ride TheBus, will likely choose to abandon commuting on public transit in favor of their car, adding to congestion.

Mahalo for giving me this opportunity to comment. In the future, more notice would be appreciated (3-minute limit). I received this newsletter announcing this hearing three days ago, on Friday, December 5th. Thank you.

-oOo-

HEARING OFFICER HAMAYASU: Tom Heinrich,
followed by Charles Carole and Bobbie Slater.

TOM HEINRICH: Thank you, Mr. Hamayasu. My
name is Tom Heinrich, and I'm chair of the Manoa
Neighborhood Board, and I'd like to summarize
several main points of discussion that both our

neighborhood board, as well as the McCully/Moilili Neighborhood Board have engaged in for some time. I note especially that while the Ala Moana Center to University of Hawaii at Manoa area would be a Phase 2 or subsequent development, this is a time to address these, of course, in the Draft EIS.

Generally speaking, first, of course, is the effect on University Avenue, particularly by what I'll just call an overhead viaduct. There are other alternatives that do need to be looked at. If that general route is continued to be considered from Ala Moana Center to the university, whether it's Eisenberg or Coolidge Streets, or even going as far as Market City, to use Market City as a different node and a route of connection to the University of Hawaii at Manoa campus.

A major concern as well, is, what should be a unified element of transportation and architecture may become, in fact, again, a most divisive element, as H-1 has served in the 3M, McCully/Moilili/Manoa area.

Secondly, is, of course, great concern over what I'll call the Varsity station near Puck's Alley, and I especially hold that architect

Scott Wilson and others will provide illustrations of what that station at this time would look like, even outside of the context of transit-oriented development.

Thirdly, is the absolute necessity of coordinating with the existing Primary Urban Center Development Plan, as well as the other T.O.D. initiatives, both in looking at potential other routes, as I mentioned a moment ago, but also in coordination with the land owners, particularly Kamehameha Schools and the University of Hawaii.

Another main point is that we absolutely have to work with coordination opportunities with the State Department of Transportation concerning the H-1 Freeway and University Avenue interchange area. This is a critical area in which other grade changes. In order to facilitate pedestrian, bicycle, and auto movements in addition to the potential of having rail transit, need to be coordinated, especially in order to avoid a so-called fly-over far above the H-1 Freeway itself (3-minute limit).

And lastly, the main point that many have brought up, is that if the project in fact is

built, that it must end up directly serving the UH-Manoa campus and not stop short, makai of H-1, but connect to at least to Dole Street and the Quarry parking structure area. Thank you.

-oOo-

HEARING OFFICER HAMAYASU: Charles Carole,

Bobbie Slater, Philip Blackman.

CHARLES CAROLE: Charles Carole. I'm speaking as a private citizen. The DEIS does not present the impacts of the future bus routes and also the number of buses on these routes between Kalihi and Kahala.

Second, the EIS uses the DBEDT 2030 population series, which is much higher than the DBEDT's 2035 population, issued in January of 2008. For example, in 2010, the population projection, based on the 2030 series, is 952,000. In the 2035, it's been reduced to 932,000, 20,000 less. Presently, the July 1st, '07 estimate by the U.S. Bureau of the Census is 905,000. This will have an effect both on the ridership and the cost. Also, our present economic situation, which we will have hyperinflation and devaluation of a dollar, is not taken into effect at all. This will also result in our tourism, people coming in, and also the use of the airport. I think a supplementary EIS should be prepared to answer our concerns. Thank you.

-oOo-

HEARING OFFICER HAMAYASU: Bobbie Slater,
Philip Blackman, followed by Scott Wilson.

Bobbie Slater, she's not here. Philip
Blackman.

PHILIP BLACKMAN: Thank you. My name is
Philip Blackman. I've participated in a number of
the hearings at the City Council level regarding
this, over the last several years. What I have
not seen in the Environmental Impact Statement
that I believe ought to be there, is a clear
statement of what has not been studied and what is
not necessary in the EIS, but that is being left
to the City Council and to the state government to
be considering during the construction and during
the implementation.

As a specific example, I was told that
there isn't attention given to the impact on the
taxpayer for the federal system that will have to
be put in place to take all the folks that might
go on to the Navy base without cars, that's really
the intention of bringing and justifying bringing
the rail to the airport location. I'll have to
come from across Nimitz, find a way that currently
have been accommodated by having hundreds,

literally thousands of cars coming each day and finding their own place at Pearl Harbor. To replace that with a shuttle system is a major expense. Just because it can be put in a different budget category, doesn't mean it shouldn't be made visible to people that are ultimately paying it from their tax dollars.

Also, the FTA, I believe, requires the new system to accommodate the same demographic, the same kind of service that's being given by TheBus, which currently remains the bus services. 50 percent of the people on the bus don't have a driver's license. If that's the same percentage that's going to be attracted to the rail ridership to meet the best standards for approval by the FTA, we'll have a problem because it's not going to have but a 50 percent impact on any reduction and congestion.

Also, with the lack of an impact and congestion was made a larger issue, the mayor and the city emphasized transit-orient development. In speaking to the support staff outside, they say that's beyond the purview of the EIS, yet something that was so well bound with the whole idea of we should have it, it was almost like take

this piece of candy and call it transit-oriented development, realize that it could not occur without the rail, and now we're told that it's not something that is being considered (3-minute limit) as its various impacts by the EIS.

So what's not in here, I'm asking to be at least listed very clearly for our policy makers, for our City Council, so they can recognize that it's being pushed on to them and not part of the EIS. Thank you.

HEARING OFFICER HAMAYASU: Thank you.

-oOo-

HEARING OFFICER HAMAYASU: Scott Wilson.

James McManus, followed by Mike Uechi.

SCOTT WILSON: Good evening. My name is Scott Wilson. I am an architect and planner in private practice. I have two comments regarding this DEIS. First of all, the overall project is supposedly being evaluated, and it should include the segments to the University of Hawaii in Manoa and to the Diamond Head end of Waikiki, since these are part of the system. The environmental impact of these segments on their respected neighborhood is not addressed at all, in the DEIS. For example, I want to show you a simulation that was done by Urban Advantage, of Berkeley. This is a vendor that has been hired in the past by the city, to do simulations of our urban city. This is of the King and University station. There's obviously an enormous impact on the neighborhood, with this proposed system, yet it is not covered

at all by the DEIS.

I would urge that the Environmental Impact Statement should cover all impacts of the system in its completed form, and it is not sufficient to start the project with a partial EIS. For this reason, I would say that this document is incomplete and should be rejected at this time. It should be returned to its authors, with the instructions to include impacts caused by all project segments.

Second comment. Section 4.7.3 is entitled "Environmental Consequences and Mitigation." This section consists of a number of photo simulations and a table of visual effects. There is no mention of the actual ground level environment, which will result, by necessity, from the imposition of a 30-to-50-foot-wide swathe of concrete overhead. As we all know, the environment under a freeway overpass or off-ramp is a degraded one, always in shadow, noisy, dirty, blighted. I would submit that this DEIS is incomplete, on the grounds that it does not contain adequate analysis of the ground level environment which will be created by this project. Thank you.

-oOo-

HEARING OFFICER HAMAYASU: James McManus, Mike Uechi, and Michelle Matson.

JAMES McMANUS: My name is James McManus. Good evening, everybody. I moved here in January of 1989, and I've been looking to help induce rail to be brought to Honolulu, because Honolulu is a very beautiful, blessed place. And I use the transit system and the bus system, which is very good. And lot of people have a fear about the bus system being hurt. It's not. The bus system would be complemented by the rail. And I really feel that the rail should go forward here.

I know by listening here tonight, there's a lot of impact problems with property owners and

businesses. But just like any other community, and I come from New York, I know a lot of business people that were put out, because we have in the federal level, what they call right-of-way. And, you know, that's what happens as progress goes on. And since I've been here, I've seen where the City Council at one time, because of Renee Mancho, our transit money went to Oregon, and they have a rail system up and running on our money that we could have had. And Abercrombie went way out of his way to get it, now he's done it again, and I don't think we should blow this one, because Honolulu is going to need it, and it needs it now.

Because all you need is one accident on the Long Island expressway -- excuse me, that's where I used to live -- and it becomes a parking lot. And you're going to have that on the H-1. And even in the local streets, like Ward Avenue, I never saw so much traffic. And, you know, it's building up so big and to the point where it's going to choke itself. And mass transit is an asset to this community, if it takes it. But it has to do the right thing to the people that live here, and this is the people who try to help as many people as it can to make it work, because

some people are going to get hurt, unfortunately. But that's transit. It goes in every community across the country, and I really feel Honolulu, the time is now, you have to do it, because in the last debate they had about the last thing with the transit, the students in University of Hawaii were begging to please start it at the university and work out, but they were denied in that.

Now (3-minute limit), I just say to the committee here, that, please, try and make it work, because if it fails this time, Honolulu is in for a real problem of traffic. Thank you. I appreciate it.

-oOo-

HEARING OFFICER HAMAYASU: Mike Uechi, Michelle Matson, Katherine Kupukaa.

MIKE UECHI: Thank you very much. My name is Mike Uechi, I'm a practicing physician. Yesterday, I was pleased to read the Honolulu Rail Transit, the street pamphlet that was passed out in the newspaper, and the first thing they addressed was, how does rail transit help reduce traffic congestion. So it says here, that by 2030, an addition of 750,000 more daily trips are expected on Oahu's roads. That impacts H-1

because I believe in 2030, we're going to be over capacity by 81 percent.

But the thing that blew me away, was the fact that they announced that rail will reduce traffic by 11 percent. So just my simple math, we were over capacity by 81 percent, and you reduce it by 11 percent. So when you're stuck in traffic, by 81 percent and you reduce it by 11 percent, and paying \$6 billion and you're still stuck in traffic, that's a significant problem, so my question is, what happens in 2030, when the people in the Leeward corridor and also the Central Oahu corridor are still stuck in traffic, except worse in 2030. So we need to be addressing the problem right now, before the situation happens.

The second thing about this Honolulu rail is, how do we expect to pay for it? From what I understand, we don't have a penny yet from the federal government, and the first penny is going to arrive in 2011, which is three years from now. So when you say we got guaranteed 925 million in the kitty, and we don't have a penny right now, what happens when that money is no longer present? Who is going to guarantee that we're going to have

anywhere close to 1.2 billion that you expect?

Secondly, since we are in a recession right now, what happens when we don't have the revenues that are backup of excise tax? What happens when both of these source of revenues don't pan out? I'm going to ask the question, what happens, then, when we cannot afford to pay it? The only source of revenue we have right now is property taxes, and if we don't have income, that's where we're going to have more trouble. Thank you very much.

-oOo-

HEARING OFFICER HAMAYASU: Michelle Matson, Katherine Kupukaa, and Bart Travaglio.

MICHELLE MATSON: Good evening. My name is Michelle Matson, and I guess you could say I have a family interest in a historic property deeded to the state, in trust, in care of the public trust, along the proposed route of this vehement blight.

One of the most significant adverse impacts of the proposed elevated steel-on-steel heavy rail system is the irreparable blight, it will implant through the vital heart of downtown Honolulu, the Waterfront and beyond. This obtrusive blight will impact four protected registered historic sites along the proposed Waterfront route, specifically Aloha Tower, Irwin Park, the Dillingham Transportation Building, and Mother Waldron Park.

Because of the city's requirement for federal funding for the proposed elevated rail project, there must be compliance with Section 106 of the National Historic Preservation Act and Section 4(f) of the Department of Transportation Act. It will therefore be taken into account that such elevated infrastructure blight would be, quote, visually incompatible and block the view of the historic resource; that is, the scale of the infrastructure would overwhelm the resource's historic appearance, and would cause the loss of integrity of setting, feeling and association of these historic sites. The historic view planes to the harbor from Bishop Street and the Chinatown Historic District will be similarly impacted.

It would therefore be a fatal mistake for Honolulu's future if the city forces the intrusion of elevated transit blight on the Honolulu Waterfront and the mauka-makai harbor views. If the Downtown Honolulu Waterfront is allowed to be impacted by the fatal mistake of elevated guideway structure, the vital visual, and indeed historic, character and integrity of the waterfront centerpiece of downtown and the harbor entrance to Honolulu will be lost. One only needs to consider the blight created by the Embarcadero Freeway along the San Francisco Waterfront, and the universal public elation when it was torn down. It is time that the City and County of Honolulu learns by the mistakes of others before it is too late.

The city also proposes to slam the elevated heavy rail route through Kaka`ako adjacent to another registered historic site, Mother Waldron Park on Halekauwila Street, diminishing its historic character and integrity, and usefulness and attraction as a vital recreational open space for today's growing population. The revised Kaka`ako Mauka master plan designates Halekauwila Street and its

extension to Kamake`e Street as a significant promenade street, a pedestrian-friendly boulevard with wide tree-lined sidewalks and new human-scale residential neighborhood (3-minute limit).

In conclusion, there are very serious public concerns surrounding the city's disregard and neglect of the significant adverse impacts of an elevated transit route along the Honolulu Waterfront specific to the historic sites. This badly planned project cannot be allowed to overshadow and overpower these significant historic sites or destroy the visual character and integrity of the vital Downtown Waterfront. Thank you.

-oOo-

HEARING OFFICER HAMAYASU: Katherine Kupukaa,

Bart Travaglio, followed by Kevin Killeen.

KATHERINE KUPUKAA: Good evening. I'm Katherine Kupukaa, and my choice is to don't build, only because the most viable alternative was HOT lanes, and that was eliminated in the alternative analysis. I guess the authors of the Environmental Impact Statement didn't realize how Kamehameha Highway is the only highway from Central and Leeward Oahu, other than the freeway, and during peak hours, the three lanes going westbound in the afternoon is just jam packed, also buses going, taking the right-hand lane, so I can't see you would remove two lanes in the medial, to make way for this train track.

What citizens are frustrated and complaining about, is the congestion, and this will not eliminate the traffic congestion that is, you know, currently going on, on the H-1 Freeway. And for the past couple months I've been catching the bus, but you can't -- the bus -- for instance, today, I caught the bus from Mililani, and the bus was half an hour late, so we had to get off the bus on Alapai Street and catch another bus, and so I was supposed to be here by six o'clock. And so my frustration is that, in Mililani, I have to

walk half a mile to the bus stop. If I were to catch the train, I would catch the No. 52 and go all the way to Leeward Community College to catch a train. I don't think you people who don't catch the bus realize that you have to wait half an hour here, half an hour there. Like today, I caught the bus in the morning and I could accomplish only two of my errands, but I just have to go home because I had to be here tonight to testify.

There are other concerns that I have, and I brought this up at the last transit meeting, and till this date, it was never answered. I posed the question of the bus ridership from Leeward Oahu to Ala Moana Shopping Center (3-minute limit), because why are we building this train if there aren't -- there's not going to be the ridership going from Leeward and Central Oahu to Ala Moana Shopping Center, and even to the University of Hawaii. This is my concern anyway. Thank you.

-oOo-

making the bus more efficient. It will be much more economical. The new buses they could bring in, don't make them like the city buses. Put them like the passenger buses that I take to work. Fifty seats, comfortable. You get on the bus, you could do work on the way into our office, and you go home. Problem is, people don't just go to their office. From their office, they go here, they go there, they go here, they go there, they do it on the way in, they do it on the way out. They're going to be doing the same, when you spend a billion dollars on a train.

It's not in the mind of the people here to take it, but if you make it convenient, it could work. If you put 50 buses more out there, that whole 50 people, and you put the buses in the HOV lane with 50 people on them instead of two, it could work. If you make your system designed so the timing is as effective as it is in Switzerland, people will know the buses are going to be here. And for the other people that said this, and it's just the frustration, buses will work, and you gotta give 'em a chance. And when you bring the new buses in, you power them with propane. There's tons of it, and it's cheap.

Your cost of your train, electric, how are you going to produce the electric? Our best hope for something like that, is to get one of the retired nuclear subs, put them in Pearl Harbor and furnish the electricity for this site. That's actually our best hope. Okay? But, otherwise, you gotta make the electricity to power the train (3-minute limit). Thank you, ladies and gentlemen. I appreciate your listening.

-oOo-

HEARING OFFICER HAMAYASU: Kevin Killeen,
followed by Gary O'Donnell.

KEVIN KILLEEN: Hi. My name is Kevin Killeen,
and I agree with guys who say there's no best
service. Improve the first-rate bus service. I'm
also concerned about the propaganda that's used,
the claim that the traffic will be reduced, future
congestion. Because the media is a little bit
lazy, they reprint stuff like that a couple days
before the election, and I think people should
realize traffic is going to be a lot worse.

And the other propaganda claiming that
the Sierra Club endorses the train, that might be
true that they had a national report, but the
local Sierra Club said they support it if certain
conditions are met. They wanted the at-grade
level. They wanted downtown service, U.H. service

first, and they wanted it done in light rail, not heavy rail. So I believe the executive board of the Sierra Club notified DTS that they don't have a position of supporting the rail. And I see that they're still implying that in these brochures that they're handing out, so, I don't blame DTS. That's the contractors that you have, working for you. But I'd appreciate it if they made it clear that traffic is going to be worse with the rail, and that Sierra Club did not endorse the rail. Thank you.

-oOo-

HEARING OFFICER HAMAYASU: Gary O'Donnell.

GARY O'DONNELL: Aloha. I'm Gary O'Donnell.

I have a master's in urban design from Pratt Institute, and I have lived and worked in Honolulu since 1985. Overall, I support the system and I thank you for your work on the EIS. However, I would support a different system over the route chosen, such as Vineyard Boulevard. This would help address some of the issues with going past historic sites, and the downtown area, and Chinatown, and it would also alleviate some of the issues of the visual impact along the Waterfront.

I think there should be a secondary system, on-grade, that will take people with more stops in the inner cities, such as on Hotel

Street. And since we are a tourist destination and we get a large part of economy from tourism, we should have it go to the airport first, rather than Salt Lake, and I would prefer that we start this system in the downtown area.

I understand one of the problems is getting 40 acres of land near the downtown area, where the construction lay-down area. I would suggest taking a look at Shafter Flats, if you haven't done so already, or possibly swapping out the park along Lagoon Drive there, as you approach, come out under the viaduct on Nimitz.

Basically, we're not going to have enough room to put all the cars on the road in 50 years from now. Population keeps growing, the way it has in the of the last 50 years. And the cost, the \$4 billion, when I hear about the hundreds of billions of dollars being spent in Washington, D.C., it's really a small amount, even if it went to \$8 billion, I would still support the rail, and thank you very much. I appreciate your time and your effort on this.

-oOo-

HEARING OFFICER HAMAYASU: Thank you. That's the end of the registered speakers. Is anyone else present who would like to provide a comment on the project issues?

If you haven't signed in to present your testimony, then please state your full name and address, for the record. Anyone else? I'm sorry, you already -- yes, of course, please. You wish to testify?

RICHARD KAWANO: Yes.

HEARING OFFICER HAMAYASU: Please step to the mike. Name and address, please, for the record.

RICHARD KAWANO: Richard Kawano, and my address is 1420 Victoria Street, 803. I'd like to speak in support of the project. I've lived here since '64. I have concerns. I've listened to the people who have concerns about the cost, but I voted for it during the election, as the majority of us did, and I do believe it's necessary, it's not a magic bullet, I know it's not going to solve all the problems, but with the traffic congestion, with the population that's going to be going on, we need to give the people a fair alternative. And President-elect Obama is talking about large infrastructure problems and you gotta look at it from the economic point of view. You know, less tourists are coming here, we're going to be impacted by that, and they're talking nationally about major infrastructure improvements across the country, and as an economic stimulus for a lot of these areas that are being severely impacted by unemployment and those things there, so it will be -- I think it's going to be good for the economy. I think it will have a positive impact on transit time for people who have to come in from Kapolei, all those houses out there.

I live right here in town. I'll never be

using it, but I still think, as a community, we need to support this thing, not just -- and then we've built H-3. So I do strongly support the project, and I hope it gets started. The sooner we get this started, the less expensive it will be for all us taxpayers. And, finally, this needs to be done with excellent management. This project needs to come in on time and on budget, you know, in the worst-case scenario, if it takes significantly longer and if it ends up double or triple, like H-3 did. So the opponents have to be listened to, and their concerns have to be addressed. Thank you very much.

-oOo-

HEARING OFFICER HAMAYASU: I'll call for more testimony, not previously testified people, but any who haven't done? Yes, please step up.

Please, your name and address, for the record.

EVE ANDERSON: Good evening. I'm Eve Anderson. My address is P.O. Box 25550, Honolulu, 96825. I'm concerned that the public, general public that's concerned about this project hasn't

had time and will not have time to read the document. I just picked up one tonight. I'm wondering if there is a possibility for you to push the deadline out to, let's say, February 7th? Let everybody get through the Christmas holidays and New year's and things.

And I'd really like to have you, as our expert, to go on T.V. and talk about the document. You can do maybe five presentations, take them section by section so more people can understand it, 'cause there ain't gonna be very many people in the general community that will get a document, or go to the library, or sit in front of a computer for 400-and-some pages worth. I know during the earlier times, you had a lot of ads on T.V. and radio, and doing all this to inform the people, so I think it would be very time and money well spent if you or somebody who designate an expert to discuss this document that's huge, so that's my concern.

-oOo-

HEARING OFFICER HAMAYASU: Anybody else wish
to testify?

With nobody else interested is providing
the testimony or comments, I conclude this
hearing.

Go ahead.

ROBERT CRONE: My name is Robert Crone. My

address is 218 Kuupua Street, in Kailua. First, I want to say that I support the position of the American Institute of Architects. I think in addition to the oral testimony given, there are some very good information in their written testimony that we should take heed of. The point that I would like to bring out today, is that Honolulu, according to the U.S. Census, is the 52nd largest city in the United States, as far as metropolitan population, and 47th largest city with relationship to its urban population. Unlike some literature that was put out in relation to the transit, there are no cities smaller than Honolulu that built rail transit systems. All the cities are larger than Honolulu.

The third rail systems, like we're contemplating here, which does not allow at-grade, have been built by maybe cities in the top 12 cities in the country. All the cities between that point and where we are down in No. 50, have built light rail systems. They built systems that have overhead wires rather than the third rail, which allows them to be overhead at-grade or underground. And they've all put them primarily at-grade, with some places overhead or underground

or they needed to, in order to pass freeways and things like that.

I think it's physically and totally irresponsible for us to think that, as the 52nd largest city in the country, our population can afford to support a system of this kind, of a grade separated system and the extra expense. The at-grade system is much more economical and why it's been chosen by approximately 20 cities, between the 12th largest and the 50th largest.

I think that regarding the construction, regarding the operation of it, and regarding the maintenance of it, these are going to be financial burdens that our community is going to have for many, many years, and we are burdening ourselves, our children and our grandchildren with this thing, and I think that in the future, it would just always be seen as something that, financially, bankrupt has been noted. Thank you.

HEARING OFFICER HAMAYASU: Anyone else wish to testify?

With nobody else interested in providing comment, I conclude this hearing at 7:29. Thank you for your time and interest in the project.

Dear Mr. Abe:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your comments regarding the Project are noted. However, alternatives that relied only on bus transit were evaluated during the Alternatives Analysis phase and shown to be less effective than the Fixed Guideway Transit Alternative. Chapter 2 of the Final EIS summarizes those findings.

As described in Section 2.2.2 of the Final EIS, enhanced bus service with a fleet of 765 buses was considered as part of the Transportation System Management (TSM) Alternative during the Alternatives Analysis process. It was documented throughout the Alternatives Analysis Report (2006b) and rejected because it would have provided little transit benefit, albeit for little cost. The type of bus used would not affect the overall findings. To serve the higher

Mr. Fred Abe
Page 2

level of transit use in the study corridor, the higher-capacity fixed guideway alternative was determined to be more cost-effective. Other areas of Oahu outside the study corridor are proposed to be served with improved bus service.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Dear Mr. Kato:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

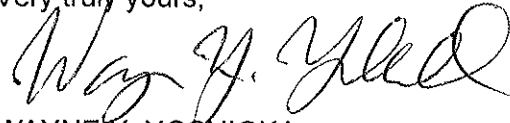

Your preference for a Fixed Guideway Transit Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more

Mr. John Kato
Page 2

information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is fluid and cursive, with the first name "Wayne" being the most prominent.

Dear Mr. Char:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The island's unique visual character and scenic beauty was considered in the visual and aesthetic assessment presented in the Draft and Final EISs. It is acknowledged that the guideway and stations will noticeably contrast with Chinatown's historic character. In addition, views in Downtown and the other areas, including protected mauka-makai views, will be blocked and some views will change, resulting in substantial visual effects. Section 4.8 of the Final EIS further assesses protected mauka-makai views from what was presented in the Draft EIS (see Tables 4-10 through 4-14 and Figures 4-39 through 4-50). The assessment acknowledges that some view obstructions and changes to views will be unavoidable and substantial. They will be most noticeable where the guideway and stations are nearby or in the foreground of views. This includes views for those who travel near the alignment. The degree of visual effect will

vary with the alignment orientation, guideway and station height, and height of surrounding buildings and trees, along with the viewer's expectations of view quality. It is also noted that the Project will conflict with Revised Ordinance of Honolulu (ROH) Section 24-1.4 where project elements, such as the guideway, will block protected mauka-makai view corridors. View changes are not likely to be obtrusive in wider vistas or regional panoramic views where the project elements serve as smaller components of the larger landscape. Section 4.8.3 of the Final EIS includes more detail on measures to minimize negative visual effects.

The Project will have a positive effect on community, social, economic, and natural resources in a number of ways. With a net reduction of more than 40,000 cars a day taken off Oahu's crowded highways by 2030, the Project will provide a transportation benefit to the community as a whole—even to those who never use the system. The high-quality transit access will serve major transit-dependent communities in Honolulu linking jobs with affordable housing and will help focus future growth into existing and planned urban areas. The City is working with communities to plan the areas around stations to attract high quality mixed-use development that will create opportunities for affordable housing and accessible jobs in an environment well suited to walking, bicycling, and transit use. This will expand economic and social opportunities to those without access to a car and allow families to save money otherwise budgeted for transportation.

The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS. However, the future extensions are not part of this Project, thus, they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time.

In response to your second comment, as discussed in the Final EIS Section 2.5.4 Safety and Security Measures, a project-specific Safety and Security Management Plan has been developed in accordance with FTA requirements to define the safety and security activities and methods for identifying, evaluating, and resolving potential safety hazards and security vulnerabilities of the system. It establishes responsibility and accountability for safety and security during the Preliminary Engineering, Final Design, construction, testing, and start-up phases of the Project. The Honolulu Police Department, the Honolulu Fire Department, the Honolulu Department of Emergency Management, and the Honolulu Emergency Services Department have been involved in preparing and will be part of implementing the plan. The plan addresses public safety and security concerns, including threats and hazards associated with the Project, specific issues that were identified through community outreach efforts, and design and architectural details to enhance safety.

The Alternatives Screening Memorandum (DTS 2006a) recognized the visually sensitive areas in Kakaako and Downtown Honolulu, including the Chinatown, Hawaii Capital, and Thomas Square/Honolulu Academy of Arts Special District. To minimize impacts on historic resources, visual aesthetics, and surface traffic, the screening process considered 15 combinations of tunnel, at-grade, or elevated alignments between Iwilei and Ward Avenue. Five different alignments through Downtown Honolulu were advanced for further analysis in the Alternatives Analysis, including an at-grade portion along Hotel Street, a tunnel under King Street, and elevated guideways along Nimitz Highway and Queen Street (Figure 2-4).

The Alternatives Analysis Report (DTS 2006b) evaluated the alignment alternatives based on transportation and overall benefits, environmental and social impacts, and cost considerations. The report found that an at-grade alignment along Hotel Street would require the acquisition of more parcels and could potentially affect more burial sites than any of the other alternatives considered. The alignment with at-grade operation Downtown and a tunnel under King Street, was not selected because of the environmental effects, such as impacts to cultural resources, reduction of street capacity, and property acquisition requirements of the at-grade and tunnel sections, which would cost an additional \$300 million.

The Project's purpose is "to provide high-capacity rapid transit" in the congested east-west travel corridor (see Section 1.7 of the Final EIS). The need for the Project includes improving corridor transit mobility and reliability. The at-grade alignment would not meet the Project's Purpose and Need because it could not satisfy the mobility and reliability objectives of the Project (see bullets below). Some of the technical considerations associated with an at-grade versus elevated alignment through Downtown Honolulu include the following:

- **System Capacity, Speed, and Reliability**—*The short, 200-foot (or less) blocks in Downtown Honolulu would permanently limit the system to two-car trains to prevent stopped trains from blocking vehicular traffic on cross-streets. Under ideal operational circumstances, the capacity of an at-grade system could reach 4,000 passengers per hour per direction, assuming optimistic five minute headways. Based on travel forecasts, the Project should support approximately 8,000 passengers in the peak hour by 2030. Moreover, the Project can be readily expanded to carry over 25,000 in each direction by reducing the interval between trains (headway) to 90 seconds during the peak period. To reach a comparable system capacity, speed, and reliability, an at-grade alignment would require a fenced, segregated right-of-way that would eliminate all obstacles to the train's passage, such as vehicular, pedestrian, or bicycle crossings. Even with transit signal priority, the at-grade speeds would be slower and less reliable than an elevated guideway. An at-grade system would travel at slower speeds due to the shorter blocks, tight and short radius curves in places within the constrained and congested Downtown street network, the need to obey traffic regulations (e.g., traffic signals), and potential conflicts with other at-grade activity, including cars, bicyclists, and pedestrians. These effects mean longer travel times and far less reliability than a fully grade-separated system. None of these factors affects an elevated rail system. The elevated rail can travel at its own speed any time of the day regardless of weather, traffic, or the need to let cross traffic proceed at intersections.*

- **Mixed-Traffic Conflicts**— *The Project will run at three minute headways. However, three-minute headways with an at-grade system would prevent effective coordination of traffic signals in the delicately balanced signal network in downtown Honolulu. A disruption of traffic signal cycle coordination every three minutes would severely affect traffic flow and capacity of cross-streets. Furthermore, there would be no option to increase the capacity of the at-grade rail system by reducing the headway to 90 seconds, which would only exacerbate the signalization problem. An at-grade system would require removal of two or more existing traffic lanes on affected streets. This effect is significant and would exacerbate congestion. Congestion would not be isolated to the streets that cross the at-grade alignment but, instead, would spread throughout Downtown. The Final EIS shows that the Project's impact on traffic will be isolated and minimal with the elevated rail, and, in fact will reduce system-wide traffic delay by 18 percent compared to the No Build Alternative (Table 3-14 in the Final EIS). The elevated guideway will require no removal of existing through travel lanes, while providing a reliable travel alternative. When traffic slows, or even stops due to congestion or incidents, the elevated rail transit will continue to operate without delay or interruption.*

An at-grade light rail system with continuous tracks in-street would create major impediments to turning movements, many of which would have to be closed to eliminate a crash hazard. Even where turning movements are designed to be accommodated, at-grade systems experience potential collision problems. In addition, mixing at-grade fixed guideway vehicles with cars, bicyclists, and pedestrians presents a much higher potential for conflicts compared to grade-separated conditions. Where pedestrian and automobiles cross the tracks in the street network, particularly in areas of high activity (e.g., station areas or intersections), there is a risk of collisions involving trains that does not exist with an elevated system. There is evidence of crashes between trains and cars and trains and pedestrians on other at-grade systems throughout the country (e.g., Phoenix, Houston, LA). This potential would be high in the Chinatown and Downtown neighborhoods, where the number of pedestrians is high and the aging population presents a particular risk.

- **Construction Impacts**—*Constructing an at-grade rail system could have more effects than an elevated system in a number of ways. The wider and continuous footprint of an at-grade rail system compared to an elevated rail system (which touches the ground only at discrete column foundations, power substations, and station accessways) increases the potential of utility conflicts and impacts to sensitive cultural resources. In addition, the extra roadway lanes utilized by an at-grade system would result in increased congestion or require that additional businesses or homes be taken to widen the roadway through Downtown. Additionally, the duration of short-term construction impacts to the community and environment with an at-grade system would be considerably greater than with an elevated system. Because of differing construction techniques, more lanes would need to be continuously closed for at-grade construction and the*

Mr. Sidney Char
Page 5

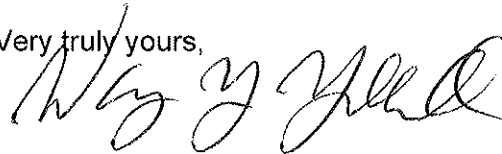

closures would last longer than with elevated construction. This would result in a greater disruption to business and residential access, prolonged exposure to construction noise, and traffic impacts.

Because it is not feasible for an at-grade system through Downtown to move passengers rapidly and reliably without significant detrimental effects on other transportation system elements (e.g., the highway and pedestrian systems, safety, reliability, etc.), an at-grade system would have a negative system-wide impact that would reduce ridership throughout the system. The at-grade system would not meet the Project's Purpose and Need and, therefore, does not require further analysis.

The resources and costs associated with construction and operation of an elevated system have been considered in project planning. As evaluated in the Alternatives Analysis, an underground system would be the least cost-effective option. An at-grade system in the Downtown area would not meet project requirements for rapid, safe, and reliable operations. The system will be constructed and operated in a sustainable manner using best practices and will result in a reduction in total energy demand on the island.

In response to your final comment, the Project's chosen technology ensures speed, reliability, and efficiency and is the only one that allows an automated, driverless system. As such, it will have a lower operating cost and attract the highest ridership of all technologies examined. As discussed previously, at-grade operation would require a fenced right-of-way with no crossings, which is not possible to construct in the Downtown area.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Mr. Ralph Bruinsslot, AIA
P.O. Box 4151
Honolulu, Hawaii 96812

Dear Mr. Bruinsslot:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The Alternatives Screening Memorandum (DTS 2006a) recognized the visually sensitive areas in Kakaako and Downtown Honolulu, including the Chinatown, Hawaii Capital, and Thomas Square/Academy of Arts Special Design Districts. To minimize impacts on historic resources, visual aesthetics, and surface traffic, the screening process considered 15 different combinations of tunnel, at-grade, or elevated alignments between Iwilei and Ward Avenue. As identified on pages 4-23 and 4-24 of the Screening Memorandum, four different alignments through Downtown Honolulu were advanced for further analysis, including an at-grade portion along Hotel Street, a tunnel under King Street, and elevated guideways along Nimitz Highway and Queen Street.

The Alternatives Analysis Report (DTS 2006b) evaluated the alignment alternatives based on transportation and overall benefits, environmental and social impacts, and cost considerations. The report found that an at-grade alignment along Hotel Street would require

the acquisition of more parcels and affect more burials than any of the other alternatives considered. The alignment with a tunnel under King Street through Downtown, in addition to the environmental effects such as impacts to cultural resources, reduction of street capacity, and property acquisition requirements of the at-grade section, would cost over \$500 million more than the least expensive alternative.

The Project's purpose is "to provide high-capacity rapid transit" in the congested east-west travel corridor. The need for the Project includes improving corridor mobility and reliability. The at-grade alignment would not meet the Project's Purpose and Need because it could not satisfy the mobility and reliability objectives of the Project. Some of the technical considerations associated with an at-grade versus elevated alignment through Downtown Honolulu include the following:

- **System Capacity, Speed, and Reliability:** *The short, 200-foot blocks (or less) in Downtown Honolulu would permanently limit the system to two-car trains to prevent stopped trains from blocking vehicular traffic on cross-streets. Even with transit signal priority, the at-grade speeds would be slower and less reliable than an elevated guideway. Under ideal circumstances, the capacity of an at-grade system could reach 4,000 passengers per hour per direction, assuming optimistic 5 minute headways. Based on travel forecasts, the Project will need to carry approximately 8,000 passengers by 2030. Moreover, the system can be readily expanded to carry over 25,000 in each direction by reducing the interval between trains (headway) to 90 seconds during the peak period. To preserve a comparable system capacity, speed, and reliability, an at-grade alignment would require a fenced, segregated right-of-way that would eliminate all obstacles to the train's passage, such as vehicular, pedestrian, or bicycle crossings.*
- **Mixed-Traffic Conflicts:** *With the planned three-minute headways, the short cycle of traffic lights would affect traffic flow and capacity of cross-streets. Furthermore, there would be no option to increase the capacity of the system by reducing the headway to 90 seconds.*
- **Construction Impacts:** *An at-grade system would consume two or more lanes of existing roadway, resulting in increased congestion or requiring that additional businesses or homes be taken to widen the roadway through Downtown. This would also have greater construction impacts and potentially affect cultural practices and burials to a greater extent than the placement of discrete column foundations for an elevated structure.*

Because it is not feasible for an at-grade system through Downtown to move passengers rapidly and reliably without significant detrimental effects on other transportation system elements (e.g., the highway and pedestrian systems, safety, reliability, etc.), an at-grade system would have a negative system-wide impact that would reduce ridership throughout the system. The at-grade system would not meet the Project's Purpose and Need and, therefore, does not require additional analysis.

The visual setting for the Project was considered in the visual and aesthetic analysis presented in the Draft and Final EISs. Several additional simulations and analysis of impacts

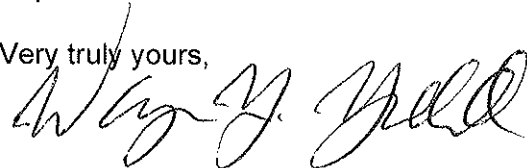

based on public comments received during the Draft EIS public comment period have been added to Section 4.8 of the Final EIS. It is acknowledged in both the Draft and Final EISs that some views Downtown will be blocked and some views will change substantially. Overall, the Project will be set in an urban context where visual change is expected and differences in scales of structures are typical. As stated in Section 4.8.3 of the Final EIS, the measures listed below will be included with the Project to minimize adverse visual effects and enhance the visual and aesthetic opportunities that the Project will create.

- *Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
- *Coordinate the project design with the City's transit-oriented development (TOD) program within the Department of Planning and Permitting.*
- *Consult with the communities surrounding each station for input on station design elements.*
- *Consider specific sites for landscaping and trees during the final design phase when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will serve to mitigate potential visual impacts.*

In addition, the Project will provide passengers with expansive views from several portions of the corridor by elevating riders above highway traffic, street trees, and low structures adjacent to the alignment.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Mr. Herb Rothouse
1910 Ala Moana Boulevard
Honolulu, Hawaii 96815

Dear Mr. Rothouse:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Chapter 6 of the Final EIS provides the Cost and Financial Analysis for the Project. The capital cost estimate for the Project is presented in Table 6-1 of the Final EIS. Estimated cost in Year-of-Expenditure dollars is approximately \$5,120 million. The costs follow the structure and requirements of the Federal Transit Administration (FTA).

As stated in Chapter 3 of the Final EIS, "Adding substantial passenger capacity with more buses is not feasible in some key locations along the system because of roadway capacity constraints. Choke points occur in Downtown Honolulu during the a.m. peak period, especially at the merger of North Beretania, North King, and Liliha Streets, and Dillingham Boulevard and along Hotel Street. King Street has been used to introduce new service in recent years due to the capacity limitation of Hotel Street; however, choke points occur at the Chinatown bus stops and at the Punchbowl Street and King Street stops. Buses often must wait to move into an

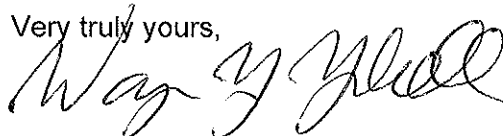

Mr. Herb Rothouse
Page 2

open and safe boarding position. Continuing to add additional service to King Street without major physical improvements would add to the gridlock in this corridor, deteriorate transit service, and complicate pedestrian and traffic safety issues. In the p.m. peak period, choke points occur along Beretania Street, Hotel Street, Nimitz Highway, and Ala Moana Boulevard in the Downtown area.”

Lastly, as stated in Chapter 3 of the Final EIS, bus service will be enhanced and modified to coordinate with the rail system. Some existing bus routes will be altered or eliminated to reduce duplication of services provided by the fixed guideway system. Buses removed from service in the study corridor will be shifted to service in other parts of the island. Certain local routes will be rerouted to provide frequent and reliable connections to the nearest rail station. A description of the future bus network, including route numbers and frequencies, is included in Appendix D of the Final EIS.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is fluid and cursive, written over the typed name.

Mr. Leslie A. Among
1720 Ala Moana Boulevard
Suite E103
Honolulu, Hawaii 96815

Dear Mr. Among:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS; however the future extensions are not part of this Project, thus they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time. Bus service between Ala Moana Center and these destinations will be enhanced

Mr. Leslie A. Among
Page 2

until those extensions are built. Nonetheless, your suggestions on routing could be considered at such time the extensions to University and Waikiki move forward.

As presented at the end of Section 2.5.10 of the Final EIS, the planned extension to UH Manoa is included as an illustrative project in the ORTP (OahuMPO 2007) and is anticipated by DTS to be completed some time prior to 2030 as a separate project that would receive its own detailed environmental review. Conceptually, the route described in the Draft EIS is feasible, but preliminary engineering alignment work was not completed for the Draft EIS. The preliminary engineering work will be performed in concert with the full environmental review. The environmental review will allow the public to present their ideas for alternatives, such as the one you proposed in your testimony.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Mr. Richard Ubersax
41-1013 Laumilo Street
Waimanalo, Hawaii 96795

Dear Mr. Ubersax:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Table 6-2 in the Honolulu High-Capacity Transit Corridor Project Alternatives Analysis Report presents estimated cost-effectiveness for the "20-mile" Fixed Guideway Transit Alternative from East Kapolei to Ala Moana Center (\$22.75 per hour of user benefit) and for the "full-corridor" Fixed Guideway Transit Alternative from Kapolei to UH Manoa (\$22.11 per hour of user benefit). Both alternatives were under the \$22.99 threshold for a rating of "Medium" at the time the report was issued.

The Draft EIS only reports estimates of cost-effectiveness for those Build Alternatives addressed in the document, namely three Fixed Guideway Transit Alternatives from East Kapolei to Ala Moana Center. The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS. However the future extensions are not part of this Project; thus, they are not required to be evaluated under

Mr. Richard Ubersax
Page 2

Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time. FTA's current threshold for a "Medium" rating is \$23.99 expressed in 2009 dollars. A cost-effectiveness analysis was not performed for these extensions in the Draft EIS as they are not part of the Project.

The difference in the cost-effectiveness index reported in the Draft EIS and the Alternatives Analysis is related to a more thorough development of user benefits. In Chapter 7 of the Draft EIS, user benefits are calculated based on travel demand modeling, which was completed in accordance with specific FTA requirements. In this case, there were additional benefits above those identified in the Alternatives Analysis that accrue to the Project in areas not directly related to ridership figures. The cost-effectiveness calculation has been reviewed by the FTA and found to have been developed consistent with its guidance.

The "Project," for purposes of the FTA in the Draft EIS, is the 20-mile alignment between East Kapolei and Ala Moana Center. The planned extensions are not part of the Draft EIS because they are not part of the Project being evaluated. They are included in the cumulative effects analysis in Sections 3.6 and 4.1 of the Draft EIS.

At such time that funding is made available for these extensions, a new EIS or other environmental documentation will be prepared that will consider the cost-effectiveness of these projects. They will be subject to the same requirements and scrutiny as applied to the current EIS process.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

DEPUTY DIRECTOR

June 11, 2010

RT9/090-332500

Mr. Chris Dolph
400 Hobron Lane
Honolulu, Hawaii 96815

Dear Mr. Dolph:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Chapter 6 of the Final EIS provides a financial analysis for the Project. Also, as stated in Section 4.18.1 of the Final EIS, the Project will generate an average of about 10,000 jobs per year over the nine-year construction period. The Project is consistent with proposals at the national level to stimulate public works activities to create employment opportunities.

The concepts, which you discuss in your comment letter, are discussed as the Managed Lane Alternative in Chapter 2 of the Final EIS. In "Chapter 2 – Alternatives Considered" of the Alternative Analysis report, November 2007, as well as in Chapter 2, Alternatives Considered, of the Final EIS, two options were considered for the Managed Lane Alternative—two-direction and reversible. This alternative would have provided a two-lane elevated toll facility between Waipahu and Downtown Honolulu, with variable pricing strategies to maintain free-flow speeds for transit and high-occupancy vehicles (HOVs). The Two-Direction Option would have served

express buses operating in both directions during the entire day. To maintain free-flow speeds in the Two-Direction Option, it would be necessary to charge tolls to manage the number of HOVs using the facility. For the Reversible Option, three-person HOVs would be allowed to use the facility for free, while single-occupant and two-person HOVs would have to pay a toll. The Reversible Option was found to be optimal.

The findings are summarized in Chapter 2 of the Final EIS as follows: The Managed Lane Alternative was evaluated for its ability to meet project goals and objectives related to mobility and accessibility, supporting planned growth and economic development, constructability and cost, community and environmental quality, and planning consistency. While this alternative would have reduced congestion on parallel highways, systemwide traffic congestion would have been similar to the No Build Alternative as a result of increased traffic on arterials trying to access the facility. Total island-wide vehicle hours of delay would have increased with the Managed Lane Alternative compared to the No Build Alternative, indicating an increase in systemwide congestion (Table 2-2, Final EIS).

The Managed Lane Alternative would not have supported planned concentrated future population and employment growth because it would not provide concentrations of transit service that would serve as a nucleus for transit-oriented development. The Managed Lane Alternative would have provided little transit benefit at a high cost. The cost-per-hour of transit-user benefits for the Managed Lane Alternative would have been two to three times higher than that for the Fixed Guideway Alternative. Similar to the Transportation System Management (TSM) Alternative, the Managed Lane Alternative would not have substantially improved service or access to transit for transit-dependent communities. No funding sources were identified for the Managed Lane Alternative. Toll revenues from the Managed Lanes Alternative would pay for ongoing operations and maintenance while remaining revenues would be used to repay debt incurred to construct the system.

The Managed Lane Alternative would have generated the greatest amount of air pollution, required the greatest amount of energy for transportation use, and would have resulted in the largest number of transportation noise impacts of all the alternatives evaluated. Because the Managed Lane Alternative would have served a shorter portion of the study corridor (approximately 16 miles compared to the 20 miles served by the fixed guideway), it would have resulted in fewer displacements and would have impacted fewer archaeological, cultural, and historic resources than the Fixed Guideway Alternative. The Managed Lane Alternative would not have affected any farmlands. Visually, the elevated structure would have extended a shorter distance, but it would have been more visually intrusive because its elevated structure, with a typical width of between 36 and 46 feet, would have been much wider than the Fixed Guideway Alternative.

After the Alternatives Analysis was completed, several scoping comments were received requesting reconsideration of the Managed Lane Alternative that was considered and rejected during the Alternatives Analysis. Because no new information was provided that would have changed the findings of the Alternatives Analysis regarding the Managed Lane Alternative, it was not included in the Draft EIS for further consideration.

In addition, the TSM Alternative studied during the Alternatives Analysis increased bus service. The alternative included express bus service that operated as bus rapid transit in existing facilities. Bus frequencies would have been increased during peak periods to provide improved service for work-related trips, particularly from developing areas. The bus fleet was assumed to increase from 525 to 765 buses, and park-and-ride lots were assumed at West Kapolei, UH West Oahu, Waipio, and Aloha Stadium. The TSM Alternative would have improved transit travel times, but it would have done little to improve corridor mobility and travel reliability. Roadway congestion also would not have been alleviated. Because buses are subject to the same congestion faced by car drivers, they cannot respond effectively to demands for better mobility or reliability. These effects of congestion are detailed in Chapter 3 of the Final EIS.

As stated in Chapter 3 of the Final EIS, "Adding substantial passenger capacity with more buses is not feasible in some key locations along the system because of roadway capacity constraints. Choke points occur in Downtown Honolulu during the a.m. peak period, especially at the merger of North Beretania, North King, and Liliha Streets, and Dillingham Boulevard and along Hotel Street. King Street has been used to introduce new service in recent years due to the capacity limitation of Hotel Street; however, choke points occur at the Chinatown bus stops and at the Punchbowl Street and King Street stops. Buses often must wait to move into an open and safe boarding position. Continuing to add additional service to King Street without major physical improvements would add to the gridlock in this corridor, deteriorate transit service, and complicate pedestrian and traffic safety issues. In the p.m. peak period, choke points occur along Beretania Street, Hotel Street, Nimitz Highway, and Ala Moana Boulevard in the Downtown area. Several routes, including CountryExpress! Routes C, D, and E are projected to be overloaded in 2030. Increasing frequency would require headways at five minutes or less. Further, the downtown street network cannot support the number of buses that would be required to meet projected demand."

Schedules cannot be guaranteed because of congestion, and many buses will have to pass up passengers as they fill to capacity during critical times (as happens now). Adding buses could help minimize the number of passengers left behind but will not address the schedule adherence issue.

Furthermore, from an energy and cost perspective, buses are less efficient in carrying a given number of riders than a fixed guideway. Buses also face very real space limitations in some parts of the City. The number of buses that would be required to carry the same number of riders that will use the fixed guideway in the Downtown area would be impossible to fit onto downtown streets. TheBus is a successful system and is the most efficiently used system in the U.S. based on information from the National Transit Database. Still, by itself based on the analysis conducted for the Alternatives Analysis, it is not a solution to solve the existing and anticipated congestion in Honolulu.

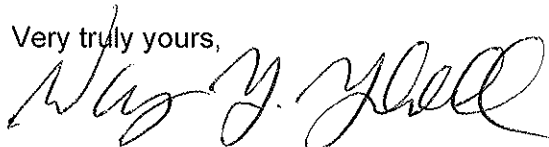

As stated in Chapter 3 of the Final EIS, bus service will be enhanced and modified to coordinate with the rail system. Some existing bus routes will be altered or eliminated to reduce duplication of service. Buses removed from service in the study corridor will be shifted to other parts of the island. Certain local routes will be rerouted to provide frequent and reliable connections to the nearest rail station. Total travel time, including transfers to bus, will be the

Mr. Chris Dolph
Page 4

same as today or less. A description of existing and future bus routes, including frequencies, is included in Appendix D of the Final EIS.

Providing free bus travel during peak hours would not support the Purpose and Need of the Project. Buses are already crowded during peak hours and making them free would exacerbate this problem while reducing revenue that could be used to support expansion of the system.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Dear Mr. Scott:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

While there are 199 properties affected at a cost of \$157 million in 2009 dollars (Table 6-1 in the Final EIS), most of the Project will be built in the median of existing public roadways. The vast majority of the acquisitions are narrow strips of property along the affected roadways. The \$157 million estimate for right-of-way acquisition is based on comparisons of property values in the general area, not typically on individual properties.

Appendix C in the Final EIS shows the full and partial acquisitions near the corner of Piikoi and Kona Street. As design progresses, there will be a better understanding as to the extent to which properties along Kona Street will be affected. Project staff will be working with all affected property owners as the Project progresses.

Mr. Steve Scott
Page 2

As detailed in Section 1.1.2 of the Draft EIS, and as approved by the City Council with Resolution 07-039, the Project extends from East Kapolei to Ala Moana Center. The Project, as addressed in the Draft EIS, matches the limits established in Resolution 07-039. Termination of the Project at Ala Moana Center has been public since Resolution 07-039. The Project has been designed to allow for an extension to climb over the Ala Moana Center parking garage that is immediately beyond the end of the Project. The only subsequent change was the decision by the City Council to recommend the Airport Alternative as the Preferred Alternative for the First Project. The alignment decisions for the future extensions would be made through a separate environmental review process that would include public involvement at the time the extensions are proposed for implementation, once funding is available.

Future extensions are not precluded by the Project identified in the Draft and Final EISs. The 35-foot-high station at Ala Moana Center is a practical terminus for the Project, which will serve the shopping center and area properties. In the future, when funding is available, the extension would be designed to best accommodate the possibilities available at that time. The high level option over the shopping center is still available and does not obviate the need for the 35-foot option built now. There are operating plans for the system that will continue to rely on the 35-foot station even after an extension is built.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Dear Mr. Hoernig:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal.

As stated in Section 4.4.3 of the Final EIS: Where relocations will occur, compensation will be provided to affected property owners, businesses, or residents in compliance with all applicable Federal and State laws and will follow the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act. The measures related to acquisitions and relocations include the following:

- *The City will assist all affected persons in locating suitable replacement housing and business sites within the means of individuals or businesses.*
- *A minimum 90-day written notice will be provided before any business or resident will be required to move.*

Mr. Bryan Hoernig
Page 2

- *Relocation services will be provided to all affected business and residential property owners and tenants without discrimination; and persons, businesses, or organizations that are displaced as a result of the Project will be treated fairly and equitably.*

Where landscaping, sidewalks, and driveway access will be affected by the Project, coordination will occur with the landowner, and these property features will be replaced, restored, and/or the property owner will be compensated.

The notice you received was to inform you of the possibility that your property may be affected. As design progresses, there will be a better understanding as to the extent to which properties along Kona Street will be affected. Project staff will be working with all affected property owners as the Project progresses.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Dear Mr. Conlan:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The EIS is a disclosure and decision-making document; it is not a work plan for long-range evaluation. Project goals and objectives are described in Chapter 1 of the Final EIS.

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, though it is understood that ridership will be low until the line reaches more critical destinations closer to downtown, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- *Reduce the time that each area will experience traffic and community disturbances.*
- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*
- *Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- *Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

As described in Chapter 2 of the Final EIS, several alignments were evaluated during the Alternatives Analysis process. One evaluated alignment was the historic OR&L line. A combination of issues, including utilities that have been placed in the right-of-way, poor location in several places, and the previous loss of the right-of-way in several locations all contributed to the elimination of that option. Every attempt is being made to minimize property takes and dislocations along the proposed right-of-way, and this is one reason for the decision to elevate the guideway.

A travel demand forecasting model used by the Oahu Metropolitan Planning Organization was used to determine which guideway stations will have the highest demand of people driving to access the transit system. While there are more than 4,100 spaces identified as part of the Project, the experience with park-and-ride facilities in Honolulu to date is limited. Generally, it has been found that parking facilities are underused. The lots contained in the Project are located toward the Ewa end of the route and are based on consideration of parking demand using the travel demand forecasting model for the year 2030. Further, the projected mode of access shares were compared to observed data from several Mainland areas, notably San Diego. Given the history of park-and-ride use on the island, it seems prudent to evaluate any need for additional or larger facilities on the basis of empirical experience rather than commit substantial additional funding now. Any need for additional parking at the four stations with park-and-ride facilities or other locations would best be determined once experience is gained about their use.

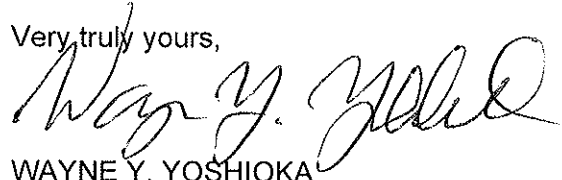

The luggage policy for the system is not final, but the concept of the policy will be to allow luggage that does not interfere with the safety or comfort of other passengers. In

Mr. Terry Conlan
Page 3

response to your last point, the Final EIS contains additional information about several aspects of the Project. Many of these changes are a result of public comments received on the Draft EIS. Please see the first section of each Chapter for a description of changes since the Draft EIS.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Ms. Amy Kimura
1310 Heulu Street, #1002
Honolulu, Hawaii 96822

Dear Ms. Kimura:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The corridor from Kapolei to UH Manoa (i.e., the study corridor) is well suited for the fixed guideway project. In 2000, 63 percent of Oahu's population of 876,200 and 80 percent of its 501,100 jobs were located within the study corridor. By 2030, these distributions will increase to 69 percent of the population and 83 percent of the employment as development continues to be concentrated into the Primary Urban Corridor and Ewa Development Plan areas. As stated in Section 1.3.1 of the Final EIS, 2,036,000, or 73 percent, of the approximately 2,790,000 islandwide daily trips, and 350,000, or 64 percent, of the 544,000 a.m. peak-period work-related trips are currently generated within the study corridor. The study corridor attracts an even higher percentage of islandwide work-related trips with 446,000, or 82 percent, of a.m. peak-period work-related trips having destinations within the study corridor.

Ms. Amy Kimura
Page 2

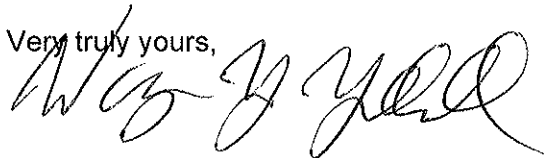

The EIS assumes that fares for all transit modes, including the fixed guideway line and TheBus, will be the same with a fare structure similar to today. Zone fares or distance-based fares are not assumed. The EIS also assumes that the City's current policy will remain in effect (i.e., that fare revenues will pay for between 27 and 33 percent of annual operating and maintenance costs).

As described in Section 6.4.2 of the Final EIS, "The fare structure for the fixed guideway is assumed to follow the current bus fare structure, with transfers between modes assumed to be free." Current users of the TheBus with its fare structure for limited income populations will be able to transfer onto or directly access the fixed guideway system with their current bus passes or one-way fare. Since the fare structure is assumed to be the same and that transit-dependent households will experience a substantial time benefit (as shown in Figure 3-5 of the Final EIS), the combination of a consistent fare structure across modes coupled with a decrease in travel time is anticipated to attract motorists out of their cars. Fares are anticipated to increase with inflation and the cost of automobile ownership, and use is anticipated to increase at or above the rate of general inflation.

Chapter 6 of the Final EIS describes the financial resources anticipated to be needed to pay for ongoing operating and maintenance costs. Operating and maintenance costs will be paid for from the same sources currently used for TheBus: Federal funding, fare revenues, and subsidies from the City's General and Highway Funds. It is anticipated that with an integrated bus and rail system in place that a slightly higher percentages of the City's operating budget will be used for transit than is currently the case.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Mr. Tom Heinrich
2426 Armstrong Street
Honolulu, Hawaii 96822-1932

Dear Mr. Heinrich:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Chapter 4 of the Final EIS includes an evaluation of the cumulative effects of the Project with other past, present, and reasonably foreseeable actions. The Project extensions, which would include a rail line to UH Manoa, are considered foreseeable projects, although no design or construction is planned until funding can be identified. The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS; however the future extensions are not part of this Project, thus they are not required to be evaluated under Chapter 343 of the Hawai'i Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because

they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time. When the planned extensions are evaluated in the future, a range of alternatives will be fully evaluated for each of them, including this extension. Because of the lack of engineering design for the future extensions, only a general analysis can be completed at this time.

Regarding concerns about the station design in Mo'ili'ili, the assessment of visual effect due to the Project, as described in Section 4.8.3 of the Final EIS considers changes to the visual landscape and viewer responses to those changes. This includes consideration of the existing development along the Project alignment. As noted, the Project does not yet extend to the University so views and design for that segment are not included. Nonetheless, as part of the design process, the City has developed design principles, which are identified in the Honolulu High-Capacity Transit Corridor Project Compendium of Design Criteria (RTD 2009m) that will be implemented in final design to minimize visual effects of the Project. For example, guideway materials and surface textures will be selected in accordance with generally accepted architectural principles to achieve effective integration between the guideway and its surrounding environment. Landscape and streetscape improvements will mitigate potential visual impacts, primarily for street-level views. These would be applied to a future University segment also.

Other measures to address visual impacts of the Project will be developed through the station design and planning process. The initial station area plans and design guidelines were first developed with coordination between DTS and the Department of Planning and Permitting (DPP). The next level of transit station design focuses on integrating individual neighborhood characteristics of the communities served by the stations. So, any concepts developed for consideration at this stage are premature.

The following mitigation framework will be included in the Project and in future extensions to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

- Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
- Coordinate the project design with City TOD planning and DPP.*
- Consult with the communities surrounding each station for input on station design elements.*
- Consider specific sites for landscaping and trees during the final design phase when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will serve to mitigate potential visual impacts.*

Section 4.8.3 of the Final EIS, Design Principles and Mitigation includes information related to the mitigation framework described above. Specifically architecture and landscape design criteria include guidelines regarding site design, materials and finishes, and lighting, which apply to stations, station areas, and the guideway.

As stated in Section 4.2.1 of the Final EIS, the Project was evaluated to assess whether it will be consistent with adopted transportation and urban development plans. This includes the

Primary Urban Center development plans. Section 4.2.2 of the Final EIS states that development plans for the Primary Urban Center and Ewa direct new growth and its supporting transit facilities and TOD to these areas. Sustainable community plans for East Honolulu, Central Oahu, and other parts of the island focus on supporting the character of these communities and preserving their natural and cultural resources.

The Project is focused exclusively on the construction and implementation of rail transit service, and that is what is covered in the Final EIS. However, as discussed in Section 4.19.2 of the Final EIS, TOD is expected to occur in project station areas as an indirect effect of the Project. The increased mobility and accessibility that the Project will provide will also increase the desirability and value of properties near the stations, thereby attracting new real estate investment nearby (in the form of TOD). Planning and zoning around station areas will be developed in the future by DPP under a process covered by the City's new TOD Ordinance (09-4).

In March 2009, the City Council approved and the Mayor of Honolulu signed Bill 10 (2008) (ordinance 09-4), which defines the City's approach to TOD around fixed guideway stations. The special districts encourage public input into the design of TOD neighborhood plans to reflect unique community identities.

In response to your statement that the Project should work with the Hawaii Department of Transportation (HDOT), consultation with HDOT has been ongoing throughout the Project's planning process. When planning is undertaken for the planned extensions, the efforts will be coordinated with HDOT as they relate to the H-1/University Avenue Interchange.

Lastly, Chapter 4 of the EIS includes an evaluation of the cumulative effects of the Project with other past, present, and reasonably foreseeable actions, including future fixed guideway extensions. Because the effects of the extensions would not be caused by the Project and because they are speculative of future actions, the detail of the analysis cannot match that for the Project. When the planned extensions are evaluated in the future, a range of alternatives will need to be evaluated for each of them.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Mr. Charles Carole
1310 Heulu Street, #1002
Honolulu, Hawaii 96822

Dear Mr. Carole:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As noted in Chapter 2 of the Final EIS, bus service will be enhanced and the bus network will be modified to coordinate with the fixed guideway system. Some existing bus routes, including peak-period express buses, will be altered or eliminated to reduce duplication of services provided by the fixed guideway system. Route 1 will continue to operate between Kalihi and Kahala without any changes to current service levels. Local bus service in Kahala, currently provided by Route 14, will not be affected by rail implementation. Further information on effects to future bus routes and frequency is provided in Appendix D of the Final EIS.

To address your second point, the EIS uses the socio-economic data that were available from the OahuMPO at the time the EIS work began, based on the Department of Business, Economic Development, and Tourism's (DBEDT) Population and Economic Projections for the

Mr. Charles Carole
Page 2

State of Hawaii to 2030 prepared in August 2004. The 2030 forecast year used in the Draft and Final EISs is consistent with FTA guidance for New Starts projects.

DBEDT has prepared new forecasts at the County level, as discussed in Population and Economic Projections for the State of Hawaii to 2035 issued in January 2009. For use in travel forecasting, these County-level forecasts must be disaggregated to the level of "Travel Analysis Zones" of which there are 764 on Oahu. At the time of the publication of the Draft EIS, these zonal-level forecasts had not been prepared and accepted by the OahuMPO.

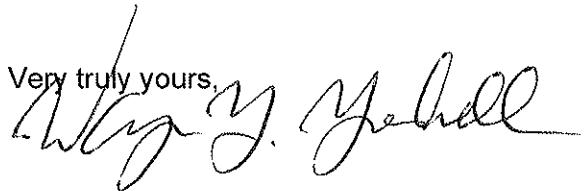

The January 2009 DBEDT forecasts have lower population projected than the August 2004 forecasts. Specifically, the January 2009 population forecast for Oahu for 2030 is 3.3 percent lower than the August 2004 forecast. However, the 2030 employment forecast for Oahu from the January 2009 series is 5.8 percent higher than the August 2004 forecast. Thus, it is not clear what the effect on ridership projections would be of using the January 2009 forecast, since the higher employment forecast would likely result in more work trips on transit while the lower population forecast would likely result in fewer trips for other purposes.

There is no foundation for the assertion that the present economic situation will result in hyperinflation and devaluation of the dollar. To be sure that the changing conditions are accounted for, Chapter 6 of the Final EIS reflects the latest economic trends in both costs and revenues.

The financial plan for the Project is a dynamic document that will be updated periodically as conditions warrant. The latest version of the financial plan (August 2009) incorporates the forecast reductions in General Excise and Use Tax (GET) surcharge collections and recognizes a reduction in the cost of many of the primary commodities needed for construction. The financial plan is a strategic document that recognizes the economy will rise and fall. Historically, these are relatively short-term fluctuations within the much longer life of the plan. At this point, there are no inconsistencies with the findings of the financial plan and trends in the economy. That includes the effects on tourism.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Mr. Philip Blackman
1676 Ala Moana Boulevard, #406
Honolulu, Hawaii 96815

Dear Mr. Blackman:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The Final EIS addresses all the disciplines required under NEPA for a project of this nature. Still, there are likely some areas not covered by NEPA that will not receive specific attention under an EIS. Regarding construction, the effects of the construction process and the short-term impacts of construction activity are discussed in Sections 3.5 and 4.18 of the Final EIS.

City bus service is currently provided to Pearl Harbor Naval Base and Hickam Air Force Base. It is assumed that this service will continue, although with an increased frequency. The cost of providing this bus service is included in the operating and maintenance cost estimates presented in Section 6.4 of the Final EIS. There is no plan to prevent employees or seamen from driving their own vehicles as they do now. The Project is intended to offer an alternative to the private automobile. On the basis of its performance, there will be many who choose the

Mr. Philip Blackman
Page 2

transit service over continuing to drive their own vehicle. Ideally, in addition to taking a shuttle to or from the station, many will be able to access their place of employment or home on bicycle or by foot.

Federal regulations do not include language that would require the Project to have rider characteristics similar to what would be accommodated by local bus service. As noted in Section 2.5.6 of the Final EIS, bus service will be enhanced, and the bus network will be modified to coordinate with the fixed guideway system. Typical experience in cities that have built rail systems is that rail attracts a wide variety of users, and it is not necessarily a function of income, employment type, or car ownership. The attraction for most people who choose to ride is time savings and convenience.

The Project is focused exclusively on the construction and implementation of rail transit service, and that is what is covered in the Draft and Final EISs. However, as discussed in Section 4.19.2 of the Final EIS, transit-oriented development (TOD) is expected to occur in project station areas as an indirect effect of the Project. The increased mobility and accessibility that the Project may provide will also increase the desirability and value of land near stations, thereby attracting new real estate investment nearby (in the form of TOD). Planning and zoning around station areas will be conducted and established by the City's Department of Planning and Permitting under a process covered by the City's new TOD Ordinance 09-4 that was developed in anticipation of the Project in March 2009.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Mr. Scott Wilson
3524 Woodlawn Drive
Honolulu, Hawaii 96822

Dear Mr. Wilson:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS; however the future extensions are not part of this Project, thus they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time.

Mr. Scott Wilson
Page 2

Visual and aesthetic conditions are discussed in Section 4.8 of the Final EIS. The Project will be set in an urban context where visual change, including shade and shadow, is expected, and differences in scales of structures are typical. Section 4.8.3 states that the fixed guideway and stations will be elevated structures. They will result in noticeable changes to views where the Project elements will be near existing views or in the foreground of these views. Impacts for the ground-level environment are illustrated by most of the visual simulations included in the Final EIS.

As these figures illustrate, the guideway support columns will be in the roadway median or to one side of the roadway. Landscaping will be provided at stations but generally not under the guideway. Column materials and surface textures will be selected in accordance with generally accepted architectural principles to integrate the guideway with its surrounding environment. The shadow pattern created at ground level by the guideway and stations will change throughout the day and seasonally, depending on the alignment's direction, time of day, and time of year.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Mr. James R. McManus
860 Halekauwila Street, #2708
Honolulu, Hawaii 96813

Dear Mr. McManus:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your support for the Project has been noted. The Project will substantially improve transit travel time and reliability. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were

Mr. James R. McManus
Page 2

in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is fluid and cursive, with the first name "Wayne" and the last name "Yoshioka" clearly legible.

Dear Mr. Uechi:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal:

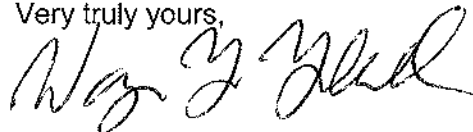

The impacts on future traffic conditions of building or not building the Project are described in Chapter 3 of the Final EIS. The project alternatives were developed to address the Purpose and Need for the Project and evaluated based on how well they addressed the identified needs. According to the Alternatives Analysis phase of the Project, regardless of which solution is selected for implementation, conditions will be worse in 2030 than now. Among all the options evaluated in the Alternatives Analysis, however, the fixed guideway substantially outperformed the others based on measures of mobility, reliability, support of planned growth areas, environmental impacts, cost-effectiveness, feasibility, and fairness. As shown in Chapter 3 of the Final EIS, the Project will reduce delay by 18 percent in 2030. No other alternative was found to accomplish such an improvement.

The capital plan that analyzes capital expenditures for the Project is presented in Section 6.3 of the Final EIS, including a description of the amount of funding anticipated from various sources. Capital costs of the Project, including finance charges, are expected to be fully paid for by a combination of FTA Section 5309 New Starts Funds and FTA Section 5307 Funds from the Federal government and revenues from the County General Excise and Use Tax (GET) surcharge levied from 2007 through 2022. The FTA New Starts Program requires a series of successively more detailed steps to be taken that show refinement in design and financing and are subject to FTA approval. In general, local funds must represent at least 50 percent of the project budget to realistically qualify for FTA funding. The GET surcharge provides 70 percent of the cost of the Project. As noted above, Chapter 6 also discusses other options for raising revenue should it be necessary to find additional funds. Section 6.6 of the Final EIS describes risks and uncertainties associated with these funding assumptions, including receipt of Federal Funds through a Full Funding Grant Agreement with FTA. The City has submitted the application to enter Preliminary Engineering and qualify for Federal New Starts Funds.

The capital plan accounts for the effects of the economic downturn and continues to be balanced. Ordinance 07-001 which approved the GET surcharge on Oahu for use in constructing a fixed guideway project does not authorize the use of property taxes to fund the project construction.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Dear Ms. Matson:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal:

The island's unique visual character and scenic beauty was considered in the visual and aesthetic analysis presented in the Final EIS Section 4.8. The Project primarily will be set in an urban context where visual change is expected and differences in scales of structures are typical. The visual effects on Honolulu's Downtown, including the Aloha Tower, Irwin Park, Dillingham Transportation Building, Bishop Street, Chinatown Historic District and Mother Waldron Neighborhood Park, are discussed under the Kalihi to Ala Moana Center Landscape Unit, discussed in Section 4.8.2 of the Final EIS. The Project complies with Section 106 of the National Historic Preservation Act and Section 4(f) of the Department of Transportation Act, and coordination with the regulatory agencies responsible for compliance is ongoing as documented in Section 4.16 and Chapter 5 of this Final EIS.

The guideway and some stations will partially block mauka-makai public views from streets that intersect the alignment. DTS will coordinate with the Department of Planning and Permitting (DPP); however, changes to some views will be unavoidable. Depending on the degree of view obstruction or blockage, some view changes will be substantial. The viewer's response to this change will vary with exposure and sensitivity and depend on the alignment orientation, guideway and station height, and height of surrounding trees and/or buildings.

The Embarcadero Freeway in San Francisco was an elevated highway, not rail, and thus is not directly comparable to this project

Although mitigation measures will minimize many adverse visual effects by providing visual buffers and reducing visual contrasts between the project elements and their surroundings, the Final EIS acknowledges, as concluded in the Section 4.8.3 of the Final EIS, that probable unavoidable adverse effects, such as view blockage, cannot be mitigated and will be significant (noted as a "High" level of visual impact in the Draft EIS) in some areas.

The Project will introduce a new linear visual element to the corridor, and changes to some views will be significant and unavoidable. The guideway and some stations will partially block mauka-makai public views from streets that intersect the alignment.

The City will implement the following mitigation framework (see Section 4.8.3) with the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

- Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.*
- Coordinate the project design with the City TOD planning and DPP.*
- Conduct public involvement workshops to consult with the communities surrounding each station for input on station design elements.*
- Consider specific sites for landscaping and trees during the final design phase when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will serve to mitigate potential visual impacts.*

Even with mitigation measures, some obstruction and changes to views will result in a high level of visual impact, or, a significant impact, and changes to some views will be unavoidable. These effects will be most noticeable where the guideway and stations are nearby or in the foreground of views.

Some views and vistas protected by City development plans will change as a result of the Project, including public views along streets and highways, mauka-makai view corridors, panoramic and significant landmark views from public places, views of natural features, heritage resources and other landmarks. Depending on the degree of view obstruction or blockage, some changes in view will be significant. Viewers' response to these changes will vary with their

exposure and sensitivity and depend on the alignment orientation, guideway and station height, and height of surrounding trees and buildings. View changes will be less notable in wider vista or panoramic views where the project elements are smaller components of the larger landscape. Generally, the project elements will not be dominant features in these views.

Design principles are identified in the Honolulu High-Capacity Transit Corridor Project Compendium of Design Criteria (RTD 2009m) and will be implemented in Final Design as mitigation measures to minimize visual effects. Specific design principles are listed in Section 4.8.3 and include: Overall Aesthetics, Station Design, Lighting and Landscaping criteria. These will be implemented in Final Design as mitigation measures to minimize visual effects. In addition, the Project will provide passengers with expansive views from several portions of the corridor by elevating riders above highway traffic, street trees, and low structures adjacent to the alignment

The visual effects on Honolulu's Downtown, including Mother Waldron Neighborhood Park and the Kakaako are discussed under the Kalihi to Ala Moana Center Landscape Unit. To minimize adverse visual effects and enhance visual and aesthetic opportunities, the City will consult with the Kakaako community for input on station design elements. Specifically, the Kakaako Station workshop will be held in conjunction with the Civic Center and Ala Moana Stations. In addition, design guidelines that establish a consistent design framework for the Project with consideration of local context will be developed and applied.

The visual effects on Irwin Park are not specifically mentioned in Table 4-10 of the Draft EIS. However, they are part of the larger views assessed in Viewpoint 15 in the Final EIS. The text on Page 4-88 of the Draft EIS has been refined in the Final EIS to clarify the visual impact analysis presented in the Draft EIS as described above.

As described in Section 4.2, Land Use in this Final EIS and expanded upon in the Honolulu High-Capacity Transit Corridor Project Land Use Technical Report (RTD 2008b), the Project is consistent with State and local plans

Preliminary effect determinations for Piers 10/11, Aloha Tower, Irwin Park, Dillingham Transportation Building, and Mother Waldron Neighborhood Playground documented in the Draft EIS were reevaluated in the Historic Effects Report: Honolulu High-Capacity Transit Corridor Project (RTD 2009d) issued by FTA on April 14, 2009. Analysis of the project's direct and indirect, and cumulative impacts to these properties, as described in the report, concluded that indirect, visual effects to the setting of Piers 10/11, Aloha Tower, and Irwin Park would not be adverse. However, the State Historic Preservation Officer (SHPO) did not concur with these findings and the FTA accepted adverse effect determinations on these resources. In the Historic Effects Report, impacts to the Dillingham Transportation Building and Mother Waldron Neighborhood Park were determined to be adverse due to differences in pre-existing integrity and character-defining features of each resource. Direct impacts to the Dillingham Transportation Building, including property acquisition, were also determined to be adverse. The SHPO concurred with these determinations.

Consultation with the SHPO subsequent to the Draft EIS resulted in revised Section 106 effects determinations to properties from no adverse effect to adverse effect—this includes

Chinatown Historic District. The Draft EIS stated that the impact to these properties would be de minimis. Since de minimis impact applies to historic properties that have a no adverse effect determination under Section 106, an avoidance alternative is included in Chapter 5 of this Final EIS for Chinatown Historic District.

Consultation with the SHPO has continued since release of the Draft EIS and the Historic Effects Report. This Final EIS summarizes all effect determinations to historic properties and Section 106 consultation as described in text and tables of Section 4.16, Archaeological, Cultural, and Historic Resources and Chapter 5. Mitigation of adverse impacts to historic resources is included in the Programmatic Agreement (Appendix H).

Within the Kakaako area, land uses adjacent to the alignment include two- and three-story walk-up apartments and commercial uses. Because Kakaako has been designated a redevelopment area, Kaiāulu 'o Kaka'ako Master Plan (HCDA 2008), changes in land uses to transit-oriented development are likely. This may result in a change in character along the alignment, especially near stations depending on local community input and what redevelopment plans administer. Substantial development has recently occurred in the neighborhood; several high-rise condominium developments have been built and additional residential and commercial development is planned. The elevated transit structure would not create a barrier to pedestrian, cyclist or automobile modes of travel.

Regarding your comment about public concerns specific to historic sites the following text from Section 8.2.3 of the Final EIS explains the process and the efforts taken both prior to the Draft document and since its publication. The lead agency is responsible for complying with Section 106 of the National Historic Preservation Act. Section 106 requires the lead agency to "accommodate historic preservation concerns with the needs of Federal undertakings through consultation among the agency official and other parties with an interest in the effects of the undertaking on historic properties..." [36 CFR 800.1(a)]. Although other parties are consulted for their input, the Federal agency has the authority to make all decisions. Extensive effort was made to identify, contact, and consult with groups entitled to be consulting parties relating to archaeological, cultural, and historic resources within the Area of Potential Effect (APE). The purpose of consultation was to identify archaeological, cultural, and historic resources and to discuss other issues relating to the Project's potential effects on such resources. Information was obtained from individuals and organizations likely to have knowledge of potential resources in the study corridor. A reasonable and good faith effort was made to identify Native Hawaiian organizations that might attach religious and cultural significance to historic properties in the APE, and they were given opportunities to discuss issues and concerns.

In addition to consultation with the State Historic Preservation Officer (SHPO), the City also consulted with organizations and agencies with concerns regarding archaeological, cultural, and historic areas. This consultation included Hawaiian civic clubs that may have an interest in the Project. Letters sent by the FTA initiated an ongoing consultation process with the following groups (Section 106 consulting parties) to identify resources, consider project effects, and develop mitigation to limit the adverse effects of the Project:

- *Advisory Council on Historic Preservation*

Ms. Michelle Matson
Page 5

- *U.S. Navy (U.S. Naval Base Pearl Harbor)*
- *Historic Hawai'i Foundation*
- *National Park Service*
- *National Trust for Historic Preservation*
- *University of Hawai'i Historic Preservation Certificate Program*
- *American Institute of Architects*
- *Hawai'i Community Development Authority*
- *Office of Hawaiian Affairs*
- *O'ahu Island Burial Council*
- *Hui Malama I Na Kupuna O Hawai'i Nei*
- *Royal Order of Kamehameha*
- *The Ahahui Ka'ahumanu*
- *The Hale O Na Ali'i O Hawai'i*
- *The Daughters and Sons of Hawaiian Warriors*
- *Association of Hawaiian Civic Clubs—and 15 individual civic clubs*

Between July 28, 2009 and November 13, 2009, FTA and the City invited all consulting parties to participate in a series of meetings to develop the Programmatic Agreement (PA) (see Section 4.16, Archaeological, Cultural, and Historic, and Appendix H, Section 106 of the National Historic Preservation Act Programmatic Agreement). Appendix F includes copies of all Section 106 correspondence.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Mr. Mike Uechi
98-111 Kaahahele Place
Aiea, Hawaii 96701

Dear Mr. Uechi:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The impacts on future traffic conditions of building or not building the Project are described in Chapter 3 of the Final EIS. According to the Alternatives Analysis phase of the Project, regardless of which solution is selected for implementation, conditions will be worse in 2030 than now. Among all the options evaluated in the Alternatives Analysis, however, the fixed guideway substantially outperformed the others based on measures of mobility, reliability, support of planned growth areas, environmental impacts, cost-effectiveness, feasibility, and fairness. As shown in Chapter 3 of the Final EIS, the Project will reduce delay by 18 percent in 2030. No other alternative was found to accomplish such an improvement.

The capital plan that analyzes capital expenditures for the Project is presented in Section 6.3 of the Final EIS, including a description of the amount of funding anticipated from various sources. Capital costs of the Project, including finance charges, are expected to be fully

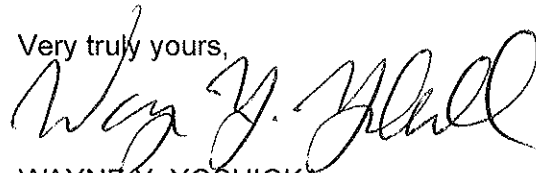

Mr. Mike Uechi
Page 2

paid for by a combination of FTA Section 5309 New Starts Funds and FTA Section 5307 Funds from the Federal government and revenues from the County General Excise and Use Tax (GET) surcharge levied from 2007 through 2022. Section 6.6 of the Final EIS describes risks and uncertainties associated with these funding assumptions, including receipt of Federal Funds through a Full Funding Grant Agreement with FTA. The City has submitted the application to enter Preliminary Engineering and qualify for Federal New Starts Funds.

The capital plan accounts for the effects of the economic downturn and continues to be balanced. Ordinance 07-001 which approved the GET surcharge on Oahu for use in constructing a fixed guideway project does not authorize the use of property taxes to fund the Project construction.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Dear Ms. Matson:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The island's unique visual character and scenic beauty was considered in the visual and aesthetic analysis presented in the Final EIS Section 4.8. The Project primarily will be set in an urban context where visual change is expected and differences in scales of structures are typical. The visual effects on Honolulu's Downtown, including the Aloha Tower, Irwin Park, Dillingham Transportation Building, and Mother Waldron Neighborhood Park, are discussed under the Kalihi to Ala Moana Center Landscape Unit, discussed in Section 4.8.2 of the Final EIS. The Project will comply with Section 106 of the National Historic Preservation Act and Section 4(f) of the Department of Transportation Act, and is coordinating with the regulatory agencies responsible for compliance.

The guideway and some stations will partially block mauka-makai public views from streets that intersect the alignment. DTS will coordinate with the Department of Planning and

Permitting (DPP) to identify the particular needs of each view; however, changes to some views will be unavoidable. Depending on the degree of view obstruction or blockage, some view changes will be substantial. The viewer's response to this change will vary with exposure and sensitivity and depend on the alignment orientation, guideway and station height, and height of surrounding trees and/or buildings.

The following mitigation framework (see Section 4.8.3 Environmental Consequences, in this Final EIS [Visual and Aesthetic Conditions]) will be included with the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

- Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.
- Coordinate the project design with City TOD planning and DPP.
- Consult with the communities surrounding each station for input on station design elements.
- Consider specific sites for landscaping and trees during the final design phase when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will serve to mitigate potential visual impacts.

Design principles are identified in the Honolulu High-Capacity Transit Corridor Project Compendium of Design Criteria (RTD 2009m) and will be implemented in Final Design as mitigation measures to minimize visual effects. Specific design principles are listed in Section 4.8.3 and include: Overall Aesthetics, Station Design, Lighting and Landscaping criteria that will be implemented in Final Design as mitigation measures to minimize visual effects. In addition, the Project will provide passengers with expansive views from several portions of the corridor by elevating riders above highway traffic, street trees, and low structures adjacent to the alignment.

The visual effects on Honolulu's Downtown, including Mother Waldron Neighborhood Park and the Kakaako are discussed under the Kalihi to Ala Moana Center Landscape Unit. To minimize adverse visual effects and enhance visual and aesthetic opportunities, the City will consult with the Kakaako community for input on station design elements. Specifically, the Kakaako Station workshop will be held in conjunction with the Civic Center and Ala Moana Stations. In addition, design guidelines that establish a consistent design framework for the Project with consideration of local context will be developed and applied.

Preliminary effect determinations for Piers 10/11, Aloha Tower, Irwin Park, Dillingham Transportation Building, and Mother Waldron Park documented in the Draft EIS were reevaluated in the Historic Effects Report: Honolulu High-Capacity Transit Corridor Project (RTD 2009d) issued by FTA on April 14, 2009. Analysis of the project's direct and indirect, and cumulative impacts to these properties, as described in the report, concluded that indirect, visual effects to the setting of Piers 10/11, Aloha Tower, and Irwin Park would not be adverse. However, the State Historic Preservation Division (SHPD) did not concur with these findings and

Ms. Michelle Matson
Page 3

the FTA accepted adverse effect determinations on these resources. In the Historic Effects Report, impacts to the Dillingham Transportation Building and Mother Waldron Park were determined to be adverse due to differences in pre-existing integrity and character-defining features of each resource. Direct impacts to the Dillingham Transportation Building, including property acquisition, were also determined to be adverse. The SHPD concurred with these determinations. Consultation with the SHPD has continued since release of the Draft EIS and the Historic Effects Report. Final determinations of effect and coordination details are presented in this Final EIS, Section 4.16. Mitigation of adverse impacts to historic resources is included in the Programmatic Agreement (Appendix H).

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Dear Mr. Travaglio:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Chapter 2 of the Final EIS summarizes the alternatives screening and selection process. Beginning in the fall of 2005, an initial screening process considered alternatives identified through previous transit studies, a field review of the study corridor, an analysis of current population and employment data for the study corridor, a literature review of technology modes, ongoing work completed as part of the Oahu Regional Transportation Plan 2030 (ORTP) prepared by the Oahu Metropolitan Planning Organization (OahuMPO) (OahuMPO 2007), and public and agency comments received during the formal Alternatives Analysis scoping process.

The screening process is documented in the Honolulu High-Capacity Transit Corridor Project Alternatives Screening Memorandum (DTS 2006a). Three scoping meetings were held during the screening process in December 2005, which included a presentation of initial alternatives to the public, interested agencies, and officials to receive comments on the Purpose

Mr. Bart Travaglio
Page 2

and Need, alternatives, and scope of the Alternatives Analysis. Refinements were made to the alternatives based on the public input during scoping.

After completion of screening in the winter of 2006, the following alternatives were studied in the Alternatives Analysis: No Build Alternative, Transportation System Management (TSM) Alternative which emphasized using buses as the primary improvement to the transportation system, Managed Lane Alternative, and the Fixed Guideway Alternative. After review of the Alternatives Analysis Report and consideration of public comments, the City Council identified a fixed guideway transit system extending from Kapolei to UH Manoa with a connection to Waikiki as the Locally Preferred Alternative. This identification, which eliminated the TSM and Managed Lane Alternatives from further consideration, became Ordinance 07-001 on January 6, 2007. The TSM Alternative did not have a significant beneficial effect and performed very much like a No Build Alternative because buses are still affected by overall roadway congestion and could not meet the requirements of the Project's Purpose and Need. The NEPA process considered a range of alternatives that was consistent with the identified Locally Preferred Alternative. As discussed in Section 2.2, there were no alternatives that had not been previously studied and eliminated for good cause that would satisfy the Purpose and Need at less cost, with greater effectiveness, or less environmental or community impact.

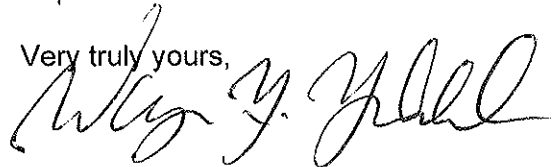

In addition, TheBus is currently purchasing more fuel-efficient buses, which will help reduce energy usage. However, like diesel, the propane in your recommendation has to be imported to Hawaii and is not a renewable resource.

Although noted, your comment regarding repurposing military nuclear reactors is outside the scope of a transit project.

Lastly, the planned electricity generation capacity on Oahu will be sufficient to support the transit system. It will require less than 2% of the power generation on the island and HECO has stated they can readily accommodate the increased demand within their current program for energy production. Over time, the benefit of electricity is that much of it can be generated from renewable sources.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Mr. Kevin Killeen
1750 Kalakaua Avenue, #3-3179
Honolulu, Hawaii 96826

Dear Mr. Killeen:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As stated in Chapter 3 of the Final EIS, "Adding substantial passenger capacity with more buses is not feasible in some key locations along the system because of roadway capacity constraints. Choke points occur in Downtown Honolulu during the a.m. peak period, especially at the merger of North Beretania, North King, and Liliha Streets, and Dillingham Boulevard and along Hotel Street. King Street has been used to introduce new service in recent years due to the capacity limitation of Hotel Street; however, choke points occur at the Chinatown bus stops and at the Punchbowl Street and King Street stops. Buses often must wait to move into an open and safe boarding position. Continuing to add additional service to King Street without major physical improvements would add to the gridlock in this corridor, deteriorate transit service, and complicate pedestrian and traffic safety issues. In the p.m. peak period, choke points occur along Beretania Street, Hotel Street, Nimitz Highway, and Ala Moana Boulevard in the Downtown area. Several routes, including CountryExpress! Routes C, D, and E are

Mr. Kevin Killeen
Page 2

projected to be overloaded in 2030. Increasing frequency would require headways at five minutes or less. Further, the downtown street network cannot support the number of buses that would be required to meet projected demand."

Bus service will be enhanced and modified to coordinate with the rail system. Some existing bus routes will be altered or eliminated to reduce duplication of services. Buses removed from service in the study corridor will be shifted to serve other parts of the island. Certain local routes will be rerouted to provide frequent and reliable connections to the nearest rail station. A description of existing and future bus routes, including frequency, is included in Appendix D of the Final EIS.

Conditions on the highway will be worse in 2030 under any circumstances and regardless of which solution is applied. The travel demand forecasting model uses guidelines established by FTA. According to modeling conducted for the Project, the fixed guideway system will relieve traffic congestion by 18 percent (Table 3-14 in the Final EIS) versus without the Project. Conditions will be substantially better with the fixed guideway than with any of the other potential solutions studied.

The Sierra Club's national umbrella organization supports rail transit, as stated in Project publications. We recognize that the local chapter of the Sierra Club differs in its opinion from the national organization and asked for certain considerations. The local chapter of the Sierra Club has submitted their comments regarding the Project, and we will address those comments and concerns as appropriate.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Honolulu, Hawaii 96822

Dear Mr. Kawano:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

Your support for a Fixed Guideway Transit Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the

Mr. Richard Kawano
Page 2

Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

A comment period of 45 days is mandated for public review and comment on a Draft EIS. The comment period duration was extended by 30 days to February 6, 2009, for a total duration of 75 days. This period was longer than the 45 to 60 days typical for U.S. Department of Transportation Draft EIS documents. The document was also released to the public and reported on by local newspapers prior to its official notice of release, thereby allowing extra time for individuals to make their comment(s) on the document.

The City held five public hearings throughout the Project study area in December 2008. Project consultant and City staff members were available to answer questions and take comments. In addition, project staff will continue outreach activities throughout the community during the length of the Project. Information about the Project is available at www.honolulutransit.org.

Ms. Eve Anderson
Page 2

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Rail transit systems with opening date populations similar to Honolulu's current population include: Utah Transit Authority's TRAX rail system, Edmonton Transit System (ETS), Calgary C-Train, Portland's MAX rail system, and Vancouver's Sky Train.

The Alternatives Screening Memorandum (DTS 2006a) recognized the visually sensitive areas in Kakaako and Downtown Honolulu, including the Chinatown, Hawaii Capital, and Thomas Square/Academy of Arts Special Design Districts. To minimize impacts on historic resources, visual aesthetics, and surface traffic, the screening process considered more than 15 different combinations of tunnel, at-grade, or elevated alignments between Iwilei and Ward Avenue. As identified on pages 4-23 and 4-24 of the Screening Memorandum, four different alignments through Downtown Honolulu were advanced for further analysis, including an at-

grade portion along Hotel Street, a tunnel under King Street, and elevated guideways along Nimitz Highway and Queen Street.

The Alternatives Analysis Report (DTS 2006b) evaluated the alignment alternatives based on transportation and overall benefits, environmental and social impacts, and cost considerations. The report found that an at-grade alignment along Hotel Street would require the acquisition of more parcels and affect more burials than any of the other alternatives considered. The alignment with a tunnel under King Street through Downtown, in addition to the environmental effects such as impacts to cultural resources, reduction of street capacity, and property acquisition requirements of the at-grade section, would cost over \$500 million more than the least expensive alternative.

The Project's purpose is "to provide high-capacity rapid transit" in the congested east-west travel corridor. The need for the Project includes improving corridor mobility and reliability. The at-grade alignment would not meet the Project's Purpose and Need because it could not satisfy the mobility and reliability objectives of the Project. Some of the technical considerations associated with an at-grade versus elevated alignment through Downtown Honolulu include the following:

- **System Capacity, Speed, and Reliability:** The short, 200-foot blocks (or less) in Downtown Honolulu would permanently limit the system to two-car trains to prevent stopped trains from blocking vehicular traffic on cross-streets. Even with transit signal priority, the at-grade speeds would be slower and less reliable than an elevated guideway. Under ideal circumstances, the capacity of an at-grade system could reach 4,000 passengers per hour per direction, assuming optimistic 5 minute headways. Based on travel forecasts, the Project will need to carry approximately 8,000 passengers by 2030. Moreover, the system can be readily expanded to carry over 25,000 in each direction by reducing the interval between trains (headway) to 90 seconds during the peak period. To preserve a comparable system capacity, speed, and reliability, an at-grade alignment would require a fenced, segregated right-of-way that would eliminate all obstacles to the train's passage, such as vehicular, pedestrian, or bicycle crossings.
- **Mixed-Traffic Conflicts:** With the planned three-minute headways, the short cycle of traffic lights would affect traffic flow and capacity of cross-streets. Furthermore, there would be no option to increase the capacity of the system by reducing the headway to 90 seconds.
- **Construction Impacts:** An at-grade system would consume two or more lanes of existing roadway, resulting in increased congestion or requiring that additional businesses or homes be taken to widen the roadway through Downtown. This would also have greater construction impacts and potentially affect cultural practices and burials to a greater extent than the placement of discrete column foundations for an elevated structure.

Because it is not feasible for an at-grade system through Downtown to move passengers rapidly and reliably without significant detrimental effects on other transportation system elements (e.g., the highway and pedestrian systems, safety, reliability, etc.), an at-grade system

Mr. Robert Crone
Page 3

would have a negative systemwide impact that would reduce ridership throughout the system. The at-grade system would not meet the Project's Purpose and Need and, therefore, does not require additional analysis.

Because of project requirements for completely grade-separated operations to avoid vehicle and pedestrian conflicts, the system can be constructed with third-rail technology, which eliminates the need for overhead lines.

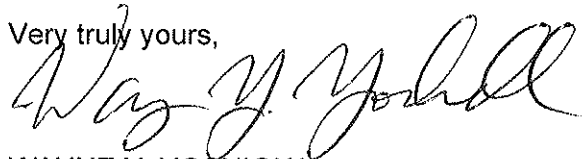

Section 6.3 of the Final EIS describes the financial resources anticipated to be needed to pay for the capital costs of the Project. Capital costs of the Project, including finance charges, are expected to be fully paid for by a combination of FTA Section 5307 and FTA Section 5309 New Starts funds from the Federal government and revenues from the County's General Excise and Use Tax (GET) Surcharge from 2007 through 2022 on Oahu. These funding assumptions are subject to a number of risks and uncertainties, as described in Section 6.6.

While the elevated rail has higher capital costs than an at-grade system, it provides more reliable service and shorter travel times, with less interference with and impact on auto traffic. The proposed sources of funding to pay for this service are documented in the Final EIS.

Section 6.4 of the Final EIS describes the financial resources anticipated to be needed to pay for ongoing operating and maintenance costs. Operating and maintenance costs will be paid for from the same sources currently used for TheBus: Federal funding, fare revenues, and City revenues from the General and Highway Funds. These funding assumptions are subject to a number of risks and uncertainties, as described in Section 6.6.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

SPEAKERS:

Bob Kilthau 1310 Haloa Drive Honolulu, Hawaii 96818	3
Herbert T.C. Loo 1569 Onipaa Street Honolulu, Hawaii 96819	4
Lennard Pepper 1352 Olin Street Honolulu, Hawaii 96818	5
Ruth Boyett 4336 Laakea Street Honolulu, Hawaii 96818	8
Dennis Egge 2920 Ala Ilima Street, #703 Honolulu, Hawaii 96818	9
Kenneth Tsumoto 3434 Ala Ilima Street Honolulu, Hawaii 96818	10

BOB KILTHAU: We're residents of Foster Village, and we think that the Salt Lake route is pretty dumb because it's going to go by all the schools, Makalapa Elementary, Radford High School, and it's not going to help people in Foster Village. It's just going to make noise for us, and while they're building it, it's going to cause a lot of trouble for traffic to get in and out of Foster Village, and we think it should go along Kam Highway, so it goes by the Pearl Harbor Complex, and the Hickam Air Force Base, and the airport. That makes a lot more sense to me.

Oh, yeah, I said the schools. Yeah, Radford High School and Makalapa Elementary School are going to be bothered by this thing, during the building and, also, it's going to be making a lot of noise for those schools, when the trains go through. And it makes a lot more sense to use Kam Highway. That's where the people -- I've talked to several people who work at Pearl Harbor, they said they'd rather have it go to Pearl Harbor, along Kam Highway. That's about it.

HERBERT T.C. LOO: I'd like to testify that this project should have been built many years ago, and it is a sad situation when we still have these few people bringing up this "if" and "or" about this particular project, which is long overdue. Of course, probably a lot of them haven't traveled to see other parts of the world, to see how the transit of people moving around by the millions are using this type of transportation, economically, safe, and, best of all, you get there in the least amount of time. And I say that we should proceed with this, with the fastest means possible and get it done, and then you'll know and appreciate what a real transit system is like.

I lived in New York City for seven years, and you'd just imagine if they didn't have the subway there. Boy, a million people travel on that every day, and it's a snap. Just think if we had this 20 years ago, boy, everybody would be less humbug with this traffic mess that we have

now. That's my testimony and I hope we get this thing built as soon as possible.

-oOo-

LENNARD PEPPER: I will not duplicate much of what I testified in public. However, in order to make sure that certain important things get recorded, I'd like to say that in the EIS, I think it's in 1-6, there were some major facilities left out. These include the Bougainville industrial area, which is an area of both retail and wholesale facilities, and we'll have a Target, as of March of next year. The Moanalua Shopping Center, the Stadium Marketplace -- the Pearl Harbor commissary and the Public Work Center, those are both military -- so those are left out.

In addition, I feel that the document itself is kind of static and does not recognize many changes which will occur in this community by 2030. It is an aging community, it is a community that will become poorer because the infrastructure is aging. In fact, Foster Village was begun in

1957, so it will be 80 years old, roughly 80 years old by 2030. Salt Lake, I think, was started over 30 years ago. It will be an aging infrastructure and an aging population. They, the aging population, will need public transportation.

The document also does not recognize changes which I anticipate in the public school system. There are five public schools along the route, at least two of them high schools. They are likely to become magnet schools by 2030, schools which specialize in one particular kind of instruction; for example, drama or English, and kids from all over the city will be coming to those schools because they will specialize in that particular function. They'll need public transportation. This is all in conjunction with my support for the Salt Lake route.

In addition to that, the EIS does not seem to have, at least the part I read, does not have clear indication of what the feeder system, the feeder bus system is going to look like. I think that's an important thing that should be included in the final EIS.

It also is not very clear about the property acquisitions which will be necessary. It

was my understanding that many properties would require only a very small strip of land be taken. When the opponents talk about this Salt Lake route, they talk as if it's going to be the whole property is going to be taken instead of, say, three feet or two feet from a yard, or carport or something.

The other thing that I guess I did not make as firmly as I should have, during the public testimony, was that the Salt Lake route enables a seven-day-a-week system serving the population. Going to church, going to Aunty, going to soccer games. Whereas the airport route is basically a five-day-a-week, "go to work and come home" system.

Something I said in the public hearing, when we were talking about starting this whole thing, was taken sort of as a joke, but it wasn't meant as a joke. One of the social benefits of this thing would be getting drunks off the road. Some people who like to drink to excess will take the public transportation rather than drive drunk, and I think that's a valuable and important social benefit.

So, in summary, the social benefits of

the system are not adequately dealt with, in the EIS, as far as I'm concerned, and they matter at least as much as getting people to work and at least as much as the cost of the system. That will do it. Thank you.

-oOo-

RUTH BOYETT: I think a static lane would look much nicer to go down Kam Highway and Nimitz. I think the view would be much nicer. I live on Salt Lake Boulevard. I don't want to have it pass on my front yard. That's all.

-oOo-

DENNIS EGGE: I believe that we should build out from Ala Moana Center or the Honolulu Convention Center area out to Middle Street, to take care of all the congestion in town. And from that point, west, I think things can be taken care of by existing TheBus and surface transportation, but I think things really get jammed up, the closer you get into town. Like one guy tonight said, what used to be a ten-minute ride from Salt Lake to Queen's Hospital is now 90 minutes. So we won't be able to tolerate that much longer. If

the Mayor would consider building out from Ala Moana Center, shopping center area, which is a major transit-oriented development at the moment, out to the Middle Street terminal, then I think they will have something. Thank you.

-oOo-

KENNETH TSUMOTO: They should get one committee and just vote on it, you know, and include a monorail one place. If they already agreed on Salt Lake, then why are they going over and over again? You know what I'm saying? Just get one panel of people just to decide it. Instead of going to -- you know what I'm saying -- going to one place to, basically, another place, that, I cannot see. Because remember what happened to the Aloha Stadium and the lawsuit?

The engineers were suing the Aloha Stadium, and the engineers on their side always answered the question. But when the other side bring up the question, famous answer, "I don't remember." So what I'm just saying is that this is the same thing what's happening now. So, you know, that's the ball game.

Dear Mr. Kilthau:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your preference for the Airport Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry more passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly lower impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS

Mr. Bob Kilthau
Page 2

discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

For schools and other noise-sensitive places that do not have nighttime, sleep activities, the FTA Transit Noise and Vibration Impact Assessment compares the existing maximum-hour noise level to the maximum-hour noise that the transit line will produce by itself. For the Salt Lake Alternative, between Aloha Stadium and the Ala Liliko'i Stations, the existing current maximum-hour Leq noise level at the school ranges from 60 to 65 dBA. A project noise level of 63 dBA or above would be an impact. The Project is predicted to have a maximum-hour Leq noise level of 51 dBA, and maximum-hour noise levels will stay the same.

As stated in Section 4.10.3 of the Final EIS, the Project will cause no severe noise impacts. Moderate impacts will occur at upper floors of a few high-rise buildings (as shown in Table 4-18 in the Final EIS). With the recommended mitigation in place (sound absorbing material and wheel skirts on the trains), the noise analysis indicates that the new noise generated by the Project will be lower than the existing noise levels in most places.

The project design includes an integrated noise-blocking parapet wall at the edge of the guideway structure that extends three feet above the top of the rail. The parapet wall will substantially reduce ground-level noise.

Wheel skirts will increase the benefit from the parapet wall at locations above the elevation of the track. The use of sound-absorptive materials below the tracks in the areas that will experience moderate noise impacts will reduce the Project noise levels from the upper floors to below the impact level. Once the Project is operating, noise levels will be re-measured to confirm that there are no noise impacts from the Project.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Dear Mr. Pepper:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

To address your first comment, the Major Activity Centers in the study corridor listed in Figure 1-4 are within one-half mile of the guideway alignment. The list is not meant to be an exhaustive list of all businesses.

In addition, the planning year of the Project is 2030, consistent with the OahuMPO Regional Transportation Plan. Anticipated change, including aging and increasing numbers of Oahu residents, is a key part of the Project's Purpose and Need. According to the Executive Summary, the Project will provide reliable mobility in areas of the corridor where people of limited income and an aging population live and will serve rapidly developing areas at the Ewa end of the corridor.

Mr. Lennard Pepper
Page 2

Your preference for the Salt Lake Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

Section 4.4 of the Final EIS discusses acquisitions and Appendix B of the Draft EIS and Appendix C of the Final EIS show each parcel. In addition, Table 4-4 in the Final EIS shows how many acquisitions are full acquisitions (the entire parcel) and how many are partial acquisitions. Partial acquisitions will not require a business or resident to be displaced and relocated.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Mr. Dennis Egge
2920 Ala Ilima Street, #703
Honolulu, Hawaii 96818

Dear Mr. Egge:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As described in Section 2.5.10 of the Final EIS, to support phased opening of the system, the first construction phase must be connected to a maintenance and storage facility, which requires considerable land. The first phase of the Project must be connected to the maintenance and storage facility because, in addition to maintenance of equipment and ongoing operations, the maintenance and storage facility houses the main control center for the entire Project, and the required testing and operation of the system could not be completed without access to it. No location has been identified closer to Downtown with sufficient available land to construct a maintenance and storage facility. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations*
- *Reduce the time that each area will experience traffic and community disturbances*

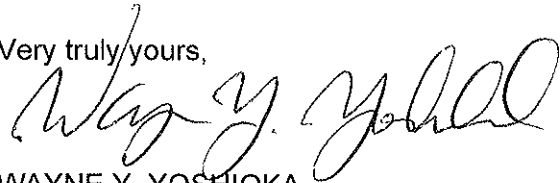

Mr. Dennis Egge
Page 2

- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding*
- *Match the rate of construction to what can be maintained with local workforce and resources*
- *Balance expenditure of funds to minimize borrowing*

The portion of the corridor Ewa of Pearl Highlands is less developed than the areas Koko Head. Right-of-way can be obtained more quickly; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted Koko Head from Pearl Highlands to Aloha Stadium, then Kalihi, and finally to Ala Moana Center.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Dear Mr. Tsumoto:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

As described in Chapter 2 of the Final EIS, monorail technology was evaluated and eliminated. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the

Mr. Kenneth Tsumoto
Page 2

Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

1 HEARING OFFICER HAMAYASU: Good Evening,
18:04:17 2 I am Toru Hamayasu, the Second Deputy Director of the
3 City and County of Honolulu Department of
4 Transportation Services. I am the hearing officer for
18:04:26 5 this public hearing for the Draft Environmental Impact
6 Statement for the Honolulu High-Capacity Transit
7 Corridor Project.

8 The purpose of this public hearing is to
9 collect comments related to the proposed transit
10 project regarding: the draft EIS; Section 106 of the
11 National Historic Preservation Act process; Section
12 4(f) of the U.S. Department of Transportation Act;
18:04:59 13 right-of-way acquisition; and floodplains affected by
14 the project.

15 Public input can be made in four ways:
16 1) public spoken testimony to me here in the public
17 hearing room; 2) if you do not wish to speak in
18 public, an individual spoken testimony for the record
19 can be made to the hearing recorder who is near the
20 public involvement station in the public information
21 area; 3) written testimony may be deposited in the
18:05:27 22 black comment box at the meeting, delivered to the
23 Department of Transportation Services office, or
24 mailed or faxed (808) 523-4730 to DTS by January 7,
25 2009; and finally, 4) testimony can be submitted

Honolulu, Hawaii

(808) 524-2090

1 online by January 7, 2009 at www.honolulutransit.org.

18:05:59

2 All comments and responses will be
3 included in the Final EIS. Revisions to the EIS will
4 be made as appropriate based on comments. The hearing
5 procedures are as follows:

6 1. Elected and public officials will be
7 heard first. Persons desiring to testify should
8 register at the entrance to the hearing room, and will
9 be called in order of registration.

18:06:29

10 2. Any individual may appear and speak
11 for him or herself, or if duly authorized for any
12 local civic group, organization, club or association,
13 subject to the rules provided herein. Speakers should
14 give their name. If representing a group, this
15 information should also be given.

18:06:55

16 3. Speakers must limit their statements
17 to three minutes. Additional prepared statements or
18 literature pertaining to the project may be submitted
19 at this hearing or by 4:30 p.m., January 7, 2009 to
20 Department of Transportation Services. These
21 statements will be made part of the official record if
22 they include a legible name and address.

23 4. For these hearings, all statements,
24 oral or written, should be directed to the hearing
25 officer and must be related to the subject matter of

Honolulu, Hawaii (808) 524-2090

1 the hearing.

18:07:28 2 5. Each person speaking before the
3 audience must do so at the floor microphone. We will
4 call testifiers in groups of three to facilitate
5 orderly progress. Please ensure you are in the
6 hearing room at the time your name is called. A court
7 stenographer will record and transcribe the hearing
8 proceedings. If required, I will announce any other
9 specific rules governing this hearing.

18:07:57 10 6. As part of this public hearing
11 process, the Honolulu High-Capacity Transit Project
12 team is not allowed to respond to any questions or
13 concerns raised by the speaker. The project team will
14 be available to address your questions in the project
15 information area outside of this hearing venue.

16 It is now 6:09 p.m. At this time I would
17 like to begin the public testimony. The first
18:08:28 18 testifier is Michael Burton followed by Robert Webb
19 and Douglas Torres.

20 MR. BURTON: Hi. Good evening. I just
21 wanted to --

22 HEARING OFFICER HAMAYASU: Please state
23 your name first.

24

25

RALPH ROSENBERG COURT REPORTERS, INC.
Honolulu, Hawaii (808) 524-2090

1 MR. BURTON: My name is Michael Burton.

2 I live here in the community. I work at the airport.

18:09:02 3 Okay. I just wanted to say that I do support the rail

4 project, however, the latest discussions that I've

5 been hearing was changing the route, and I think it's

6 a waste of public's money to route the rail down from

7 Pearl Harbor toward the airport. My rationale is

18:09:24 8 because that it's bypassing densely populated

9 neighborhoods, such as Foster Village here at Salt

10 Lake, and I think public's money could be better used

11 by routing it down Salt Lake rather than going toward

12 the airport.

13 Secondly, in that route toward the

14 airport you're going to be intruding on a lot of

15 military property, which means you're going to have to

18:09:57 16 get third-party permitting and whatever that process

17 might be to get the okay to build your infrastructure

18 on their property. And, therefore, I think it's going

19 to be -- that's going to create a lot of delays in the

20 forward motion of this project.

21 Routing it down Salt Lake, because it is

22 a lot of city and county land along that Salt Lake

23 route there will be very little problems as far as

18:10:27 24 intruding on personal property and federal property

25 and what have you in that area. Like I said, it will

Honolulu, Hawaii

(808) 524-2090

1 benefit the Foster Village community as well as Salt
2 Lake community. That's it.

3 HEARING OFFICER HAMAYASU: Thank you.

4 Next speaker is Robert Webb.

22

23

24

25

RALPH ROSENBERG COURT REPORTERS, INC.
Honolulu, Hawaii (808) 524-2090

1 MR. WEBB: First I would like to thank
2 you for allowing me to express my viewpoint on the
18:11:00 3 issue.

4 HEARING OFFICER HAMAYASU: Please state
5 your name first.

6 MR. WEBB: My name is Robert Webb. I'm a
7 28-year resident of Salt Lake.

8 I Robert Webb oppose the Salt Lake route
9 for the following reasons:

10 Number one, I feel very strongly the
11 schools that would be involved are the Radford High,
12 Aliamanu elementary and middle schools should not be
13 uprooted in any way, shape or form. I feel the
18:11:27 14 students should not encounter any difficulty in their
15 learning when a link is being built and when it's open
16 for service. And for the same reason I feel the Salt
17 Lake Library should not be touched, okay.

18 Thirdly, I -- you might think I'm a
19 little paranoid or what, but I don't care. I think
20 that if we have a substation in a highly, densely
18:12:00 21 populated area, we are going to have a real social
22 problem on our hands and that is a lot of homeless
23 people will take shelter at a substation, and I'll be
24 damned if some of our kids are getting woo'd by types
25 like that and they might get involved in some kind of

Honolulu, Hawaii

(808) 524-2090

1 illicit activity like drug pushing, et cetera,
2 et cetera. Okay.

18:12:27 3 I also feel strongly that despite the
4 overcrowdings of parking in the Aliamanu district it
5 is doubtful there will be enough people that abandon
6 their driving to utilize the rail. I'm sure that it
7 can be argued. The rail may be still an option for
8 those who are currently obtaining bus service
9 presently. I can see that segment of the population
10 which would favor the rail here in Salt Lake.

18:12:57 11 I also feel strongly that I -- excuse
12 me -- that many people who probably -- and don't feel
13 insulted when I say a thing like this -- many people
14 who probably have not lived for an extensive period of
15 time on the mainland or in foreign countries don't
16 know the experience of being too close to steel wheel
17 on steel rail. It can get pretty noisy, although
18 studies have been shown to show that it shouldn't be a
18:13:27 19 problem, but I still have my doubts about decibel
20 levels and the impact on people and what connection it
21 might have with sleep deprivation.

22 And I feel last but not least because of
23 the noise level and condemnation of residential and
24 business property --

25 (Buzzer sounds.)

Honolulu, Hawaii

(808) 524-2090

1 HEARING OFFICER HAMAYASU: Please
2 summarize.

3 MR. WEBB: Okay. In conclusion, I feel
4 that the Salt Lake linkage would create more
5 disruption to the quality of life and incur more
6 social cost than what the community is willing to
7 bear. Thank you.

18:13:57

8 HEARING OFFICER HAMAYASU: Next speaker
9 is Douglas Torres followed by T. K. Chun and Thomas
10 Strout.

11

12

13

14

15

16

17

18

19

20

21

22

23

24

25

RALPH ROSENBERG COURT REPORTERS, INC.
Honolulu, Hawaii (808) 524-2090

1 MR. TORRES: My name is Doug Torres, and
2 I'm a resident of Salt Lake Boulevard. We, the
3 residents and community of Salt Lake Boulevard are
4 against the rail down Salt Lake Boulevard. As
18:14:28 5 indicated, there will be only two stations along the
6 Salt Lake Boulevard, one at the stadium and one at Ala
7 Lilikoi Street.

8 Almost the entire length of the boulevard
9 it's only for rail to pass through; no stops. How can
10 the people who voted for it justify all the homes and
11 lives that will be affected by this rail, passing
12 above 400 times a day? How is it going to affect the
13 students of Makalapa Elementary, Radford High School,
14 Aliamanu Elementary seeing, hearing, feeling 20 times
18:14:58 15 per hour during peak hours? How do you think it will
16 affect the quality of life of those who live on Salt
17 Lake Boulevard?

18 The Council has voted 7 to 1 in favor of
19 changing the rail from Salt Lake back to the original
20 route to the airport. You have voted for the rail
21 down the boulevard. Now, feel how it feels to be
22 deceived, disappointed and frustrated that things can
23 get. When the rail route has changed from the airport
24 to Salt Lake Boulevard by Councilmember Cachola, we,
18:15:29 25 the residents of the boulevard, could not believe this

Honolulu, Hawaii

(808) 524-2090

1 was happening. Our frustration and disappointment has
2 been with us for a long time. He has sold our quality
3 of life for a vote and for his vision. A good
4 community leader takes care of his community but will
5 not sacrifice other communities for the betterment of
6 his. A good representative will make sure of this,
7 but in both cases this is not to be. His vision is
18:15:56 8 the same vision that Salt Lake Boulevard starts and
9 ends at Ala Lilikoi Street. You call this tunnel
10 vision. It starts at Aloha Stadium, passes Halawa
11 Estates Shopping Center, Stadium Mall, Foster Village,
12 Makalapa Elementary, Radford High School and the park,
13 Aliamanu and the Naval Housing and Aliamanu
14 Elementary. All these communities and residents are
15 not seen in his vision or they were and are to be
16 sacrificed.

17 We have a second chance and we must take
18:16:28 18 advantages of this. With our eyes wide open we must
19 first remember we live in the best location on this
20 island which is called central. Every location is in
21 driving distance. Yes, we will not give up our cars.
22 And we also have so many different ways to get to our
23 destination and to our home. We will be the last
24 place on this island to give up our cars, because we
25 live in the best location, which is central.

Honolulu, Hawaii

(808) 524-2090

1 This does not mean that we give up rail.

18:16:57

2 Our hope is Councilmember Cachola and our community
3 leaders must have an open mind and take a good look at
4 the airport route. The advantage is ours because of
5 the location we live and the location for the rail
6 station.

7 (Buzzer sounds.)

8 Living in a central location would give
9 us the best of three ways to travel, the rail, our
10 buses and most of all our cars. I hope that you not
11 only heard what I have to say but that you listened to
12 the words I have to say, because the families, friends
13 along the boulevard --

18:17:29

14 HEARING OFFICER HAMAYASU: Please
15 summarize.

16 MR. TORRES: -- will not lose the second
17 chance we have to move the rail back to the airport.

18 (Applause.)

19 HEARING OFFICER HAMAYASU: Thank you.

20 T. K. Chun followed by Thomas Strout.

21

22

23

24

25

RALPH ROSENBERG COURT REPORTERS, INC.
Honolulu, Hawaii (808) 524-2090

1 MR. CHUN: My name is T. K. Chun. I'm a
18:17:57 2 retired engineer. I live in Pacific Heights area. I
3 missed the hearing last night because of the Christmas
4 party. I support the rail transit system and I vote
5 for it. Good engineering should start with the
6 critical area. We shouldn't start from way up in the
18:18:26 7 Kapolei area. We should start from Waipahu to the
8 downtown area. That's the critical area. And we
9 should do it now. It's probably going to take us more
10 than ten years.

11 I'll tell you a little story. I was
12 the -- I went to the first public hearing in 1963 for
13 H3. It took us 30 years to build it. So I hope we
14 can build this maybe in ten years or less, because in
18:18:58 15 other countries they build it in four or five years,
16 so I hope I can ride it before I die, before I kick
17 the bucket. I'm 74 years old and I helped build H3,
18 so it took us -- it took us 30 years to do H3. I hope
19 we don't take another 30 years to get our mass transit
20 system.

21 Thank you.

22 (Applause.)

23 HEARING OFFICER HAMAYASU: The next
24 speaker is Thomas Strout followed by Tony Soon and
18:19:27 25 Doug Pyle.

Honolulu, Hawaii

(808) 524-2090

1 MR. STROUT: Hello, my name is Tom
2 Strout. I'm a resident of the Salt Lake area. I'm
3 just curious as to why they think the airport would be
4 more advantageous and more efficient to draw in money
5 as opposed to the Salt Lake alignment. The reason
6 being, the employment distribution in the airport,
7 Hickham, Pearl Harbor area, according to your DEIS
8 ranks sixth and the Salt Lake employment ranks seventh
18:19:59 9 so there's not much of a difference there, but the
10 population difference between the airport versus Salt
11 Lake, airport ranks 23rd; Salt Lake ranks sixth. And
12 by the year 2030 airport is going to rank 24th and
13 Salt Lake is going to rank 9th.

14 Now, of these rankings, the bigger
18:20:25 15 population is this side of the stadium, you know.
16 When you look at the drafts you have in your DEIS, it
17 just did not make much sense when there's such little
18 effect out that way. Now, come closer to 2030, yeah,
19 you'll have a greater amount of people out that way,
20 but how many of them travel all the way into town?
21 Some of them only come halfway. The traffic problem
22 is the downtown corridor. If we relieve the traffic
18:20:57 23 there, it makes it simplified and easier for everybody
24 coming from the other side of the island, you know.
25 That's what I think we should try and look at how we

Honolulu, Hawaii

(808) 524-2090

1 really want to spend the money.

2 Besides the airport route is going to be
3 more costly. It's going to take longer for that route
4 to go from one destination to another. And it just
5 doesn't -- you know, they're going to put a longer
6 delay on getting this thing built and we need to get
7 the thing started.

8 Thank you.

9 HEARING OFFICER HAMAYASU: Next speaker

18:21:28 10 is Tony Soon, followed by Doug Pyle and Maurice
11 Morita.

12

13

14

15

16

17

18

19

20

21

22

23

24

25

RALPH ROSENBERG COURT REPORTERS, INC.
Honolulu, Hawaii (808) 524-2090

1 MR. SOON: Hi. My name is Tony Soon and
2 I live in the Salt Lake area. I voted for the rail,
3 because it was going through Salt Lake. I feel it's
4 fraudulent what the city council are trying to do at
5 this time. Trying to rob us of something equivalent to
6 a birthright that we should be having for all our
7 children and grandchildren. .

8 I have two sets of comments that I would
18:21:59 9 like to make tonight and one is on the DEIS, and I
10 didn't really read the DEIS in great detail, but here
11 are a synopsis of some of the things which I found
12 which was wrong.

13 First of all, the DEIS refers to the Salt
14 Lake route as an alternate. When, in fact, it was the
15 only route that was considered for the vote. I think
16 that was wrong. The other thing is that the DEIS
17 makes a skewed assumption that there has been no
18:22:29 18 population growth in the year 2030 for the Salt Lake
19 area, whereas they took the other areas into
20 consideration.

21 The other thing that the DEIS
22 contemplated was who was the rail supposed to serve,
23 and according to them, according to their DEIS report,
24 it says it is for people with limited income and an
25 aging population. That's the people of Salt Lake. I

Honolulu, Hawaii

(808) 524-2090

18:22:59 1 think by bypassing the people of Salt Lake, they would
2 be robbing these older people and younger people,
3 younger residents, of this opportunity of being able
4 to enjoy the benefits of being on the rail.

5 Then the DEIS also makes reference to the
6 transportation equity and what that means is it's a
7 fair distribution of resources so that no other group,
8 no group, carries an unfair burden or receives an
18:23:27 9 unfair share of the benefits. When they route the
10 rail down by the airport, what they're doing is that
11 they're robbing the people of Salt Lake of this
12 opportunity.

13 And here are my personal comments on
14 this. I would say the people of Salt Lake are aging,
15 and they have many children, a lot of younger
16 residents and they're really low income and they need
17 to be on the rail. The other thing again is there is
18 this fallacy that is being passed around that the rail
19 must go to the airport. Well, I lived in the City of
18:23:57 20 Toronto, which is nearly 4 million people. The subway
21 does not go to the airport. The subway stops five
22 miles away from the airport and there's a bus that
23 takes the tourists to the airport. The other thing
24 that you need to remember is that can you imagine a
25 tourist spending thousands of dollars coming to Hawaii

Honolulu, Hawaii

(808) 524-2090

1 and leaving \$20 tips and \$100 tips and then all of a
2 sudden cannot find \$30 so they can take a taxi. It's
3 utterly ridiculous.

18:24:28

4 The other thing I'm worried about is that
5 Salt Lake --

6 (Buzzer sounds.)

7 MR. STROUT: -- this report was made by
8 three people, which includes the military, and I think
9 somehow because the military is south of Nimitz, I
10 can't help but be very suspicious about this report.

11 Thank you.

12 HEARING OFFICER HAMAYASU: Next speaker
13 is Doug Pyle followed by Maurice Morita.

14

15

16

17

18

19

20

21

22

23

24

25

RALPH ROSENBERG COURT REPORTERS, INC.
Honolulu, Hawaii (808) 524-2090

1 MR. PYLE: Hello. I don't know if
2 there's a particular format for introducing ourselves.
3 Doug Pyle. I live in downtown. I have family here in
18:24:58 4 Salt Lake and I also have -- as chair of the
5 democratic party's labor caucus. The democratic party
6 of Hawaii's labor caucus which supports rail, the
7 democratic party supports rail in general, as passed
8 by a resolution at the convention last spring.

9 The labor caucus has had a lot of talk
10 about it in terms of jobs and its value along those
11 lines and so I strongly support getting rail underway,
18:25:30 12 both for the jobs it would recreate in construction as
13 well as the economic stimulus it would provide, and
14 given the economy in Hawaii and nationwide that's even
15 more important to get this going soon.

16 Ideally both routes would be -- are great
17 and should be built. The question is which first, and
18 it does -- there's -- I wouldn't say that our caucus
19 has a consensus, but there is agreement that there
18:25:59 20 should be as early as possible start. The community
21 did vote on the package, so there's an advantage to
22 starting with Salt Lake, and some suggestions -- I
23 don't know how much flexibility there is still in
24 design, but perhaps if the Salt Lake route were built
25 first, there could be a less expensive, say, light

Honolulu, Hawaii

(808) 524-2090

1 rail or tram off to the airport, such as other cities
2 have. I've taken the one in San Francisco, as an
3 example.

18:26:28

4 And another consideration is that along
5 the route are several important destinations. We also
6 need boarding points in dense population areas, where
7 workers, shoppers can board to get to the destination.
8 Salt Lake has a very dense population and so it
9 deserves its own station. And one consideration is
10 connecting through Camp Catlin Road. That would be --

18:26:58

11 that's right next to government housing, so it may
12 be -- there may be property that could be used for
13 developing, for example, a spur off to the airport and
14 Pearl Harbor.

15 I don't want to take up any more time
16 than is allotted and I just wanted to be brief and say
17 that the Democratic Party in general and certainly the
18 labor caucus that I chair supports the construction of
19 rail.

20 Thank you.

21 HEARING OFFICER HAMAYASU: Next speaker

18:27:30

22 Maurice Morita.

23

24

25

RALPH ROSENBERG COURT REPORTERS, INC.
Honolulu, Hawaii (808) 524-2090

1 MR. MORITA: Hi. My name is Maurice
2 Morita and I live in South Salt Lake, and I hold
3 different hats. I also am the vice chair for the
4 neighborhood board 18 for Salt Lake, Aliamanu and
5 Foster Village and I also work for the Hawaii State
6 Teachers Association who supports the rail, too. Not
7 the route, but the rail.

8 I do feel for the people that live on
18:27:59 9 Salt Lake. We have some staff and some friends that
10 do live on Salt Lake, and they always tell me because
11 they know that I support the rail that I'm sorry, but
12 I oppose the rail, and the reason why they oppose the
13 rail is because they don't want it through their
14 backyard. And that's the problem that we have is
15 prisons, rubbish dumps; nobody wants it in their
16 backyard so the City Council sometimes doesn't know
17 where to build or put those things. And it's hard.
18:28:27 18 So we send the prisoners to Texas. Unfortunately, we
19 can't send people away.

20 But I think the rail is for the future
21 and I -- and, like I said, I do understand the people
22 that live on Salt Lake Boulevard, you know, for years
23 and the way they feel, but to me I think we need the
24 rail to come through Salt Lake for various reasons
25 that these folks have said.

Honolulu, Hawaii

(808) 524-2090

1 As far as the schools go, they do take a
2 sound test to see if there's too much noise, and if
3 there is too much noise, then the Department of
18:28:59 4 Education usually will put air conditioners in the
5 classroom. So that would be a plus for the schools to
6 have air in the classroom, like all the other state
7 offices and county offices are all air conditioned.
8 Even the prison have air conditioners, but the schools
9 don't have -- you know, some do, but not all. That
10 would be a plus for the schools there that is on the
11 site.

12 And then the other reasons that were
13 given about why the rail should come through Salt Lake
18:29:27 14 is we do have an aging group here and there's a lot of
15 people that work in downtown, so I think that it would
16 be advantageous for us. In talking to you, Toru, it
17 could cost less to do a spur from Salt Lake to the
18 airport than versus from the airport to South Salt
19 Lake. So I think we would save a lot of money if we
20 go to Salt Lake first and then do a spur to the
21 airport when it decides to go to Waikiki, because
22 they're not going to Waikiki on the first round.

23 Thank you.

24 HEARING OFFICER HAMAYASU: Next speaker
18:30:00 25 is Janice Soon Fah.

Honolulu, Hawaii

(808) 524-2090

1 MS. FAH: My name is Janice Soon Fah and
2 I'm a resident of Salt Lake. I'm also a teacher at
3 the Department of Education. I went out to exercise
4 my vote in the full knowledge that my vote would be
5 honored, and I think the Salt Lake vote carried the
6 rail. And I think we betrayed the trust of voters and
7 we will lead to more apathy in voter turnout if we do
8 not honor this vote that the Salt Lake residents made.

18:30:27

9 As far as concerns by the residents, I
10 think as the residents who are concerned that this is
11 going to create unsightly trains in their backyards,
12 if they were to look at the route, the route follows
13 Salt Lake Boulevard, and if they're familiar with the
14 rail systems -- I lived in Toronto for 26 years before
15 moving here to Hawaii, and I've lived here for 12
16 years, and actually the light rapid transit in Toronto
17 drives along some of the most prestigious
18 neighborhoods and it is so quiet, it is so clean, it
19 is so efficient that people who formerly would drive
20 their cars bumper to bumper into downtown Toronto will
21 hop on that train and be in downtown in 30 minutes.

18:30:58

22 They can read their newspapers, they can relax and
23 they can actually enjoy the commute.

18:31:29

24 As a Salt Lake resident, I work in
25 Kapolei, so I have a lot riding on this rail

Honolulu, Hawaii

(808) 524-2090

1 development, because I can see where a lot of young
2 teachers who live in central district now will be able
3 to offer their services in Leeward district where we
4 have a demand for highly qualified teachers to teach
5 in our struggling schools in the Leeward district.

18:31:58

6 Okay. I also understood from the
7 information that was provided that no homeowner
8 property will have to be acquired, at least not their
9 entire home, which is what some people may fear; that
10 it will infringe on their property and their property
11 will be acquired, but because it's going to be an
12 aboveground rail, what will happen is most of the
13 run -- most of the operations will be above ground and
14 they will just need land space to locate the elevators

18:32:28

15 that will take the commuters to the ground level. So
16 I think if we familiarize ourselves with the rail and
17 what it's going to offer our community, we, the Salt
18 Lake residents, will fight those politicians who at
19 first opposed the rail and now that the vote has been
20 carried for the rail are striving to influence that
21 decision to move it to the airport. I say we go for
22 Salt Lake and the airport or we go with the voters who
23 voted for Salt Lake.

24 Thank you.

25 HEARING OFFICER HAMAYASU: Thank you.

RALPH ROSENBERG COURT REPORTERS, INC.

RALPH ROSENBERG COURT REPORTERS, INC.
Honolulu, Hawaii (808) 524-2090

1 MR. PEPPER: My name is Len Pepper. I
2 live at 1352 Olin Street which is in Foster Village.
18:33:29 3 I am in favor of the Salt Lake route. I think that
4 the EIS is a good document and now I'm going to
5 proceed to crab about it.

6 There are some things missing, which I
7 think have import as far as deciding which alignment
8 to use. In 1 -- I think it's in 1-6, there is a list
9 of activity centers. That list does not include the
18:33:58 10 Moanalua Shopping Center. It does not include the
11 Stadium Marketplace. It did not include the
12 Bouganville industrial area where we have got, for
13 example, both wholesale and retail outlets and we have
14 got a Target coming, I think, in March. It does not
15 include the commissary area. It does not include the
16 military public works center.

18:34:29 17 It's a fairly static document. It does
18 not -- it gives a lot of statistical information about
19 what it's going to be like in 2030, but it doesn't
20 look at what the community is really going to look
21 like and what the people are going to be like in 2030.
22 In my judgment it is an aging community, Foster
23 Village, for example, was begun in 1957 and so by 2030
18:34:56 24 it's going to be about 80 years old. The Salt Lake
25 area will -- is also -- is about 30 years old at this

Honolulu, Hawaii

(808) 524-2090

1 point. The infrastructure will be aging, the
2 population will be aging. It is likely to be poorer
3 than it is now. Therefore, there is need for
4 considerable assistance from public transportation.

18:35:22

5 There are five schools, along the route.
6 Makalapa School, Radford High School, Aliamanu
7 Elementary, Aliamanu Intermediate and Moanalua High
8 School. Again, in my vision of 2030, there will be
9 magnet schools and other attractions which will bring
10 people to those schools from other areas. Those kids
11 will need public transportation.

18:35:59

12 In addition, the document seems to talk
13 mostly about a five-day-a-week bring people to work
14 and bring them back from work, but there's a lot of
15 social benefit to be derived seven days a week from a
16 public transportation system, and I hope that those
17 things will be taken into account.

18 If there are other things, I'll give them
19 to the public steno. Thank you.

20 HEARING OFFICER HAMAYASU: Is there
21 anyone else that wishes to testify?

18:36:26

22 Please state your full name and address
23 for the record.

24

25

RALPH ROSENBERG COURT REPORTERS, INC.
Honolulu, Hawaii (808) 524-2090

1 MR. TAYLOR: Hello. My name is Mark
2 Taylor and I'm a resident of 3427 Ala Hinalo Street in
3 Salt Lake.

4 I'm just here to speak in favor of the
5 Salt Lake alignment. I've already provided written
6 testimony so I'm not going to repeat what's in that in
7 this oral statement. I'm just going to highlight one
8 item, which is in the Draft EIS which has to do with
9 the cost of the airport alternative versus the Salt
10 Lake alternative. The draft says in Section 6.4.2

18:36:57

11 that both the Salt Lake and airport alternatives would
12 be financially feasible and yet that same paragraph
13 says that the airport alternative would require \$1.4
14 billion in federal funding from the Federal Transit
15 Administration. The document also says, though, that
16 the FTA has not been approached to consider the 1.4
17 billion for the airport alternative. They've only

18:37:25

18 agreed to consider 1.2 billion. I don't really quite
19 understand how the EIS can state categorically that
20 the airport alternative is financially feasible if the
21 FTA has not been approached for funding that's
22 required to construct it.

23 I think the reality is that this project
24 is hovering on the very cliff of affordability, and if
25 we go to the airport route and a couple of hundred

Honolulu, Hawaii

(808) 524-2090

1 million dollars in additional costs we're putting all
18:37:59 2 the taxpayers in this room at risk of potentially
3 having their property taxes raised to cover the
4 shortfall, because if the FTA doesn't pay for it and
5 the excise tax doesn't pay for it, all of you will be
6 paying for it with higher property taxes.

7 I would also point out that Draft EIS
8 does say that the Salt Lake route is the most cost
9 effective route. It provides in the terms of the
10 amount of dollars we're spending in benefit per dollar
18:38:25 11 a higher efficiency return than the airport route
12 does. So simply from the standpoint of fiscal
13 prudence, the Salt Lake route should continue as the
14 preferred route for the transit system.

15 Thank you.

16

17

19

20

21

22

23

24

25

RALPH ROSENBERG COURT REPORTERS, INC.
Honolulu, Hawaii (808) 524-2090

1 MR. REMMELL (phonetic): My name is Ben
2 Remmell. I'm a professional engineer and master
3 planner. And I'd like to comment on two things, which
4 is the project phasing, which is Chapter 2 of the
5 Draft Environmental Impact Statement, and it says that
6 the first phase would be from Kapolei to Waipahu, and
18:38:59 7 I totally disagree with that, because it would -- if
8 we run out of money, the general excise tax is not
9 providing the money that we need. We need to build it
10 to eliminate the bottlenecks at Middle Street and
11 Pearl City, so the first phases should be from Aloha
12 Stadium to downtown and that's what I recommend for
18:39:28 13 the DAS to consider in the project phasing.

14 The second point I want to make is that
15 the single and most important reason for building mass
16 transit is to eliminate traffic congestion. Rail
17 simply does not do that, despite spending \$7 billion.
18 The City's alternative analysis show that the current
19 2,000 vehicles per hour at Pearl City, which is now
18:40:01 20 congested, will increase to 8,000 vehicles per hour
21 after the \$7 billion rail is built. What we need is
22 an alternative solution which the alternative analysis
23 discarded fraudulently. And I suggest we need to
18:40:23 24 build a Nimitz flyover and a Kam flyover, both of
25 which would be three lanes over the Kam highway and

Honolulu, Hawaii (808) 524-2090

1 Nimitz which will eliminate the bottlenecks at the
2 Pearl City H1/H2/Middle Street merge for less than \$1
3 billion and that's what the DEIS must and should
4 include.

5 That's what I recommend.

6 (Applause)

7 HEARING OFFICER HAMAYASU: Anyone else

18:40:56 8 wishing to testify?

24

25

RALPH ROSENBERG COURT REPORTERS, INC.
Honolulu, Hawaii (808) 524-2090

1 MR. UECHI: My name is Mike Uechi. I'm a
2 physician. It's really interested to read the -- this
3 pamphlet put out by the City at taxpayers' money, The
4 Honolulu Rail Transit, and one of the questions they
5 ask is how would property owners along the route be
18:41:28 6 affected, and it states here that while some
7 residential and commercial properties must be acquired
8 in full, most of the right-of-way acquisitions
9 required are for portions of individual parcels.
10 Now, does that mean that if part of the rail post, the
11 support, goes through part of a property like say
12 through the living room, that you pay for that portion
13 of the land and let the person live in the rest of the
18:41:57 14 land? That's the part that I really don't understand.
15 What does portions mean? Does it mean a little bit of
16 thing that's not attached to the home or business, and
17 that's the only portion you're going to pay for.

18 The other question I have is that while
19 construction of rail goes on and let's say there's a
20 delay and another delay and another delay while
21 properties that are being sold or leased are abandoned
18:42:25 22 by property owners, what's going to happen to the cost
23 of construction? What's going to happen to the
24 community that's involved when this rail gets stalled
25 for any reason at all, whether there's problems with

Honolulu, Hawaii (808) 524-2090

1 finding burial sites along the City properties or
2 whether you run out of money or any type of thing that
3 will stall the development while it's going on right
4 now? And that's the type of questions I would like to
5 ask you guys right now, because I think these are the
6 questions the community needs to know before we
7 actually start the rail.

18:42:59

8 That's all I have to say.

9 HEARING OFFICER HAMAYASU: Any other
10 person wishing to speak?

11

17

18

19

20

21

22

23

24

25

RALPH ROSENBERG COURT REPORTERS, INC.
Honolulu, Hawaii (808) 524-2090

1 MR. GENADIO: My name is Frank Genadio.

2 You have my address. I'm from Kapolei. I thought

3 that you could only testify once, but when Dr. Uechi

4 came up, I realized I could testify again. I've been

5 following the hearings. In Kapolei I tried to make

18:43:28 6 the point that the Draft EIS brushed off other

7 technologies. I happen to be a proponent of something

8 called the HSST urban magnetic levitation system.

9 Those of you who are concerned about the cost should

10 be aware that the maglift guideway would be built at

11 least 20 percent cheaper. The guideway construction

12 would accommodate 25.3 miles for the 20 mile cost

18:43:59 13 reflected in the Draft EIS. In other words, we could

14 have an extension into Salt Lake from the airport

15 route, we could also have an extension to UH Manoa

16 whose students have been left out of this entirely,

17 and we could even have a spur into Waikiki.

18 It also happens to be at least twice as

19 quiet as steel wheels on steel rail and its guideway

20 is much less obtrusive and will require much less

18:44:28 21 impact on property. Thank you.

22 (Applause.)

23 HEARING OFFICER HAMAYASU: Another

24 speaker.

25

RALPH ROSENBERG COURT REPORTERS, INC.
Honolulu, Hawaii (808) 524-2090

1 MS. ING: Yes. My name is Renee Ing. My
2 address is P.O. Box 23094, Honolulu 96823. I'd like
3 to talk about another technology that was not included
4 in the EIS despite words to the effect that everything
5 was studied, and I think it should be studied.

18:44:58 6 Phileas magnetic guided -- magnet guided, not magnet
7 levitation. A similar system was funded in San
8 Francisco and someplace in Oregon by the FTA in 2007
9 and that means it could be funded for here. It is 1.5
10 billion compared to 5 and 6 billion. It's 1.5 billion

18:45:29 11 for the Kapolei to UH route. It can be built with
12 just plain old -- our plain old GET money. You don't
13 even need New Starts money. But on top of that it can
14 be quiet running through Salt Lake. Not only can you
15 go cut and cover, you cut a mini tunnel underneath the
16 boulevard, cover it so that Salt Lake Boulevard

18:45:57 17 continues to run, but you cut and cover a tunnel
18 underneath.

19 On top of that if you had to, you
20 could -- because it's a Prius-like vehicle, it's very,
21 very quiet and it will be of hydrogen fuel cells in a
22 few years and on top of that it does this thing called
23 running silent. It can be -- the noise can be cut for
24 a little bit while it's going through the residential
25 areas. That's the noise problem.

Honolulu, Hawaii

(808) 524-2090

1 The second problem that we have been
2 hearing a lot about it that if the route that's
18:46:30 3 constructed now, actually if it were for steel rail, I
4 think it's a pretty good route, but the problem is
5 there are other technologies. Phileas can go around a
6 lot of these places that are going to be intersected
7 by a steel train, Phileas will not cut through them,
8 it will simply go around them, because it is very,
9 very flexible. So I would really hope that the City
10 administration will study the Phileas system and the
18:46:59 11 urban maglift that Mr. Genadio was talking about in
12 the EIS. The FTA usually says it expects
13 municipalities to study a broad range of modes of
14 technology, not just one. So it's not something that
15 Honolulu will be -- you know, it would be unusual for
16 Honolulu to do this. Other municipalities studied a
17 lot of different ways of technology before they
18 choose, and to give them the chance to submit a
18:47:30 19 request for proposal.

20 Thank you.

21 HEARING OFFICER HAMAYASU: Anyone else
22 who wishes to testify? If nobody else is interested
23 in providing their comments, I conclude the hearing at
24 6:48 p.m. Thank you for your time and interest in
25 the project.

MR. TAKAI: I signed up.

HEARING OFFICER HAMAYASU: I'm reopening
the hearing.

RALPH ROSENBERG COURT REPORTERS, INC.
Honolulu, Hawaii (808) 524-2090

1 MR. TAKAI: My name is Mark Takai. I'm a
2 state representative, representing the communities of
3 Aiea and Pearl City. Tonight I speak as the chairman
4 of the Kamehameha Highway improvements task force and
5 for those of you who are unfamiliar with our task
6 force, it's comprised of all the elected officials in
18:48:29 7 the Aiea, Pearl City and Salt Lake areas. It also
8 consists of the Aiea, Pearl City and Salt Lake, Foster
9 Village neighborhood boards. In addition to that, it
10 includes some of the significant stakeholders along
11 the Kamehameha Highway corridor in Aiea/Pearl City.

12 The corridor for us begins on Center
13 Drive on the east side and goes all the way for about
18:48:57 14 5.5 miles to the end of Kamehameha Highway on the
15 Pearl City side, which is a little bit past Sam's
16 Club.

17 We've been working at improvements along
18 this corridor for about three years, and we try to
19 meet quarterly. Two years ago when this issue came
20 up, we took a position as a task force, and I just
21 wanted to mention -- and we sent it in a few times and
22 I've testified in front of the Council a number of
23 times, but I wanted to put this in the record. A
18:49:28 24 couple of things that the City as you move down this
25 path should be considering.

Honolulu, Hawaii (808) 524-2090

1 The first one is about 20 years ago there
2 was a compromise made by the City and Hawaiian
3 Electric to underground the 48 kilavolt lines on the
4 mauka side of the viaduct, but to construct the 138KV
18:49:57 5 lines that are the huge super structures, the huge
6 metal poles that run the entire length of the
7 corridor, and I do believe it goes up Salt Lake
8 Boulevard as well. Our task force recommends that the
9 City consider incorporating the 138KV and all of the
10 other utilities down that corridor into the mass
11 transit super structure. It's a small price for our
12 community to -- I mean, it's a big price for our
18:50:28 13 community to have the train coming through our
14 corridor and I think it's a small price for the users
15 and for the City to incorporate those utility lines
16 within the super structure.

17 The second one is we spent a lot of money
18 and a lot of time planning for aesthetic improvements
19 up and down the corridor. In fact, we hired -- the
20 State hired Parsons Brinckerhoff and in that
21 consulting contract we have set aside some funds to
18:50:59 22 hire an architectural engineer --

23 (Buzzer sounds.)

24 -- who has spent a lot of time designing
25 motifs and everything. So we would like to request as

Honolulu, Hawaii

(808) 524-2090

1 you move forward that you consider working with us,
2 especially in our corridor, but also working with
3 other communities as you design the way these super
4 structures look and the way the medians look
5 throughout our communities.

6 I'll be sending written comments in
7 later. Thank you.

18:51:28

8 HEARING OFFICER HAMAYASU: There's no

Honolulu, Hawaii (808) 524-2090

1 MR. LOO: My name is Herbert Loo. I'm a
2 retired master sergeant, retired in 1966. When I was
3 drafted in 1945, I took my first train ride from
18:51:52 4 Iwilei up to Schofield. Too bad they don't still have
5 that train line. I'm here to support the rail
6 transit, because in my travels in New York City, seven
7 years there, you see billions of people traveling on
8 the subway, terrific transportation. Just think if
9 they didn't have that type of transportation, just
10 think if we had that transportation 20 years ago. We
11 are so backwards here it's pitiful. Build it right
18:52:29 12 away, as soon as possible. Thank you.

13 (Applause.)

14 HEARING OFFICER HAMAYASU: Anyone else
15 wishing to testify? I thought there was somebody
16 there. No. Yeah.

RALPH ROSENBERG COURT REPORTERS, INC.
Honolulu, Hawaii (808) 524-2090

1 SCOTT: My name is Scott. I live here in
2 the Salt Lake area. I'm born and raised here in
18:52:57 3 Hawaii. I've seen a lot of stuff growing up here as a
4 kid. I've seen how when I was a little kid I could go
5 to Queen's with my dad, when he used to work there, in
6 ten minutes. Nowadays if you're not on the road
7 before 6:00 in the morning to get past Middle Street,
8 you'll be lucky to take an hour and a half. That's
9 five, seven miles, and it's not getting any better.
10 It's only getting worse. There's no perfect solution
11 with mass transit, but if we don't do something with
12 this rail and get something going, regardless of what
18:53:29 13 medium we use, whether it be steel on steel, magnetic
14 or otherwise, ten years from now to try and figure out
15 something, then it's going to be too late.

16 The other thing, too, we have got to look
17 in the smart sense. You know, picking these routes
18 and stuff is great, but we have got to link one end of
19 the island to the other, because if there's a bad
20 wreck or something like that, traffic and everything
21 around here comes to a halt. Also, through the
22 airport. We have got to get some efficiency into how
18:53:58 23 we get around here. The smart thing would be is
24 whatever route we pick, think of the long term as far
25 as linking the new university in Kapolei out there to

Honolulu, Hawaii

(808) 524-2090

1 the universities and work down in town and also
2 allowing for the business people and other people who
3 travel light to go through the airport, because the
4 ability to build a super structure there is easy.
5 Look at the parking structures they've got going up.
6 It's not an eyesore and it makes it more centralized,
7 especially being all of this is part of the Department
8 of Transportation.

18:54:30

9 So, we have got to do something now. Not
10 talk about it, think about it, maybe build it in 20
11 years, like the H3. Obviously the H3 works. In other
12 places around the world they use rail on rail, DART,
13 BART. It all works. But we need to implement it now
14 before it's almost too late.

15 Thank you.

16 HEARING OFFICER HAMAYASU: Anyone who
17 hasn't spoken wish to speak? Okay. I'm going to give
18 this gentleman another chance.

18:54:57

19

20

21

22

23

24

25

RALPH ROSENBERG COURT REPORTERS, INC.
Honolulu, Hawaii (808) 524-2090

1 MR. PYLE: Thank you. Doug Pyle. I
2 spoke earlier on behalf of an organization I chaired
3 and I want an opportunity to add a few personal items
4 of testimony. Two points, one would be the --
5 everybody who lives or has family like I do in Salt
6 Lake knows how the congestion really jams up right at
7 the convergence where H1 and Red Hill and the on-ramp
18:55:28 8 here below Tripler all come together, and rail would
9 be a great alternative for this community in
10 particular to be able to have -- to get out of that
11 mess and get to their destinations, and I think that's
12 an advantage that the airport route does not have.
13 Although in the long run I think the airport route
14 would be real valuable to also have, perhaps as a
15 spur.

16 And secondly, and I think it's very
18:55:58 17 important, I haven't seen the City doing this yet -- I
18 hope it will -- look at rail as being one part of an
19 integrated transit plan, including pedestrian/bicycle
20 and just -- I grew up in Portland, Oregon which won
21 awards for planning comprehensively. It has rail, but
22 it has a bus mall that is pedestrian/bus only, no
23 cars. Fareless Square, which is extremely successful.
18:56:26 24 People can park their cars, park and ride, and if
25 they're downtown, they ride any of the modes of

Honolulu, Hawaii

(808) 524-2090

1 transportation for free, and then go home. The
2 traffic flows wonderfully there because they planned
3 in a comprehensive way, and I hope the City will do
4 that, too.

5 One final point when I just noticed that
6 no other hands were going up, I remembered hearing at
7 one of the hearings was reportedly had low turnout,
8 and even though perhaps there's only a few people that
9 testified, I think the record should show that this
10 room is over full and there's standing room and in the
11 parking lot it was real hard for me to find a spot.

18:57:00

12 There's a lot of interest here in Salt Lake certainly,
13 I assume in support, but certainly a great deal of
14 interest in this, so I didn't want that to go unnoted,
15 the turnout.

16 Thank you.

17 HEARING OFFICER HAMAYASU: Okay. Again,
18 I'd like to open up for a person who didn't testify
19 already. If not, okay. Go ahead.

20

21

22

23

24

25

RALPH ROSENBERG COURT REPORTERS, INC.
Honolulu, Hawaii (808) 524-2090

18:57:27 1 MR. SOON: Tony Soon here again. It is
2 said that the airport route is going to cost \$200
3 million more. The reality is I can assure you it's
4 probably going to be more like half a billion. Where
5 is that money going to come from? I do not know. You
6 know right now the City is under duress in trying to
7 meet the EPA standards for a secondary waste water
18:57:59 8 treatment plant. That's going to be \$1.5 billion.
9 That 200 -- supposedly \$200 million can go toward a
10 down payment on getting this fixed.

11 We also have the existing (inaudible)
12 carriers down there that all need to be repaired.
13 That's another \$300 million that's going to take
14 basically. And then they talk about a \$5 million
15 annual operational cost in perpetuity, meaning for my
18:58:25 16 lifetime and my grandkids lifetime and that \$5 million
17 could go toward building a homeless shelter, maybe two
18 homeless shelters every year, or it could go toward
19 fixing schools or it could go toward fixing over
20 20,000 potholes a year. Every year we can just fix
21 these potholes, 20,000 of them.

22 So I think by putting the routes south of
23 the Nimitz down by the airport way, which is a
24 blighted area of town, I think it's stupidity, and
18:58:59 25 because most of the people who live south of Nimitz

Honolulu, Hawaii

(808) 524-2090

1 are military and most of them drive and, of course,
2 they get gas for half price or, okay, two-thirds of
3 what we pay for it and you do need your car with a
4 sticker on it to be able to enter into the military
5 compounds. So trust me, they're still going to be
6 driving. Now what happens after 5:00 on this route?
7 It's going to totally deserted. And my opinion to the
8 City is that maybe what we need is a wiki-wiki system
9 that will serve that area and maybe at 6:00 we just
10 cut it off. Why are we going to have a route running
11 down to the airport with nobody sitting on it except
12 people going back to Kapolei? Is it not for everybody
13 in Honolulu? Why just only people in Kapolei.

18:59:29

14 Thank you.

15 HEARING OFFICER HAMAYASU: Anyone else?

16 Okay. If nobody else is interested in speaking or
17 providing their comments, I'm concluding this hearing
18 again at 7:00.

18:59:59

19 Thank you for coming.

20 (Hearing concluded at 7:00 p.m.)

Dear Mr. Burton:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your preference for the Salt Lake Alternative has been noted. To address your first point, while each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the

Mr. Michael Burton
Page 2

Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

Regarding your second point, communication and coordination with the military and other parties have been ongoing and will continue as the Project progresses.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Mr. Robert Webb
5320 Likini Street, #6
Honolulu, Hawaii 96818

Dear Mr. Webb:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal.

Your opposition to the Salt Lake Alternative is noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. Compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry more passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more

information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

Regarding schools, Radford High, Aliamanu Elementary, and the Salt Lake Public Library are located along the Salt Lake alignment and, therefore, will not be affected by the Project.

Your concerns about traction power substations have also been noted. However, the traction power substations will be secured within a locked building and will not be accessible to the public.

For your next points, as presented in Chapter 3 of the Final EIS, the Project will result in reduced vehicle miles traveled and higher shares of total travel when compared to No Build conditions. As stated in Section 3.4.2, approximately 40,000 automobiles will be removed from roadways as a result of the Project, compared to No Build conditions. In addition, park-and-ride lots will be built at East Kapolei, UH West Oahu, Pearl Highlands, and Aloha Stadium. These lots will allow riders to access the fixed guideway system via car.

As stated in Section 4.10.3 of the Final EIS, the Project will cause no severe noise impacts. Moderate impacts will occur at upper floors of a few high-rise buildings (as shown in Table 4-18 in the Final EIS). With the recommended mitigation in place (sound absorbing material and wheel skirts), the noise analysis indicates that the new noise generated by the Project will be lower than the existing noise levels in most places.

The project design includes an integrated noise-blocking parapet wall at the edge of the guideway structure that extends 3 feet above the top of the rail. The parapet wall will substantially reduce ground-level noise.

Wheel skirts will increase the benefit from the parapet wall at locations above the elevation of the track. The use of sound-absorptive materials below the tracks in the areas that will experience moderate noise impacts will reduce the Project noise levels from the upper floors to below the impact level. Once the Project is operating, noise levels will be re-measured to confirm that there are no noise impacts from the Project.

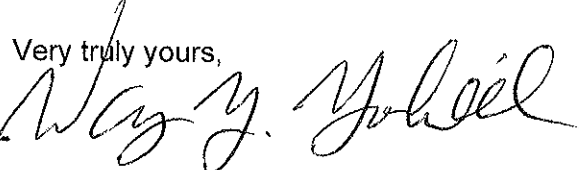

Lastly, Section 4.4.3 of the Final EIS specifies the following mitigation for impacted business and residential owners. Where relocations will occur, compensation will be provided to affected property owners, businesses, or residents in compliance with all applicable Federal and State laws and will follow the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act. The plan includes the following measures related to relocations:

- The City will assist all affected persons in locating suitable replacement housing and business sites within an individual's or business's financial means.*

Mr. Robert Webb
Page 3

- *The City will provide relocation advisory services to businesses where acquisition of adjacent property may substantially reduce clientele, limit accessibility, or affect a business in other substantial ways.*
- *A minimum 90-day written notice will be provided before any business or resident will be required to move.*
- *Relocation services will be provided to all affected business and residential property owners and tenants without discrimination; and persons, businesses, or organizations that are displaced as a result of the Project will be treated fairly and equitably.*
- *Where landscaping, sidewalks, and driveway access will be affected by the Project, coordination will occur with the landowner, and these property features will be replaced and/or the property owner will be compensated in accordance with the Real Estate Acquisition Management Plan (RTD 2008q).*

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Dear Mr. Soon:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your comments have been noted. The EIS is required to look at the range of reasonable alternatives that meet the Project's Purpose and Need. The Draft EIS analyzed three alternatives: Salt Lake, Airport, and a combination of both. The City has since identified the Airport Alternative as the Preferred Alternative. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

Mr. Tony Soon
Page 2

Per your comments regarding population, the projections were provided by the OahuMPO. The Salt Lake neighborhood is fully developed, and average household size is decreasing over time. Population in that area is not anticipated to increase between now and 2030.

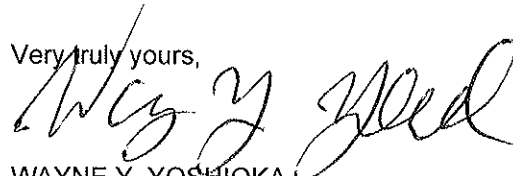

For your next point as to who the Project is intended to serve, the Project is intended to serve the entire population of Oahu, including the communities of concern discussed in the Draft and Final EISs. Figure 4-15 in the Draft EIS indicates that Salt Lake, as well as Waipahu, Kalihi, and the Pearl Harbor and Airport areas, contain concentrations of these populations. The Salt Lake alignment includes many residents who would benefit from the rail system. The same is true for the Airport alignment. The difference is that along Salt Lake, the majority of users are residents of the area. Along the Airport alignment, most users are employees who come from all over the island. Residents in Salt Lake will be served by local feeder bus service that will integrate with the fixed guideway system. Tourism is only a minor percentage of the ridership expected for the Airport alignment. It can be argued that both have merit. As indicated in Chapter 3 of the Draft EIS, the Airport alignment has more riders. Chapter 6 of the Draft EIS shows Salt Lake is slightly less expensive, but with a few more environmental impacts. The cost-effectiveness ratio in Chapter 7 of the Draft EIS shows the two alternatives are nearly identical in terms of overall performance.

Regarding equity, Section 4.7 of the Draft EIS reviews Environmental Justice regulatory context and methodology. This includes the basis for determining environmental justice areas within the project corridor. Federal law requires that no low income or minority population be disproportionately adversely impacted by a project. Communities with concentrations of populations that are protected by environmental justice requirements, as defined by the Federal Government, exist along both the Salt Lake and Airport alignments and are comparable in size and number.

Lastly, the military was not involved in the selection of the Airport Alternative.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Dear Mr. Soon:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Chapter 6 of the Final EIS can provide information on the cost and financial analysis for the Project. Also, a comparison of the estimated costs of the Salt Lake Alternative and the Airport Alternative is presented in Table 6-1 of the Draft EIS. The proposed capital funding sources for the Project cannot be used for non-public transportation projects like a secondary wastewater treatment plant. Enabling legislation for the County General Excise and Use Tax surcharge and Ordinance 07-001 preclude the use of the collected funds for purposes other than a fixed-guideway transit system.

In addition, Section 6.4 of the Final EIS describes the funding sources to pay for ongoing operations and maintenance costs associated with maintaining the resulting transit system in a state of good repair. Operations and maintenance costs will be paid for from the same sources

currently used for TheBus: Federal funding, fare revenues, and subsidies from the City's General and Highway Funds. Funding for guideway maintenance will be covered in the City's annual budgeting process and amounts to between 2 and 3 percent of the City's annual operating budget. As shown in Table 6-3 of the Final EIS, approximately 65 percent of the 2030 transit operating and maintenance costs will be for TheBus.

Your preference for the Salt Lake Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments. Figure 3-12 in the Draft EIS shows daily boardings and alightings at each station. As shown, the stations along the Airport Alternative will attract higher ridership than those along the Salt Lake Boulevard Alignment.

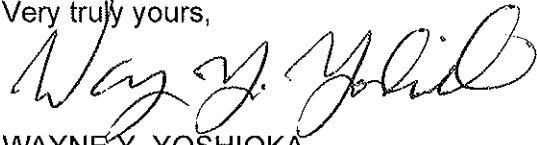

Pearl Harbor Naval Base and the Airport are major employment destinations. The fixed guideway system will provide an alternative to use of automobiles for those traveling to and from destinations along the Airport Alternative. In addition, ridership projections for the forecast year of 2030 have been developed using the travel demand model used by the Oahu Metropolitan Planning Organization (OahuMPO) for the Oahu Regional Transportation Plan (ORTP), which was calibrated against collected traffic and transit ridership information and then validated against recent counts to be sure it properly represents travel activity in the transportation system (Section 3.2.1 of the Final EIS). An on-board transit survey was completed in December 2005 and January 2006, and the latest socioeconomic information available as of October 2008 was incorporated. Traffic counts were collected in 2005, 2007, and 2008. The model is based upon a set of realistic input assumptions regarding land use and demographic changes between now and 2030 and expected transportation levels of service on both the highway and public transit system. OahuMPO undergoes model updates every five years to reflect land use and transportation network changes. The model is approved by the OahuMPO Technical Advisory Committee. Based upon the model and these key input assumptions, approximately 116,000 trips per day are expected to use rapid transit system on an average weekday in 2030. Since the Draft EIS was published, the travel demand model has been refined by adding an updated air passenger model (which forecasts travel in the corridor related to passengers arriving or departing at Honolulu International Airport), defining more

Mr. Tony Soon
Page 3

realistic drive access modes (driving alone or car pooling) to project stations and recognizing a more robust off-peak non-home-based direct demand element (trips that do not originate at home) based on travel surveys in Honolulu.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Dear Mr. Pyle:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Chapter 6 of the Final EIS provides a financial analysis for the Project. Also, as stated in Section 4.18 of the Final EIS, the Project would generate an average of about 10,000 jobs per year over the nine-year construction period.

Your preference for the Salt Lake Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been identified as the Preferred Alternative as described above. Compared to the other alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake

Mr. Doug Pyle
Page 2

neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly lower impacts to the natural and built environment. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative.

The Alternatives Analysis phase, which preceded the EIS process, is documented in Chapter 2 of the Final EIS. It evaluated a range of modal and general alignment alternatives, in terms of their costs, benefits, and impacts. The scoping process for the Alternatives Analysis involved a presentation of the viable alternatives to the public and interested public agencies and officials to receive comments on the Purpose and Need, alternatives, and scope of the analysis. Scoping for the EIS followed the FTA process that provides for a culling of alternatives studied in the EIS through an Alternatives Analysis. The scoping process initiated for the Alternatives Analysis included a variety of highway, bus and fixed guideway options for consideration. During the later scoping effort for the EIS, the public was requested to propose alternatives that would satisfy the purpose and need at less cost or with greater effectiveness, less environmental or community impact and to propose alternatives that were not previously studied and eliminated for good cause. The only alternative that emerged that met these criteria was a fixed-guideway alternative following several alternative alignments. All reasonable alternatives that emerged from these processes were ultimately evaluated in the Draft and Final EISs.

Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts, and mitigation commitments.

In addition, during the alternatives screening process, a Camp Catlin Road alignment was reviewed and eliminated.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Dear Mr. Pyle:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your preference for the Salt Lake Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the

Mr. Doug Pyle
Page 2

alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The Project is designed to be one part of a multi-modal transportation system. Access to stations will be in the form of bus, walking, bicycling, and drop-off and, in some cases, park-and-ride. As indicated in Chapter 2 of the Final EIS (Section 2.5.6), the bus system will be modified to complement the rail transit system, with additional feeder buses connecting surrounding communities to the stations. The Project is coordinating with City and State agencies to encourage development of enhanced pedestrian and bicycle facilities near the stations, although the actual construction of such facilities is beyond the scope of this Project.

Lastly, substantial attendance of the Salt Lake neighborhood at the Public Hearing held in the Salt Lake area is noted.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Mr. Len Pepper
1352 Olino Street
Honolulu, Hawaii 96818

Dear Mr. Pepper:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your comment about other activity centers in reference to Figure 1-4 of the Draft EIS is noted. , The figure is not intended to be all inclusive. It is intended to illustrate the nature of major activity centers in the corridor.

The travel demand forecasting model uses OahuMPO data that reflects population in the corridor in 2030. OahuMPO uses data from a variety of sources, including from the Department of Business, Economic Development and Tourism (DBEDT). DBEDT data reflects an aging population and changing socioeconomic conditions. The analysis presented in Chapter 1 of the Final EIS presents 2030 population and employment forecasts.

The fixed guideway system will provide improvements to transit availability and reliability that would serve all transportation system users, including the elderly and moderate- and low-

Mr. Len Pepper
Page 2

income populations. All fixed guideway stations will have similar design elements to make system use easier for all patrons, including infrequent users, the elderly, and persons with disabilities. All platforms will be at the same level as the vehicle floor to provide level boarding for all passengers and to accommodate wheelchairs. In addition to stairs and escalators, elevators will be provided at all stations to accommodate elderly and disabled riders.

As discussed in Section 4.4.2 of the Draft EIS, four of the five schools listed in your comment letter are along the Salt Lake Alternative route, which will not be affected by the Project. These schools will continue to be served by TheBus and other public transit services.

Last, peak hour analysis was performed in the Final EIS in order to evaluate the transit system during periods of highest demand and use. It is anticipated that the transit system will operate 7 days per week in conjunction with the schedules for TheBus.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more

Mr. Mark Taylor
Page 2

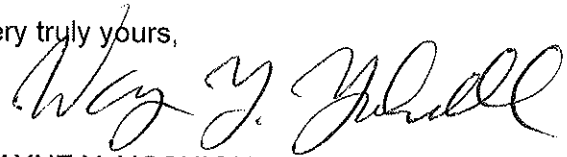

information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The statement in the Draft EIS was correct at the time it was written, namely that "FTA has agreed to consider a funding request of \$1.2 billion but has not been approached regarding a higher level." FTA has not agreed to provide \$1.2 billion or to provide more than that. The level of Federal funding described in the Draft EIS is used as an estimate of federal funds. Further, there is no plan to use property taxes to fund the Project construction.

FTA's general practice for the financial evaluation of proposed New Starts projects is to consider financial feasibility with anticipated receipt of FTA funding. Section 6.6 of the Final EIS describes the risks and uncertainties associated with New Starts funding.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Mr. Ben Ramelb
1148 Ala Lilikoi Street
Honolulu, Hawaii 96818

Dear Mr. Ramelb:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Regarding your first point, as described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- *Reduce the time that each area will experience traffic and community disturbances.*

- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*
- *Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- *Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

The financial plan is balanced for the entire Project and subject to careful and ongoing scrutiny by the Federal Transit Administration (FTA), so there will not be a situation in which only a portion of the system will be built. If there is a shortfall, additional revenue sources will be considered. Section 6.6 of the Final EIS discusses risks and uncertainties and potential sources to cover shortfalls.

Regarding your second point, Section 1.7 of the Final EIS discusses the Purpose and Need of the Project. As stated in this section, the reason for the fixed guideway is not only to help relieve congestion, but to offer travelers an alternative to the car. There is currently no option but for most people to drive and congestion is increasing as a result.

Neither the Alternative Analysis nor the Draft or Final EISs show that rail would worsen traffic. Table 3-12 in the Alternatives Analysis shows that roadway conditions will be worse in 2030 whether the fixed guideway, managed lane, or more buses are implemented. However, traffic conditions will be better with the fixed guideway compared to conditions without it. The Alternatives Analysis showed that rail decreases congestion more effectively than any of the other options studied in the Alternatives Analysis. The Managed Lane Alternative would not eliminate congestion and bottlenecks on the H-1 Freeway. Table 3-12 in the Alternative Analysis Report shows that, under the No Build Alternative, there would be 18,049 vehicles per hour (vph) operating on the H-1 Freeway in 2030. Vehicle volumes rise to 18,327 vph (Two-direction Option) or 18,419 vph (Reversible Option) with the Managed Lane Alternative, while traffic volumes decrease to 17,209 vph with the 20-mile Fixed Guideway Transit Alternative. Accordingly, the Fixed Guideway Transit Alternative will reduce traffic volumes from those projected under the 2030 No Build Alternative.

Localized bypasses would not meet system goals for corridor-wide benefits to mobility, reliability, access, and equity. The Hawaii Department of Transportation, which is responsible for the freeway system, has evaluated needs for the freeway system and identified the highway projects that would be most efficient at reducing congestion on Oahu. The projects, including a

Mr. Ben Ramelb
Page 3

Nimitz Flyover, are listed in Table 2-3 of the Draft EIS and included in the analysis for all project alternatives. Effects of the Nimitz Flyover on traffic conditions in 2030 are discussed in Section 3.4.2 of the Final EIS. Travel on the Nimitz Flyover was included in all forecasts of future travel conditions and is reflected in the times for the following travel pairs under the No Build Alternative: Kapolei to Downtown, Ewa to Downtown, and Mililani to Downtown. As shown in Figure 3-7 of the Final EIS, the Nimitz Flyover does improve transit travel times with the No Build Alternative between certain travel pairs (e.g., between Mililani and Downtown) compared to 2007 conditions. However, as also shown in this figure, travel times improve substantially more with the addition of the Project. The important finding in the Final EIS is that conditions on the highway will be better with rail compared to what they would be if the Project were not built even after the Nimitz Flyover, improvements to the H-1 Freeway, and all other projects in the OahuMPO Regional Transportation Plan are built.

As shown in Table 6-1 of the Final EIS, the Project will cost \$4.6 billion in 2009 dollars and \$5.5 billion in inflated dollars, including finance charges. The State of Hawaii's Highway Modernization Plan dated January 22, 2009, estimates the cost of the Nimitz Viaduct at \$600 million for an approximately 2.5-mile elevated highway with two lanes, which equals \$240 million per mile.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Mr. Mike Uechi
(No address or e-mail provided)

Dear Mr. Uechi:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Property acquisition will occur early in the construction process. In all cases, the City will be required to follow the requirements of the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act. As stated in the Final EIS, Section 4.4 Acquisitions, Displacements, and Relocations, Environmental Consequences and Mitigation:

A partial acquisition typically is either a narrow strip of land or a more substantial portion of a large parcel. It is assumed that for the properties that would be partially acquired, existing land uses would not change. For residential properties, if the proposed right-of-way line comes within 5 feet of a residential structure, it is considered a full acquisition. If the right-of-way line is outside the 5 feet, it is considered a partial acquisition. For commercial properties, including situations where the commercial property could lose its function, full acquisition was considered.

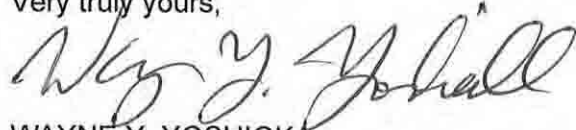

Mr. Mike Uechi
Page 2

Regarding other construction delays, the City is working closely with the Oahu Island Burial Council to develop the most effective ways to find, identify, protect, or relocate iwi kupuna (Hawaiian burials) if they are found well in advance of Project construction. Similar steps are being taken to minimize other risks.

To answer your second question, Section 6.6 of the Final EIS discusses risks and uncertainties associated with the financial analysis presented in Chapter 6. Changes in project schedule are one source of risk that is discussed. Chapter 6 also discusses other options for raising revenue should it be necessary to find additional funds. In addition to construction contingency, to minimize the risk of construction delays, the City will require contractors to pay liquidated damages if they cannot meet contract schedules. Furthermore, on a project of this size, the contractor's best incentive to complete work on time or even ahead of schedule is that they can generally make a higher profit if they do so.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Dear Mr. Genadio:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal:

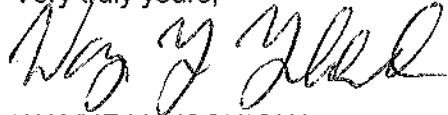

No comparative magnetic levitation project has ever been built within the U.S. Therefore, no data is available to support a cost estimate. Some of the savings recognized in other countries for beam-track vehicles would not apply in the U.S. because of requirements to include an emergency egress walkway. While the system is inherently quieter, other systems may be designed to match the noise level of magnetic levitation when in operation. Also, the smaller structures proposed in the comment result in shorter span-lengths, which increases the number of columns required and the cost to construct both the additional foundations and columns.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this

Mr. Frank Genadio

Ms. Renee Ing
P.O. Box 23094
Honolulu, Hawaii 96823

Dear Ms. Ing:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As discussed in Chapter 2 of the Final EIS, additional alternatives, including other technologies, were evaluated during the Alternatives Analysis phase of the Project. The Alternatives Analysis phase evaluated a range of transit mode and general alignment alternatives in terms of their costs, benefits, and impacts. An initial screening process considered alternatives identified through previous transit studies, a field review of the study corridor, an analysis of current population and employment data for the study corridor, a literature review of technology modes, work completed for the Oahu Regional Transportation Plan 2030 (ORTP) prepared by the Oahu Metropolitan Planning Organization (OahuMPO) (OahuMPO 2007), and public and agency comments received during the formal Alternatives Analysis scoping process.

During the fall of 2005 and winter of 2006, the City and County of Honolulu (City) completed the alternatives screening process that is documented in the Honolulu High-Capacity Transit Corridor Project Alternatives Screening Memorandum (DTS 2006a). Scoping meetings were held with the purpose of presenting alternatives to the public, interested agencies, and officials and receiving comments on the Purpose and Need, alternatives, and scope of the

Alternatives Analysis. Refinements were made to the alternatives as a result of public comments. Rubber-tire fixed guideway vehicles were considered a technology option throughout the Alternatives Analysis.

The following alternatives were studied in the Alternatives Analysis: No Build Alternative, Transportation System Management (TSM) Alternative, Managed Lane Alternative, and the Fixed Guideway Alternative. After review of the Alternatives Analysis Report and consideration of public comments, the City Council selected a fixed guideway transit system extending from Kapolei to UH Manoa with a connection to Waikiki as the Locally Preferred Alternative. The selection, which eliminated the TSM and Managed Lane Alternatives, became Ordinance 07-001 on January 6, 2007. The fixed guideway system is the most cost-effective system of all the alternatives studied.

As stated in Section 2.2.3 of this Final EIS, the NEPA Notice of Intent requested input on five transit technologies. A technical review process that included the opportunity for public comment was used in parallel with the alignment analysis to select a transit technology. The process included a broad request for information that was publicized to the transit industry. Transit vehicle manufacturers submitted 12 responses covering all of the technologies listed in the Notice of Intent. Rubber tire on concrete systems, including the Phileas system, were evaluated by an independent five-member technology panel comprised of four transit experts and a transportation academic that was appointed by the City Council. The panel considered the performance, cost, and reliability of the proposed technologies. The Phileas bus, was evaluated as a high capacity bus option. The guidance system that is under development is still experimental and not able to meet the operating requirements posed by the Review Panel. Likewise, fuel cell propulsion systems and other developing and promising technologies were considered but not retained as they are not yet available in full production form. The panel accepted public comment twice as part of its review. By a four-to-one vote, the panel chose a steel wheel operating on steel rail system. The four panel members selected steel-wheel technology because it is , safe, reliable, economical, and non-proprietary. Proprietary technologies, meaning those technologies that would have required all future purchases of vehicles or equipment to be from a single manufacturer, were eliminated because none of the proprietary technologies offered substantial proven performance, cost, and reliability benefits compared to steel wheel operating on steel rail. The Phileas system, by comparison does not yet have a functioning guidance operation. At this point in time, it effectively operates as a bus that cannot provide the reliability and safety of the guideway technology chosen by the panel. Based on manufacturer performance information, Phileas is also not materially quieter than the proposed steel wheel rail system. Furthermore, selecting a proprietary technology also would have precluded a competitive bidding process, likely resulting in increased overall project costs. The panel's findings were summarized in a report to the City Council dated February 22, 2008.

A guided-bus system operating on an exclusive guideway following the same alignment would not reduce adverse effects, including property acquisitions of the Project During the Alternatives Analysis process at the beginning of the project, a broad range of alignments were considered. When a historic property or park / recreational property was found to have a potential impact, alternate alignments were studied, as discussed and documented in 5.2, 5.3 and 5.5. of the Final EIS.

Ms. Renee Ing
Page 3

As stated in Section 4.10.3 of the Final EIS, the Project will cause no severe noise impacts. If no mitigation were provided, moderate impacts would occur at upper floors of a few high-rise buildings (as shown in Table 4-18 in the Final EIS).

The project design includes an integrated noise-blocking parapet wall at the edge of the guideway structure that extends three feet above the top of the rail. The parapet wall will substantially reduce ground-level noise. In areas with high-rise apartments and hotels that have lanais above the elevation of and facing the rail, the parapet wall will have a limited benefit (less than a 3-dBA noise reduction) at floors above the level of the guideway. Wheel skirts, which are part of the vehicles and cover the wheels, will increase the benefit from the parapet wall at locations above the elevation of the track. The use of sound-absorptive materials below the tracks in the three areas that would otherwise experience moderate noise impacts will reduce the Project noise levels from the upper floors to below the impact level. Once the Project is operating, noise levels will be re-measured to confirm that there are no noise impacts from the Project. If additional noise impacts occur, then FTA will require the evaluation of measures to mitigate the impacts.

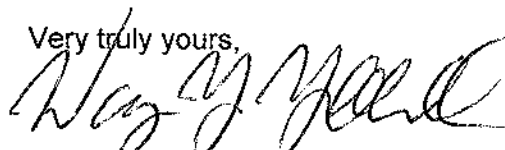

With the required mitigation in place (noise blocking parapet wall, sound absorbing material and wheel skirts, as described below), the noise analysis indicates that the new noise generated by the Project will be lower than the existing (2009) noise levels in most locations and will not have any noise impacts to residences or businesses based on FTA noise criteria and guidance.

Chapter 8 of the Final EIS details the Project's public involvement activities, including scoping and Public Hearing dates. The Project conducted numerous Community Information Meetings, manned booths at public events, conducted Speakers Bureau presentations, and maintained a website and hotline to solicit public comment throughout the planning process.

The estimated implementation cost for guided buses operating in exclusive right-of-way is not substantiated. Actual cost of constructing an elevated exclusive busway serving the same area as the Project would be similar to the cost to implement the Project with the selected technology because the guideway would be of a similar size. If the guideway were designed to highway standards to accommodate any form of unguided vehicle, it would be larger and more costly. If multiple access points were provided, the right-of-way needs and cost would be substantially higher. The proposal to construct the busway in a cut-and-cover tunnel would further increase the cost relative to the elevated alternative considered through the Alternatives Analysis process.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

The Honorable K. Mark Takai
House of Representatives
State Capitol, Room 305
Honolulu, Hawaii 96813

Dear Representative Takai:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The 138KV lines cannot be incorporated in the guideway structure. The National Electrical Safety Code and Occupational Safety and Health Administration require clearances around KV lines. In addition, the KV lines cannot be incorporated into an enclosed space due to the heat generated by these lines. As discussed in Section 4.18.2 of the Final EIS, "Communication and coordination have been initiated with the affected utility agencies and companies and will continue throughout design and construction." Further, "Design criteria will govern all new utility construction outside of buildings, as well as the support, maintenance, relocation, and restoration of utilities encountered and affected by construction of the fixed guideway." The design criteria will evaluate relocation of utilities that are in conflict with the fixed guideway.

As mentioned above, the Airport Alternative from East Kapolei to Ala Moana Center has been selected as the Preferred Alternative. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments. Any utility relocation associated with the Salt Lake Boulevard alignment will not be required for the Project.

In addition, the DTS will continue to work with the Hawaii State Department of Transportation and other groups regarding corridor features and aesthetics.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Scott
(No address or e-mail provided)

Dear Scott:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

Your comments have been noted. The Project will provide an alternative transportation mode and additional connection between UH West Oahu and Downtown. It will serve the Airport and provide park-and-ride facilities for commuters. The Project will include enhanced bus service integrated with the fixed guideway system. The local bus feeder system will connect neighborhoods and commercial districts to the fixed guideway system.

The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS; however, the future extensions are not part of this Project; thus, they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed

Scott
Page 2

for implementation at this time, they are not part of the Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time. Bus service between Ala Moana Center and these destinations will be enhanced until those extensions are built.

The FTA and DTS appreciate your interest in the Project. The Final EIS has been issued in conjunction with the distribution of this letter. You may view the Final EIS on the Project website at www.honolulutransit.org. You may request a DVD of the Final EIS and additional content through the "Contact Us" tab on the website or by calling the Project hotline at 566-2299. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is fluid and cursive, written over the printed name.

1 TORU HAMAYASU: Good evening. I'm Toru
2 Hamayasu, the 2nd Deputy Director of the City and County
3 of Honolulu Department of Transportation Services. I am
4 the Hearing Officer for this public hearing for the
5 Draft Environmental Impact Statement for the Honolulu
6 High-Capacity Transit Corridor Project.

7 The purpose of this public hearing is to
8 collect comments related to the proposed transit project
9 regarding the draft EIS, Section 106 of the National
10 Historic Preservation Act process, Section 4(f) of the
11 U.S. Department of Transportation Act, right-of-way
12 acquisition, and floodplains affected by the project.

13 Public input can be made in four ways. Public
14 spoken testimony to me here in the public hearing room.
15 If you do not wish to speak in the public, an individual
16 spoken testimony for the record can be made to the
17 hearing recorder, who is near the Public Involvement
18 Station in the Project Information Area next door.
19 Written testimony may be deposited into the black
20 comment box at this meeting or delivered to the
21 Department of Transportation Services office or mailed
22 or faxed (808) 523-4730 to DTS by January 7th, 2009.
23 And finally, testimony can be submitted online by
24 January 7th, 2009, at www.honolulustransit.org.

25 All comments and responses will be included in

1 the final EIS. Revisions to the EIS will be made as
2 appropriate, based on comments.

3 The hearing procedures are as follows: One,
4 elected and public officials will be heard first.
5 Persons desiring to testify should register at the
6 entrance to the hearing room and will be called in order
7 of registration.

8 Any individual may appear and speak for him or
9 herself, or if duly authorized, for any local civic
10 group, organization, club or association, subject to the
11 rules provided herein. Speakers should give their name.
12 If representing a group, this information should also be
13 given.

14 Speakers must limit their statements to 3
15 minutes. Additional prepared statements or literature
16 pertaining to the project may be submitted at this
17 hearing or by 4:30 p.m., January 7th, 2009, to
18 Department of Transportation Services. These statements
19 will be made part of the official record if they include
20 a legible name and address.

21 For these hearings, all statements, oral or
22 written, should be directed to the Hearing Officer and
23 must be related to the subject matter of the hearing.

24 Each person speaking before the audience must
25 do so at the floor microphone. We will call testifiers

1 in groups of three to facilitate orderly progress.
2 Please ensure you are in the hearing area at the time
3 your name is called. A court stenographer will record
4 and transcribe the hearing proceedings. If required, I
5 will announce any of the specific rules governing this
6 hearing.

7 As part of this public hearing process, the
8 Honolulu Rail Transit Project Team is not allowed to
9 respond to any questions or concerns raised by the
10 speaker. The Project Team will be available to address
11 your questions in the Project Information Area outside
12 of this hearing venue.

13 It is now 6:14. At this time, I would like to
14 begin the public testimony. The first testifier is
15 Frank Genadio, followed by Young Kim, and Scott Miguel.

16 ---oOo---

21
22
23
24
25

1 FRANK GENADIO: Frank Genadio of Kapolei. You
2 have my address from a previous testimony. My remarks
3 are directed to the attempted EIS to eliminate a
4 technology that is not steel wheels on steel rails. The
5 City Council fumbled away its chances to place the right
6 question on the November ballot, leaving us with a
7 take-it-or-leave-it choice for steel.

8 Actually, the Council should have placed two
9 questions on the ballot. First would be: Do you
10 support a fixed-rail transit system for Oahu? The
11 second would be: If you answered "yes," do you favor a
12 fair and open competition among all four types of rail
13 technologies?

14 For those of you not familiar with what the
15 Federal Transit Administration considers rail, it is not
16 just steel wheels, but includes rubber tire on concrete,
17 conventional monorail, and elevated magnetic levitation,
18 the system I favor.

19 Based on responses to the City's request for
20 information, there would be 10 technology suppliers,
21 including five that do not propose steel-on-steel.
22 Figure 29 of the EIS shows a solid structure that is 28
23 to 32 feet across as a bridge needed for steel wheel
24 systems. The HSS (inaudible) maglev guideway in
25 comparison would be only 21 feet across, including open

1 space between the beams on which the levitated train
2 would ride. Picture the difference on Farrington
3 Highway and the lessened impact on homes and businesses.
4 And also consider the fact that the maglev is at least
5 twice as quiet as steel-on-steel without any need for
6 steel's noise mitigation measures.

7 Those of you with children or grandchildren in
8 five to nine years might be interested in knowing that
9 the EIS project for a 20-mile steel wheel bridge would
10 cover at least 25 miles of guideway for the maglev.
11 Using the same amount of labor and materials in the
12 current plan, that is no loss of jobs or decrease sales
13 of steel and concrete, this would enable extension of
14 the guideway to the U.H. Manoa campus within the time
15 line for the initial system. Since U.H. West Oahu will
16 have limited curriculum, reaching Manoa is important to
17 future college students from this area.

18 The first maglev -- the HSS (inaudible) maglev
19 is not only faster and much quieter and cheaper to
20 develop than steel-on-steel, it would also will be
21 somewhere between \$12 and 18 million per year cheaper to
22 operate and maintain because of (inaudible) running.
23 Cost to modify the EIS to accommodate other technologies
24 is a drop in the bucket of the plan's estimated
25 \$7 billion budget.

1 I'm suggesting that this EIS be delayed and
2 reworked and that the start of preliminary engineering
3 either be deferred or that the study cover all
4 technologies that met the City's initial requirements.
5 Mahalo.

6 TORU HAMAYASU: Next speaker is Young Kim.

1 YOUNG KIM: Good evening. My name is Young
2 Kim. I came here, this is my second time around to mass
3 transit development plan. First one was in the late
4 '80s, early '90 timeframe with Rene Mansho. At that
5 time, I was able to convince the City Council not to
6 develop the rail transit. And this time, my second time
7 around, majority have expressed a willingness to build a
8 transit, so I'm for it, but the plan organization little
9 bit askewed or disorganized.

10 I lived in Japan for first 14 years and I
11 enjoyed the mass transit system in Japan. Core area had
12 all the transit system, but as the population increased,
13 number of train route have tremendously increased beyond
14 the Tokyo perimeter. When I left town, we had only one
15 subway. Now I think there's nine to 11 different subway
16 going all over Tokyo.

17 My question to you is: Where is this storage
18 area and maintenance facility so that the mass transit
19 have to begin from Leeward side? And I just found out
20 from the other side there is a map showing that the
21 Leeward Community College area is one. That's great.
22 So why not build from there toward the core destination
23 area? That way you can -- as soon as you open it, you
24 can use it for the ridership toward the airport.
25 There's more people working around the airport, Hickam,

1 Pearl Harbor area than any other place. Extend it to
2 downtown and to the U.H. Manoa and Waikiki. You have
3 better chance of success than try to do the Leeward from
4 Kapolei to Waipahu. Thank you.

5 TORU HAMAYASU: Next speaker is Scott Miguel,
6 followed by Michael Burton.

1 SCOTT MIGUEL: Good evening, everyone. I'm
2 Scott Miguel. I supported this back in the '90s when
3 the (inaudible). The question I have is: What do you
4 tell the grandchildren that will have to pay for the
5 system that you say the prices have changed from what's
6 gonna be built to what's not gonna be built? And what's
7 bugging me is, why change and why proofread the EIS
8 report from the Federal Government when it doesn't have
9 to be proofread? By now probably realize I didn't vote
10 for it, but why proofread it when it was already done
11 right by the U.S. Government? What were you hiding from
12 the people? Because I feel that there's a lot of people
13 out there that say, what are you gonna tell your mom and
14 pa's generation of young kids, hey, you're gonna have to
15 pay for something that maybe is gonna be used in Aiea,
16 as a senator is proposing right now. Charles Djou is
17 proposing Aiea to town. What's wrong with that? You
18 promised the people of Kapolei something? Yeah, it's
19 sad that five, maybe 10 people showed up, but what do
20 you tell the younger generation when we get older, it
21 was promised to me. Why wasn't it done then? There is
22 no answers for a lot of things.

23 That's why tonight I'm hoping you can enlighten
24 me so maybe I can believe something like this, because I
25 have to believe. I don't believe it's possible. You

1 guys come up with different solutions, different way,
2 different solutions. Did you guys really have a plan?
3 Are you guys coordinating with the different agencies?
4 Are you guys pulling the (inaudible), because when you
5 guys are building this, there's a lot of places you guys
6 gotta touch; a lot of different companies you guys gotta
7 work with. Is there a coordination or is there anything
8 that the City has, because so far the people haven't
9 been told everything.

25

1 MICHAEL BURTON: Hi, I'm Michael Burton and I
2 just wanted to say that I do support the rail system. I
3 do see it's a necessary utility for the people who do
4 travel into downtown to work. However, I'm also a
5 resident of Salt Lake, and I just want to put my point
6 across.

7 One, Congressman Chachula is saying something
8 about starting the project in, say, Aiea, and I agree
9 with that because, after all, the Kapolei area is kind
10 of desolate at this point and with the perspective of us
11 running out of money through -- in the project, because
12 there hasn't been a hundred percent guarantee, that's a
13 wise decision.

14 Outside of that, I disagree with him with
15 changing the route from Pearl Harbor -- to change the
16 route from the Salt Lake route instead of going down
17 Pearl Harbor. I believe that the Pearl Harbor route is
18 a waste of time and misuse of people's money, the
19 public's money, because it's bypassing populated areas
20 such as Salt Lake, Foster Village, and the industrial
21 area right around the Bougainville area and, of course,
22 it's gonna hit Salt Lake, but I feel that if the rail is
23 routed where the public can take advantage of it, where
24 it's convenient, you know, would be better use of the
25 public's money. And that's all I really have to say.

1 Thank you.

2 TORU HAMAYASU: The next speaker is Natlynn

24

25

1 NATLYNN CUNNINGHAM: Hi. I'm Natlynn
2 Cunningham, and I live in the Royal Kunia area. I do
3 not support the current rail system and do support the
4 alternative currently being recommended to start closer
5 to town from the Aiea/Salt Lake area. I believe that
6 would generate more income while it's being built and
7 support more ridership.

8 My question to you, as I'm a budget officer and
9 for many years, I'm looking at the Federal money that we
10 have not secured yet, that we're gonna go and secure in
11 2010. Suppose that we get it. The cost of the rail
12 will -- historically costs have tripled, quadrupled. So
13 instead of costing \$5 billion, it may cost us
14 \$15 billion or \$20 billion by the time it's ready to be
15 done. Where is the rest of that money gonna come from?
16 How much is the Government support, the Federal
17 Government?

18 As I understand, the maintenance will be paid
19 from the City's pot. Does anybody here think that we
20 can afford to maintain the rail? Can we? I mean, every
21 time we hit a pothole, I think people should think about
22 it. Maintenance of the rail is way beyond what this
23 city can support, and I don't want to see my children
24 and my grandchildren have to leave Hawaii because the
25 taxes are too high and they can't afford to live here.

1 It's already expensive. I mean, the future of our local
2 people will be threatened by additional taxes. Thank
3 you.

4 TORU HAMAYASU: Next speaker is Eric Minton.

24

25

1 ERIC MINTON: Aloha. I'm not really
2 comfortable on this side of the microphone, but I am in
3 support of a mass transit. I'm in favor of all forms of
4 mass transit. I understand one thing Mayor Hannemann
5 said, and I know he's right, steel-on-steel will be
6 cheaper to maintain. But steel-on-steel is such a
7 heavier train, and I have tried to get an answer from
8 the various committees, what will the difference in
9 construction costs be compared to the other forms
10 against the maintenance?

11 I have had had an opportunity to ride trains in
12 many, many cities. I went to high school in New York
13 City. I went to college in L.A. Business has taken me
14 to Toronto and Montreal, all cities that have all kinds
15 of varieties. My favorite system, which I really wish
16 we were considering, is the monorail. It's the
17 smallest, lightest structure. It blocks the last
18 community, you know, last line, stuff like that. It's
19 cheapest to build.

20 But we'd better not do what we did, what, 20
21 years ago and shoot ourselves in the foot, because if we
22 don't get some form of really mass transit, we'll go no
23 place. The island will die. It has to happen, a better
24 transit system. I live 30 miles from this room. It
25 took me an hour and 20 minutes to get here. I figured

1 it would only take 40, and that's after calling up the
2 offices to get directions to get here. I don't know
3 where this area is. The meetings closer to me are all
4 on work days.

5 So anyway, that's what I'm saying. I really
6 hope that we look more at the monorail, but we cannot
7 say no. Thank you.

8 TORU HAMAYASU: Thank you. That's the last of
9 the registered speakers. Is there anyone else present
10 who would like to provide a comment on the project
11 issues? You sure? With nobody else interested in
12 providing a comment, I conclude this hearing at 6:29.
13 Thank you for your time and interest in this project.

Dear Mr. Genadio:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

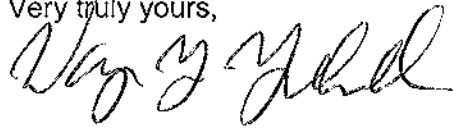

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses comments regarding the above-referenced submittal:

As stated in Section 2.2.3 of this Final EIS, the NEPA Notice of Intent requested input on five transit technologies. A technical review process included the opportunity for public comment and was used in parallel with the alternatives analysis to select a transit technology. The process included a broad request for information that was publicized to the transit industry. Transit vehicle manufacturers submitted 12 responses covering all of the technologies listed in the Notice of Intent. An independent five-member technology panel composed of four transit experts and a transportation academic appointed by the City Council evaluated guided rubber-tire-on-concrete systems (e.g., Phileas bus system and VAL-type systems), monorail (which is a variation on rubber-tyred technology), steel-wheel-on-steel-rail systems, (e.g., light rail and rapid rail), and magnetic levitation (MAGLEV). The panel considered the performance, cost, and reliability of the proposed technologies.

Mr. Frank Genadio
Page 3

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Mr. Young Kim
94-536 Lumiauau Street, F102
Waipahu, Hawaii 96797

Dear Mr. Kim:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The potential locations of the maintenance and storage facility are shown in Figures 2-8 and 2-9 of the Final EIS. As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- *Reduce the time that each area will experience traffic and community disturbances.*
- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*

Mr. Young Kim
Page 2

- *Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- *Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

The Project will terminate at Ala Moana Center. Available funding is insufficient to extend to UH Manoa or Waikiki at this time. The Project has logical termini and independent utility from any extensions that may be constructed in the future. The future extensions to East Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS. However, the future extensions are not part of the Project; thus, they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. When the extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time. UH Manoa and Waikiki will be connected by more frequent bus service until the extensions are completed.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

Waipahu, Hawaii 96797

Dear Mr. Miguel:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been identified as the Preferred Alternative as described above. Compared to the other alternatives discussed in the Draft EIS, the Airport Alternative will carry more passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly lower impacts to the natural and built environment. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative.

Mr. Scott Miguel
Page 2

The Alternatives Analysis phase, which preceded the EIS process, is documented in Chapter 2 of the Final EIS. It evaluated a range of modal and general alignment alternatives, in terms of their costs, benefits, and impacts. The scoping process for the Alternatives Analysis involved a presentation of the viable alternatives to the public and interested public agencies and officials to receive comments on the Purpose and Need, alternatives, and scope of the analysis. Scoping for the EIS followed the FTA process that provides for a culling of alternatives studied in the EIS through an Alternatives Analysis. The scoping process initiated for the Alternatives Analysis included a variety of highway, bus and fixed guideway options for consideration. During the later scoping effort for the EIS, the public was requested to propose alternatives that would satisfy the purpose and need at less cost or with greater effectiveness, less environmental or community impact and to propose alternatives that were not previously studied and eliminated for good cause. The only alternative that emerged that met these criteria was a fixed-guideway alternative following several alternative alignments. All reasonable alternatives that emerged from these processes were ultimately evaluated in the Draft and Final EISs.

Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts, and mitigation commitments.

The project is coordinating with all affected agencies in developing the plan to build the Rail Transit project. Details regarding the Project's coordination can be found in Appendices F and G of the Final EIS.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- *Reduce the time that each area will experience traffic and community disturbances.*
- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*
- *Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- *Balance expenditure of funds to minimize borrowing.*

Ms. Natlynn Cunningham
Page 2

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

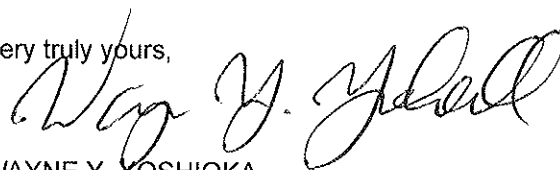

The FTA imposes guidelines for estimating costs to prevent the type of overruns mentioned in the comment. They include conservative cost factors and high contingencies. Cost estimates are carefully reviewed by various FTA representatives, and risks and uncertainties are considered in developing financial plans for the Project, as discussed in Chapter 6 of the Final EIS, which also contains additional financial information. The Federal government will contribute about 30% percent of the total capital cost.

The estimated operating and maintenance cost for the fixed guideway is \$77 million a year for the entire 20-mile system. This is addressed in Chapter 6 of the Final EIS along with the basis for the numbers. As noted in Chapter 6 of the Final EIS, City policy states that the transit system as a whole must recover between 27 and 33 percent of operations costs from farebox revenue. A 30 percent recovery from fares will generate about \$23 million a year. The remainder, the subsidy required for the full fixed guideway system or about \$54 million, will be budgeted for in the annual City budgeting process, as is currently done for TheBus. Fixed guideway operating costs will represent between 2 and 3 percent of the City's annual operating budget and about 25% of the transit budget.

Section 6.4 of the Final EIS describes the funding sources to pay for ongoing operating and maintenance costs associated with maintaining the resulting transit system in a state of good repair. Operating and maintenance costs will be paid for from the same funding sources currently used for TheBus: Federal funding, fare revenues, and subsidies from the City's General and Highway Funds.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Dear Mr. Minton:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraph addresses your comments regarding the above-referenced submittal:

In parallel with the alignment analysis, as stated in Section 2.2.3 of this Final EIS, the NEPA Notice of Intent requested input on five transit technologies. A technical review process included the opportunity for public comment and was used in parallel with the alternatives analysis to select a transit technology. The process included a broad request for information that was publicized to the transit industry. Transit vehicle manufacturers submitted 12 responses covering all of the technologies listed in the Notice of Intent. An independent five-member technology panel composed of four transit experts and a transportation academic appointed by the City Council evaluated guided rubber-tire-on-concrete systems (e.g., Phileas bus system and VAL-type systems), monorail (which is a variation on rubber-tyred technology), steel-wheel-on-steel-rail systems, (e.g., light rail and rapid rail), and magnetic levitation (MAGLEV). The panel considered the performance, cost, and reliability of the proposed technologies.

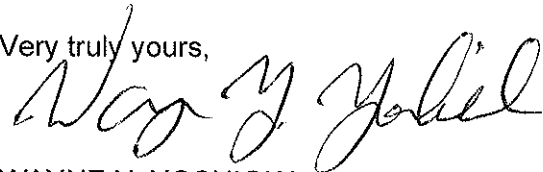

Mr. Eric Minton
Page 2

Proprietary technologies, meaning those technologies that would have required all future purchases of vehicles or equipment to be from a single manufacturer, were eliminated because none of the proprietary technologies offered substantial proven performance, cost, and reliability benefits compared to steel wheel operating on steel rail.

The panel accepted public comment twice as part of its review. By a four-to-one vote, the panel chose a steel wheel vehicle operating on steel rail system because it was considered safe, reliable, economical, and non-proprietary. Those results are documented in the panel's report to the City Council dated February 22, 2008 entitled "Independent Technology Selection Panel Report".

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

SPEAKERS:

Glenn Oamilda 3
91-1179 Puamaeole Street, #24V
Ewa Beach, Hawaii 96706

Michael Burton 5
2889 Ala Ilima Street, #16A
Honolulu, Hawaii 96818

GLENN OAMILDA: I'm opposed to the rail, as it is, the proposed city, simply because, No. 1, it's not environmentally friendly. In other words, it's concrete in the sky. And the highest point on that rail, the way they got it designed, is about a seven-story building, the highest point, 80 feet. So I don't think that's environmental friendly. Plus, the condemnation, the city condemnation for people in Waipahu especially, where I'm from, and especially in Ewa Beach, I think it's going to do harm to the elders and the old people that have accustomed to living in this kind of environment.

And the other thing, too, where the rail is going to start from, east Kapolei, it's ag. land. And I think that's No. 1 priority where we should preserve agriculture land. So that's where the start is going to be. Plus, not only that, the Ewa development plans does not call for a transit. The Ewa development plan does not call for a transit, a rail transit in the second city on the Ewa Plains, so that's why I'm opposed to it. Plus, I don't think it will relieve traffic. By 2030, they said it's going to be only 20

percent reduction, 20 or 23 percent, and I think that's a small number. I think that's really a small number to be dumping all that money into a system that's going to be eventually borne on the public, the cost is going to be borne on the public.

The other thing, too, is the maintenance of that system, I don't think the public is ready to maintain that system for the longevity of the rail, in perpetuity. And I don't think that's fair to have the public bear the cost of the rail.

So those are the three things, and I'm really opposed to, No. 1, again, is the cost; No. 2, is the environment; and No. 3, I don't think it will relieve traffic, you know, but what the alternative designation mitigation said it will, it would deter the traffic, I don't think that's a fair assessment.

Plus, in this economic downturn, I think the money should be wisely spent on our roads and our sewer. The EPA has fined the city a billion dollars to upgrade the system, the sewer system, to complete the total secondary treatment, and the city have reneged on that idea. And of course the roads, the roads are critical to the communities.

So those are the other things that I totally oppose to the rail. So, that's it.

I was born and raised in Waipahu, and I now live in Ewa Beach.

-oOo-

MICHAEL BURTON: Well, first off, I just wanted to say that I do support the rail, and I think it's a necessary utility, you know, coming in from the corridor of Kapolei to downtown and onward to U.H. I was listening to a lot of talk radio in regards to changes that Councilman Djou was recommending, and he did say that he wanted to see the rail start, the project start somewhere in Pearl City-Aiea rather than all the way out by Kapolei, and I think that's a wise part, a wise insight on his part, because it's a better use of public's money. The reason why, is because from Pearl City going into town, that's where you pick up the majority of the riders. So with that, you'll get higher usage out of it, and as you build that portion and going into town, after you complete that, and hopefully you don't run out of money in the process because nothing has been a hundred percent guaranteed, after that portion is completed, then we can go back and finish the

Kapolei and phase of the operation.

The one thing I was in objection to, was, is routing of the rail through Pearl Harbor to the airport. I feel that it should go through Salt Lake, and the reason why, is because there's a dense population of people in the Salt Lake area and along that route, that can take better advantage of the rail, if was stopped, conveniently adjusted for them, to meet their needs.

One of the things that I did notice in the Salt Lake route, is that there's only one stop, at Aliamanu, I believe that's what it is, Aliamanu-Salt Lake, that stop right there. Whereas the Pearl Harbor route has three. Now, in my opinion, if they decide to go with the Salt Lake route rather than the Pearl Harbor route, could one of those stops, the Arizona Memorial stop, be transferred over to Salt Lake, somewhere in between, I think it's Radford High School, Foster Village, put a stop right over there, that's the Bougainville industrial area, and then continue on to Salt Lake and then onward? Because that whole Foster Village is kind of left out, it's just passed over, with the rail, and I think

with a stop in that area, it will better support
the whole rail system.

Dear Mr. Burton:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As described in Section 2.5.10, Project Phasing, and further in Section 8.6.9, Construction Phasing, in the Final EIS, to support phased opening, the first construction phase must be connected to a maintenance and storage facility, which requires considerable space. No location has been identified closer to Downtown with sufficient available space to construct a maintenance and storage facility. Therefore, construction will begin between East Kapolei and Leeward Community College. The Project will be constructed in phases to accomplish the following:

- *Match the anticipated schedule for right-of-way acquisition and utility relocations.*
- *Reduce the time that each area will experience traffic and community disturbances.*

- *Allow for multiple construction contracts with smaller contract size to promote more competitive bidding.*
- *Match the rate of construction to what can be maintained with local workforce and available financial resources.*
- *Balance expenditure of funds to minimize borrowing.*

The portion of the corridor in the Ewa direction of Pearl Highlands is less developed than the areas in the Koko Head direction. Right-of-way can be obtained more quickly at the west end of the Project; therefore, overall project construction can begin earlier, resulting in lower total construction costs. Construction is planned to continue uninterrupted in the Koko Head direction from Pearl Highlands to Aloha Stadium, Kalihi, and finally to Ala Moana Center.

As portions of the Project are completed, each will be opened incrementally so that system benefits, even if limited during the initial phases, will be realized prior to completion of construction of the entire Project.

Your preference for the Salt Lake Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been identified as the Preferred Alternative as described above. Compared to the other alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly lower impacts to the natural and built environment. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative.

The Alternatives Analysis phase, which preceded the EIS process, is documented in Chapter 2 of the Final EIS. It evaluated a range of modal and general alignment alternatives, in terms of their costs, benefits, and impacts. The scoping process for the Alternatives Analysis involved a presentation of the viable alternatives to the public and interested public agencies and officials to receive comments on the Purpose and Need, alternatives, and scope of the analysis. Scoping for the EIS followed the FTA process that provides for a culling of alternatives studied in the EIS through an Alternatives Analysis. The scoping process initiated for the Alternatives Analysis included a variety of highway, bus and fixed guideway options for consideration. During the later scoping effort for the EIS, the public was requested to propose alternatives that would satisfy the purpose and need at less cost or with greater effectiveness, less environmental or community impact and to propose alternatives that were not previously studied and eliminated for good cause. The only alternative that emerged that met these criteria was a fixed-guideway alternative following several alternative alignments. All reasonable alternatives that emerged from these processes were ultimately evaluated in the Draft and Final EISs.

Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the

Mr. Michael Burton
Page 3

Preferred Alternative, how comments were considered in the decision-making process, impacts, and mitigation commitments.

Various locations for the stations were evaluated for the Salt Lake alignment. Limited space for stations and bus connections, along with poor pedestrian access, restricted possible station locations for this alignment.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

A handwritten signature in black ink, appearing to read "Wayne Y. Yoshioka". The signature is written in a cursive, flowing style.

Dear Mr. Oamilda:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The island's unique visual character and scenic beauty was considered in the visual and aesthetic analysis presented in the Draft and Final EISs. The assessment of visual effect due to the Project as described in Section 4.8.3 of the Final EIS considers changes to the visual landscape and viewer responses to those changes. This includes the existing development along the Project alignment. Within the Project corridor the environment changes from rural at the Wai'anae end of the corridor to dense high-rise development at the Koko Head end.

As part of the design process, the City has developed design principles, which are identified in the Honolulu High-Capacity Transit Corridor Project Compendium of Design Criteria (RTD 2009m) that will be implemented in final design to minimize visual effects of the Project. For example, guideway materials and surface textures will be selected in accordance with generally accepted architectural principles to achieve effective integration between the guideway and its surrounding environment. Landscape and streetscape improvements will mitigate potential visual impacts, primarily for street-level views. Other measures to address visual impacts of the Project are being developed through the station design

and planning process. The initial station area plans and design guidelines were first developed with coordination between DTS and the Department of Planning and Permitting (DPP). The next level of transit station design focuses on integrating individual neighborhood characteristics of the communities served by the stations.

The following mitigation framework will be included in the Project to minimize negative visual effects and enhance the visual and aesthetic opportunities that it creates:

- Develop and apply design guidelines that will establish a consistent design framework for the Project with consideration of local context.
- Coordinate the project design with City TOD planning and DPP.
- Consult with the communities surrounding each station for input on station design elements.
- Consider specific sites for landscaping and trees during the final design phase when plans for new plantings will be prepared by a landscape architect. Landscape and streetscape improvements will serve to mitigate potential visual impacts.

Section 4.8.3 of the Final EIS, Design Principles and Mitigation includes information related to the mitigation framework described above. Specifically architecture and landscape design criteria include guidelines regarding site design, materials and finishes, and lighting, which apply to stations, station areas, and the guideway.

In addition, as stated in Section 4.4.3 of the Final EIS: Where relocations will occur, compensation will be provided to affected property owners, businesses, or residents in compliance with all applicable Federal and State laws and will follow the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act. The measures related to relocations include the following:

- The City will assist all affected persons in locating suitable replacement housing and business sites within an individual's or business's financial means.
- A minimum 90-day written notice will be provided before any business or resident will be required to move.
- Relocation services will be provided to all affected business and residential property owners and tenants without discrimination; and persons, businesses, or organizations that are displaced as a result of the Project will be treated fairly and equitably

Where landscaping, sidewalks, and driveway access will be affected by the Project, coordination will occur with the landowner, and these property features will be replaced, restored, and/or the property owner will be compensated.

As presented in Section 4.6.3 of the Final EIS, "The project alignment follows Farrington Highway through the Waipahu neighborhood. The area is urbanized, with land uses along the highway consisting primarily of commercial uses, strip retail plazas, and both mid-rise and medium density apartments." As shown in Appendix C of the Final EIS, Sheets RW-008 through RW-014a, right-of-way acquisition needs are primarily associated with the proposed West Loch, Waipahu, and Leeward Community College transit stations, with the exception of the need to place a proposed maintenance and storage facility just Ewa of the Leeward Community College Station. This area is a 43-acre vacant parcel, and the acquisition will not affect existing land uses. Condemnation is a last resort. The City must follow the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act and assist residents to find adequate, safe, and sanitary housing.

Mr. Glenn Oamilda
Page 3

Regarding your concern for agricultural lands and development, the DPP has been working with the Waipahu community on a TOD plan that will help the local community shape the future of areas around the stations. The existing agricultural lands shown in the City's land use maps are slated for development and will be re-zoned in the future. As part of the development of this area, some land uses will need to change to accommodate the Project. It should be noted, however, that impacts to the natural and built environments will be minimized whenever possible. Zoning changes that are currently being considered are the responsibility of DPP. The preservation of agricultural land was considered in development of the project alignment. Less than 1% of agricultural land will be affected by the Project. Section 4.2 in the Final EIS discusses specific plans and policies set forth for a rapid transit system, with land set aside specifically to accommodate rail. Also see Figure 4-2 for the Planning Regions and Planned Land Use map. As quoted, "Land has been set aside in the City of Kapolei for a transit station/bus terminal/park and ride facility..."

Conditions on Oahu's highways will be worse in 2030 under any circumstance and regardless of which solution is applied; however, conditions will be substantially better with the fixed guideway than with the other potential solutions studied. As shown in Table 3-10 in the Alternatives Analysis Report, the Transportation System Management Alternative would only reduce vehicle hours of delay (VHD) by 2.4 percent, and the Two-direction Managed Lane Alternative would reduce VHD by 4.3 percent. According to Table 3-14 in the Final EIS, the Project will reduce VHD by 18 percent.

Regarding your concerns about maintenance of the system, the long-term operating and maintenance cost for a rail system is less on a per-passenger basis than for a bus system. As shown in Figure 6-2 of the Final EIS, the majority of on-going transit operating and maintenance costs will be for TheBus (about 70% of the total transit budget). The operating costs for the rail system will be funded through the same sources used for TheBus: Federal funding, fare revenues, and City revenues from the General and Highway Funds.

Lastly, enabling legislation for the County's General Excise and Use Tax Surcharge and Ordinance 07-001 preclude the use of the funds for purposes other than a fixed-guideway transit system.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA

RALPH ROSENBERG COURT REPORTERS, INC.
Honolulu, Hawaii (808) 524-2090

1 HEARING OFFICER HAMAYASU: Good evening,
18:04:17 2 I am Toru Hamayasu, the Second Deputy Director of the
3 City and County of Honolulu Department of
4 Transportation Services. I am the hearing officer of
18:04:26 5 this public hearing for the Draft Environmental Impact
6 Statement for the Honolulu High-Capacity Transit
7 Corridor Project.

8 The purpose of this public hearing is to
9 collect comments related to the proposed transit
10 project regarding: the draft EIS; Section 106 of the
11 National Historic Preservation Act process; Section
12 4(f) of the U.S. Department of Transportation Act;
18:04:59 13 right-of-way acquisition; and floodplains affected by
14 the project.

15 Public input can be made in four ways:
16 1) Public spoken testimony to me here in the public
17 hearing room; 2) if you do not wish to speak in
18 public, an individual spoken testimony for the record
19 can be made to the hearing recorder who is near the
20 public involvement station in the public information
21 area across the hallway; 3) written testimony may be
22 deposited in the black comment box at this meeting,
18:05:29 23 delivered to the Department of Transportation Services
24 office, or mailed or faxed (808) 523-4730 to DTS by
25 January 7, 2009; and finally, 4) testimony can be

Honolulu, Hawaii

(808) 524-2090

1 submitted online by January 7, 2009 at
2 www.honolulutransit.org.

3 All comments and responses will be
18:05:59 4 included in the Final EIS. Revisions to the EIS will
5 be made as appropriate based on comments. The hearing
6 procedures are as follows:

7 1. Elected and public officials will be
8 heard first. Persons desiring to testify should
9 register at the entrance to the hearing room, and will
10 be called in order of registration.

11 2. Any individual may appear and speak
12 for him or herself, or if duly authorized, for any
18:06:29 13 local civic group, organization, club or association,
14 subject to the rules provided herein. Speakers should
15 give their name. If representing a group, this
16 information should also be given.

17 3. Speakers must limit their statements
18 to three minutes. Additional prepared statements or
19 literature pertaining to the project may be submitted
18:06:55 20 at this hearing or by 4:30 p.m., January 7, 2009 to
21 Department of Transportation Services. These
22 statements will be made part of the official record if
23 they include a legible name and address.

24 4. For these hearings, all statements,
25 oral or written, should be directed to the hearing

Honolulu, Hawaii

(808) 524-2090

1 officer and must be related to the subject matter of
2 the hearing.

3 5. Each person speaking before the
18:07:28 4 audience must do so at the floor microphone. We will
5 call testifiers in groups of three to facilitate
6 orderly progress. Please ensure you are in the
7 hearing room at the time your name is called. A court
8 stenographer will record and transcribe the hearing
9 proceedings. If required, I will announce any other
10 specific rules governing this hearing.

18:07:57 11 6. As part of this public hearing
12 process, the Honolulu High-Capacity Transit Project
13 team is not allowed to respond to any questions or
14 concerns raised by the speaker. The project team will
15 be available to address your questions in the project
16 information area outside of this hearing venue.

17 It is now 6:05 p.m. At this time I would
18 like to begin the public testimony. The first
18:08:28 19 testifier is Arnold Widder followed by Robert Wong.

RALPH ROSENBERG COURT REPORTERS, INC.
Honolulu, Hawaii (808) 524-2090

18:08:34 1 MR. WIDDER: Mr. Hamayasu, since --
2 number 1, since the EIS draft concluded that the rail
18:04:59 3 could --

4 HEARING OFFICER HAMAYASU: Please state
5 your name for the record.

6 MR. WIDDER: Arnold E. Widder,
7 W-I-D-D-E-R.

8 HEARING OFFICER HAMAYASU: Thank you.

9 MR. WIDDER: Number one since the EIS
10 draft concluded that the rail would cut traffic by
11 only 1 percent and since there couldn't be a worse
12 time to burden local taxpayers with probable increases
13 to excise taxes to pay our billions of dollars of
14 steel rail debt, I'm still against the rail system.
15 I'm concerned that the expensive media advertising of
18:05:30 16 how great the rail system was overwhelmed the voters.

17 Number two, a vote was taken and seems to
18 be irrevocable, however, I pray that the airport and
19 UH will be placed back into the original plans and
20 Salt Lake will become the spur. The only reason why
21 Salt Lake was submitted was because the Salt Lake
22 Councilmember coerced the mayor to adopt it or lose
23 the steel rail system that the majority of
18:05:58 24 councilmembers did not originally want.

25 Number three, has anybody publicly showed

Honolulu, Hawaii (808) 524-2090

1 concern that if Hawaiian bones are found in the
2 pathways that it would greatly slow down the process.

3 Number four, the Honolulu mayor is
4 presently trying to get millions of dollars for very
5 worthy public works projects. If the federal
6 government gives Honolulu a major funding for our
7 rail, I believe they will give us far less for our
18:06:29 8 other community work projects which will probably go
9 to other needy citizens.

10 Thank you.

11 To other needy cities.

12 HEARING OFFICER HAMAYASU: I'm sorry,
13 would you like to state that so that she can hear it?

14 MR. WIDDER: I think I said citizens. I
15 meant cities, to go to other needy cities.

16 HEARING OFFICER HAMAYASU: The next
17 speak, Robert Wong.

18

20

21

22

23

24

25

RALPH ROSENBERG COURT REPORTERS, INC.
Honolulu, Hawaii (808) 524-2090

1 MR. WONG: Good evening. That was fast.
2 Thank you for the opportunity to listen to my
3 comments. I appreciate everybody's work in putting
18:07:00 4 all this information together. It's quite staggering.
5 I did attend one town meeting with the mayor, so I'm a
6 little bit informed but not quite totally. I've lived
7 in New York City for almost ten years and I used the
8 metro NTA, New Jersey transit path, metro north, and I
18:07:25 9 have a degree in quality control, so I think it's -- I
10 don't have actual experience in urban planning or
11 transportation industry, but my theory kind of helped
12 me formulate my thoughts.

13 The mayor said that the system would be
14 mostly built at elevation versus at grade as a result
15 of public consensus, and they didn't want to sacrifice
16 the existing lane or two to locate the train tracks,
17 and he also signaled that the system would have to
18:07:59 18 work with the bus authority in order to execute a
19 smooth process getting people to and from the trains.
20 I have two concerns that I would like to address.

21 Based on what I've read in the newspapers
22 and the web site, the total cost of the project seems
23 to generate a lot of conflict, and I hear people
24 saying that it's cost prohibitive versus the City
18:08:28 25 government's position that the costs are manageable.

Honolulu, Hawaii

(808) 524-2090

1 In any event, there's -- the amount of information is
2 way too much, I think, for the normal citizen to
3 process and digest. I would like to see a greater
4 portion of the system be built at grade to bring the
5 costs down and with the assumption that building it at
18:08:58 6 grade is going to be more cost effective.

7 A kind of contingent benefit, as I see
8 it, to that using city or state roadways, particularly
9 where four to six lanes exist in the same direction.
10 So if you brought that down to two or three, you're
18:09:28 11 going to force more cars off of the road. Of course,
12 this is a consensus issue as well as a fiscal one, but
13 I hope there can be some kind of compromise.

14 The second thing is a little more
15 important, and I --

16 (Buzzer sounds.)

17 HEARING OFFICER HAMAYASU: Please
18 summarize.

19 MR. WONG: I'll send them in.

20 Thank you.

21 HEARING OFFICER HAMAYASU: That's the end
22 of the registered speakers. Anyone else who would
18:10:00 23 like to provide comments on project issues?

24 Please step forward, state your name and
25 address for the record.

Honolulu, Hawaii

(808) 524-2090

1 MR. HOLMAN: My name is Russell Holman
2 and I have a P. O. Box, 1201, Honolulu, Hawaii. I'm a
3 transportation consultant. I'm sorry for not being
4 prepared to have a written testimony, but I have a few
5 concerns regarding the infrastructure needs since we
6 are at the Bishop Museum today I'm more concerned
7 about the alignment going through Dillingham. As you
8 look at it, I notice there's a lot of utility poles in
9 the corridor, some of these KV lines and all that.
10 But in the process I know there is a lot of median
11 work to be done when you're doing the fixed guide rail
12 construction. Somehow if they can put those utility
13 lines and telephone lines underground like some of
14 these places like east Honolulu, I think that can
15 beautify in terms of beautification of this
16 neighborhood as well. Because when you're riding the
17 bird's eye view in the fixed rail, you don't want to
18 see all of these telephone lines, you know, with wires
19 all the other stuff. And overall with the alignment
20 if they can somehow get the utility lines as well and
21 bring it underground, I think that might beautify the
22 riders as well and the infrastructure needs.

23 Thank you.

24 HEARING OFFICER HAMAYASU: Anyone else
25 wish to testify? Do you want to check outside,

Honolulu, Hawaii

(808) 524-2090

1 Patrick?

2 With nobody else interested in providing
3 comments, I conclude this hearing at 6:12 p.m.

4 Thank you for your time and interest for
5 the project.

Honolulu, Hawaii 96815

Dear Mr. Widder:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

As shown in Table 3-14 of the Final EIS, the fixed guideway system will reduce vehicle hours of delay by 18 percent when compared to the No Build Alternative. In addition, Figure 3-11 in the Final EIS shows that the fixed guideway will substantially increase the transit share of total travel during the a.m. two-hour peak period. To determine the effects of the Project, street and highway system peak-period traffic volumes were evaluated at key screenline locations in the study corridor (a screenline is a virtual line drawn across the road network at selected locations to enable comparisons). As shown in Tables 3-9 and 3-10 in the Final EIS, traffic volumes will decrease by up to 11 percent at these screenlines during the a.m. and p.m. peak hours when compared to the No Build Alternative. Traffic reductions will result from people choosing to use transit during peak travel times.

Guidelines set forth by the NEPA of 1966, as amended and Chapter 343 of the Hawaii Revised Statutes stipulate that public involvement be carried out on large projects such as this one. As the largest infrastructure project ever to be constructed on Oahu, the City felt that it was important to disseminate information to as many people as possible. Thus, a broad range of print and visual media was necessary to reach different population segments.

Your preference for the Airport Alternative has been noted. While each of the alternatives discussed in the Draft EIS includes trade-offs between benefits and impacts, the Airport Alternative from East Kapolei to Ala Moana has been selected as the Preferred Alternative as described above. As compared to the alternatives discussed in the Draft EIS, the Airport Alternative will carry the most passengers, provide the greatest transit-user benefits, and result in the fewest vehicle hours of delay. It will provide access to employment centers at Pearl Harbor Naval Base and Honolulu International Airport and will serve the Salt Lake neighborhood with connecting bus service. Of the three Build Alternatives addressed in the Draft EIS, the Airport Alternative will have slightly less impacts to the natural and built environment analyzed in the Draft EIS. During the public comment period on the Draft EIS, the public overwhelmingly supported the Airport Alternative. Of the comments that specifically supported one of the alternatives, more than 75 percent were in support of the Airport Alternative. For more information this selection is discussed in Section 2.4 of the Final EIS. Since publication of the Draft EIS, design has been advanced, further analysis has been completed, and information has been added in response to comments on the Draft EIS and agency coordination. The Final EIS discusses the process that was used to select the Preferred Alternative, how comments were considered in the decision-making process, impacts and mitigation commitments.

The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS; however the future extensions are not part of this Project, thus they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes and NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time. Other extensions, such as Central Oahu, have been considered and may be undertaken at some point after the current Project is constructed.

In the event that burials are encountered, they will be identified and managed in compliance with applicable laws. This will include consultation with project proponents, the Oahu Island Burial Council, the State Historic Preservation Division, and recognized lineal and/or cultural descendents to develop burial treatment plans. While this could slow down the project development process, applicable laws will be followed. As described in Section 4.18.11 of the Final EIS, the Programmatic Agreement will govern the treatment of burials discovered during construction.

Mr. Arnold E. Widder
Page 3

As described in Section 6.3.2 of the Final EIS, most Federal funding for the capital costs of the Project is expected to come from the FTA Section 5309 New Starts Program. This is a discretionary program administered by the U.S. Department of Transportation for this specific purpose; these funds are not "taken away" from other Federal funding programs that would flow to the City and County of Honolulu.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Dear Mr. Wong:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The Alternatives Screening Memorandum (DTS 2006a) recognized the visually sensitive areas in Kakaako and Downtown Honolulu, including the Chinatown, Hawaii Capital, and Thomas Square/Academy of Arts Special Design Districts. To minimize impacts on historic resources, visual aesthetics, and surface traffic, the screening process considered more than 15 different combinations of tunnel, at-grade, or elevated alignments between Iwilei and Ward Avenue. As identified on pages 4-23 and 4-24 of the Screening Memorandum, four different alignments through Downtown Honolulu were advanced for further analysis, including an at-grade portion along Hotel Street, a tunnel under King Street, and elevated guideways along Nimitz Highway and Queen Street.

The Alternatives Analysis Report (DTS 2006b) evaluated the alignment alternatives based on transportation and overall benefits, environmental and social impacts, and cost

considerations. The report found that an at-grade alignment along Hotel Street would require the acquisition of more parcels and affect more burials than any of the other alternatives considered. The alignment with a tunnel under King Street through Downtown, in addition to the environmental effects such as impacts to cultural resources, reduction of street capacity, and property acquisition requirements of the at-grade section, would cost over \$500 million more than the least expensive alternative.

The Project's purpose is "to provide high-capacity rapid transit" in the congested east-west travel corridor. The need for the Project includes improving corridor mobility and reliability. The at-grade alignment would not meet the Project's Purpose and Need because it could not satisfy the mobility and reliability objectives of the Project. Some of the technical considerations associated with an at-grade versus elevated alignment through Downtown Honolulu include the following:

- **System Capacity, Speed, and Reliability:** The short, 200-foot blocks (or less) in Downtown Honolulu would permanently limit the system to two-car trains to prevent stopped trains from blocking vehicular traffic on cross-streets. Even with transit signal priority, the at-grade speeds would be slower and less reliable than an elevated guideway. Under ideal circumstances, the capacity of an at-grade system could reach 46,000 passengers per hour per direction, assuming optimistic 5 minute headways. Based on travel forecasts, the Project will need to carry approximately 8,000 passengers by 2030. Moreover, the system can be readily expanded to carry over 25,000 in each direction by reducing the interval between trains (headway) to 90 seconds during the peak period. To preserve a comparable system capacity, speed, and reliability, an at-grade alignment would require a fenced, segregated right-of-way that would eliminate all obstacles to the train's passage, such as vehicular, pedestrian, or bicycle crossings.
- **Mixed-Traffic Conflicts:** With the planned three-minute headways, the short cycle of traffic lights would affect traffic flow and capacity of cross-streets. Furthermore, there would be no option to increase the capacity of the system by reducing the headway to 90 seconds.
- **Construction Impacts:** An at-grade system would consume two or more lanes of existing roadway, resulting in increased congestion or requiring that additional businesses or homes be taken to widen the roadway through Downtown. This would also have greater construction impacts and potentially affect cultural practices and burials to a greater extent than the placement of discrete column foundations for an elevated structure.

Because it is not feasible for an at-grade system through Downtown to move passengers rapidly and reliably without significant detrimental effects on other transportation system elements (e.g., the highway and pedestrian systems, safety, reliability, etc.), an at-grade system would have a negative systemwide impact that would reduce ridership throughout the system. The at-grade system would not meet the Project's Purpose and Need and therefore does not require additional analysis.

Mr. Robert Wong
Page 3

Project costs (both capital and operating) are described in Chapter 6 of the Final EIS and are subject to very close and continuing scrutiny by the Federal Transit Administration (FTA) and third party reviewers. To date, the FTA has accepted the financing structure for the Project and looks forward to more detail and clarity as the Project is refined in design.

The Alternatives Analysis examined potential configurations for the fixed guideway system. These configurations included possible surface operations on some portions of the alignment in Downtown. Reducing the number of lanes could encourage drivers to switch modes of transportation. However, the Build Alternatives addressed in the Draft and Final EISs involve exclusive operations on an elevated guideway. As stated above, these exclusive operations along the entire guideway provide more reliable service compared to a configuration with some surface operations. This configuration also reduces effects on traffic, parking capacity, and potential right-of-way needs, as discussed above.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

Mr. Russell Holman
P.O. Box 1201
Honolulu, Hawaii
(Incomplete address provided)

Dear Mr. Holman:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address your comments regarding the above-referenced submittal:

The Alternatives Analysis examined several alignments through the Kalihi area, including a route down King Street. The North King Street alignment was evaluated in the Alternatives Analysis. The North King Street alignment would have affected a greater number of parcels located within environmental justice/communities of concern areas (29 parcels of which 2 are residential versus 23 parcels of which none are residential along Dillingham Boulevard). In addition, a North King Street alignment would have moderate-high visual impacts whereas the Dillingham Boulevard alignment would have low-moderate visual impacts. The noise analysis conducted revealed moderate impacts at 52 receivers along the North King Street alignment whereas there would be moderate impacts at 17 receivers along Dillingham Boulevard.

There are 43 cultural practices and resources along the North King Street alignment that would be affected during construction and 2 that would be affected during operation. With the Dillingham Boulevard alignment, 23 cultural practices would be affected during construction and none that would be affected during operation (cultural practices varied from one-time annual events to cultural activities regularly held by churches or community organizations). The historic analysis identified pre-1965 tax map lots within the study corridor. Locations on this list included resources reviewed in previous studies and/or already included in the State Historic Preservation Division's State and National Register lists. The North King Street alignment is adjacent to 33 historic resources (of which 5 are on either the Hawaii Register or Eligible for the National Register) whereas the Dillingham Boulevard alignment is adjacent to 12 potentially historic resources (of which only 1 is on one of the registers). Accordingly, the alignment along Dillingham Boulevard was selected.

As discussed in Section 4.18.2 of the Final EIS, "Communication and coordination have been initiated with the affected utility agencies and companies and will continue throughout design and construction." Further, "Design criteria will govern all new utility construction outside of buildings, as well as the support, maintenance, relocation, and restoration of utilities encountered and affected by construction of the fixed guideway." In addition, "Along several roadway corridors, most existing overhead utilities in conflict with the guideway and safety clearance requirements will be relocated underground. Existing overhead electrical and communication utilities not in conflict with the aerial guideway and safety clearance requirements will remain overhead. Coordination will occur with emergency services and utility companies to ensure that utility relocations meet their needs and that sufficient clearance is provided. The City will evaluate relocation of utilities that are in conflict with the fixed guideway during preliminary design."

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Acceptance of the Final EIS by the Governor of the State of Hawaii and issuance of the Record of Decision under NEPA are the next anticipated actions.

Very truly yours,

WAYNE Y. YOSHIOKA
Director
