EXHIBIT C

SECTION 8. The monies described in Section 1 for the fiscal year July 1, 2002 to June 30, 2003 are appropriated as indicated in the following projects and public improvements in the UTILITIES OR OTHER ENTERPRISES function. Nothing in this section shall be construed as restricting the allocation of monies among the work phase appropriations (e.g., planning, design, and construction).

PROJECT NUMBER	FUNCTIONS, PROGRAMS & PROJECTS	WORK PHASE	SOURCE OF FUNDS	TOTAL ALL FUNDS

November 13, 2002

Ms. Michelle Spalding Matson
3931 Gall Street
Honolulu, Hawaii 96815

Dear Ms. Matson:

Subject: Primary Corridor Transportation Project

This responds to your comments on the Major Investment Study/Draft Environmental Impact Statement (MIS/DEIS) and Supplemental Draft Environmental Impact Statement (SDEIS). We are responding in two parts. Part A responds to your participation in a September 28, 2000 meeting, your oral testimony at the October 5, 2000 Special Transportation Committee Meeting, your oral testimony at the October 12, 2000 formal Public Hearing, your oral testimony at the October 26, 2000 Special Transportation Committee Meeting, and your oral testimony at the November 14, 2000 Special Transportation Committee Meeting regarding the MIS/DEIS. Part B responds to your oral testimony at the April 20, 2002 public hearing and your May 6, 2002 letter regarding the SDEIS.

Part A – MIS/DEIS Comments

1. *Embedded trackwork for an LRT system is estimated to cost substantially more per mile to supply and install than the high-capacity, high-quality paving needed for the BRT transitway (in the range of $8-12 million more per mile). Over approximately 11.8 miles, the cost differential would be $94-142 million. (**Note:** Power Source, states that both LRT and BRT can be powered by new embedded plate technology.)*

   Response: The added cost for the LRT is for the steel tracks and additional utility relocation required. These costs are seperate and in addition to the cost of the traction power system, which for both the BRT and LRT could be touchable embedded-plate technology.

2. *SMA and Zoning Maps absent for Waikiki area (Figures 3.1-5 A-E).*

   Response: The Special Management Area for Waikiki was shown on MIS/DEIS Figure 3.1-8D, Special Manegement Area: Kalihi – University. Zoning meps for Waikiki were shown on MIS/DEIS Figure 3.1-5D, Zoning Map: Kalihi - University.

3. *Transit Center and Transit Station locations and descriptions absent (area covered, structural size and character, combined uses, access impact on surrounding community/communities, etc.) Figures 3.1-6 A-D and 5.15).*

   Response: The transit centers and park-and-rides identified in the FEIS as an independant project, or where the transit center will not be built for 12 years or more, will undergo their own environmental review process to address their related impacts and mitigation measures. At that time, details about each individual transit center's specific location, physical characteristics and operations will be documented.

4. *Although Kapiolani Park was placed in the Register of Historic Places in 1992, it is neither listed nor mapped as a Historic Resource in the DEIS (Kapiolani Park Trust Lands include the Honolulu Zoo and portions of Kapahulu Avenue and Jefferson School). (Figure 3.10-A and Tables 3.10-1 and 5.10-1) However, Kapiolani Park is mapped and listed as an adjacent Parkland Resource in the DEIS (Table 3.11-1 and Figure 3.11-1C).*

   Response: Thank you for the information about Kapiolani Park, which is listed on the State Register of Historic Places. This information is included in the FEIS.

5. *Statistics are based on the 1990 Census.*

   Response: Much of the demographic information (e.g., census tract data) needed for the MIS/DEIS was not available at the time the document was completed. The FEIS includes the most up to date census information available.

6. *Projected high ridership numbers to qualify for federal funding are derived from islandwide demographic totals not specific to Proposed Route.*

   Response: The travel forecasts for the Primary Corridor Transportation Project were developed using travel forecasting procedures developed for the Oahu Metropolitan Forecasting Model Development Project. These procedures simulate the choices made by residents, business, and visitors regarding the nature, number, mode, time-of-day, and geographic orientation of trips that they make on a typical weekday. The procedures have been developed with data obtained in extensive surveys of Oahu households, transit riders, and air passengers. Future year forecasts reflect the population and employment forecasts that have been prepared by DBEDT and the zonal allocations that have been prepared by the City Department of Planning and Permitting.

   The ridership forecasting process uses geographic specific transit networks which simulate the precise alignment of each bus route in the network. These simulation networks were prepared uniquely to reflect the route locations and service frequencies in each of the three alternatives. In accordance with FTA guidelines, in evaluating the performance of the alternatives the same distribution of future population and employment is assumed. Since it does not allow the differences in growth-shaping potential to be included in the analysis, the ridership results for the Refined LPA are likely understated rather than overstated when compared to the No-Build and TSM Alternatives.

7. *The BRT Alternative offers the ability to accommodate even further increases in demand, without major road construction. This could be achieved by using higher capacity BRT vehicles or further increasing the frequency of transit service. (**Note:** also a possibility of converting to new technology embedded plate, entrained LRT referenced above.)*

   Response: The statement referred to in the MIS/DEIS states "The BRT Alternative could accommodate even further increases in travel demand beyond 2025 without major road construction". This statement is assuming the BRT Alternative is already implemented and its facilities constructed and therefore any future travel demand past 2025 can be accommodated without additional roadway construction.

   There is no plan to convert to LRT in the future.

8. *The In-Town BRT stops in the Chinatown Special District, and in the Hawaii Capitol Special District would not have canopies or other elements which would impact views of any important landmarks. The transit stop planned in front of the Duke Kahenamoku Statue on Kalakaua Avenue, also would not have a canopy. Other sensitive areas include the following: Waikiki Special District / Ala Moana Park (and Kapiolani Park / Kalia Road in Fort DeRussy / along Kalakaua Avenue (Note: Kapiolani Park and along Kapahulu Avenue were omitted.)*

   Response: Kapiolani Park has been added as a visually sensitive area in the FEIS.

9. *The archaeological resources, iwi kupuna, uncovered along Kalakaua Avenue in the vicinity of Kapiolani Park Beach, Kuhio Beach, and Kapiolani Park are ignored in the DEIS!*

   Response: An assessment of the archaeological resources in the study area has been conducted for the FEIS and is discussed in Chapter 5. The project is aware of the potential that excavation work may uncover cultural/archaeological resources in certain areas. Therefore, we will employ archaeological monitoring during excavation work at certain locations, such as in Waikiki.

10. *[Parklands and Section 4(f) Evaluation] This section discusses potential impacts to parks and recreational resources in the project area. None of the alternatives would change the character, function or use of any park or recreational resource in the study area, despite that the two build alternatives would use the Aloha Stadium overflow parking lot as a park-and-ride lot. This use of park property would trigger the provisions of Section 4(f) of the U.S. Department of Transportation Act. The TSM and BRT Alternatives would enhance transit access to parks and recreational resources in the project area by improving the level of transit service to parks along the alignments of these alternatives. Vehicular access to Ala Moana Park would be adversely effected under the BRT alternative because of the conversion of two general-purpose lanes to transit lanes on both Ala Moana and Kapiolani Boulevards. (Note: The DEIS again ignores Kapiolani Park.)*

    Response: Kapiolani Park, which includes Honolulu Zoo, was identified on Table 3.11-1 of the MIS/DEIS as a park and recreational resource. A Section 4(f) Evaluation and park impact analysis regarding Kapiolani Park (Honolulu Zoo) was not conducted because it was uncertain at that time whether the traction power supply station (TPSS) would remain at that location. However, as a result of comments received regarding substation locations and further project refinements since the MIS/DEIS was released, the proposed TPSS location originally shown in the Kapiolani Park area will be relocated to a different site Ewa of Kapahulu Avenue. It should be noted that the substations will only be constructed if the technology selected, such as embedded-plate, requires them.

11. *Of the many existing and planned public parks and recreational resources in the project area identified in Section 3.1.1, only one would be affected by the alternatives such as a Section 4(f) Evaluation is required. ... (Note: The DEIS again ignores Kapiolani Park.)*

    Response: See response to comment #10.

12. *Parklands are publicly owned. Subsequent developments would not encroach on parks. Impacts on parklands would be assessed during the environmental review process for each subsequent development. (Note: Again, the DEIS again ignores the Kapiolani Park Trust.)*

    Response: See response to comment #10.

13. *Through the use of electric bus technology, the BRT Alternative would reduce air and noise emissions ... regional air emissions would be less. ... would generally be quieter than conventional diesel buses. However, as with the TSM Alternative, the Regional BRT system would create a noise impact along a section of H-1 that would require noise mitigation. ... Transit center impacts will be separately analyzed in a subsequent phase since there are multiple alternative sites for each location. Under a worst [case] condition, the BRT Alternative could potentially displace up to 12 businesses. Up to two partial displacements are also possible. (Note: This segmentation of the cumulative project violates State law.)*

    Response: Cumulative impacts are addressed in the MIS/DEIS, SDEIS, and FEIS Section 5.13.1. The transit centers that will be constructed whether or not the Refined LPA is constructed will be analyzed as separate projects and have separate environmental documents prepared. The Primary Corridor Transportation Project's EIS addresses the impacts associated with the Kapolei Transit Center, North-South Road Park-and Ride and Aloha Stadium Transit Center.

14. *The additional federal construction funds associated with the TSM alternative would translate into 3,080 person years of jobs created directly and indirectly during project construction. (Note: What is the differential factor describing "new jobs", above, vs. "person years of jobs"?)*

    Response: One of the economic impact measures in the FEIS is the number of person years of jobs generated during construction of the project. The forecasts include direct construction jobs created as well as jobs created through the multiplier effect into the economy of these new jobs. The reason that they are referred to as new jobs is that they would not exist unless there was an influx of "new" federal money from discretionary grants. The reason these jobs are stated as person years of jobs is that they are temporary during the construction period of the project. Permanent jobs (e.g. bus drivers, mechanics, etc.) are also presented in the economic impact section (5.1) of the FEIS.

15. *...the lower cost per new rider represents the more cost-effective alternative. ... the cost per new rider for the TSM Alternative is $9.74, which is greater than the cost per new rider for the BRT Alternative of $7.67... (Note: As determined by an assumption of a full 120 passengers per BRT vehicle and based on 1990 Islandwide population data?)*

    Response: The cost-effectiveness measure utilizes the forecasted transit ridership for the year 2025 for each alternative. Transit ridership forecasts are based on a projected population of 1,083,000 for Oahu in 2025. Ridership forecasts assume that BRT vehicles will have loads of 100 passengers per vehicle during the peek hour in the area between Honolulu Community College and Union Mall but that they will have fewer passengers on board at other locations and at other times.

16. *The Draft Environmental Impact Statement for the proposed primary corridor transportation project is deficient because it is missing key information. It should be returned for completion before it is further considered.*

    Response: It is to be expected that there would be relevant information missing in the MIS/DEIS. The environmental review process allows for agencies and the public to review the MIS/DEIS and to inform the sponsoring agency of any missing information. The FEIS incorporates additional and updated information.

17. *For example, the draft EIS we are provided with has a map showing a circular rapid transit route through Waikiki. No specific transit stops or larger transit centers are on the map. Although in recent meetings, we were provided with more detailed photographs with specific transit stops only. However, three major transit centers are listed on a chart in the draft EIS. But the draft EIS describes the location of only two of what we now have been told are ten major transit centers planned.*

    Response: Regarding the examples given, possible locations of transit stops in Waikiki are shown on MIS/DEIS Figure 2.2-5 and possible locations of transit centers are shown in MIS/DEIS Figure 2.2-3. Refined locations are shown in the corresponding figures in the FEIS.

18. *And what of peripheral parking to serve proposed dual tram rapid transit in Waikiki. Again, no locations to provide parking for outsiders and hotel employees are disclosed. What impact will this have on surrounding communities.*

    Response: Park-and-ride locations which could be used by workers and others destined for Waikiki are shown in Table 4.4-1 of the FEIS.

19. *Further, the draft EIS states that the total cost of the system over 25 years will be "$1,060.3 million." In similar terms, this means the cost of $1 billion. However, in recent meetings, we were told that this is really not true because the cost will only be $800 million. But within 25 years, $200 million will be needed for new equipment. This brings us to what new equipment will be needed within 25 years.*

    Response: In addition to the Regional and In-Town BRT elements, the Refined LPA includes expansion of the present bus fleet and the normal replacement of vehicles within this fleet over time as they reach the end of their useful life (assumed to be 12 years for buses and 15 years for BRT vehicles).

20. *It is disclosed in the draft EIS the dual tram rapid transit dedicated lane electro-plate technology which is demonstrate preferred by the City administration for Honolulu but not yet fully tested in Trieste, Italy or built elsewhere can also be adapted for light-rail transit. In the draft EIS we are told that the contemplated tram rapid transit cannot be entrained or coupled with additional cars but light-rail transit can.*

    Response: The statement that embedded plate technology is being developed by the manufacturers for application on light rail as well as buses is not to say that the City is still considering LRT as a candidate technology for Honolulu. LRT has been rejected as an option.

21. *We are told that the ridership projections extend to the year 2025. If and when more capacity is needed, will we then convert the duel tram rapid transit to light-rail transit with that 200 million. Will we then have a monorail train running through Waikiki and beyond to the Ala Wai Canal river walk and central park restaurants and shops were the golf course is now.*

    Response: There is no plan to convert the BRT to LRT post-2025.

22. *In conclusion, what are the historical integrity and character of Honolulu. We are told that the draft EIS and shown at meetings that there will be a bullet shape double tram slicing past Iolani Palace. This plastic bullet will also be slicing past to the majestic Moana Hotel, the Waikiki shoreline viewplanes and historic Kapiolani Park.*

    Response: The physical appearance of the In-Town BRT vehicle has not been determined. The photo simulations are illustrative only of the type of technologies that have been implemented elsewhere. A vehicle could be designed unique to Honolulu to reflect a consensus vision of what is meant by "Hawaiian Sense of Place". In any event, the operation of vehicles would not affect the character of any historic property along the In-Town BRT alignment.

23. *Is this the administration's interpretation of Hawaiian sense of place that has been so consistently eluding them? Does this mean that if Waikiki can't be Las Vegas at the moment at least Waikiki can mimic the artificial trappings of Las Vegas. Is this what the Japanese tour executive meant when he recently stated, "The most important asset in Waikiki is its beautiful nature, but we really would like to see some other products." To this we say thanks, but no thanks.*

    Response: See response to comment #22.

24. *The City is nearing completion of reducing four traffic lanes to three lanes along Kalakaua Avenue in order to expand the Kuhio Beach recreation area. With the proposed addition of a dedicated rapid transit lane, traffic will be reduced to two lanes, including stopping and loading by commercial and other transportation vehicles. There is foreseeable increased congestion and gridlock consequent to separated transit corridor lanes and platforms consuming major portions of traffic arteries and thoroughfares, even if fewer people are driving cars and more are using rapid transit. The DEIS states that such would result in a reduced level of service for auto traffic within the urban core, but it is silent on how traffic congestion and gridlock will be mitigated with lane closures along Kapiolani Boulevard and within Waikiki.*

    Response: The changes in lane designations identified above have already been completed and were incorporated into the planning for the Refined LPA. The lanes designations for the Refined LPA on Kalakaua Avenue between Saratoga Road and Uluniu Avenue, is three mixed-traffic lanes and a semi-exclusive curb lane shared by the BRT, private buses, and right-turning autos. On Kalakaua Avenue between Uluniu Avenue and Kapahulu Avenue the BRT will operate in mixed traffic so there will be no change from today (i.e. three mixed traffic lanes).

    The forecasts of year 2025 travel demand have changed from the DEIS to the FEIS, but the traffic analyses still indicate that the Refined LPA will not result in more congested traffic operations along the BRT corridors than the TSM or No-Build Alternatives. At the same time, the transit level of service (LOS) will be consistently better with the Refined LPA since it will provide an alternative, less congested mode of transportation to travelers in these corridors. This is especially beneficial in the Waikiki area where all alternatives are projected to result in congestion for motorists on Kuhio Avenue. Traffic operations for motorists on Kalakaua Avenue are projected to be similar between all Alternatives, since the BRT will be in semi-exclusive and mixed-flow lanes.

25. *And what of the peripheral parking to serve the proposed duel tram rapid transit in Waikiki? The PUC-DP draft revision portends "a comprehensive transportation system can be accomplished only through the use and development of parking spaces on the periphery." The Joint Waikiki Task Force report states that peripheral parking locations need to be provided and that passenger service should be allowed to be structured by the employers for hotels and shops. A Waikiki Improvement Association representative recently stated, "The tram will improve access to Waikiki for employees. The priority is to accommodate the Waikiki work force."*

    Response: There are no parking locations proposed or planned as part of the Refined LPA beyond those specifically identified in the FEIS. The only new parking planned as part of this project would be at designated transit centers and park-and-rides, shown in Table 4.4-1 in the

FEIS. The park-and-rides shown are well outside of Waikiki, and could be used by Waikiki workers for accessing the BRT system thereby reducing the number of autos entering and parking in Waikiki.

26. *Sites suggested for Waikiki use have included Kapahulu basayard, Kapahulu Library, Jefferson School and the zoo parking lot. However, Kapahulu Advisory Group members have expressed concerns that a transit center and parking facility would work against uniting the Kapahulu Community, and that the site, which is not centrally located along Kapahulu Avenue, would be mainly used as parking for employees of Waikiki hotels, which have been established.*

   Response: See response to comment #25.

27. *Again, no locations to provide parking for outsiders and hotel employees are disclosed in the DEIS. In Kapahulu, where there is a concerted effort to calm traffic and revitalize the community business district, providing peripheral parking for 38,000 Waikiki hotel employees would have a devastating impact on the community.*

   Response: See response to comment #25.

28. *How can a rapid transit alternative be considered for Waikiki when it is undisclosed in the DEIS what impact transit centers and associated peripheral parking will have on the surrounding communities?*

   Response: There are no transit centers proposed in Waikiki, only eight transit stops. There are no parking locations proposed or planned to support the in-Town portion of the BRT beyond those specifically identified in the FEIS. The only new parking planned as part of this project would be at designated transit centers and park-and-rides.

29. *Specific to the Diamond Head Special District, the DEIS curiously ignores the Diamond Head Historic, Cultural and Scenic District, within which is situated Kapiolani Park Trust lands. Here, a rapid transit stop is planned contiguous to the zoo parking lot. The DEIS mentions nothing about the proposed transit stop in the park and the impact on the historic Trust lands, which are registered on the State register. This is not even mentioned in the DEIS.*

   Response: Thank you for information about Kapiolani Park, which is listed on the State Register of Historic Places, and the Diamond Head Special District. These resources are identified as such in the FEIS. The Kapahulu transit stop, while adjacent to Honolulu Zoo, will not use any of its property. The transit stop will not affect the historic characteristics of Kapiolani Park, and will be consistent with the land use objectives of the Diamond Head Special District. In addition, after conducting a survey of urban street trees, the project will not relocate any tree along Kapahulu Avenue.

30. *In addition, the DEIS states that the embedded plate technology of the rapid transit system requires substations every one-half mile. That is 24 buildings about the size of a small one-story house. Such a rapid transit electric substation is planned on Kapiolani Park Trust lands at the zoo parking lot adjacent to the transit stop. Notably, a court order precludes the use of Kapiolani Park Trust lands from being used for municipal facilities and provides for addition of adjacent lands to the Trust to compensate for ongoing municipal use of such lands for a fire station, while continuing to retain such lands within the Trust.*

   Response: See response to comment #10.

31. *Also of significant absence in the DEIS is the fact that Kapiolani Park was listed on the State of Hawaii Register of Historic Places. Yet, the DEIS discloses that the monkeypod trees at this location are planned to be removed, relocated or cut down for rapid transit purposes.*

   Response: See response to comment #29.

32. *Such significant impacts and the impacts on the surrounding community through which transit riders would commute to park at the zoo parking lot are not addressed in the DEIS. This leads us to believe that the cumulative impact of the larger project has not been addressed, much less disclosed, in the DEIS.*

   Response: The Kapahulu transit stop, while adjacent to Honolulu Zoo, would not use any of its property. The time limits on the metered parking at the zoo would be a deterrent to its use by BRT commuters. Discussion of potential cumulative impacts of the project with other past, present and reasonably foreseeable future actions is provided in Section 5.13 of the FEIS.

33. *In conclusion, the community visioning team emphasizes that traffic calming solutions are required to ensure that Kapahulu Avenue adequately services and complements that area's street-front retail activity and to mitigate against the transformation of the town's main street into an unintended freeway.*

   Response: There is no plan to transform Kapahulu Avenue into an unintended freeway as part of the primary corridor transportation project. To the contrary one of the goals of the project is to encourage people to use public transportation so that the island's communities are more livable and less dominated by private autos.

34. *However, the PUC-DP draft revision advocates urban villages and dedicated high-capacity transit corridors proposed for Date Street, Kapahulu Avenue and Waialae Avenue in the Kaimuki area. Again, none of the indicated high-capacity transit corridor extensions and associated cumulative impacts of the larger project on surrounding communities are addressed in the DEIS. We emphasize that this should be accomplished before the DEIS is given further consideration.*

   Response: Discussion of potential cumulative impacts of the project with other past, present and reasonably foreseeable future actions is provided in Section 5.13 of the FEIS.

35. *A Kaimuki Transit Center is shown in the DEIS, which states that the transit center would provide enhanced local circulation and access to the BRT system. At an OMPO meeting, a clarification was requested for the referenced Kaimuki Transit Center. The response clarified that the facility would be located on Waialae Avenue. Why is the Kaimuki Transit Center designated with no perceivable transit connection or location?*

   Response: The transit hub in Kaimuki would be an on-street transfer point on Koko Head Avenue just makai of Waialae Avenue. It would be a convenient place for local residents to transfer between local circulator routes and routes which connect Kaimuki with other parts of the island.

36. *Again, none of the indicated extensions and associated cumulative impacts of the larger project on the surrounding communities are addressed. We emphasize that this should be accomplished before it is given any further consideration.*

   Response: Discussion of potential cumulative impacts of the project with other past, present and reasonably foreseeable future actions is provided in Section 5.13 of the FEIS.

37. *Why would the City entertain the notion to intrusively impact internal traffic patterns and visitor center support services with a high-capacity transit corridor in Waikiki? Would not this transit experiment be better suited and better placed in the more open areas of Kapolei and Central Oahu – where there could be more efficient use of time-proven technology and more time saved for more people over longer distances to the downtown destination?*

Response: The Refined LPA includes a Regional BRT component and an In-Town BRT component. The Regional BRT will serve Kapolei and Central Oahu. The FEIS Chapter 4 presents the traffic and transportation effects resulting from implementing the Refined LPA. The Refined LPA would not affect visitor center support services and will improve the ambience in Waikiki by significantly reducing the number of diesel buses.

38. *Peripheral parking locations are undisclosed.*

Response: All parking facilities proposed as part of the Refined LPA are identified as park-and-rides or transit centers with parking in Table 4.4-1 in the FEIS.

39. *We understand that BRT Waikiki terminus is proposed for Kapahulu Avenue yet the only available parking is at the Zoo. This park is trust land and it has been ruled by the court that municipal facilities including the power substations of which one is located in the park on the plan would not be a proper use of the park.*

Response: As a result of comments received regarding the substation locations and further project refinements since the MIS/DEIS was released, the traction power supply station originally shown in the Kapiolani Park area was relocated to a location on Kuhio Avenue. (See FEIS Appendix B.) It should be noted that the substations will only be constructed if the embedded plate technology were selected.

Part B – SDEIS Comments

40. *I'm here today to testify in opposition to the in-town portion of the BRT proposal in its entirety.*

Response: Thank you for attending the public hearing and expressing your preference for the project.

41. *This is a very restrictive undertaking. It restricts the free flow of traffic.*

Response: It is not the conversion of lanes that will create the congestion, the congestion for motorists will be there without the BRT. When people are diverted onto public transit, congestion for motorists will be less with the Refined LPA than it would be with the No-Build or TSM Alternatives. Conditions will be much better for BRT riders with the Refined LPA since they will have a path clear of the congestion along much of the In-Town and Regional BRT routes.

42. *It restricts the free enterprise of private carriers by threatening their livelihood.*

Response: The Refined LPA is not designed to serve patrons of private transportation services. Section 5.1.5 of the SDEIS and FEIS provides additional details.

43. *It restricts open discussion of reasonable alternatives for real traffic congestion solutions.*

Response: A full range of transportation alternatives were considered and evaluated with extensive public input. Chapter 2 of the FEIS describes the alternatives that were considered during the course of the project.

44. *And last, but certainly not least, it restricts advancement of the quality of life in our urban area by overburdening the City taxpayers with unwieldy capital and operations costs.*

Response: The Refined LPA has been developed using value engineering to keep costs down so as not to overburden City taxpayers. Also the financing plan uses a phased approach to project implementation based on funding availability so as not to require an increase in City taxes.

45. *What does the In-Town BRT really mean? It means compounded congestion on main thoroughfares by a 60-foot tram every two to four minutes that eat up the traffic lanes.*

Response: See response to comment # 41.

46. *In spite of the City Administration's claims, this will not get cars off the road. It will cause cars to circumnavigate the main traffic thoroughfares into surrounding communities and neighborhoods, increasing noise and pollution in residential areas.*

Response: It is not the conversion of lanes that will create the congestion. The congestion for motorists will be there without the BRT. When people are diverted onto public transit, congestion for motorists will be less with the Refined LPA than it would be with the No-Build or TSM Alternatives. Conditions will be much better for BRT riders with the Refined LPA since they will have a path clear of the congestion along much of the In-Town and Regional BRT routes.

Even though there will be diversion of some motorists to transit with the Refined LPA, some traffic is likely to shift between parallel major thoroughfares. Tables 4.4-3 and 4.4-6 in the FEIS summarize these shifts. The neighborhood roadways adjacent to BRT corridor are generally discontinuous, making them inconvenient alternatives to the main thoroughfares for use by through traffic. While not forecast to occur, if traffic infiltration does become an issue, DTS has a variety of traffic calming measures that they can use to mitigate these types of problems.

47. *The SDEIS states BRT would result in over 18 percent work trips on transit and 14.7 percent with no-build. That's only a 3.3 percent increase in work trips at a cost of nearly one billion in 1998 dollars, not including debt service.*

Response: The cost of building new roads and widening existing roads to accommodate these motorists if they weren't diverted to transit would be much more costly.

48. *And the operations and maintenance is a whopping 71 percent subsidized by City taxpayers to supplement the fares taken in.*

Response: City Council members have consistently recognized the need to keep transit fares reasonable through a subsidy. In 2001 the City Council adopted Resolution 00-28, CD-1, that states in part, that the farebox recovery ratio will not fall below 27 percent nor exceed 33 percent. The balance is met by a General Fund subsidy.

49. *Yet Councilmember Beinum says in regards to – City Council, last year, places a 33 percent ceiling on any transit subsidy.*

Response: See response to comment #48.

50. *Together this is going to cost the City texpeyers 83 million in capital cost and 133 million in operations subsidy, with in-town feres only covering four percent of the operating costs.*

Response: This is incorrect. Debt service payments on GO bonds for BRT related capital costs will average $4.4 million per year. Average annual operating and maintenance costs for the BRT (i.e. costs in addition to the No-Build) would be $7.2 million in 2007 and $21.1 million in 2016. These are in YOE dollars. The fares will cover 27 percent of the BRT O&M costs, not 4 percent.

51. *This capital and operating cost totals $216 million in City taxpayer dollars paid annually as of 2010, with only three minutes saved for Downtown to Waikiki.*

Response: The average annual increase in total City contribution over the No-Build Alternative for the period 2003 to 2016 would be $30.2 million in YOE dollars.

52. *Also, what the BRT really means is land development and higher property taxes along transit corridors, forcing small businesses out of once affordable business districts. The SDEIS is not shy about exposing this objective as it states repeatedly that more desirable land use and development patterns in coordination with specific developers are in store for our now stable urban communities.*

Response: By itself, the In-Town BRT would have little influence on land use development in the PUC. In order for land use objectives identified in the Draft Update of the PUC DP to materialize, certain policies or actions would have to be implemented, such as changes in zoning regulations, land consolidations, tax incentives, changes in market conditions, etc. The value added by the In-Town BRT is that it would support transit-oriented development, such as mixed-use higher density land uses. Regardless of how the PUC DP process concludes, the PUC will continue to be highly populated and contain most of the employment on the island. These characteristics of the PUC necessitate a good public transportation system now and in the future.

53. *Construction jobs are temporary, but the impact on our streets, in our neighborhoods, and on our livelihoods will be here to stay for several generations if the In-Town BRT is allowed to roll forward on the fast track, driven right at us by the big bucks boys. This is the wrong system for Honolulu's constrained urban area. The solution to gridlock is over the longest distance to serve the greatest number of people in the least amount of time.*

Response: Comment noted. It is a statement of opinion. Besides providing temporary construction jobs, permanent jobs will result from the BRT project because of the need for additional drivers, mechanics, etc. Among all of the alternatives considered, the Refined LPA will serve the greatest number of Oahu residents at a reasonable cost.

54. *Lack of correlation to pending Primary Urban Center development plan revisions.*

Response: Discussion of project consistency with the Draft Update of the Primary Urban Center Development Plan is provided in Section 5.1 in both the MIS/DEIS and the FEIS.

55. *Absence of traffic testing for cumulative traffic impacts of the proposed In-Town BRT*

Response: The way the Refined LPA will offset the conversion of general purpose lanes to transit priority use is by attracting enough people out of the cars to reduce the number of autos on the road. The OMPO travel demand forecasting models used on this project are among the most sophisticated in the world. These models have indicated that the types of upgrades in transit service proposed with the Refined LPA will be successful in attracting enough people out of their autos to offset the proposed loss of lanes to general purpose traffic. The diversion of people from auto to transit will not happen overnight and could not happen during a "test" period involving the coning off of lanes since the features of the BRT system would not be in place and it would not be perceived as a permanent alternative that gives people confidence that they have an option once they give up their car. Coning off lanes in the absence of the BRT in place proves nothing that isn't known already.

56. *Absence of information and location of impacts on two significant historic sites and landscapes.*

Response: The potential impacts to historic sites are discussed in Section 5.10 in the MIS/DEIS, SDEIS, and FEIS.

57. *Incomplete community participation and questionable support for specific components, facilities, and routes for the In-Town BRT Waikiki terminus.*

Response: The BRT project's community involvement activities began in 1998 with the Trans 2K meetings and have continued throughout project development. Community participation activities have included five Trans 2K meetings, working group meetings, and hundreds of neighborhood board, city council, organization, etc. meetings where the project has been discussed.

58. *Public and private circulator transportation, service and delivery operations impacts.*

Response: There will be transportation impacts as a result of the BRT, including parking and loading impacts, as discussed in Chapter 4. Mitigation will be considered on a case by case basis for areas of concentrated parking and loading impacts. Loading areas in Waikiki and other commercial areas along the In-Town BRT corridor will still be available at designated hours. In some cases in Waikiki, new pull out bays will be constructed to accommodate passenger vehicle loading and unloading on Kuhio Avenue.

59. *Infrastructure and utility impacts*

Response: Section 5.12 presents the Construction Activity Impacts to Infrastructure and Utilities.

When relocation or modifications of existing active utilities are necessary, efforts will be made to keep them in service during construction.

60. *Absence of defined and proven technology*

Response: The City will be proceeding with hybrid-electric vehicles on the In-Town BRT. These vehicles have been proven in revenue service and are commercially available. In 2008 a decision will be made whether to proceed with embedded-plate technology, which by then should have had enough time being in revenue service in other cities to be considered service proven. If it hasn't proven itself the City has the option of continuing with hybrid-electric vehicles.

61. *Absence of cumulative capital costs, operations subsidies and debt service as projected beyond 1998 dollars.*

Response: Capital costs, operating subsidies, and debt service are shown in Year of Expenditure dollars throughout the financial narrative and tables. Year of Expenditure dollars are calculated to include a projected rate of inflation, using a combination of national and state trends.

62. *Absence of the defined City taxpayer burden to carry the non-federal cost of the proposed project*

Response: The local costs are identified by type, year, Year of Expenditure amount, and proposed revenue source.

63. *Absence of ancillary facilities descriptions, locations, linkages and impacts on surrounding communities; and*

Response: Comment noted. It is a statement of opinion. The MIS/DEIS, SDEIS, and FEIS present the benefits and impacts associated with the BRT project, including ancillary facilities.

64. *Compromised present quality of life and "Hawaiian Sense of Place", e.g. adverse impact of dedicated / embedded rapid transit infrastructure, equipment, utilities and facilities on scenic viewplanes and landscapes*

Response: No project element, including transit centers and stops, traction power supply stations (TPSS), and ramps, are expected to adversely affect important or scenic viewplanes. Transit stops within historic and special districts will be carefully planned and designed to not impact the sensitive viewplanes, landscapes or other important characteristics of these districts.

65. *Further, there is a question of incomplete expansion and improvement of the present Transportation Service Management program to meet its fullest In-Town potential, including maximizing the hub-and-spoke circulator system, express vehicles, and public and private ridership incentives.*

Response: The phasing for the In-Town BRT will involve a transition over time from the existing bus system to a hub-and-spoke system that complements the BRT.

66. *Finally, it appears that the larger objective of providing mass transit to serve the greatest number of people over the longest distance in the least amount of time remains to be comprehensively addressed.*

Response: The FEIS clearly and comprehensively addresses how the Refined LPA within given financial constraints will serve the greatest number of people over the longest distances in the least amount of time.

67. *The SDEIS states that to give transit the priority necessary to make it an attractive alternative to the automobile, some lanes along the proposed In-Town BRT alignment will need to be converted from general-purpose lanes to transit only lanes, which will ultimately result in reduced number of lanes for general purpose traffic (see 2-19).*

Response: This is a correct statement.

68. *The SDEIS further states that major regional roadways would still experience traffic bottlenecks in 2025, and only the BRT could provide a non-congested travel mode through key intersections in*

the Urban Core that still would be at or near capacity, because the In-Town BRT would be buffered from traffic delays, which would result in additional reduced level-of-service for automobile traffic within the Urban Core (see 2-19 and S-8).

Response: The FEIS corrects this statement so that it is clear that it is not the conversion of lanes that will create the congestion, the congestion for motorists will be there without the BRT. When people are diverted onto public transit, congestion for motorists will be less with the Refined LPA than it would be with the No-Build or TSM Alternatives. Conditions will be much better for BRT riders with the Refined LPA since they will have a path clear of the congestion along much of the In-Town and Regional BRT routes.

69. *Thus, the In-Town BRT becomes a major part of the problem, not the solution. Prioritization of the BRT at congested intersections would mean stopping all other traffic at the intersections it approaches, in effect compounding congestion in the urban core.*

Response: The potential for the BRT vehicles to extend the green phase will only be implemented at locations where it will not significantly impact cross street traffic.

70. *This, coupled with the integration of exclusive and semi-exclusive transit lanes and median loading platforms, will for the most part preclude normal traffic from using the main arteries of Honolulu due.*

Response: See response to comment #68.

71. *Therefore, because of such lane restrictions and delays, the City anticipates that motorists will be forced out of their cars onto the In-Town BRT, when in fact, motorists will choose to take alternate routes through surrounding communities and neighborhoods instead.*

Response: See response to comment #68.

72. *Indeed, the SDEIS discloses that during construction of In-Town BRT transit lanes within existing streets, a public information program will disseminate information on detours and recommended alternative routes in order to minimize public inconvenience (see S-12 and S-15). Certainly, this information will be helpful to motorists in knowing which surrounding community and neighborhood streets are most accessible.*

Response: We concur and will work with not only the immediate neighborhoods surrounding the construction area, but with local media to alert the general public of construction activities, recommended detours, etc.

73. *However, the SDEIS does not address the significant impacts on the surrounding areas resulting first from cumulative construction impacts or subsequently from restricted traffic lanes and the In-Town BRT's prioritization over vehicular traffic.*

Response: The MIS/DEIS, SDEIS, and FEIS, Chapter 4 present the traffic and transportation effects associated with implementing the BRT. Chapter 5, Section 5.12 presents the construction impacts and Section 5.13 presents the cumulative effects.

74. *Further, the City has conducted no comprehensive traffic count studies for the major thoroughfares proposed to be converted to BRT corridors.*

Response: Traffic impact analyses have been performed for all of the streets along which the In-Town BRT will operate. The findings are discussed in detail in Chapter 4.

75. *And the City has ignored concerns reflected in measures brought before the City Council and requests at public meetings to test the impacts of such lane closures on Honolulu's urban streets.*

Response: See response to comment #55.

76. *How would neighborhoods surrounding BRT corridors be buffered from traffic overflow and congestion resulting from the buffered BRT and vehicular level-of-service service delays?*

Response: See response to comment #46.

77. *How would ensuing traffic congestion otherwise be mitigated in neighborhoods surrounding BRT corridors?*

Response: See response to comment #46.

78. *Prior to seeking the funds to construct the proposed In-Town BRT, the City must determine the significant physical impact this will have on the areas, communities and neighborhoods, surrounding the In-Town BRT corridors.*

Response: This was done in the MIS/DEIS, SDEIS, and FEIS.

79. *By implementing a simple two-to-three-month trial period of coning off the In-Town BRT lanes proposed to be closed or limited to through traffic, and ramping up existing express and mauka/makai bus service with a mass transit publicity campaign, the effects of any ridership increase and traffic congestion impacts will become obvious. WHY HAS THE CITY ADMINISTRATION REPEATEDLY REFUSED TO IMPLEMENT THIS TRIAL PROGRAM, AND WHAT TRAFFIC IMPACTS ARE THEY HESITANT TO DISCLOSE? By avoidance of this comparatively simple and cost-effective trial measure, the City administration appears to be concealing what could become Honolulu's worst traffic nightmare – the significant negative impacts of the In-Town BRT.*

Response: The way the Refined LPA will offset the conversion of general purpose lanes to transit priority use is by attracting enough people out of the cars to reduce the number of autos on the road. The OMPO travel demand forecasting models used on this project are among the most sophisticated in the world. These models have indicated that the types of upgrades in transit service proposed with the Refined LPA will be successful in attracting enough people out of their autos to offset the proposed loss of lanes to general purpose traffic. The diversion of people from auto to transit will not happen overnight and could not happen during a "test" period involving the coning off of lanes since the features of the BRT system would not be in place and it would not be perceived as a permanent alternative that gives people confidence that they have an option once they give up their car. Coning off lanes in the absence of the BRT in place proves nothing that isn't known already.

80. *The SDEIS states that the last detailed boarding study was conducted in 1991; that in February, 2000, DBEDT revised its 2025 general population forecast for Oahu downward by 5%; that the BRT would improve the person-carrying ability within the Urban Core by an average of 11% over the no-build alternative; that such capacity would be only slightly greater than the demand; and that the demand would amount to only a 3.3% increase in work trips (see 3-11 and S-8). Thus*

there would be a maximum capacity increase of 7.7% for non-work trips. But these trips are not defined and the SDEIS ignores the fact that both the Urban Core resident population and visitor count have continued to decrease over the past ten years.

Response: The economy has been weak in Honolulu for the past decade. This is not forecast to last forever. The planning horizon for the FEIS is the year 2025. The economy is expected to recover between now and then and the growth in population and jobs forecast are expected to be realized.

81. *Indeed, the majority of Honolulu citizens will not give up their automobiles to hop on the In-Town BRT simply to go from point A to point B. Many have two or even three jobs to maintain costly living expenses in Honolulu. Many have active families that require transportation to various activities, such as after-school soccer and baseball in the year-round mild climate. Many transport bulk purchases both during and after work hours from popular warehouse stores. And many of these tasks are required to be accomplished in between the others.*

Response: The BRT will give Oahu residents an alternative to driving their cars, but is not intended to replace the automobile. It only takes a small percentage of auto drivers to divert to transit to make a significant difference.

82. *In addition, would the City choose to suffocate private enterprise by attempting to displace non-subsidized private sector passenger transportation with the City subsidized In-Town BRT?*

Response: The Refined LPA is not expected to drive any private carriers out of business. The service the In-Town BRT will provide is oriented to residents and workers in the urban core not to tourists, which is the market served by private carriers. The BRT will not take business away from tour bus and shuttle operators, since it will not pick-up tourists at their hotels and take them on various scenic tours. It will not take them to-and-from the Airport. It will not take them to-and-from their hotels and the Convention Center. It will not pick them up at the cruise ship terminal and carry them and their luggage directly to their hotels. And unlike the private shuttles it is not designed to operate in a loop that only goes between Waikiki hotels and the various tourist sites of interest. Some tourists may end up using BRT since it does serve some of the same destinations that the tourists want to go to, but the In-Town BRT goes to these places because most of these are also major employment sites or sites where local residents go to as well. The number of tourists expected to use the public transit system with the Refined LPA is forecast to be no greater proportionally than today (i.e. around 10-15 percent of total daily boardings).

83. *Public-private partnerships can be successfully forged to eliminate, rather than create, additional transportation subsidy burdens on the local taxpayer, thus benefiting the public interest as well as promoting the welfare of private enterprise and the local economy.*

Response: Where it is possible, and cost-effective to do so the City intends to contract with private passenger carriers to provide some of the service in the hub-and-spoke network.

84. *Contrary to the City's claims, the BRT will not provide an "attractive alternative" to the automobile. It will provoke a forced alternative to the automobile – one that would be as roundly opposed as the State's recently quickly-felled traffic camera citation program, which is now going to cost the State taxpayers millions of dollars to undo.*

Response: Comment noted. It is a statement of opinion. No one will be forced to ride the BRT.

85. *The SDEIS states that the In-Town BRT vehicles would operate at-grade in exclusive transit lanes along major arterial streets (see Table 2.2-4). In other locations, the In-Town BRT system would operate either in semi-exclusive lanes (used by transportation carriers or vehicles making turns) or in mixed traffic. Along about 38% of its length, the In-Town BRT would run in transit lanes in the median of existing arterial roads (e.g., sections of Kapiolani and Dillingham Boulevards). Along 29% of the alignment, the system would run along the curb in semi-exclusive lanes. Semi-exclusive lanes would be shared with right-turning vehicles, and in the case of Waikiki, with other buses (public and private) and trolleys. For the remaining one-third of the alignment the BRT would operate in mixed traffic (see 2-11).*

Response: These are quotes from the SDEIS. They do not require a response.

86. *Many recent failing water mains and sewer lines have already demonstrated the serious impact of providing only one or two lanes available to through traffic. The In-Town BRT would be intensifying this impact by taking the following:*

Downtown
- *Dillingham – 2 center lanes*
- *Iwilei – 2 lanes*
- *North King – 2 lanes*
- *Hotel – 2 lanes*
- *Bishop – 1 curb lane, makai*
- *Aloha Tower Drive – 1 curb lane, makai*
- *Alakea – 1 curb lane, mauka*

Kakaako Makai
- *Nimitz – undefined*
- *Ala Moana – undefined*
- *Channel – undefined*
- *Ilalo – undefined*
- *Ward – undefined*
- *Auahi – undefined*

Kekeeko Mauka
- *Halekauwila – 1 lane*
- *South Street – 2 lanes*
- *Pohukaina – 2 lanes*
- *Auahi – 2 lanes*
- *Queen – 2 lanes*

- *Richards – 1 lane*
- *South King – 1 lane*
- *Pensacola – 2 curb lanes, Ewa side*
- *Kapiolani*
  - *a) 2 center lanes to Atkinson*
  - *b) transition from 2 center to 2 curb lanes in mixed traffic to Kalakaua*
  - *c) 2 curb lanes to Isenberg*
  - *d) transition from 2 curb to 2 center lanes in mixed traffic to University*

- *University – 2 exclusive center lanes to South King*
- *South King to UH – 1 semi-exclusive curb lane*
- *UH to Kapiolani – 1 exclusive center lane*

Response: Further refinements have been made to the In-Town BRT to reduce traffic impacts since publication of the SDEIS. It is not the conversion of lanes however that will create the congestion. The congestion for motorists will be there without the BRT. When people are diverted onto public transit, congestion for motorists will be less with the Refined LPA than it would be with the No-Build or TSM Alternatives. Conditions will be much better for BRT riders with the Refined LPA since they will have a path clear of the congestion along much of the In-Town and Regional BRT routes.

87. *UH Manoa*
- *Richards – 1 lane*
- *South King – 1 lane*
- *Pensacola – 2 curb lanes, Ewa side*
- *Kapiolani*
  - *a) 2 center lanes to Atkinson*
  - *b) transition from 2 center to 2 curb lanes in mixed traffic to Kalakaua*
  - *c) 2 curb lanes to Isenberg*
  - *d) transition from 2 curb to 2 center lanes in mixed traffic to University*
- *University – 2 exclusive center lanes to South King*
- *South King to UH – 1 semi-exclusive curb lane*
- *UH to Kapiolani – 1 exclusive center lane*

Response: See response to comment #86.

88. *Waikiki Loop*
- *Ala Moana -*
  - *a) 1 semi-exclusive makai curb lane to Kalia*
  - *b) 1 exclusive mauka center lane to Hobron, 1 semi-exclusive mauka curb lane to Kalia*
- *Kalia – add 2 lanes to Saratoga*
- *Saratoga – 2 lanes*
- *Kalakaua – split 1-way couplet*
- *Kalakaua to Kapahulu – 1 semi-exclusive makai curb lane*
- *Kapahulu to Kuhio – 1 semi-exclusive curb lane at Waikiki Terminus – Kapiolani Park Transit Stop*
- *Kuhio to Saratoga – 1 semi-exclusive mauka curb lane*

Response: See response to comment #86.

89. *To compound this conundrum, the City administration proposes to raid the City's Sewer Fund to balance the City's budget to ultimately fund the first $35 million of the Waikiki-to-Downtown segment of the In-Town BRT (see Exhibit C, attached). However, if the Sewer Fund is raided for the first $35 million this year, how will the remaining 62% work trips in automobiles (see S-8) get through the torn-up streets with the BRT consuming traffic lanes as the 100-year-old sewer lines continue to break? The traffic will not magically disappear, as the City administration would have us believe. Again, it will simply be rerouted to a greater magnitude via ripple effect into and through surrounding neighborhoods and communities.*

Response: The City Council has approved the budget for funding the first branch of the In-Town BRT. In the City's representative form of government it is the Council's decision as to how public funds are spent each year.

90. *Further, the SDEIS states that the construction implementation schedule would focus construction-phase impacts in one area at a time by geographically distributing the work at each phase of construction, with development of the In-Town BRT system between 2002 and 2006, with the initial fleet of In-Town BRT vehicles being ordered, manufactured and delivered in 2003 and 2004, and with testing and start-up occurring in 2005 (see 2-25 and 28). However, the SDEIS also states that a decision on the In-Town operating system technology "may" be made in another year, as existing technologies either do not satisfactorily meet the City's expectations and specifications or have not advanced to a state where they are considered service proven. As no decision has been made on an appropriate technology, how can capital and operating costs be projected with any reliability?*

Response: The phasing plan as outlined in the FEIS calls for the use of hybrid-electric buses initially along the In-Town BRT, with a decision to convert to embedded-plate technology (EPT) made in 2008, if EPT is service proven by then.

91. *In addition, the SDEIS states that construction schedules would be phased according to the availability of funds. Therefore, the construction schedule would be flexible and could be delayed according to fiscal constraints (see S-16). In viewing the above wavering revelations en toto, it does not appear that the City has an efficient and effective plan to implement this project as stated, or to even mitigate its impacts on the Honolulu urban community. With deficiencies of such magnitude, it can be concluded that traffic solutions for Honolulu require further study for more appropriate and effective alternatives.*

Response: The MIS/DEIS, SDEIS, and FEIS Chapter 2 present the project's implementation plan, and Chapter 6 presents the financing plan. The environmental documents present the traffic and transportation impacts in Chapter 4 and environmental impacts in Chapter 5. No further study is needed.

92. *Notably, the SDEIS states that the BRT would be superior to the TSM alternative in terms of regional mobility, and that greater mobility would be provided by the BRT because of increases in transit and HOV use (see S-8). Thus, the question arises as to why the In-Town BRT is proposed to consume lane space in the urban core when it could be placed in more efficient use over longer distances in the regional Ewa-Downtown application, and when greater flexibility and mobility can be provided by smaller high-occupancy vehicles with a greater number of routes and more convenient stops in the urban core in lieu of fixed 130-person capacity trams on dedicated lanes in a confined area?*

Response: Buses operating as collectors will pick-up people in the less dense outlying areas and bring them to transit hubs where they can transfer to longer distance express buses that benefit from using the priority lanes on H-1 and In-town on designated arterials. It is only logical to employ the priority lane concept along the sections of the corridor where the most people will be riding the system in the same direction at the same time and that is in the urban core not in the outlying areas.

The Regional BRT includes A.M. and P.M. zipper lanes along H-1that will benefit both bus passengers and HOV occupants. In-Town bus passengers will benefit from the BRT priority lanes and HOV occupants will benefit from the reduced congestion overall with the Refined LPA, and more specifically from SDOT projects that will increase the capacity of H-1 and Nimitz Highway by the addition of a contra-flow HOV lane.

93. *The In-Town BRT portends surging land re-development and higher property taxes along transit corridors, forcing small businesses out of once affordable business districts. The SDEIS is not shy about exposing this objective, as it states repeatedly that more desirable land use and development patterns in coordination with specific developers are in store for Honolulu's established urban communities. In fact, the SDEIS identifies one criterion for selection of a new transit technology as being a specific alignment to "evoke the desired land use response from land developers" (see 2-19). Thus, the SDEIS demonstrates little to no concern for the future welfare of the small businesses, patrons, and residents of the areas proposed to be impacted by the In-Town BRT transit corridors, and indeed, is ultimately writing them out of the equation in favor of increased development and density – supporting not the community, but the In-Town BRT.*

Response: The potential for an area to change depends upon many factors of which transportation accessibility is just one factor. Land use policies, zoning, parcel size and availability, availability and condition of utilities, and market demand are other factors. As the Refined LPA is implemented the City needs to establish land use policies and incentives that encourage the retention of small businesses where it is deemed important to do so and to focus development interest on designated redevelopment areas and sites.

94. *According to the SDEIS, the proposed In-Town BRT will necessitate 17 businesses to relocate, along with up to 47 partial business displacements. Fair market compensation for land, buildings, and uses would be provided to property owners directly affected by right-of-way requirements, and affected businesses would be encouraged to plan moves in advance so that relocation would occur with minimal delays and inconvenience (see S-10 and S-12). Further, land value increases generated by development rights will cause property taxes to skyrocket, and the remaining small businesses will be unable to survive in the redevelopment area. Thus, for example, the BRT corridor along Dillingham Boulevard would incite removal of small businesses, consolidation of lots, and construction of highest and best use buildings, both in value and density – serving not the community, but the developer.*

Response: See response to comment #93.

95. *The SDEIS states that where on-street parking is removed to permit BRT transit lanes, new neighborhood parking facilities would be considered to replace on-street parking, but only if they served a community purpose (see S-8). Thus, many residents in single-family dwellings along BRT transit corridors, including University Avenue, would be without adequate parking for their homes unless this becomes a larger community need. Once determined as a community need in this established residential area, one or more residential lots in a central location would be required to be taken by the City's power of eminent domain to build a multi-level parking garage in order to fulfill the public purpose of replacing the public parking that was lost to the BRT. Again, this appears to be contrary to the welfare of the established community.*

Response: In urban communities such as Downtown, McCully/Moiliili, and Ala Moana trade-offs need to be made on the best use of the limited public rights-of-way along arterial streets. In the case of University Avenue far more people will benefit from increasing the people carrying ability

of this street then will be impacted by the removal of on-street parking. There are 78 on-street parking spaces on University Avenue that will be removed to enable over 6,000 passengers a day a less congested route. Whether replacement parking is needed is up to the community. Representatives from the affected Neighborhood Board indicated, at least initially, that they did not think that replacement parking would be required by the community if it involved the loss of any residences, businesses, or parks. Other approaches that do not require the displacement of residences, businesses, or parks, (e.g. using diagonal parking on some local streets; shared use of commercial or institutional parking at night by residents, etc.) can also be explored if the community wants replacement parking.

96. *Here also, the SDEIS lists another criterion that the selected transit technology must be flexible enough in order to not pre-empt parades or other activities along the alignment. Yet the proposal does nothing to ensure that the In-Town BRT does not disrupt businesses and residences as it bisects the communities and business districts it passes through every 2 to 4 minutes via dedicated transit corridors. In fact, the SDEIS aggressively proposes to remove 912 parking spaces and 725 feet of curbside loading space to provide for dedicated curbside BRT lanes (see 4-25 and 4-26).*

Response: BRT operation will be much like that of a bus, and bus service is currently provided on virtually all streets proposed for use by the BRT. Therefore, no impact on neighborhoods and businesses is expected from the BRT operation, beyond those disclosed in the EIS. BRT operation will not adversely bisect communities and business districts, as demonstrated by the Hotel Street bus mall operations in the downtown/Chinatown area.

On-street parking and loading zone impacts have been reduced since the MIS/DEIS. There will be some parking and loading space impacts as a result of the BRT, as discussed in Sections 4.3 and 4.4 of the FEIS. Mitigation will be considered on a case by case basis for areas of concentrated parking and loading impacts. Freight loading areas in Waikiki and other commercial areas along the In-Town BRT corridor will still be available at the currently designated hours. In some cases in Waikiki, new pull out bays will also be constructed to accommodate commercial vehicle loading and unloading (e.g. on Kuhio Avenue).

97. *This impact would be greatest in commercial business and Waikiki resort zones within the Urban Core, where loading areas are vital and must be accessible in order to ensure efficient and timely delivery of goods and services. However, the SDEIS fails to address established loading requirements of the private trucking and delivery industry in Waikiki and other commercial areas along the In-Town BRT corridors. Further, the SDEIS fails to address the cumulative economic impacts of the In-Town BRT on surrounding businesses and resorts, and private delivery and non-subsidized passenger transportation services when one lane is removed from Bishop and Alakea Streets and Kalakaua, Kuhio and Kapahulu Avenues, and when two lanes are removed from Kapiolani and Dillingham Boulevards and University Avenue.*

Response: Impacts to passenger and freight loading zones have been reduced since publication of the MIS/DEIS. Freight loading areas in Waikiki and other commercial areas along the In-Town BRT corridor will still be available at the currently designated hours. No lanes will be converted for BRT use on Bishop Street, Alakea Street, or Kapahulu Avenue. Private buses will share the curbside BRT priority lanes on Kalakaua and Kuhio Avenues. Measures have been taken on Dillingham Boulevard (widening, turnouts, and use of alternate access) to accommodate freight delivery.

98. *The BRT SDEIS makes no mention that either Kapiolani Park or Irwin Memorial Park are listed on the Hawaii State Register of Historic Places and eligible for the National Register of Historic Places (see Table 5.10-1 on 5-45). Yet, the BRT SDEIS describes the BRT 60-foot trams running curbside to these sites.*

Response: Kapiolani Park is identified as an historic property in the FEIS because a transit stop will be located adjacent to the park. The transit stop will be constructed within the Kapahulu Avenue right-of-way, and no park property will be used. In response to concerns expressed at a meeting with representatives of the Kapiolani Park Preservation Society the location of the BRT stop on Kapahulu has been shifted further mauka. (See Appendix B Drawing No. I-35).

Irwin Memorial Park will not be affected by the project since the BRT will operate in mixed traffic using existing streets and the existing bus stops near the Maritime Museum at Aloha Tower Marketplace.

99. *Further, Kapiolani Park is a known habitat for the white tern, listed as endangered by the State of Hawaii and a federally protected species under the Migratory Treaty Bird Act (see S-11).*

Response: This information about the white tern is disclosed in Section 5.7 of the FEIS, which also states the results of interagency coordination that has been conducted with the State Department of Land and Natural Resources, Division of Forestry and Wildlife (DLNR-DOFAW) and the U.S. Fish and Wildlife Services (USFWS).

100. *There is a serious question as to why the SDEIS does not recognize and acknowledge Kapiolani Park, which is nearly 200 acres, as a significant site contiguous to the proposed In-Town BRT corridor. The SDEIS states that the In-Town BRT terminus is at an undefined transit stop on the Koko Head side of Kapahulu Avenue between Kalakaua and Kuhio Avenues (see 2-16 through 19 and 3-3 through 3-7). This places the BRT Waikiki turnaround transit stop, with attendant 8-ft. wide, 160-ft. long raised loading platform, ADA ramps and railings, and power supply sub-station upon and within the Kapiolani Park Trust lands on Kalakaua Avenue and fronting the Honolulu Zoo (see S-1, 2-12 and sheet TRM 14 dated 7-24-00, Exhibit A as attached). In addition to Kapiolani Park being listed as a Registered Historic Site, the Court has ruled that municipal facilities are not an appropriate use of Kapiolani Park Trust lands (see SP No. 89-0015, Conclusions of Law and Order, 1991).*

Response: The In-Town BRT stop will not use any part of Kapiolani Park. The transit stop will be totally within the Kapahulu Avenue right-of-way, including provisions for ADA access. The TPSS will be located in an empty lot on the Ewa-makai corner of Kapahulu Avenue and Kuhio Avenue. It will not be placed on park property.

In response to concerns expressed at a meeting with representatives of the Kapiolani Park Preservation Society the location of the BRT stop on Kapahulu has been shifted further mauka. (See Appendix B Drawing No. I-35).

101. *In view of the above, the location of the proposed BRT route's attendant municipal facilities would therefore appear to be a violation of the historic trust provisions, as well as a significant negative impact on the historic landscape and viewplanes of this historic site.*

Response: See response to comment #100.

102. *While the City claims that only shelter and street furniture improvements are planned to be constructed at the Kapiolani Park terminus (see 2-18), there is additional concern that the cumulative impact of the municipal facility components of the In-Town BRT transit system will evolve into much more than a mere bus stop at this terminus. Indeed, the SDEIS states that a) certain local routes would be converted into circulators to feed the In-Town BRT system and new circulator routes would provide frequent service from the transit stop on the Koko Head side of Waikiki (see 2-5); and b) project elements such as ...transit stops ... provide urban design opportunities to improve existing landscapes with cohesively designed architectural elements, landscaping, street furniture, street trees and lighting (see S-10). Thus, Kapiolani Park is planned to be the access point from East Honolulu to the BRT system's Waikiki-to-Downtown route, and there is additional concern that the Design Opportunities the City administration has planned for the proposed BRT project could most assuredly impact the historic landscape of Kapiolani Park as well with expanded parking and transit center amenities to service East Honolulu access to the In-Town BRT system at this Waikiki terminus (see 2-18).*

Response: The Kapahulu BRT stop will be an on-street transfer point for some circulator bus routes not an off-street transit center. To serve circulator routes the local bus stop at curbside on the Ewa side of Kapahulu Avenue at Cartwright Road will be relocated to Lemon Road. The BRT stop will be across the street at curbside on the Koko Head side of Kapahulu Avenue. Transferring passengers will use the crosswalk at Lemon Road to connect between the routes. There is sufficient right-of way on both sides of Kapahulu Avenue to accommodate the stops without interfering with pedestrian flows or impacting Kapiolani Park. Design of the BRT stop will take into account the historic landscape of Kapiolani Park.

What is proposed is not an off-street transit center or a park-and-ride. In fact the services which will be added should make Kapiolani Park even more accessible by transit and help reduce the auto and parking congestion that exists in the area today.

103. *Along with ignoring that the selected Waikiki transit terminus is a historic site, the SDEIS also does not address the visual impact of the 60-foot long, 15-feet-high double tram cars impacting the significant historic park, Diamond Head and shoreline viewplanes every 3 minutes, nor the structural impact of the raised and elongated loading platform and power supply station within the monkeypod trees and open space of this historic landscape along Kapahulu Avenue. From this it can be easily determined that there is much about the Waikiki/Kapahulu segment of the In-Town BRT proposal that remains to be disclosed. There are many more unanswered questions about the impact of such a plan on this historic site, including but not limited to the question of what is to become of this significant area if this East Honolulu public transportation terminus is implemented?*

Response: The In-Town BRT transit stop near Kapiolani Park will require special design treatment, similar to other proposed transit stops in or near Chinatown, the Capitol District, Thomas Square and other important visual and historic locales.

Visual impact analysis is not appropriate for vehicles, including the In-Town BRT vehicles, which are essentially more environmentally friendly buses. For your information, the height of the BRT vehicles would be about ten and a half feet, not 15 feet.

As described in response to comment #102, the TPSS will not be located in Kapiolani Park.

The Kapahulu Avenue Transit Stop will not be used as a transit center. Although transfers will occur, they will be conducted in the same manner as bus transfers are conducted today at many on street transfer locations.

104. *Further, while transit stops, centers and transfer points are shown for the In-town BRT from Iwilei to Kamekee, no transit stops or transfer centers are shown for Waikiki in the SDEIS. However, as with the University/King Transit Stop accessing the mauka In-Town BRT route with peak period service proposed to be generally provided every 5 to 15 minutes and off-peak service every 15 to 30 minutes (see 2-7), the Kapahulu Transit Stop at the Waikiki BRT terminus is clearly a foreseeable candidate as a transit center transfer point for bus routes from East Honolulu accessing the Waikiki-to-Downtown In-Town BRT route.*

Response: As indicated in response to comment #102, it will be an on-street transfer point not an off-street transit center.

105. *Surely these concerns and any impact disclosures prompted there from should be properly addressed in an additional SDEIS specific to the Waikiki segment in accordance with the established Environmental Impact Review process for proposed projects funded by public revenue sources.*

Response: The MIS/DEIS, SDEIS, and FEIS Chapter 2 presents the project description, including the Waikiki BRT stops. The environmental documents also disclose the impacts and benefits associated with implementing the BRT project.

106. *As an example, the SDEIS states that the Kakaako Makai Branch would operate between the Iwilei Transit Center on the Ewa end and an undefined Kapahulu Stop on the Koko head end (see S-5), and goes on to disclose that portions of the Kakaako Mauka and Makai branches on Richards Street have been realigned to address resident input (see S-6), as objections to using Richards Street makai of South King Street for the BRT route lead to requests for the City to explore alternate alignments (see 2-29). Further, the Director of the City Department of Transportation Services, Cheryl Soon, clearly stated at the McCully/Moiliili Neighborhood Board's regular meeting of February 7, 2002, that the planning process will have as many meetings as needed (see Neighborhood Board #8 Meeting Minutes, page 5).*

However, although specific concerns were stated in responses to the BRT MIS/DEIS regarding the Kapahulu end of the proposed BRT route as described, there has been no further opportunity for resident community input regarding the impacts of the proposed In-Town BRT corridor on this area, and more specifically Kapiolani Park. In fact, interested and affected organizations and individuals, including but not limited to the Kapiolani Park Preservation Society and the Diamond Head/Kapahulu/St. Louis Heights Neighborhood Board, have been neither directly informed of nor invited to sporadic Waikiki workshops to address the Waikiki segment of the In-Town BRT route.

Response: The proposed BRT project will not affect Kapiolani Park. DTS has coordinated with the Kapiolani Park Preservation Society and attended and responded to questions at many Diamond Head/Kapahulu/St. Louis Heights Neighborhood Board meetings.

107. *Further, the Diamond Head/Kapahulu/St. Louis Heights Neighborhood Board was informed by City Councilmember Balnum at their April 11, 2002, regular meeting that there would be no SDEIS published on the In-Town BRT lane relocations, commercial loading zone changes, or any other changes to the Waikiki/Kapahulu portion of the proposal.*

Response: The MIS/DEIS, SDEIS and FEIS reflect the effects associated with the project including any proposed lane configuration or commercial loading zone changes, etc.

108. *Therefore, desired community input on the potential significant impacts of the In-Town BRT on the Kapahulu area has been virtually precluded. Had the few Waikiki workshops occurred openly and informatively, the concern about the potential significant impact on one of the area's most prominent historic sites along the proposed In-Town BRT route, Kapiolani Park, could have been brought forth.*

Response: The proposed BRT project will not affect Kapiolani Park. It will provide another transportation means to access the park.

109. *The SDEIS states that priority treatment for buses would involve minimal physical change, resulting in little or no visual impact to the existing landscape, regardless of lane use (see S-10). However, the SDEIS does not address the visual and viewplane impact on the traditional Hawaiian Sense of Place for residents and visitors alike experiencing the 51 futuristic, 60-foot-long double tram cars, 15 feet in height, as they stop in front of historic Iolani Palace, cut along the significant Waikiki ocean shoreline viewplane, and intrude on historic Kapiolani Park landscape and significant Diamond Head resource viewplanes every 3 minutes.*

Response: As stated above, the BRT vehicles will be about ten and a half feet tall, not 15 feet. The look of the vehicles will be selected with community input. We do not understand how the impact described is any different than what currently occurs today with city buses, which pass through the Capitol District and Waikiki, near the shoreline.

110. *In addition, a tree survey and impact analysis for the In-Town BRT identified 144 trees that would be impacted by the project, of which 36 trees are classified as "notable", i.e., important to the urban landscape character, either individually or groped to comprise a recognized and important element of the visual landscape (see S-11). According to the SDEIS, a certified arborist determined that 25 trees were too old or otherwise unsuitable for successful transplantation, and these trees would be replaced elsewhere with City stock trees. Further, removing and relocating ten (10) "notable" mature monkeypod trees from Kapiolani Boulevard (see S-14) would unquestionably have a grave effect and significant impact on the visual character and integrity of this area!*

Response: Monkeypod trees on Kapiolani Boulevard that will be effected by the proposed action will be relocated on-site, meaning they will be moved with minimal trimming and replanted in the same vicinity. Therefore, the visual character or integrity of this area will be maintained.

111. *The SDEIS states that a financial plan analysis, conducted by consultants hired by the City administration, assessed the city's ability to operate and maintain the proposed transportation network, and financial plans were developed based on two key assumptions among others: 1) that the full scope of each alternative must be completed without raising taxes, and 2) that the City's high bond rating must not be effected. The SDEIS further states that funding would be sought from multiple federal and local sources, and that City general obligation bonds would be used to fund up to 47% of the cost of the project and additional general obligation bonds would be issued to fund early construction activities in anticipation of later federal or State reimbursement (see S-15, 16 and 18).*

Response: $40 million in State Highway Funds were removed as a capital revenue source and replaced with a combination of City GO Bond proceeds and FTA Section 5309 New Start grant funds. The increase of GO Bonds did not affect the City's capacity to fund the project, nor the City's future bond rating position.

112. *However, the above assumptions did not factor in the fact that the State has now declined to assist with the financing of the proposed project. This would appear to place an unduly burdensome risk on the City's taxpayers and have the potential to jeopardize the City's bond rating.*

Response: See response to comment #111.

113. *The SDEIS defines the local funding for this $1 billion project as $285.9 million in general obligation bonds with interest and principal debt service paid by the local taxpayer, and the City highway fund for $35.7 million, with the remainder of the $904 million – $422.3 million and $160 million – coming from Federal Transit Administration and Federal Highway Funds, respectively. For FY 2002 – 2010, the average total annual impact on the City taxpayer general fund (89%) and highway fund (11%) required for capital cost and operating cost subsidy would be: $107.8 Million for the regional BRT system (see S-18).*

Response: The FEIS financial plan demonstrates that the project can be financed without the use of State highway funds. Adjustments were made in phasing, revenue sources, and the amounts used from the various revenue sources in any given year. The changes made in the SDEIS and the FEIS demonstrates, in part, how the basic financial plan can be adjusted to account for changing conditions.

114. *The SDEIS further states that based on the above assumptions, major existing revenue sources were examined and costs were then compared to the revenue projected to be available from these sources over the nine-year period of FY 2002 to FY 2010, the period within which all of the capital improvements except vehicle replacements would be implemented. However, this could be somewhat misleading, as the SDEIS states that construction schedules would be phased according to the availability of funds and would be flexibly adjusted according to fiscal considerations (see S-16). Therefore, considering the question of availability of funds and the phasing of flexible construction schedules this may mean that in view of the State withdrawing from the project, construction may be delayed indefinitely or discontinued permanently with any shortage of local funds.*

Response: See response to comment #113.

115. *Further, because the SDEIS addresses the cost of the proposed project in terms of 1998 dollars, the SDEIS appears to be highly misleading and without regard for the total debt cost and capital expense outlay over the implementation phase of the proposed project.*

Response: The cost of the proposed project in the FEIS uses 2002 dollars, inflated to Year of Expenditure dollars in each of the project years.

116. *The SDEIS states that capital costs for the regional BRT from Kapolei to Kapahulu would cost $904 million over nine years from FY 2002 to FY 2010, and that construction of the In-Town BRT transit lanes and acquisition of a fleet of 51 high capacity electric vehicles would cost $345.5*

million with the balance of the capital costs to expand existing maintenance facilities and increase the transit fleet to 730 buses. The SDEIS further states that the capital costs for the In-Town BRT would be $388.2 million from FY 2002 to FY 2025 (see S-17 and S-6).

However, Table 2.3-1 on 2-26 of the SDEIS lists a different set of numbers -- $355.64 million for the In-Town BRT with a total cost of $999.5 million, and notes this increase includes $32.8 million for the addition of the Kakeako Makai branch and the Pensacola St. realignment, $8.3 Million for 13 additional In-Town BRT vehicles, and $14.5 Million for BRT alternative refinements.

In any event, the question remains centered on the mixed juggling of the numbers and whether these costs are limited to capital costs only, while annual inflation factors from the 1998 level through 2025 and debt service, including City taxpayer repayment of principal and interest, should be more properly disclosed as well.

Response: While the numbers have changed from the SDEIS to the FEIS due to further refinements to the project, you are misstating the SDEIS. On page S-17 it states that the capital cost of the entire "Refined BRT" (not the "Regional BRT" as you incorrectly indicate) is projected to be $904 million in YOE dollars for the period 2002-2010. It also states that the cost of the In-Town BRT portion in YOE for this same period would be $345.5 million.

The reason for the difference with Table 2.3-1 is that Table 2.3-1 reflects capital costs for the period 2002-2025 expressed in 1999 dollars. So there is a difference in the time frames and in the use of present and future dollars.

Debt service for the bonded portion of these capital costs is reflected in the cash flow analyses in Appendix E of the SDEIS and FEIS.

117. *The non-federal capital cost of the proposed BRT project is to be financed through City taxpayer-reimbursed General Obligation bonds. The SDEIS states: "BRT would result in over 18% WORK TRIPS on transit ... and 14.7% with no-build" (see S-8). This is only a 3.3% increase in work trips at a cost of nearly $1 billion in 1998 dollars, not including debt service.*

Response: The nearly $1 billion includes the normal replacement of the entire bus fleet over a 23 year period. This roughly $440 million in capital costs would be needed whether the BRT system were built or not. More to the point, however is that the cost of improving the transit system to attract additional riders out of their autos is less than half of what the cost would be to widen the roads to carry these same people if they remained in their autos. (See Chapter 2, Section 2.6.1 of the FEIS for the Highway Alternative).

118. *Further, the operations and maintenance cost is projected at a whopping 71% to be subsidized by City taxpayers to supplement collected fares (see 6-1). According to the SDEIS, operations and maintenance subsidies for the regional BRT in 1998 dollars would be $133 million in FY 2025, and the total estimated operating cost for the regional BRT system would be $188.4 million in FY 2010 (see S-6, 17 and 18). Thus, all but at least $55.4 million of the operations and maintenance costs of the regional BRT system will be subsidized by the Honolulu taxpayer in FY 2025 -- a 71% subsidy to increase work trips only 3.3%. Yet, Councilmember Balnum's Resolution adopted by the City Council last year places a 33% ceiling on any transit subsidy (see Exhibit B, attached).*

Response: The FEIS shows a 67 percent public operating subsidy.

In July 2001, the City Council adopted a policy that requires the bus farebox recovery ratio to not fall below 27 percent nor exceed 33 percent. The 33 percent ceiling is a ceiling on the amount of the bus fare, not a ceiling on the transit subsidy. This describes the Council's policy of the appropriate level of public support for the ongoing operations and maintenance of a public transportation system. The FEIS financial analysis assumes a 27 percent farebox recovery ratio.

119. *Together, as formulated in the SDEIS, this is going to cost the City taxpayers annually $83 million in capital costs and $133 million in operations subsidy, with In-Town fares only covering 4% of the additional operations cost. This capital and operation cost totals $216 million City taxpayer dollars paid annually as of 2010, with undefined debt service and inflation costs.*

The SDEIS defines the local funding for this $ 1 billion project as $285.9 million in general obligation bonds with interest and principal debt service paid by the local taxpayer, and the City highway fund for $35.7 million, with the remainder of the $904 million capital investment (in 1998 dollars) -- $422.3 million and $160 million -- coming from Federal Transit Administration and Federal Highway Funds, respectively (see S-18). Here the City anticipates a 64% : 36% funding ratio for funding from federal and local sources, respectively. However, federal funding practices indicate that high-end transportation projects in the $1 billion range, such as that proposed for Honolulu, would only be funded at a 50%:50% matching fund ratio, as the more costly the project, the less federal funding match awarded. Further, according to national experts in this area, this would be allocated at only $100 million annually for five years to help ensure accountability.

Response: You are mixing costs for the entire island-wide transit system with fare revenue for only the In-Town BRT. The correct numbers for the In-Town BRT that were in the SDEIS are an annual O&M cost of $20.5 million in year 2010 in YOE dollars with annual fare revenue of $5.13 million.

The financial plan presented in Chapter 6 shows that a combination of funding sources will be used. Federal sources of capital funding will be FTA formula and grant funds, and FHWA highway program funds. The federal portion of FTA New Starts funds can be as high as 80 percent, but are typically 50 percent shared with the local entity. The Refined LPA assumes a 50 percent federal share for these funds. FHWA funds are 90 percent federally funded for projects on the Interstate highway system and 80 percent for other eligible highways. Since some portions of the project will be funded with FTA funds and some with FHWA funds the average federal share is projected to be about 65 percent.

120. *Moreover, current indications are that the Congressional re-authorization dollar amount is going to be controversial this year in a battle of how much will be inserted in the transportation bill. In addition, the Federal Transportation Administration has confirmed that the State has withdrawn support of the Honolulu BRT project proposal and is no longer part of the BRT financing equation.*

Response: This is factually incorrect. The State has not withdrawn support for the BRT project. To the contrary, OMPO which is the agency responsible for allocating federal funding for transportation projects has included funding for the Refined LPA in its updated long-range plan. The OMPO Policy Committee which makes these decisions is primarily comprised of State legislators and City Council members. What has been agreed to at OMPO is that the state will not be supplying the local match for some project elements that was assumed in the DEIS (this amounted to $40 million total). The City instead will supply the match, which is what was shown in the SDEIS and is now shown in the FEIS.

121. *Yet, the City administration "anticipates" federal and state funding reimbursement "later", and the City administration "assumes" that the $ billion-plus transportation project will be completed without raising taxes, and that the City's bond rating will not be affected (see S-16 and S-18).*

Response: While the conclusions stated are correct, they are not the City administrations conclusions, they are the conclusions of extensive financial analyses, the results of which are presented in Chapter 6 of the FEIS.

122. *Does the City and County of Honolulu have the financial capacity to afford this? Under the City's current fragile financial condition it would appear that this would place an unduly burdensome weight on Honolulu City taxpayers, as well as negatively affect the City's current bond rating to the point where such rating agencies as Moody's, Standard & Poor's, and Fitch's could downgrade City bonds to junk-bond rating, causing financing costs to soar even higher for City taxpeyers. Rather than paying down the debt load, the present City administration advocates restructuring the City's debt load by creating more debt to pay off existing debt, spinning the City's taxpayers, those ultimately responsible for satisfying both principal and interest paid on capital improvement general obligation bonds, into an ever deeper fiscal black hole. Therefore, the In-Town portion of the proposed BRT system, with all its inherent problems and impacts on the urban core, will be much, much more than a bad investment for City taxpayers – it will become an unwieldy fiscal burden on the citizens of Honolulu.*

Response: As shown in the table below, the additional City revenues required to supplement debt service payments from the Highway Fund comprise no more than 0.75% of the City's Operating Budget in any one year. This amount is thus quite modest in comparison to the total resources the City makes available for its annual operating costs.

ESTIMATED ADDITIONAL CITY FUNDS REQUIRED FOR DEBT SERVICE FOR REFINED LPA

	Operating Budget	Additional Debt Svc over Highway Fund	Percent of Budget
FY 2002	894,234,610		
FY 2003	896,000,000	0	0.00%
FY 2004	1,016,500,000	0	0.00%
FY2005	1,086,200,000	0	0.00%
FY 2006	1,103,700,000	668,252	0.06%
FY 2007	1,147,200,000	3,029,022	0.26%
FY 2008	1,177,600,000	4,463,634	0.38%
FY 2009	1,212,310,000	6,672,519	0.55%
FY 2010	1,246,679,300	8,431,998	0.68%
FY 2011	1,286,138,678	9,152,805	0.71%
FY2012	1,324,723,859	9,002,063	0.68%
FY2013	1,364,465,585	10,296,863	0.75%
FY2014	1,404,360,949	8,120,231	0.58%
FY2015	1,445,289,293	6,271,871	0.43%
FY2016	1,487,494,561	8,891,344	0.60%
FY2017	1,530,921,754	9,336,197	0.61%
FY2018	1,575,616,776	10,611,835	0.69%
FY2019	1,621,615,563	11,210,802	0.69%
FY2020	1,668,959,509	12,276,159	0.74%
FY2021	1,717,684,522	11,846,202	0.69%
FY2022	1,767,832,054	7,637,032	0.44%
FY2023	1,819,443,836	8,575,354	0.48%
FY2024	1,872,562,010	10,592,910	0.57%
FY2025	1,927,231,169	8,212,203	0.43%

Notes
Operating Budget estimates for 2002 - 2013 provided by City Finance Department.
Operating Budget estimates for 2014 - 2025 assume the Operating Budget will increase annually at the compound annual growth rate demonstrated over the 2002-2013 period (2.92%).
Additional Debt Service over Highway Fund is the funding required in addition to the maximum level of funds projected to be available for debt service from the Highway Fund, assuming a 0.5% annual growth of the Highway Fund.

123. *The proposed In-Town BRT is a very restrictive undertaking. It restricts the free flow of traffic. It restricts the free enterprise of private carriers by threatening their livelihood. It restricts open discussion of reasonable alternatives for REAL traffic congestion solutions. And last, but certainly not least, it restricts advancement of the quality of life in our urban area by overburdening the City taxpeyers with unwieldy capital and operations costs.*

Response: Comment noted. It is a statement of opinion. The BRT project will provide Oahu residents with another transportation option and as a result has the potential to enhance the quality of life.

124. *What does the In-Town BRT really mean? It means compounded congestion on main thoroughfares by 60-foot trams every 2 to 4 minutes that eat up traffic lanes. In spite of the City administration's claims, this will not get cars off the road. It will cause cars to circumnavigate the main traffic thoroughfares into surrounding communities and neighborhoods, increasing congestion, noise and pollution in residential areas. The construction jobs are temporary – but the impact on our streets, in our neighborhoods, and our livelihoods will be here to stay for several generations if the In-Town BRT is allowed to roll forward.*

Response: Comment noted. It is a statement of opinion without substantiation.

125. *The In-Town BRT is the wrong system for Honolulu's contained urban area. The solution to Oahu's urban traffic gridlock is over the longest distance to serve the greatest number of people in the least amount of time. The transportation proposal should be focusing instead solely upon addressing Oahu's transportation needs between Kapolei, the "Secondary Urban Center," and Honolulu's urban core (see S-3). Ironically, what is most practical and less costly for the higher density in-town Honolulu Urban Core surrounded by smaller mountain, valley and shoreline communities and business districts, is a combination of far more accessible, flexible and convenient public and private circulator and express routes – that which was rejected by the City administration in favor of the In-Town BRT.*

Response: It was the City Council and OMPO Policy Committee that selected the BRT as the LPA, not the City Administration.

We will send you a CD-ROM copy of the Final Environmental Impact Statement (FEIS) under seperate cover. If you require a printed copy of the FEIS, please contact Faith Miyamoto at 527-6976. We appreciate your interest in the project.

Dear Mr. Maxwell:

Subject: Primary Corridor Transportation Project

This is in response to your oral testimony at the April 20, 2002 public hearing regarding comments on the Supplemental Draft Environmental Impact Statement (SDEIS).

1. *I'd like to talk about the economic impact. Our country had eight years of prosperity, and now I think we're going to have four years of disparity.*

   Response: Comment noted.

2. *As an unemployed person, I will not be paying taxes until I get a job. So I think you guys should think before you ink.*

   Response: Comment noted.

3. *And also, technology changes every day. I think, in the next ten years, the bus system that we have now will be some kind of different bus system.*

   Response: We concur.

4. *And once you start this project, you won't be able to change it. That's all I had to say.*

   Response: The project has been refined as a result of our community involvement activities. In addition, one of the benefits of BRT is that the routing can be revised, if required without a major disruption to service. This differs from light rail, which is stationary and the rails, electric source, etc. would result in major disruptions if changes were required.

We will send you a CD-ROM copy of the Final Environmental Impact Statement (FEIS) under separate cover. If you require a printed copy of the FEIS, please contact Faith Miyamoto at 527-6976. We appreciate your interest in the project.

Sincerely,

CHERYL D. SOON

Ms. Cheryl Soon, Director
Department of Transportation Services
City & County of Honolulu

Dear Ms. Soon,

I am in support of the Bus Rapid Transit program all the way!

The BRT is a good start for introducing a mass transit program in Hawaii. There are many of us that rely on public transportation and welcome improvements to our existing Bus system, and I think this is definitely the way to go.

Thank you for your insight.

RECEIVED
Oct 27 3 48 PM '00
CITY C.
HONOLULU, HI

TESTIMONY BEFORE THE CITY AND COUNTY OF HONOLULU
COUNCIL COMMITTEE ON TRANSPORTATION ON THE PRIMARY
CORRIDOR TRANSPORTATION PROJECT

Thank you Chairman Bainum and Committee Members. I am Ed McInerny, a concerned private citizen.

While I don't believe anyone in this room would agree that the No-Build alternative offered in the MIS/DEI's Summary is a viable solution, care must be taken in giving consideration to the other alternatives.

My primary concern this evening, has to do with the proposed implementation of the Transportation System Management (TSM) and the Bus Rapid Transit (BRT) concepts and their effect.

In the case of the in-town BRT system and the proposed use of electrified vehicles on exclusive transitory lanes along existing streets, I am genuinely concerned as to the effect this may have on the traffic patterns in those areas.

In addition, during the construction phase of the project, what will the impact be on businesses and other transportation providers along the proposed route. In high density areas such as Waikiki, what will be the effect on both freight and passenger loading zones and their impact on those industries? Will emergency service such as Police, fire and Ambulances be affected in these areas?

While any change can sometimes be disruptive, thought must be given and sensible solutions sought out.

In conclusion, I am not opposed to improvements to Oahu's Transit System, but can only hope that any of the alternatives you select will help to enhance our existing award winning transportation system.

November 13, 2002

Mr. Ed McInerny
1878B 10th Avenue
Honolulu, Hawaii 96816

Dear Mr. McInerny:

Subject: Primary Corridor Transportation Project

This responds to your October 26, 2000 letter regarding comments on the Major Investment Study/Draft Environmental Impact Statement (MIS/DEIS).

1. *In the case of the In-Town BRT system and the proposed use of electrified vehicles on exclusive transitory lanes along existing streets, I am genuinely concerned as to the effect this may have on the traffic patterns in those areas.*

   Response: Chapter 4 of the MIS/DEIS and FEIS address anticipated transportation impacts.

2. *In addition, during the construction phase of the project, what will the impact be on businesses and other transportation providers along the proposed route.*

   Response: Section 5.12 of the MIS/DEIS and FEIS discuss the impacts of construction activities.

3. *In high density areas such as Waikiki, what will be the effect on both freight and passenger loading zones and their impact on those industries?*

   Response: In the public outreach for the project, the City established a Working Group (WG) for the Waikiki area which included representatives from hotels, retail and service industries, commercial passenger and freight carriers, and residents. One topic of discussion was the proposed BRT lane configurations for the various segments of the In-Town BRT in Waikiki. In addition, a detailed study of passenger and freight loading activities was performed and reviewed with the Waikiki WG. Discussions with this working group led to revisions in the

proposed project that resulted in no appreciable loss of on-street loading space along the streets affected by the BRT. This was achieved by allowing freight carriers to use the BRT shared lane during legal delivery hours (10 p.m. to 9 a.m. on Kalakaua Avenue and 10 p.m. to 7:30 a.m. on Kuhio Avenue); the BRT would simply pass around a stopped loading truck by using the adjacent traffic lane.

4. *Will emergency service such as Police, fire and Ambulances be affected in these areas?*

   Response: On the contrary, the proposed network of exclusive and semi-excusive BRT lanes will greatly enhance emergency vehicle times by providing an uncongested lane for such vehicles to reach incident locations. With proper emergency traffic signal preemptions in place, BRT vehicles will be able to move out of the exclusive lane at the nearest intersection to allow emergency vehicles to pass through the intersection unimpeded by either left turning or cross street traffic.

We will send you a CD-ROM copy of the Final Environmental Impact Statement (FEIS) under separate cover. If you require a printed copy of the FEIS, please contact Faith Miyamoto at 527-6976. We appreciate your interest in the project.

Dear Chair Yoshimura and Councilmembers:

I honorably request that you approve "Resolution 00-249."

Therefore, it's imperative that the "City and County of Honolulu" move forward in this positive manner to address the traffic problems that we now face. I've personally attended most of the "Community" meetings regarding this issue and fully support this project.

Hence, I still wonder though, how do we as a community address the number of new vehicles sold/purchase each year (20% increase in 2000, 33% increase in 1999, etc)? I strongly endorse the mobility concepts forwarded by the City Administration.

We must continue to plan and work for the future population.

Sincerely,

attention: Cheryl Soon, Director

Dear Ms. Soon;

I would like to add my opposition to the present Bus Rapid Transit project.

My reasons are many but chief among them is the fact that we have a very good bus system right now and only need, perhaps, a few additional buses in outlying areas. The millions of dollars necessary for this proposal would be better used elsewhere.

Thank you.

Yours truly,
Mrs. V. McWaters

Oahu Metropolitan Planning Organization Policy Committee
707 Richards Street, Suite 200
Honolulu, Hawaii 96813

Subject: Primary Corridor Transportation Project Major Investment Study/Draft Environmental Impact Statement (MIS/DEIS)

These are my opinions: I do not presume to speak for anyone else.

THE PROPOSING AGENCY

1. I think that the Oahu Metropolitan Planning Organization (OMPO) should insist that the State DOT become a co-lead for preparation of the MIS/FEIS. Designating the DOT as a co-lead will help with State "buy-in", improve MIS/FEIS cost estimates and technical analysis, and make the City and State cooperate in setting realistic priorities.

THE COST ISSUE

2. As proposed in the MIS/DEIS, so much FHWA, DOT, and City funds would be committed for BRT development that it would be necessary to postpone most other desirable freeway, arterial, and bikeway improvements. In my opinion, OMPO needs to identify ways to reduce the cost of the BRT proposal and to spread out costs over a longer period.

   To allow OMPO to make informed decisions about the relative costs and benefits of proposed new Regional BRT freeway access ramps and parking facilities, I request that the MIS/FEIS:

- estimate BRT use in 2010, and in 2025, of the proposed H-1 Kapolei ramp, Kunia ramp, Radford ramp, Kaonohi ramp, and Middle Street ramp if the entire Regional BRT were completed as proposed.

- estimate what bus ridership would be lost and/or what additional person hours of travel delay would result in 2010 from postponing construction of the proposed H-1 Kapolei ramp, or the proposed Kunia ramp, or the proposed Radford ramp, or the proposed Kaonohi ramp, or all four proposed ramps, or the proposed Middle Street ramp.

- estimate how much construction cost (including ancillary improvements) could be deferred by postponing construction of the proposed H-1 Kapolei ramp, or the proposed Kunia ramp, or the proposed Radford ramp, or the proposed Kaonohi ramp, or the proposed Middle Street ramp.

- estimate what bus ridership would be lost and what construction cost could be deferred by postponing construction of each separate proposed new BRT parking facility.

THE SUBSIDY ISSUE

3. I think that OMPO needs to get a better understanding - - and set reasonable limits - - on public subsidies to encourage City bus ridership. OMPO should not allow either FHWA or FTA funds to be used for unreasonable subsidies. Is it worth spending $30 million of public funds to build a special BRT access ramp at Kapolei to encourage a few hundred more leeward Oahu commuters to ride the bus during rush-hour traffic? Is it worth

spending $20,000 of public funds to build a park-and-ride stall in a Middle Street parking garage, and offer free parking, to encourage one more leeward Oahu commuter to ride the bus during rush-hour traffic? Is it worth spending $1,200/year of public funds for subsidies to encourage one more leeward Oahu commuter to ride the bus during rush-hour traffic? (Excluding capital costs, taking fare revenues into account, average City commuter express bus operating subsidies already exceed $5.50/day per round-trip rider. Unfortunately, this amounts to more than $1,200/year/rider.)

THE SHORT TERM WHO IS BETTER OFF/WHO IS WORSE OFF ISSUE

4. I think the MIS/DEIS needs to disclose how many bus riders will be better off and how many drivers will be worse off after completion of the In-Town BRT in 2005. I also think the MIS/DEIS needs to disclose how completion of the In-Town BRT will impact total vehicle hours of traffic delay in 2005 and total persons hours of travel delay in 2005. There is no question that a bus on an exclusive transit right-of-way (ROW) would not be slowed by traffic congestion. However, consider the impact on peak eastbound morning traffic approaching Middle Street in 2005 when an eastbound traffic lane is removed from Dillingham Boulevard and converted to BRT use. Or, consider the impact on peak eastbound afternoon traffic approaching Piikoi Street in 2005 when eastbound lanes of both Kapiolani and Ala Moana Boulevards have been converted to BRT use.

THE LONG TERM VIEW

5. Over the long term, if traffic lanes are taken away from a highly congested roadway network, I think that drivers will alter their bebavior so that there is no increase in peak period traffic delay. Contrary to the 2025 projections in the MIS/DEIS, I do not believe that taking traffic lanes away from cars to establish a BRT system will ever actually reduce peak period traffic delay. On the other hand, when traffic congestion lasts for hours, and there is a lot of latent travel demand, a good BRT system can significantly increase peak period person throughput and significantly reduce peak period travel delay for bus riders. That's why I support the concept of an exclusive, continuous In-Town BRT ROW.

6. Over the long term, it is bad planning for the MIS/DEIS to propose that the BRT share traffic lanes with cars on Kapiolani Boulevard between Atkinson Drive and University Avenue. MIS/DEIS traffic projections clearly show that any part of the In-Town BRT which shares arterial traffic lanes with cars will end up mired in peak period traffic congestion. It is not essential that the BRT route be located on Kapiolani Boulevard, or that the BRT route extend all the way to UH Manoa. However, I think it is essential for the MIS/FEIS to propose a continuous, exclusive In-Town BRT ROW which will prevent the BRT from being stuck in traffic.

AR00015961

THE ENVIRONMENTAL JUSTICE ISSUE

7. Apart from planning considerations, I do not think it complies with FTA standards for "environmental justice" to take traffic lanes away from cars (and ban left turns to/from driveways) along the low income Dillingham Boulevard BRT ROW but not to take traffic lanes away from cars along the more affluent Kapiolani Boulevard BRT ROW east of Atkinson Drive.

ISSUES POSED BY THE PROPOSED EASTBOUND MORNING H-1 ZIPPER-LANE EXTENSION

8. Deployment of the morning zipper-lane reduces the westbound H-1 to a single lane in part of the Waiawa Interchange. This is already causing a traffic jam for Ewa-bound traffic. The MIS/FEIS needs to include capacity analysis at all potential bottlenecks, including the Waiau and Waiawa Interchanges, to determine necessary modifications so that the Ewa-bound H-1 will have adequate capacity to handle projected 2025 traffic when two Ewa-bound lanes are removed by deployment of the morning zipper-lane. Because of the eastbound shoulder lane, the Kalauao screenline discussed in the MIS/DEIS may not be the most critical section for analysis.

9. The MIS/DEIS proposes a morning zipper-lane extension which will dump most eastbound HOV traffic onto a westbound freeway on-ramp from Nimitz Highway. Unfortunately, the MIS/DEIS totally fails to address management of morning contra-flow traffic on Nimitz Highway.

ISSUES POSED BY THE PROPOSED WESTBOUND AFTERNOON H-1 ZIPPER-LANE

10. In combination with DOT westbound H-1 widening from Kaonobi to the Pearl City off-ramp, the proposed MIS/DEIS afternoon zipper-lane could significantly reduce travel delay through two major afternoon freeway bottlenecks. One of these bottlenecks is caused by heavy traffic from the Pearl Harbor/Nimitz Highway on-ramp merging onto the Ewa-bound H-1; the other is caused by the drop in westbound H-1 lanes between the Halawa Interchange and the Pearl City off-ramp.

11. The City's proposal for an afternoon zipper-lane justifies further study even if no BRT freeway access ramps are built. However, implementation will be complicated and costly. Issues that are not adequately addressed in the MIS/DEIS, and still need to be resolved, include:

- headlight glare problems resulting from removal of the permanent median barrier between Waiawa and Waiau Interchanges.
- necessary widening/strengthening of the existing eastbound shoulder lane (which was not designed for heavy use) and other required improvements which should be scheduled at the same time to reduce the inconvenience to motorists.

- appropriate widening/modification of the Waiawa interchange.
- capacity of the southbound H-2 and eastbound H-1 to handle projected 2025 traffic when two town-bound lanes are removed by deployment of the afternoon zipperlane. Capacity analysis is needed at all potential bottlenecks, such as the Waiau Interchange, where there is no eastbound shoulder lane. Because of the eastbound shoulder lane, the Kalauao screenline discussed in the MIS/DEIS may not be the most critical section for analysis.

Thank you for the opportunity to express my opinions.

Sincerely,

D. Meller

JEREMY HARRIS
MAYOR

CHERYL D. SOON
DIRECTOR

GEORGE "KEOKI" MIYAMOTO
DEPUTY DIRECTOR

TPD11/00-05418R

November 13, 2002

Mr. D. Meller
2749 Rooke Avenue
Honolulu, Hawaii 96817

Dear Mr. Meller:

Subject: Primary Corridor Transportation Project

This is in response to your November 6, 2000 letter regarding comments on the Major Investment Study/Draft Environmental Impact Statement (MIS/DEIS).

1. *I think that the Oahu Metropolitan Planning Organization (OMPO) should insist that the State DOT become a co-lead for preparation of the MIS/FEIS. Designating the DOT as a co-lead will help with State "buy-in", improve MIS/FEIS cost estimates and technical analysis, and make the City and State cooperate in setting realistic priorities.*

   Response: HDOT elected to be a cooperating agency, not a co-lead on the Primary Corridor Transportation Project (PCTP).

2. *As proposed in the MIS/DEIS, so much FHWA, DOT, AND City funds would be committed for BRT development that it would be necessary to postpone most other desirable freeway arterial, and bikeway improvements. In my opinion, OMPO needs to identify ways to reduce the cost of the BRT proposal and to spread out costs over a longer period.*

   Response: Implementation of the PCTP does not preclude implementation of any of the most desired highway or bikeway projects as established by the OMPO Policy Committee, since these projects are included in the regional transportation plan (TOP 2025).

3. *Estimate BRT use in 2010, and in 2025, of the proposed H-1 Kapolei ramp, Kunia ramp, Radford ramp, Kaonohi ramp, and Middle Street ramp if the entire Regional BRT were completed as proposed.*

   Response: Subsequent to the MIS/DEIS being published and based on comments received, the exclusive BRT ramps in Kapolei, Kunia, Kaonohi, Radford Drive, and Middle Street have been deleted from the project. Instead the BRT will use existing or HDOT proposed freeway ramps at Kapolei, North-South Road, and Middle Street. Priority treatments such as queue jump lanes are proposed at these ramps instead. Also, a new ramp for the exclusive use of BRT buses is proposed at Luapele Drive. This new ramp would serve the Aloha Stadium Transit Center/Park-and-Ride.

4. *Estimate what bus ridership would be lost and/or what additional person hours of travel delay would result in 2010 from postponing construction of the proposed H-1 Kapolei ramp, or the proposed Kunia ramp, or the proposed Radford ramp, or the proposed Kaonohi ramp, or all four proposed ramps, or the proposed Middle Street ramp.*

   Response: See response to comment #3.

5. *Estimate how much construction cost (including ancillary improvements) could be deferred by postponing construction of the proposed H-1 Kapolei ramp, or the proposed Kunia ramp, or the proposed Radford ramp, or the proposed Kaonohi ramp, or the proposed Middle Street ramp.*

   Response: See response to comment #3. The eggregate savings of the ramp deletions is estimated at $166 million in 2002 dollars.

6. *Estimate what bus ridership would be lost and what construction cost could be deferred by postponing construction of each separate proposed new BRT parking facility.*

   Response: Each proposed park-and-ride is sized to meet the projected usage as determined from the travel demand forecasting models. Phasing of each facility is based on projected need and funding availability, such that the responses to the question raised are already built into the project.

7. *I think that OMPO needs to get a better understanding -- and set reasonable limits -- on public subsidies to encourage City bus ridership. OMPO should not allow either FHWA or FTA funds to be used for unreasonable subsidies. Is it worth spending $30 million public funds to build a special BRT access ramp at Kapolei to encourage a few hundred more leeward Oahu commuters to ride the bus during rush-hour traffic? Is it worth spending $20,000 of public funds to build a park-and-ride stall in a Middle Street parking garage, and offer free parking, to encourage one more leeward Oahu commuter to ride the bus during rush-hour traffic? Is it worth spending $1,200/year of public funds for subsidies to encourage one more leeward Oahu commuter to ride the bus during rush-hour traffic?*

   Response: The Honolulu City Council considered the costs and benefits of each of the alternatives in the MIS/DEIS and chose the BRT Alternative as the Locally Preferred Alternative. Likewise the Policy Committee of OMPO considered the costs and benefits of a wide range of projects and voted to include the BRT Alternative in the regional transportation plan for 2025.

8. *I think the MIS/DEIS needs to disclose how many bus riders will be better off and how many drivers will be worse off after completion of the In-Town BRT in 2005.*

   Response: Chapter 4 of the FEIS includes information to compare the projected travel time delay within the urban core for the Refined LPA compared to the No-Build and TSM Alternatives for the year 2025. In addition, Chapter 4 includes a traffic analysis depicting level of service information for the No-Build, TSM and Refined LPA Alternatives. A year 2025 not 2005 traffic analysis is what is required for an EIS on a transit project.

9. *I also think the MIS/DEIS needs to disclose how completion of the In-Town BRT will impact total vehicle hours of traffic delay in 2005 and total person hours of travel delay in 2005. There is no question that a bus on an exclusive transit right-of-way (ROW) would not be slowed by congestion. However, consider the impact on peak eastbound morning traffic approaching Middle Street in 2005 when an eastbound traffic lane is removed from Dillingham Boulevard and*

converted to BRT use. Or, consider the impact on peak eastbound afternoon traffic approaching Pilkoi Street in 2005 when eastbound lanes of both Kapiolani and Ala Moana Boulevards have been converted to BRT use.

Response: See response to comment #8.

10. *Over the long term, if traffic lanes are taken away from a highly congested roadway network, I think that drivers will alter their behavior so that there is no increase in peak period traffic delay. Contrary to the 2025 projections in the MIS/DEIS, I do not believe that taking traffic lanes away from cars to establish a BRT system will ever actually reduce peak period traffic delay.*

Response: Comment noted.

11. *On the other hand, when traffic congestion lasts for hours, and there is a lot of latent travel demand, a good BRT system can significantly increase peak period person throughput and significantly reduce peak period travel delay for bus riders. That's why I support the concept of an exclusive, continuous In-Town BRT ROW.*

Response: The FEIS findings are consistent with your stated position.

12. *Over the long term, it is bad planning for the MIS/DEIS to propose that the BRT share traffic lanes with cars on Kapiolani Boulevard between Atkinson Drive and University Avenue. MIS/DEIS traffic projections clearly show that any part of the In-Town BRT which shares arterial traffic lanes with cars will end up mired in peak period traffic congestion.*

Response: The BRT Alternative is comprised of exclusive BRT, semi-exclusive BRT and mixed-use lanes. The BRT system strives to strike a balance between transit speed and impacts to general traffic. In segments where it was judged that roadway capacity was needed for general traffic and the BRT operation would not be significantly affected, exclusive lanes were replaced by either semi-exclusive or mixed-flow operation. In areas of high BRT ridership volumes, exclusive transit lanes were retained such as on Dillingham Boulevard and Hotel Street.

On the section of Kapiolani Boulevard that you mention, the trade-off between the impact to motorists of losing the contraflow lane would not be offset by the cumulative travel time savings to BRT riders. Therefore it is recommended that the BRT operate in mixed traffic along this section of Kapiolani Boulevard.

13. *It is not essential that the BRT route be located on Kapiolani Boulevard, or that the BRT route extend all the way to UH Manoa. However, I think it is essential for the MIS/FEIS to propose a continuous, exclusive In-Town BRT ROW which will prevent the BRT from being struck in traffic.*

Response: See response to comment #12. The BRT alignment was developed based on extensive community input and sound transit planning principles. Kapiolani Boulevard was chosen because there are many major travel generators to be served and large vacant sites located there on which the BRT could help shape transit oriented development. Having UH Manoa as the terminus of one of the In-Town BRT branches is consistent with a universal transit planning objective of trying to terminate a line at a major generator of transit trips. Achieving exclusive lanes all along the BRT alignment is not practical. About two-thirds of the alignment will be in exclusive or semi-exclusive (shared with right-turning vehicles) lanes. The remaining sections of the alignment will operate in mixed traffic. There are only a few of these mixed traffic sections where delays of any significance are expected, (along Alakea and Bishop Streets on the two

Waikiki branches, the section of Ala Moana Boulevard between Forrest Avenue and Aloha Tower Drive on the Kakaako Mauka branch, and the section of Kapiolani Boulevard between Atkinson Drive and University Avenue on the UH branch). It was not considered practical or necessary to make these sections exclusive or semi-exclusive.

14. *Apart from planning considerations, I do not think it complies with FTA standards for "environmental justice" to take traffic lanes away from cars (and ban left turns to/from driveways) along the low income Dillingham Boulevard BRT ROW but not to take traffic lanes away from cars along the more affluent Kapiolani Boulevard BRT ROW east of Atkinson Drive.*

Response: The highest ridership on the In-Town BRT is forecast to occur along Dillingham Boulevard. In fact, the reasons for proposing exclusive lanes on Dillingham Boulevard and mixed-use lanes on Kapiolani Boulevard are related to the relative transportation benefits and impacts totally unrelated to socioeconomic characteristics of the areas. The In-Town BRT is projected to serve four times the number of riders along Dillingham Boulevard compared to along Kapiolani Boulevard Koko Head of Atkinson Drive. This means that four times as many BRT users would be delayed if the Dillingham Boulevard exclusive lanes were abandoned. The reason priority lanes were not proposed along Kapiolani Boulevard Koko Head of Atkinson Drive was not just because of there being lower ridership but also to preserve the peak period contra-flow traffic operation.

15. *The MIS/FEIS needs to include capacity analysis at all potential bottlenecks, including the Waiau and Waiawa interchanges, to determine necessary modifications so that the Ewa-bound H-1 will have adequate capacity to handle projected 2025 traffic when two Ewa-bound lanes are removed by deployment of the morning zipper lane. Because of the eastbound shoulder lane, the Kaluaa screenline discussed in the MIS/DEIS may not be the most critical section for analysis.*

Response: The FEIS uses the Year 2025 Oahu Regional Transportation Plan (RTP) highway network as the base network for all future alternatives. This plan is a fiscally-constrained plan and was approved by the Oahu Metropolitan Organization (OMPO) Policy Committee on April 6, 2001. Included in this future highway network is a project to widen H-1 Freeway by one lane in the eastbound direction from Waiawa Interchange to Halawa Interchange (project no. P-7) and a project to widen H-1 Freeway by one lane in the westbound direction from the Waimalu Viaduct to Pearl City off-ramp (project no. P-6). Also included were projects for H-1 widening in the westbound direction from Waiau to Waiawa Interchange (project no. P-43) and through the Waiawa Interchange (project no. P-42). Table 4.4-1 in Chapter 4 of the FEIS shows that these improvements would allow both directions of H-1 Freeway to operate at LOS E during both the AM and PM peak hours with the zipper lane deployed.

16. *The MIS/DEIS proposes a morning zipper-lane extension which will dump most eastbound HOV traffic onto a westbound freeway on-ramp from Nimitz Highway. Unfortunately, the MIS/DEIS totally fails to address management of morning contra-flow traffic on Nimitz Highway.*

Response: The proposed zipper lane extension would directly serve the A.M. contraflow lane on Nimitz Highway that the HDOT is planning.

17. *In combination with DOT westbound H-1 widening from Kaonohi to the Pearl City off-ramp, the proposed MIS/DEIS afternoon zipper-lane could significantly reduce travel delay through two major afternoon freeway bottlenecks. One of these bottlenecks is caused by heavy traffic from the Pearl Harbor/Nimitz Highway on-ramp merging onto the Ewa-bound H-1; the other is caused by the drop in westbound H-1 lanes between the Halawa Interchange and the Pearl City off-ramp.*

Response: The project agrees with this statement.

18. *The City's proposal for an afternoon zipper-lane justifies further study even if no BRT freeway access ramps are built. However, implementation will be complicated and costly.*

Response: Comment noted.

19. *Issues that are not adequately addressed in the MIS/DEIS, and still need to be resolved, include: 1) headlight glare problems resulting from removal of the permanent median barrier between Waiawa and Waiau interchanges. 2) necessary widening/strengthening of the existing eastbound shoulder lane (which was not designed for heavy usa) and other required improvements which should be scheduled at the same time to reduce the inconvenience to motorists. 3) appropriate widening/modification of the Waiawa interchange. 4) capacity of the southbound H-2 and eastbound H-1 to handle projected 2025 traffic when two town-bound lanes are removed by deployment of the afternoon zipper lane. Capacity analysis is needed at all potential bottlenecks, such as the Waiau interchange, where there is no eastbound shoulder lane. Because of the eastbound shoulder lane, the Kaiaueo screenline discussed in the MIS/DEIS may not be the most critical section for analysis.*

Response: 1) AASHTO Guidelines do not indicate that antiglare treatment in this area is required. The guidelines state that, "Where there is no fixed-source lighting, headlight glare across medians or outer separations can be a nuisance, particularly where the highway has relatively sharp curves. Under these conditions, some form of antiglare treatment should be considered as part of the median barrier installation, provided it does not act as a snow fence and create drifting problems. "(A Policy on Geometric Design of Highways and Streets, AASHTO, 1994, pg. 369.) The location of concern has fixed-source lighting and does not have relatively sharp curves.

2) The shoulders will be reconstructed to carry projected traffic loads. H-1 will be widened from Waiau Interchange to Aiea to accommodate the P.M. zipper lane (including the Waimalu viaduct). 3) Proposed improvements include adding a lane to H-1 WB to provide an option to H-1 WB and H-2 NB; widening of H-2 inbound ramp to 3 lanes + shoulders; widening of H-1 between the Pearl City viaduct and A.M. crossover to accommodate the P.M> cross-over. 4) See response to comment #15.

We will send you a CD-ROM copy of the Final Environmental Impact Statement (FEIS) under separate cover. If you require a printed copy of the FEIS, please contact Faith Miyamoto at 527-6976. We appreciate your interest in the project.

Honolulu, Hawaii 96815

Dear Mr. Miller:

Subject: Primary Corridor Transportation Project

This responds to the comment you made on the Major Investment Study/Draft Environmental Impact Statement (MIS/DEIS). Your testimony at the November 14, 2000 Special Transportation Committee Meeting supported the In-Town BRT as the Locally Preferred Alternative (LPA), with some concerns. Thank you for supporting the project.

We appreciate your interest in the project.

Sincerely,

CHERYL D. SOON
Director

14 November 2000

Review Hearing

Subject: **Draft Impact Environmental Statement**
Primary Corridor Transportation Project

• • •

Witness: J. T. Miller - Retired and a 36 year resident of Honolulu.

RECEIVED
NOV 14 10 09 AM '00
HONOLULU CITY COUNCIL

Only recently did I learn of the changes under study for the Honolulu Rapid Transit System. Upon studying the subject DIES, my primary concern is the BRT proposal for the segment of **Richards Street from King Street to Ala Moana Blvd.** This new extension down to Halekauwila Street is totally unworkable.

The segment in question, proceeding makai down Richards Street from King Street, presently a one way street that barely functions as it is during the work week. The Primary Corridor Transportation Project would convert this street to a two way street, with huge articulated, tractor type buses proceeding down the center of it, with two scant lanes on either side to facilitate the following:

King Street to Queen Street

On the Diamond Head side:

The Main Downtown U. S. Post Office marshalling yard and loading docks, where over a hundred trucks arrive and depart daily, (except Saturday and Sunday).

On the Ewa side:

The 24 story City Bank Building: The main entrance and exit for six stories of parking for this building is directly across the street from the Post Office loading docks.

Queen Street to Halekauwila Street (one block):

On the Ewa side:

Main entry and exit to six floors of resident and business parking for the 27 story Harbor Square Complex. Main entry red curb loading zone for the apartment complex, frequently used by emergency (fire trucks and ambulance) vehicles who have no compunctions about stopping traffic for indefinite periods of time.

Queen Street to Halekauwila Street (continued)

On the Diamond Head side:

Sole entry and exit to six floors of parking for 12 story Melim Building. Twenty feet mauka of that exit is the sole entry and exit for 5 stories of parking for the 12 story Oceanview Center.

Halekauwila Street to Punchbowl

Sole entry and exit to parking garage floors for the 12 story Haseko Bldg.

ENVIRONMENTAL DISFIGUREMENT

Directly in front of the Oceanview Center, the following flora and fauna will be ripped out and eliminated for the purpose of bus traffic:

EIGHT (8) 30 foot palm trees
Three (3) Plumeria trees
A 60 ft. segment of curbed grass

Radical alterations required for turning radius of large rapid transit vehicles in this segment (and not addressed in the DEIS) are:

1. Narrowing of Nimitz Boulevard to two lanes at Richards Street area.
2. Closing of Halekauwila turnoff lane for Diamond Head bound traffic on Nimitz Blvd. for access to Kaakaako area, as Halekauwila will be BRT only from Richards to Punchbowl Street.

Possible Alternatives:

[redacted] Because this particular segment of the BRT is ill conceived, the following alternatives are submitted.

The 'slip' segment of the Waikiki bound route could be routed:

1. Hotel Street to King Street to Punchbowl Street to Pohukaina St. where a Passenger Transit Stop could be located at the Federal Bldg.

[redacted] 2. Hotel Street to King Street to South Street to Pohukaina St.

Both of these possible alternatives have less congestive impact than that proposed.

November 13, 2002

Mr. J. T. Miller
Harbor Square Condo
700 Richard Street, #1909
Honolulu, Hawaii 96813

Dear Mr. Miller:

Subject: Primary Corridor Transportation Project

This is in response to your November 14, 2000 letter regarding comments on the Major Investment Study/Draft Environmental Impact Statement (MIS/DEIS).

1. *Only recently did I learn of the changes under study for the Honolulu Rapid Transit System. Upon studying the subject DEIS, my primary concern is the BRT proposal for the segment of Richards Street from King Street to Ala Moana Blvd. This new extension down to Halekauwila Street is totally unworkable.*

   Response: Since the MIS/DEIS was published, the alignment has been changed to remove the BRT from Richards Street between South King Street and Halekauwila. The revised alignment uses Alakea (mauka-bound) and Bishop (makai-bound) Streets instead.

2. *The segment in question, proceeding makai down Richards Street from King Street, is presently a one way street that barely functions as it is during the work week. The Primary Corridor Transportation Project would convert this street to a two way street, with huge articulated, trecior type buses proceeding down the center of it, with two scant lanes on either side.*

   Response: See response to comment #1.

3. *Directly in front of the Oceanview Center, the following flora and fauna will be ripped out and eliminated for the purpose of bus traffic: **EIGHT (8) 30 foot palm trees**, three (3) Plumeria trees, a 50 foot segment of curbed grass.*

   Response: See response to comment #1.

4. *Radical alterations required for turning radius of large rapid transit vehicles in this segment (and not addressed in the DEIS) are: 1) Narrowing of Nimitz Boulevard to two lanes at Richards Street area; 2) Closing of Halekauwila turnoff lane for Diamond Head bound traffic on Nimitz Blvd: for access to Kakeako area, as Halekauwila will be BRT only from Richards to Punchbowl Street.*

Response: Nimitz Boulevard will not be reduced to two lanes at Richards Street. BRT vehicles will not be turning at Halekauwila and Richard Streets. The Halekauwila turnoff lane will not be closed to Koko Head-bound traffic. General traffic will be allowed on Halekauwila Street from Richards to Punchbowl Street.

5. *Because this particular segment of the BRT is ill conceived, three following alternatives are submitted.*

The 'slip' segment of the Waikiki bound route could be routed: 1) Hotel Street to King Street to Punchbowl Street to Pohukaina St. where a Passenger Transit Stop could be located at the Federal Building. 2) Hotel Street to King Street to South Street to Pohukaina Street. Both of these possible alternatives have less congestive impact than that proposed.

Response: The King Street to Punchbowl Street alignment had been looked at and rejected due to the significant traffic impact at the King/ Punchbowl Streets intersection of adding another signal phase to accommodate the BRT turning from Punchbowl mekei bound to King Street Ewa bound. Rerouting the BRT along King Street all the way to South Street was rejected since it would miss serving the Federal Building and several other important generators on Halekauwila Street.

We will send you a CD-ROM copy of the Final Environmental Impact Statement (FEIS) under separate cover. If you require a printed copy of the FEIS, please contact Faith Miyamoto at 527-6976. We appreciate your interest in the project.

Sincerely,

CHERYL D. SOON

Re: In-Town Bus Rapid Transit

To Whom It May Concern:

I wish to voice my opposition to the current proposal for the In-Town Bus Rapid Transit. Two aspects of the current proposal will increase traffic congestion. First the use of existing traffic lanes for the exclusive use of BRT will reduce the capacity of the streets for travel by all other types of vehicles. Second giving traffic signal priority to BRT will cause increased traffic congestion on all streets that the BRT crosses.

The design premise of this project is biased against automobile use. Providing alternatives to the private automobile is the stated purpose of this project (see DEIS S.1). The proper purpose of this project should be to reduce overall traffic congestion.

If the exclusive bus lanes are put into operation and the BRT is allowed to interrupt traffic signals, the motoring public will become outraged at the increase in traffic congestion. This outrage will follow the same pattern as the reaction to the recent traffic camera program. Predictability, the results will be the same. After enough public complaint, the City and County will be forced to remove the priority lanes and discontinue use of traffic signal interruption. This will mean that all money spent on construction of the priority lanes and traffic signal interruption equipment will be lost. In addition more money will need to be spent to remove the priority lanes.

Our current traffic system would benefit greatly from the following improvements:

1. Street widening – additional lanes for all type of vehicle traffic.
2. Intersection channelization – left and right turn bays with turn arrows.
3. Bus pullouts – allow a turn out lane for the Bus to load and unload passengers.
4. Coordinated traffic signals – using real time traffic data to change signal cycles.

The following streets could be upgraded to increased traffic capacity:

1. Auahi St. from South St. to Queen St.
2. Queen St. from Nimitz Hwy to Kamakee st.
3. McCully St. from H-1 to Kalakaua Blvd.
4. Bingham St. from Punahou St. to McCully St.
5. Punahou St. from King St. to Philip St.
6. Ward Ave from H-1 to King St.
7. Lusitania St. from Punchbowl St. to Kinau St.

The Bus system could be improved by applying the following suggestions:

1. Using global positioning satellite receivers on each bus to provide real time bus locations. This will allow real time bus scheduling to eliminate bus bunching (when several buses are traveling the same route close together).
2. Using the GPS data to display real time bus arrival schedules at each bus stop.
3. Eliminate redundant bus stops. By removing stops that are too close together overall bus travel time is reduced.

I would like to make a final comment about our "societal choice to have a good bus system". Mass transportation was originally provided by private enterprise. Our government's current monopoly of the mass transportation business was only accomplished by legislation and regulation, not by the government providing better service than the private sector. If private enterprise were allowed to compete for mass transit customers we would very likely have a more responsive transportation system and at an lower overall cost.

Sincerely Yours,

Mark A. Monoscalco

November 13, 2002

Mr. Mark A. Monoscalco
430 Lewers Street, #23D
Honolulu, Hawaii 96815-2421

Dear Mr. Monoscalco:

Subject: Primary Corridor Transportation Project

This is in response to your April 18, 2002 letter and your oral testimony at the April 20, 2002 public hearing regarding comments on the Supplemental Draft Environmental Impact Statement (SDEIS).

1. *I wish to voice my opposition to the current proposal for the In-Town Bus Rapid Transit. Two aspects of the current proposal will increase traffic congestion.*

   Response: Comment noted.

2. *First the use of existing traffic lanes for the exclusive use of BRT will reduce the capacity of the streets for travel by all other types of vehicles.*

   Response: It is not the conversion of lanes that will create the congestion. The congestion for motorists will be there without the BRT. When people are diverted onto public transit, congestion for motorists will be less with the Refined Locally Preferred Alternative (LPA) than it would be with the No-Build or Transportation System Management (TSM) Alternatives. Conditions will be much better for BRT riders with the Refined LPA since they will have a path clear of the congestion along much of the In-Town and Regional BRT routes.

3. *Second, giving traffic signal priority to BRT will cause increased traffic congestion on all streets that the BRT crosses.*

   Response: The potential for the BRT vehicles to extend the green phase will only be implemented at locations where it will not significantly impact cross street traffic.

4. *The design premise of this project is biased against automobile use. Providing alternatives to the private automobile is the stated purpose of this project (see DEIS S.1).*

   Response: The PCTP has focused on the transit portion of the island-wide transportation plan. Highway improvements have been addressed in the OMPO regional plan update (TOP 2025).

5. *The proper purpose of this project should be to reduce overall traffic congestion.*

   Response: Which it will do.

6. *If the exclusive bus lanes are put into operation and the BRT is allowed to interrupt traffic signals, the motoring public will become outraged at the increase in traffic congestion. This outrage will follow the same pattern as the reaction to the recent traffic camera program. Predictability, the results will be the same. After enough public complaint, the City and County will be forced to remove the priority lanes and discontinue use of traffic signal interruption. This will mean that all money spent on construction of the priority lanes and traffic signal interruption equipment will be lost. In addition more money will need to be spent to remove the priority lanes.*

   Response: Comment noted.

7. *Our current traffic system would benefit greatly from the following improvements:*
   1. *Street widening – additional lanes for all type of vehicle traffic.*
   2. *Intersection channelization – left and right turn bays with turn arrows.*
   3. *Bus pullouts – allow a turn out lane for the Bus to load and unload passengers.*
   4. *Coordinated traffic signals – using real time traffic data to change signal cycles.*

   Response: 1.) Additional lanes at bottleneck locations could be beneficial. General lane widening to increase overall roadway capacity would be a temporary fix, not a long-term solution. 2.) Left and right turn bays do help traffic flow at intersections, and the Refined LPA implements them where feasible along the In-Town BRT alignment. 3.) Bus pullouts are recommended in the Refined LPA in the Dillinghem Boulevard and Kuhio Avenue corridors to reduce the impacts of local buses on general traffic. 4.) The City has a state of the art traffic management center. It also has an ongoing traffic signal optimization program. Given the large number of traffic signals in Honolulu, it will take time to optimize all of the signals, but the process has been initiated and the public will see benefits from the program in the near future.

8. *The following streets could be upgraded to increased traffic capacity:*
   1. *Auahi St. from South St. to Queen St.*
   2. *Queen St. from Nimitz Hwy to Kamakee St.*
   3. *McCully St. from H-1 to Kalakaua Blvd.*
   4. *Bingham St. from Punahou St. to McCully St.*
   5. *Punahou St. from King St. to Philip St.*
   6. *Ward Ave. from H-1 to King St.*
   7. *Lusitenie St. from Punchbowl St. to Kinau St.*

   Response: The City continues to look for ways to improve its roadway system. These suggestions will be incorporated into the City's on-going review. It should be noted that the routing of the University Branch of the Refined LPA was relocated from Ward Avenue to Pensacola Street because of concerns regarding the capacity of Ward Avenue.

9. *The Bus system could be improved by applying the following suggestions:*
   1. *Using global positioning satellite receivers on each bus to provide real time bus locations. This will allow real time bus scheduling to eliminate bus bunching (when several buses are traveling the same route close together).*
   2. *Using the GPS data to display real time bus arrival schedules at each bus stop.*
   3. *Eliminate redundant bus stops. By removing stops that are too close together overall bus travel time is reduced.*

   Response: 1.) GPS is already installed on buses and real-time bus schedule kiosks are also planned. 2.) The City is currently reviewing various intelligent transportation system (ITS) elements that could eventually be integrated into the City transit system. 3.) Local bus stops are

closely spaced to provide maximum transit access. To decrease transit travel time, limited stop bus service such as the CityExpress! has been introduced. The proposed BRT included in the Refined LPA is the next step in providing even faster service.

10. *I would like to make a final comment about our "societal choice to have a good bus system." Mass transportation was originally provided by private enterprise. Our government's current monopoly of the mass transportation business was only accomplished by legislation and regulation, not by the government providing better service than the private sector. If private enterprise were allowed to compete for mass transit customers we would very likely have a more responsive transportation system and at a lower overall cost.*

    Response: The reason that the City took over the bus system is that the private sector could no longer make a profit running it and were in the process of abandoning all but the profitable routes. Since a significant segment of the population is dependent on transit for their mobility, the City with the public's support stepped in to ensure that these people would not be left immobile. There is a role for the private sector in the Refined LPA, which is to provide contracted circulator services.

11. *I've been a resident there (Waikiki) for over 13 years. I wish to voice my opposition to the current proposal for the In-town Bus Rapid Transit.*

    Response: Comment noted.

12. *First, the use of existing traffic lanes for the exclusive use of the BRT will reduce the capacity of the streets for travel by all other types of vehicles.*

    Response: See response to comment #2.

13. *Second, giving traffic signal priority to BRT will cause increased traffic congestion on all streets that BRT crosses.*

    Response: See response to comment #3.

14. *The design premise of this project is biased against automobile use. Providing alternatives to the private automobile is the stated purpose of this project, and that is listed in the DEIS, section one.*

    Response: The Supplemental Draft Environmental Impact Statement (MIS/DEIS), SDEIS, and FEIS Chapter 1 state the purposes of the Primary Corridor Transportation Project as:
    1. Increase the people-carrying capacity of the transportation system in the primary transportation corridor by providing attractive alternatives to the private automobile.
    2. Support desired development patterns.
    3. Improve the transportation linkage between Kapolei, which is envisioned to be the "Secondary Urban Center" of Oahu, and Honolulu's Urban Core.
    4. Improve the transportation linkages between communities in the Primary Urban Center (PUC) to increase the attractiveness of in-town living.

15. *I believe the proper purpose of this project should be to reduce overall traffic congestion.*

Response: The BRT project alone cannot reduce overall traffic congestion. The Oahu Metropolitan Planning Organization's (OMPO's) Transportation for Oahu Plan, TOP 2025 presents the transportation projects, including the Refined LPA, that collectively will help alleviate traffic congestion.

16. *If the exclusive bus lanes were put into operation and BRT is allowed to interrupt traffic signals, the motoring public will become outraged at the increase in the traffic congestion. I believe this outrage will follow the same pattern as the reaction to the recent traffic camera program. Predictably, the results will be the same. After enough public complaint, the City and County will be forced to remove the priority lanes and discontinue use of traffic signal interruption.*

    This will mean that all of the money spent on the construction of the priority lanes and traffic signal interruption equipment will be lost. In addition, more money will need to be spent to remove the priority lanes.

    Response: Comment noted.

17. *I would like to make some suggestions to improve our current traffic system. I believe we would greatly benefit from the following improvements: Street widening, additional traffic lanes for all types of vehicles.*

    Response: See response to comments #7 and #15. The TOP 2025 plan includes street widening and additional traffic lane projects.

18. *Suggestion two would be intersection channelizations, adding left and right turn lanes, with turn arrows.*

    Response: See response to comments #7 and #15. The TOP 2025 plan includes intersection improvement projects.

19. *Suggestion three, bus pullouts, allow a turn-out lane for the bus to load and unload passengers without blocking traffic lanes.*

    Response: Bus turnouts will be installed along sections of Dillingham Boulevard and Kuhio Avenue.

20. *And suggestion four, coordinated traffic signals, by using reelime traffic data to change traffic signal times.*

    Response: The City's In-town traffic system has this capability now.

21. *I believe the following streets could be upgraded to increase traffic capacity. From South Street to –*

    Response: See response to comments #8 and #15.

22. *I'd like to make a final comment about a quote that's been in the paper about our societal choice to have a good bus system. Mass transportation was originally provided by private enterprise. Our government's current monopoly of the mass transportation business was only accomplished by legislation and regulation, not by government providing better service than the private sector. If private enterprise were allowed to compete for mass transit customers, we would very likely have a more responsive transportation system and at an overall lower cost.*

    Response: See response to comment #10.

We will send you a CD-ROM copy of the Final Environmental Impact Statement (FEIS) under separate cover. If you require a printed copy of the FEIS, please contact Faith Miyamoto at 527-6976. We appreciate your interest in the project.

Sincerely,

CHERYL D. SOON

Dear Mr. Morse:

Subject: Primary Corridor Transportation Project

This responds to the comment you made on the Supplemental Draft Environmental Impact Statement (SDEIS).

This is not good. Don't proceed with BRT. Poor planning and too costly.

Response: Comment noted.

We appreciate your interest in the project.

Sincerely,

CHERYL D. SOON
Director

RE: Oahu's Trans 2K Mass Transit System Plan

Dear Ms. Soon:

I, am writing to you in response to the different types of transportation systems slated for the island of Oahu for the state of Hawaii. I do not drive and am solely dependent upon the transportation systems of Hawaii like, the buses (regular & express services), the taxicabs and sometimes catching a ride with my friends that drive. **I am in support of the TSM (Transportation System Management) for the Urban Honolulu areas, with a partial BRT (Bus Rapid Transit) servicing the Suburbs to bring commuters to Urban downtown.** It makes sense to bring in people from the Suburbs rapidly using the High Occupancy Vehicle or the Zipper lanes to the downtown areas or transfer at transit centers to another transit vehicle closer to your destination (i.e. regular service or express buses) via a transit vehicle. The heavily used streets of Urban Honolulu servicing both the public and private sectors are not as wide across as some of the other cities in the continental United States like Boston, Albany, New Orleans, Miami, etc. The streets in Urban Honolulu are used by private & commercial vehicles such as cars, vans, mini-buses, buses, mopeds, trolleys,

motorcycles and bicycles. In fact, the number of trolley services and routes have increased in the last few years due to tourist vacationing and having their Wedding ceremonies in Hawaii. If a BRT (bus rapid transit) system is chosen, 2 – 2-1/2 lanes of the street will be converted to dedicated lanes for the transit vehicles as well as a median strip to unload & pick-up passengers as explained by the engineer of the project. Closing of 2 lanes of traffic, especially on busy, busy Dillingham Boulevard will have serious problems as only 1 lane of traffic is opened for travelers going East and the other 1 lane for travelers going West. The problem also persists on Kalakaua Avenue in the heart of Waikiki district near the famous Waikiki & Kuhio beach areas. Previously 4 lanes of traffic headed towards the east, now 1 lane of traffic has been changed to a curb for trolleys and private tour vehicles to load & unload passengers. If 1 more lane or traffic is changed to a dedicated lane for the Transit vehicle, only 2 lanes of traffic will serve everyone else.

ADDITIONAL PROBLEMS which need to be addressed:

1. The type of BRT system the City & County of Honolulu is proposing will consist of electric embedded plates on the dedicated lanes which will activate the tram whenever the protruding metal strip touches the electric plates. QUESTION: what happens when there are water main breaks on the road as has been happening recently in Honolulu (many water pipes are 40 – 60 years old and in dire need to be replaced). In fact on Monday, October 23rd, there was a water main break on Kuhio Avenue again. About 3 – 4 months ago, there were 3 major water main breaks on the main thoroughfare of Kapiolani Boulevard in

About a 1 month period. The Board of Water Supply crew worked throughout the night & day, but took longer than usual, due to underground electric and cable wiring under the streets. These are just 2 of the proposed streets to be converted to a IN-TOWN BRT system lane. Will the transit vehicle be electrically charged and harmful to anyone on the tram? What about people with Pacemakers?

2. The dedicated lanes will be solely used by the transit tram, that anyone who wishes to make a left turn into a driveway, must approach a dedicated intersection, then make a U-turn and return in the opposite direction to enter the intended driveway, even though it is several blocks away.

3. If there is a traffic accident or a stalled vehicle on the street, how will drivers be able to proceed around the accident, if only 1 lane of traffic is opened? How would emergency vehicles like the police, ambulance and fire trucks be able to pass? Will everyone be allowed to use the dedicated lanes also?

4. Is there enough room for large commercial, construction, military vehicles, machineries, and semi-trucks with containers – since some of them require 1 – 2 lanes of traffic to maneuver on the roads. How would these huge vehicles be able to make wide right turns because of the way they are manufactured and cannot infringe onto the dedicated lanes?

5. Is there enough space on the median strips for passengers including the elderly, physically handicapped, adults with babies, bicyclists and wheelchair bound to

load and unload on the transit platforms? I wonder how people with wheelchairs will be able to unload out of the trams, as someone else in a wheelchair boards the tram, causing massive jam on the median strip?

6. The intervals between transit trams is unrealistic. The time limit is between 4 – 8 minutes and between 2 – 4 minutes during rush hour. I clocked the time it took passengers riding the Ala Moana Center Shuttle bus to unload and board at the major Ala Moana Center transit center stop. The time it took a full to capacity bus (these are not the articulated buses that are used for express routes) filled with of 65 passengers to unload from the front & back doors and for 20 passengers to board the bus was approximately 2 minutes. On another day, it took 60 passengers to unload and 25 passengers to board the bus approximately 3 minutes. These were healthy young to middle aged passengers, no one requiring extra time to stow away their bicycle, parents carrying babies, carrying baby strollers, diaper bags or wheelchair bound passengers. What happens when you encounter passengers that require additional attention and time before the bus driver may leave the transit area? How can you justify the timetable? It is a vital transportation link for those on fixed income and movement is not as flexible as others. Many other factors are involved in the timetable. The driver of the bus route is asked for directions, which bus will take people to their destination, if transfers are needed – directions on transfer points, explanation of Express buses with it's limited stops – especially elderly citizens and foreigners who don't understand English nor the word ?Express"

Even though through Mayor Harris's visioning team expressed a mass transit system about 2 years ago, the communities that will be affected by the Mass Transit were never consulted or any information given till September 26, 2000. Additional informational meetings and public hearings were held on October 2nd, 5th, 23rd and 26th. The general public has till November 6, 2000 to respond and submit written testimony The City & County of Honolulu Transportation Department planners, engineers, consultants spoke of 3 mass transit proposals as in the planning stage, but the presentations I have seen is leaning towards the BRT & In-Town BRT System (electric plates embedded on the streets to power the transit vehicles) – even though only 1 city in Italy is currently using it nor has it been formally approved as the system best for the Island of Oahu in the state of Hawaii. There have not been any other tests conducted to compare the effectiveness of this particular system. I understand that several drivers were approached earlier this year to be drivers for the TRANSIT TRAM vehicles prior to any decision on which of the 3 mass transit alternatives best fits towards the year 2025 for the Island of Oahu as the population continues to grow in certain areas like Kapolei. Urban Honolulu is very congested due to the fact that the majority of Oahu's population work, live, play and drive their vehicles as well as influx of Major Office buildings, restaurants, parking lots, condominiums, houses, parks and attractions for the visitor industry. The vicinity of Kapolei and other Suburb cities on Oahu are still vast open areas and is starting to develop as a 2nd Major City and better suited for dedicated lanes or use of Zipper lanes to accommodate the BRT system proposed by the City & County Transportation Department and the Visioning Team.

There is a trend for the population in Hawaii to work out of their own homes using their computers to do business on the Internet like banking, communicate, reference, shop, etc. The people living in the suburbs & Urban Honolulu may also utilize the community shops and services, but occasionally need to travel to downtown or other districts of Oahu. The people that need to commute will utilize the MASS TRANSIT Services– either with a direct route or transfer at transit centers to buses that will take them closer to their destinations. Sometimes, it may take longer via the regular bus routes (due to frequent stopping at each bus stop) or it may be shorter and takes less time then traveling on a BRT tram route as several transfers maybe needed to reach their destination. Once on the TRAM the ride is faster (due to limited stops) – BUT **THE KEY IS THE PASSENGER MUST BE ON THE TRAM** and not be waiting for a tram or a bus at the transit centers to experience such a faster timetable to reach their destination. On 1 occasion, I caught a bus to get to City Express B bus stop in Waikiki. I waited 5 minutes for the Express "B" Bus, then I reached Downtown Honolulu in 9 minutes, finally walked for 3 minutes to Longs Drugs Store for a total travel time of 17 minutes. If I catch the regular bus to Longs Drugs Store it takes approximately 20 – 27 minutes with the bus stop located directly across the street. The Express Bus system may save time in reaching your destination, but it also depends whether I have bulky & heavy packages to carry then I would prefer to catch only 1 bus rather then to catch several different buses to get home faster. **It's a matter of convenience or time factor.** This is the same argument with the IN-TOWN BRT System – the difference is that the Transit stops are farther apart

because there are less stops along the route, but how much more of an inconvenience is it to wait & transfer to other transit vehicles (maybe 2 – 3 more) at the Transit stop?

I support the BRT (Bus Rapid Transit) System from the Suburb to Urban Honolulu, then use the Transportation System Management system for Urban Honolulu. It could expand the City Express routes A, B & Country Express C with very limited bus stops), other express route services and by consolidating some of the regular bus routes into express routes for Urban Honolulu. The City & Country Express has been operating for about 2 months, starting from August 20, 2000, and is not fully tested to its full capacity. The BRT System from the suburbs may use some other type of tram that is environmental friendly and that does not need to use an electric plates embedded into the street. It need not be a system that does require dedicated lanes (which tears up the streets, trees planted on the median strips need be removed, motorist will not be able to turn left into the driveways, etc.) It may also pick-up passengers from the safety of the curb – especially for the elderly parents with babies, for children, bicycle riders, wheelchair bound as well as the other handicapped (blind) passengers. Why is the City & County of Honolulu pushing for a RAPID TRANSI SYSTEM (OR IS IT A LIGHT RAIL SYSTEM?) that will use an embedded plate system, is it a possibility that a private developer or contractor is anxiously approaching the City & County to consider their system & products?

Important decisions require time, careful study, careful planning and consideration with many factors and variables that will affect the transportation flow for

the general public as well as thousands of visitors that will visit and use the transit system of the State of Hawaii, as a very unique and special place, much smaller than Atlanta, New York, Los Angeles, San Francisco and other major cities. The system that Works beautifully for their cities, may not necessarily be the right one for the Island of Oahu. Hawaii is a tourist oriented destination of which the Transit System will need to compete with private tour vans & buses, private trolleys, bicycles and other means of transportation in Urban Honolulu.

Thank you for the opportunity.

RE: Final Draft Environmental Impact Statement –Bus Rapid Transit

I, Daisy Murai, a tax payer, resident of Kapahulu and whose main mode of transportation is via Oahu Transit Services TheBus System. I **DO NOT SUPPORT the IN-TOWN BRT** portion of the Bus Rapid Transit plan. I am in full support of a Bus Rapid Transit system for the areas outside of the Primary Urban Center of Honolulu. There is at least 1 traffic accident caused from motorist traveling to and from the outskirts of Honolulu to the Downtown area almost on a daily basis. This is the area of major traffic congestion in the mornings and afternoons and they deserve first preference to relieve congestion.

The In-Town BRT plans have many more factors to consider that will require extensive, detailed planning and design. There are several problems that I find that have not been addressed and taken into consideration for the Downtown streets.

1) Implanting electronic metal strips on the streets for exclusive or shared usage by the BRT tram or vehicle.

   A) Have all the streets (Pensacola, Alakea, Bishop, Dillingham, Ala Moana, University, etc) been up-graded to handle the extra load on the streets (sewer lines, water pipes, cable wires) or will they be fixed when the electric plates are embedded on the streets – adding more expense? Presently, there have had almost 1 water main break per week
   somewhere on the Island of Oahu. Some have been major breaks (ie. McCully & Kapiolani corner) Every break on the street, the tram will not proceed and repairs galore. – major problems!

   B) On the shared lanes, is the problem of picking-up trash by the private refuse companies for tenants affected being addressed and solved? (Trash bins are left on the streets in the morning on Alakea, Bishop, Ala Moana, Kuhio Avenue, etc.-due to not enough space to maneuver the huge trucks) This problem will also hamper passengers loading and unloading from vehicles, as wells as vendors delivering their products.

   C) Will salt water corrode the metal strips? The corner of Saratoga and Kalia Roads, the salt water from the ocean surges onto the road through the storm drain whenever there is high tide.

2) Time Schedule – is very unrealistic

   A) 2, 4, 6, 8 minute intervals during peak hours of the day is very unrealistic. It does not give the riders enough time to depart and board (even able bodied passengers – refer to my first testimony on Ala Moana Shuttle bus route No. 8 – where it took 3 - 4 minutes to unload a full to capacity of 60 – 65 able bodied passengers). It is not taking handicap passengers into account – especially if there are wheelchair bound (sometimes they require 10 minutes to settle into their seats). This will also prevent the handicap, senior citizens and wheelchair bound passengers from boarding – ADA rule not followed. It is not taking into account passengers with baby strollers who require additional time to settle into their seats.

   B) If the interval between trams are too short (to prevent an overlap of the next tram traveling on the same route), very few passengers will be able to board per tram. The transit service will not be efficient nor profitable, causing higher maintenance costs, increase in the fares, higher taxes, higher service fees and even less tram services This defeats the purpose of the transit service as a high capacity people mover.

   C) The City & Country Express system is great for getting around Oahu, but even that system is has an overlap of busses catching up to the bus in front. Sometimes, the next bus is with-in 1 minute of the earlier bus.

3) Routes

   A) Has a scientific survey being conducted with tests to determine which areas need this system more than others? Has a trial test being conducted before implementation – where all the minuet problems

   B) Some streets needs to be expanded to accommodate the BRT System, have theses being addressed?

   C) Has the **impact on neighboring streets and neighborhood being addressed**– if the motorists decide to avoid BRT lanes on Dillingham, Kapiolani, Ala Moana, University, Kalakaua and Kuhio Avenues, etc. and travel through the adjacent neighborhoods? This is the same approach as a CTAP project where motorist have taken side streets when they spot a CTAP project in operation (police officers with radar guns checking the speed of the automobiles and residents holding-up signs to slow down and drive carefully).

   D) Traffic gridlock, accidents and road rage will occur in the Primary Urban Center of Honolulu due to the narrowness of the roadways, unlike other larger metropolitan cities that can accommodate many more lanes of traffic than Oahu.

AR00015977

FDEIS Testimony 4/20/2002

Educating the general public, more public input, testing and re-testing are vital and crucial elements to make the BRT System work. Without addressing these important input from the general public and specialists. the transit problems will never be solved. If this is the best, most efficient, most reliable, most affordable, most convenient transit system for Oahu, then everyone connected with this particular system should get out of their cars and commute utilizing the BRT System on a daily basis.

Thank you for the opportunity to speak.

RE: Primary Corridor Transportation Project
Island of Oahu, Hawaii (SDEIS)

Dear Ms. Soon,

I have enclosed additional comments to the Supplemental Draft Environmental Impact Statement (SDEIS) on the Bus Rapid Transit (BRT) system.

These additions are copies that I submitted to Ms. Donna Turchie, Senior Transportation Representative of the Federal Transit Administration, Region IX, and to Ms. Genevieve Salmonson, Director – State of Hawaii, Office of Environmental Quality Control.

Thank you for the opportunity to respond from a private citizen who rides the bus daily.

Daisy M. Murai

RE: SUPPLEMENTAL DRAFT ENVIRONMENTAL IMPACT STATEMENT
TESTIMONY FOR HONOLULU, HAWAII & ISLAND OF OAHU
BUS RAPID TRANSIT (BRT)

Dear Ms. Turchie:

Enclosed is my written testimony that I presented at the Transit Public Hearing on April 20, 2002 at the Hawaii Convention Center in Honolulu, Hawaii. This is the testimony City & County of Honolulu Transportation Director, Cheryl Soon and State of Hawaii Office of Environmental Quality Control Director Genevieve Salmonson both received.

I still oppose the In-Town BRT portion of this mass transit system plan for the Primary Urban Center of Honolulu and the Island of Oahu presented on the Supplementary Draft Environmental Impact Statement. This phase should wait till outside areas of Honolulu have their traffic congestion problems solved first before attempting to proceed with the In-Town route from Iwilei to Waikiki as proposed by City Director Soon & City Council Transportation Committee Chairperson Bainum.
The water & sewer pipes in Honolulu have not been up-graded for years as countless number of water main pipes have broken with-in the last 3 years, due to wear and tear as heavier motor vehicles (trolleys, buses, limousines, trucks, SUV) use the roadways. These are the very streets that the City wish to start the Bus Rapid Transit System, with no mention of up-grading the roadways before commencing with this most ambitious project.

The first priority should encompass the areas outside of Urban Honolulu, as these are the areas most affected by traffic gridlock for Monday – Friday commuters. I feel that this is where the transit plans should be implemented first.

The time intervals between trams are very unrealistic. My main mode of transportation is riding the City Buses to my destinations. I timed 60 – 65 able bodied persons getting off the bus No. 8 Shuttle Bus between Waikiki and Ala Moana (Shopping) Center. It took 3 – 4 minutes for passengers to get off and another 4 – 5 minutes for passengers to get on the bus to travel back to Waikiki with their bags and boxes of purchases, as well as families with baby strollers and toddlers. This does not take into account handicap passenger that need extra time. The time intervals as proposed by the City & County of Honolulu of 2, 4, 6, 8 minutes during rush hour

are totally unrealistic. A wheelchair rider needs 5 – 10 minutes to settle into his or her seat from the curbside loading platform. If the rush hour intervals are followed, very few passengers will be able to board or get off the trams, as the next one is right behind it. The trams will cause gridlock and not be able to keep up with the time schedule.

The loading platforms for passengers in the middle of the streets will not be large enough to accommodate free movement for passengers with wheelchairs, baby stroller, walkers and folding shopping carts. In Japan. I witnessed in certain areas that utilize boarding platforms in the middle of the streets crammed pack with students waiting for their buses - sometimes with barely room to spare. I shudder to think what may happen when the students are inattentive to the surrounding traffic while on the boarding platform. What happens when toddlers and children stray from their parents.

I also see problems of jaywalkers from young to old in certain parts of Honolulu – like Downtown, Chinatown, Kapiolani Boulevard and especially in Waikiki. People are rushing to catch a certain bus, in a hurry or inattentive to the surrounding traffic. These are problems facing Honolulu presently.

I'm sure that the best engineers, consultants and experienced personnel have spent countless hours of planning, preparing, cross examining to study the huge impact created by such a massive mass transit system, but public input is also crucial and vital, as these are the people who will use and be most affected by this project. Educating the public, testing and re-testing are important aspects not to be taken for granted.

I suggest that all those connected with the project and those in support utilize the In-Town BRT system. Riders want the most direct route and closest to their destinations, rather than spend time waiting at transit centers for their connecting tram. If the ridership is low, the fees will increase to a point many people will not be able to afford to ride the BRT in the future. The heavy burden to maintain the BRT will fall on the tax payers of Hawaii.

Thank you for your attention.

Ms. Daisy M. Mural
c/o Kapahulu Neighbors
3039 Kaunaoa Street
Honolulu, Hawaii 96815

Dear Ms. Mural:

Subject: Primary Corridor Transportation Project

This is a combined response to your comments on the Major Investment Study/Draft Environmental Impact Statement (MIS/DEIS) and Supplemental Draft Environmental Impact Statement (SDEIS). We are responding in two parts. Part A responds to your October 25, 2000 letter regarding the MIS/DEIS. Part B responds to your April 20, 2002 letter, your oral testimony at the SDEIS April 20, 2002 Public Hearing, and your May 3, 2002 letter regarding the SDEIS.

Part A – MIS/DEIS Comments

1. *I am in support of the TSM (Transportation System Management) for the Urban Honolulu areas, with a partial BRT (Bus Rapid Transit) servicing the Suburbs to bring commuters to Urban downtown. It makes sense to bring in people from the Suburbs rapidly using the High Occupancy Vehicle or the Zipper lanes to the downtown areas or transfer at transit centers to another transit vehicle closer to your destination (i.e., regular service or express buses) via a transit vehicle.*

   Response: Comment noted. It states the commenter's preference for an LPA.

2. *If a BRT (bus rapid transit) system is chosen, 2 - 2-1/2 lanes of the street will be converted to dedicated lanes for the transit vehicles as well as a median strip to unload & pick up passengers as explained by the engineer of the project. Closing of 2 lanes of traffic, especially on busy, busy Dillingham Boulevard will have serious problems as only 1 lane of traffic is opened for travelers going east and the other 1 lane for travelers going west.*

   Response: The BRT Alternative is comprised of a mix of exclusive BRT, semi-exclusive BRT and mixed-use lanes. The BRT system strives to strike a balance between transit speed and impacts to general traffic. In segments where it was judged that roadway capacity was needed for general traffic and the BRT operation would not be significantly effected, exclusive lanes were replaced by either semi-exclusive or mixed-flow operation. In areas of high BRT ridership volumes, exclusive transit lanes were retained such as on Dillingham Boulevard. To reduce impacts to general-purpose traffic on Dillingham Boulevard, 18-foot-wide lanes are proposed between Puuhale Street and Waiakamilo Road. Eighteen-foot-wide lanes will permit vehicles to go around buses stopped at the curb and right-turning vehicles. Separate left-turn/U-turn lanes will also be provided at signalized intersections. To preserve the True Kamani trees, instead of 18-foot lanes between Waiakamilo Road and Kaaahi Street turnouts will be provided for local buses.

Because of the diversion of people from autos to transit, even with the BRT lanes, the traffic LOS along Dillingham Boulevard will be equal to or better than conditions with the No-Build Alternative. Additionally, traffic LOS on parallel streets such as N. King Street and Nimitz Highway will be equal to or in most cases better with the BRT lanes on Dillingham Boulevard than without them.

Moreover, the exclusive BRT lanes on Dillingham Boulevard will enable Dillingham Boulevard to carry 3 times the number of people that it can carry today.

3. *The problem also persists on Kelekeue Avenue in the heart of Waikiki district near the famous Waikiki & Kuhio beach areas. Previously 4 lanes of traffic headed towards the east, now 1 lane of traffic has been changed to a curb for trolleys and private tour vehicles to load & unload passengers. If 1 more lane or traffic is changed to a dedicated lane for the Transit vehicle, only 2 lanes of traffic will serve everyone else.*

   Response: With the Refined LPA, the lane designation on Kalakaua Avenue between Saratoga Road and Ulunlu Avenue will be three mixed-traffic lanes and a semi-exclusive curb lane shared by the BRT, private buses and right-turning autos. On Kalakaua Avenue between Ulunlu Avenue and Kapahulu Avenue (i.e. by Kuhio Beach), the BRT will operate in mixed traffic so there will be no change from today in the lane configuration.

4. *The type of BRT system the City & County of Honolulu is proposing will consist of electric embedded plates on the dedicated lanes which will activate the tram whenever the protruding metal strip touches the electric plates. QUESTION: what happens when there are water main breaks on the road as has been happening recently in Honolulu (many water pipes are 40 - 60 years old and in dire need to be replaced). Will the transit vehicle be electrically charged and harmful to anyone on the tram? What about people with Pacemakers?*

   Response: The electrical conductor will be insulated under the ground so that there will be no harmful effects. Additionally, the EPT vehicles will be capable of operating under battery power for short distances, so they will be able to negotiate around any temporary blockages while a broken water main is being repaired.

   The manufacturer will be required to develop a method to insulate passengers with Pacemakers from electromagnetic impacts.

5. *The dedicated lanes will be solely used by the transit tram, that anyone who wishes to make a left turn into a driveway, must approach a dedicated intersection, then make a U-turn and return in the opposite direction to enter the intended driveway, even though it is several blocks away.*

   Response: In the case that the BRT lane is located in the middle of the roadway, such as Dillingham Boulevard, left-turns and U-turns are allowed only at designated locations for purposes of vehicle safety. Where the BRT lane is adjacent to the curb, crossing of the lane by other vehicles is allowed.

6. *If there is a traffic accident or a stalled vehicle on the street, how will drivers be able to proceed around the accident, if only 1 lane of traffic is opened? How would emergency vehicles like the police, ambulance and fire trucks be able to pass? Will everyone be allowed to use the dedicated lanes also?*

   Response: The two candidate technologies, embedded plate and hybrid propulsion, both provide the flexibility to operate outside of the designated BRT lanes and therefore can easily maneuver

around accident sites, emergency vehicles and traffic. Also, the proposed network of exclusive and semi-excusive BRT lanes would greatly enhance emergency vehicle response times providing an uncongested lane for such vehicles to reach incident locations. With proper emergency traffic signal preemptions in place, BRT vehicles would be able to move out of the exclusive lane at the nearest intersection to allow emergency vehicles to pass through the intersection unimpeded by either left turning or cross street traffic.

There are no plans for mixed-traffic to utilize exclusive BRT lanes, however, in the case of an emergency police will handle traffic flow on a case-by-case basis.

7. *Is there enough room for large commercial, construction, military vehicles, machineries, and semi-trucks with containers – since some of them require 1 - 2 lanes of traffic to maneuver on the roads. How would these huge vehicles be able to make wide right turns because of the way they are manufactured and cannot infringe onto the dedicated lanes?*

   Response: Generally there will not be any barriers on the exclusive lanes that are not crossable. Larger vehicles that have larger turning radii can infringe temporarily on the exclusive lanes to complete their turns.

8. *Is there enough space on the median strips for passengers including the elderly, physically handicappad, adults with babies, bicyclists and wheelchair bound to load and unload on the transit platforms? I wonder how people with wheelchairs will be able to unload out of the trams, as someone else in a wheelchair boards the tram, causing massive jam on the median strip?*

   Response: The platforms are approximately eight feet wide by 160 feet long. The ADA standard requirement for wheelchair maneuverability is an area eight feet by five feet. There will be sufficient room for ingress and egress on and off the bus. Additionally, there will be at least two boarding and exiting doors on the bus. Boarding and exiting by wheelchair will be much easier than today since the floor of the bus and the passenger platform would be at the same height. A "bridge plate" that extends out from the floor of the bus when the door opens will bridge the gap between the bus and platform, such that no wheelchair lift will be required.

9. *The intervals between transit trams is unrealistic. The time limit is between 4 - 6 minutes and between 2 - 4 minutes during rush hour. What happens when you encounter passengers that require additional attention and time before the bus driver may leave the transit area? How can you justify the timetable?*

   Response: As indicated in response to comment #8, because of prepayment of fares passengers will be able to both enter and exit from both doors on the vehicle. They also will be wider than standard doors. Additionally, since no wheelchair lifts are needed, dwell times at stops will be much shorter than today.

10. *Even though through Mayor Harris's visioning team expressed a mass transit system about 2 years ago, the communities that will be effected by the Mass Transit were never consulted or any information given till September 26, 2000.*

    Response: The Oahu Trans 2K public outreach process started in September 1998 and has continued through preparation of the FEIS. During this time hundreds of public meetings have been held throughout Oahu, with a focus on the communities along the primary corridor to inform

the public of the projects attributes and impacts and to elicit their input during the process. A full listing of the outreach activities is presented in Appendix A of the FEIS (Coordination and Consultation).

11. *The City & County of Honolulu Transportation Department planners, engineers, consultants spoke of 3 mass transit proposals as in the planning stage, but the presentations I have seen is leaning towards the BRT & In-Town BRT System (electric plates embedded on the streets to power the transit vehicles) – even though only 1 city in Italy is currently using it nor has it been formally approved as the system best for the Island of Oahu in the state of Hawaii. There have not been any other tests conducted to compare the effectiveness of this particular system. I understand that several drivers were approached earlier this year to be drivers for the TRANSIT TRAM vehicles prior to any decision on which of the 3 mass transit alternatives best fits towards the year 2025 for the Island of Oahu as the population continues to grow in certain areas like Kapolei.*

    Response: No decision has been reached on the final BRT technology. A final decision is not needed until 2008. Touchable embedded plate is one of the two options being considered. One of the criteria upon which a technology decision will be made is the experience of that technology in passenger service. The City Council will have the option of rejecting any technology that is not considered service proven. No bus drivers have been approached by the City to be drivers for the BRT system.

12. *The vicinity of Kapolei and other Suburb cities on Oahu are still vast open areas and is starting to develop as a 2nd Major City and better suited for dedicated lanes or use of Zipper lanes to accommodate the BRT system proposed by the City & County Transportation Department and the Visioning Team.*

    Response: This is what is proposed in the Refined LPA.

13. *The people that need to commute will utilize the MASS TRANSIT Services – either with a direct route or transfer at transit centers to buses that will take them closer to their destinations. Sometimes, it may take longer via the regular bus routes (due to frequent stopping at each bus stop) or it may be shorter and takes less time than traveling on a BRT tram route as several transfers may be needed to reach their destination. Once on the TRAM the ride is faster (due to limited stops) – BUT **THE KEY IS THE PASSENGER MUST BE ON THE TRAM** and not be waiting for a tram or a bus at the transit centers to experience such a faster timetable to reach their destination.*

    Response: We concur that passengers generally do not like to transfer. The travel demand forecasting models account for the fact that certain passengers will have a faster ride by taking local buses and avoiding transferring. The probability of a passenger selecting a given route is a function of total travel time by the chosen path, including penalties assigned for having to transfer.

14. *It's a matter of convenience or time factor. This is the same argument with the IN-TOWN BRT System – the difference is that the Transit stops are farther apart because there are less stops along the route, but how much more of an inconvenience is it to wait and transfer to other transit vehicles (maybe 2 - 3 more) at the Transit stop?*

    Response: The travel time savings including the transfers, with implementation of the Refined LPA will be, in most cases, faster than exists today. In outlying areas transit hubs will be established that allow for a pre-timed transfer between local circulator buses and BRT express

routes. The additional transferring in the Refined LPA will to a high degree be offset by these timed transfers, and by the more frequent, more comfortable, and more reliable service provided. In many cases the total travel time will be less with the Refined LPA.

15. *I support the BRT (Bus Rapid Transit) System from the Suburb to Urban Honolulu, then use the Transportation System Management system for Urban Honolulu. It could expand the City Express routes A, B & Country Express C with very limited bus stops), other express route services and by consolidating some of the regular bus routes into express routes for Urban Honolulu.*

   Response: Comment noted. It states the commenter's preference for an LPA.

16. *The BRT System from the suburbs may use some other type of tram that is environmental friendly and that does not need to use an electric plates embedded into the street. It need not be a system that does require dedicated lanes (which tears up the streets, trees planted on the median strips need be removed, motorist will not be able to turn left into the driveways, etc.) It may also pick up passengers from the safety of the curb – especially for the elderly parents with babies, for children, bicycle riders, wheelchair bound as well as the other handicapped (blind) passengers. Why is the City & County of Honolulu pushing for a RAPID TRANSIT SYSTEM (OR IS IT A LIGHT RAIL SYSTEM?) that will use an embedded plate system, is it a possibility that a private developer or contractor is anxiously approaching the City & County to consider their system & products?*

   Response: The embedded plate technology is only being considered for the In-Town BRT. Buses with diesel or hybrid diesel/electric power will be used in the outlying communities. No manufacturer is being given preferential consideration in the technology selection process.

17. *Important decisions require time, careful study, careful planning and consideration with many factors and variables that will affect the transportation flow for the general public as well as thousands of visitors that will visit and use the transit system of the State of Hawaii, as a very unique and special place, much smaller than Atlanta, New York, Los Angeles, San Francisco and other major cities. The system that works beautifully for their cities may not necessarily be the right one for the island of Oahu. Hawaii is a tourist oriented destination of which the Transit System will need to compete with private tour vans & buses, private trolleys, bicycles and other means of transportation in Urban Honolulu.*

   Response: From the outset the Primary Corridor Transportation Project has strived to develop a transit system that uniquely fits the special setting in Honolulu. The purpose of this system however is not to compete with the private transportation providers who very effectively serve the visitor market, it is to better serve the residents of Oahu and to give them a viable alternative to using private autos for certain trips.

Part B – SDEIS Comments

18. *I, Daisy Murai, a tax payer, resident of Kapahulu and whose main mode of transportation is via Oahu Transit Services TheBus System. I DO NOT SUPPORT THE IN-TOWN BRT portion of the Bus Rapid Transit plan. I am in full support of a Bus Rapid Transit system for the areas outside of the Primary Urban Center of Honolulu. There is at least one traffic accident caused from motorists traveling to and from the outskirts of Honolulu to the Downtown area almost on a daily basis. This is the area of major traffic congestion in the mornings and afternoons and they deserve first preference to relieve congestion.*

   Response: Comment noted. No response required because this is a statement of preference regarding supporting the Regional BRT and not the In-Town BRT.

19. *Have all the streets (Pensacola, Alakea, Bishop, Dillingham, Ala Moana, University, etc.) been upgraded to handle the extra load on the streets (sewer lines, water pipes, cable wires) or will they be fixed when the electric plates are embedded on the streets – adding more expense? Presently, there have have had almost one water main break per week somewhere on the island of Oahu. Some have been major breaks (i.e. McCully and Kapiolani corner). Every break on the street, the tram will not proceed and repairs galore – major problems!*

   Response: Provisions to upgrade the streets have been included in the cost estimates. Concrete lanes will be provided for exclusive and semi-exclusive BRT lanes prior to EPT. Provisions to protect utilities from additional traffic load will be incorporated when the concrete lanes are constructed.

20. *On the shared lanes, is the problem of picking up trash by the private refuse companies for tenants effected being addressed and solved? (Trash bins are left on the streets in the morning on Alakea, Bishop, Ala Moana, Kuhio Avenue, etc. – due to not enough space to maneuver the huge trucks.) This problem will also hamper passengers loading and unloading from vehicles, as well as vendors delivering their products.*

   Response: DTS will coordinate with building managers where such trash pick-up may need to be scheduled to avoid conflicts with the BRT. Moreover, the BRT vehicles will not be limited to operating in a fixed lane, but will be able to maneuver around obstacles such as trash dumpers left in the street.

21. *Will salt water corrode the metal strips? The corner of Saratoga and Kalia Roads, the salt water from the ocean surges onto the road through the storm drain whenever there is high tide.*

   Response: A non-corrosive metal will have to be used for the EPT plates.

22. *2, 4, 6, 8 minute intervals during peak hours of the day is very unrealistic. It does not give the riders enough time to depart and board (even able bodied passengers – refer to my first testimony on Ala Moana Shuttle bus route No. 8 – where it took 3 – 4 minutes to unload a full to capacity of 60 – 65 able bodied passengers). It is not taking handicap passengers into account – especially if there are wheelchair bound (sometimes they require 10 minutes to settle into their seats). This will also prevent the handicap, senior citizens and wheelchair bound passengers from boarding – ADA rule not followed. It is not taking into account passengers with baby strollers who require additional time to settle into their seats.*

   Response: Boarding and alighting will be much easier with the In-Town BRT. Passengers will be able to get on-and-off from a platform that is at the same height as the bus floor (13 inches) so that there will be no steps to negotiate. Also, because there will be prepayment of fares, passengers will be allowed to both enter and leave from any of 2 or 3 doors on the articulated buses. Passengers in wheelchair and scooters will be able to board and alight directly without the use of a lift. Passengers with baby strollers will also find it much easier to get on-and-off the bus. The net effect of these features is that dwell time at stops will be less.

23. *If the interval between trams are too short (to prevent an overlap of the next tram traveling on the same route), very few passengers will be able to board per tram. The transit service will not be efficient nor profitable, causing higher maintenance costs, increase in the fares, higher taxes, higher service fees and even less tram services. This defeats the purpose of the transit service as a high capacity people mover.*

    Response: See response to comment # 22.

24. *The City & Country Express system is great for getting around Oahu, but even that system is has an overlap of busses catching up to the bus in front. Sometimes, the next bus is within 1 minute of the earlier bus.*

    Response: Platooning of buses occurs whenever there is frequent service on a route and traffic conditions and other factors such as deploying a wheelchair lift slows down the flow of buses on that alignment. With priority lanes and level boarding for disabled passengers being part of the Refined LPA, these delays will be reduced and platooning, while it will still occur will not happen as often.

25. *Has a scientific survey been conducted with tests to determine which areas need this system more than others? Has a trial test been conducted before implementation – where all the minute problems*

    Response: Data from household surveys conducted by OMPO and forecasts of future land use were used in establishing current travel patterns and where future service would be most effective.

26. *Some streets need to be expanded to accommodate the BRT System, have these been addressed?*

    Response: Yes, and they are discussed in the MIS/DEIS, SDEIS, and FEIS Chapter 2.

27. *Has the impact on neighboring streets and neighborhood being addressed – if the motorists decide to avoid BRT lanes on Dillingham, Kapiolani, Ala Moana, University, Kalakaua and Kuhio Avenues, etc. and travel through the adjacent neighborhoods? This is the same approach as a CTAP project where motorists have taken side streets when they spot a CTAP project in operation (police officers with radar guns checking the speed of the automobiles and residents holding up signs to slow down and drive carefully).*

    Response: Chapter 4 of the FEIS addresses traffic impacts for each of the streets mentioned. It acknowledges that with the Refined LPA there will be additional impacts to some streets along the alignment, but that overall there will be more benefits to not only transit riders but motorists as well. With regard to impacts to neighborhood streets, most neighborhood streets are discontinuous and would not be used as an alternate route by through traffic. In the event a neighborhood street is impacted, there are a variety of traffic calming measures that can be used to mitigate the impacts.

28. *Traffic gridlock, accidents and road rage will occur in the Primary Urban Center of Honolulu due to the narrowness of the roadways, unlike other larger metropolitan cities that can accommodate many more lanes of traffic than Oahu.*

    Response: It is not the conversion of lanes that will create the congestion, the congestion for motorists will be there without the BRT. When people are diverted onto public transit, congestion for motorists will be less with the Refined LPA than it would be with the No-Build or TSM Alternatives. Conditions will be much better for BRT riders with the Refined LPA since they will have a path clear of the congestion along much of the In-Town and Regional BRT routes.

29. *Educating the general public, more public input, testing and re-testing are vital and crucial elements to make the BRT System work. Without addressing these important input from the general public and specialists, the transit problems will never be solved. If this is the best, most efficient, most reliable, most affordable, most convenient transit system for Oahu, then everyone connected with this particular system should get out of their cars and commute utilizing the BRT System on a daily basis.*

    Response: Comment noted. No response required. The public involvement for this project began in 1998 and will continue throughout project development and implementation.

30. *I'm a citizen – a private citizen, member of the general public, and also, I live in Kapahulu, and I frequently use the bus system every day. In fact, I just came to the Convention Center from all the way down from the zoo area, catching the City Express B. It took 10 minutes. So that system really works, and I'm for that.*

    Response: We appreciate you attending the public hearing and that TheBus system is your preferred transportation method.

31. *I do not support the In-Town BART system – BRT system portion of the mass transit plan for Oahu. The areas outside the Primary Urban Center of Honolulu seriously need a transit system to get to Downtown and should be the first priority to ease their traffic congestion. They're the ones that always have those traffic accidents at least once a day.*

    Response: Comment noted. No response required because this is a statement of preference regarding supporting the Regional BRT and not the In-Town BRT.

32. *The In-Town BRT system has many unanswered questions that need to be addressed.*

    Response: Comment noted. No response required. The MIS/DEIS, SDEIS, and FEIS present the proposed project and associated impacts, benefits, and mitigations.

33. *One, are the sewer lines, water pipes, cable wires all upgraded? For example, remember the big, big water main break we had at the corner of McCully Street and Kapiolani? It took a full day before things could be rectified.*

    Response: Efforts to coordinate utility upgrades have been initiated and will continue during final design.

34. *Two, on shared curb lanes, like Bishop and Alakea, how would deliveries be made?*

    Response: BRT vehicles will not be operating in mixed traffic lanes on Bishop and Alakea Streets. BRT vehicles will be able to maneuver around parked delivery vehicles, just as existing buses do today.

35. *How would loading and unloading of passengers be handled?*

Response: Loading zones for commercial vehicles loading and unloading freight and passengers will be mitigated if the mitigation measures meet other livable community objectives and are the result of community-based planning. For example, as discussed in Section 4.4, some loading zone losses in Waikiki will be mitigated by creating turnout bays to allow passenger and freight loading during designated hours.

36. *Also, private rubbish pickup bins, they cannot maneuver within the parking lots, because it's too narrow, and they have to have the rubbish bins on the outside for pickup.*

Response: DTS will coordinate with building managers where such trash pick-up may need to be scheduled to avoid conflicts with the BRT. Moreover, the BRT vehicles will not be limited to operating in a fixed lane, but will be able to maneuver around obstacles such as trash dumpsters left in the street.

37. *Time schedule is also unrealistic. You say two, four, six, eight minutes. Unfortunately, if you catch the No. 8 shuttle to Ala Moana, it takes about four minutes for able-bodied people that are not handicapped, on wheelchairs, about four minutes just to depart. You really need four to ten minutes just to have someone on a wheelchair to get on the bus into their seats.*

Response: See response to comment # 22.

38. *Four, the impact on surrounding streets and neighborhoods should also be taken very seriously into consideration. For example – car system or a project with the police department, they find that people would bypass that street that's doing CIP projects, because they know they're going to get in trouble for speeding. They'll take alternate routes. That's what's going to happen.*

Response: Congestion overall will be less with the Refined LPA, so traffic infiltration into neighborhoods should not increase compared to the No-Build Alternative. Also, most neighborhood streets are discontinuous and would not be used as an alternate route by through traffic. In the event a neighborhood street is impacted, there are a variety of traffic calming measures that can be used to mitigate the impacts.

39. *Therefore, educating the general public, more public input, testing and re-testing before implementation is needed for a more efficient, more direct route, affordable, convenient transit system. If this is the best system, I suggest everyone connected with the BRT system use it daily to show it.*

Response: What you are asking for can only happen by implementing the BRT system.

40. *I still oppose the In-Town BRT portion of this mass transit system plan for the Primary Urban Center of Honolulu and the Island of Oahu presented in the Supplementary Draft Environmental Impact Statement*

Response: Comment noted. No response required. It is a statement of opposition to the In-Town BRT.

41. *This phase should wait till outside areas of Honolulu have their traffic congestion problems solved first before attempting to proceed with the In-Town route from Iwilei to Waikiki as proposed by City Director Soon & City Council Transportation Committee Chairperson Belnum.*

Response: Timing and implementation of the P.M. zipper lane and related Regional BRT improvements must be coordinated with the State DOT. SDOT wants to widen the H-1 Freeway in the areas where the P.M. zipper lane is proposed before installing the zipper lane. Since the Iwilei-Waikiki segment of the In-Town BRT can be a viable improvement to the transit system immediately, the City Council has elected to proceed with this segment as the first step in phasing of the BRT system.

42. *The water & sewer pipes in Honolulu have not been upgraded for years as countless number of water main pipes have broken within the last 3 years, due to wear and tear as heavier motor vehicles (trolleys, buses, limousines, trucks, SUV) use the roadways. These are the very streets that the City wish to start the Bus Rapid Transit System, with no mention of upgrading the roadways before commencing with this most ambitious project.*

Response: Efforts to coordinate utility upgrades have been initiated and will continue during final design.

43. *The first priority should encompass the areas outside of Urban Honolulu, as these are the areas most effected by traffic gridlock for Monday – Friday commuters. I feel that this is where the transit plans should be implemented first.*

Response: Timing and implementation of the P.M. zipper lane and related Regional BRT improvements must be coordinated with the State DOT. SDOT wants to widen the H-1 Freeway in the areas where the P.M. zipper lane is proposed before installing the zipper lane. Since the Iwilei-Waikiki segment of the In-Town BRT can be a viable improvement to the transit system immediately, the City Council has elected to proceed with this segment as the first step in phasing of the BRT system.

44. *The time intervals between trams are very unrealistic. My main mode of transportation is riding the City Buses to my destinations. I timed 60 – 65 able bodied persons getting off the bus No. 8 Shuttle Bus between Waikiki and Ala Moana (Shopping) Center. It took 3 – 4 minutes for passengers to get off and another 4 – 5 minutes for passengers to get on the bus to travel back to Waikiki with their bags and boxes of purchases, as well as families with baby strollers and toddlers. This does not take into account handicap passenger that need extra time. The time intervals as proposed by the City & County of Honolulu of 2, 4, 6, 8 minutes during rush hour are totally unrealistic. A wheelchair rider needs 5 – 10 minutes to settle into his or her seat from the curbside loading platform. If the rush hour intervals are followed, very few passengers will be able to board or get off the trams, as the next one is right behind it. The trams will cause gridlock and not be able to keep up with the time schedule*

Response: Boarding and alighting will be much easier with the In-Town BRT. Passengers will be able to get on-and-off from a platform that is at the same height as the bus floor (13 inches) so that there will be no steps to negotiate. Also passengers will be allowed to both enter and leave from any of 2 or 3 doors on the articulated buses. Passengers in wheelchair and scooters will be able to board and alight directly without the use of a lift. Passengers with baby strollers will also find it much easier to get on-and-off the bus. The net effect of these features is that dwell time at stops will be much less than today.

45. *The loading platforms for passengers in the middle of the streets will not be large enough to accommodate free movement for passengers with wheelchairs, baby stroller, walkers and folding shopping carts. In Japan I witnessed in certain areas that utilize boarding platforms in the middle of the streets crammed pack with students waiting for their buses – sometimes with barely room to spare. I shudder to think what may happen when the students are inattentive to the surrounding traffic while on the boarding platform. What happens when toddlers and children stray from their parents.*

    Response: The in-street platforms will be a minimum of 8-feet wide, and will be 10-feet wide where possible. In most cases they will be 160-feet long which is more that ample for two BRT buses to be letting passengers on-and off simulteneously. For the passenger loads forecast there will be ample room for people to wait, to get on-and-off the buses, and to circulate freely. The in-street platforms will have 3.5-feet high sturdy safety railings along the backside of the platform which is the side adjacent to traffic. Platforms such as those proposed have been in place on light rail and BRT systems all over the World.

46. *I also see problems of jaywalkers from young to old in certain parts of Honolulu – like Downtown, Chinatown, Kapiolani Boulevard and especially in Waikiki. People are rushing to catch a certain bus, in a hurry or inattentive to the surrounding traffic. These are problems facing Honolulu presently.*

    Response: Comment noted. In certain locations where jaywalking pose a safety hazard, measures will be taken to mitigate against it. For example, along S. King Street near Iolani Palace it is proposed to install a barrier, consisting of decorative bollards with chains connecting them, along the edge of the sidewalk next to the curb to discourage jaywalking.

47. *I'm sure that the best engineers, consultants and experienced personnel have spent countless hours of planning, preparing, cross examining to study the huge impact created by such a massive mass transit system, but public input is also crucial and vital, as these are the people who will use and be most affected by this project. Educating the public, testing and re-testing are important aspects not to be taken for granted.*

    Response: The community involvement process for the project has been on-going since 1998 and will continue throughout project development and implementation.

48. *I suggest that all those connected with the project and those in support utilize the In-Town BRT system. Riders want the most direct route and closest to their destinations, rather then spend time waiting at transit centers for their connecting tram. If the ridership is low, the fees will increase to a point many people will not be able to ride the BRT in the future. The heavy burden to maintain the BRT will fall on the tax payers of Hawaii.*

    Response: The concept behind the hub-and-spoke system is that passengers are provided greater choices of places they can travel to, and in some cases more directly and/or faster by passing through the transit centers and transfer points. Since the bus routes will be scheduled to arrive and depart at common intervals, the amount of waiting that will be required will be substantially less than in an un-coordinated system.

We will send you a CD-ROM copy of the Final Environmental Impact Statement (FEIS) under separate cover. If you require a printed copy of the FEIS, please contact Faith Miyamoto at 527-6976. We appreciate your interest in the project.

Sincerely,

Department of Transportation Services
City and County of Honolulu

Dear Ms. Soon,

There has been a lot of controversy opposing the Bus Rapid Transit program. However, there are more positive than negative.

Our community needs the benefits that this plan will bring us. The positive gains are shorter commutes, less auto traffic in the future, and in this time of economic uncertainty, more jobs and investment in the community.

I am in support of all efforts for this!

Thank you,

Kevin Nakamoto

Ms. Cheryl Soon, Director
Department of Transportation Services
City and County of Honolulu

Dear Ms. Soon,

I understand that there has been a lot of controversy opposing the Bus Rapid Transit program. I personally agree with what you are trying to accomplish and support you throughout.

With this plan it will solve majority of the major concerns the communities have right now as far as commute and traffic problems. It oot only will eliminate a 1.5 hour drive, but will bring additional jobs and money to Hawaii.

This is a perfect start to what will become a safer more abundant environment to the communities/businesses as well as tourism, with the growth of West Oahu. I know that a lot of planning, research and investment ha ve gone into this system and I commend you for this great effort.

I am in support of all your efforts,

Thank you,

Stacey K. Namihara

Honolulu, Hawaii 96817

Dear Ms. Namihara:

Subject: Primary Corridor Transportation Project

This is in response to your April 19, 2002 letter regarding comments on the Supplemental Draft Environmental Impact Statement (SDEIS).

1. *I understand that there has been a lot of controversy opposing the Bus Rapid Transit program. I personally agree with what you are trying to accomplish and support you throughout.*

   Response: Thank you for supporting the BRT project.

2. *With this plan it will solve majority of the major concerns the communitias have right now as fer as commute and treffic problems. It not only will eliminate a 1.5 hour drive, but will bring additional jobs and money to Hawaii.*

   Response: The BRT project is one component of the transportation system that will give commuters an eltemative to driving their cars and will result in additional jobs for project construction and operation.

3. *This is a perfect start to what will become a safer more abundant environment to the communities/businesses es well as tourism, with the growth of West Oahu. I know that a lot of planning, research and investment have gone into this system and I command you for this great effort.*

   Response: We appreciate your insight into the effort involved in planning a project of this magnitude.

We will send you a CD-ROM copy of the Final Environmental Impact Statement (FEIS) under separate cover. If you require a printed copy of the FEIS, please contact Faith Miyamoto at 527-6976. We appreciate your interest in the project.

Sincerely,

Cheryl D. Soon

Public Comment Form

Primary Corridor Transportation Project
Island of Oahu, Hawaii

The information you provide on this form will help the C & C of Honolulu and the Federal Transit Administration in the future planning of the Primary Corridor Transportation Project. We appreciate any comment you may have. Comments must be postmarked or received by November 6, 2000.

Name: Kim Nichols

Representing: Self

Address: 1346 Mokai st
Kailua, HI 96734
2686379

Please make any comments below:

(3-42) (3-55)

(1) PM 2.5 pollution maybe cumulatively the more dangerous pollutant. Please address this in the final EIS.

(2) Concerning the Kailua TSM + BRT (2-18) (2-21) programs (and perhaps the no-build) the nature of the neighborhood transit centers & route should be fleshed out more. Please include; where it might be; if there is a shelter how will it look; Kailua park development plan is HD specific; how will redevelopment occur (pg 3-14) how many feeder buses to be encouraged in Kailua!!

note: tourism is not to be encouraged in Kailua!!

5-42 not adequate

NEWS OF THE WEEK

AIR POLLUTION

Panel Backs EPA and 'Six Cities' Study

The Environmental Protection Agency (EPA) has won a major victory in the fierce battle over its tough new standard for particulate air pollution. Dealing a sharp blow to critics from industry, a nonpartisan research group has reevaluated key data that EPA relied upon to set that standard and has come out firmly behind the agency. Although all scientific debate isn't over, the reanalysis "puts to bed many of the concerns that were raised" 3 years ago, asserts John Vandenberg, an EPA environmental scientist.

At issue was EPA's 1997 decision to extend its regulation from particles 10 micrometers or less in size to those a mere 2.5 micrometers or less across ($PM_{2.5}$). EPA based its decision largely on two controversial studies that linked these tiny particles, released mainly by motor vehicles and power plants, to higher death rates.

In the Six Cities study, Harvard researchers examined the relation between levels of PM and sulfates (a component of fine particles) and death rates among more than 8000 people in six U.S. cities, following them for 14 to 16 years. The American Cancer Society (ACS) study followed over 500,000 people in 154 cities for 8 years. Both found a slight rise in death rates from heart and lung disease in cities with higher levels of $PM_{2.5}$, although the mechanism remained unclear. Based largely on the ACS death count, EPA calculated that the benefits of cutting $PM_{2.5}$ to 65 $\mu g/m^3$ over 24 hours would far outweigh the multibillion-dollar costs.

After EPA proposed the standard in 1996, the American Petroleum Institute (API) and other industry groups blasted the two studies. Some scientists also argued in congressional hearings that the apparent link might result from other air pollutants, a less healthy lifestyle in dirtier cities, or other confounding factors. Industry groups sued to block the new regulations. A federal court decided that the science was sound but threw out the rules based on legal arguments, which will be heard by the Supreme Court this fall. At the same time, skeptical industry groups and some lawmakers demanded that the Harvard researchers turn over their raw data. The researchers refused, saying that subjects' confidentiality would be breached.

To resolve the scientific and data-sharing issues, Harvard turned to the nonprofit Health Effects Institute (HEI) in Cambridge, Massachusetts. HEI assembled an expert panel to reanalyze both studies. In a report released last week, that panel concluded that the association between $PM_{2.5}$ and excess mortality is real. The team, led by statistician Daniel Krewski of the University of Ottawa, replicated the studies from original data sets and got essentially the same results: slightly higher death rates in the dirtier cities (see table). The team probed the data for more than 30 possible confounders, from altitude to health services, and tested the link "in nearly every possible manner" with various analytical techniques. The results still held.

Confirmation. Reanalysis yielded results almost identical to the original studies: a rise in death rate of 28% (in the Six Cities study) and 18% (in the ACS study) from cleanest to most polluted city.

Bill Frick, an attorney with the API, agrees that the reanalysis has "eliminated some of the uncertainty." Another major epidemiology study released by HEI that looked at daily PM levels and deaths in 90 cities has also cleared up earlier doubts (*Science*, 7 July, p. 22). But Frick argues that researchers still need to figure out which component of $PM_{2.5}$ causes harm and hence what problem needs to be fixed—power plants or diesel trucks, for instance. A slew of new federally funded research is addressing those questions and will feed into EPA's assessment of $PM_{2.5}$ science this fall. Until EPA decides whether to adjust the standard next year, it won't ask states to comply with the regulations.

Meanwhile, the legal scuffle over access to research data continues. In the wake of the controversy, Congress in 1998 passed a law, sponsored by Senator Richard Shelby (R–AL), mandating that federally funded researchers release their raw data if requested under the Freedom of Information Act. To the relief of scientific groups, the White House interpreted the law narrowly, limiting it to grants awarded after fall 1999 and only to data used to support regulations. The U.S. Chamber of Commerce threatened to sue to broaden that interpretation and began the process by filing requests last December for the Harvard data. So far, EPA has refused to turn over the data because the study predates the law. Keith Holman, an attorney with the Chamber of Commerce, says the group hasn't yet decided whether to litigate the case. –JOCELYN KAISER

ScienceScope

Money and Management The chair of the House Science Committee, James Sensenbrenner (R–WI), is worried that the National Science Foundation (NSF) might receive too much of the first despite a shortage of the second. However, his desire to correct the perceived imbalance has stalled a bill to reauthorize NSF's programs.

Last week the committee announced that it would mark up H.R. 4901, a 3-year blueprint for NSF to replace one that expires next month. It's the committee's fourth stab this year at a reauthorization bill (*Science*, 2 June, p. 1564). But moments before the panel convened, Sensenbrenner pulled the bill, citing his failure to reach an agreement on how to respond to "ethical lapses at NSF." Sensenbrenner is incensed at the agency's response to a government finding that Luther Williams, former head of education programs, improperly accepted outside honoraria, and he has written into the bill a tough new ethics program. But Democrats and NSF officials believe the language is unnecessary. Sensenbrenner also objects to proposed language that would double NSF's budget over 5 years, saying it would undermine his panel's credibility with appropriators.

Going to Sea Drawing on research showing that supertankers and other big ships are a major source of air pollution (*Science*, 31 October 1997, p. 823), two California-based environmental groups are pushing the Environmental Protection Agency (EPA) to clamp down on the problem. Lawyers with the Earthjustice Legal Defense Fund are negotiating with EPA to settle a lawsuit that calls for tougher controls on seagoing vessels, the Bluewater Network said last week.

In a 17 July report (www.bluewaternetwork.org), the network notes that big ships typically use high-sulfur fuels that produce prodigious amounts of sulfur and nitrogen oxides and particulate matter. The lawsuit, filed last February on the network's behalf, challenges EPA plans to regulate the emissions through an international agreement. The groups say EPA's plan is unenforceable and would allow emissions to increase by 13% by 2030. EPA officials, however, predict that tougher U.S. rules would cause captains to sail to other ports to refuel.

November 13, 2002

Ms. Kim Nichols
1246 Mowai Street
Kailua, Hawaii 96734

Dear Ms. Nichols:

Subject: Primary Corridor Transportation Project

This is in response to your October 12, 2000 Public Hearing comment form and oral testimony at the October 12, 2000 Public Hearing regarding comments on the Major Investment Study/Draft Environmental Imapct Statement (MIS/DEIS).

1. *$PM_{2.5}$ pollution maybe cumulatively the more dangerous pollutant. Please address this in the final EIS.*

   Response: All air pollutants are described in Section 3.5 of the FEIS.

2. *Concerning the Kailua TSM and BRT programs (2-18) (2-11) (and perhaps the no-build) the nature of the neighborhood transit center, please flesh it out more. Please include: where it might be; if there is a shelter how will it be; Kootaupoko development plan is no growth; how will redevelopment occur; how many feeder buses. Note: Tourism is not to be encouraged in Kailuall*

   Response: Community-based planning will be used for identifying the site and design of the Kailua/Kaneohe transit center(s). The transit center(s) in Kailua/Kaneohe will be planned and designed in accordance with the Koolaupoko Sustainable Communities plan.

3. *I'd like to make some comments about things that are not included in the DEIS. And one of them is in the air quality concerns in chapter – or Section Three. The ten micron end below particle – particulate matter is of interest now. It is a big deal. And therefore, I hope that will be included in the Final EIS.*

   Response: The project area and State of Hawaii is in compliance with the National Ambient Air Quality Standards for PM-10.

4. *Along those lines, it doesn't seem that these hybrid vehicles or the electric or hybrid vehicles are included in any of the No-Build program or the TSM program, and they could easily be phased in and, thereby, the decrease in air pollution also be included in those things. Please include them, if you can, in the Final EIS, and there in the financial benefits and environmental benefits.*

   Response: For purposes of the EIS, the transit technology provided in the No-Build Alternative and the TSM Alternative are minibuses and 40-foot standard and articulated buses. While minibuses could use alternative fuel sources, including electric batteries or propane, standard and articulated buses, particularly the ones used on long-haul routes, would need to be diesel or hybrid diesel/electric because of the mountainous terrain and limited range of battery-powered vehicles. However, the EIS does not preclude alternative technologies from being considered in the future.

5. *Finally, in Kailua – and I'm representing myself. In page 218 in – they talk about the neighborhood transit centers, and I just hope that that can be fleshed out a little bit in the final, especially where they are going to be.*

   Response: Planning and design of the Kailua/Kaneohe transit centers are proceeding as separate projects from the BRT and will include community input.

6. *If there is lane changes, how does that – it says – talks about redevelopment around these centers in Section 714.*

   Response: Along with serving existing transit needs, one of the other goals of the PCTP is to help shape growth in the corridor. The reason why there is development potential around transit centers is due to the high pedestrian traffic in and around these centers.

7. *And how is that going to affect the area, especially in the Koolaupoko Development Plan, if it is in agreement with the Koolaupoko Development Plan?*

   Response: The proposed project would not affect the objectives and implementation of the adopted Koolaupoko Sustainable Community Plan.

8. *And, you know, how many feeder buses will there be? Is there going to be more buses? And can these buses be electric? Are all the opportunity costs going to be lost? I don't think so, if we can include those electric buses in the other sections.*

   Response: More feeder buses, both in terms of routes and frequency of service, are proposed. Alternative propulsion systems are being studied.

We will send you a CD-ROM copy of the Final Environmental Impact Statement (FEIS) under separate cover. If you require a printed copy of the FEIS, please contact Faith Miyamoto at 527-6976. We appreciate your interest in the project.

Sincerely,

Cheryl D. Soon

November 13, 2002

Mr. Bill Pelzer
1420 Victoria Street, #1304
Honolulu, Hawaii 96822

Dear Mr. Pelzer:

Subject: Primary Corridor Transportation Project

This is in response to your oral testimony at the April 20, 2002 public hearing regarding comments on the Supplemental Draft Environmental Impact Statement (MIS/DEIS).

1. *I'm a resident in the state since 1965, and I wish to write in summary opposition to the subject project, to which I will come immediately.*

   Response: Comment noted.

2. *I'd like to thank Midweek magazine for calling my attention to something that, in spite of my long residence and in spite of public hearings, has never come to my attention before. And I just never knew anything like this ever existed. And that doesn't stand too well to speak of for the media generally in Oahu.*

   Response: The community involvement for the project has been active since 1998 and will continue throughout design and implementation.

3. *And for lack of investigative reporting, one of the big information we do not have at our disposal to consider today is what politicians and their contributors stand to profit from this project, this billion dollar project, this thousand million dollar project.*

   Response: Comment noted.

4. *According to the plan, of course, by experience, we know that it will cost at least twice as much before they complete it. Then it's going to take about $4,000 for every man, woman and child of the – the population on this island. About $12,000 for every three-person family.*

   Response: Comment noted.

5. *And let no one tell us that somebody else is going to pay for this, because no matter, whether this money comes from the City or from the State or from the Federal, it's our tax money.*

   Response: Comment noted. Chapter 6 discusses the financial aspects of the project.

6. *Lastly, on the project itself, I see that the project was projected for 2025. Our roads are already moving parking lots. 2025, a quarter century from now. And every two weeks, a shipload of new cars come in, and the parking lots in the staging areas on Sand Island are filled with thousands of cars that are not on the road yet. In another quarter century, there will be no road space available for buses or for cars or anything.*

   Response: The planning horizon is consistent with Federal Transit Administration guidelines.

7. *So what are the solutions? Well, I feel there are two things we need. One, we need a limitation of the cars, number of cars, on the island, a system by which, for every new car that comes aboard, we have to have certainty that an existing vehicle becomes permanently out of circulation to make space for it. There is no other way.*

   Response: It is beyond the project scope to analyze a system that prohibits new cars on the road without an existing vehicle being permanantly removed from the roadways.

8. *And as for public transportation, there is no other way, but to get it off the road, to get a central corridor based on a monorail-type system. I know this is going to cost money. But since monorails do not have to stop for traffic and for red lights, every seat on the monorail easily covers about, let's say, a couple of dozen or so seats that exist on buses.*

   Response: A grade separated system was rejected at the outset by the public and City Council as being too costly and unsightly. Selection of a Locally Preferred Alternative has already been made.

We will send you a CD-ROM copy of the Final Environmental Impact Statement (FEIS) under separate cover. If you require a printed copy of the FEIS, please contact Faith Miyamoto at 527-6976. We appreciate your interest in the project.

Sincerely,

Cheryl D. Soon

October 12, 2000

Sheryl Soon, Director
Dept. of Transportation
City & County of Honolulu

Dear Ms. Soon,

This is to express my opposition to the MIS-DEIS for the Primary Corridor Transportation Project.

I want first, however, to express my appreciation to you and to the City and County of Honolulu for the effort in attempting to help citizens coming to Honolulu from the west end of Oahu. I want also to express my appreciation for the effort to inform the public of the draft plan and to engage the community in a dialogue regarding transportation matters.

My opposition to the plan involves several issues:

1. the need for dedicated lanes within urban Honolulu is not demonstrated. Frankly, the current use of buses within urban Honolulu is satisfactory and flexible. Dedicated lanes will not eliminate the need for local buses in the remaining lanes since express stops will be relatively far apart.

2. the use of Kapiolani Boulevard for two dedicated lanes, with local buses also using the Kapiolani corridor will make it virtually impossible to get automobiles up and down Kapiolani Boulevard and will impact negatively on businesses on the Boulevard.

3. the current underuse of the articulated express buses along Kapiolani Boulevard does not bode well for the future occupancy of a rapid transit system. I have requested, but have not received from the Department of Transportation, ridership figures for individual express buses that the city and county is currently using.

4. The MIS-DEIS overstates the anticipated ridership and understates the anticipated cost of the system.

5. the proposed transit plan will negatively impact traffic going north/south or south/north. Since traffic signals will be synchronized to allow buses/trains to change the traffic signals, the traffic heading towards the mountains or ocean - already a significant problem during rush hours - will be adversely impacted.

In summary, the proposed system, using dedicated mass transit lanes, is not necessary, will create major problems for automobile traffic within urban Honolulu and will fail any reasonable test for cost benefit analysis.

Sincerely,

Richard Port

October 17, 2000

Cheryl Soon, Director
Dept. of Transportation
City & County of Honolulu
711 Kapiolani Blvd. Suite 1200
Honolulu, HI 96813

Testimony in Opposition to the Major Investment Study-Draft Environmental Impact Statement

Dear Ms. Soon,

Before expressing my opposition to the MIS-DEIS for the Primary Corridor Transportation Project, I want first to express my appreciation to you and to the City and County of Honolulu for the effort in attempting to help citizens coming to Honolulu from the west end (Ewa, Mililani, etc.) of Oahu. I want also to express my appreciation for the effort to inform the public of the draft plan and to engage the community in a dialogue regarding transportation matters.

My opposition to the plan involves several issues:

1. the need for dedicated lanes within urban Honolulu has not been demonstrated. Frankly, the current use of buses within urban Honolulu, is both satisfactory and flexible. Since express stops will be relatively far apart (1/4 to 1/2 mile), dedicated lanes will not eliminate the need for local buses using the remaining undedicated lanes.

2. the use of Kapiolani Boulevard for two dedicated lanes, with local buses also using the Kapiolani corridor will make it virtually impossible to get automobiles up and down Kapiolani Boulevard and will impact negatively on businesses on the Boulevard. The MIS-DEIS needs to address the current automobile capacity of Kapiolani Boulevard and the projected reduction in automobile capacity after the dedicated lanes are built and local buses are added. Specifically, what happens to those who must use their automobiles (salespersons, delivery servicepersons) in the downtown Honolulu corridor during the day.

3. the current underuse of the articulated express buses along Kapiolani Boulevard does not bode well for the future occupancy of a rapid transit system. I have requested, but have not received from the Department of Transportation, ridership figures for individual express buses that the city and county is currently using.

4. the current bus system, using articulated buses, is capable of expanding ridership exponentially without dedicated/restricted lanes.

5. the MIS-DEIS overstates the anticipated ridership and understates the anticipated cost of the system. According to the city's own figures, total bus ridership is now the lowest

since 1979 despite an increase in the number of buses from 350 to 525 during this time and an increase in population. All of the ten U.S. cities that are the most intensive users of public transportation, including Honolulu, have experienced significant per capita ridership declines in the 1980-1998 period. Eight of the ten have rail lines, and still they decline.

6. the proposed transit plan will negatively impact traffic going north/south or south/north. Since traffic signals will be synchronized to allow buses/trains to change the traffic signals going east/west, the traffic heading towards the mountains or ocean - already a significant problem during rush hours - will be adversely impacted.

7. the MIS-DEIS does not take into account the changing work habits anticipated over the next 25 years. Specifically, more people are working out of their homes and are expected to spend fewer hours at their offices.

In summary, the proposed system, using dedicated mass transit lanes, is not necessary, will create major problems for automobile traffic within urban Honolulu and will fail any reasonable test for cost benefit analysis.

Sincerely,

Richard Port

November 14, 2000

RECEIVED
Nov 14 10 09 AM '00
HONOLULU, HAWAII
CITY CLERK

Duke Bainum, Chair
Committee on Transportation
Honolulu City Council
530 South King Street
Honolulu, HI 96813

Testimony in Opposition to Resolution 00-249 - Selection of a Locally Preferred Alternative for the Primary Corridor Transportation Project

Dear Council Member Bainum:

I have attached my testimony to Ms. Cheryl Soon dated October 17, 2000 which provides pertinent information and concerns regarding the draft Environmental Impact Statement for this mass transit project.

It is surprising to me that this committee and the Honolulu City Council would consider moving to support this project without analyzing my concerns and the concerns of hundreds of our citizens who have responded to the draft Environmental Impact Statement. Why the rush? Why aren't we waiting for a new draft of the EIS which would attempt to respond to the concerns raised by our community, including neighborhood boards, business groups and individual citizens?

The urban core portion of the plan, with the proposed dedicated lanes, is an attempt to enforce social engineering on our community. Specifically, it appears to force citizens out of their cars, even those who must use their cars for business or personal use. Even those senior citizens who currently use our bus system will be impacted because they will have to walk long distances between the new transit stops, or wait to transfer to local buses which will have to move up and down the same streets.

The dedicated lanes within the urban core are unnecessary. Our traffic problems do not involve the area from downtown Honolulu to Waikiki or the University. Our traffic problems involve getting people from Mililani and Ewa and the Leeward coast to urban Honolulu. That is the problem that the City Council needs to address.

I urge your committee to obtain a revised EIS, responsive to citizens concerns before moving this matter to the full council.

Sincerely,

Richard Port

CHERYL D. SOON
DIRECTOR

GEORGE "KEOKI" MIYAMOTO
DEPUTY DIRECTOR

TPD10/00-05263R

November 13, 2002

Mr. Richard J. Port
1600 Ala Moana Boulevard, #3100
Honolulu, Hawaii 96815

Dear Mr. Port:

Subject: Primary Corridor Transportation Project

This is a combined response to your comments on the Supplemental Draft Environmental Impact Statement (MIS/DEIS) and Supplemental Draft Environmental Impact Statement (SDEIS). We are responding in two parts. Part A responds to your MIS/DEIS comments and Part B responds to your SDEIS Comments.

Part A – MIS/DEIS Comments

1. *I would like to ask, however, that the City immediately release its current ridership for each of the bus routes and each of the buses and make that available. I realize that it's about paper but at least a copy somewhere where it can be looked at.*

   Response: Available ridership data for the current bus system was sent to you. Also, the FTA National Transit Database has ridership information on-line. The FTA's web address is www.fta.dot.gov.

2. *But the problem I have with BRT is the problem that we have in traffic is not so much from downtown to the University or downtown to Waikiki. I can drive faster from downtown to Waikiki or University faster than I go from the ocean to the H-1 on any of the four areas. I don't have time to explain but basically it takes longer to go North/South.*

   Response: There is no question that it is slower traveling mauka/makai than it is traveling Ewa/Koko Head whether you are in a bus or an auto. The PCTP focuses on east/west routing because this is the dominant direction of travel and where there are a sufficient number of buses to warrant conversion of lanes for priority use by buses. During planning for BRT buses and the hub-and-spoke conversion in the PUC, opportunities for bus priority treatments on mauka/makai streets will be identified.

3. *This plan, BRT now, calls for buses to be able to change the lights to green going East/West which is only going to back up the traffic North/South and make it worse than it is.*

   Response: Traffic impacts are addressed in Chapter 4 of the FEIS. Traffic signals will not be pre-empted by the BRT. At certain intersections, BRT vehicles approaching a green signal will activate a 4 to 10-second extension of the green indication for that cycle only. BRT vehicles stopped at a red signal will move concurrently with the through traffic in the same direction, unless

the BRT vehicle must turn or change lanes, in which case it will be given a 4 to 10-second green signal in advance of the general purpose traffic lanes. All traffic signal extensions and advance indications will be timed in the field during actual operation to minimize adverse effects on general traffic flow.

4. *Kapiolani Corridor, I don't understand how you're going to take away the lanes there and have reasonable traffic on Kapiolani Boulevard. And I don't understand why people would want to come from Manoa or Mekiki all the way down to Kapiolani. If you're going to do this and I'm against doing it. But if you're going to do BRT, I would think you'd be using King Street and Beretanie instead of Kapiolani. People would not have to go as far.*

   Response: There would continue to be very frequent bus service along King and Beretania Streets with the Refined LPA. The reason the In-Town BRT alignment is proposed on Kapiolani Boulevard is to serve major generators such as Ala Moana Center and the Convention Center, as well as to help shape growth at the large vacant parcels and underutilized properties in Kakaako and Ala Moana.

5. *But I don't believe those cost figures. Maybe it's a little bit like the big dig in Boston. For those of you who are familiar those were supposedly inspected cost by Congress. But frankly were never right in the beginning. And I don't believe these cost figures are right.*

   Response: Comment noted.

6. *Also, it doesn't take into account...If we're talking about 2025, really, more people are working out of their homes and will continue to increase the number of people... Just last night I sent an e-mail from here to Belfast from my house and came back in the morning to me. I had the response already.*

   Response: The concept of telecommuting has been discussed for decades and yet has had no noticeable impact on travel demand to date. Even if telecommuting increases significantly in the future it would not eliminate the need for the Refined LPA. Instead it would help flatten the peaks.

7. *This is to express my opposition to the MIS/DEIS for the Primary Corridor Transportation Project.*

   Response: Comment noted. It states the commenter's preference for an LPA.

8. *First, the need for dedicated lanes within urban Honolulu has not been demonstrated. Frankly, the current use of buses within urban Honolulu is satisfactory and very flexible. Dedicated lanes will not eliminate the need for local buses in the remaining lanes since we've been told express stops will be one-quarter to one-half mile apart. Meaning, there will have to be local buses on additional lanes.*

   Response: The Refined LPA is comprised of a mix of exclusive BRT, semi-exclusive BRT and mixed-use lanes. The BRT system strives to strike a balance between transit speed and impacts to general traffic. In segments where it was judged that roadway capacity was needed for general traffic and the BRT operation would not be significantly affected, exclusive lanes were replaced by either semi-exclusive or mixed-flow operation. In areas of high BRT ridership volumes that would be effected by congestion, exclusive transit lanes were retained such as on Dillingham Boulevard and on Hotel Street.

The In-Town BRT is only one element of the transit plan for the Primary Urban Center. The plan also includes conversion of the bus system to a hub-and –spoke network will consist of new local circulator routes, as well as continuation of many existing line haul and express routes. All existing bus routes will be evaluated for re-routing to intersect with the BRT at or near the proposed BRT stops. Some local service will also be retained on streets where the BRT will operate, so that riders will have an option of higher speed, limited stop service, or slower speed service with more frequent stops. The goal is to have an integrated network of transit services that provide convenient and cost-effective options for potential users.

9. *Two, the use of Kapiolani Boulevard for two dedicated lanes, with local buses also using the Kapiolani corridor, will make it virtually impossible to get automobiles up and down Kapiolani Boulevard and will impact negatively on businesses on the boulevard. The MIS/DEIS needs to address the current automobile capacity of Kapiolani Boulevard and the projected automobile capacity after the dedicated lanes are built and local buses are added.*

   Response: Year 2025 intersection operations based on the Oahu Regional Transportation Plan traffic forecasts are projected to operate within capacity with the exception of the Kapiolani/Atkinson intersection. This intersection is influenced by congestion at the Kapiolani/Kalakaua intersection, which is projected to be congested, with or without the BRT. These analyses include the effect of local buses which will be decreased in number when the BRT is fully implemented.

10. *Number three, the current underuse of the articulated express buses along Kapiolani Boulevard does not bode well for the future occupancy of a rapid transit system. I have requested, but have not received from the Department of Transportation, ridership figures for the individual express buses that the City and County is currently using. The current bus system using articulated buses can increase ridership exponentially without dedicated restricted lanes. I question the statement in the media presentation that we cannot increase the people-carrying capacity of our articulated buses.*

    Response: Ridership on the existing CityExpress! routes is only partially indicative of the ridership potential of the In-Town BRT. The In-Town BRT will operate at much closer intervals, at faster speeds and greater reliability due to priority lanes, raised platforms, loading from multiple doors with pre-payment of fares, and signal priority at selected locations.

11. *Number four, the MIS/DEIS overstates the anticipated ridership and understates the anticipated cost of the system.*

    Response: Comment noted.

12. *And finally, five, the proposed transit plan will negatively impact traffic going north/south or south/north. Since traffic signals will be synchronized to allow buses/trains to change the traffic signals going east and west, the traffic heading towards the mountains or the ocean, already a significant problem during rush hours, will be adversely impacted.*

    Response: Traffic signals will not be pre-empted by the BRT. At certain intersections, BRT vehicles approaching a green signal will activate a 4 to 10-second extension of the green indication for that cycle only. BRT vehicles stopped at a red signal will move concurrently with the through traffic in the same direction, unless the BRT vehicle must turn or change lanes, in which case it will be given a 4 to 10-second green signal in advance of the general purpose traffic lanes.

All traffic signal extensions and advance indications will be timed in the field during actual operation to minimize adverse effects on general traffic flow.

13. *And in summary, the proposed system, using dedicated mass transit lanes, is not necessary, will create major problems for automobile traffic within urban Honolulu and will fail any reasonable test for cost benefit analysis.*

    Response: The Refined LPA proposed reallocation of general-purpose lanes for transit is the only reasonable way to achieve greater person carrying capacity in the future. The Refined LPA Alternative will provide an attractive, dependable, affordable alternative to the private automobile.

    Using cost-effectiveness measures prescribed by the FTA, the Refined LPA scores much better than the No-Build and TSM Alternatives.

14. *This is to express my opposition to the MIS/DEIS for the Primary Corridor Transportation Project.*

    Response: Comment noted. It states the commenter's preference for an LPA.

15. *The need for dedicated lanes within urban Honolulu is not demonstrated. Frankly, the current use of buses within urban Honolulu is satisfactory and flexible. Dedicated lanes will not eliminate the need for local buses in the remaining lanes since express stops will be relatively far apart.*

    Response: See response to comment #8.

16. *The use of Kapiolani Boulevard for two dedicated lanes, with local buses also using the Kapiolani corridor will make it virtually impossible to get automobiles up and down Kapiolani Boulevard and will impact negatively on businesses on the Boulevard.*

    Response: See response to comment #9.

17. *The current underuse of the articulated express buses along Kapiolani Boulevard does not bode well for the future occupancy of a rapid transit system. I have requested, but have not received from the Department of Transportation, ridership figures for individual express buses that the City & County is currently using.*

    Response: See response to comment #10.

18. *The MIS/DEIS overstates the anticipated ridership and understates the anticipated cost of the system.*

    Response: Comment noted.

19. *The proposed transit plan will negatively impact traffic going north/south or south/north. Since traffic signals will be synchronized to allow buses/trains to change the traffic signals, the traffic heading towards the mountains or ocean – already a significant problem during rush hours – will be adversely impacted.*

    Response: See response to comment #12.

20. *In summary, the proposed system, using dedicated mass transit lanes, is not necessary, will create major problems for automobile traffic within urban Honolulu, and will fail any reasonable test for cost benefit analysis.*

    Response: See response to comment #13.

21. *Before expressing my opposition to the MIS/DEIS for the Primary Corridor Transportation Project, I want first to express my appreciation to you and to the City and County of Honolulu for the effort in attempting to help citizens coming to Honolulu from the west end (Ewa, Mililani, etc.) of Oahu. My opposition to the plan involves several issues.*

    Response: Comment noted. It states the commenter's opinions.

22. *The need for dedicated lanes within urban Honolulu has not been demonstrated. Frankly, the current use of buses within urban Honolulu, is both satisfactory and flexible. Since express stops will be relatively far apart (1/4 to 1/2 mile), dedicated lanes will not eliminate the need for local buses using the remaining undedicated lanes.*

    Response: See response to comment #8.

23. *The use of Kapiolani Boulevard for two dedicated lanes, with local buses also using the Kapiolani corridor will make it virtually impossible to get automobiles up and down Kapiolani Boulevard and will impact negatively on businesses on the Boulevard. The MIS/DEIS needs to address the current automobile capacity of Kapiolani Boulevard and the projected reduction in automobile capacity after the dedicated lanes are built and local buses are added. Specifically, what happens to those who must use their automobiles (salespersons, delivery servicepersons) in the downtown Honolulu corridor during the day.*

    Response: See response to comment #9.

24. *The current underuse of the articulated express buses along Kapiolani Boulevard does not bode well for the future occupancy of a rapid transit system. I have requested, but have not received from the Department of Transportation, ridership figures for individual express buses that the City and County is currently using.*

    Response: See response to comment #10.

25. *The current bus system, using articulated buses, is capable of expanding ridership exponentially without dedicated/restricted lanes.*

    Response: Although the existing bus system has the capacity to expand, the buses would have to continue to operate in mixed traffic. The Refined LPA provides a mix of exclusive BRT, semi-exclusive BRT and mixed-use lanes. The BRT system will attract new riders by providing a faster more reliable service by offering limited stop operations in bus priority lanes.

26. *The MIS/DEIS overstates the anticipated ridership and understates the anticipated cost of the system. According to the City's own figures, total bus ridership is now the lowest since 1979 despite an increase in the number of buses from 350 to 525 during this time and an increase in*

population. All of the ten U.S. cities that are the most intensive users of public transportation, including Honolulu, have experienced significant per capita ridership declines in the 1980-1998 period. Eight of the ten have rail lines, and still they decline.

Response: The travel forecasts for the Primary Corridor Transportation Project were developed using travel forecasting procedures developed for the Oahu Metropolitan Forecasting Model Development Project. These procedures simulate the choices made by residents, business, and visitors regarding the nature, number, mode, time-of-day, and geographic orientation of trips that they make on a typical weekday. The procedures have been developed with data obtained in extensive surveys of Oahu households, transit riders, and air passengers. Future year forecasts reflect the population and employment forecasts that have been prepared by DBEDT and the zonal allocations that have been prepared by the City Department of Planning and Permitting.

The travel forecasting methodology and resulting travel forecasts used for the Primary Corridor Transportation Project are described in the FEIS Chapter 4. The transportation plan for Oahu is described in the Oahu Metropolitan Planning Organization's report, Transportation for Oahu Plan TOP 2025.

Overall transit ridership is growing at a faster rate than other modes of transportation. According to the American Public Transportation Administration, public transit ridership has grown for six consecutive years, reaching new record levels. This growth in transit ridership outpaced growth of the population and highway use.

Honolulu's specific experience shows that ridership responds to the implementation of faster, more convenient service. CityExpress! and CountryExpress! routes were created to provide limited-stop express service along Honolulu's busiest corridors. Ridership along these three routes has grown dramatically, and comments from the public demonstrate the appeal of faster bus service.

Other transit systems in major U.S. cities have proven that rapid bus systems attract greater ridership. For example, implementation of the Metro Rapid BRT system in Los Angeles resulted in increases in ridership of 33% and 26% along the two BRT corridors.

Furthermore, any decision to move forward with transit improvements cannot be based solely on historical ridership statistics. Future plans for transit are made in anticipation of critical issues in the coming years and decades, including: increasing population growth, increasing need for alternative modes of transportation among various segments of the population, growing concern about air pollution caused by automobiles, increasing costs to consumers of parking and gasoline, and limited land and budget availability that prevents further expansion of roads. To address these impending issues, the City has chosen to move forward to make transit a more appealing and effective choice for the future.

27. *The proposed transit plan will negatively impact traffic going north/south or south/north. Since traffic signals will be synchronized to allow buses/trains to change the traffic signals, the traffic heading towards the mountains or ocean – already a significant problem during rush hours – will be adversely impacted.*

    Response: See response to comment #12.

28. *The MIS/DEIS does not take into account the changing work habits anticipated over the next 25 years. Specifically, more people are working out of their homes and are expected to spend fewer hours at their offices.*

    Response: The concept of telecommuting has been discussed for decades and yet has had no noticeable impact on travel demand to date. Even if telecommuting increases significantly in the future it would not eliminate the need for the BRT. Instead it would help flatten the peaks.

29. *In summary, the proposed system, using dedicated mass transit lanes, is not necessary, will create major problems for automobile traffic within urban Honolulu, and will fail any reasonable test for cost benefit analysis.*

    Response: See response to comment #13.

30. *It is surprising to me that this committee and the Honolulu City Council would consider moving to support this project without analyzing my concerns and the concerns of hundreds of our citizens who have responded to the draft Environmental Impact Statement. Why the rush? Why aren't we waiting for a new draft of the EIS which would attempt to respond to the concerns raised by our community, including neighborhood boards, business groups and individual citizens?*

    Response: The City Council has followed procedures in accordance with NEPA and FTA guidelines. Selection of the Locally Preferred Alternative occurred based on the MIS/DEIS and input received from public oral and written testimony. Responses to comments received on the MIS/DEIS are contained in the FEIS.

31. *The urban core portion of the plan, with the proposed dedicated lanes, is an attempt to enforce social engineering on our community. Specifically, it appears to force citizens out of their cars, even those who must use their cars for business or personal use. Even those senior citizens who currently use our bus system will be impacted because they will have to walk long distances between the new transit stops, or wait to transfer to local buses which will have to move up and down the same streets.*

    Response: Congestion is forecast without the BRT. The BRT rather than forcing anyone to use it tries to attract users by offering an alternative that can move independant of the congested lanes. When people are diverted onto public transit, congestion for motorists will be less with the Refined LPA than it would be with the No-Build or TSM Alternatives. Conditions will be much better for BRT riders with the Refined LPA since they will have a path clear of the congestion along much of the In-Town and Regional BRT routes. Senior citizens will not be giving up anything, they will be gaining the choice of using the BRT or continuing to use local buses.

32. *The dedicated lanes within the urban core are unnecessary. Our traffic problems do not involve the area from downtown Honolulu to Waikiki or the University. Our traffic problems involve getting people from Mililani and Ewa and the Leeward coast to urban Honolulu. That is the problem that the City Council needs to address.*

    Response: Traffic congestion exists in town as well as along the H-1 and H-2 corridors, and is projected to only get worse in the future. That is why there is an In-Town BRT as well as a Regional BRT component in the Refined LPA.

33. *I urge your committee to obtain a revised EIS, responsive to citizens concerns before moving this matter to the full council.*

    Response: See response to comment #30.

34. *Finally, you opposed the In-Town BRT as the Locally Preferred Alternative (LPA) at the November 14, 2000 Special Transportation Committee Meeting.*

    Response: Comment noted. It states your preference for an LPA.

Part B – SDEIS Comments

35. *I oppose the City's current plan for BRT.*

    Response: Comment noted. Thank you for attending the public hearing.

36. *To be fair, the City has a very good bus system. It has been getting better with the introduction of articulated buses, and it can be improved. I would be happy to provide the City with some ideas, although I doubt that they would be accepted.*

    Response: Comment noted.

37. *The bad news is the BRT plan is too expensive. Property taxes will be increased significantly. To believe otherwise, I have a mountain at the end of Waikiki that I'm putting up for sale tomorrow.*

    Response: Comment noted.

38. *Furthermore, the plan is based on false philosophical principles of social engineering, that people will use buses or trams and get out of their cars. I was fascinated by the comment that was made by the previous speaker on the early – and I attended some of those meetings – "It's going to make it easier to drive. Win-win." In fact, I was told by the head of the Transportation Department that, in fact, this was not social engineering. But in the last six months or a year, it's come out. So what we were told originally is not true. It is social engineering. It is to force people out of their cars.*

    Response: Comment noted. The MIS/DEIS, SDEIS, and FEIS Chapter 1 state the purposes of the Primary Corridor Transportation Project as:

    1. Increase the people-carrying capacity of the transportation system in the primary transportation corridor by providing attractive alternatives to the private automobile.
    2. Support desired development patterns.
    3. Improve the transportation linkage between Kapolei, which is envisioned to be the "Secondary Urban Center" of Oahu, and Honolulu's Urban Core.
    4. Improve the transportation linkages between communities in the Primary Urban Center (PUC) to increase the attractiveness of in-town living.

39. *About 15 years ago, the public, you and I, as property taxpayers, paid for the improvements in Kakaako. We were told, at that time, that the purpose for the improvements in Kakaako was that low income and middle income housing would be built there so that the workers in Waikiki would be close to their jobs, they wouldn't have to use – come long distances with the bus system. It was a lie. Now that was a State lie. But what we have here is a system that is being prepared for us that is going to be very, very expensive.*

Response: Comment noted. No response required.

40. *And, in summary, let me say this. It's a very unusual thing to see a former chairman of the Democratic Party, a progressive one, some use the L word, agreeing with the Libertarian Party chair, who couldn't be farther apart. But we agree on this. This is the wrong plan.*

Response: Comment noted. No response required.

We will send you a CD-ROM copy of the Final Environmental Impact Statement (FEIS) under separate cover. If you require a printed copy of the FEIS, please contact Faith Miyamoto at 527-6976. We appreciate your interest in the project.

Sincerely,

CHERYL D. SOON

Dear Mr. Robinson:

Subject: Primary Corridor Transportation Project

This responds to your October 31, 2000 phone conversation with the City and County of Honolulu Department of Transportation Services regarding your comment on the Major Investment Study/Draft Environmental Impact Statement (MIS/DEIS).

An elevated rail or highway would avoid condemnation of the property along Dillingham Blvd. Concerned about the TV news report last night where a lady being interviewed steted the BRT proposal may condemn her business on Dillingham.

Response: No businesses are proposed to be condemned along Dillingham Boulevard with any of the Alternatives.

We will send you a CD-ROM copy of the Final Environmental Impact Statement (FEIS) under separate cover. If you require a printed copy of the FEIS, please contact Faith Miyamoto at 527-6976. We appreciate your interest in the project.

Sincerely,

RECEIVED
Oct 20 3 24 PM '00
CITY CLERK
HONOLULU, HAWAII

O'ahu Transit Services Inc

Dear Members of Transportation Committee,

I am writing to give feedback regarding the new hub-and-spoke bus system, which started on Sept. 1. In its present form, the system has many negative aspects, in my opinion. First of all, why do the buses travel on our side street (Lumiauau) when they could easily stay on Kamehameha Hwy and turn right into Waikele via Lumiaina, a much wider four lane thoroughfare? Why must the buses come every 30 minutes starting from 5 a.m. and ending at 11:15 p.m. every day, including weekends? This is not downtown Honolulu!

Monday through Friday, most of our residents go to sleep early in order to get up early, yet loud, almost empty buses travel Lumiauau until 11:15 p.m. Furthermore, most of our residents enjoy "sleeping in" on Saturday morning, yet loud, nearly empty buses travel Lumiauau as early as 5 a.m. This is unacceptable!

Please don't force me to go door to door in Waikele with a petition demanding the City and County of Honolulu modify the hub-and-spoke system such that Lumiauau be returned to a bus free zone. Your prompt response to this matter is greatly appreciated.

Most Sincerely,

Patrick Rorie (586-3657)

November 13, 2002

Mr. Patrick Rorie
94-870 Lumiauau Street, Apt. X202
Waipahu, Hawaii 96797

Dear Mr. Rorie:

Subject: Primary Corridor Transportation Project

This is in response to your October 19, 2000 letter and your oral testimony at the October 19, 2000 Special Transportation Committee Meeting regarding comments on the Major Investment Study/Draft Environmental Impact Statement (MIS/DEIS).

1. *I am writing to give feedback regarding the new hub-and-spoke bus system, which started on Sept. 1. In its present form, the system has many negative aspects, in my opinion.*

   Response: Comment noted.

2. *First of all, why do the buses travel on our side of the street (Lumiauau) when they could easily stay on Kamehameha Hwy and turn right into Waikele via Lumiaina, a much wider four-lane thoroughfare?*

   Response: This is not an issue for the PCTP. Your comment has been referred to the planners of the current hub-and-spoke conversion at DTS.

3. *Why must the buses come every 30 minutes starting from 5 a.m. and ending at 11:15 p.m. every day, including weekends? This is not downtown Honolulu!*

   Response: See response to comment #2.

4. *Monday through Friday, most of our residents go to sleep early in order to get up early, yet loud, almost empty buses travel Lumiauau until 11:15 p.m. Furthermore, most of our residents enjoy "sleeping in" on Saturday morning, yet loud, nearly empty buses travel Lumiauau as early as 5 a.m. This is unacceptable!*

   Response: See response to comment #2.

5. *Please don't force me to go door to door in Waikele with a petition demanding the City and County of Honolulu modify the hub-and-spoke system such that Lumiauau be returned to a bus free zone. Your prompt response to this matter is greatly appreciated.*

   Response: See response to comment #2.

6. *I'm not anti-bus. We have one of the best bus systems in the country. It's vital that we continue to use the bus system to help transport people. However, based on its present form, the hub and spoke bus system, I'm opposed to it unless changes are made.*

   Response: See response to comment #2.

7. *The reason being, starting in September 1, I couldn't help but notice...I live in a condo near Lumiauau Street, which is a side street in Waikele, and I couldn't help but notice that there's this bus, No. 433. It just seem to come every 30 minutes from like 5 a.m. to 11:15 p.m. And I think to myself, you know, I live in Waikele and there are pros and cons to that. But one thing, you know, downtown Honolulu one thing you want to get away from in this type of situation with the bus. And, so, I just couldn't help but notice that. The reason I bring up the times are because the key like for the 11:15 p.m., you know, most of our residents have to go to bed fairly early to fight the traffic the next morning. And so, for this bus to be coming at 11:15 p.m., it seems awfully late in the evening when we're trying to sleep. And, again, my windows are open. Others have air conditioners. Five a.m. on Saturday morning? I mean, again, we're trying to sleep in at least Saturday or Sunday. Would be nice to sleep in a couple days a week. And at 5:00 a.m. this bus comes in and it's pretty... The newer ones are quieter but it's still a nuisance. Also, the buses are pretty much empty.*

   Response: See response to comment #2.

8. *Also on Saturday and Sunday, we have soccer games going on in the park near my condo and the vehicles line all parked all along Lumiauau and so I'm not sure where the buses are stopping to let people off. Maybe in the middle of the street. That doesn't seem very safe.*

   Response: See response to comment #2.

9. *And then, finally, it just seems like this bus could go into ... instead of turning onto our side street, it could get on to Lumiaina which is a four-lane thoroughfare. That much makes a lot more sense.*

   Response: See response to comment #2.

We appreciate your interest in the project.

Sincerely,

CHERYL D. SOON

November 13, 2002

Ms. Ann Ruby
55 S. Kukui Street
Honolulu, Hawaii 96813-2328

Dear Ms. Ruby:

Subject: Primary Corridor Transportation Project

This is in response to your testimony at the April 20, 2002 public hearing regarding comments on the SDEIS.

1. *And I took your bus to get here this morning.*

   Response: We appreciate you taking the time to attend the public hearing and for using TheBus.

2. *I have spent considereble time in Portland, Oregon; Seattle, Washington; and Vancouver, British Columbia. Each hes its own different rapid transit system.*

   Response: Comment noted.

3. *Portland has e bus rapid transit. It is not rapid, it hes to stop at all the cross streets, and it takes up too much road space. Only those with lots of time ride it. It's faster to drive.*

   Response: Comment noted.

4. *According to the plan, of course, by experience, we know that it will cost at least twice as much before they complete it. Then it's going to teke ebout $4,000 for every man, woman and child of the – the population on this island. About $12,000 for every three-person family.*

   Response: Comment noted.

5. *Seattle hes their one little monorail put up for the World's Feir in 1962 from downtown to Seattle Center. But many people ride it, not only tourists. It is fast, cleen, quiet end efficient. Seattle eree is thinking more monorails.*

   Response: Comment noted.

6. *Seattle did build a very expensive bus tunnel, a rail rapid bus tunnel, but they ere apparently scrapping this idea now.*

   Response: The Seattle bus tunnel is in operation.

7. *Vancouver, British Columbia, has what they call the SkyTrain, end it was built, I think, originally 1988 for the World's Fair, and it has the SkyTrain bus hub system. It's extremely efficient. It's non-invasive to roads, and they are expanding them, and it's a well-run system.*

   Response: Comment noted.

8. *To me, clearly, BRT is not the wey to go. I don't want to see buses running every two minutes up and down Kalakaua or eny street.*

   Response: Comment noted.

9. *I have been a bus rider since 1989, but I must sey that this BRT is very unfair to cars.*

   Response: Comment noted.

10. *I think the words "Bus Rapid Transit" is an oxymoron, because buses, by nature, are not rapid.*

    Response: Comment noted.

11. *I would rather see e nice, thin, sleek, trim, quiet monorail system built ebove the existing roadways, with no interference to cars. And each station could heve a bus. And that system hes worked very well in Vancouver, British Columbia, and it's a good system.*

    Response: Comment noted. It is a statement regarding preference for monorail.

We appreciate your interest in the project.

Sincerely,

CHERYL O. SOON

November 13, 2002

Mr. Harrison Rue
2902B Kalawao Place
Honolulu, Hawaii 96822

Dear Mr. Rue:

Subject: Primary Corridor Transportation Project

This is in response to your testimony at the October 26, 2000 Special Transportation Committee Meeting regarding comments you made on the Major Investment Study/Draft Environmental Impact Statement (MIS/DEIS).

1. *I'm speaking in support of the city's unprecedented effort to find a workable cost effective environmentally friendly solution to our island's transportation needs. And I believe the current Bus Rapid Transit proposal meets those needs.*

   Response: Comment noted. Thank you for supporting the project.

2. *At the end of that public process, I'm remembering that there was a half a dozen key elements that came out. We've heard some of them talked about tonight. One of the things that didn't come up tonight is over 25% of our island residents are elders or kids or disabled. Can't drive. So, we're looking at meeting their needs.*

   Response: The Refined LPA provides an attractive transportation option to the non-driving community.

3. *We need to look at moving people, not cars. There was strong consensus at all the meetings that we can't continue to just widen roads downtown. So, this does something else. And, the consensus at the end of round four, by those several thousands people, was that preserving the priority lanes for transit with the effective signal preference, pedestrian circulator buses connections would give us the most bang for the buck.*

   Response: Comment noted. Again, thank you for supporting the project.

We will send you a CD-ROM copy of the Final Environmental Impact Statement (FEIS) under separate cover. If you require a printed copy of the FEIS, please contact Faith Miyamoto at 527-6976. We appreciate your interest in the project.

November 13, 2002

Mr. William Samaritano
1778 Ala Moana Boulevard
Honolulu, Hawaii 96815-1605

Dear Mr. Samaritano:

Subject: Primary Corridor Transportation Project

This is in response to your testimony at the April 20, 2002 public hearing regarding comments on the SDEIS.

1. *I'm a resident of Waikiki for over 21 years, and I am against this Bus Rapid Transit, if you can call it rapid transit.*

   Response: Thank you for attending the public hearing and expressing your views.

2. *Back in 1990, Kevin Costner starred in the film called "Field of Dreams," in which he played an Iowa farmer who kept hearing voices that told him, "If you build, he will come." The film was called "Field of Dreams," and the voices Kevin kept hearing told him to build a baseball field in the middle of his cornfield in Iowa. Now, being Hollywood, everything worked out in the end, and everyone lived happily ever after. Now, I'm sure you're wondering what this "Field of Dreams" has to do with BRT. Well, I think the same forces are at work here with our City officials. I think they are hearing voices similar to those, saying, "If you build it, they will use it." This type of thinking may work great for Hollywood, where things exist in the fantasy world. However, this type of thinking is a disaster for the real world, no matter how well-intentioned.*

   Response: Comment noted.

3. *A recent example of this well-intentioned thing is the defunct van cam project, a project which started out with the best of intentions, trying to keep speeders and motorists who speed off our streets. What the people of Honolulu have ended up with is a project that is going to cost taxpayers millions of dollars, money we do not have.*

   Response: Comment noted.

4. *So you have to ask yourself, Why build BRT? A project many people will admit and have said that will create major traffic jams, turn our main thoroughfares into parking lots.*

   Response: It is not the conversion of lanes that will create the congestion. The congestion for motorists will be there without the BRT. When people are diverted onto public transit, congestion for motorists will be less with the Refined LPA than it would be with the No-Build or TSM Alternatives. Conditions will be much better for BRT riders with the Refined LPA since they will have a path clear of the congestion along much of the In-Town and Regional BRT routes.

5. *Our City officials have this notion that they can make us use this thing and get out of our cars by making it inconvenient for us to use our cars. The "If they build it, they will use it" syndrome.*

   Response: Comment noted. The MIS/DEIS, SDEIS, and FEIS Chapter 1 state the purposes of the Primary Corridor Transportation Project are not to force people out of their cars by making it inconvenient for them, but to:
   1. Increase the people-carrying capacity of the transportation system in the primary transportation corridor by providing attractive alternatives to the private automobile.
   2. Support desired development patterns.
   3. Improve the transportation linkage between Kapolei, which is envisioned to be the "Secondary Urban Center" of Oahu, and Honolulu's Urban Core.
   4. Improve the transportation linkages between communities in the Primary Urban Center (PUC) to increase the attractiveness of in-town living.

6. *Traffic is already bad, and yet people still not – still do not use the existing bus system as much as they should, a bus system that has received many national rewards for being one of the best in the country.*

   Response: It will not require a major shift of people from autos to transit for the Refined LPA to have a positive impact on reducing congestion while giving transit riders significant benefits. By 2025 the Refined LPA is projected to attract an additional 2 percent of the auto drivers on to transit than would have occurred with the No-Build Alternative.

7. *Solutions? Let's expand on this nationally honored system. Why try and reinvent the wheel? Let's do like what the gentleman suggested earlier. Turnouts for the existing bus system, better left- and right-turn lanes. Why rebuild the wheel? Why try and force us out of cars? Something we know is not going to happen.*

   Response: Bus turnouts will be added along sections of Dillingham Boulevard and Kuhio Avenue. Bus turnouts are not a complete solution in and of themselves.

We will send you a CD-ROM copy of the Final Environmental Impact Statement (FEIS) under separate cover. If you require a printed copy of the FEIS, please contact Faith Miyamoto at 527-6976. We appreciate your interest in the project.

Dear Mr. Samuel:

Subject: Primary Corridor Transportation Project

This is in response to your testimony at the October 19, 2000 Special Transportation Committee Meeting regarding your comment on the Major Investment Study/Draft Environmental Impact Statement (MIS/DEIS).

> *"I'm just here as a resident of Lele Pono. And due to the congestion, the atmosphere and the congestion that is there now it's just too much. And based on that, I think we need another location."*

Response: The former Kamehameha Drive-In site is no longer being considered for a transit center.

We will send you a CD-ROM copy of the Final Environmental Impact Statement (FEIS) under separate cover. If you require a printed copy of the FEIS, please contact Faith Miyamoto at 527-6976. We appreciate your interest in the project.

Sincerely,

CHERYL D. SOON

Dear Ms. Soon,

Hawaii needs to develop a modern, efficient public transportation system, and this project is the perfect solution.

I am in support of the work and input that the community has contributed towards developing the Bus Rapid Transit system. I look forward to the future traffic relief this will bring!

Thank you,

Noel Sario

April 18, 2002

Dear Ms. Soon:

I am in favor of the proposed Bus Rapid Transit (BRT) program. It is clear to me that without building new roads and more parking lots, traffic will continue to get worst with more driving delays and more congestion, pollution, road rage, accidents and deaths. I don't have to be a traffic expert to figure that out. I think that those against any kind of mass transit system are short sighted, ignorant or have some sort of selfish motivations against it. More roads and parking lots are not what the people want. Therefore, the only answer to traffic problems seems to be some sort of mass transit, which the BRT is one off.
The BRT is a great start for introducing a mass transit program to Hawaii. It will help the people of Hawaii to take a first big step toward mass transit with minimal effort. We already have and use similar type buses and we have the roadways on which to run on. The rest are enhancement facilities which will make it attractive to riders and a plan to organize the operation. Simple.
The math is also very simple. The more riders on the BRT, the less cars on the road. Simple.

Dear Ms. Sauter:

Subject: Primary Corridor Transportation Project

This is in response to your testimony at the October 19, 2000 Special Transportation Committee Meeting regarding comments on the Major Investment Study/Draft Environmental Impact Statement (MIS/DEIS).

1. *But, I guess, as a registered nurse I have great concerns about the fumes and the pollution that will be caused by the center at Kam. With prevailing winds, pollution comes straight towards our condominium, towards our project. Pollution is one of my great concerns about this center being there around a residential area.*

   Response: The former Kamehameha Drive-In site is no longer being considered for a transit center.

2. *Along with noise which is another great health factor. Although people don't usually see noise as a health factor.*

   Response: The FTA noise criteria are based on levels that are well below the thresholds of health risks to humans. The Refined LPA alternative will not result in any severe noise impacts along the alignment. Therefore there is no health risk associated with the operational noise levels of the Refined LPA.

3. *And then, of course, traffic problems which have already been enumerated about as far as having the buses be able to control the light at Keonohi and Moanalua intersection. Traffic there already is unbelievable and if you don't believe it, come at Christmas time. It is totally unmovable at Christmas.*

   Response: The transit center site at Kamehameha Drive-In and the on/off-ramp from Kaonohi Street to H-1 have been eliminated from consideration.

We will send you a CD-ROM copy of the Final Environmental Impact Statement (FEIS) under separate cover. If you require a printed copy of the FEIS, please contact Faith Miyamoto at 527-6976. We appreciate your interest in the project.

CITY CLERK
HONOLULU, HAWAII

Dear Chair Bainum and Committee Members:

RE: Support of Bus Rapid Transit

I am writing in support of the Bus Rapid Transit (BRT) alternative as outlined in the Major Investment Study/Draft Environmental Impact Statement that has been prepared for the Primary Urban Corridor Transporation Project.

The BRT alternative will make Honolulu a better, more livable city with less traffic. The costs associated with the automobile are immense. We can't continue to build more highways or double deck our freeways. Roadways and parking lots are expensive to build. Automobiles pollute the air and water. The best solution is to improve public transportation with the BRT alternative.

Bus rapid transit is greatly needed improve Honolulu's traffic congestion and to provide an alternative to cars dominating our city. I support the BRT alternative because it will provide mobility to people who choose not to own, cannot afford, or are unable to drive a car.

Mobility should not be limited only to peoplewho can afford and operate cars. Honolulu needs to increase its transportation options, not only to decrease congestion, but to provide equal opportunity of mobility to all citizens–including children, seniors, the poor, or the disabled, or people who simply choose not to drive a car.

Thank you for considering my opinions.

I am against BRT for the following
- We can not afford to eliminate parking spaces to force people to ride
- try coning off these lanes and see what a driving nightmare it will become.
- we can not afford the cost now let alone the cost overruns.
- the state needs to improve the program that is poorly running now - education, transportation, sewer & water etc. - we don't need more BIG GOV
- I am a delivery person and getting around now is a nightmare
- COST & POOR PLANNING
- stop giving for uninsured drivers and getting people without insurance off the road would help.

- I'm not against mass transit - just this plan

Honolulu, Hawaii 96821

Dear Ms. Schultz:

Subject: Primary Corridor Transportation Project

This is in response to your testimony at the April 20, 2002 public hearing regarding comments on the Supplemental Draft Environmental Impact Statement (SDEIS).

1. *We can not afford to eliminate parking spaces to force people to ride.*

   Response: Comment noted.

2. *Try coning off these lanes and see what a driving nightmare it will become.*

   Response: A test of closing a lane is not a test of what will happen with the BRT, it is only a test of what happens when a lane is closed which is something everyone knows the consequences of from when lanes are temporarily closed during utility construction.

   As is pointed out in Chapter 4 of the FEIS, over time there will be more than enough people diverted from autos to transit to offset the impact of converting lanes for priority use by buses. This diversion from autos will only happen once it is clear that the BRT installation is a permanent improvement, not part of some test.

   What is proposed with the first branch between Iwilei and Waikiki will be a good test of the ability of BRT to attract new riders and the impacts of converting lanes in selected locations.

3. *We can not afford the cost now let alone the cost overruns.*

   Response: This project has been developed following City Council policy to not increase taxes. The financial analysis (Chapter 6 of the FEIS) shows that no increases in existing taxes or new taxes will be required to fund the project as proposed.

4. *This state needs to improve the programs that it is poorly running now – education, transportation, sewer and water, etc. – we don't need more BIG GOV.*

   Response: Comment noted. No response required.

5. *I am a delivery person and getting around now is a nightmare.*

   Response: Comment noted. No response required.

6. *COST & POOR PLANNING*

   Response: It is unclear what this statement means.

7. *Stop paying for uninsured drivers and getting people without insurance off the road would help.*

   Response: It is beyond the scope of this project to analyze the effects of uninsured motorists.

8. *I'm not against mass transit – just this plan.*

   Response: Comment noted. No response required.

We will send you a CD-ROM copy of the Final Environmental Impact Statement (FEIS) under separate cover. If you require a printed copy of the FEIS, please contact Faith Miyamoto at 527-6976. We appreciate your interest in the project.

Please make any comments below:

No substantive materials

I am opposed to the BRT because:
- It requires tax dollars to supplement ridership costs that are better spent for public safety and infrastructure maintenance.
- The 3.3% ridership does not justify the cost.
- The loss of 900 street parking spaces adversely affects small business and personal business.
- The impedence of traffic on affected streets is unwarranted and will result in gridlock.
- Adversely affecting traffic around the Home Depot/Costco shopping block on Nimitz Highway will hinder shopping. You cannot carry large packages, lumber, or groceries on a bus.
- The City's shell game surrounding the "no new taxes" claim is deceptive and insidious.
- Traffic congestion on Nimitz Highway is already terrible. That highway needs to be widened not narrowed by the BRT.
- Lack of publication and notification of this project on the part of the city shows deception and unwise tactics on the part of the city.
- Many other cities have built R/T systems witho

I frequently visit Waikiki's shops, restaurants and park facilities. This requires transiting Kuhio and Kalakaua avenue. The BRT will inhibit my ability to use these services.

November 13, 2002

Mr. Rod Schultz
5314 Oio Drive
Honolulu, Hawaii 96821

Dear Mr. Schultz:

Subject: Primary Corridor Transportation Project

This is in response to your oral testimony at the April 20, 2002 public hearing regarding comments on the Supplemental Draft Environmental Impact Statement (SDEIS).

1. *I'm speaking in opposition to the BRT.*

   Response: Comment noted. No response required.

2. *I am in favor of rapid transit system in general, but I'm opposed to the BRT scheme.*

   Response: Comment noted. No response required.

3. *I'm opposed because of the high cost to the taxpayers for a very small benefit to public transportation.*

   Response: Comment noted. No response required.

4. *I'm opposed to it because of the effect on traffic along Dillingham road, Kuhio Avenue, and Kalakaua in particular, roads that we in East Honolulu use frequently.*

   Response: Because these are major transportation corridors, traffic demand will continue to grow. This growth in traffic would result in congestion in the future without the BRT. When people are diverted onto public transit, congestion for motorists will be less with the Refined LPA than it would be with the No-Build or TSM Alternatives. Conditions will be much better for BRT riders with the Refined LPA since they will have a path clear of the congestion along much of the In-Town and Regional BRT routes.

5. *It's incredible to me, with the new Home Depot on Alakawa Street and the new Costco there, that we're going to have the traffic on Nimitz and Dillingham Highways. You can't take lumber and bricks home from Home Depot on the bus.*

Response: It is not expected that the BRT will be able to serve every trip. There are many businesses along the alignment who will benefit from the increase in people able to access their stores.

6. *It's incredible to me that the City says that this will result in no new taxes. We're going to spend a billion dollars for the system, plus there's going to be a recurring cost to subsidize ridership, and yet we're not going to increase taxes. The money has to come from somewhere, and I guarantee it will come out of the texpayer's pocket.*

   Response: The financial plan provides for a project that can be paid for without an increase in taxes, using multiple revenue sources, 64 percent of which would be federal funds.

7. *Traffic on Nimitz Highway is already heavy. Diverting treffic from Dillingham to Nimitz Highway is just going to make Nimitz Highway transportation unbellevable.*

   Response: It is not the conversion of lanes that will create the congestion. The congestion for motorists will be there without the BRT. When people are diverted onto public transit, congestion for motorists will be less with the Refined LPA than it would be with the No-Build or TSM Alternatives. Conditions will be much better for BRT riders with the Refined LPA since they will have a path clear of the congestion along much of the In-Town and Regional BRT routes. As shown in Chapter 4 of the FEIS traffic on Nimitz Highway will be less congested with the Refined LPA than with the No-Build or TSM Alternatives.

8. *I agree with the people that just found out recently about this system. I just heard about it when it was just recently publicized, had no concept of the BRT system before that time. So any idea that this is publicly – that there's been public notification or adequate public notification is incradible.*

   Response: The community involvement for this project began in 1998 and has been the focus of numerous newspaper articles, radio shows, and television stories. There have been hundreds of meetings throughout the community where the project has been discussed.

9. *Finally, I hope that tha City learns from the State's recent disester in the cem vans and realizes that, "If this is so good for us, why doe it hurt so bad?"*

   Response: Comment noted. No response required.

10. *It requires tax dollars to supplement ridership costs that are better spent for public safety and infrastructure maintenance.*

    Response: It is up to the City Council to determine how tax revenues are spent. Ever since the bus system was made public, each City Council has recognized that there are many members of the community who depend on public transportation for their mobility.

City Council members also recognized that it would be far more costly to widen and build new roads to accommodate bus riders if they were in autos instead.

11. *The 3.3% ridership does not justify the cost.*

    Response: See response to comment #10.

12. *The loss of 900 street parking spaces adversely affects small business and personal business.*

    Response: DTS is aware that the proposed elimination of on-street parking spaces is of concern to small businesses, as well as residences. As discussed in Section 4.3, in areas where a large concentration of parking spaces would be affected, replacement parking in new off-street parking facilities would be considered, but only if they meet other livable community objectives and are the result of community-based planning.

13. *The impedance of traffic on affected streets is unwarranted and will result in gridlock.*

    Response: See response to comment #7.

14. *Adversely affecting treffic around the Home Depot/Costco shopping block on Alakawa Street will hinder shopping. You cannot carry large packages, lumber, or groceries on a bus.*

    Response: It is not expected that the BRT will be able to serve every trip. There are many businesses along the alignment who will benefit from the increase in people able to access their stores.

15. *The City's shell game surrounding the "no new taxes" claim is deceptive and insidious.*

    Response: Comment noted. It is a statement of opinion.

16. *Treffic congestion on Nimitz Highway is already terrible. That highway needs to be widened not narrowed by the BRT.*

    Response: Nimitz Highway will not be narrowed by the In-Town BRT. To the contrary, the SDOT has plans to increase the capacity of Nimitz Highway by installing an A.M. peak period contra-flow lane.

17. *Lack of publication and notification of this project on the part of the City shows deception and remrod tactics on the part of the city.*

    Response: The community involvement process for this project began in 1998 and has been continuous since that time. The public will continue to be involved in the project throughout design and construction.

18. *Many othar citias have built R/T systams without impacting traffic; why can't we?*

    Response: See response to comment #7.

19. *I fraquantly visit Waikiki's shops, restaurants and park facilities. This requires transiting Kuhio and Kalakaua Avenue. Tha BRT will inhibit my ability to use thesa services.*

    Response: See response to comment #7.

20. *Tha In-Town BRT will provida an altemative to driving to the shops, restaurants and parks on Kuhio and Kalekaua Avanuas.*

    Response: Comment noted. No response required.

We will send you a CD-ROM copy of the Final Environmental Impact Statement (FEIS) under separate cover. If you require a printed copy of the FEIS, please contact Faith Miyamoto at 527-6976. We appreciate your interest in the project.

Att: Comments on the SDEIS.

CDS/vm

Comments on the Supplemental Draft Environmental Impact Statement

by Cliff Slater

> "Political skill is the ability of foretell what is going to happen tomorrow, next week, next month and next year. And to have the ability afterwards to explain why it didn't happen." Sir Winston Churchill.

The Supplemental Draft Environmental Impact Statement (SDEIS) is deficient in failing to plan on reducing traffic congestion, failing to justify its unprecedented predictions for Bus/Rapid Transit ridership, and failing to address the many proven alternatives which have elsewhere been shown to be more effective than what the City proposes.

First, Honolulu commuters are expecting that the *Primary Corridor Transportation Project*[1] will give them some measure of relief from traffic congestion. Instead, the City's BRT plan predicts that traffic congestion, under the City's most optimistic BRT scenario, will be worse than it is today. The City plans to improve bus service by removing existing automobile lanes and changing them to exclusive bus lanes. In short, they will improve bus service for the 8% of commuters that use it, but only by making traffic congestion worse for the 92% of our citizens that drive.

Second, traffic congestion will be even worse than what the City projects because they will not meet their optimistic BRT ridership projections. Fewer riders will mean more cars.

Third, the serious decline in Honolulu's bus ridership over the past ten years is totally ignored in discussing projected ridership increases. Nor does the City address reasons for the long-term decline in the percentage of commuters using public transportation all over the U.S. These must be explained to make any sense of the City's projections.

Fourth, even if the City were to make its BRT budget estimates, the cost per each additional bus rider will be an outrageous $3,700 annually. Cost overruns will increase this. There are far more effective and cost efficient projects to be adopted that will also qualify for federal funds.

Fifth, like its former rail transit plan, the City has examined none of the alternatives that have proven to work elsewhere. We shall discuss these in detail.

Sixth, the Federal Transit Administration's (FTA) name is on the SDEIS giving the impression that they have examined and approved the plan.

Ten years ago the state of Hawaii employed outside transportation experts from the nation's leading universities to critique the rail transit proposal of the time.[2] No such outside critique was sought for the BRT plan. However, the experts' comments on the rail transit plan are for the most part valid for today's BRT plan. We shall quote from them extensively where appropriate.

[1] *Supplemental Draft Environmental Impact Statement: Primary Corridor Transportation Project.* U.S. Department of Transportation and the City and County of Honolulu. March 2002. (SDEIS)

[2] *An Evaluation of the Honolulu Rapid Transit Development Project's Alternative Analysis and Draft Environmental Impact Statement.* Hawaii Office of State Planning and University of Hawaii. May 1990.

One: Traffic congestion will get worse

> "...the primary benefit of rapid transit is not the reduction of automobile congestion. Rapid transit's primary benefit should be to substantially increase mobility for transit-dependent commuters."
>
> Executive Summary, *Evaluation of the Honolulu Rapid Transit Development Project's AA/DEIS.* Hawaii Office of State Planning. February, 1991.

You would think that when the City discusses *Improving Urban Mobility,* they mean reducing traffic congestion. They do not. What the city means is improving service for bus riders—at the expense of drivers. Here's what the plan says:

- "While greatly improving transit service and person carrying capacity, the ... BRT ... would result in a somewhat reduced Level of Service[3] for automobile traffic within the urban core."[4]
- "The ... BRT ... would provide more person carrying ability ... by reallocating roadway lanes from general ... use to transit or ride-share use."[5]
- "Due to their use of exclusive transit lanes, BRT vehicles could pass freely through congested intersections even though intersection LOS for the general-purpose lanes might be poor. The result would be less delay for transit riders and better transit schedule reliability."[6]

It is easy to figure out why traffic will get worse; many streets will have existing lanes turned into auto-free exclusive BRT lanes. Below are rush hour photos of affected City streets. Note that on Kapiolani Boulevard four lanes are going one-way into town. These will be reduced to just two lanes. Dillingham Boulevard presently has three lanes coming into town one-way in the morning; it will be reduced to ONE! See the SDEIS pp. 2-21 & 2-22 for a list of all the many streets that will lose lanes.

The City did not see fit to carry over existing congestion levels for 1995 for comparison purposes from the DEIS. However, table 1.2-9 on page 1-18 of the DEIS may be compared to table 4.2-3 on page 4-14 of the SDEIS to see that overall traffic congestion in the future with BRT is projected to be worse than today. Improving public transportation is unlikely to have any beneficial effects on traffic congestion. See Appendix I for comments on the 1992 rail plan's likely impact on traffic congestion by some of the nation's leading transportation experts. And bear in mind as you read them that grade-separated rail was obviously a better candidate for traffic congestion relief than BRT.

You can easily imagine what all this reduction in rush-hour road space will do to traffic. Review the photos on the page following.

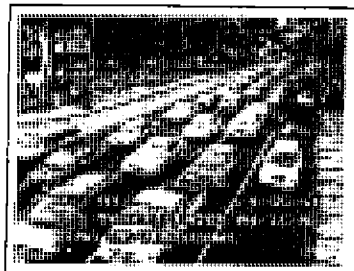
[3] Level of Service (LOS) is a measurement of traffic congestion conditions from A to F with A being the best and F being totally congested.

[4] SDEIS, S-8.7.

[5] SDEIS 4-11.5

[6] SDEIS 4-20.5

AR00016013



King Street at Punchbowl—one lane to be removed.

Dillingham at Waiakamilo—two lanes to be removed.

Dillingham at Kalihi St—two lanes to be removed.

Kapiolani at Keeaumoku Street—two lanes to be removed.

Ala Moana at Atkinson—two lanes to be removed

N. King St at Beretania—two lanes to be removed.

Two: Congestion will be even worse if the City's ridership forecasts are too optimistic:

Are the City's ridership forecasts believable? Let us review their earlier forecasts.

- The HART plan forecast in 1980 that if the City did nothing beyond already planned road improvements and merely expanded the bus system, ridership would increase to 100 million annually by 1995.[7] In fact, by 1995 ridership was only 73 million—a 37% over estimation.
- Subsequently, the Hali 2000 study, predicted in 1984 that if the City did nothing special beyond what they had already committed to, bus ridership would increase to 85 million riders by 2000.[8] However, actual bus ridership of 66.6 million for 2000 was less than it had been at the time of the prediction. Thus, this was a 22% over estimation.
- Subsequently, in 1992 the City forecast, for their rail transit plan, a 21% increase in ridership from 1991 to 2005[9] if they did nothing special.[10] So far, we have seen an 8.5-13% DECREASE.[11] Even if ridership does not decline further by 2005, it will be a 32%+ over estimation.

Now the City is forecasting that, once again, if we do nothing special, there will be 286,700 daily bus trips in 2025[12] against 1991 trips of 206,650, a 39% increase. However, since 1991 we have had this decline in ridership and so, to make their forecast, they will need to increase simple, regular bus ridership 54%.

Now remember that this decline in ridership for 1991-2000 has occurred despite a 5% increase in Oahu's population and more buses in use—from 475[13] to 525.[14] And ridership is still declining as of the latest publicly available data of September 2001.[15]

Given the above it is impossible to believe that the City will actually make anything like a 54% increase.

On top of the "No Build" forecast the City wants us to believe that the BRT will boost this to 336,700 daily transit trips[16] vs. 206,650 trips in 1991 (about 186,000 today).[17]

[15] American Public Transportation Association statistics to September 2001.

[16] SDEIS 7-6. These are linked trips, which is to say, from departure point to destination regardless of transfers. This is different from what the City normally reports which is boardings. If you transfer once on your way to your destination it will count as two boardings. Typically, for the system overall, there are 16% more boardings than trips.

[17] SDEIS 4.5.4.

AR00016014

No city in the U.S. has experienced such an increase in public transportation no matter what they have done—rail transit, busways or anything else—once they were past the initial government takeovers and subsequent massive deficits of the 1970's.

One can begin to understand why many University of Hawaii specialists in economics and forecasting wrote the City Council in 1992 about its then rail transit plan, saying, "We have little faith in the projected ridership and cost figures."[18]

One can also understand the outpouring of criticism from the state's own distinguished experts on the flaws in the ridership projections (see Appendix I). One of them was Dr. Moshe Ben-Akiva, Turner Professor of Civil Engineering at MIT, and a forecasting colleague of Nobel Prize winner, Professor Daniel L. McFadden. Ben-Akiva said of the 1992 exercise, "I question the validity of the forecasting procedure..." and "I am not convinced that any of the models is transferable to other situations and I would recommend not to use them without further testing." And "Any forecasting exercise of this nature would be associated with significant uncertainties."

One of the recommendations that came out of the U.S. Dept. of Transportation's review of the highly flawed rail transit forecasting of the 1970s and 1980s was that planners should "acknowledge that uncertainty in achieving any specific level of predicted ridership levels exists," and should, "be conveyed simply by expressing forecast ridership for each alternative as a range rather than a single point value."[19]

What should give us pause is that City forecasts for the last 30 years have been consistently in error and in the same range of 30%+ as those experienced elsewhere. Yet this latest forecast of BRT ridership, the 336,700 riders projected for 2025, is shown to the nearest hundred. This conveys to the reader a certainty to the nearest 3/100ths of one percent, a ridiculous claim.

The best way to test forecasting models is to backcast. You go back to the 1984 data from the Hali 2000 study and and use it in your model to forecast for 2001. Then go back to the 1992 data from the rail transit FEIS and again forecast for 2001. If the forecasts match the actual outcome then your model *might* have a chance of being right about the future. Certainly if a model cannot even backcast, it should not even be considered when risking taxpayers' monies. This has not been done.

Three: The long-term declines in ridership must be explained

> "Since the entire justification for the project rests on significant rates of electing public transportation over the private automobile, the failure to discover what would influence this choice may be a serious flaw." Dr. Canan. *Evaluation of the Honolulu Rapid Transit Development Project's AA/DEIS.* Hawaii Office of State Planning. February, 1991.

World War II aside, the per capita use of public transit peaked in Hawaii (and the U.S.) in the early 1920's when the automobile began to compete with streetcars and buses. It continued declining until World War II when it then rose sharply with the introduction of gas rationing. At war's end, when rationing ended, the decline continued again until reaching its all time low in 1971.[20] At that time, the City socialized the then profitable bus system.[21]

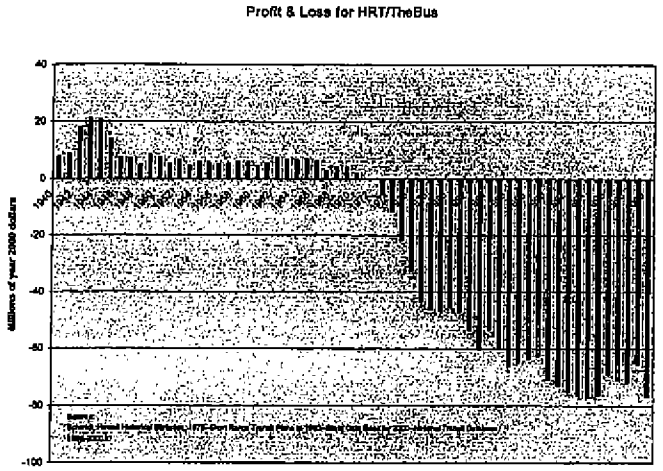
[18] University of Hawaii faculty members. *Memorandum to Members of the Council,* City & County of Honolulu. November 7, 1991.

[19] Pickrell, Don H. Urban Rail Transit Projects: Forecast Versus Actual Ridership and Costs. U.S. Dept. of Transportation. October 1990. p. 74.

[20] Total annual transit rides, divided by population, or per capita transit use, is what used to be called the *riding habit.* In the days of privately operated public transportation it was considered the key indicator of transit viability. For example, in Honolulu proper in 1920 we had 17 million transit rides with a population of just 82,000—a riding habit of 207—and solidly profitable. By 1998 the area covered had expanded to the whole of Oahu and we had 71 million riders but a population of 872,500—a riding habit of 81. (see chart below.) See Appendix V for chart.

[21] See *Annual Report for 1971.* Honolulu Rapid Transit Co. Ltd.

Once the City took over, it poured money into new routes to the suburbs, up the hillsides, and around the island. With new buses and new routes, transit use rose again—albeit this time at a heavy cost to the taxpayer. In 1984 the per capita transit use peaked once more and then began another decline that has continued for the last 16 years.



The principal causes of the decline in public transportation use are well-known and well documented. The choices we make between public transportation and automobile are primarily functions of changes in real incomes, commuting costs and service availability.

As real (net of inflation) incomes increase, people tend to use public transportation less. Public transportation service is one of what economists technically refer to as *inferior goods*—those goods and services that the more income you have, the less you want them.[22] Thus, over the long-term, increases in incomes work against transit ridership.

When real automobile commuting costs decline, people tend to use automobiles more. Conversely, increases in auto costs drive people to public transportation. When service availability declines, such as less frequent bus service, people tend to switch to automobiles.

[22] UCLA's Professor George Hilton pointed this out in 1967 saying, "...an increase of one percent in family income will typically reduce the family's use of rail passenger service by 0.6 percent. Thus, rail passenger trains provide an inferior service with respect to income, analogous to potatoes, farinaceous foods, and other inferior goods, consumption of which decreases with increments in income." Hilton, George W. *Rail Transit and the Pattern of Modern Cities: The California Case.* Traffic Quarterly, vol. XXI, no. 3. July 1967. p. 388.

AR00016015

Changes in real fares also impact ridership. The American Public Transportation Association calculates that, "On the average, a ten percent increase in bus fares would result in a four percent decrease in ridership."[23]

Commuting costs also include the value we place on our time, which we tend to value at approximately what we earn. This is an important, albeit mostly intuitive, decision that commuters make. For example, some downtown commuters park their cars on Beretania Street at around $70 a month and others park them near the center of downtown for $150. The more affluent value their time more and tend to choose the more expensive parking. The less affluent choose the longer walk and the cheaper parking.

Parking costs are often the deciding factor in the commute decision. Our state government significantly subsidizes parking costs for state employees thus encouraging them to commute by car.

Our city government requires developers to provide minimum amounts of parking in their buildings. This has encouraged the construction of far more parking than can be economically justified and thus parking costs are far lower than they would be if left to market forces. This again has encouraged people to drive.

Service availability is usually a function of residential density. The higher density, the closer are bus stops and the greater the frequency of buses. People moving from Kaimuki to Makakilo will tend to use bus service less since bus stops will often be further away and buses less frequent.

Most of these factors are working against future public transportation increases. Incomes are rising, fares are increasing, parking costs are steady, density of residential areas is generally declining as more people leave the inner city and move to suburban areas such as those in the Leeward areas.[24]

A smaller percentage of workers are using public transportation to get to work both locally and nationally. Latest estimates of the 2000 Census journey-to-work data (due later this year) are that it will show Hawaii having a significant reduction in the percentage of workers using public transportation to commute than did in 1990.[25] This is a trend that has been ongoing nationally and locally since 1980.

In summary, bus ridership is not going to increase by merely "visioning"—a euphemism, for "wishful thinking." Voters should demand of their elected officials solid justification in forecasting increases in bus ridership—more than just improving their re-election chances.

Fourth: The City cost estimates

The BRT plan's capital costs will be $750 million more than the No-Build alternative half of which will be federally funded. It is incorrect to dismiss the federal funding as "free" money. The fact is that there are many sensible alternatives that would generate equal or greater funding than BRT.

For example, a busway qualifies for 80% federal funding and its operating costs would be minimal. A busway would allow City buses to operate more frequent schedules because they

[23] APTA's online paper on fare elasticities.

[24] See Table 1.14 of the 2000 State Data Book showing 1990-2000 population changes by district and census tracts. Honolulu District lost 5,000 residents while Ewa District gained 42,000.

[25] See Demographia Cox for 2000 data.

would not be operating on clogged highways. Vanpools, jitney buses, shared-ride taxis and other high-occupancy vehicles would be far more popular for the same reason.

And it must be remembered that a rail transit line or a bus system expansion carries with it a massive increases in operating costs. Highways, on the other hand, have relatively minor maintenance per passenger carried.

It is difficult to believe the cost forecasts for BRT because they tell us that there will be a 49 percent increase in jobs in public transit[26] yet there will only be a 24% increase in operating and maintenance costs.[27] However, since employee costs are typically 70% of operating costs,[28] how can this possibly be?

The City's calculation of the cost for each new ride demonstrates the poor value of the BRT plan. The calculation is $7.42 for each additional ride for the BRT over and above that of the No-Build alternative. This amounts to $3,710 annually per new rider.[29]

Fifth: Few real alternatives are being considered:

> "Perhaps what is most surprising, and to some extent alarming, about the alternatives presented is that few real choices are offered." Dr. Cervero p. 3.7
>
> "The TSM option appears "born to lose," as most TSM options are in alternatives analyses." Dr. Rutherford p. 7.2
>
> Evaluation of the Honolulu Rapid Transit Development Project's AA/DEIS. Hawaii Office of State Planning. February, 1990.

The City has not proposed, or even examined, alternatives that have been proven to work elsewhere. Nor did they for the 1992 rail transit plan.[30] They merely keep proposing the conventional solutions to solve our traffic problems that have not worked anywhere else. This should be recognized and the public told the real and uncomfortable truths.

The fact is that the problems we face in transportation are as myriad as are the solutions needed. Let's take some examples of problems and possible solutions:

- *Congestion caused by people commuting at normal daytime hours to major job centers such as downtown and Waikiki.*
  These trips are one-time peak hour trips and TheBus is not the answer. What commuters need to get them out of their cars is door-to-door transportation. The most efficient way to do this with vanpools. The problem is that the vanpool is priced at $70 a month vs. the Express Bus at $25. This makes the bus the hands down winner for people on a tight budget. However, the price for TheBus does not reflect its cost whereas the vanpool does.[31] If the Express Bus were to charge commuters its cost of $175 per rider per month, few would ride it. Obviously, if anything, we should be subsidizing vanpools instead of Express Buses.

[26] SDEIS S-9. Transit jobs forecast to increase from 1,181 to 1,760, or 49%.

[27] SDEIS 6-5. The forecast is operating costs for the BRT plan to be $188 million in 2010 vs. $152 million today for No-Build, all expressed in 2010 dollars.

[28] 1996 National Transit Database System Wide Information for Honolulu DTS.

[29] The City shows the additional cost for each new ride as $7.42. Allowing commuters 500 rides annually (250 trips x 2 daily) is $3,710 cost per new rider annually. Source: SDEIS Table 7.3-1B on page 7-12.

[30] See Appendix III.

[31] The vanpool covers 90% of its operating cost whereas the Express Bus only covers 15%.

AR00016016

Another fine example is that offered by Honolulu's tour bus operators whose vehicles are not that busy during commute hours. They have offered guaranteed seat Express bus service that would require a subsidy far less than what it is currently costing the City. Either of these services can provide commuter service for hotel workers and others who tend to commute at set times. A study participated in by state workers in 1991 showed that 91% of participants were very interested in door-to-door guaranteed-seat service.[32]

- *Congestion caused by people moving around the Urban Center throughout the day.*
  TheBus is not the best way to attract people from their cars for journeys from say, Downtown to Waikiki; it is too slow. Honolulu's jitney buses of the 1930's with their smart uniformed drivers were then much faster and more popular than the streetcars judging from the evidence given during HRT's suit against them in 1940. At that time the public pleaded with the court for the jitney buses to stay. As a current example, the air-conditioned handsome jitney buses in Atlantic City provide service at 40-second intervals—and they run 24 hours a day.
  Another option is the use of shared-ride taxis. These taxis are able to take many commuters at prices lower than exclusive ride taxis and since they accommodate more riders, relieve traffic congestion. They are widely used in Washington, DC and elsewhere but illegal in Honolulu.
- *A growing annual bus subsidy that is now over $100 million annually.*[33]
  Our bus system is the most efficient government bus system in the U.S. We also have a wonderful post office. You can be proud of them as long as you do not compare either of them with their profitable counterparts such as Atlantic City jitney bus service and Federal Express. There are ways to reduce the heavy burden on taxpayers and vanpools, private bus use, shared-ride taxis and jitney buses are just some of them.
  Ten years ago, Britain's London Transport was losing 40 cents on every dollar they took in. Today, it is privatized and profitable with the same level of service it had before. Buenos Aires, Argentina, thirty years ago lost more money than TheBus. Today, a myriad companies run 18,000 buses, none more than 23 passenger, and they are profitable and no longer a drain on the taxpayer.
- *During rush hours all highways coming into town from the Leeward area are far too congested.*
  COST first proposed ten years ago that we should examine the feasibility of a new busway along the same alignment as the former rail transit proposed line from Waiawa to about the old OR&L rail station downtown. It would be two lanes with a safety lane, one-way into town in the morning and one-way out in the afternoon with three or four places for ingress and egress to the main freeways. It could be either state-funded for HOV van pools, high-occupancy autos and buses or it could be privately funded as a tollway. Motorists pay to be on it but it would take a great deal of traffic off existing freeways. Nothing has been done about this proposal.
  A busway would expand leeward mobility far more than BRT, cost less and qualify for a greater percentage of federals funds.

[32] Flannelly, K.J., Flannelly, L., McLeod, M.S., Jr., Behnke, R.W. *Direct Comparison of Commuters' Interests in Using Different Modes of Transportation.* Transportation Research Record #1321. Transportation Research Board. 1991.

[33] Including capital costs.

FTA misrepresentation:

The Federal Transit Administration's (FTA) name is shown above the City's on the SDEIS giving the impression that they have examined and/or written the plan with the same kind of input as the City planners and approved it. Unless the FTA has indeed carefully examined the plan and signed off on its forecasts then it should either remove its name from the Final EIS or make it clear to the public that it does not stand behind these forecasts but is merely accepting "local decisions."

Summary

The problem is that the City never spends time analyzing our traffic and transportation problems. Instead they get "visions" of the wishful thinking, ribbon-cutting variety. Then the solution drives everything else. To paraphrase the old saying, they put the train before the passenger.

And, as with all governments, they tend to simplistic views of complicated problems that will allow them a one-size-fits-all solution. Give them responsibility for clothing and you get the Mao jacket and the old Soviet baggy suit. Give them transportation and it's the one-size bus.

What is needed is a review of what has worked elsewhere in improving mobility, ameliorating traffic congestion and reducing costs.

- New York City shows us that having the City take a hands-off approach to parking and letting the market drive it significantly reduces automobiles on the road.
- Honolulu's own experience with vanpools shows us that using vouchers in conjunction with vanpools would allow us to simultaneously increase ridership and lower costs.
- Buenos Aires and London's experiences with privatization show how we could provide better service at lower cost.
- Door-to-door buses and vans using busways such as Washington DC's Shirley Highway, and others elsewhere, show us that busways can carry far more riders than rail transit lines.
- Atlantic City's Jitney buses today and Honolulu's experiences during the 1930's show us how to run a profitable urban service.
- Washington DC's shared-ride taxis show us how to increase highway capacity during rush hour.

In short, we need a businesslike approach to our traffic and transportation problems rather than a bureaucratic one.

AR00016017

Notes to Appendices I-III

The written comments on the 1990 Draft Environmental Impact Statement were submitted by those listed below and a summary was prepared by University of Hawaii staff. The final document was published as *An Evaluation of the Honolulu Rapid Transit Development Project's Alternative Analysis and Draft Environmental Impact Statement.* Hawaii Office of State Planning and University of Hawaii. May 1990.

Dr. Penelope Canan, Professor of Sociology at the University of Denver and faculty director of the University's International Institute for Environment & Enterprise. She has served as the chair of the Environment and Technology Section of the American Sociological Association.

Dr. Moshe Ben-Akiva, Turner Professor of Civil Engineering at MIT. He works closely with Nobel Prize winner, Professor Daniel L. McFadden on forecasting issues.

Robert Cervero, Professor of Urban and Regional Planning at the University of California, Berkeley, and a member of the Editorial Board, *Journal of the American Planning Association.*

G. Scott Rutherford, is Professor of Civil and Environmental Engineering at the University of Washington and Director of its Transportation Engineering Graduate Studies Program.

Donald Shoup, Professor and Chair of Urban Planning at University of California, Los Angeles and is also Director, of UCLA's Institute of Transportation Studies.

John R. Pucher, Professor of Urban Planning at the Blaustein School of Planning and Public Policy at Rutgers University.

What follows are quotations from the *Evaluation.* For ease of checking these quotations, the number shown after the author's name at the end of each quotation refers to the page number and the quotation's position on it. Thus, 10.5 refers to a quotation that is on page 10, 50% down the page.

Appendix I—On traffic congestion

"A rapid transit system will not be likely to improve [traffic congestion], and such improvements should not be a major selling point for the system." Rutherford 1.5

"... it is debatable whether any noticeable impact will occur on highway facilities ..." Rutherford 6.5

"... estimates of fuel, pollution, and time savings on highway facilities are generally paper exercises that seldom occur in the real world." Rutherford 3.5

"The Final Environmental Impact Statement should more clearly state that the primary benefit of rapid transit will be to substantially increase mobility for transit-dependent commuters." UH 3.7

"...the primary benefit of rapid transit is not the reduction of automobile congestion. Rapid transit's primary benefit should be to substantially increase mobility for transit-dependent commuters." UH 24.3

"...it appears that relatively few public benefits of any regional significance will result from any of the fixed guideway alternatives." Cervero 14.3

"...it would be highly misleading to measure the success or failure of the proposed transit system solely on the basis of its ability to reduce auto congestion. To the extent that it increases the travel speed of current bus riders, who are slowed down by roadway congestion, this would be a benefit even if congestion levels on roadways did not fall at all. At least bus riders, who are not at all responsible for creating the congestion problem on the roads, would be less likely to suffer from it." Pucher 12.5

"The only really effective way to reduce auto congestion is by raising the price of auto use ... and by giving traffic priority to buses and high occupancy vehicles." Pucher 12.4

"In order to increase transit's mode splits to the 20-30% range, a level that would begin to yield quite noticeable and important social and environmental benefits, some combination of the following initiatives would likely need to be introduced: increased fuel taxes and registration fees; elimination of free or heavily subsidized parking; introduction of an auto-restricted zone in the core area (such as practiced in Singapore); creation of HOV-lanes and contra-flow lanes that give buses operating on surface streets substantial speed advantages..." Cervero 11.6

Appendix II—On forecasting

"I question the factoring of the transit trip table on the basis of population and employment growth, mainly because over the last decade Honolulu has shown rapid growth in everything but transit ridership...This same pattern has been observed in many other U.S. cities." Rutherford 2.5

"...the rates of growth for transit have not been in lock step with population and employment growth." UH 31.9

"The City's...model assumes that growth in transit ridership can be related as a linear function to growth in population and employment. This is a simple assumption that the City made for convenience. Although we have reasons to doubt the validity of this assumption, we have no better substitute." UH 36.7

"The City's consultants used a "pivot-point" methodology to project ridership for the different alternatives in the year 2005. This method, which was endorsed by UMTA, has only been used elsewhere for rail extension projects, rather than for a complete system." UH 2.2

"The major weakness that reoccurs at several phases of the ridership forecasting methodology is the absence of validation against local data." Ben-Akiva 9.5.

"...no evidence is presented in the report on the validity of the...tables." Ben-Akiva 2.8

"...the level of accuracy of these boarding counts is not specified." Ben-Akiva 2.8

"The report does not present data to support these assumptions." Ben-Akiva 3.4

"My conclusion is that the selected values for the parameters of the mode choice model have not been sufficiently justified." Ben-Akiva 7.7

"I question the validity of the forecasting procedure..." Ben-Akiva 7.9

"I am not convinced that any of the models is "transferable" to other situations and I would recommend not to use them without further testing." Ben-Akiva 8.7

"Any forecasting exercise of this nature would be associated with significant uncertainties." Ben-Akiva 9.8

"...it is possible that parallel bus routes that now provide better service to some will experience a reduction in service level...it should be pointed out that several new guideway projects in the U.S. attempted to force an unnatural number of trips to the guideway, even for short segments of longer bus trips. Some systems actually had lower total transit ridership after a fixed guideway system was built." Rutherford 6.6

"Since the entire justification for the project rests on significant rates of electing public transportation over the private automobile, the failure to discover what would influence this choice may be a serious flaw." Canan 1.8

Appendix III—Inadequacy of the alternatives considered

1. General.

"Perhaps what is most surprising, and to some extent alarming, about the alternatives presented is that few real choices are offered." Cervero 3.7

"...we think that the TSM alternative has not been adequately defined in the AA/DEIS." UH 17.4

"The range of alternatives considered in the AA/DEIS was disappointingly narrow and might have included other options." Rutherford 1.6

"I believe that it is vitally important to pay as close attention to the proper design of the TSM alternative as it is to the design of the rail alternatives before an informed decision can be made about whether and how to finance new rail transit." Shoup 12.9

"The proper specification of this [TSM] alternative is crucial, because it affects all the subsequent calculations of how many more riders the rail system will attract, and how much extra revenue will have to be raised to finance the rail system...it does *not* involve any other of the now common transportation *demand* management techniques that are an integral component of transportation system management. I would argue that the TSM alternative is inadequately specified, and thus that the contribution that TSM can make toward improving transportation is *underestimated*. If this is true, the improvements attributable to the rail alternatives are *overestimated*." Shoup 12.3

2. Busways.

COST COMMENT: Busways as used by the consultants here refers to grade-separated or barrier-separated lanes reserved for buses and high occupancy vans and cars. They are also sometimes referred to as transitways.

"In particular, what is lacking is a serious investigation of several viable dedicated busway options." Cervero 3.4

"Where the current set of alternatives really fall short is in ignoring various busway configurations as a fundamental option to rail transit." Cervero 5.4

"Quite aside from the neglect of low cost TSM alternatives, there is no exploration of the possibility of investing more in HOV lanes for buses and carpools, as an intermediate level of investment between the No-Build alternative and the rail alternatives." Shoup 12.8

"The additional riders that might be drawn to busways (by virtue of the superior quality of service offered buy buses feeding directly into neighborhoods) might more than make up any higher costs (if indeed cost estimates are accurate). If presented in terms of a more traditional benefit-cost framework, it is likely that busways would compare far more favorably with fixed guideway rail options." Cervero 4.9

"The real advantage of busways...is that they reduce...transferring, the Achilles heel of mass transit in many modern, low-density metropolises like Honolulu." Cervero 4.3

"...a TSM II could be considered that...might include contraflow lanes, busways, reversible bus streets ... " Rutherford 7.2

"In summary, I would recommend that an additional study be commissioned that seriously examined a range of busway options as legitimate contenders to the fixed guideway rail options." Cervero 5.3

3. Buses and Vanpools.

"...I do not believe a sufficient number of significant high-quality mass transit alternatives have been considered for Oahu." Cervero 3.3

> *COST COMMENT: Mass transit is used here with its normal meaning of vehicles moving people en masse such as in trains, buses, vans or taxis. By brilliant PR, the city has managed to co-opt it to solely mean rail transit.*

"It is particularly important that intensified and significantly upgraded bus transit options be considered for Oahu in light of the fact that the bus system already in place has proven itself to be one of the most heavily utilized and cost-productive operations in the country." Cervero 5.3

"Other TSM strategies, such as those involving regional vanpool services, timed-transfer bus facilities, and auto-restraint measures, are ignored." Cervero 3.9

D. Political Considerations.

"This criticism [of the City's TSM alternative], I believe, is less a reflection on the work of the consultants and more an outcome of pressures exerted by various political and special interest groups." Cervero 3.4

> *COST COMMENT: This may be acknowledging that Parsons, Brinckerhoff, the City's consultant for the Alternatives Analysis is also one of the nation's primary authorities on busways. They are the authors of High Occupancy Vehicle Facilities. December 1990.*

"The TSM option appears "born to lose," as most TSM options are in alternatives analyses." Rutherford 7.2

"As presented, the alternatives give the impression that a fixed guideway rail system, be it light or heavy rail, was pre-established at the outset to be the preferred high-capacity transit technology for Oahu." Cervero 3.8

Appendix IV

State Data Book, Table 18.24-- PUBLIC TRANSIT, FOR OAHU: 1991 TO 2000

[As of June 30. Tables in previous Data Book editions were based on calendar year. Service provided by City and County of Honolulu bus system]

Year	Number of buses	Bus mileage 1/	Total passengers 2/	Revenues (dollars)
1991	510	18,063,079	72,815,706	18,757,312
1992	475	18,185,305	72,980,668	19,534,923
1993	470	18,120,044	75,557,318	19,837,616
1994	501	18,396,694	77,338,147	23,897,154
1995	508	19,031,466	72,745,086	25,058,736
1996	523	19,090,912	68,923,459	30,420,976
1997	524	19,452,528	68,634,884	29,804,091
1998	525	19,665,805	71,822,553	29,197,402
1999	525	19,639,602	66,236,147	27,819,265
2000	525	20,359,607	66,602,820	27,055,656

1/ Estimated number of vehicle miles.

2/ Estimated number of passengers, including senior citizens and disabled.

November 13, 2002

Mr. Cliff Slater
3105 Pacific Heights Road
Honolulu, Hawaii 96813

Dear Mr. Slater:

Subject: Primary Corridor Transportation Project

This is in response to your oral testimony at the April 20, 2002 SDEIS Public Hearing and April 20, 2002 letter regarding comments on the Supplemental Draft Environmental Impact Statement (SDEIS).

1. *I'm a 40-plus year resident. I have a bus pass. And I'm here to testify against the telebus.*

   Response: Comment noted. No response required.

2. *You've – one of the things that you have not heard is that the cost of the system for each additional rider on the BRT, as opposed to the TSM Alternative, each rider will be subsidized $3,500 annually.*

   Response: The system is not being built only for new riders. It will substantially benefit existing riders as well. Comparing total system capital and operating costs to only new riders is not meaningful except as a relative measure. From a relative standpoint the Refined LPA is more cost-effective than either the TSM or No-Build Alternatives, in terms of the cost per new rider served.

3. *That seems to me to be somewhat excessive. And I just don't believe that we're putting our money in the right place.*

   Response: Comment noted. It is a statement of opinion.

4. *The approach should be more, what is the 92 – you know, how are we going to solve traffic congestion for the 92 percent of the people who drive, in addition to taking care of the eight percent of the people who take the bus?*

   Response: The Refined LPA is the transit component of the island-wide transportation plan. The vast majority of the funding in the OMPO TOP 2025 Plan is for highway projects not transit. The Refined LPA will help reduce congestion by diverting some motorists out of their autos.

5. *Now, with only three minutes to address the City's voluminous paperwork, which I've gone through, I'm just going to stick to one issue, and that is, the City's absurd forecast for the No-Build Alternative. And what I'm about to say is all detailed and footnoted in the written testimony. If anybody wants it, they can contact me. The No-Build Alternative is essentially the one that says,*

If we only do what we've got now with some minor improvements, then what kind of ridership do we get? And I chose that no-build – those no-build forecasts rather than the BRT forecast, because we can compare past forecasts with what actually happened to the ridership.

Response: Comment noted.

6. *Secondly, this ridership, the no-build ridership, is the cornerstone on which the BRT forecast is based. And if this is not achieved, then there will be even more cars on the roads, and traffic congestion would be even worse than the City presently predicts.*

   Response: Comment noted.

7. *So if we look at Honolulu's forecasting record, first the Hart plan in 1960 overestimated what the 1995 ridership would be under the no-build scenario by 37 percent.*

   Response: This is not a relevant comment. Totally different forecasting models were used in 1992.

8. *Then the Hall 2000 study of 1984 overestimated the 1995 ridership by 30 percent.*

   Response: This is not a relevant comment. Totally different forecasting models were used in 1984.

9. *The City's 1992 forecast, which they did for the rail transit program, that overestimated the bus ridership for 2000 by 32 percent. You have to hand the City at least they're consistent.*

   Response: This is not a relevant comment. Totally different forecasting models were used in 1992.

10. *And just to sum up, okay, the City now tells us that, for the no-build, we're going to have a 54 percent increase from what we have today, and there is – we have about eight pounds of paperwork from the City, and there is not one place where that is addressed. And as somebody said a little earlier, the devil is in the details. If you don't get the ridership, you just got a lot of fancy hardware and no results.*

    Response: The projected increases in population, employment, service levels, ridership, etc between today and 2025 with the No-Build Alternative and the bases for these forecasts are documented in the FEIS.

11. *The Supplemental Draft Environmental Impact Statement (SDEIS) is deficient in failing to plan on reducing traffic congestion, failing to justify its unprecedented predictions for Bus / Rapid Transit ridership, and failing to address the many proven alternatives which have elsewhere been shown to be more effective than what the City proposes.*

    Response: The purpose of the BRT project is not to on its own reduce traffic congestion. It is one component of a larger transportation system. The DEIS, SDEIS, and FEIS Chapter 1 state the purposes of the Primary Corridor Transportation Project as:
    1. Increase the people-carrying capacity of the transportation system in the primary transportation corridor by providing attractive alternatives to the private automobile.
    2. Support desired development patterns.

3. Improve the transportation linkage between Kapolei, which is envisioned to be the "Secondary Urban Center" of Oahu, and Honolulu's Urban Core.
4. Improve the transportation linkages between communities in the Primary Urban Center (PUC) to increase the attractiveness of in-town living.

As indicated in Chapter 4 of the FEIS, congestion will be less with the Refined LPA compared to the other alternatives. Ridership forecasts were prepared using state-of-the-art forecasting models. There are no proven alternatives elsewhere that are more cost-effective than the Refined LPA.

12. *First, Honolulu commuters are expecting that the Primary Corridor Transportation Project1 will give them some measure of relief from traffic congestion. 1 Supplemental Draft Environmental Impact Statement: Primary Corridor Transportation Project. U.S. Department of Transportation and the City and County of Honolulu. March 2002 (SDEIS)*

Response: See response to comment #10. It is unrealistic for commuters to expect that one project on its own will alleviate traffic congestion.

13. *Instead, the City's BRT plan predicts that traffic congestion, under the City's most optimistic BRT scenario, will be worse than it is today.*

Response: Not a correct statement. As shown in Chapter 4 of the FEIS, traffic LOS will be worse with the No-Build and TSM Alternatives compared to the Refined LPA.

14. *The City plans to improve bus service by removing existing automobile lanes and change them to exclusive bus lanes. In short, they will improve bus service for the 8% of commuters that use it, but only by making traffic congestion worse for the 92% of our citizens that drive.*

Response: Chapter 4 of the FEIS fully discusses the consequences of converting selected general purpose lanes to priority use by transit vehicles.

When people are diverted onto public transit, congestion for motorists will be less with the Refined LPA than it would be with the No-Build or TSM Alternatives. Conditions will be much better for BRT riders with the Refined LPA since they will have a path clear of the congestion along much of the In-Town and Regional BRT routes.

15. *Second, traffic congestion will be even worse than what the City projects because they will not meet their optimistic BRT ridership projections. Fewer riders will mean more cars.*

Response: Comment noted.

16. *Third, the serious decline in Honolulu's bus ridership over the past ten years is totally ignored in discussing projected ridership increases. Nor does the City address reasons for the long-term decline in the percentage of commuters using public transportation all over the U.S. These must be explained to make any sense of the City's projections.*

Response: The decline in ridership of the bus system in Honolulu over the past decade is tied to the weak economy and minimal population growth that has occurred during this period.

The decline in the percent of people using transit in the U.S. has resulted from growth patterns in most cities that are difficult to serve effectively by transit. In contrast the concentration of growth proposed for the primary corridor combined with an improved transit system is why Honolulu is projected to counter this trend.

17. *Fourth, even if the City were to make its BRT budget estimates, the cost per each additional bus rider will be an outrageous $3,700 annually. Cost overruns will increase this. There are far more effective and cost-efficient projects to be adopted that will also qualify for federal funds.*

Response: The system is not being built only for new riders. It will substantially benefit existing riders as well. Comparing total system capital and operating costs to only new riders is not meaningful except as a relative measure. From a relative standpoint the Refined LPA is more cost-effective than either the TSM or No-Build Alternatives, in terms of the cost per new rider served.

18. *Fifth, like its former rail transit plan, the city has examined none of the alternatives that have proven to work elsewhere. We shall discuss these in detail.*

Response: Comment noted.

19. *Sixth, the Federal Transit Administration's (FTA) name is on the SDEIS giving the impression that they have examined and approved the plan.*

Response: The FTA is the federal lead agency for the project under NEPA. One of their responsibilities is to review and approve the MIS/DEIS, SDEIS, and FEIS.

20. *Ten years ago the state of Hawaii employed outside transportation experts from the nation's leading universities to critique the rail transit proposal of the time. 2 No such outside critique was sought for the BRT plan. However, the experts' comments on the rail transit plan are for the most part valid for today's BRT plan. We shall quote from them extensively where appropriate. 2 An Evaluation of the Honolulu Rapid Transit Development Project's Alternative Analysis and Draft Environmental Impact Statement. Hawaii Office of State Planning and University of Hawaii. May 1990.*

Response: Comment noted. We do not agree that the Honolulu Rapid Transit Project that was proposed ten years ago is comparable to the proposed Primary Corridor Transportation Project.

21. *"...the primary benefit of rapid transit is not the reduction of automobile congestion. Rapid transit's primary benefit should be to substantially increase mobility for transit-dependent commuters."*

Executive Summary, Evaluation of the Honolulu Rapid Transit Development Project's AA/DEIS. Hawaii Office of State Planning. February, 1991.

You would think that when the City discusses Improving Urban Mobility, they mean reducing traffic congestion. They do not. What the city means is improving service for bus riders – at the expense of drivers.

Response: This quote and the report cited pertain to the 1990 Honolulu Rapid Transit Development Project and is dated information that pertains to a different project. The cited report paragraph actually states: "The final environmental impact statement should more clearly state that the primary benefit of rapid transit will be to substantially increase mobility for transit-

dependent commuters. Rapid transit may relieve some traffic congestion, but that objective is more difficult to achieve, because of the large latent demand for auto travel in highly congested areas. Some of the other public benefits of rapid transit such as the increase in general mobility, the decrease in required downtown parking capacity, the opportunity to improve urban design and character, and the facilitation of both pedestrian travel and short, intra-city trips should also be discussed in the final environmental impact statement."

Urban mobility does not necessarily mean reducing traffic congestion. It entails providing residents with several options to utilize in making a trip, be that the automobile, transit, taxis, walking, or bicycling.

22. *Here's what the plan says:*

"While greatly improving transit service and person carrying capacity, the ... BRT ... would result in a somewhat reduced Level of Service for automobile traffic within the urban core." (SDEIS, S-8.7)

Response: The text actually states: "While greatly improving transit service and person carrying capacity, the TSM and Refined BRT Alternatives would result in a somewhat reduced LOS for automobile traffic within the Urban Core." (SDEIS, eighth bullet)

23. *"The ... BRT ... would provide more person carrying ability ... by reallocating roadway lanes from general ... use to transit or ride-share use" (SDEIS 4-11.5)*

Response: The text actually states: "Improvements within the In-Town urban core with the TSM and Refined BRT Alternatives focus on converting general-purpose traffic lanes to semi-exclusive and exclusive transit lanes. Doing so improves person-carrying capacity, thereby providing an alternative to the automobile for mobility within the Urban Core. (SDEIS page 4-11, fourth paragraph)

"Table 4.2-1 shows that the Refined BRT alternative would improve the person carrying ability within the Urban Core by an average of 11 percent over the No-Build Alternative. This means that to get an equivalent increase in general-purpose throughput, total Urban Core roadway lanes would have to be increased by almost two lanes in each direction, which will require major displacements." (SDEIS page 4-1, Section 4.2.1, third paragraph)

24. *"Due to their use of exclusive transit lanes, BRT vehicles could pass freely through congested intersections even though intersection LOS for the general-purpose lanes might be poor. The result would be less delay for transit riders and better transit schedule reliability." (SDEIS 4-20.5)*

Response: No response required. It is a direct quote from the SDEIS. It should be noted that the paragraph begins by stating: "Improving person carrying capacity in a congested urban area relies on the ability of the transit system to operate efficiently. Table 4.2-7 shows that the Refined BRT Alternative would be unique in providing a travel mode that could avoid the auto congestion at key intersections that is forecasted for all alternatives."

25. *It is easy to figure out why traffic will get worse; many streets will have existing lanes turned into auto-free exclusive BRT lanes. Below are rush hour photos of affected City streets. Note that on Kapiolani Boulevard four lanes are going one-way into town. These will be reduced to just two lanes. Dillingham Boulevard presently has three lanes coming into town one-way in the morning; it will be reduced to ONE! See the SDEIS pp. 2-21 & 2-22 for a list of all the many streets that will lose lanes.*

Response: The comment is incorrect. There are two (not three) through travel lanes in each direction on Dillingham Boulevard today. Besides, it is not the conversion of lanes that will create the congestion. The congestion for motorists will be there without the BRT. When people are diverted onto public transit, congestion for motorists will be less with the Refined LPA than it would be with the No-Build or TSM Alternatives. Conditions will be much better for BRT riders with the Refined LPA since they will have a path clear of the congestion along much of the In-Town and Regional BRT routes.

26. *The City did not see fit to carry over existing congestion levels for 1995 for comparison purposes from the DEIS. However, table 1.2-9 in page 1-18 of the DEIS may be compared to table 4.2-3 on page 4-14 of the SDEIS to see that overall traffic congestion in the future with BRT is projected to be worse than today.*

Response: As shown in Chapter 4 of the FEIS congestion will be less with the Refined LPA not worse compared to the No-Build and TSM Alternatives.

27. *Improving public transportation is unlikely to have any beneficial effects on traffic congestion.*

Response: As shown in Chapter 4 of the FEIS congestion will be less with the Refined LPA not worse compared to the No-Build and TSM Alternatives.

28. *See Appendix I for comments on the 1992 rail plan's likely impact on traffic congestion by some of the nation's leading transportation experts. And bear in mind as you read them that grade-seperated rail was obviously a better candidate for traffic congestion relief than BRT.*

Response: See response to questions 72, below. It should be noted that the information quoted was prepared over ten years ago for the Honolulu Rapid Transit Development Project. It is outdated information and the former rail project and the proposed BRT project do not have identical alignments, stop locations, etc.

29. *You can easily imagine what all this reduction in rush-hour road space will do to traffic. Review the photos on the page following.*

Response: See response to comment # 14.

30. *The HART plan forecast in 1980 that if the City did nothing beyond already planned road improvements and merely expanded the bus system, ridership would increase to 100 million annually by 1995. (Transit Coalition for Honolulu. The Hart Book. 1981) In fact, by 1995 ridership was only 73 million – a 37% overestimation.*

Response: The accuracy of travel demand forecasting models has improved significantly since 1980.

31. *Subsequently, the Hall 2000 study, predicted in 1984 that if the City did nothing special beyond what they had already committed to, bus ridership would increase to 85 million riders by 2000. (The daily data of 274,000 was changed to annual to allow comparisons.) However, actual bus ridership of 66.6 million for 2000 was less than it had been at the time of the prediction. Thus, this was a 22% overestimation.*

Response: The accuracy of travel demand forecasting models has improved significantly since 1984.

32. *Subsequently, in 1992 the City forecast for their rail transit plan, a 21% increase in ridership from 1991 to 2005 (Final Environment Impact Statement. 4-10.7) If they did nothing special. (This is the so-called No-Build Alternative, defined as those eight roadway projects already committed for the next two years, and expansion of bus service for areas planned for development.) So far, we have seen an 8.5 – 13% DECREASE. (State Data Book 2000. Table 18.24. See also Appendix III.) Even if ridership does not decline further by 2005, it will be a 32%+ overestimation.*

    Response: The relatively static population growth combined with the weak economy during the past decade, which were not anticipated when the 1992 forecasts were prepared, have resulted in the overestimation.

33. *Now the City is forecasting that, once again, if we do nothing special, there will be 286,700 daily bus trips in 2025 (SDEIS, Table 7.1-2) against 1991 trips of 206,650, a 39% increase. However, since 1991 we have had this decline in ridership and so, to make their forecast, they will need to increase simple regular bus ridership 54%.*

    Response: The forecast of 2025 ridership is consistent with the population growth forecast and return to a healthier economy than has prevailed during the past decade.

34. *Now remember that this decline in ridership for 1991 – 2000 has occurred despite a 5% increase in Oahu's population and more buses in use – from 475 ((1993-4 State Data Book) to 525. (2000 State Data Book) And ridership is still declining as of the latest publicly available data of September 2001. (American Public Transportation Association statistics to September 2001)*

    Response: See responses to comments #32 and #33.

35. *Given the above it is impossible to believe that the City will actually make anything like a 54% increase.*

    Response: Comment noted.

36. *On top of the "No Build" forecast the City wants us to believe that the BRT will boost this to 336,700 daily transit trips (SDEIS 7-6. These are linked trips, which is to say, from departure point to destination regardless of transfers. This is different from what the City normally reports which is boardings. If you transfer once on your way to your destination it will count as two boardings. Typically, for the system overall, there are 16% more boardings than trips.) vs. 206,650 trips in 1991 (about 186,000 today). (SDEIS 4.5.4.)*

    Response: The relationship between linked-trips and boardings is not a static percentage. It varies with possible changes in service provided and with changes in trip patterns.

37. *No city in the U.S. has experienced such an increase in public transportation no matter what they have done – rail transit, busways or anything else – once they were past the initial government takeovers and subsequent massive deficits of the 1970s.*

    Response: No one is comparing ridership to what it was in the pre-1970s.

38. *One can begin to understand why many University of Hawaii specialists in economics and forecasting wrote the City Council in 1992 about its then rail transit plan, saying "We have little faith in the projected ridership and cost figures." (University of Hawaii faculty members. Memorandum to Members of the Council, City & County of Honolulu, November 7, 1991.)*

    Response: Specialists in travel demand forecasting from the University of Hawaii have been involved in developing the forecasting models that were used in the current ridership forecasts.

39. *One can also understand the outpouring of criticism from the state's own distinguished experts on the flaws in the ridership projections (see Appendix I). One of them was Dr. Moshe Ben-Akiva, Turner Professor of Civil Engineering at MIT, and a forecasting colleague of Nobel Prize Winner, Professor Daniel L. McFadden. Ben-Akiva said of the 1992 exercise, "I question the validity of the forecasting procedure..." and "I am not convinced that any of the models is transferable to other situations and I would recommend not to use them without further testing." And "Any forecasting exercise of this nature would be associated with significant uncertainties."*

    Response: OMPO has spent the last 5 years developing a vastly improved set of forecasting models. These are the models used in the PCTP. Comments made in reference to the models used in 1992 are not applicable.

40. *One of the recommendations that came out of the U.S. Dept. of Transportation's review of the highly flawed rail transit forecasting of the 1970s and 1980s was that planners should "acknowledge that uncertainty in achieving any specific level of predicted ridership levels exists," and should, "be conveyed simply by expressing forecast ridership for each alternative as a range rather than a single point value." (Pickrell, Don H. Urban Rail Transit Projects: Forecast Versus Actual Ridership and Cost. U.S. Dept. of Transportation. October 1990. p. 74.)*

    Response: This recommendation from the Pickrell Report was not adopted by the FTA who oversee how forecasting is done.

41. *What should give us pause is that City forecasts for the last 30 years have been consistently in error and in the same range of 30%+ as those experienced elsewhere. Yet this latest forecast of BRT ridership, the 336,700 riders projected for 2025, is shown to the nearest hundred. This conveys to the reader a certainty to the nearest 3/100ths of one percent, a ridiculous claim.*

    Response: It is standard practice to show ridership forecasts as they are shown in the FEIS.

42. *The best way to test forecasting models is to backcast. You go back to the 1984 date from the Hall 2000 study and use it in your model to forecast for 2001. Then go back to the 1992 date from the rail transit FEIS and again forecast for 2001. If the forecasts match the actual outcome then your model might have a chance of being right about the future. Certainly if a model cannot even backcast, it should not even be considered when risking taxpayers' monies. This has not been done.*

    Response: The models used to forecast ridership were indeed calibrated using industry approved methods of validation.

43. *Since the entire justification for the project rests on significant rates of electing public transportation over the private automobile, the failure to discover what would influence this choice may be a serious flaw." Dr. Canen. Evaluation of the Honolulu Rapid Transit Development Project's AA/DEIS. Hawaii Office of State Planning. February, 1991.*

    Response: Again, the analysis cited was completed in April 1990 and pertained to the Honolulu Rapid Transit Development Project. It is not applicable to the PCTP.

44. *World War II aside, the per capita use of public transit peaked in Hawaii (and the U.S.) in the early 1920s when the automobile began to compete with streetcars and buses. It continued declining until World War II when it then rose sharply with the introduction of gas rationing. At war's end, when rationing ended, the decline continued again until reaching its all time low in 1971. (Total annual transit rides, divided by population, or per capita transit use, is what used to be called the riding habit. In the days of privately operating public transportation it was considered the key indicator of transit viability. For example, in Honolulu proper in 1920 we had 17 million transit rides with a population of just 82,000 -- a riding habit of 207 -- and solidly profitable. By 1998 the area covered had expanded to the whole of Oahu and we had 71 million riders but a population of 872,000 -- a riding habit of 81. See Appendix V for chart.)*

    Response: Comment noted.

45. *At that time, the City socialized the then profitable bus system. (See Annual Report for 1971. Honolulu Rapid Transit Co. Ltd.)*

    Response: It is interesting to note that in 1971 HRT Ltd and wholly-owned subsidiaries had $402,917 earnings in 1971 and in 1972 the parent company reported a $494,449 loss, while the 1972 consolidated statement of loss indicated a $109,149 loss. (Source: HRT, Ltd., Annual Report, 1972).

46. *Once the City took over, it poured money into new routes to the suburbs, up the hillsides, and around the island. With new buses and new routes, transit use rose again -- albeit this time at a heavy cost to the taxpayer. In 1984 the per capita transit use peaked once more and then began another decline that has continued for the last 16 years.*

    Response: Actually, the 1995 annual bus ridership exceeded 1984 (80,837,153 total passengers compared to 76,260,187, respectively).

47. *The principal causes of the decline in public transportation use are well-known and well documented. The choices we make between public transportation and automobile are primarily functions of changes in real incomes, commuting costs and service availability.*

    Response: Although this statement may be true, the author does not reference where this is documented and by whom it is well known. It can also be said that commuters that are provided a rapid transit system that provides a faster commute that includes limited stops along the route may choose public transportation instead of driving a car. This is evidenced by the popularity of the CityExpress! routes Honolulu has implemented.

48. *As real (net of inflation) incomes increase, people tend to use public transportation less. Public transportation service is one of what economists technically refer to as inferior goods -- those goods and services that the more income you have, the less you want them. (UCLA's Professor George Hilton pointed this out in 1967 saying "... an increase of one percent in family income will typically reduce the family's use of rail passenger service by 0.6 percent. Thus, rail passenger trains provide an inferior service with respect to income, analogous to potatoes, farinaceous foods, and other inferior goods, consumption of which decreases with increments in income." Hilton, George W. Rail Transit and the Pattern of Modern Cities: The California Case. Traffic Quarterly, vol. XXI, no. 3. July 1967. p. 388) Thus, over the long-term, increases in incomes work against transit ridership.*

    Response: The referenced document is 35 years old and refers to "heavy" rail. In the paragraph following the one quoted it states: "There is little question that the Bay Area Rapid Transit will be more successful than the Southern Pacific commutation service in attracting passengers from automobiles."

49. *When real automobile commuting costs decline, people tend to use automobiles more. Conversely, increases in auto costs drive people to public transportation. When service availability declines, such as less frequent bus service, people tend to switch to automobiles.*

    Response: Comment noted. Although the factors stated do affect automobile and transit use, other factors also affect their use including income, proximity of transit service provided, automobile ownership, etc.

50. *Changes in real fares also impact ridership. The American Public Transportation Association calculates that, "On the average, a ten percent increase in bus fares would result in a four percent decrease in ridership." (APTA's online paper on fare elasticities.)*

    Response: Comment noted. The publication quoted also noted that peak-hour commuters are much less responsive to fare changes than transit passengers traveling during off-peak hours.

51. *Commuting costs also include the value we place on our time, which we tend to value at approximately what we earn. This is an important, albeit mostly intuitive, decision that commuters make. For example, some downtown commuters park their cars on Beretania Street at around $70 a month and others park near the center of downtown for $150. The more affluent value their time more and tend to choose the more expensive parking. The less affluent choose the longer walk and the cheaper parking.*

    Response: Comment noted. Other factors regarding parking and costs include the location of the work place, work hours, employer parking subsidies, etc. It should be noted that the BRT would allow people an option to driving their cars and not having to pay for parking. There are many affluent people around the nation that choose public transportation for their commute over driving a car.

52. *Parking costs are often the deciding factor in the commute decision. Our state government significantly subsidizes parking costs for state employees thus encouraging them to commute by car.*

    Response: Comment noted.

53. *Our city government requires developers to provide minimum amounts of parking in their buildings. This has encouraged the construction of far more parking than can be economically justified and thus parking costs are far lower than they would be if left to market forces. This again has encouraged people to drive.*

    Response: See response to comment #50.

54. *Service availability is usually a function of residential density. The higher density, the closer are bus stops and the greater the frequency of buses. People moving from Kalmuki to Makakilo will tend to use bus service less since bus stops will often be further away and buses less frequent*

    Response: Comment noted.

55. *Most of these factors are working against future public transportation increases. Incomes are rising, fares are increasing, parking costs are steady, density of residential areas is generally declining as more people leave the inner city and move to suburban areas such as those in the Leeward areas. (See Table 1.14 of the 2000 State Data Book showing 1990-2000 population changes by district and census tracts. Honolulu District lost 5,000 residents while Ewa District gained 42,000.)*

   Response: These are unsubstantiated assertions. Fares have not increased to any greater extent than parking charges. Future growth plans call for the densification of the primary corridor not decline.

56. *A smaller percentage of workers are using public transportation to get to work both locally and nationally. Latest estimates of the 2000 Census journey-to-work data (due later this year) are that it will show Hawaii having a significant reduction in the percentage of workers using public transportation to commute than did in 1990. (See Demographia Cox for 2000 data.) This is a trend that has been ongoing nationally and locally since 1980.*

   Response: In reviewing the reference cited, what was not included was that Hawaii's employment also declined between 1990 and 2000, from 567,765 to 563,154 or a loss of 4,611 jobs. The transit market share for work trips also decreased between 1990 and 2000, from 41,827 to 35,368 or 6,453. To correct this trend the City is proposing major improvements to the bus system as embodied in the Refined LPA. Similar types of improvements in other cities have demonstrated the ability to reverse these trends and to divert people out of their autos and on to transit.

57. *In summary, bus ridership is not going to increase by merely "visioning" – a euphemism, for "wishful thinking." Voters should demand of their elected officials solid justification in forecasting increases in bus ridership – more than just improving their re-election chances.*

   Response: The ridership forecasts were not prepared by elected officials. The methodology used in preparing the forecasts is documented in the FEIS and in the Final Documentation for the OMPO Travel Forecasting Model Development Project.

58. *The BRT plan's capital costs will be $750 million more than the No-Build alternative half of which will be federally funded. It is incorrect to dismiss the federal funding as "free" money. The fact is that there are many sensible alternatives that would generate equal or greater funding than BRT.*

   For example, a busway qualifies for 80% federal funding and its operating costs would be minimal. A busway would allow City buses to operate more frequent schedules because they would not be operating on clogged highways. Vanpools, jitney buses, shared-ride taxis and other high-occupancy vehicles would be far more popular for the same reason.

   Response: The comment doesn't reflect an understanding of what is being proposed since busways are the back-bone of the Refined LPA. These busways are within existing transportation rights-of-way.

59. *And it must be remembered that a rail transit line or a bus system expansion carries with it a massive increases in operating costs. Highway, on the other hand, have relatively minor maintenance per passenger carried.*

   Response: That's because the operating and maintenance costs of the cars and trucks using the roads aren't included. If these costs are included the bus system is much more cost effective in terms of cost per passenger carried.

60. *It is difficult to believe the cost forecasts for BRT because they tell us that there will be a 49 percent increase in jobs in public transit (SDEIS S-9). Transit jobs forecast to increase from 1,181 to 1,760, or 49%.) yet there will only be a 24% increase in operating and maintenance costs. (SDEIS 6-5. The forecast is operating costs for the BRT plan to be $188 million in 2010 vs. $152 million today for No-Build, all expressed in 2010 dollars.) However, since employee costs are typically 70% of operating costs (1996 National Transit Database System Wide Information for Honolulu DTS.) how can this possibly be?*

   Response: The 2025 jobs are being compared with 2010 operating and maintenance costs, which is not correct.

61. *The City's calculation of the cost for each new ride demonstrates the poor value of the BRT plan. The calculation is $7.42 for each additional ride for the BRT over and above that of the No-Build Alternative. This amounts to $3,710 annually per new rider. (The City shows the additional cost for each new ride as $7.42. Allowing commuters 500 rides annually (250 trips x 2 daily) is $3,710 cost per new rider annually. Source: SDEIS Table 7.3-1B on page 7-12.)*

   Response: See response to comment #2.

62. *"Perhaps what is most surprising, and to some extent alarming, about the alternatives presented is that few real choices are offered." Dr. Cervero p. 3.7*

   "The TSM option appears "born to lose," as most TSM options are in alternatives analyses." Dr. Rutherford p. 7.2

   Evaluation of the Honolulu Rapid Transit Development Project's AA/DEIS. Hawaii Office of State Planning. February, 1990.

   Response: The information cited is over ten years old and pertains to a different project.

   On the same page as the Dr. Cerver's quote, it also states: "This criticism, I believe, is less a reflection on the work of the consultants and more an outcome of pressures exerted by various political and special interest groups. The range of alternatives presented are built on several prior studies which established this corridor as the most potentially cost-effective one for building a fixed guideway system. At the outset, the consultants acknowledge that the same corridor which evolved from the PEEP I and PEEP II studies was adopted in this latest round of analysis. Through a careful prescreening of alternative routings for different segments as a result of a series of public hearings in 1987-88, the final set of alternatives were pruned to those included in the latest reports. Ostensibly because of concerns of displacing established residences, encroaching on parkland, interfering with surface street traffic, and intruding on several sites of historical significance, a number of other routing alternatives were eliminated."

   In the paragraph above Dr. Rutherford's quote, first sentence it states: "Given the linear nature of travel demand, high densities, the constrained travel corridor, good weather, and high current ridership, Honolulu is an obvious candidate for a fixed guideway transit of some sort."

63. *The City has not proposed, or even examined, alternatives that have been proven to work elsewhere. Nor did they for the 1992 rail transit plan. (See Appendix III.) They merely keep proposing the conventional solutions to solve our traffic problems that have not worked anywhere else. This should be recognized and the public told the real and uncomfortable truths.*

Response: BRT has proven itself successful in cities around the World, including Curitiba, Brazil; Nagoya, Japan; Madrid, Spain; Brisbane, Australia; Wellington, New Zealand; Dublin, Ireland; Ottawa, Canada; Pittsburgh, PA; Washington, D.C.; Los Angeles, CA; New York City, NY; and Orlando, FL to name a few.

64. *Congestion caused by people commuting at normal daytime hours to major job centers such as downtown and Waikiki. These trips are one-time peak hour trips and TheBus is not the answer. What commuters need to get them out of their cars is door-to-door transportation. The most efficient way to do this with vanpools. The problem is that the vanpool is priced at $70 a month vs. the Express Bus at $25. This makes the bus the hands down winner for people on a tight budget. However, the price for TheBus does not reflect its cost whereas the vanpool does. (The vanpool covers 90% of its operating cost whereas the Express Bus only covers 15%.) If the Express Bus were to charge commuters its cost of $175 per rider per month, few would ride it. Obviously, if anything, we should be subsidizing vanpools instead of Express Buses.*

Response: Reducing congestion requires a multi-modal approach. Buses, BRT, vanpools, HOV lanes, parking management, etc. are all measures that are needed.

65. *Another fine example is that offered by Honolulu's tour bus operators whose vehicles are not that busy during commute hours. They have offered guaranteed seat Express bus service that require a subsidy far less than what it is currently costing the City. Either of these services can provide commuter service for hotel workers and others who tend to commute at set times. A study participated in by state workers in 1991 showed that 91% of participants were very interested in door-to-door guaranteed-seat service. (Flannelly, K.J., Flannelly, L., McLeod, M.S., Jr. Behnke, R. W. Direct Comparison of Commuters' Interests in Using Different Modes of Transportation. Transportation Research Record #1321. Transportation Research Board. 1991)*

Response: The referenced study indicates that the survey conducted was not participated in by state workers but by Mililani workers using a mail survey conducted in cooperation with the neighborhood board. Six hundred and sixty-six (666) surveys were analyzed. The 91% interest in door-to-door, guaranteed-seat service was based on a $1.00 one-way fare. The study also shows that if the one-way fare offered increases to $2.00, ..."consumer interest drops sharply with higher fares and quickly becomes negative." The negative interest relates to a $3.00 one-way fare.

66. *Congestion caused by people moving around the Urban Center throughout the day. TheBus is not the best way to attract people from their cars for journeys from say, Downtown to Waikiki; it is too slow. Honolulu's jitney buses of the 1930s with their smart uniformed drivers were then much faster and more popular than the streetcars judging from the evidence given during HRT's suit against them in 1940. At that time the public pleaded with the court for the jitney buses to stay. As a current example, the air-conditioned handsome jitney buses in Atlantic City provide service at 40-second intervals -- and they run 24 hours a day.*

Another option is the use of shared-ride taxis. These taxis are able to take many commuters at prices lower than exclusive ride taxis and since they accommodate more riders, relieve traffic congestion. They are widely used in Washington, DC and elsewhere but illegal in Honolulu.

Response: Independent small vehicle carriers are most likely to fall under the City and County's taxicab rules and regulations the Department of Customer Service administers, Chapter 12, Regulations of Common Carriers and Their Fees, Rivas Ordinances of Honolulu. As of 1998, there were 1,365 taxicabs licensed to do business in the City and County.

Upon initial reading, jitney services would not appear to be allowed under the City rules, except when there is a total stoppage in the public bus service (see Section 12-1.11 Special operations). This section appears to treat jitney services as an extreme exception, rather than an allowable practice under certain conditions. Taxicabs, however, are allowed to provide shared-ride service, as long as each passenger agrees to share the ride with the other passenger(s) (see Sec. 12-1.24 Shared-ride service; Sec. 12-1.4 Prohibited acts. (d) Additional Passengers). This section on shared ride service specifically allows for limousines and multi-passenger vans. Under the shared rider service rule, any taxicab could technically operate as a jitney by having signage indicating that it is a shared ride taxicab for a particular street or route.

The State Public Utilities Commission (PUC) regulates non-taxicab transportation service carriers—Hawaii Administrative Rules, Title 6, Chapter 62, Motor Carrier Rules and Classification of Property and Passenger Carriers. In general, the PUC-regulated carriers are companies with one or more fleets of vehicles ranging from large vans to shuttles to mini-buses to full-size buses.

The PUC issues two types of certificates for non-taxicab transportation service carriers: irregular route and regular route. The certificate of irregular route service is for service of a general nature, which may have fixed stops but not on a regular schedule. All of the major transportation and tour companies have certificates of irregular route service. The certificate of regular route service is for service over a fixed route with stops at fixed locations and on a time schedule, which could be daily or hourly. Examples of regular route service are E Noa Tours' Waikiki Trolley and the Ala Moana Shuttle. Companies under regular route certificates operate in such areas as Maui's Kapalua/Kaanapali/Wailea/Lahaina loop and between resort areas on the island of Hawaii. Regular route service is almost akin to a private bus service. Although, there is no public subsidy, some companies keep passenger fares low by seeking cost sharing form resort properties and attractions serviced by regular route service.

Specifically exempt from PUC rules are "county-regulated passenger carrying operations known as "jitney services"... "utilizing motor vehicles that have seating accommodations for six to 25 passengers, operate along specific routes during defined service hours, and levy a flat fare schedule" (See Hawaii Revised Statutes, Chapter 271-5(18), Exemptions, generally). The intent of this exemption seems to be one of avoiding doubly regulating jitney operations. However, as described earlier, the City and County of Honolulu does not currently regulate jitney services, except for providing an exception for service during a total bus stoppage. In fact, under the PUC's current rules structure, a regulated motor carriers could operate a service that would have many of the same features as a jitney service, i.e., fixed route, semi-regular schedule of smaller vehicles such as trolleys or shuttle vans or mini-buses.

(Source: Draft Product 2-5, Technical Paper on Privatization Options, June 1999)

67. *A growing annual bus subsidy that is now over $100 million annually (including capital costs). Our bus system is the most efficient government bus system in the U.S. We also have a wonderful post office. You can be proud of them as long as you do not compare either of them with their profitable counterparts such as Atlantic City jitney bus service and Federal Express. There are ways to reduce the heavy burden on taxpayers and vanpools, private bus use, shared-ride taxis*

and jitney buses are just some of them. Ten years ago, Britain's London Transport was losing 40 cents on every dollar they took in. Today, it is privatized and profitable with the same level of service it had before. Buenos Aires, Argentina, thirty years ago lost more money than TheBus. Today, a myriad companies run 18,000 buses, none more than 23 passenger, and they are profitable and no longer drain on the taxpayer.

Response: Comment noted. No response required.

68. *During rush hours all highways coming into town from the Leeward area are far too congested. COST first proposed ten years ago that we should examine the feasibility of a new busway along the same alignment as the former rail transit proposed line from Waiawa to about the old OR&L rail station downtown. It would be two lanes with a safety lane, one-way into town in the morning and one-way out in the afternoon with three or four places for ingress and egress to the main freeways. It could be either state-funded for HOV van pools, high-occupancy autos and buses or it could be privately funded as a tollway. Motorists pay to be on it but it would take a great deal of traffic off existing freeways. Nothing has been done about this proposal.*

   A busway would expand leeward mobility far more than BRT, cost less and quality for a greater percentage of federal funds.

   Response: Use of the already in place H-1 freeway as a busway/HOV facility by extending the existing A.M. zipper lane and adding a P.M. zipper lane along with ramp improvements that give priority to buses is a much more cost effective solution to serving the Leeward area than building a whole new busway (particularly since much of the right-of way for an independent busway no longer exists).

69. *The Federal Transit Administration's (FTA) name is shown above the City's on the SDEIS giving the impression that they have examined and/or written the plan with the same kind of input as the City planners and approved it. Unless the FTA has indeed carefully examined the plan and signed off on its forecasts then it should either remove its name from the Final EIS or make it clear to the public that it does not stand behind these forecasts but is merely accepting "local decisions."*

   Response: The MIS/DEIS, SDEIS, and FEIS are Federal documents and the FTA (as the lead Federal agency) is responsible for the contents. The City is a cooperating agency.

70. *The problem is that the City never spends time analyzing our traffic and transportation problems. Instead they get "visions" of the wishful thinking, ribbon-cutting variety. Then the solution drives everything else. To paraphrase the old saying, they put the train before the passenger.*

   Response: It should be noted that the City, State, and OMPO are continually analyzing and implementing solutions to Honolulu's traffic and transportation problems. This is evidenced by the Transportation for Oahu Plan, TOP 2025, which includes congestion relief projects, transit and alternative modes projects, operations and safety projects, second access projects, projects that support community planning goals, and projects that provide local circulation and/or community access.

71. *And, as with all governments, they tend to simplistic views of complicated problems that will allow them a one-size fits-all solution. Give them responsibility for clothing and you get the Mao jacket and the old Soviet baggy suit. Give them transportation and it's the one-size bus.*

Response: The Refined LPA includes many components including conversion of the bus system to a hub-and-spoke network; maximizing use of the existing H-1 Freeway through zipper lane and ramp improvements; and an In-Town BRT which significantly increases the people carrying capacity of the roadway system in the urban core. These are all innovative, cost-effective approaches to meeting future needs without the need for major roadway widening and new construction.

72. *What is needed is a review of what has worked elsewhere in improving mobility, ameliorating traffic congestion and reducing costs.*
   A) New York City shows us that having the City take a hands-off approach to parking and letting the market drive it significantly reduces automobiles on the road.
   B) Honolulu's own experience with vanpools shows us that using vouchers in conjunction with vanpools would allow us to simultaneously increase ridership and lower costs.
   C) Buenos Aires and London's experiences with privatization show how we could provide better service at lower cost.
   D) Door-to-door buses and vans using busways such as Washington DC's Shirley Highway, and others elsewhere, show us that busways can carry far more riders than rail transit lines.
   E) Atlantic City's Jitney buses today and Honolulu's experiences during the 1930s show us how to run a profitable urban service.
   F) Washington DC's shared-ride taxis show us how to increase highway capacity during rush hour.

   Response:
   A) New York City parking costs can be as much as $600 per month. New York City Transit carries six million trips per day, about two billion trips annually. New York has a fine, well-established, public subway and bus system, which includes BRT. (http://www.mta.nyc.ny.us/nyct/facts/ffintro/htm)

   B) On a per ride basis, vanpool costs become comparable to the operating and maintenance costs of a bus when there are at least 5 passengers per van.

   C) Bus privatization in London was not initiated to relieve traffic problems. Charlie Lloyd of the University of North London points out that while privatization has been relatively cost effective in London, that stands in sharp contrast to privatization ventures elsewhere in Britain. (http://www.citebc.ca/Mar96_London.html) These bus systems also still report to Transport for London, which oversees bus companies and sets fares. Transport for London reports to London's mayor.

   Our research for Buenos Aires mentions public buses and subway system, not privatization.

   D) We concur that busways can carry as many people as rail transit lines and thus the BRT Alternative. "Since September, 1969, high-speed buses have been traveling on the Shirley's exclusive bus lanes, providing for many commuters an alternative to the daily time-consuming, rush-hour drive in bumper-to-bumper traffic. An increasing number of these former motorists are leaving their cars at home or parked in the suburbs and taking the bus, because the bus gets them to and from work much faster." (http://www.roadstothefuture.com/Shirley_Busway.html)

   E) Jitneys were popular in the first half of the 20th century in lots of American cities, like Honolulu. The reason they worked well and are only seen in a few cities today may be attributable to the

population increases and geographic expansion major urban areas have experianced. Honolulu's population has quadrupled since 1930, when it was 202,887. (http://www.hawaii.gov/dbedt/2000/010197.html)

F) Washington D.C. has an efficient and effective public transit system which includes an extensive rail system plus local and express buses. In 2000, 37 percent of Washington residents took public transportation to work, 12 percant walked, and four percant worked from home. Thirty-eight percent of the city's residents do not own a car. Average daily ridership on the Washington Metro was 588,500 in January 2001and the average daily ridership on Metrobus was 473,900. While shared taxis do help to alleviate some traffic during rush hour, the metro area's highways and freeways would go from bad to worse if shared taxis were the only transportation alternative. Taxi cab rides would average more than $20 one way for most suburban Oahu residents' homes to downtown Honolulu, which would be $40 round trip. Even if shared with 3 other people that's $10 per day or $225 per month for most commuters.

73. *(A)"A rapid transit system will not be likely to improve [traffic congestion], and such improvements should not be a major selling point for the system." Rutherford 1.5*
B) "...it is debatable whether any noticeable impact will occur on highway facilities ... " Rutherford 6.5
C) "...estimates of fuel, pollution, and time savings on highway facilities are generally paper exercises that seldom occur in the real world." Rutherford 3.5
D) "The Final Environmental Impact Statement should more clearly state that the primary benefit of rapid transit will be to substantially increase mobility for transit-dependent commuters." UH 3.7
E) "...the primary benefit of rapid transit is not the reduction of automobile congestion. Rapid transit's primary benefit should be to substantially increase mobility for transit-dependent commuters." UH 24.3
F) "...it appears that relatively few public benefits of any regional significance will result from any of the fixed guideway alternatives." Cervero 14.3
G) "...it would be highly misleading to measure the success or failure of the proposed transit system solely on the basis of its ability to reduce auto congestion. To the extent that it increases the travel speed of current bus riders, who are slowed down by roadway congestion, this would be a benefit even if congestion levels on roadways did not fall at all. At least bus riders, who are not at all responsible for creating the congestion problem on the roads, would be less likely to suffer from it." Pucher 12.5
H) "The only really effective way to reduce auto congestion is by raising the price of auto use ... and by giving traffic priority to buses and high occupancy vehicles." Pucher 12.4
I) "In order to increase transit mode splits to the 20-30% range, a level that would begin to yield quite noticeable and important social and environmental benefits, some combination of the following initiatives would likely need to be introduced: increased fuel taxes and registration fee; elimination of free or heavily subsidized parking; introduction of an auto-restricted zone in the core area (such as practiced in Singapore); creation of HOV-lanes and contra-flow lanes that give buses operating on surface streets substantial speed advantages ..." Cervero 11.6

Response: The comments cited are from early 1990 publications regarding the Honolulu Rapid Transit Project. This information is over ten years old and was prepared regarding a rail project. Over the past ten years the travel demand models and methodologies and other analytic tools (energy, air quality, etc.) have evolved and have been refined. Also, only part of the information is presented in the quotes.

(A) The conclusion actually states: "A rapid transit system will not likely to improve level of service on streets and highways, and such improvements should not be a major selling point for the system."

(B) The sentence actually states: "As mentioned in Question 1, it is debatable whether any noticeable impact will occur on highway facilities because of the large latent demand for auto travel in highly congested areas. I do no think the issue is important; instead, this system will increase non-auto mobility substantially in a low polluting, energy efficient, and cost-effective manner."

(C) The paragraph actually reads: "The basic model structure discussed in Section 3.7 of the Task 5 report is described as a "nested logit model," which first splits travelers between auto and transit and then estimates access modes to transit separately. This model structure is appropriate as long as people's choice patterns follow model assumptions. If people must make a substantial tradeoff between being an auto passenger and a transit rider, this model structure may overestimate the number of actual automobiles taken off the road. In other words, the question is, what is the impact of auto occupancy when transit improves substantially? Measurements of improvements in auto travel due to transit investments have proven elusive as the latent demand for auto use has filled slots vacated by transit riders. For this reason, estimates of fuel, pollution, and time savings on highway facilities are generally paper exercises that seldom occur in the real world."

(D) See response to comment #20, above.

(E) The paragraph actually reads: "In this regard, we agree with Rutherford who argued that the primary benefit of rapid transit is not the reduction of automobile congestion. Rapid transit's primary benefit should be to substantially increase mobility for transit–dependent commuters. If you accept that premise, then the most cost-effective alternative may not be the most beneficial to the transit-dependent population."

(F) The paragraph actually states: "Given that all of the alternatives would only increase regional transit mode splits only slightly above the No-Build option, it appears that relatively few public benefits of any regional significance will result from any of the fixed guideway alternatives. This suggests that only those alternatives with marginal costs per additional rider that begin to match the fares that users will pay should seriously be considered. Only alternatives 10 and 11 seem viable on these grounds."

(G) The beginning of the paragraph quoted states: "The percentage reduction in total auto travel probably will not be significant—under 10%, even in the short-run. In the long-run, the initial reduction in congestion and improvement in travel time will almost certainly disappear, as new travel demand is simulated by the more attractive travel conditions—i.e. less congestion—on roadways. The only really effective way to reduce auto congestion is by raising the price of auto use (for example, by higher gasoline taxes, higher motor vehicle registration fees, and higher parking fees and taxes) and by giving traffic priority to buses and high occupancy vehicles. Building a new transit system would produce travel benefits even if it does not reduce congestion levels on roadways, because more trips would obviously be served. Thus, ..."

(H) See (G) above.

(I) The end of the sentence quoted actually states: "...and the introduction of various land use incentives (e.g. density bonuses; transferable development rights; impact fee credits) that will cluster future development around transit stations and encourage a development pattern that closely conforms with fixed guideway transit."

74. *A) I question the factoring of the transit trip table on the basis of population and employment growth, mainly because over the last decade Honolulu has shown rapid growth in everything but transit ridership ... This same pattern has been observed in many other U.S. cities." Rutherford 2.5*
B) "...the rates of growth for transit have not been in lock step with population and employment growth." UH 31.9
C) The City's ... model assumes that growth in transit ridership can be related as a linear function to growth in population and employment. This is a simple assumption that the City made for convenience. Although we have reasons to doubt the validity of this assumption, we have no better substitute." UH 36.7
D) "The City's consultants used a "pivot-point" methodology to project ridership for the different alternatives in the year 2005. This method, which was endorsed by UMTA, has only been used elsewhere for rail extension projects, rather than for a complete system." UH 2.2
E) The major weakness that reoccurs at several phases of the ridership forecasting methodology is the absence of validation against local data." Ben-Akiva 9.5.
F) "...no evidence is presented in the report on the validity of the ... tables." Ben-Akiva 2.8G) "...the level of accuracy of these boarding counts is not specified." Ben-Akiva 2.8
H) "The report does not present data to support these assumptions." Ben-Akiva 3.4
I) "My conclusion is that the selected values for the parameters of the mode choice model have not been sufficiently justified." Ben-Akiva 7.7
J) "I question the validity of the forecasting procedure ..." Ben-Akiva 7.9
K) "I am not convinced that any of the models is "transfereble" to other situations and I would recommend not to use them without further testing." Ben-Akiva 8.7
L) "Any forecasting exercise of this nature would be associated with significant uncertainties." Ben-Akiva 9.8
M) "...it is possible that parallel bus routes that now provide better service to some will experience a reduction in service level ... it should be pointed out that several new guideway projects in the U.S. attempted to force an unnatural number of trips to the guideway, even for short segments of longer bus trips. Some systems actually had lower total transit ridership after a fixed guideway system was built." Rutherford 6.6
N) "Since the entire justification for the project rests on significant rates of electing public transportation over the private automobile, the failure to discover what would influence this choice may be a serious flaw." Canan 1.8

Response: The comments cited are from early 1990 publications regarding the Honolulu Rapid Transit Project. This information is over ten years old and was prepared regarding a rail project. Over the past ten years the travel demand models and methodologies and other analytic tools (energy, air quality, etc.) have evolved and have been refined. Also, only part of the information is presented in the quotes.

A) This quote is from Review of Ridership for AA/DEIS Honolulu Rapid Transit Development Project by G. Scott Rutherford, Ph.D., P.E., Associate Professor of Civil Engineering, University of Washington and dated April 17, 1990. The quote actually reads, *"I question the factoring of the transit trip table on the basis of population and employment growth, mainly because over the last decade Honolulu has shown rapid growth in everything but transit ridership. Faced with this trend, it is inappropriate to increase the trip table merely on the basis of population and employment growth. From 1980 to 1987 population increased about 8 percent, motor vehicles 29 percent, and transit riders only 3 percent. This same pattern has been observed in many other U.S. cities." Rutherford 2.5*

The transit trip table was developed using the current travel demand forecasting process used by the Oahu Metropolitan Planning Organization (OMPO). The transit trip table is not derived through a factoring procedure but through a fully calibrated nested LOGIT mode choice model calibrated using 1995 population and employment data. The year 2025 population and employment data used are the current OMPO year 2025 projections.

B) The paragraph states, *"One can see from Figures 6 and 7 that the rates of growth for transit ridership have not been in lock step with population and employment growth." UH 31.9*

Figures 6 and 7 referred to in the quote are graphs that plot annual bus passengers versus population on Oahu and annual bus passengers versus annual employment on Oahu, respectively. The general theme of the discussion surrounding these graphs is that there is not a linear correlation between bus passengers and either population or employment. As discussed in the response to comment #74A), future transit ridership is not determined through a factoring process but through OMPO's calibrated LOGIT mode choice model.

C) This quote reads, *"The City's Fratar model assumes that growth in transit ridership can be related as a linear function to growth in population and employment. This is a simple assumption that the City made for convenience. Although we have reasons to doubt the validity of this assumption, we have no better substitute." UH 36.7*

A Fratar model was not used to forecast future transit ridership. OMPO's calibrated LOGIT mode choice model was used.

D) This excerpt is quoted in its entirety. *"The City's consultants used a "pivot-point" methodology to project ridership for the different alternatives in the year 2005. This method, which was endorsed by UMTA, has only been used elsewhere for rail extension projects, rather than for a complete system." UH 2.2*

A "pivot-point" method was not used to forecast the transit ridership for the alternatives. OMPO's calibrated LOGIT mode choice model was used.

E) and L) These excerpts are from Evaluation of Ridership Forecasting for the: Honolulu Rapid Transit Development Project – Alternative Analysis and Draft Environmental Impact Statement, written by Dr. Moshe Ben-Akiva, Professor, MIT, and dated May 4, 1990. Ben-Akiva states, *"The major weakness that reoccurs at several phases of the ridership forecasting methodology is the absence of validation against local data." Ben-Akiva 9.5.* He concludes with, *"Any forecasting exercise of this nature would be associated with significant uncertainties. My suggestions have been directed at some areas where uncertainties may be reduced and at others where their magnitude should be assessed" Ben-Akiva 9.8*

OMPO's travel demand forecasting model was calibrated using 1995 data. Included in the model development was a detailed household interview survey that involved members of the household keeping a daily trip diary. The model was then used for the Oahu Regional Transportation Plan

(ORTP) Update approved by the OMPO Policy Committee in April 2001. The base year for the ORTP was the year 2000, and this study helped to validate the model to local conditions. Therefore, the weakness asserted by Ben-Akiva is no longer an issue.

F), G) and H) These quotes are contained in a section of the report that discusses base transit data. It actually reads, *"The base year ridership data are obtained from the 1986 bus on-board survey. The report identifies several deficiencies in this survey that required: (i) some additional cleaning and recoding of the original survey records; (ii) a recalculation of expansion weights; and (iii) the use of an origin/destination rather than production/attraction format. It appears that a great deal of effort was invested in an attempt to overcome the limitations of this survey. However,no evidence is presented in the report on the validity of the resulting O/D tables. It is assumed that the survey expansion is based on the total boardings by time of day, bus route, direction and route segment. But the level of accuracy of these boarding counts is not specified." Ben-Akiva 2.8 . "The report does not present data to support these assumptions." Ben-Akiva 3.4*

The OMPO travel demand forecasting model used by the Primary Corridor Transportation Project to forecast travel demand used the more recent 1991 On-Board Bus Survey, TheBus Comprehensive Operations Analysis completed in 1993, and update transit data supplied by Oahu Transit Service (OTS), the operator of the municipal transit system, to calibrate the 1995 base year model. The model was validated as part of the ORTP Update study in 2001.

I) This quote pertains to Ben-Akive's discussion of the parameters used in a later mode choice model used in the Honolulu Rapid Transit Project. The discussion focuses on the validity of using coefficients in the incremental LOGIT model that were developed for models used in other areas of the country. The quote is, *"My conclusion is that the selected values for the parameters of the mode choice model have not been sufficiently justified." Ben-Akiva 7.7*

As stated previously, the OMPO travel forecasting model was developed using detailed travel surveys and transportation information collected on Oahu. The model modules, including the incremental LOGIT model, were calibrated for local conditions.

J) and K) These quotes pertain to Ben-Akiva's evaluation of generated non-home based transit trips. These trips were modeled using model forms borrowed from Washington, D.C. The actual quotes are, *"The concept of generated Non-Home-Based (NHB) transit trips by fixed guideway facilities is reasonable. The discussion of the similarities between Washington, D.C. and Honolulu is also reasonable. However, I question the validity of the forecasting procedure that was employed to capture this phenomenon." Ben-Akiva 7.9* He concludes by saying, *"I am not convinced that any of the models is 'transferable" to other situations and I would recommend not to use them without further testing." Ben-Akiva 8.7*

The OMPO travel demand forecasting model was developed to help model non-home-based trips as well as home-based trips. As a result, the OMPO model utilizes 11 trip purposes, 4 of them relate to non-home-based trips. Data to calibrate the model for these trip purposes were collected using a survey with detailed household trip diaries and, therefore, reflect local travel behavior.

M) This is another quote from Review of Ridership for AA/DEIS Honolulu Rapid Transit Development Project by G. Scott Rutherford, Ph.D., P.E., Associate Professor of Civil Engineering, University of Washington and dated April 17, 1990. The actual quotes is, *"It is possible that parallel bus routes that now provide better service to some will experience a reduction in service level. While this is a policy and resource issue to the transit agency, it should*

be pointed out that several new guideway projects in the U.S. attempted to force an unnatural number of trips to the guideway, even for short segments of longer bus trips. Some systems actually had lower total transit ridership after a fixed guideway system was built." Rutherford 6.6

The Refined LPA is not a fixed guideway system. In fact, the more heavily used parallel bus routes are routed along the BRT transit lanes and are incorporated into the BRT system. In this way more riders will be able to take advantage of the faster speeds and improved reliability that the transit priority lanes will provide.

N) This excerpt is from a report entitled, Honolulu Rapid Transit Development Project, Alternatives AnaylsisfDraft Environmental Impact Statement, Social and Economic Impacts Review, by Penelope Canan, Ph.D., consultant, dated April 1990. In a critique of the Public Involvement Program for the Honolulu Rapid Transit Project she states, *"Since the entire justification for the project rests on significant rates of electing public transportation over the private automobile, the failure to discover what would influence this choice may be a serious flaw." Canan 1.8*

The choice of transit or auto mode is projected for all alternatives by the OMPO travel demand forecasting model. The nested LOGIT mode choice module was calibrated to local conditions based on detailed travel data collected as part of the model development process. The selection of travel mode, therefore, reflects actual propensities by the local population to choose one mode over the other.

75. A)*Perhaps what is most surprising, and to some extent alarming, about the alternatives presented is that few real choices are offered." Cervero 3.7*
B) "...we think that the TSM alternative has not been adequately defined in the AA/DEIS." UH 17.4
C) "The range of alternatives considered in the AA/DEIS was disappointingly narrow and might have included other options." Rutherford 1.6
D) "I believe that it is vitally important to pay as close attention to the proper design of the TSM alternative as it is to design of the rail alternatives before an informed decision can be made about whether and how to finance new rail transit." Shoup 12.9
E) "The proper specification of this [TSM] alternative is crucial, because it affects all the subsequent calculations of how many more riders the rail system will attract, and how much extra revenue will have to be raised to finance the rail system .. it does not involve any other of the now common transportation demand management techniques that are in integral component of transportation system management. I would argue that the TSM alternative is inadequately specified, and thus that the contribution that TSM can make toward improving transportation is underestimated. If this is true, the improvements attributable to the rail alternatives are overestimated." Shoup 12.3

Response: To use quotes from a 1990 review of the then Rapid Transit Project, when the authors haven't even seen the current set of alternatives is totally improper.

76. *COST COMMENT: Busways are used by the consultant here refers to grade-seperated or barrier-separated lanes reserved for buses and high occupancy vans and cars. They are also sometimes referred to as transitways.*
A) "In particular, what is lacking is a serious investigation of several viable dedicated busway options." Cervero 3.4
B) "Where the current set of alternatives really fall short is in ignoring various busway configurations as a fundamental option to rail transit." Cervero 5.4

C) "Quite aside from the neglect of low cost TSM alternatives, there is no exploration of the possibility of investing more in HOV lanes for buses and carpools, as an intermediate level of investment between the No-Build alternative and the rail alternatives." Shoup 12.8
D) "The additional riders that might be drawing to busways (by virtue of the superior quality of service offered buy buses feeding directly into neighborhoods) might more than make up any higher costs (if indeed cost estimates are accurate). If presented in terms of a more traditional benefit-cost framework, it is likely that busways would compare far more favorably with fixed guideway rail options." Cervero 4.9
E) "The real advantage of busways ... is that they reduce ... transferring, the Achilles heel of mass transit in many modern, low-density metropolises like Honolulu." Cervero 4.3
F) "...a TSM II could be considered that ... might include contraflow lanes, busways, reversible bus streets ..." Rutherford 7.2
G) "In summary, I would recommend that an additional study be commissioned that seriously examined a range of busway options as legitimate contenders to the fixed guideway rail options." Cervero 5.3

Response: Comment noted. Again, the author is quoting information written about the Honolulu Rapid Transit Development Project over ten years ago. Because only one sentence, or a portion of a sentence are quoted, the reader is mislead into the quoted authors' meaning. Also, since the quoted information was published, high occupancy vehicle lanes have been implemented on Oahu and more are planned. The BRT project is a busway project.

A) In the next two sentences after the one quoted, Dr. Cervero states: "This criticism, I believe, is less a reflection on the work of the consultants and more an outcome of pressures exerted by various political and special interest groups. The range of alternatives presented are built on several prior studies which established this corridor as the most potentially cost-effective one for building a fixed guideway system."

B) The last sentence of the paragraph is quoted. The prior information states: "In summary, I would recommend that an additional study be commissioned that seriously examined a range of busway options as legitimate contenders to the fixed guideway rail options. It is particularly important that intensified and significantly upgrade bus transit options be considered for Oahu in light of the fact that the bus system already in place has proven itself to be one of the most heavily utilized and cost-productive operations in the country. Given the solid base of bus services already in place, it would seem that various busway alternatives could be linchpins to creating a first-rate regional transit service. In terms of alignments and areas served, the alternatives presented seem well grounded. While extensions (e.g. to Ewa or Hawaii Kai) could be considered, the basis for limiting the analysis to the chosen corridor seems sound and well supported..."

C) The sentence following the one quoted states: "I realize that no analysis of alternatives can consider every option that anyone recommends, and it may be that the AA/DEIS considered a TSM alternative that was prespecified."

D) The last two sentences of the paragraph are quoted. The first of the paragraph states: "It should be mentioned that several smaller reports were prepared which addressed busway options: *Report on Bus on Busways*, prepared by the Department of Transportation Services of the City and County of Honolulu; and *Expended Bus/Fixed Guidway Mass Transit Alternatives*, prepared by the Economic Development and Transportation Committee of the City and County of Honolulu. While on the same topic, it is interesting that the two studies reach different

conclusions – the former generally dismisses busways as a legitimate alternative while the latter strongly endorses them. The former seems almost like an alternative while the latter strongly endorses them. The former seems almost like an afterthought to the larger battery of studies done on rail transit while the latter comes across as a strong reaction to ignoring busways within the Alternatives Analysis. While steps in the right direction, both studies, I believe, fail to examine busways within the necessary scope or depth they deserve. The *Report on Bus on Busways* uses the results from the PEEPI and PEEP II analyses to conclude that busways would be costlier than fixed guideway over the long run, primarily in terms of higher operations and maintenance costs. This finding is a bit surprising in that it counters a considerable body of conventional wisdom that says, *ceteris paribus*, busways are cheaper than rail transit on a per kilometer basis (Meyer, et al., 1964; Peckrell, 1989; Kain 1990). Moreover, the analysis ignores the demand side of the equation."

E) Again, the author is only presenting part of the information quoted. The paragraph reads: "Busway options could range from a system of inter-connected HOV lanes and other preferential treatments (e.g. Houston) to newly constructed, exclusive busways (e.g., Ottawa). Even hybrids might be considered, like dual-mode/duel-propulsion bus-rail systems (e.g., Essen, West Germany; Adelaide, Australia). Options could also vary with respect to geographic coverage, frequency and quality of service, and routing patterns. In contrast to a fixed guideway rail system, busways enable transit vehicles to perform both feeder (collection-distribution) and line-haul (trunkline) functions. The same vehicles connecting major terminuses and activity centers can also filter into neighborhoods to provide more convenient access. Park-and-ride facilities can be scaled back accordingly. Thus, the real advantage of busways, at least from a ridership standpoint, is that they reduce the incidence of transferring, the Achilles heal of mass transit in many modern, low-density metropolises like Honolulu. Clearly, several gradations of busway options would offer a striking contrast to alternatives 2-11, all of which rely heavily on motorists park-and-riding as the primary form of collecting and distributing passengers. A well conceived set of busway options would provide decision-makers with a bonafide set of alternatives, many of which would have noticeable different costs and benefits, in which to debate and eventually work toward a consensus."

F) Dr. Rutherford's paragraph that is partially quoted states: "The TSM option appears to be "born to lose," as most TSM options are in alternatives analyses. Since the TSM option, by definition, needs to be lower cost, a TSM II could be considered that showed what $1 billion would buy for a different type of service. Elements might include:

- bus tunnels and bridges,
- contraflow lanes,
- busways,
- reversible bus streets,
- bus stations integrated with land use,
- free service,
- employer bus passes,
- visitor passes,
- wider application of park-and-ride with express buses, and
- services at park-and-ride lots such as daycare, retail stores, and automotive facilities and services."

G) The sentence quoted is the first of the paragraph which states. "In summary, I would recommend that an additional study be commissioned that seriously examined a range of busway options as legitimate contenders to the fixed guideway rail options. It is particularly important that

intensified and significantly upgrade bus transit options be considered for Oahu in light of the fact that the bus system already in place has proven itself to be one of the most heavily utilized and cost-productive operations in the country. Given the solid base of bus services already in place, it would seem that various busway alternatives could be the linchpins to creating a first-rate regional transit service. In terms of alignments and areas served, the alternatives presented seem well grounded. While extensions (e.g., to Ewa or Hawaii Kai) could be considered, the basis for limiting the analysis to the chose corridor seems sound and well supported. Where the current set of alternatives really fall short is in ignoring various busway configurations as a fundamental option to rail transit."

77. Buses and Vanpools.
A) "... I do not believe a sufficient number of significant high-quality mass transit alternatives have been considered for Oahu." Cervero 3.3
B) COST COMMENT: Mass transit is used here with its normal meaning of vehicles moving people en masse such as in trains, buses, vans or taxis. By brilliant PR, the city has managed to co-opt it to solely mean rail transit.
C) "It is particularly important that intensified and significantly upgraded bus transit options be considered for Oahu in light of the fact that the bus system already in place has proven to be one of the most heavily utilized and cost-productive operations in the country." Cervero 5.3
D) Other TSM strategies, such as those involving regional vanpool services, timed-transfer bus facilities, and auto-restraint measures, are ignored." Cervero 3.9

Response: It is not clear why these quotes were chosen since they support features that are embodied in the Refined LPA, namely an "Intensified and significantly upgraded bus transit option", with a "timed transfer" hub-and-spoke network.

78. Political Considerations.
A) "This criticism [of the City's TSM alternative], I believe, is less a reflection on the work of the consultants and more an outcome of pressures exerted by various political and special interest groups." Cervero 3.4
B) COST COMMENT: This may be acknowledging that Parsons, Brinckerhoff, the City's consultant for the Alternatives Analysis is also one of the nation's primary authorities on busways. They are the authors of High Occupancy Vehicle Facilities. December 1990.
C) "The TSM option appears "born to lose," as most TSM options are in alternatives analyses." Rutherford 7.2
D) " As presented, the alternatives give the impression that a fixed guideway rail system, be it light or heavy rail, was pre-established at the outset to be the preferred high-capacity transit technology for Oahu:" Cervero 3.8

Response: There was no pre-determined outcome, nor was there political pressure exerted on the consultants. The selection of the Locally Preferred Alternative was based on extensive quantitative analyses and public input. These analyses are documented in the FEIS.

We will send you a CD-ROM copy of the Final Environmental Impact Statement (FEIS) under separate cover. If you require a printed copy of the FEIS, please contact Faith Miyamoto at 527-6976. We appreciate your interest in the project.

Sincerely,

CHERYL D. SOON

November 13, 2002

Mr. Tom Smyth
P. O. Box 2359
Honolulu, Hawaii 96804

Dear Mr. Smyth:

Subject: Primary Corridor Transportation Project

This is in response to your oral testimony at the April 20, 2002 public hearing regarding comments on the Supplemental Draft Environmental Impact Statement (SDEIS).

1. *I won't take personal offense to the fact that you overlooked the dozen or so other elected officials that are here today. Mr. Bren has already spoken. But I'm speaking now, of course, of those neighborhood board members who are equally elected and who serve without compensation, and who I think deserve some recognition for the fact that they're representing their communities in meetings like this.*

   Response: We apologize and did not intend to offend the elected neighborhood board members that took the time to attend the public hearing.

2. *I'm a member of the Downtown Neighborhood Board, who's been an Oahu resident for nearly 30 years, downtown resident in Kakaako and Downtown area for about 20 years. The Downtown Neighborhood Board took a position early on, when this project was first presented, to support it generally, and we are the most affected by it, because all the routes, all of the routes, go through Downtown. They bring people in and take them out. We're affected by the lack of a system like this, by the traffic congestion that occurs in Downtown.*

   Response: This is a background comment that does not require a response.

3. *We had three specific concerns at the time the project was presented: A) The so-called Richards Makai portion of the Kakaako Mauka routing, which has been corrected; B) the two-lane Halekauwila routing from Richards to Punchbowl, which has not been; and finally C) the makai curbside routing along Ala Moana Park, replacing parking spaces that are very much needed on the weekends for people using the mauka portion of the park.*

   Response: This is a factual statement not requiring a response.

4. *As to this being a stealth project, I disagree totally. I can't think of a project that's had more public meetings, more public input, more public participation. I understand that more people would have been here today. The opponents were going to bus people in, but there was already to much traffic Downtown.*

Response: We appreciate you recognizing the community involvement efforts that have been associated with the project.

5. *Finally, as the only certified public – or certified economic developer in the state of Hawaii, I would say categorically that businesses do better as people are more mobile. Businesses will prosper in the area served by the system. They won't suffer. I think that's a given, and that's an argument that needs to be laid aside. So we think this helps local business.*

   Response: Comment noted. No response required.

6. *It certainly helps local residents. It certainly helps those of us who live Downtown to go out of town. We speak only of traffic coming in the morning and going home at night. But, in fact, with the Kapolei development, it's going to go much more in the opposite direction. A BRT system offers that flexibility which highways don't.*

   Response: Thank you for supporting the project and sharing your views regarding the benefits of BRT.

We appreciate your interest in the project.

Sincerely,

CHERYL D. SOON
Director

Subject: Aloha! Here is a comment on the BRT proposal. Mahalo.

Aloha, Cindy,

Thank you for our telephone conversation this morning. My day got busy, and
I did not have a chance to e-mail you this right away.

I have some comments on the proposed Bus Rapid Transit concept, which I would
like to ask you to forward to Director Soon and to any others you feel should
receive it.

Thanks a lot,
Richard (see below)

To Whom it May Concern:

I have reviewed an abstract of the proposed Bus Rapid Transit system
proposal, and would like to convey these thoughts:

Being originally from the Bay Area of CA, I have the following observations
about BART: it never took away from the roadway system. Either it went

above or below ground, or when it was at grade, it was placed in areas where
there was room to add it to the median without removing traffic lanes.
Further, it allowed for huge parking lots at each major outlying station, so
"parking and BARTing" is a real possibility.

The BRT System appears to take away from several major Diamond Head-Ewa
roadways, such as South King, Kapiolani, and Ala Moana. Since we still
depend very heavily on the auto, and I have sincere doubts that the BRS will
remove sufficient auto traffic to compensate for the traffic lanes removed, I
am afraid that BRS will contribute to the congestion problem. The concept of
making things so bad that you force people out of automobiles is a very
counterproductive method (in these days of productivity gains, one has to
couch this thought using the term "antiproductivity". Do we want to impose
another economic competitiveness handicap upon Honolulu?

Honolulu is long and thin, and east-west traffic has always been the main
problem. Removing more lanes in this direction simply contributes to the
ongoing arteriosclerosis we have--the body of Honolulu is trying to race

faster, but the blood supply is being reduced by continued narrowing of the
arteries.

I have not been able to study BRT very well, but one thing that could

AR00016034

ameliorate this difficulty somewhat is if there were small, frequent circulator vans (cheap, say for a quarter) that folks could take to quickly
get around the downtown area. Then more people could feel that they could
leave their car at home and not be parayzed in town.

Another measure needs coordination with the State DOT (and cooperation therefrom) in connection with SR 125, which is intended to look at means of
enhancing the capacity of the central H-1 corridor (in conjunction with additional HOV--diamond--lanes). Tbis would allow larger numbers of commuters to reach Honolulu in fewer vehicles, with less horrendous traffic
jams. There are reasonable ways to add a "shoulder lane" to the central H-1
corridor for use during rush hour, but DOT does not seem to be acting on SR
125. I understand that projects such as H-1 capacity enhancement must make
it into a document for submission to the Federal government by December this
year, or they will be out of consideration for another 5 years.

Thank you for considering these comments.

Sincerely,
Richard C. Stancliff

Comments on BRT for Council Transportation Committee

Thank you for holding and inviting me to the Tuesday Transportation Committee hearing on the proposed BRT system. Unfortunately, I will be off-island and unable to attend.

Being originally from the Bay Area of CA, I have the following observations about BART, the Bay Area Rapid Transit: it never took away from the roadway system. Either it went above or below ground, or when it was at grade, it was placed in areas where there was room to add it to the median without removing traffic lanes. Further, it allowed for huge parking lots at each major outlying station, so "parking and BARTing" is a real possibility.

November 13, 2002

Mr. Richard C. Stancliff
1107 Pikoi Street, #16
Honolulu, Hawaii 96814

Dear Mr. Stancliff:

Subject: Primary Corridor Transportation Project

This is in response to your October 21, 2000 e-mail and November 13, 2000 fax regarding comments on the Major Investment Study/Draft Environmental Impact Statement (MIS/DEIS).

1. *Being originally from the Bay Area of CA, I have the following observations about BART: It never took away from the roadway system. Either it went above or below ground, or when it was at grade, it was placed in areas where there was room to add it to the median without removing traffic lanes.*

   Response: Previous studies have shown that construction of a subway through Honolulu's urban core would be prohibitively expensive due to disruption of existing underground utilities and constant dewatering required due to high water table and poor soils.

   A fully grade-separated aerial transit alternative was also considered and eliminated due to its high costs and physical and visual impacts.

   The decision to utilize an at-grade system for all of the alternatives was therefore made or the purposes of minimizing right-of-way impacts and keeping costs affordable. Due to right-of-way constraints and insufficient space in existing roadway medians or non-existent medians, the Refined LPA includes a mixture of shared-use lanes and exclusive BRT lanes for the In-Town BRT portion of the alignment.

2. *Further, it allowed for huge parking lots at each major outlying station, so "parking and BARTing" is a real possibility.*

   Response: Additional park-and-ride facilities to include approximately 3,600 parking spaces are being planned at various locations on Oahu, as part of or in concert with the Refined LPA.

3. *The BRT Systems appears to take away from several major Diamond Head-Ewa roadways, such as South King, Kapiolani, and Ala Moana. Since we still depend very heavily on the auto, and I have sincere doubts that the BRS will remove sufficient auto traffic to compensate for the traffic lanes removed, I am afraid that BRT will contribute to the congestion problem.*

   Response: It is not the conversion of lanes that will create the congestion. The congestion for motorists will be there without the BRT. When people are diverted onto public transit, congestion

for motorists will be less with the Refined LPA than it would be with the No-Build or TSM Alternatives. Conditions will be much better for BRT riders with the Refined LPA since they will have a path clear of the congestion along much of the In-Town and Regional BRT routes.

4. *The concept of making things so bad that you force people out of automobiles is a very counterproductive method (in these days of productivity gains, one has to couch this thought using the term "antiproductivity". Do we want to impose another economic competitiveness handicap upon Honolulu?*

   Response: The concept is not to force people out of their cars by making things so bad. The forecast is that congestion will occur without BRT. The difference being that with the Refined LPA people will at least have an option that reduces the delays resulting from the congestion.

5. *Honolulu is long and thin, and east-west traffic has always been the main problem. Removing more lanes in this direction simply contributes to the ongoing arteriolsclerosis we have – the body of Honolulu is trying to race faster, but the blood supply is being reduced by continued narrowing of the arteries.*

   Response: See response to comment #3.

6. *I have not been able to study BRT very well, but one thing that could ameliorate this difficulty somewhat is if there were small, frequent circulator vans (cheap, say for a quarter) that folks could take to quickly get around the downtown area. Then more people could feel that they could leave their car at home and not be paralyzed in town.*

   Response: Part of the hub-and spoke network in the Refined LPA would comprise circulators in the urban core that connect with the BRT stops to serve destinations beyond walking distances from the alignment.

7. *Another measure needs coordination with the State DOT (and cooperation therefrom) in connection with SR 125, which is intended to look at means of enhancing the capacity of the central H-1 corridor (in conjunction with additional HOV–diamond–lanes). This would allow larger numbers of commuters to reach Honolulu in fewer vehicles, with less horrendous traffic jams. There are reasonable ways to add a "shoulder lane" to the central H-1 corridor for use during rush hour, but DOT does not seem to be acting on SR 125. I understand that projects such as H-1 capacity enhancement must make it into a document for submission to the Federal government by December this year, or they will be out of consideration for another 5 years.*

   Response: The OMPO TOP 2025 Plan includes numerous projects in addition to the Regional BRT for enhancing the people carrying ability of the H-1 freeway.

We will send you a CD-ROM copy of the Final Environmental Impact Statement (FEIS) under separate cover. If you require a printed copy of the FEIS, please contact Faith Miyamoto at 527-6976. We appreciate your interest in the project.

Sincerely,

CHERYL D. SOON

RE: Bus Rapid Transit- SDEIS

My name is David Stanton and I support the BRT . I frequently take the bus between my residence in Aiea and Iolani School which I attend. It takes me approximately 1 hour and 30 minutes to make this trip now.

We don't need more cars clogging the streets. What we need is an efficient affordable way for students and other members of the public to get to our daily destinations. Please think of the students like me who would greatly benefit from the faster bus service the BRT would provide.

Sincerely,

David Stanton

Dear Mr. Stanton:

Subject: Primary Corridor Transportation Project

This is in response to your April 20, 2002 letter regarding comments on the Supplemental Draft Environmental Impact Statement (SDEIS).

1. *My name is David Stanton and I support the BRT. I frequently take the bus between my residence in Aiea and Iolani School which I attend. It takes me approximately 1 hour and 30 minutes to make this trip now.*

   Response: This comment is background information that does not require a response.

2. *We don't need more cars clogging the streets. What we need is an efficient affordable way for students and other members of the public to get to our daily destinations. Please think of the students like me who would greatly benefit from the faster bus service the BRT would provide.*

   Response: Comment noted. Thank you for supporting the project.

We appreciate your interest in the project.

Sincerely,

CHERYL D. SOON

November 12, 2002

Ms. Linda Starr
P. O. Box 240310
Honolulu, Hawaii 96824

Dear Ms. Starr:

Subject: Primary Corridor Transportation Project

This is in response to your testimony at the October 12, 2000 formal Public Hearing regarding comments on the Major Investment Study/Draft Environmental Impact Statement (MIS/DEIS).

1. *But when I read the document, one thing that I noticed is that it is written with the conclusion in mind already and building backwards.*

   Response: The alternatives were treated in a balanced manner in the MIS/DEIS. It is a federal requirement that all alternatives be treated in a balanced manner and the MIS/DEIS was prepared to ensure that this "balanced treatment" requirement is met. A complete description and comparison of the No-Build Alternative, Transportation System Management (TSM) Alternative, and Bus Rapid Transit (BRT) Alternatives were discussed in the MIS/DEIS.

2. *What I'd like to see in this document is for the TSM to be further expanded.*

   Response: Comment noted. Not enough detail is given on how the TSM should be expanded.

3. *One of the things would be to flesh out more transit centers. We want to keep people from getting into their cars. Once they get into their car, they're committed to their car. They don't want to drive their car, park it, get out, and catch the bus, and get off the bus, and catch another bus, and get onto a train, catch a train, or whatever. We want to make it so that there's more buses that will pick them up at the doorstep, take them to the transit center, so they don't have to get into the cars.*

   Response: The Refined LPA includes many ways transit riders can access the system (i.e., by walking, bicycle, and auto). Since bringing buses within walking distance of all residents is not feasible, park-and rides (free standing and at some of the transit centers) are also being proposed.

4. *And also, for pollution, it assumes that people are still going to be driving gasoline-powered cars. Today, we have companies that have hybrid electric cars. Who knows? In 25 years, all cars would be electric, and then you won't have the pollution.*

   Response: We agree that in the future there may be less polluting fuel sources available for cars than gasoline. However, pollution would be reduced further by the implementation of the Refined LPA utilizing the candidate technologies, including an embedded plate system or a hybrid electric propulsion system.

5. *And I would prefer the TSM. And to make it work, to improve the way it works, what I recommend is that you explore the possibility of building bus bays so that buses can pull up so that the traffic can flow freely when the buses are stopping to pick up people.*

   Response: As part of the Refined LPA bus turnouts will be constructed along selected sections of the In-Town BRT alignment to facilitate the free flow of traffic as the bus stops to drop-off and pick-up passengers.

We will send you a CD-ROM copy of the Final Environmental Impact Statement (FEIS) under separate cover. If you require a printed copy of the FEIS, please contact Faith Miyamoto at 527-6976. We appreciate your interest in the project.

Sincerely,

CHERYL D. SOON
Director

APR 2 0 2002

Comments to BRT

Thank Mr. Chair, Mayor Harris, City Council members and the guests for allowing me to speak. My name is Joel Stauring; I am the Planning, Zoning, and Transportation Chair of the McCully-Moiliili Neighborhood Board. I have come to speak on a resolution our board passed back in November of 2000. This resolution was passed at that time and several of the issues still have not been addressed or answered.

3. We question the logic and arguments presented for an in-town fixed rapid transit system supported by a hub and spoke bus system to a redesigned Middle Street terminus. We suggest that a rapid transit system from the outlying country areas to a Middle Street terminus that would connect riders to bus expresses into the urban core should be open to further exploration and discussion.

   I want to bring out two points from this statement. First, why do we need a system to take the valuable road space in town when there is an excellent bus system already in place? Secondly, our neighborhood does not want to see upward development. There has not been one transit system that has not caused higher density development along its corridor.

9. We recommend that a study be undertaken by an independent company for the proposed BRT and the Major Investment Study Draft Environmental Impact Statement MIS/DEIS.
   I add, look what happened at Enron and Arthur Anderson; I believe everyone would like to see an independent study conducted.

10. We recommend the development of an urban Honolulu traffic management plan before proceeding with a fixed rail transportation system.

Lastly, I personally want to bring up the issue of cost of over $1 Billion dollars. Coming from the finance and investing profession I can tell you an increase this large in the debt ratio may cause Moody's and Standards & Poor to drop the bond ratings for the City. This will force the City to issue bonds at higher interest rates for future CIP projects. This translates to more costs to operate the city, causing an increase in taxes.

I foresee the city may raise vehicle registrations to try to recoup the costs of this project and encourage motorists out of their automobiles and onto the BRT.

POSITION OF THE McCULLY-MO' ILI' ILI NEIGHBORHOOD BOARD NO.8 ON THE BUS RAPID TRANSPORTATION PLAN

November 2, 2000

The McCully-Mo'ili'ili Neighborhood Board No. 8 submits the following comments regarding the proposed Transportation Plan to the City Council of Honolulu and The City Administration.

1. The proposed dedicated fixed tram routes through McCully-Mo'ili'ili as communicated by the City Administration via the Department of Transportation Services as the preferred route voiced by McCully-Mo'ili'ili residents during the Trans 2K community meetings were never supported by participants from our neighborhood. We do not understand the basis for this statement by the City Administration via the Department of Transportation Services.

2. The Major Investment Study Draft Environmental Impact Statement MIS/DEIS is deficient in its economic analysis on alternative modes of transportation and its impact on private transportation systems. The Board takes a cautious approach in supporting a transportation monopoly.

3. We question the logic and arguments presented for an in-town fixed rapid transit system supported by a hub and spoke bus system to a redesigned Middle Street terminus. We suggest that a rapid transit system from the outlining country areas to a Middle Street terminus that would connect riders to bus expresses into the urban core should be open to further exploration and discussion.

4. Due to conflicting statistical information, we question the immediate necessity to make a decision on establishing a dedicated fixed route system.

5. We question whether the City has maximized the potential of the current bus system. We are pleased that the City is investigating alternative forms of energy for the BRT; likewise, we suggest that buses in the future could be powered by photovoltaic and fuel cells.

6. We believe the MISDEIS does not adequately address 21st Century communication systems and its impact on a work force traditionally reliant on transportation to and from an established work center.

7. The City states that the transportation system will dictate future development for the PUC. We believe the MIS/DEIS is does not adequately address social and environmental impacts related to development and growth. We believe transportation, planning, zoning, and water resource allocation are inseparable in planning urban growth; and thus believe that an EIS should be prepared with these four components as a sum of the total rather than as individual denominations. We believe segmenting these four components, while perhaps legal under the law, is ultimately detrimental in determining our vision for the future; and ensuring the quality of life we desire for our community of McCully-Mo'ili'ili.

8. We believe that transportation should be developed to help level the economic playing field for small landowners and businesses. We do not believe the Honolulu transportation system should subsidize large investors and landowners at the expense of Hawaii's taxpayer.

9. We recommend that a study be undertaken by an independent company for the proposed BRT and the MIS/DEIS.

10. We recommend the development of an urban Honolulu traffic management plan before proceeding with a fixed rail transportation system.

11. We note that the general public has been given very little time to fully study and comprehend the enormity of the proposals; especially in its impact to development as proposed in the City's Draft Primary Urban Center Development Plan.

12. There are too many unanswered questions for the Board to take the next step in supporting a billion dollar BRT transportation venture.

13. The McCully-Mo'ili'ili Neighborhood Board support further studies to analyze financial, social and environmental impacts for fixed rail transportation systems.

14. We are able to support the Transportation System Management Alternative number 2.

John Kato, Chairperson
McCully-Mo'ili'ili Neighborhood Board No. 8.

November 13, 2002

Mr. Joel Stauring
2323 A Lime Street
Honolulu, Hawaii 96826

Dear Mr. Stauring:

Subject: Primary Corridor Transportation Project

This is in response to your oral testimony at the April 20, 2002 public hearing and your April 20, 2002 letter regarding comments on the Supplemental Draft Environmental Impact Statement (SDEIS).

1. *I'm the Planning, Zoning, and Transportation chair for the McCully-Moiliili Neighborhood Board. In November of 2000, our board passed a resolution opposing the BRT in our area. I would like to take a few minutes – I guess a minute to discuss some of the points in the resolution.*

   Response: Thank you for attending the public hearing and sharing your thoughts regarding the project.

2. *We, the board, question the logic and arguments presented for a In-town fixed rapid transit system supported by a hub-and-spoke bus system to a redesigned Middle Street terminus. We suggest that a rapid transit system from the outlying country areas to a Middle Street terminus that would connect riders to bus expresses into the urban core should be open to further exploration and discussion.*

   Response: An LPA has already been selected in November 2000.

3. *One of the points I wanted to bring out was that we do not oppose this BRT in outlying areas. We think it will help and enhance those areas. But in town, in our neighborhood, it will congest it more. The bus system is a great system, and we believe it works within those areas.*

   Response: Chapter 4 of the FEIS fully discusses the consequences of converting selected general purpose lanes to priority use by transit vehicles.

   When people are diverted onto public transit, congestion for motorists will be less with the Refined LPA than it would be with the No-Build or TSM Alternatives. Conditions will be much better for BRT riders with the Refined LPA since they will have a path clear of the congestion along much of the In-Town and Regional BRT routes.

4. *The second thing I wanted to bring up is that our neighborhood is opposed to upward development. All transit systems have seen that higher density developments have gone in along the corridor of bus rapid transit – I'm sorry – against where transit systems have been brought in. And so we oppose that in our area.*

Response: By itself, the In-Town BRT would have little influence on land use development in the PUC. In order for higher density development to occur, a number of factors in addition to good access need to occur. These factors include supportive land use/ zoning policies; adequate parcel sizes; favorable land costs: and demonstrated market demand for the proposed project in that location.

5. *We recommend that a study be undertaken by an independent company for the proposed BRT and the Major Investment Study Draft – Major Investment Study.*

   Response: A multitude of independent consultants have been and will continue to be involved in analyzing the impacts and costs of the project.

6. *I'd add, look at what happened to Enron and Arthur Anderson. I believe everyone would agree that we need to have an independent study conducted to look over those figures.*

   Response: Comment noted. We disagree that the Primary Corridor Transportation Project and the Enron/Arthur Anderson situation are similar.

7. *We recommend the development of an urban Honolulu traffic management plan before proceeding with a fixed rail transportation system.*

   Response: A Honolulu traffic management plan is a good idea. The Transportation for Oahu Plan (TOP 2025) approved by the Oahu Metropolitan Planning Organization (OMPO) on April 6, 2001 provides a long-range perspective for the entire island. The Honolulu urban area has been evaluated through several sub-area studies. A Honolulu traffic management plan would help to unify the results of these studies.

   As a point of clarification, the Refined LPA does not propose fixed-rail transit. Instead, it proposes a more flexible bus rapid transit (BRT) system that utilizes rubber-tired vehicles running in a combination of exclusive, semi-exclusive, and mixed-flow roadway lanes.

8. *Lastly, I personally want to bring up the issue of the cost of over $1 billion, and that is in 1995 – or 1998 money. When we pay it out, it will be well over that due to inflation. Coming from a finance profession, I can tell you that the increase in large debt ratio will cause – or may cause Moody's and Standard & Poors to drop the bond ratings for the City, which will cause increased interest rates and future – for future CIP projects. This translates to more costs to operate the City, causing an increase in taxes.*

   Response: The cost of the project is paid for with a combination of federal and local revenue sources. 64 percent of the project is paid for by federal sources. The $369.9 million dollars in General Obligation bond proceeds, to be spent over a 14 year period, is well within the capacity of the City as measured by rating agencies and the City's Debt and Financial Policies as passed by the City Council in April 2002.

9. *I also foresee the City may raise vehicle registrations to try to recoup the costs of the project and to encourage motorists out of their automobiles and onto the BRT.*

   Response: Comment noted. The MIS/DEIS, SDEIS, and FEIS Chapter 6 discuss the project financing, which does not include raising vehicle registration fees.

10. *We question the logic and arguments presented for an in-town fixed rapid transit system supported by a hub and spoke bus system to a redesigned Middle Street terminus. We suggest that a rapid transit system from the outlying country areas to a Middle Street terminus that would connect riders to bus expresses into the urban core should be open to further exploration and discussion.*

    I want to bring out two points from this statement. First, why do we need a system to take the valuable road space in town when there is an excellent bus system already in place? Secondly, our neighborhood does not want to see upward development. There has not been one transit system that has not caused higher density development along its corridor.

    Response: The Regional BRT will provide service between Kapolei and the Middle Street Transit Center, where people can continue into town on that bus, or connect to local buses or the In-Town BRT system. The BRT will carry more people than single-occupancy vehicles and give Honolulu residents another transportation mode to use when making trips. The BRT alone will not result in development, but will help give access to neighborhoods.

11. *We recommend that a study be undertaken by an independent company for the proposed BRT and the Major Investment Study Draft Environmental Impact Statement MIS/DEIS.*

    I add, look what happened at Enron and Arthur Anderson; I believe everyone would like to see an independent study conducted.

    Response: See responses to comments # 5 and #6.

12. *We recommend the development of an urban Honolulu traffic management plan before proceeding with a fixed rail transportation system.*

    Response: See response to comment #7.

13. *Lastly, I personally want to bring up the issue of cost of over $1 Billion dollars. Coming from the finance and investing profession I can tell you an increase this large in the debt ratio may cause Moody's and Standards & Poor to drop the bond ratings for the City. This will force the City to issue bonds at higher interest rates for future CIP projects. This translates to more costs to operate the city, causing an increase in taxes.*

    Response: See response to comment #8.

We will send you a CD-ROM copy of the Final Environmental Impact Statement (FEIS) under separate cover. If you require a printed copy of the FEIS, please contact Faith Miyamoto at 527-6976. We appreciate your interest in the project.

Sincerely,

CHERYL D. SOON
Director

Honolulu, Hawaii 96813

Dear Ms. Soon:

Re: Primary Corridor Transportation Project
Supplemental Draft Environmental Impact Statement

I have recently consulted Traffic Engineers from Charlotte, N.C. and Chicago, Illinois in an effort to answer my questions regarding Bus Rapid Transit. Mr. William Finger, Traffic Engineer for Charlotte, N. C. told me that there are a number of successful Rapid bus systems, most notably Ottawa, Curitiba, Pittsburgh, Euclid, and Eugene. The key to success, according to Mr. Finger, is dedicated bus lanes. "Riding the bus must be faster than driving". Mr. Tom Kaeser, Traffic Engineer for Chicago, told me of a miserable failure in the early '80's where counterflow bus lanes were attempted on 'one way' streets. Numerous accidents occurred both at intersections and mid-block, resulting in lawsuits against the city and at least one fatality. "The streets were well marked with warning signs and paint, but it didn't help. The counterflow bus lanes were subsequently removed".

Please answer the following questions for me:

1) If, according to experts, riding a bus must be faster than driving in order to be called rapid, how can the Primary Corridor Transportation Project be called rapid? The buses in this plan do not travel faster than traffic.

2) You have stated that bus riders will cut 3 min. from their commute time in certain areas on this system. I see this as a deliberate attempt to fool the public because a time savings of this nature can, and will be accomplished simply by skipping or removing stops. Buses will not be moving faster than cars, so please explain for me how this system will meet the rapid criteria?

3) My investigation of counterflow bus lanes on 'one way' streets has proven to me that such implementation would be an extreme safety hazard. Please site specific examples of successful counterflow situations on 'one way' streets. (Chicago found that by simply removing a few stops in the desired direction they were able to accomplish the same time savings.Again, we are not talking rapid, but rather a system of express buses.

I have been told by experts that $1,000,000,000 is over the top for a bus system that does not meet the description of rapid. What would be your reasoning for deliberately deceiving the public, your City Council, the FTA, and the OAQC? Is your intent simply to "capture Federal money" as a recent BRT newspaper advertisement suggests. Is this a 'get the money now, worry about the system later' scheme? I look forward to your comments.

Sincerely,

Cheryl Stephenson

TPD5/02-01885R

November 13, 2002

Ms. Cheryl A. Stephenson
1777 Ala Moana Boulevard, #739
Honolulu, Hawaii 96815

Dear Ms. Stephenson:

Subject: Primary Corridor Transportation Project

This is in response to your oral testimony at the Public Hearing on April 20, 2002, and your May 6, 2002 letter regarding comments on the Supplemental Draft Environmental Impact Statement (SDEIS).

1. *I'd like to confine my comments to the City budget. On Thursday, we read in the newspaper that there's a moratorium on swimming pools considered because the City lacks money for maintenance. And a quote from Ann Kobayashi says, "When a pool goes in, we should plan ahead and see that we have the money to operate and maintain it." I see a lot of quotes about pay for systems and that there will be no new taxes for the systems. But I don't see a lot of print about how we're going to pay for the maintenance. If we can't pay for public swimming pool maintenance, how can we possibly pay for the maintenance on a new fendangled bus system?*

   Response: The financial plan includes a detailed projection of the operating and maintenance costs, and the sources of revenue for those costs.

2. *I also have some questions about the real vision of the Department of Transportation, when we were first hearing about an expensive embedded-plate electromagnetic system to move the buses. In today's Advertiser, the last paragraph, is a quote from Cheryl Soon that says that now a half a billion dollars will be spent on the current planned buses, and I believe these are wheeled type buses. But she goes on to say that a later consideration might be the embedded-plate electromagnetic bus system if the technology improves. Now, isn't this just a little wishy-washy? It says to me that you don't have a clear vision of where you're going, and you're willing to spend half a billion dollars in buses now and change your mind at a future date.*

   Response: This is not wishy-washy. It is sound implementation planning that uses state-of-the-art technology, but only after it has been thoroughly tested and is service proven in other cities. The plan is to start the system with environmentally friendly, hybrid-electric buses, and to convert to embedded plate, once it has been service proven. There is always the option of continuing with hybrid-electric even once embedded plate is proven. This decision will not have to be made until 2008.

3. *I have recently consulted Traffic Engineers from Charlotte, N.C. and Chicago, Illinois in an effort to answer my questions regarding Bus Rapid Transit. Mr. William Finger, Traffic Engineer for Charlotte, N.C. told me that there are a number of successful Rapid bus systems, most notably Ottawa, Curitiba, Pittsburgh, Euclid, and Eugene. The key to success, according to Mr. Finger, is*

dedicated bus lanes. "Riding the bus must be faster than driving". Mr. Tom Kaeser, Traffic Engineer for Chicago, told me of a miserable failure in the early 80s where contraflow bus lanes were attempted on 'one way' streets. Numerous accidents occurred both at intersections and mid-block, resulting in lawsuits against the city and at least one fatality. "The streets were well marked with warning signs and paint, but it didn't help. The counterflow bus lanes were subsequently removed".

Response: Comment noted. As stated in the MIS/DEIS, SDEIS, and FEIS, Chapter 2, the Primary Corridor Transportation Project includes exclusive, semi-exclusive, and shared travel lanes that give priority to buses. Only about seven percent (1.9 lane miles) of the In-Town BRT will be contra-flow, the remaining 23.7 lane miles will be normal flow.

Contra-flow bus lanes exist in many cities around the world. Examples of existing contra-flow bus lanes in the U.S. include the Lincoln Tunnel in New York, Sansome Street in San Francisco, Spring Street in downtown Los Angeles, most of the Lymmo downtown circulator loop in Orlando,FL, and a section of Kuhio Avenue in Waikiki.

4. *If, according to experts, riding a bus must be faster than driving in order to be called rapid, how can the Primary Corridor Transportation Project be called rapid? The buses in this plan do not travel faster than traffic.*

   Response: During the peak hours, the BRT vehicles will be traveling faster than autos in the general purpose lanes on H-1 since they will be in the zipper lane. Similarly, where the BRT vehicles will be in exclusive arterial lanes they will be traveling faster than autos wherever the autos are caught in congestion. This is because the BRT lanes will have unrestricted flow, whereas motorists will typically encounter traffic delays.

5. *You have stated that bus riders will cut 3 min. from their commute time in certain areas on this system. I see this as a deliberate attempt to fool the public because a time savings of this nature can, and will be accomplished simply by skipping or removing stops. Buses will not be moving faster than cars, so please explain for me how this system will meet the rapid criteria?*

   Response: Many bus riders will have savings much greater than 3 minutes. Travel time savings will occur not only because there will be limited stops. Savings will occur from the priority lanes, and from features of the buses and the stops. These include level boarding from 3 doors at a time with pre-payment of fares. Signal priority at selected intersections will also help speed up the BRT travel times.

6. *My investigation of counterflow bus lanes on 'one way' streets has proven to me that such implementation would be an extreme safety hazard. Please cite specific examples of successful counterflow situations on 'one way' streets. (Chicago found that by simply removing a few stops in the desired direction they were able to accomplish the same time savings. Again, we are not talking rapid, but rather a system of express buses.*

   Response: See response to comment #3.

7. *I have been told by experts that $1,000,000,000 is over the top for a bus system that does not meet the description of rapid. What would be your reasoning for deliberately deceiving the public, your City Council, the FTA, and the OAQC? Is your intent simply to "capture Federal money" as a recent BRT newspaper advertisement suggests. Is this a "get the money now, worry about the system later" scheme? I look forward to your comments.*

Response: The roughly $1 billion cost refers not only to the Regional and In-Town BRT. Approximately $500 million of this will be for replacement of buses and Handi-Vans over the 23-year planning period of the project. This project is very cost effective when compared to any existing or planned BRT or light rail system.

We will send you a CD-ROM copy of the Final Environmental Impact Statement (FEIS) under separate cover. If you require a printed copy of the FEIS, please contact Faith Miyamoto at 527-6976. We appreciate your interest in the project.

Sincerely,

Ms. Soon:

Re: Comments and Concerns (Primary Corridor Transportation Project)

PURPOSE AND NEED FOR ACTION

How do you enhance mobility and improved travel time and enhance the quality of life for Oahu residents by taking away lanes for exclusive and semi-exclusive bus use?
How is this deemed an attractive alternative if it is not on its own "right of way" and causes traffic congestion or gridlock and at the same time increases that total congestion?

ALTERNATIVES CONSIDERED

Why was the TSM Alternative not considered as an improvement with the proposed hub and spoke system?
Why wouldn't you provide improved service at the Eva end of the system first instead of in the Downtown/Waikiki corridor which gains only 3 minutes time (from 18.7 to 15.7 minutes) for 3.3% increase in ridership at a cost of Millions of dollars. Additionally it uses 12 of the existing transit stops and only adds 4 new ones. Where is this money being spent?

Contra Flow lanes are proposed on King and Pensacola, what other streets will have this type lane? Do you consider Contra Flow lanes to be safe? Have any cities in the mainland discontinued the use of these type of lanes because of fatalities to pedestrians?

ADDED COST TO THE PUBLIC

How can you say this will not cost the taxpayers any additional money when your Capital Cost Summary shows an increase of $745,600,000 over the no build option?
What about the Annual Operating and Maintenance Costs which are millions higher than the No Build Option? Isn't that additional taxpayer cost?

TRANSPORTATION IMPACTS

The plan mentions use of articulated buses. How long are they? How long are the Bi—articulated buses that are briefly mentioned?

How will the BRT offer fast efficient travel when it is on mostly semi-exclusive transit lanes. What happens when vehicles that make up 80% to 90% of the traffic on the roads needs to turn left or right and stop at lights? Do you account for their concerns of congestion and gridlock?

THE NUMBERS DO NOT COMPUTE. ASSUME THE SMALLER NUMBER OF 80% OF THE VEHICLES ON THE ROAD GET REDUCED BY 3%, THAT STILL LEAVES 77% OF THEM ON THE ROAD. Tax paying citizens have spent $1,000,062,500 for an improperly designed BUS SYSTEM not a mass transit system, WHY?

You show a loss of 912 parking spaces and 26 loading zones. How are businesses, residents and the PUBLIC in general compensated for the loss of commerce or convenience that they suffer? Is this not a form of DISPLACEMENT?

FTA COST-EFFECTIVENESS

You claim an average 11 percent increase in person carrying ability in the Urban Core. Don't you achieve this by carrying a significant number of tourists who do not have cars? Is this not a direct competition with private carriers? Is this why you are trying to do the Urban Core first to "pad the numbers" to try and justify the multi-million dollar expenditure to the FTA?

ASSUMPTIONS-THAT REQUIRE ANSWERS

How do you make an effective plan with all the FINANCIAL ASSUMPTIONS on Page 6-23? What are the consequences to the TAX PAYING PUBLIC if your assumptions are incorrect?

The Federal Transit money has been reduced by $30,000,000 this year, the State has said they are not interested in funding the project (Brian Minaai letter to Cheryl Soon dated September 18, 2001, "It is not our intent or expectation to provide funding for the BRT project; and bave developed our capital improvements programs accordingly." How can the TAXPAYERS in the city afford this?

Public Transit systems survive primarily because of SUBSIDIES and not fares. How can you say there will be no increase in taxes when you go from 1181 transit jobs to 1760 or an increase of 49%? Won't that cause an increase in expenses that the PUBLIC pays for through taxes?

The reply "details of parking and loading zone mitigation would be coordinated at the neighborhood level during subsequent project planning". This is not mitigation of their loss but merely FINALLY informing them of your intentions to eliminate their parking. Why wasn't this done in advance so they could express their opinions? How are they compensated for the loss?

The financial plans were developed "based on the assumptions that the full scope of each alternate must be completed WITHOUT raising taxes, and that the City's high bond rating must not be affected." With the realization that you are in effect RAISING TAXES and the Mayor has over spent and the City is broke and the mandatory review later this year will no doubt lower the bond rating bow is any BRT option viable?

You state the "City General Obligation (GO) bonds would be used to fund up to 47% of the cost of these altematives. Additional GO bonds would be issued to fund early construction activities in anticipation of later federal or State reimbursement." How is this assumption ethical or possible since the State is written out of the process?

Where is the data that supports your statement? "A fully grade-separated transit system was considered and rejected because of high cost, physical and visual impacts, and community opposition."

"Duplication of routes is operationally not efficient and results in slower travel through the corridor." Isn't the proposed downtown/Waikiki branch at least a partial duplication of existing routes 8,19 and 20? How is this efficient?

Can you explain, on Ala Moana Blvd., if the Auto LOS is an "F" and the BRT runs on a shared lane rather than an exclusive lane how can the Transit LOS be improved to an "A"? The bus is part of the problem shouldn't the LOS should still be an F? (Table 4.2-7)

On Ala Moana Blvd., what is the benefit of narrowing and adding lanes to change the LOS F to LOS E at Hobron Lane? One block later three lanes, have to "bottleneck" down to two lanes at Kalia Road, what will that do to the LOS?

You state that Kuhio sidewalks should be widened. "This would remove one traffic lane in each direction." How can this not impact vehicles, tour busses, taxis and delivery vans with a 50% reduction in lanes?

Per Table 5.1-4 the total project is estimated to cost is estimated at $1,062,500,000 in 1998 dollars. How do you justify that over half $550,800,000 is being spent outside Hawaii for equipment?

CONCLUSION

Table 6.1-3C shows the In-Town BRT will cost $345,509,000 from 2002 to 2010. How can you justify that amount of money for a few additional bus stops on already existing roadways for a 3.3% increase in ridership and a THREE minute improvement in time from Downtown to Waikiki?

WHY NOT JUST ADD A FEW NEW EXPRESS ROUTES TO AN ALREADY GREAT BUS SYSTEM AND SAVE THE FEDERAL MONEY FOR A TRUE MASS TRANSIT SYSTEM ON ITS OWN RIGHT OF WAY WITHOUT INCREASING CONGESTION ON OUR ALREADY CROWDED STREETS?

WHY DO YOU NEED TO PUT DOWN NEW CONCRETE WHEN THE EXISTING ASPHALT IS ADEQUATE EXCEPT AT THE BRT TRANSIT STOPS?

TEST THE SYSTEM WITHOUT PUTTING DOWN THE CONCRETE SO THE MONEY IS NOT WASTED WHEN THIS BECOMES OAHU'S NEXT "VAN CAM 2" AND YOU DISCONTINUE THE PROGRAM?

November 13, 2002

Mr. Dick Stephenson
1777 Ala Moana Boulevard, Box 2701-2001
Honolulu, Hawaii 96815

Dear Mr. Stephenson:

Subject: Primary Corridor Transportation Project

This is in response to your oral testimony at the April 20, Public Hearing and your May 5, 2002 letter regarding comments on the Supplemental Draft Environmental Impact Statement (SDEIS).

1. *I have rewritten my testimony so many times sitting here, I don't know where to start. Three minutes is very short. I am a bus rider, a satisfied, middle class bus rider, but I also need a car for various reasons that were stated here. There's many things you cannot take on the bus.*

   Response: We concur that there are times when an automobile is required.

2. *I also support the mass transit plan. When I first heard about BRT and tried to find out something about it, this was the first booklet that I was able to get (indicating). Let me quote you from page two. It says it all. "A successful transportation plan will make it easier and more pleasant to drive, not more difficult." Have we heard anything about easier here today?*

   Response: The refined LPA will result in a less congestion overall than the TSM or No-Build Alternatives.

3. *"Such a plan must expand our choice to become a win-win proposition for drivers, transit riders, pedestrians and bicyclists." Have you heard win-win here today?*

   Response: Comment noted. No response required.

4. *This is what it's all about. This isn't staged. This is real people with real concerns now talking about a real plan, which has been a changing, moving target up till now. And yes, there's going to be more refinement before it moves forward.*

   Response: Refinements are an integral part of the project development and implementation process for major projects such as this.

5. *Couple points that weren't brought up. 912 parking spaces are going to be eliminated in this plan in the urban core, 26 loading zones. If we don't need those, why aren't they gone already? We need those. There's nothing in the plan – and I see it back there, it's this thick – that mitigates the problem for the businesses where those parking spaces are being taken away.*

   Response: DTS is aware that the proposed elimination of on-street parking spaces is of concern to many people. As discussed in Section 4.3, in areas where a large concentration of parking spaces would be effected, replacement parking in new off-street parking facilities will be considered, but only if they meet other livable community objectives and are the result of community-based planning.

6. *If Duke was here – I believe he's gone now. Duke? I don't see him. Okay. I would say this to him if he were here: "Duke, stop and take a deep breath and ask your five counterparts, who because of turmoil – that's six of you who will not be here in the next four to eight years, to back off.*

   Response: Comment noted.

7. *Six months will not lose federal funding.*

   Response: There is an annual cycle which the federal funding process follows.

8. *And let the new incoming City Council vote for a plan that they will have to live with for the next four, or if they're fortunate to rerun, eight years."*

   Response: It was up to the present City Council to pick the LPA and to budget funds for moving the first segment of design and construction forward. It will be up to future City Councils to approve subsequent segments of the project.

9. *Again, the name of this project is Bus Rapid Transit system. There's nothing rapid about it.*

   Response: Comment noted.

10. *Another point that wasn't brought up strong enough. Of the billion plus dollars that this plan is going to cost, 550 million, over half, will be spent outside of Hawaii.*

    So much for jobs for people in Hawaii. That's jobs for people building buses on the mainland, or France, or Italy, or wherever we get them.

    Response: The purchases outside of Hawaii are primarily for replacement of the bus fleet over a 23-year period which will be needed even with the TSM and No-Build Alternatives.

    The BRT, plus TheBus and TheHandi-Van vehicles are manufactured outside of Hawaii. The BRT project will result in additional permanent bus drivers and administrative jobs plus over 4,000 persons-year construction jobs. The MIS/DEIS, SDEIS, and FEIS Section 5.1.5 present the economic impacts/benefits related to the BRT project.

11. *Taxes will not go up. I think Cheryl Soon is correct in that. Taxes will not go up for four days. That's when she goes, on April 24, to Honolulu Hale and asks for $35 million for this in-town portion of the plan. The plan, Bus Rapid Transit System, should be shortened to Bus System. And it can be shortened further to BS.*

    Response: Comment noted.

12. *How do you enhance mobility and improved travel time and enhance the quality of life for Oahu residents by taking away lanes for exclusive and semi-exclusive bus use?*

Response: Chapter 4 of the FEIS fully discusses the consequences of converting selected general purpose lanes to priority use by transit vehicles.

When people are diverted onto public transit, congestion for motorists will be less with the Refined LPA than it would be with the No-Build or TSM Alternatives. Conditions will be much better for BRT riders with the Refined LPA since they will have a path clear of the congestion along much of the In-Town and Regional BRT routes.

13. *How is this deemed an attractive alternative if it is not on its own "right of way" and causes traffic congestion or gridlock and at the same time increases the total congestion.*

Response: See response to comment # 12.

14. *Why was the TSM Alternative not considered as an improvement with the proposed hub and spoke system?*

Response: The TSM would be an improvement over the No-Build Alternative. It just isn't as effective an improvement compared to the Refined LPA.

15. *Why wouldn't you provide improved service at the Ewa end of the system first instead of in the Downtown/Waikiki corridor which gains only 3 minutes time (from 18.7 to 15.7 minutes) for 3.3% increase in ridership at a cost of millions of dollars. Additionally, it uses 12 of the existing transit stops and only adds 4 new ones. Where is this money being spent?*

Response: Timing and implementation of the P.M. zipper lane and related Regional BRT improvements must be coordinated with the State DOT. SDOT wants to widen the H-1 Freeway in the areas where the P.M. zipper lane is proposed before installing the zipper lane. Since the Iwilei-Waikiki segment of the In-Town BRT can be a viable improvement to the transit system immediately, the City Council has elected to proceed with this segment as the first step in phasing of the BRT system.

16. *Contra Flow lanes are proposed on King and Pensacola, what other streets will have this type lane? Do you consider Contra Flow lanes to be safe? Have any cities in the mainland discontinued the use of these type of lanes because of fatalities to pedestrians?*

Response: Contra-flow lanes will be installed on sections of S. King, Pensacola, Richards, and Kalaimoku Streets. Contra-flow lanes are safe provided proper signing and other warning devices are in place.

17. *How can you say this will not cost the taxpayers any additional money when your Capital Cost Summary shows an increase of $745,600,000 over the no build option?*

Response: The statement made is that there will be no increase in taxes needed to fund the project, not that it will not cost more than the No-Build Alternative.

18. *What about the Annual Operating and Maintenance Costs which are millions higher than the No Build Option? Isn't that additional taxpayer cost?*

Response: See response to comment # 17.

19. *The plan mentions used of articulated buses. How long are they? How long are the bi-articulated buses that are briefly mentioned?*

Response: The articulated buses will be 60-feet long. Bi-articulated buses are not proposed for use on this project. (They are 80-feet long).

20. *How will the BRT offer fast efficient travel when it is on mostly semi-exclusive transit lanes. What happens when vehicles that make up to 80% to 90% of the traffic on the roads need to turn left or right and stop at lights? Do you account for their concerns of congestion and gridlock?*

Response: It is not the conversion of lanes that will create the congestion. The congestion for motorists will be there without the BRT. When people are diverted onto public transit, congestion for motorists will be less with the Refined LPA than it would be with the No-Build or TSM Alternatives. Conditions will be much better for BRT riders with the Refined LPA since they will have a path clear of the congestion along much of the In-Town and Regional BRT routes.

21. *THE NUMBERS DO NOT COMPUTE. ASSUME THE SMALLER NUMBER OF 80% OF THE VEHICLES ON THE ROAD GET REDUCED BY 3%, THAT STILL LEAVES 77% OF THEM ON THE ROAD. Tax paying citizens have spent $1,000,0652,500 for an improperly designed BUS SYSTEM not a mass transit system, WHY*

Response: Getting three percent of the autos off the road will make a difference.

22. *You show a loss of 912 parking spaces and 26 loading zones. How are businesses, residents and the PUBLIC in general compensated for the loss of commerce or convenience that they suffer? Is this not a form of DISPLACEMENT?*

Response: The Refined LPA's parking impacts would total roughly 533 unrestricted and restricted parking spaces, as reported in the FEIS. As discussed in Section 4.3, in areas where a large concentration of parking spaces would be affected, replacement parking in new off-street parking facilities would be considered, but only if they meet other livable community objectives and are the result of community-based planning. This is a policy decision to be addressed by the City. The on-street parking and loading impacts are not considered displacement, as defined by the federal government. For a discussion on displacements, see Section 5.2 of the FEIS.

23. *You claim an average 11 percent increase in person carrying ability in the Urban Core. Don't you achieve this by carrying a significant number of tourists who do not have cars? Is this not a direct competition with private carriers? Is this why you are trying to do the Urban Core first to "pad the numbers" to try and justify the multi-million dollar expenditure to the FTA?*

Response: The service the In-Town BRT will provide is geared to the needs of residents and workers in the urban core not to tourists, which is the market served by private carriers. The BRT will not take business away from tour bus and shuttle operators, since it will not pick-up tourists at their hotels and take them on various scenic tours. It will not take them to-and-from the Airport. It will not take them to-and-from their hotels and the Convention Center. It will not pick them up at the cruise ship terminal and carry them and their luggage directly to their hotels. And unlike the private shuttles it is not designed to operate in a loop that only goes between Waikiki hotels and the various tourist sites of interest. Some tourists may end up using BRT since it does serve some of the same destinations that the tourists want to go to. But the In-Town BRT goes to these places

because most of these are also major employment sites or sites where local residents go to as well. The number of tourists expected to use the public transit system with the Refined LPA is forecast to be no greater proportionally then today (i.e. around 10-15 percent of total daily boardings).

24. *How do you make an effective plan with all the FINANCIAL ASSUMPTIOINS on Page 6-23? What are the consequences to the TAX PAYING PUBLIC if your assumptions are incorrect?*

Response: The Decision Factors in the last section of the financial plan narrative describe the major factors that may influence the financial plan. The financial plan was developed in a way to allow for the adjustment of the plan as conditions change. The ability of the plan to be flexible is demonstrated in changes made from the MIS/DEIS stage, to the SDEIS stage, to the FEIS. The basic conceptual model has been the same throughout, while allowing for changes in costs, and changes in revenue sources.

25. *The Federal Transit money has been reduced by $30,000,000 this year, the State has said they are not interested in funding the project (Brian Minaai letter to Cheryl Soon dated September 18, 2001, "it is not our intent or expectation to provide funding for the BRT project; and have developed our capital improvements programs accordingly." How can the TAXPAYERS in the city afford this?*

Response: State highway funds are not included as a revenue source in the FEIS. The $40 million dollars are paid for with a combination of FTA Section 5309 New Start grant funds and City GO Bond proceeds.

26. *Public Transit systems survive primarily because of SUBSIDIES and not fares. How can you say there will be no increase in taxes when you go from 1181 transit jobs to 1760 or an increase of 49%? Won't that cause an increase in expenses that the PUBLIC pays for through taxes?*

Response: In 2001, the City Council passed a policy that says that bus fares should recover no less than 27 percent of the cost, and no more than 33 percent. This reflects the City's policy position on the extent of public support for public transportation. Operations and maintenance (O&M) costs will be higher for a system that has more capacity and carries more passengers. If the fares are kept at 27 percent of operating costs, then the BRT O&M costs will be an average of $16.1 million more than the No Build O&M costs, and $10.9 million more than the TSM alternative. The City has the financial capacity for this increase using existing sources of revenue.

27. *The reply "details of parking and loading zone mitigation would be coordinated at the neighborhood level during subsequent project planning". This is not mitigation of their loss but merely FINALLY informing them of your intentions to eliminate their parking. Why wasn't this done in advance so they could express their opinions? How are they compensated for the loss?*

Response: Parking impacts were disclosed in the MIS/DEIS, and we have tried to be as responsive in addressing community concerns about loss of parking. However, elimination of parking is an unavoidable adverse impact, and the mitigation proposed is to consider replacement parking in new off-street parking facilities in areas of concentrated parking impacts, but only if such replacement parking were to meet other liveble community objectives and are the result of community-based planning. This is a policy decision to be addressed by the City.

28. *The financial plans were developed "based on the assumptions that the full scope of each alternate must be completed WITHOUT raising taxes, and that the City's high bond rating must not be affected." With the realization that you are in effect RAISING TAXES and the Mayor has over spent and the City is broke and the mandatory review later this year will no doubt lower the bond rating how is any BRT option viable?*

Response: In preparing the FEIS, the level of GO bonds per year was established within the City's Debt and Financial Policies as passed by the City Council in April, 2002, leaving capacity for other major capital projects.

29. *You state the "City General Obligation (GO) bonds would be used to fund up to 47% of the cost of these alternatives. Additional GO bonds would be issued to fund early construction activities in anticipation of later federal or State reimbursement." How is this assumption ethical or possible since the State is written out of the process?*

Response: Not removing the State as a reimbursement source was an inadvertent clerical error. This is corrected in the FEIS.

30. *Where is the data that supports your statement? "A fully grade-separated transit system was considered and rejected because of high cost, physical and visual impacts, and community opposition."*

Response: The 1990 Rapid Transit Project reflects a very detailed plan, including costs and impacts for an elevated rail system. Based on what was known from that project, at the outset of the PCTP, the community at public meetings, and the City Council rejected a grade-separated transit system as too costly and unsightly.

31. *"Duplication of routes is operationally not efficient and results in slower travel through the corridor." Isn't the proposed downtown/Waikiki branch at least a partial duplication of existing routes 8, 19 and 20? How is this efficient?*

Response: As part of the Primary Corridor Transportation Project, future transit operations were evaluated with assumed modifications to the transit system. Transit route modifications assumed for the FEIS analysis include the following: Route 8 would be replaced by the BRT and Routes 19 and 20 would be maintained to provide local bus service between Hickam AFB and Waikiki. Routes 19 and 20 are local buses, which stop more frequently than the limited stop BRT would. By stopping at only selected transit stops, the BRT will be able to travel faster, providing better travel times to transit riders. This is similar to the way Route A CityExpress! and Route 3 – Ruger both operate on Kapiolani Boulevard, the former a limited stop route and the latter and local route.

32. *Can you explain, on Ala Moana Blvd., if the Auto LOS is an "F" and the BRT runs on a shared lane rather than an exclusive lane how can the Transit LOS be improved to an "A"? The bus is part of the problem shouldn't the LOS should still be an F? (Table 4.2-7)*

Response: The auto LOS is an overall index of intersection operation which is comprised of a weighted average of all intersection approaches. The transit LOS is comprised only of the BRT movements at the intersection. The Ala Moana Boulevard intersections listed in Table 4.2-7 are within a portion of the BRT route that includes semi-exclusive transit lanes. These semi-exclusive

lanes would only allow BRT, City bus, tour bus, and vehicles turning right into cross streets. The reduced level of demand and the assumed transit priority at traffic signals for this lane will allow it to operate at a better LOS than other lanes and approaches.

33. *On Ala Moana Blvd., what is the benefit of narrowing and adding lanes to change the LOS F to LOS E at Hobron Lane? One block later three lanes, have to "bottleneck" down to two lanes at Kalia Road, what will that do to the LOS?*

    Response: The Refined LPA documented in the FEIS includes modifications to the cross-section of Ala Moana Boulevard between Atkinson Drive and Kalia Road. This includes the addition of semi-exclusive lanes for use by BRT vehicles, City buses, tour buses, and vehicles turning right into cross streets. This segment of Ala Moana Boulevard is already experiencing significant traffic congestion and reallocation of one lane in each direction from general-purpose to semi-exclusive use would have greatly worsened the situation. Because this area included an existing wide median, new lanes are proposed between Hobron Lane and Kalia Road by narrowing the median and reducing the width of the travel lanes. The three Koko Head bound through lanes will be continued through the Kalia Road intersection before being merged back to two lanes.

34. *You state that Kuhio sidewalks should be widened. "This would remove one traffic lane in each direction." How can this not impact vehicles, tour buses, taxis and delivery vans with a 50% reduction in lanes?*

    Response: Widening of the sidewalks along Kuhio Avenue is being proposed as part of the Livable Waikiki project. It is incorporated in all of the alternatives that were looked at in the PCTP.

35. *Per Table 5.1-4 the total project is estimated to cost is estimated at $1,062,500,000 in 1998 dollars. How do you justify that over half $550,800,000 is being spent outside Hawaii for equipment?*

    Response: The purchases outside of Hawaii are primarily for replacement of the bus fleet over a 23-year period which will be needed even with the TSM and No-Build Alternatives.

36. *Table 6.1-3C shows the In-Town BRT will cost $345,509,000 from 2002 to 2010. How can you justify that amount of money for a few additional bus stops on already existing roadways for a 3.3% increase in ridership and a THREE minute improvement in time from Downtown to Waikiki?*

    Response: The costs for the In-Town BRT include a lot more than a few additional bus stops. It includes paving the BRT lanes with concrete, installing embedded-plate modules and traction power system, installing more advanced traffic signal elements, improving sidewalks to make it easier to get to the stops, and installing waiting platforms with canopies, benches, lighting and landscaping.

37. *WHY NOT JUST ADD A FEW NEW EXPRESS ROUTES TO AN ALREADY GREAT BUS SYSTEM AND SAVE THE FEDERAL MONEY FOR A TRUE MASS TRANSIT SYSTEM ON ITS OWN RIGHT OF WAY WITHOUT INCREASING CONGESTION ON OUR ALREADY CROWDED STREETS?*

    Response: Express routes on their own would not offer the same benefits of a BRT system that has many other features to speed it along including zipper lanes, special freeway ramps, priority lanes in-town, level boarding from 3 doors, and signal priority at selected intersections.

38. *WHY DO YOU NEED TO PUT DOWN NEW CONCRETE WHEN THE EXISTING ASPHALT IS ADEQUATE EXCEPT AT THE BRT TRANSIT STOPS?*

    Response: The existing asphalt concrete pavements in most locations will not be able to sustain heavy repetitive loads from BRT vehicles. Concrete lanes will extend the life of the pavement and reduce the road maintenance over the life of the project.

    Pavement damage can be observed on many City and County Streets where TheBus routes its vehicles on asphalt concrete pavements. This is readily observed on Dillingham Boulevard where the curbside lanes have severe rutting and damage due to TheBus traffic. The City has several projects to place concrete lanes at locations with heavy repetitive bus traffic loads. Recent examples of projects that have been completed or are planned are on King Street and Kapiolani Boulevard.

39. *TEST THE SYSTEM WITHOUT PUTTING DOWN THE CONCRETE SO THE MONEY IS NOT WASTED WHEN THIS BECOMES OAHU'S NEXT "VAN CAM 2" AND YOU DISCONTINUE THE PROGRAM?*

    Response: A test of closing a lane is not a test of what will happen with the BRT, it is only a test of what happens when a lane is closed which is something everyone knows from when lanes are temporarily closed during utility construction.

    As is pointed out in Chapter 4 of the FEIS, over time there will be more than enough people diverted from autos to transit to offset the impact of converting lanes for priority use by buses. This diversion from autos will only happen once it is clear that the BRT installation is a permanent improvement, not part of some test.

    What is proposed with the first branch between Iwilei and Waikiki will be a good test of the ability of BRT to attract new riders and the impacts of converting lanes in selected locations.

We will send you a CD-ROM copy of the Final Environmental Impact Statement (FEIS) under separate cover. If you require a printed copy of the FEIS, please contact Faith Miyamoto at 527-6976. We appreciate your interest in the project.

Sincerely,

CHERYL D. SOON
Director

Testimony in Support of Bus Rapid Transit

My name is Georgette Stevens-Begley and I have been a resident of Makakilo for the past 12 years and I grew up in Wai`anae. Although I work in Kapolei, when I was younger I used to take the bus from Wai`anae to Honolulu and Waipahu to get to college and know that the Bus Rapid Transit (BRT) would have been beneficial back then and will be beneficial now. I support BRT because:

1. The users would get to their workplace much quicker than if they drove their cars during peak-time.
2. The users would save a lot of money on their car maintenance, fuel bill, and in some cases insurance because their risk exposure would decrease significantly. Some of my family members travel from Makaha to Honolulu and that is a daily round trip of 80 miles.
3. Since there would be a lane dedicated for BRT, there would be less roadways for others to drive on and it will encourage others to use BRT.

Since I can remember, traffic has always been a problem and continues to get worse. Our City and State have examined various forms of transportation systems, such as the mass rail system, and have come to no conclusion, with the exception of the zipper lane. With the BRT in place, it will not be too costly to implement, it will be beneficial to most of the daily commuters into Honolulu, and it will also decrease the amount of use-to-be-nice-guys who turned into road-rage-monsters.

Mahalo.

Dear Ms. Stevens-Begley:

Subject: Primary Corridor Transportation Project

This is in response to your September 25, 2000 letter regarding comments on the Major Investment Study/Draft Environmental Impact Statement (MIS/DEIS).

1. *Although I work in Kapolei, when I was younger I used to take the bus from Waianae to Honolulu and Waipahu to get to college and know that the Bus Rapid Transit (BRT) would have been beneficial back then and will be beneficial now. I support BRT.*

   Response: Comment noted. Thank you for supporting the project.

2. *The users would get to their workplace much quicker than if they drove their cars during peak-time.*

   Response: Comment noted. The analysis concurs with this statement.

3. *The users would save a lot of money on their car maintenance, fuel bill, and in some cases insurance because their risk exposure would decrease significantly.*

   Response: Comment noted.

4. *Since there would be a lane dedicated for BRT, there would be less roadways for others to drive on and it will encourage others to use BRT.*

   Response: Comment noted.

5. *Our City and State have examined various forms of transportation systems, such as the mass rail system, and have come to no conclusion, with the exception of the zipper lane. With the BRT in place, it will not be too costly to implement, it will be beneficial to most of the daily commuters into Honolulu, and it will also decrease the amount of use-to-be-nice-guys who turned into road-range monsters.*

   Response: Comment noted.

We appreciate your interest in the project.

Sincerely,

CHERYL D. SOON

Duke Bainum, Chair
Transportation Committee
Council, City and County of Honolulu
Honolulu, Hawaii 96813

Re: Testimony in Support of Resolution 00-249 Relating to The Selection of a Locally Preferred Alternative for the Primary Corridor Transportation Project
Hearing: Tuesday, November 14, 2000, 10:00 a.m.

Dear Chair Bainum and Members of the Committee:

I am a resident of Aiea and a member of the Aiea Neighborhood Board #20. I am testifying today in my individual capacity.

Like my neighbors, I am grateful to the Chairman Bainum and our Councilmember Gary Okino for having the public meetings in the community about the proposed new transportation system. Traffic and congestion are big concerns in my neighborhood as they are in many other communities. Because I believe this proposal will alleviate some of those problems in my community, I support this resolution.

With respect to specific items that may be part of the transportation plan as it effects Aiea, I suggest the following that were raised at a community meeting held on October 8, 2000:

1. **Eliminate the Kam Drive-In Site as a Transit Center.** The community is unanimous on this point. No one wants a transit center at this site because it is already congested and because of noise and health concerns.

2. **Designate Kam Highway as a High-Speed Transportation Corridor.** I support the proposal made by Councilmember

Gary Okino at the November 8th public meeting, which would designate Kam Highway as a high-speed corridor for the transit system with a dedicated lane for buses. The extra lane can be constructed by using the median strip and this will not result in the time, expense and inconvenience to businesses and drivers that would result from widening the existing road.

3. Transit Centers. Construct transit centers at the former Slemons Volvo site and the stadium parking lot adjacent to K-Mart for our area. The Slemons site is already the stop for 8 existing bus routes and it is close to main retail center for the area, i.e., Pearlridge Center, Westridge Shopping Center and Pearl Kai Center. The property is adjacent to the bike path and the Pearl Harbor Historic Trail and would give bikers and present and future users of the Trail access to bus system.

Finally the cost of Councilman Okino's proposal will be less than the proposal in the draft EIS which calls for ramps to be constructed from the freeway to Kaonohi Street and construction of a transit center at the Kam Drive-In site.

I am in support of this resolution if Councilmember Okino's proposal is incorporated.

Thank you for allowing me to testify on this bill.

Jane Sugimura

Ms. Jane Sugimura
98-500 Koauka Loop, #20F
Aiea, Hawaii 96701

Dear Ms. Sugimura:

Subject: Primary Corridor Transportation Project

This is in response to your October 19, 2000 testimony at the Special Transportation Committee Meeting, your November 14, 2000 fax, and your oral testimony at the November 14, 2000 Special Transportation Committee Meeting regarding comments on the Major Investment Study/Draft Environmental Impact Statement (MIS/DEIS).

1. *As a member of the Neighborhood Board, we did have a meeting last week Monday and because of the concerns raised by the community, the Aiea Neighborhood Board did unanimously adopt the resolution which you will be getting opposing the Kam Drive-In site as a transportation center for the reasons here tonight and at our meeting.*

   Response: The former Kamehameha Drive-In site is no longer being considered for a transit center.

2. *I am concerned about the fact that I think in response to Gary's earlier question about consideration of the Kam Highway corridor. I hope that doesn't preclude the fact that maybe the transportation center could be down there because I think, you know, most of the people who live in the community or what I've heard do not want it at the Kam Drive-In site for all of the reasons that, you know, people have testified about. If there is some way we could find other site for the transportation center, maybe, you know, we can find that out during the task force. That's what we would be looking to do and I as an individual look forward to working with all of you to try to resolve it.*

   Response: The former Kamehameha Drive-In site is no longer being considered for a transit center.

3. *Like my neighbors, I am grateful to the Chairmen Beinum and our Councilmember Gary Okino for having the public meetings in the community about the proposed new transportation system. Traffic and congestion are big concerns in my neighborhood as they are in many other communities. Because I believe this proposal will alleviate some of those problems in my community, I support this resolution.*

   Response: Comment Noted. Thank you for supporting the project.

4. ***Eliminate the Kam Drive-In Site as a Transit Center.*** *The community is unanimous on this point. No one wants a transit center at this site because it is already congested and because of noise and health concerns.*

Response: The former Kamehameha Drive-In site is no longer being considered for a transit center.

5. *Designate Kam Highway as a High-Speed Transportation Corridor. I support the proposal made by Councilmember Gery Okino at the November 8th public meeting, which would designate Kam Highway as a high-speed corridor for the transit system with a dedicated lane for buses. The extra lane can be constructed by using the median strip and this will not result in the time, expense and inconvenience to businesses and drivers that would result from widening the existing road.*

   Response: The Pearl City/Aiea Working Group recommended a peak period contra-flow lane for buses on Kamehameha Highway. A planning study of the contra-flow lane is included in the FY 2003 CIP.

6. *Construct transit centers at the former Siemons Volvo site and the stadium parking lot adjacent to K-Mart for our area. The Siemons site is already the stop for 8 existing bus routes and it is close to main retail center for the area, i.e., Pearlridge Center, Westridge Shopping Center and Pearl Kai Center. The property is adjacent to the bike path and the Pearl Harbor Historic Trail and would give bikers and present and future users of the Trail access to bus system.*

   Response: The Pearl City/Aiea Working Group recommended the former Jim Siemons auto dealership as a transit center site due to its proximity to Kamehameha Highway and Pearlridge Shopping Center. DTS is proceeding with this transit center independent of the PCTP.

   The working group also evaluated several locations for a transit center/park-and-ride facility at Aloha Stadium. The overflow (Kamehameha Highway) parking lot site was selected.

7. *Finally the cost of Councilmen Okino's proposal will be less than the proposal in the draft EIS which calls for ramps to be constructed from the freeway to Keonohi Street and construction of a transit center at the Kam Drive-In site.*

   Response: The concept proposed by Councilman Okino is what is included in the Refined LPA. Some of the elements however are proceeding as seperate projects.

8. *I am in support of this resolution if Councilmember Okino's proposal is incorporated.*

   Response: Based on input received from the members of the Pearl City/Aiea Working Group including Councilmember Okino, Kamehameha Highway will be established as the main transit spine within Pearl City/Aiea with contraflow exclusive bus lanes operating during the a.m. and p.m. peak periods. This is proceeding as an independent project.

We will send you a CD-ROM copy of the Final Environmental Impact Statement (FEIS) under separate cover. If you require a printed copy of the FEIS, please contact Faith Miyamoto at 527-6976. We appreciate your interest in the project.

Sincerely,

APR 2 0 2002

April 19, 2002

Dear Sir or Madam:

Aloha!

I have been taking the bus for the past 8 years, and I've rode it everywhere on the island. I take the bus to and from work and school. Recent improvements on the bus system such as the Bike racks, City Express as well as the new hub system have made my commute a little more convenient.

This time, I would like you to support the Bus Rapid Transit system to further improve the commute of everyone on the island. There are several reasons for doing so:

- Honolulu needs a high-capacity, fast people-mover, especially during rush-hour. Commute time has gotten longer and longer and there is no signs of improvement.
- A rapid-transit system would "connect" Honolulu with West and Central Oahu in a way that business can be conducted without having to worry about traffic and parking: Imagine a system that shuttles university students between UH Manoa and UH Community Colleges.
- Revitalize our construction industry and give jobs.
- The new system will open up more jobs for bus operators, supervisors, and maintenance workers.

I hope that you would support this system.

Best regards,

Allan Tagayuna

Mr. Henry Takahashi
98-943 Moanalua Road
Apt. 1702
Aiea, Hawaii 96701

Dear Mr. Takahashi:

Subject: Primary Corridor Transportation Project

This is in response to your October 19, 2000 oral testimony at the Special Transportation Committee meeting regarding the Major Investment Study/Draft Environmental Impact Statement (MIS/DEIS).

1. *I oppose the project you guys are thinking of because of what are the hours it's going to be operating. I get up at three o'clock in the morning, go to work and I get home at five o'clock certain days. And when I coming on the street coming up by Kam Drive-In at three o'clock, only 15 cars can make a left-turn onto Moanalua Highway.*

   Response: If your concern is the hours of operation of the system as a result of its location at Kamehameha Drive-In, the transit center site at Kamehameha Drive-In and the on/off-ramp from Kaonohi Street to H-1 have been eliminated from consideration.

2. *And how are you guys going to get the bus from Kam Highway up to Kam Drive-In when it's illegal to make a left turn. Since Kam Drive-In has been open, it was never allowed to make a left turn. So when you guys are going to make the hub, are you guys going to make it legal to make a left-turn now?*

   Response: The former Kamehameha Drive-In site is no longer being considered for a transit center.

3. *Have you guys ever thought about looking at Sears warehouse? Because you guys got all the right to condemn the land. There's an off ramp close by and it's easier to build another ramp going to Ewa off that highway.*

   Response: The Sears warehouse property was evaluated as a potential transit center site but was eliminated from consideration because it would require a major business displacement. Also, a BRT H-1 ramp was considered near that location, but eliminated from consideration due its high cost and substantial residential displacements.

We will send you a CD-ROM copy of the Final Environmental Impact Statement (FEIS) under separate cover. If you require a printed copy of the FEIS, please contact Faith Miyamoto at 527-6976. We appreciate your interest in the project.

Mr. Clifton Takemura
2249 Date Street, Apt. 3
Honolulu, Hawaii 96826

Dear Mr. Takemura:

Subject: Primary Corridor Transportation Project

This responds to the comments you made on the Major Investment Study/Draft Environmental Impact Statement (MIS/DEIS) and Supplemental Draft Environmental Impact Statement (SDEIS). We are responding in two parts. Part A responds to your testimony at the October 26, 2000 Special Transportation Committee Meeting regarding the MIS/DEIS. Part B responds to your oral testimony at the SDEIS April 20, 2002 Public Hearing.

Part A – MIS/DEIS Comments

1. *And I personally feel that if we had the light-rail system that was originally planned many years ago, the current problems that we're having right now with so many cars on the street, industrial vehicles that also have to use the same road and causing trouble for pedestrians and other forms of traffic would have been relieved and would have never shown up to be so bad in this half of our twentieth century and be an issue in this beginning of this millennium.*

   Response: Comment noted.

2. *And I look forward to the BRT. Being a bus rider for many years, I am a great fan of the bus system. But also I feel too by my neighborhood board as well as my visioning team is that we want to see the bus route improved basically with this tram-on-wheels and the BRT.*

   Response: Comment noted. Thank you for supporting the project.

Part B – SDEIS Comments

3. *I'm a resident of McCully-Moiliili. I'm also a member of the McCully-Moiliili Neighborhood Board and chairman of their Legislative Affairs Committee. I had an opportunity this morning to hear a lot of people talk about the problem of BRT and the master plan, that is, environmental – the environmental statement has to offer.*

   Response: Thank you for attending the public hearing.

4. *I'm a bus rider ever since being a little boy, born here in the Island of Oahu. And I currently am a bus rider, and I pay for with – sometime with my own – buy the bus pass to use our bus system. And, also, I'm a regular driver as well. I've seen the problem about our cars, our problem with our cars and our traffic. I only want to say that we have been so far talking about traffic congestion, when we should be talking about how could we solve this problem by defining it as a traffic decongestion.*

   Response: We appreciate you sharing your bus riding and Oahu's traffic congestion history.

5. *You know, we live on this island that is very unique, where it's mixed up with a lot of local people, families, both using cars, other forms of transportation to ourselves. But we do have a very good public transit system.*

   Response: Thank you for complementing the current bus system.

6. *The only thing I've been concerned of is the people that – from Waikiki that say that this rapid transit system is another problem.*

   Response: Comment noted. No response required.

7. *I went to see the new EIS to maybe turn this – to drop the – their condition putting it into Waikiki and maybe turning it into a hub-and-spoke area, and then moving this BRT from the country side of our island to the University system itself, that which keeps it on the other side of the Ala Wai so that it would relieve the concern of the people of Waikiki. This is my suggestion based on the new EIS.*

   Response: Waikiki is one of the densest residential and employment sites on the island. Connecting it to other parts of the island by the In-Town BRT will help reduce the number of autos and buses circulating in Waikiki.

8. *And I hope that the people of this DTS will consider my suggestion. And I will be putting in my additional comments in a written testimony, and I'll send it to you people.*

   Response: We appreciate you expressing your views regarding the Waikiki portion of the project.

We will send you a CD-ROM copy of the Final Environmental Impact Statement (FEIS) under separate cover. If you require a printed copy of the FEIS, please contact Faith Miyamoto at 527-6976. We appreciate your interest in the project.

Comment on Honolulu BRT Project
Honolulu Department of Transportation Services
ATTN: Director Cheryl D. Soon
May 6, 2002

RE: Comment in Full Support of BRT Primary Corridor Project

The traffic congestion caused by far too many private auto commuters in Honolulu is progressively getting worse and the BRT project is the ONLY solution being seriously considered. The project plan has been formulated through a thorough, carefully thought out process and offers real hope in effectively addressing our traffic/commute problems. The current outcries against the system seem largely from the uninformed, narrow-minded status quo motorists who see the project as a threat to their exclusive use of the road.

A key assumption critics make is that commuters will not get out of their autos to use the BRT. This assumption is based on how the buses currently run, and may be valid if that were true. However, the BRT will have more frequent regular buses running in exclusive project lanes allowing travel to be as fast as private autos, even faster during times of peak congestion. Including the time additionally saved by not needing to park a car, a commuter could net considerable savings in time, effort, money, resources, etc. etc.(!) in the daily commute compared to using their autos. And, imagine how many more would consider taking the BRT after seeing commuters "fly" by in the buses while they are stuck in traffic.

As more commuters use the BRT the overall traffic situation will improve as overall auto traffic decreases. Thereby, in the bigger picture we all benefit. The bottom line is that there is not a single more effective and positive way to improve the overall quality of life here for all while enhancing the value of our number one industry (tourism) than to significantly reduce auto use and correspondingly encourage alternatives such as walking, bicycling, and mass transit as envisioned in the BRT project.

The BRT project is a fine way for City & County to demonstrate some real and badly needed leadership on this matter. It is very likely that our children will be grateful that the right direction was taken before auto gridlock was reached.

November 13, 2002

Ms. Claire Tamamoto
99-21 Hailimanu Place
Aiea, Hawaii 96701

Dear Ms. Tamamoto:

Subject: Primary Corridor Transportation Project

This responds to the comments you made on the Major Investment Study/Draft Environmental Impact Statement (MIS/DEIS) and Supplemental Draft Environmental Impact Statement (SDEIS). We are responding in two parts. Part A responds to your November 14, 2000 oral testimony at the November 14, 2000 Transportation Committee meeting regarding the MIS/DEIS. Part B responds to the comments you made at the SDEIS April 20, 2002 Public Hearing.

Part A – MIS/DEIS Comment

1. *Testimony supported the PCTP.*

   Response: Thank you for supporting the project.

Part B – SDEIS Comments

2. *Last year, City Council passed legislation moving our city towards a much needed transportation plan. Transportation is a vital component to our community's planning and also a universal concern for residents, businesses and visitors alike.*

   Response: We concur and appreciate you attending the public hearing an expressing your views regarding the BRT project.

3. *I would like to speak in favor of the SDEIS as released. The Supplemental Draft Environmental Impact Statement accurately reflecting a seven-month process I participated in my communities, Aiea and Pearl City. The Department of Transportation Services and the consultant should be recognized for their efforts to hear and assess the needs and concerns and also the working feasibility of the projects that were coordinated – incorporated in the Primary Corridor Transportation Project.*

   Response: Thank you.

4. *Our community, in particular, is very concerned about the proposed off-ramp and the location of the transit center at the Kamehameha Drive-In site. Through the Department of Transportation Services sponsored Working Groups, we were able to discuss those concerns, look at alternatives and the traffic flow through our communities, and agree on a workable solution that serves the communities, while still addressing the needs of the overall BRT program.*

   Response: As a result of the comments received on the DEIS and the working group meetings, the Kamehameha Drive-in site was dropped from further consideration. The working groups resulted in several project changes which were addressed in the SDEIS.

5. *The SDEIS replaces the Kaonohi Street and the Radford Drive ramps with the Luapele Drive ramp. The Aiea/Pearl City committee supported the deletion of the Kamehameha Drive-In site and the transportation center at the Kaonohi Street – with the Kaonohi Street on- and off-ramps.*

   Response: We appreciate your participation in the Pearl City/Aiea Working Group.

6. *We also supported the continued planning of two transit centers along the Kamehemeha Highway – along Kamehameha Highway to be linked with the Aloha Stadium transit center. The community businesses and DEIS discussed and supported the recommendations for shared buses and HOV contraflow lanes along Kamehameha Highway during peak traffic hours. The committee felt the selection of the proposed transportation center at the beginning of Kamehameha Highway town-bound, another midway through the Pearlridge area, complemented the proposed transportation center at Aloha Stadium. The proposed peak traffic and contraflow dedicated bus lanes would address the needs of our communities by enhancing inter-community transportation.*

   Response: These projects are being developed as separate projects.

7. *I feel it is important to protect the integrity of the community process that has been conducted over the past year. I know our communities were given ample opportunity to bring our concerns. That process, I would have hoped, would have been given to the other communities affected by the Draft EIS. The process, with the commitment made by those communities and the City to fashion a plan, a working document, I'm sure that could be modified by the time they're done with the implementation of BRT. I am proud of this sort of capacity building between government agencies and the communities that is essential if we are to move forward on any type of plan.*

   Response: There were five working groups that met between the time the DEIS was released and before the SDEIS was released for review and comment. The working groups suggestions and input resulted in the project changes the SDEIS addresses. A sixth working group was formulated in the Salt Lake area between the SDEIS and the FEIS being released.

8. *I'm going to go slightly off here. Because I'm a little confused at the purpose of this hearing. I thought that we were here to discuss comments on the SDEIS. I was encouraged to see so many people come out to testify, and I would like to encourage these people to continue with the process. It is important that you have come to share your thoughts. But it is also important that you hear the thoughts and the concerns of the other voters that have been involved in this process for over a year. I think it's only fair to them that you also work with them.*

   Response: You are right, the purpose of the April 20, 2002 public hearing was to hear comments on the BRT project, including the information presented in the MIS/DEIS and SDEIS.

9. *I know I'm supposed to summarize. So a little more. Because, you know, we talked about cost, additional cost. Cost is going to be there no matter what. I don't think you can get away from it. I think it makes sense to leverage what cost we have against federal monies to decrease the amount of hit that we, the taxpayers, take here.*

   Response: Comment noted.

10. *I think, on the outlying areas, one of the big things that you have to realize is we have a zipper lane. The zipper lane gridlocks in town. You need to solve the in-town problem first, or else we go nowhere.*

    Response: Comment noted.

11. *I just encourage you to continue to go forward, implement something, because we've been waiting for over 20 years.*

    Response: Thank you.

We will send you a CD-ROM copy of the Final Environmental Impact Statement (FEIS) under separate cover. If you require a printed copy of the FEIS, please contact Faith Miyamoto at 527-6976. We appreciate your interest in the project.

Sincerely,

CHERYL D. SOON
Director

Rose Ichi

Dillingham Bus Lanes
10-27-00

As a concerned businessman and fellow commuter, I feel that we should look at an alternative to the current plan of running the buses down the center of Dillingham. I have listed some of the reasons that I feel that this plan will not be effective and why it should be revised.

1) The current design calls for the removal of three lanes on Dillingham to make way for two bus lanes. The buses will stop for passengers about every quarter mile. Many of us feel that a quarter mile is too far for many bus riders. Since the buses have to stop at each traffic light and bus stop, this will not accomplish your needs of quicker travel time for the bus.

2) The removal of over fifty percent of the lanes on Dillingham and leaving only one town bound and one Ewa bound lane will cause major traffic congestion for King Street and Nimitz Highway. Should a traffic problem or construction work be needed on King Street or Nimitz Highway, Dillingham will not be able to handle the additional traffic flow and all commuters will suffer.

3) With the current plan of the bus stops in the center of the road, there may be more pedestrian accidents since no matter which direction you are traveling, you must cross a traffic lane to get to the bus stops. It will also cause a higher risk for accidents to bus riders since there will be traffic flowing on each side of the people who are waiting at the bus stops. The speed at which most vehicles travel down Dillingham must be looked at for pedestrian safety.

4) With only one town bound and one Ewa bound lane and the inability to make left turns into driveways and businesses, this will be a major disadvantage to the community and businesses. It will decrease productivity for businesses and result in revenue loss since many customers will avoid the area due to the major inconvenience. The needs of most commuters are concentrated in the few hours of the morning and a few hours in the afternoon but this bus line will be in place twenty four hours a day. It is a major commitment of dollars and inconvenience to the general public for just a few hours each day to accommodate the morning and afternoon commuters.

5) Before any construction is to begin, there should be an actual test using cones to create your bus lanes and leaving the one town and one Ewa lane to see how this will affect the other streets and the community. An actual physical test would be more convincing than a plan written on paper. Please do such a test before spending the projected $322,000.000 for this project.

Commuting Plan

Due to the lack of lanes coming from the H-1 viaduct on to Dillingham, we should look at Nimitz as a possible route for the express bus system. Currently Dillingham has only one lane to exit the H-1 and it is located in the center of all the others lanes. Even if there were two lanes created for an exit, you would still need to be in the center of the H-1 to exit.
Nimitz however has four lanes that exit the H-1, three from the right side and one from the left car pool lane. This seems like a better route to use for the express system.

Route 1) An express bus starts in Waianae and makes a few stops in Nanakuli, Makakilo, and Kapolei then on to the H-1 Zipper lane. After the Zipper lane ends the bus can stay in the car pool lane and exit H-1 from the left exit on to Nimitz. At some point on Nimitz, there should be a stop to drop off and pick up passengers. The next stop would be down town Honolulu and then on to the U.H. Since this first route 1 bus leaves Waianae at sometime around 5:00am or 5:30am, this bus can be used for a 7:00am or 7:30am run from the east side of Honolulu.

Route 2) An express bus starts in Wahiawa and makes a few stops in Mililani, Waipio then on to the Zipper lane. This bus will take the same route as route 1 bus stopping on Nimitz to pick up and drop off passengers. This bus will then stop in down town Honolulu and then on to Waikiki.

Route 3) An express bus starts in Ewa and makes a few stops in Waipahu, Waikele then on to the Zipper lane. This bus will use the same route as the others.

Some of the keys for this project to work will be the use of the Zipper and carpool lane, making fewer stops and changing the traffic lights for quicker flow into town.

Other things to consider would be to look at contraflow lanes on Dillingham, King and School St. as additional ways to get commuters to their destinations quicker. Adding more parking spaces at the U.H. and colleges and starting most of the classes after 9:00. This way students can leave there homes later without having to fight the current traffic with the rest of us. Most students are only in school form 8:00am till 2:00am, this will not create additional traffic in the afternoon since most of them will be out by 3:00pm..

These are only a few suggestions that we may want to look at before we invest and remove lanes from our roads. I realize that Ms. Soon's task of solving the traffic issues are great and I commend her for being open with us at trying to find a solution for all of us. I feel that finding better ways to use our roads at the times that we need it the most are the keys for better traffic.

Sincerely,
Calvin Tamaye

2250 Kamehameha Highway
Honolulu, Hawaii 96819

Dear Mr. Tamaye:

Subject: Primary Corridor Transportation Project

This is in response to your October 27, 2000 letter regarding comments on the Major Investment Study/Draft Environmental Impact Statement (MIS/DEIS).

1. *As a concerned businessman and fellow commuter, I feel that we should look at an alternative to the current plan of running the buses down the center of Dillingham. I have listed some of the reasons that I feel that this plan will not be effective and why it should be revised.*

   Response: Comment noted. See responses to comments #7, #8, #9, #10, and #12.

2. *The current design calls for the removal of three lanes on Dillingham to make way for two bus lanes. The buses will stop for passengers about every quarter mile. Many of us feel that a quarter mile is too far for many bus riders. Since the buses have to stop at each traffic light and bus stop, this will not accomplish your needs of quicker travel time for the bus.*

   Response: The proposed project will re-designate two, not three, lanes on Dillingham Boulevard for exclusive BRT use. The center BRT stops will be supplemented by local bus service with more frequent curbside bus stops; bus riders can transfer between the BRT and local buses to more easily access the BRT without being forced to walk the longer distances between BRT stops.

3. *The removal of over fifty percent of the lanes on Dillingham and leaving only one town bound and one Ewa bound lane will cause major traffic congestion for King Street and Nimitz Highway. Should a traffic problem or construction work be needed on King Street or Nimitz Highway, Dillingham will not be able to handle the additional traffic flow and all commuters will suffer.*

   Response: As documented in Chapter 4 of the FEIS, there will be enough people diverted out of the cars onto public transit for Dillingham Boulevard to operate effectively with one general purpose lane in each direction, plus turn lanes at major intersections. Along half of the route, the general purpose lanes will be extra wide so that stopped and right-turning vehicles will not hold up traffic behind it. Along the other half, bus turnouts will be installed so that stopped buses do not block traffic.

   Because of the diversion of people from autos to transit, even with the BRT lanes, the traffic LOS along Dillingham Boulevard will be equal to or better than conditions with the No-Build Alternative. Additionally, traffic LOS on parallel streets such as N. King Street and Nimitz Highway will be equal to or in most cases better with the BRT lanes on Dillingham Boulevard than without them.

Moreover, the exclusive BRT lanes on Dillingham Boulevard will enable Dillingham Boulevard to carry 3 times the number of people that it can carry today

4. *With the current plan of the bus stops in the center of the road, there may be more pedestrian accidents since no matter which direction you are traveling, you must cross a traffic lane to get to the bus stops. It will also cause a higher risk for accidents to bus riders since there will be traffic flowing on each side of the people who are waiting at the bus stops. The speed at which most vehicles travel down Dillingham must be looked at for pedestrian safety.*

   Response: The conceptual design of transit stops located in the median includes features such as safety railings along the back of the platforms. The only vehicles using the lane along the front side of the platform will be BRT buses. Traffic signals and crosswalks will be provided at BRT stations to allow pedestrians to safely cross the street. Additionally, the median stops would require passengers to only cross half the street at a time when going to or from a bus stop.

5. *With only one town bound and one Ewa bound lane and the inability to make left turns into driveways and businesses, this will be a major disadvantage to the community and businesses. It will decrease productivity for businesses and result in revenue loss since many customers will avoid the area due to the major inconvenience. The needs of most commuters are concentrated in the few hours of the morning and a few hours in the afternoon but this bus line will be in place twenty four hours a day. It is a major commitment of dollars and inconvenience to the general public for just a few hours each day to accommodate and morning and afternoon commuters.*

   Response: The Refined LPA proposed reallocation of general-purpose lanes for transit is the only reasonable way to achieve greater person carrying capacity in the future. The Refined LPA Alternative will provide an attractive, dependable, affordable alternative to the private automobile.

   Along the BRT alignment through Kalihi on Dillingham Boulevard, are many retail establishments that serve the Kalihi Community. Participation from residents and business owners in the community has been actively sought throughout project planning. A Kalihi Working Group was established comprised of Kalihi businesses, elected officials, and representatives from civic organizations to provide input and feedback to the engineering team as they refined the details of the BRT project for the FEIS. A topic of discussion in the Kalihi Working Group was alternative access to area businesses and maintaining access to businesses during construction. Many refinements were made to the project to accommodate concerns raised. The resultant plan will permit access to all properties fronting Dillingham Boulevard through various means. First off, no driveways will be closed, so there will continue to be access via right-turns in and right-turns out of these driveways. For vehicles traveling along the opposite side of the street, access will be provided via a left-turn or a U-turn at intersections. Additionally, Colburn Street and portions of Keumualii Street will be improved to provide alternative access to those businesses that have access from both Dillingham Boulevard and these secondary streets.

   To minimize the amount of widening required, the physical design of the BRT lanes involves jogs to permit left-turn lanes and median platforms. These jogs will not safely permit use of the lanes by motorists during off-peak hours.

6. *Before any construction is to begin, there should be an actual test using cones to create your bus lanes and leaving the one town and one Ewa lane to see how this will affect the other streets and the community. An actual physical test would be more convincing than a plan written on paper. Please do such a test before spending the projected $322,000,000 for this project.*

Response: The proposed BRT system is based on ridership experience of the City's existing bus services, including the recently implemented express bus services that use much of the proposed BRT alignment, forecasts of BRT and local bus ridership using regional travel forecasting models, and input received at hundreds of public outreach meetings. A test without all features of the BRT system in place (i.e., limited stop operations in exclusive and semi-exclusive lanes using low-floor vehicles with level boarding through multiple doors, and prepayment of fares) would be misleading and not a true test of the system. For example, the project proposes to completely reconstruct Dillingham Boulevard through the Kalihi area to provide significant pedestrian amenities to facilitate access to BRT stations, as well as building new BRT stations and exclusive lanes in the center of the roadway. Without such major reconstruction, it would not be possible to provide the substantial time savings for transit riders through this corridor that would be offered by the BRT. Most importantly, potential new riders would not likely perceive the demonstration service as permanent and would not be induced to change their travel mode.

7. *Due to the lack of lanes coming from the H-1 viaduct on to Dillinghem, we should look at Nimitz as a possible route for the express bus system. Currently Dillingham has only one lane to exit the H-1 and it is located in the center of all the others lanes. Even if there were two lanes created for an exit, you would still need to be in the center of the H-1 to exit. Nimitz however has four lanes that exit the H-1, three from the right side and one from the left car pool lane. This seems like a better route to use for the express system.*

   Response: Since Dillingham Boulevard is a preferable route to Nimitz Highway for serving Kalihi residents and businesses, the H-1 Regional BRT buses will exit onto Middle Street to serve the Middle Street Transit center. After dropping-off and picking-up passengers at the transit center, express buses would exit onto Kamehameha Highway (Dillingham Boulevard) and continue into town using the BRT lane on Dillingham Boulevard.

8. *Route 1) An express bus starts in Waianae and makes a few stops in Nanakuli, Makakilo, and Kapolei then on to the H-1 Zipper lane. After the Zipper lane ands the bus can stay in the car pool lane and exit H-1 from the left exit on to Nimitz. At some point on Nimitz, there should be a stop to drop off and pick up passengers. The next stop would be downtown Honolulu and then on to the UH. Since this first route 1 bus leaves Waianae at sometime around 5 or 5:30 a.m., this bus can be used for a 7 or 7:30 a.m. run from the east side of Honolulu.*

   Response: There is an express route in the Refined LPA similar to what is suggested, except that it would take advantage of the Middle Street ramp and the Dillingham Boulevard exclusive lanes rather than using Nimitz Highway.

9. *Route 2) An express bus starts in Wahiawa and makes a few stops in Mililani, Waipio then on to the Zipper lane. This bus will take the same route as route 1 bus stopping on Nimitz to pick up and drop off passengers. This bus will then stop in downtown Honolulu and then onto Waikiki.*

   Response: There is an express route in the Refined LPA similar to what is suggested, except that it would take advantage of the Middle Street ramp and the Dillingham Boulevard BRT lanes rather than using Nimitz Highway. It would also benefit from the proposed direct connector ramp at the Waiawa interchange that would permit buses to go directly from the p.m. zipper lane into the H-2 mauka bound HOV lane.

10. *Route 3) An express bus starts in Ewa and makes a few stops in Waipahu, Waikala then onto the Zipper lane. This bus will use the same route as the others.*

    Response: There is a route in the Refined LPA similar to what is suggested, with the routing via Dillingham Boulevard instead.

11. *Some of the keys for this project to work will be the use of the Zipper and carpool lane, making fewer stops and changing the traffic lights for quicker flow into town.*

    Response: The Refined LPA would create an H-1 BRT Corridor consisting of new express and zipper lanes, allowing express buses from Ewa and Central Oahu to bypass peak period traffic congestion on their way to downtown. Traffic signals would be synchronized and programmed to provide priority to the transit lanes at selected intersections.

12. *Other things to consider would be to look for contreflow-lanes on Dillingham, King and School St. as additional ways to get commuters to their destinations quicker.*

    Response: The Hawaii DOT has proposed an A.M. peak period contra-flow lane on Nimitz Highway. As far as Dillingham Boulevard, a contra-flow BRT operation was analyzed and rejected due to: 1) the restrictions on left turns and U-turns during peak periods, 2) added operating costs of having to place and pick-up traffic cones twice a day, 3) safety hazard of island BRT boarding platforms that become obstacles that have to be maneuvered around when the contra-flow lanes are not in operation, and 4) loss of benefit to BRT vehicles operating in the reverse direction when the contra-flow lane is in operation. Contraflow lanes on Nimitz Highway, Dillingham Boulevard, and King Street are not possible during the P.M. peak period since there is not the same imbalance in the direction of travel that exists in the A.M. peak.

13. *Adding more parking spaces at the UH and colleges and starting most of the classes after 9:00. This way students can leave their homes later without having to fight the current traffic with the rest of us. Most students are only in school from 8 a.m. to 2 e.m. (sic), this will not create additional traffic in the afternoon since most of them will be out by 3 p.m.*

    Response: Adjusting hours such as that proposed is consistent with the travel demand management goals of the Oahu Regional Transportation Plan. Adding parking is not. Providing an improved transit alternative such as the Refined LPA would be preferable.

14. *These are only a few suggestions that we may want to look at before we invest and remove lanes from our roads.*

    Response: Comment noted.

We will send you a CD-ROM copy of the Final Environmental Impact Statement (FEIS) under separate cover. If you require a printed copy of the FEIS, please contact Faith Miyamoto at 527-6976. We appreciate your interest in the project.

Mr. Kalsuml Tanaka
1141 Walmanu Street, #105
Honolulu, Hawaii 96814

Dear Mr. Tanaka:

Subject: Primary Corridor Transportation Project

This is in response to your oral testimony at the April 20, 2002 public hearing regarding comments on the Supplemental Draft Environmental Impact Statement (SDEIS).

1. *I would like to discuss or present in terms of public policy – Number one, what is the state of affairs on the financial reality of today when deliberating projects that will cost more money?*

   Response: Comment noted. It is the City Council's responsibility to define public policy and determine the City's ability to finance all the city's projects. The Major Investment Study/Draft Environmental Impact Statement (MIS/DEIS), SDEIS, and Final Environmental Impact Statement (FEIS), Chapter 6 discuss the Primary Transportation Corridor Project's financial feasibility.

2. *Number two, the sources for running the project are largely from federal funds and local taxes. Therefore, public policy deliberations should ask, for whose benefit predominantly? What should be the priorities?*

   Response: All of the alternatives analyzed are focused on serving residents of Oahu with priority on those who live and/or work in the Primary Transportation Corridor.

3. *Who should pay and how should it be paid? Moreover, what happens if it didn't work?*

   Response: The financial plan indicates the proposed funding sources.

4. *Let me illustrate several examples of what I think should be deliberated upon. The City has many parks that are not used or never been used. Swimming pools that exist that are not used. Libraries. Public transportation should be predominantly for the benefit of local residents. Public transportation should connect them. Teenagers, elderly citizens, could be transported from parks to their homes, to swimming pools, libraries, health care centers.*

   Response: We concur and the BRT project is one component in Oahu's transportation system that will allow residents, if they so desire, to access parks, swimming pools, their homes, jobs, etc.

5. *Then the issue is, where on Oahu first? Kalakaua Avenue? On Kalakaua Avenue, 21 hours out of 24? Frequency of four minutes to six minutes? Who are likely to be the riders. Of course local residents. But many, many tourists. Did they pay for the taxes?*

   Response: As is the case in all U.S. cities tourists in Honolulu are permitted to use the public transit system along with residents.

6. *What about the children in Waianae? What about the elderly who are strapped to the radius of about a hundred yards once the only sedan leaves the household? How about, instead of against, be for, for the persons who are – who should be the beneficiaries of public transportation.*

   Response: The Refined LPA includes improved transit service to Waianae.

7. *Why not connect, why not run, why not give them the best instead of giving the best on Kalakaua Avenue?*

   Response: The majority of jobs in Waikiki occur near Kalakaua Avenue. The Refined LPA will provide a much faster connection for Waikiki workers who live in Waianae.

8. *Isn't it the obligation, when deliberating, that the taxpayers and the electorate are to become the intended beneficiaries?*

   Response: The proposed BRT project will give all residents an option to driving their cars for trips.

9. *Moreover, we are talking about scarce resources.*

   Response: Comment noted.

10. *Moreover, the argument should not be, if you are against BRT, you are against public transportation. I, for one believe that there should be much, much, much more public transportation for local residents. And instead of forcing motorists out of their cars, let's first satisfy those who don't have transportation. They ought to be addressed first before any sorts of engineering to force those who already have means of transportation out into tax-subsidized programs.*

    Response: The Refined LPA is designed to serve those dependent on public transportation as well as attract those who have a choice of modes. There is no attempt to force anyone to use public transportation. To the contrary, the focus is on providing a better more attractive transit system than what is available today so that motorists voluntarily choose to use it.

We will send you a CD-ROM copy of the FEIS under separate cover. If you require a printed copy of the FEIS, please contact Faith Miyamoto at 527-6976. We appreciate your interest in the project.

Sincerely,

CHERYL D. SOON
Director

MAY, 8 2002

May 5, 2002

Ms. Cheryl D. Soon, Director
Department of Transportation Services
City and County of Honolulu
650 King St., 3rd Floor
Suite 702
Honolulu, Hi #96813

Dear Ms. Soon,

At the urging of friends I attended the meeting you arranged at the Convention Center ; otherwise I would have been totally unaware that a new transportation system was being planned. I think there should have been more notice to the neighborhoods about this proposal, I have not heard anything like this since the light rail proposal. I have lived here in Waikiki for 25 years and use the current bus system from time to time and find it very dependable in the Waikiki area.

I don't have knowledge of the traffic difficulties in the outer areas of Hawaii But I do feel that within the Waikiki area you are trying to institute something that IS NOT NEEDED. Your plan to limit certain lanes for BRT only will cause the traffic to be worse, not better. Within Waikiki our current bus system is working well and we need those streets that you want to take away for our Taxi our service vehicles, special transportation vehicles, and private cars.

Ninety percent of the people in Waikiki have a need for private vehicles, taxi, vehicles that transport tourists, and service vehicles, they must be able to use the streets and DO NOT need further congestion that would be caused by losing necessary lanes. The current bus system is adequate for the other 10% and for myself.

If you want the Federal money and you are certain that the project will not cause an increase of property taxes then use the money where it would be most beneficial; transport people from the outer areas to connect with our city buses. It appears to me that you want to force all people to use the new BRT system even though it will not benefit the majority of the people.

Sincerely,

Lila Tarsey

Dear Ms. Tersey:

Subject: Primary Corridor Transportation Project

This is in responds to your comments on the Supplemental Draft Environmental Impact Statement (SDEIS).

1. *At the urging of friends I attended the meeting you arranged at the Convention Center; otherwise I would have been totally unaware that a new transportation system was being planned. I think there should have been more notice to the neighborhoods about this proposal. I have not heard anything like this since the light rail proposal. I have lived here in Waikiki for 25 years and use the current bus system from time to time and find it very dependable in the Waikiki area.*

   Response: We appreciate you taking the time to comment about the project. The project team has attended numerous Waikiki Neighborhood Board meetings to discuss the project. Also, a Waikiki Neighborhood Board member participated in the Waikiki working group meetings. There have been several articles in the local papers and stories on the local radio and television programs regarding the proposed BRT project.

2. *I don't have knowledge of the traffic difficulties in the outer areas of Hawaii But I do feel that within the Waikiki area you are trying to institute something that IS NOT NEEDED. Your plan to limit certain lanes for BRT only will cause the traffic to be worse, not better. Within Waikiki our current bus system is working well and we need those streets that you want to take away for our Texi our service vehicles, special transportation vehicles, and private cars.*

   Response: New lanes will be added in parts of Waikiki (Ala Moana Boulevard and Kalia Road) not taken away. Along these streets and the other streets where the In-Town BRT is opereting in priority lanes, private buses will be sharing these lanes.

3. *Ninety percent of the people in Waikiki have a need for private vehicles, texi, vehicles that transport tourists, and service vehicles, they must be able to use the streets and DO NOT need further congestion that would be caused by losing necessary lanes. The current bus system is adequate for the other 10% and for myself.*

   Response: See response to comment # 2.

4. *If you want the Federal money and you are certain that the project will not cause an increase of property taxes then use the money where it would be most beneficial; transport people from the outer areas to connect with our city buses.*

   Response: The Refined LPA will transport people from the outlying areas to-and-from town.

5. *It appears to me that you want to force all people to use the new BRT system even though it will not benefit the majority of the people.*

   Response: No one will be forced to ride the BRT system. It will provide residents with another transportation option.

We will send you a CD-ROM copy of the Final Environmental Impact Statement (FEIS) under separate cover. If you require a printed copy of the FEIS, please contact Faith Miyamoto at 527-6976. We appreciate your interest in the project.

Sincerely,

Honolulu, Hawaii 96815-1640

Dear Ms. Thomas:

Subject: Primary Corridor Transportation Project

This is in response to your comment form regarding the Supplemental Draft Environmental Impact Statement (SDEIS).

1. *There is no room for more buses, it will only create more congestion.*

   Response: Chapter 4 of the FEIS fully discusses the consequences of converting selected general purpose lanes to priority use by transit vehicles.

   When people are diverted onto public transit, congestion for motorists will be less with the Refined LPA than it would be with the No-Build or TSM Alternatives. Conditions will be much better for BRT riders with the Refined LPA since they will have a path clear of the congestion along much of the In-Town and Regional BRT routes.

2. *We don't only go on a joy ride with our cars, we also carry things for work, kids, groceries. Bus is not the answer.*

   Response: Comment noted.

Mr. Steve Tierney
1550 Wilder Avenue, #1010
Honolulu, Hawaii 96822

Dear Mr. Tierney:

Subject: Primary Corridor Transportation Project

This is in response to your testimony at the October 12, 2000 Public Hearing regarding comments on the Major Investment Study/Draft Environmental Impact Statement (MIS/DEIS).

1. *Whichever method is chosen, whether it's the No-Build or the TSM or BRT, I really would like to see quieter buses. When you're sitting at a bus stop and a bus comes up and it passes on, it makes a lot of noise. If you live close to a bus route, that noise wakes you up in the morning. So whatever, quieter buses would be really appreciated.*

   Response: Both vehicle technologies under consideration, embedded-plate and hybrid electric, would be substantially quieter than the existing diesel buses.

2. *Another thing that would be good would be a periodic shoppers bus designed especially to accommodate shoppers with shopping carts. Maybe every third or fourth bus on that line could be especially designed to accommodate this. Right now, large baggage can't be carried on the current buses.*

   Response: Duly noted, however no change in current policy regarding shopping carts is presently proposed.

3. *Something else that would be useful would be restrooms in the hubs. I know Kalihi Transit Center has that, but some of the hubs don't. I don't know if people are considering Punchbowl and King or Punchbowl and Beretania as a hub, but I think it is. It would be nice if there were public restrooms there.*

Response: Restrooms and other amenities are planned to be installed at many of the transit centers.

4. *Also, a very good thing to have would be at the bus stops, especially the frequently used ones where overlapping lines occur, would be a waiting time indicator for the bus that's coming and how many minutes it would be before it gets there. This can be done pretty easily, I think, with global positioning on each bus, or some kind of system on each bus, Star, especially heavily used ones.*

   Response: As part of the Refined LPA, information on the arrival time of the next bus would be available at transit centers and major BRT stops.

We will send you a CD-ROM copy of the Final Environmental Impact Statement (FEIS) under separate cover. If you require a printed copy of the FEIS, please contact Faith Miyamoto at 527-6976. We appreciate your interest in the project.

Sincerely,

CITY CLERK
HONOLULU, HAWAII

Re: Primary Corridor Transportation Project
Major Investment Study/Draft EIS

Chair Bainum, Committee Members:

Welcome to Kapolei and thank you for this meeting on a very important matter to our community - Transportation.

My name is Maeda Timson. I am Chair our Kapolei Neighborhood Board, and have been active with the Hub and Spoke Project and other Transportation matters such as the WikiWiki Ferry and Express Bus. I also must commute into town and back every day during peak and non-peak hours. I have also spoke to numerous bus and car riders from Makakilo, Honokai Hale, Villages of Kapolei, and Ewa Villages.

I would like to comment on what I feel is the best-proposed alternative based on my personal experience and that of other community members.

The BRT alternative is best suited for our community. Because of our diverse and growing population in the City of Kapolei this method offers fast, efficient, dependable service which is also environmentally friendly preserving our open spaces and the beauty of Leeward Oahu. We have students, retirees, working people and tourist who frequent The Bus to and from the Leeward Coast and Ewa Plains as well as these same groups of people who must use their automobiles. By using this method to improve public transportation, community can leave their cars at home, save money on gas and save their sanity and lower their stress level of driving in traffic! It will also expand new friendships that otherwise would not happen.

Please support the Bus Rapid Transit alternative.

Sincerely,

Maeda Timson

Re: Community Meeting on 10/19/00 @ 6:30 p.m.

As a homeowner across the street from the proposed site I would like to register my dissatisfaction with the idea of creating a bus terminal or turnaround right outside my bedroom window. It is bad enough we have to be disturbed by the 5:30 a.m. noise of the swap meet on Wednesday, Saturday & Sunday. Now we will have extra noise everyday.

What happened to the idea of creating a much needed park for the many youth and families in the area ? That was an idea with true merit that deserves to be put forward.

If the City & County has the money to acquire this parcel and build a bus terminal then it could easily afford to turn it into the much needed park instead. This is not a matter of "not in my back yard" but rather having government give us what we really need.....a park !

Ms. Cheryl Soon, Director
Department of Transportation
City & County of Honolulu
650 South King Street
Honolulu, Hawaii 96813

Dear Ms. Soon:

Subject: Testimony in Support of the Bus Rapid Transit System

The City and County of Honolulu desperately needs a modern, efficient public transportation system. The daily grid lock on our highways and roads is getting worse every year.

I am aware of other Cities, such as Portland, Oregon where a well planned rapid transit system was a cornerstone for redevelopment and economic revitalization in the City. It was also used in the land use planning for future growth in the Portland metropolitan area.

Efficient transportation systems for moving people and commerce has been sorely needed in our city for some time now. The City's Bus Rapid Transit System provides people with a realistic commuting alternative that will reduce travel time. Also, as in the case of Portland, I expect that BRT will provide new business opportunities in redevelopment area.

I am in support of the continued work and development of the Bus Rapid Transit System for the City and County of Honolulu.

Thank you for providing me an opportunity to testify.

Mr. Jon von Kessel
c/o Government Efficiency Teams
1645 Ala Wai Boulevard, Apt. 1304
Honolulu, Hawaii 96815

Dear Mr. von Kessel:

Subject: Primary Corridor Transportation Project (PCTP)

This is in response to your testimony at the October 5, 2000 Special Transportation Committee Meeting regarding comments on the Major Investment Study/Draft Environmental Impact Statement (MIS/DEIS).

1. *So, this then brings us to the next point of when we have fixed guideways on certain routes such as the A, B and C bus routes. We end up having a severe problem when those do not intersect with other transit routes. Perfect example is the A route crossing Kalakaua and Kapiolani. You still have to walk another two and a half blocks to come back to catch the bus to go the other way. So, that is an alignment of bus stops that must be done. And that is very relevant to what you're proposing. Whether it's accepted or not, it has to do with all transportation.*

   Response: All existing bus routes will be evaluated for re-routing to intersect with the BRT at or near the proposed BRT stops. The In-Town BRT is only one element of the transit plan for the Primary Urban Center. The plan also includes conversion of the bus system to a hub-and –spoke network which will consist of new local circulator routes, as well as continuation of many existing line haul and express routes. The goal is to have an integrated network of transit services that provide convenient and cost-effective options for potential users.

2. *The BRT is being proposed as a quasi-rail system. You have dedicated space with dedicated hardware infrastructure that is for the purpose which is quasily the same as a rail system. Whereas a full rail system obviously is going to restrict any use by other activities. So, that must be considered. So, then with the closing summary is if in fact one has to walk more than three or four blocks they're not going to use whatever transportation services are available particularly if they've got groceries or whatever in their arms. So, having things dedicated onto streets that are not conductive of the other transportation mixes then we're looking for doom.*

Response: In-Town BRT stop spacing is between ¼- and ½-mile apart. This is typical for a high capacity, limited stop service. It offers a balance of faster speeds with convenience to destinations acceptable to most passengers. To serve passengers who may find the stop spacing too far apart there will be interconnecting local bus service and circulator routes to which they can transfer for completing their journeys.

We will send you a CD-ROM copy of the Final Environmental Impact Statement (FEIS) under separate cover. If you require a printed copy of the FEIS, please contact Faith Miyamoto at 527-6976. We appreciate your interest in the project.

Sincerely,

CHERYL D. SOON

Lea Sasak Watts
1777 Ala Moana #1810
Honolulu, Hi 96815

MAY - 8 2002

Ms. Cheryl D. Soon, Director
Department of Transportation Services
Ctrl. City and County of Honolulu
650 King St., 3rd Floor
Suite 702
Honolulu, Hi #96813

Dear Ms. Soon,

I attended the recent meeting at the Convention Center where plans were displayed by Transportation Services to show the proposed Bus Rapid Transit route.

I have had an apartment on Ala Moana Blvd since 1975 and I do not own a car; so I depend on The Bus and taxies for my transportation. My experience with the current bus system has been good within the Waikiki area; and find they are on time and offer a good schedule.

I have studied your plans and believe that your plan to take away two lanes on Ala Moana Blvd and Kalakaua for strickly BRT use will be disastrous.
I consistently travel these two streets by bus and by taxi, and not enough space exists to dedicate two lanes to the new BRT without causing complete gridlock.

Tourist arrive in Waikiki by taxi and special transportation vehicles from the airport using the Nimitz to Ala Moana Blvd to Kalakaua.
The new BRT that you are planning will never be the answer to their needs; yet they and the people who provide their transportation are the most consistent users of these particular streets. Hawaii's business is tourism, and the BRT added to the downtown Honolulu or Waikiki will not be encouraging to that business. In fact if you try to force everyone onto the bus Honolulu will lose the reason it exists, it will lose its tourists. Even now we are losing tourist because we are overbuilt.

We must continue to keep the beaches beautiful and unobstructed, we need more trees and greenery, and as much open space as we possibly can get to present a beautiful area to which our tourist will want to return. I understand your plan provides for removing the trees and greenery from the middle of Ala Moana Blvd and also other streets to provide extra space for this new BRT., that would be a mistake, we need to keep every inch of beauty that we have, that is the basis of our business here in Hawaii. Again our current bus system is working

well in Waikiki, why not just improve it where needed? Maybe you need to build a BRT system to help people from outlying areas to reach Honolulu and Waikiki to connect with our current bus system; why don't you concentrate on that possibility.

Sincerely,

Lea Watts

Ms. Lea Sasak Watts
1777 Ala Moana Boulevard, #1810
Honolulu, Hawaii 96815

Dear Ms. Watts:

Subject: Primary Corridor Transportation Project

This is in response to your May 3, 2002 letter regarding comments on the Supplemental Draft Environmental Impact Statement (SDEIS).

1. *I attended the recent meeting at the Convention Center where plans were displayed by Transportation Services to show the proposed Bus Rapid Transit route.*

   Response: Comment noted. We assume that you are referring to the SDEIS April 20, 2002 Public Hearing held at the Convention Center.

2. *I have had an apartment on Ala Moana Blvd. since 1975 and I do not own a car; so I depend on TheBus and taxis for my transportation. My experience with the current bus system has been good within the Waikiki area; and find they are on time and offer a good schedule.*

   Response: Comment noted.

3. *I have studied your plans and believe that your plan to take away two lanes on Ala Moana Blvd. and Kalakaua for strictly BRT use will be disastrous. I consistently travel these two streets by bus and by taxi, and not enough space exists to dedicate two lanes to the new BRT without causing complete gridlock.*

   Response: No lanes will be taken away on Ala Moana Boulevard in Waikiki, in fact lanes will be added. Through re-striping and narrowing of the median an additional lane in each direction for priority use by buses and right-turning vehicles will be added. One lane on the section of Kalakaua Avenue between Saratoga Road and Uluniu Avenue will be converted for shared use by BRT buses, private buses and right-turning autos.

4. *Tourist arrive in Waikiki by taxi and special transportation vehicles from the airport using the Nimitz to Ala Moana Blvd. to Kalakaua. The new BRT that you are planning will never be the answer to their needs; yet they and the people who provide their*

transportation are the most consistent users of these particular streets. Hawaii's business is tourism, and the BRT added to the downtown Honolulu or Waikiki will not be encouraging to that business. In fact if you try to force everyone onto the bus Honolulu will lose the reason it exists, it will lose its tourists. Even now we are losing tourists because we are overbuilt.

Response: Private buses and mini-buses that transport tourists to-and-from the Airport will be able to use the BRT lanes in Waikiki. The BRT will not be competing with these private services since it will not serve the Airport.

5. *We must continue to keep the beaches beautiful and unobstructed, we need more trees and greenery, and as much open space as we possibly can get to present a beautiful area to which our tourist will want to return. I understand your plan provides for removing the trees and greenery from the middle of Ala Moana Blvd. and also other streets to provide extra space for this new BRT., that would be a mistake, we need to keep every inch of beauty that we have, that is the basis of our business here in Hawaii.*

   Response: The landscaped median on Ala Moana Boulevard will remain. However in some locations the median will be narrowed and new trees planted to replace any that are removed.

6. *Again our current bus system is working well in Waikiki, why not just improve it where needed?*

   Response: Waikiki is one of the densest residential and employment sites on the island. Connecting it to other parts of the island by the In-Town BRT will help reduce the number of autos and buses circulating in Waikiki.

7. *Maybe you need to build a BRT system to help people from outlying areas to reach Honolulu and Waikiki to connect with our current bus system; why don't you concentrate on that possibility.*

   Response: See response to comment #6.

We will send you a CD-ROM copy of the Final Environmental Impact Statement (FEIS) under separate cover. If you require a printed copy of the FEIS, please contact Faith Miyamoto at 527-6976. We appreciate your interest in the project.

Sincerely,

Dear Ms. West:

Subject: Primary Corridor Transportation Project

This is in response to your comment form and April 23, 2002 letter regarding the Supplemental Draft Environmental Impact Statement (SDEIS).

1. *Cone off Waikiki area for weeks before it's a final.*

   Response: A test of closing a lane is not a test of what will happen with the Bus Rapid Transit (BRT), it is only a test of what happens when a lane is closed which is something everyone knows the consequence of from when lanes are temporarily closed during utility construction.

   As is pointed out in Chapter 4 of the Final Environmental Impact Statement (FEIS), over time there will be enough people diverted from autos to transit to offset the impact of converting lanes for priority use by buses. This diversion from autos will only happen once it is clear that the BRT installation is a permanent improvement, not part of some test.

   What is proposed with the first In-Town BRT branch between Iwilei and Waikiki will be a good test of the ability of BRT to attract new riders and the impacts of converting lanes in selected locations.

2. *I would like to see the implementation of cones in Waikiki, have it all coned off, and cone it for a month before you put the buses in and do anything else.*

   Response: See response to comment # 1.

3. *Please, please <u>try</u> before you all buy, espacially in Waikiki BRT. May I suggest (strongly) that barricades starting at Hobron and Ala Moana be installed for the route BRT will take thru all Waikiki, for 30 days. "Try."*

   <u>Response</u>: See response to comment # 1.

4. *Last Saturday the 20th it took me 3 signals to get through the Hobron / Ala Moana because of an arthritis walk – 1 lane coned.*

   <u>Response</u>: Comment noted. No response required.

We will send you a CD-ROM copy of the FEIS under separate cover. If you require a printed copy of the FEIS, please contact Faith Miyamoto at 527-6976. We appreciate your interest in the project.

November 13, 2002

Mr. Greg Wonghan
2333 Kapiolani Boulevard, #3416
Honolulu, Hawaii 96826-4479

Dear Mr. Wonghan:

Subject: Primary Corridor Transportation Project

This is in response to your oral testimony at the April 20, 2002 public hearing regarding comments on the Supplemental Draft Environmental Impact Statement (SDEIS).

1. *I'm opposed to the BRT for the simple reason that many of the areas that you have on plan for development of the BRT will create a lot more congestion.*

   Response: Chapter 4 of the FEIS fully discusses the consequences of converting selected general purpose lanes to priority use by transit vehicles.

   When people are diverted onto public transit, congestion for motorists will be less with the Refined LPA than it would be with the No-Build or TSM Alternatives. Conditions will be much better for BRT riders with the Refined LPA since they will have a path clear of the congestion along much of the In-Town and Regional BRT routes.

2. *I'm particularly concerned about the area in Waikiki as the BRT enters into Waikiki through Ala Moana. As many people who know that live in that area, not only today, but in the past, realize that this is one of the most heavily occupied areas, residential and otherwise, in the whole state of Hawaii. And to bring BRT into that particular neighborhood flies in the face of reason.*

   Response: By narrowing the lane widths and reducing the median somewhat, it will be possible with the Refined LPA to add two semi-exclusive curb lanes on Ala Moana Boulevard while still maintaining the same number of general purpose traffic lanes.

3. *And I think what everybody should realize is that what the State is doing and the County is doing is moving very aggressively into the process of privatizing. I think a lot of us, when we think about and hear the term "privatization," we think of smaller government, we think of less costly government. But in this particular case, I think, in recent history, the way politics have moved in the state of Hawaii, we realize that privatization means paying off people on the inside, and it goes against the common good of the public.*

   Response: Comment noted. No response required. This is a statement regarding privatization and payoffs, which are beyond the project scope.

4. *The cost of this edifice here wes three hundred end fifty some odd million. Over the next 20 years, the cost of floating bonds and so forth, with interest, will be in excess of one billion dollars. So we're talking about epproximetely three times tha cost. If you're talking about 1.6 billion for the BRT, we're looking at three to four billion dollers. And as meny of us know, with this economy, we're having a real tough time satisfying the debt thet's creeted by these bonds.*

   Response: The amount to be paid for with City GO Bonds is $359.5 million, not $1.6 billion.

5. *What a lot of people don't know, that every three years, the State of Hawaii basically experiences a spike with respect to the payment of interest on these bonds.*

   Response: The 5.5 percent interest rate reflects the Bond Buyer 11 High Grade GO Bond Index, at a 25-year maturity. This industry standard takes into consideration historical fluctuations.

6. *And so you know what we do folks, when we get thet spike? Well, what the State hes decided, in their infinite wisdom, is to go out end float a whole other set of bonds just to pay for the interest. Isn't that exciting? That's the kind of budgeting end planning I think that we're embracing as we aggressively move towards privatization. What we're losing in the process is the present end future common good of the public.*

   Response: Comment noted.

We will send you a CD-ROM copy of the Final Environmental Impact Statement (FEIS) under separate cover. If you require a printed copy of the FEIS, please contact Faith Miyamoto at 527-6976. We appreciate your interest in the project.

Sincerely,

November 13, 2002

Mr. Louis Xigogianis
430 Lewers Street, Apt. 6B
Honolulu, Hawaii 96815

Dear Mr. Xigogianis:

Subject: Primary Corridor Transportation Project

This is in response to your oral testimony at the April 20, 2002 public hearing regarding comments on the Supplemental Draft Environmental Impact Statement (SDEIS).

1. *And I would like to say that when Cheryl Soon gave e presentation to – I think it was the Waikiki Residents Association several months ago about the BRT, I liked it. I thought it was very sleek.*

   Response: Thank you for attending the public hearing.

2. *But since then, I've changed my mind. And after e lot of the testimony today, I feel that it has quite a few problems that haven't been answered.*

   Response: We appreciate you expressing your views regarding the proposed project.

3. *And I would like to propose a compromise, and that is, we should work on our present bus system and extend it, improve it, and do all kinds of things to encourage people to ride the present bus system.*

   Response: The Refined LPA will be phased in over a 13-year period. The initial years will be focused on what you suggest, namely improving the existing bus system including installing the In-Town BRT.

4. *I'm a senior citizen, and I have my bus pass, and I have a car. I live in Waikiki. But I take the bus whenever I go to town, just about every time I go to town, because it's so much simpler. It takes e little longer than driving, but then you don't heve to worry about the perking.*

   Response: Thank you for using the bus system. The BRT system will provide you with an additional transportation mode to use in making trips.

5. *And I think that, if you live out in the country, they already have Express buses. I think that could be improved upon. I think if you live in Manoa or some of the mountain areas and the ridges, I think that that – that those areas could be better served if they had buses that went around and around and around met up with the main line buses. Because many people that live in Manoa don't want to take the bus because it only runs every 45 minutes or so, and it only runs maybe till 10 o'clock at night. And so if you come in to Waikiki, why, you can't take the bus home.*

   Response: That is what is proposed with the Refined LPA.

6. *I'm in favor of the present bus system, so let's spend some of the money you were going to spend on the BRT, let's put that into the present bus system, improve that, and then think about the future, since so many people are worried about the future – we should be – and maybe consider a monorail system for the future.*

   Response: That is what is proposed with the Refined LPA.

We will send you a CD-ROM copy of the Final Environmental Impact Statement (FEIS) under separate cover. If you require a printed copy of the FEIS, please contact Faith Miyamoto at 527-6976. We appreciate your interest in the project.

November 13, 2002

Mr. Ron York
1824 Dillingham Boulevard
Honolulu, Hawaii 96819-4019

Dear Mr. York:

Subject: Primary Corridor Transportation Project

This is in response to your testimony at the April 20, 2002 public hearing regarding comments on the Supplemental Draft Environmental Impact Statement (SDEIS).

1. *I am a property owner on the Dillingham corridor. First, I want to say I really think the process is fraught from the informational position. As a property owner along the corridor, the only way I found out that there was something happening in that area is by one of my cohorts that lives across the street saying they're holding some meetings. None of us were ever informed. And something of this magnitude, that is going to have a financial impact on the worth of the people's property and also the employment of these people, they should have the information before they sign extension on leases, because this construction cycle is going to take a long period of time. All right.*

   Response: The project's public involvement process began in 1998 with the TRANS 2K meetings. There have been hundreds of meetings regarding the project, including the working groups formed to give the public a better understanding of the project. The working groups input resulted in project changes, which are reflected in the SDEIS. The project has been the subject of numerous newspaper articles plus radio and television spots. In addition, the eight project newsletters have each been distributed to over 10,000 people on the project mailing list.

2. *I have a letter here that we addressed, with Romy Cachola, to Cheryl Soon, asking for answers. And it says, "How will BRT impact Teamsters trucking industries who depend on timely delivery of goods and services, that cannot happen when two lanes of traffic will be designated solely for BRT, leaving just one lane in each direction?" Cheryl Soon's answer: "In Dillingham Boulevard corridor, the BRT team has worked with each of the business and property owners on Dillingham to insure that access for both delivery trucks and customers will be maintained." Nobody has ever contacted and nobody can show me a written letter that has been given to any business or lessee along the corridor. And this is going to really impact, because most of those people rely on people crossing the center lane to get into their property and their small little parking areas, and we are going to lose all of that. All right. So we never was informed correctly. And that's disturbing. Okay.*

   Response: Representatives of businesses on Dillingham Boulevard participated in a series of workshops the City held with the Kalihi Business Association and were participants in the Kalihi Working Group meetings. Alternatives to maintaining access to businesses along Dillingham Boulevard were developed at these meetings.

3. *The thing also that bothers me is that we have construction going on around this island in the same areas on continuous years. Dillingham is a prime corridor for that. The end of H-1 Freeway, Ainakoa Street, prime targets for that. I strongly suggest that, whatever kind of transit system you people ever design, that you turn around and work below the grade first and make sure everything is updated below the grade before you put any concrete or blacktop down, because you people are going to be the severe impact that you're going to have on traffic, not the traffic. Okey.*

   Response: Efforts to coordinate with other projects has already begun. These coordination efforts will continue through the final design and construction phases.

4. *In regards to Dillingham becoming only a two-lane highway, Dillingham is one of only five hub roadways that go into town, probably the second largest transportation artery going into town. And to perceive that you can take two lanes of that traffic out of there and not impact traffic is absurd. That traffic right now is blocked up past the airport on-ramp. It will be way out towards Radford area. All right. You have three lanes of traffic that people jump trying to get in at the last minute, so you're going to block all of the traffic to the Express lane that gets you down to Nimitz Highway. All right.*

   Response: As documented in Chapter 4 of the FEIS, there will be enough people diverted out of the cars onto public transit for Dillingham Boulevard to operate effectively with one general purpose lane in each direction, plus turn lanes at major intersections. Along half of the route, the general purpose lanes will be extra wide so that stopped and right-turning vehicles will not hold up traffic behind it. Along the other half, bus turnouts will be installed so that stopped buses do not block traffic.

   Because of the diversion of people from autos to transit, even with the BRT lanes, the traffic LOS along Dillingham Boulevard will be equal to or better than conditions with the No-Build Alternative. Additionally, traffic LOS on parallel streets such as N. King Street and Nimitz Highway will be equal to or in most cases better with the BRT lanes on Dillingham Boulevard than without them.

   Moreover, the exclusive BRT lanes on Dillingham Boulevard will enable Dillingham Boulevard to carry 3 times the number of people that it can carry today.

5. *All of the surface work that has to be done on any road in this state is done from the right-hand lane. That means water, sewers, gas lines, all of that is in the right-hand lane, and that has been to be serviced by our municipality utility companies, which will block all traffic. Right now you have three to four buses that piggyback down the road because they can't get distances between themselves. And now you're going to make that even worse.*

   Response: See response to comment #3.

6. *How are you going to get transportation deliveries when they can't pull off the road? How are the mail people going to get in when they can't pull off the road? So you have some serious problems here that I would like to see you come up with solutions for first before anybody can supporting a system like this.*

   Response: Most businesses on Dillingham Boulevard have off-street areas where delivery vehicles can park. Others have rear access via parallel streets such as Colburn and Kaumualii Streets.

We will send you a CD-ROM copy of the Final Environmental Impact Statement (FEIS) under separate cover. If you require a printed copy of the FEIS, please contact Faith Miyamoto at 527-6976. We appreciate your interest in the project.

Sincerely,

CHERYL D. SOON
Director

JOSEPH W.C. YOUNG, D.D.S
317 NENUE STREET
HONOLULU, HAWAII 96821

RECEIVED
Nov 13 8 48 AM '00
CITY CLERK
HONOLULU, HAWAII

November 10, 2000

Honorable Chairman and Committee Members,

My name is Joseph Young and I am speaking in favor of the Bus Rapid Transit (B.R.T.).

After years of research and study the City, with many meetings with the community arrived at alternatives.

This alternative is not only for the present but especially for the future.

We all know that the traffic is getting worse everyday and the cost of gasoline is going up more frequently.

The increase in traffic can't be helped due to progress. This is experienced in all cities.

To alleviate this situation is to select the B.R.T. alternative, a more benign and affordable solution to the situation.

Here are some of the reasons why B.R.T. is the best choice:

1) This alternative will improve mobility.
2) This will provide people who do not drive, a better way to travel.
3) The project's finances will be shared by the Federal Government.
4) It will result in less pollution.
5) It will reduce the building of more highways.
6) It will especially link our 2nd city with downtown Honolulu.

There are many other good reasons.

The time to act is now.

Therefore I ask you to favorably consider the B.R.T. alternative.

Sincerely,

Joseph W.C. Young, D.D.S.

Dear Dr. Young:

Subject: Primary Corridor Transportation Project

This is in response to your comments on the MIS/DEIS. We are responding to your November 10, 2000 letter and your testimony at the November 14, 2000 Special Transportation Committee Meeting regarding the MIS/DEIS:

1. *My name is Joseph Young and I am speaking in favor of the Bus Rapid Transit (B.R.T.).*

   Response: Comment noted. Thank you for supporting the project.

2. *Here are some of the reasons why B.R.T. is the best choice:*
   a) This alternative will improve mobility.
   b) This will provide people who do not drive a better way to travel.
   c) The project's finances will be shared by the Federal Government.
   d) It will result in less pollution.
   e) It will reduce the building of more highways.
   f) It will especially link our second city with downtown Honolulu.

   Response: DTS agrees with these statements.

We appreciate your interest in the project.

Sincerely,

CHERYL D. SOON
Director

Dear Ms. Young:

Subject: Primary Corridor Transportation Project

This is in response to your comments on the MIS/DEIS. We are responding to your testimony at the October 19, 2000 Special Transportation Committee Meeting regarding the MIS/DEIS:

1. *I do support the concept of the Bus Rapid Transit alternative. I think that measures must be taken to increase the people-carrying capacity of our roads and the Bus Rapid Transit can accomplish this without any new taxes or user fees.*

   Response: Comment noted. It states a preference for a Locally Preferred Alternative (LPA).

2. *Furthermore, I do support the afternoon zipper lane as well as the extension of the morning zipper lane.*

   Response: Comment noted.

We appreciate your interest in the project.

Sincerely,

CHERYL D. SOON
Director

Glossary
Acronyms
Bibliography
List of Preparers
List of Recipients

Glossary

GLOSSARY

Arterial Roadway: A roadway with partial control of access, with some intersections at-grade and intended to move high volumes of traffic over long distances at high speed.

Articulated Vehicle: A vehicle, which is jointed in a fashion, which allows passenger access through the joint. Allows longer vehicles to turn at a shorter radius.

At-Grade: On the ground surface or that surface at which highest pedestrian and vehicular traffic occurs.

Below-Grade: Placed below the ground surface as with a subway.

Best Management Practices: Schedules of activities, prohibitions of practices, maintenance procedures, and other management practices to prevent or reduce pollution. BMPs can also include treatment requirements, operating procedures, and practices to control facility site runoff, spillage or leaks, sludge or waste disposal, or drainage from raw material storage.

Bus Lane: A lane of a road or street specifically designated for buses (may or may not be exclusive).

Bus Rapid Transit (BRT): BRT involves major investments in infrastructure, equipment, operational improvements, and technology that substantially upgrade bus system performance by providing faster operating speeds, greater reliability of service, and increased convenience and passenger amenities.

Capital Costs: Nonrecurring costs required to construct transit systems, including costs of right-of-way, facilities, rolling stock, power distribution, and the associated administrative and design costs, and financing charges during construction.

Carpool: A group of passengers and drivers organized to utilize one automobile on a regular basis, riding together, for the same trip purpose (generally the work trip).

Central Business District: The single business and commercial region, which dominates the financial life of an urban region and may also contain a very substantial portion of the specialty commercial activity.

Central Oahu: The DPA, which contains the wide plateau between the Waianae and Koolau Mountain ranges. It includes the more recently developed Mililani, Waipio, Waikele and Kunia. Portions within the primary transportation corridor include Waipahu, Kunia, Waikele and Waipahu.

Circulator: Circulator routes provide service within a neighborhood or activity center. These routes are designed to accommodate shorter passenger trips that either could not be served by line haul transit or would cause localized overcrowding on line haul routes. These routes typically connect to line haul routes at a commercial or activity center, and route alignment may be circuitous in order to provide more convenient passenger access and neighborhood coverage.

Collector: Collector routes provide service between residential areas and line haul routes. Some routes also operate through downtown Honolulu. Collector service often may be coordinated with a line haul route to reduce transfer wait time.

Consist: A make up of transit vehicles forming a train (e.g. 2, 4, 6, etc.)

Curb Lane: A road or street lane adjacent to the curb at its side.

DBA: Abbreviation for decibels of sound pressure as read on the "A" scale.

Development Plan Area (DPA): The City and County of Honolulu prepares a Development Plan (DP) for each of the eight DPAs on the island of Oahu, as defined by the General Plan. Each DPA has its own detailed land use and public facilities maps, as well as policies and conceptual schemes in line with the development objectives and policies in the General Plan.

Distribution: The process of letting passengers off at a number of different locations.

Elevated Guideway: A guideway, which is positioned above the normal activity level (e.g. elevated over a street).

Emissions: Particulate, gaseous, noise or electro-magnetic by-products of the transit system or vehicle.

Envelope: Definition of the vertical and horizontal space required for both the transit vehicle and/or the guideway.

Ewa: The DPA containing the second city of Kapolei, Barbers Point Naval Air Station, Campbell Industrial Park, and the Ewa villages. It is also used to indicate direction.

Express Service: Transit service where a very limited number of stops are made en route.

Fixed Guideway Modernization Program (FGM): Federal Transit Authority (FTA) 5309 Capital Investment Grants and Loans program used to help fund major transit capital improvement projects.

General Plan: The General Plan (revised 1992) of the City and County of Honolulu includes broad statements on the objectives and policies of the City and County with regard to overall physical and economic development of the island, as well as the health and safety of the island's residents.

General Obligation Bonds (G.O. Bonds or GO Bonds): Bonds the City and County of Honolulu issues to assist in paying for capital projects.

Grade-Separated: Crossing lines of traffic vertically separated from each other and do not share a common intersection.

Headway: The time interval between identical points on successive vehicles passing the same point along the way.

Heavy Rail Transit: Rail transit mode characterized by exclusive grade-separated operation (aerial or subway in many cases) and higher average operating speeds and passenger capacities. Usually heavy rail involves a higher degree of automation and central control than does light rail.

High-Occupancy Vehicle (HOV): Typically includes carpools with two or more people, vanpools, and buses.

Hub-and-Spoke Network: A transit structure, which is characterized by primary, or trunk, routes and collector routes that converge at transit centers throughout a service area. Collector, or feeder, routes serve residential areas or special generators and connect to trunk routes at transit centers. Hub-and-spoke represents an effective system design to minimize duplicative line haul service or connect relatively independent communities within a single metropolitan area.

Intelligent Transportation Systems (ITS): ITS are technologies that provide incident management, transit priority, and traveler information along major streets and highways.

Interchange: The system of interconnecting ramps between two or more intersecting roadways or guideways, which are grade-separated.

Koko Head: Geographical area in the southeast corner of Oahu. Used to indicate direction pointing to this area.

Kupuna Iwi: Ancestral native-Hawaiian burial site.

Level-of-Service (LOS): The LOS is an industry-accepted standard for measuring the efficiency of traffic conditions, with a LOS of A indicating the best traffic conditions and F indicating the worst.

Light Rail Transit (LRT): Transit mode characterized by its ability to operate in both at-grade and/or grade-separated environment, and usually operating in smaller trains consisting of 2, 4, or 6 vehicles.

Line Haul: A transit system, which offers service along a line or corridor.

Link: A representative portion of a transportation network, which joins two modes.

Linked Trip: Total passenger (fare-paying) trips. Linked trips exclude transfers; consequently, the number of linked trips must always be less than (or equal to) the number of unlinked (boarding) trips.

Local Service: A type of operation involving frequent stops and consequent low speeds, the purpose of which is to deliver and pick up transit passengers as close to their destinations or origins as possible.

Makai: Hawaiian terminology meaning direction pointing to the ocean.

Mauka: Hawaiian terminology meaning direction pointing to the mountains.

Mode: A particular form or method of travel.

Monorail: A guideway where vertical vehicle support and lateral guidance is provided by a single track or rail.

Network: A system of real or hypothetical interconnecting links that form the configuration of transit routes and stops, which constitute the total system.

No-Build Condition (No-Build): A project alternative, which includes the existing transportation system and conversion of the present predominately radial route structure to a hub-and-spoke configuration. Also included are highway improvement projects, which have been identified by OMPO I the TOP 2025. All elements of the No-Build Alternative also are part of each of the other alternatives. The No-Build Alternative also serves as the baseline for establishing environmental impacts of the other alternatives.

Off-Peak: Those periods of the day where demand for transit service is not at a maximum.

On-Demand: Transit service rendered upon the specific demand of a passenger

Operating Costs: Recurring costs incurred in operating transit systems, including wages and salaries, maintenance of facilities and equipment, fuel, supplies, employee benefits, insurance, taxes, and other administrative costs. Amortization of facilities and equipment is not included.

Park-and-Ride Facility: The transfer point of an intermodal trip where the driver of an automobile parks her or his automobile and changes to the transit mode.

Patronage: The number of person-trips carried by a transit system over a specified time period.

Peak Hour: The hour of the day in which the maximum demand for service is experienced.

Peak Period: A specified time period for which the volume of traffic is greater than that during other similar periods (i.e., peak hour, peak 5 minutes, etc.).

Person-trip: A trip made by a person by any travel mode.

Primary Transportation Corridor: The corridor extending from Kapolei to University of Hawaii at Manoa and Waikiki. The corridor is by far the most urban region on Oahu and in the State, encompassing more than 56 percent of the island's population and more than 80 percent of its employment.

Primary Urban Center (PUC): The DPA, which extends from Waialae-Kahala to Pearl City, and is bounded on the north (mauka) by the Koolau mountain range and on the south (makai) by the coastline. The PUC consists of 3 sub-regions: the Heart of Honolulu, the Salt Lake/Airport area, and the Heart of Pearl Harbor.

Queue jump lane: A queue jump lane is a short exclusive lane that allows buses to move to the head of a line of traffic.

Revenue Service: The time during which a transit vehicle is in service and available to passengers for transportation. This term also applies to revenue car-miles and to revenue car-hours. The time during which a vehicle is not available is deadheading time.

Right-of-Way (ROW): The corridor (horizontal and vertical space) occupied by the transportation way.

Route: The course followed by a transit vehicle as a part of the transit system.

Screenlines: Screenlines are imaginary lines or a distinct geographic features, such as a river, which cross transportation facilities being analyzed.

Section 4(f): Section 4(f) is from the U.S. Department of Transportation Act. It permits the use of land for a transportation project from a significant publicly-owned public park, recreation area, wildlife and waterfowl refuge, or a historic site, only when it has been determined that there is no feasible and prudent alternative to such use and the project includes all possible planning to minimize harm to the property resulting from such use.

Transfer: The portion of a trip between two connecting transit routes, both of which are used for completion of the trip.

Transit: A transportation system principally for moving people in an urban area and made available to the public usually through paying a fare.

Transitway: Specifically designed way traversed by transit vehicles constrained to the way.

Transit Center: Transit centers are transportation facilities also referred to as intermodal transfer facilities, transportation centers, stations, and terminals. They provide passengers access to the transportation system and are points of transfer between routes and/or modal interchange.

Transit Stop: The optional stop for a particular trip to leave the transit system.

Transportation Demand Measures (TDM): TDM elements include a variety of measures to reduce vehicle demands, including an integrated high-occupancy vehicle (HOV) lane system, park-and-ride lots, bicycle facilities, Transportation Management Associations (TMAs), and measures to encourage reductions in work trips.

Transportation System Management (TSM): TSM consists of transportation improvements designed to improve public transit service without major capital investments. TSM techniques include re-structuring of the bus route system, creation of transit centers and park-and-ride facilities, priority treatment for transit vehicles by signal control measures, and added service and/or frequency to major activity centers.

Travel Time: The time required to travel between two points, not including terminal or waiting time.

Trip: The one-way movement of one person between origin and destination, including the walk to and from the means of transportation.

Trips, Home-Based: Trips having either origin or destination at the home.

Trips, Non-Home Based: Trips having neither origin nor destination at the home.

Urban Core: The portion of the primary transportation corridor between Middle Street on the west and Waikiki/U.H. Manoa on the east.

Urbanized Area (UZA) Formula Grant Program: FTA Section 5307 grant program, which is a special program to fund capital improvement projects.

Zipper Lane: The zipper lane is a peak-period contraflow lane created by a movable barrier adjacent to the highway median. There is currently a zipper lane on a portion of H-1 to serve the Koko Head-bound peak morning traffic. Access is restricted to high-occupancy vehicles with either two or three or more occupants, depending on the time of operation, and motorcycles.

List of Preparers

LIST OF PREPARERS

PUBLIC AGENCIES

City and County of Honolulu Honolulu, Hawaii. Local agency proposing project. Key personnel include:

Department of Transportation Services

Cheryl D. Soon, AICP, Director
- -Masters in City Planning, Harvard University
- -B.A., Colby College
- -American Institute of Certified Planners

Keoki Miyamoto, Deputy Director

Kenneth Hamayasu, Chief, Transportation Planning Division (TPD)
- - B.S.C.E., University of Hawaii
- - Professional Engineer in Hawaii

Norman Kawachika, Engineer
- - Engineer, Electrical Engineering - Stanford University
- - MS, Electrical Engineering - Rensselaer Polytechnic Institute
- - BS, Electrical Engineering - University of Hawaii

Kenneth Banao, Planner, TPD
- - B.B.A., University of Hawaii

Phyllis Kurio, Transportation Planner, TPD
- - B.A., University of Hawaii

Faith Miyamoto, Environmental Planner, TPD
- - M.S., University of Hawaii
- - B.A., University of California, Berkeley

Bruce Nagao, Environmental Planner, TPD
- - B.F.A., University of Hawaii

Isidro M. Baquilar, Chief Project Engineer
- - M.E., Mapua Institute of Technology, Manila
- - B.S.C.E., Mapua Institute of Technology, Manila
- - Professional Engineer in Hawaii

Paul Steffens, Chief, Public Transit Division
- - M.A., Naval War College, Newport, Rhode Island
- - B.S.B.A., University of Nevada

PRIME CONSULTANTS

PB Consult. General engineering, planning and environmental consultant. Key personnel include:

Robert Bramen, Senior Vice President, Certified Senior Project Manager/Senior Professional Associate
- Project Manager
- Education
  - M. Architecture, University of Pennsylvania
  - M. City Planning, University of Pennsylvania
  - B. Architecture, University of California, Berkeley
- Registered Architect in California and Massachusetts
- Certified Planner

Ann L. Koby, Assistant Vice President, Certified Senior Project Manager, Senior Professional Associate
- Principal Consultant
- Deputy Project Manager
- Education
  - B.B.A., General Business, Lamar University
- Certified Planner

Susan Killen, Senior Supervising Environmental Planner, Senior Professional Associate, Certified Senior Project Manager
- SDEIS Task Manager
- Education
  - Graduate Studies, Urban Planning, Antioch University
  - M.Ed., Education, Central Washington State University
  - B.A., Art/Education, Seattle University
- Certified Planner

David Atkin, Senior Supervising Environmental Planner, Certified Senior Project Manager, Senior Professional Associate
- Planning
- Education
  - Ph.D., Biology (Ecology), Princeton University
  - B.S., Biology (Marine), Stanford University

Mark Scheibe, Assistant Vice President, Professional Associate
- Planning and Engineering
- Education
  - M.S., Transportation Engineering, Northwestern University
  - B.S., Civil Engineering, University of Santa Clara
- Professional Engineer in Oklahoma, California, Washington, New Mexico, Arizona, Alaska, Oregon and Texas

Joe Savage, Principal Consultant
- Engineering
- Education
  - B.S., Engineering Science, Florida State University
- Professional Engineer in Washington State

Dexter Eji, Supervising Engineer
- Civil
- Education
  B.S., Civil Engineering, Walla Walla College
  Post graduate work in Structural Engineering at University of Hawaii
- Professional Engineer in Hawaii

Clyde Shimizu, Senior Supervising Civil Engineer
- Civil
- Education
  B.S., Civil Engineering, University of Hawaii
- Professional Engineer in Hawaii, California

Wayne Yoshioka, Senior Supervising Transportation Engineer
- Transportation
- Education
  B.S., Civil Engineering, University of Hawaii
  Graduate Courses, University of Hawaii
  Graduate Courses, University of Colorado, Denver
- Professional Engineer in Colorado

Steven Wolf, Senior Project Manager/Senior Professional Associate, Lead Noise and Vibration Specialist
- Noise Analyst
- Education
  B.S. Mathematics, Long Island University
  Graduate Studies, Applied Mechanics, Polytechnic Institute of Brooklyn

Jason Yazawa, Senior Planner
- Planning
- Education
  M.U.R.P., Urban and Regional Planning, University of Hawaii
  B.A., Economics, University of Hawaii
- Certified Planner

Nami Ohtomo, Environmental Planner
- Planning
- Education
  M.P.P., Public Policy, University of Michigan
  M.S., Natural Resources and Environment, University of Michigan
  A.B., East Asian Languages and Civilizations, Harvard-Radcliffe Colleges

Jan Reichelderfer, Geologist/Environmental Planner
- Planning
- Education
  Professional Certificate, Environmental Planning, University of Hawaii
  M.S., Geology, University of Illinois, Urbana, Illinois
  B.S., Geology, University of Delaware, Newark, Delaware
- Certified Professional Geologist

Dave Miller, Principal Professional Associate, Senior Planning Manager, Certified Senior Project Manager
- Planning
- Education
  M. A. and Ph. D., Economics, Northwestern University
  B. S., Business Administration, Temple University

Edward Tadross, Environmental Planner, Noise Specialist
- Noise Analyst
- Education
  B. A., Environmental Studies, Tulane University
  B. A., Earth Sciences, Tulane University

Rachel Adams, Assistant Planner
- Planning
- Education
  B.A., International Development, Clark University

Brad Lee, Assistant Engineer
- Traffic Analysis
- Education
  B. Civil Engineering, University of Hawaii-Manoa

Robert Malone, Environmental Planner/GIS Specialist
- Environmental Planning
- Education
  M.R.P., Regional Planning, University of Massachusetts, Amherst
  B.S., Management, Clemson University
- Certified Planner

Shadde Rosenblum, Transportation Planner
- Transportation Planning
- Education
  M.U.R.P, Urban Regional Planning, University of California at Irvine
  B.A., International and Regional Studies, University of the Pacific

Doris Chan, Environmental Planner
- Environmental Planning
- Education
  B.A., Environmental Analysis and Design, University of California at Irvine

Larissa Sato, Senior Planner
- Planning
- Education
  B.S., Civil Engineering, University of Hawaii at Manoa

Jovalene Yoshioka, Document Production
Zam Criste, Graphics
Edie Sagarang, Graphics
Colin Maruoka, Traffic Analysis
Michael Cashman, Word Processing
Jodi Javonillo, Word Processing
Corinne Tam, Word Processing

AR00016108

SSFM International In-Town BRT Engineering. Key personnel include:

Warren Sato, Project Manager
- Engineering
- Education
  B.S., Civil Engineering, University of Hawaii

Wendy Humphries, Project Engineer
- Engineering
- Education
  B.S., Environmental Resources Engineering, Humboldt State University (Arcata, California)
- Professional Engineer

Jesse Q. Tano, Senior Project Engineer
- Engineering
- Education
  B.S., Civil Engineering, University of Hawaii

Julie Ann C. Hashimoto, Civil Engineer
- Engineering
- Education
  B.S., Civil Engineering, University of Hawaii

Cory Bersch, Project Engineer
- Engineering
- Education
  B.S,. Civil Engineering, California State University, Long Beach

James Cramsie, Project Engineer
- Engineering
- Education
  B.S., Civil Engineering, California State University, Long Beach

R.M. Towill Corporation Regional BRT Engineering. Key personnel include:

Greg Hiyakumoto, Senior Project Manager
- Engineering
- Education
  B.S., Civil Engineering, University of Hawaii
  B.S., Structural Engineering, University of Hawaii

Lydia Yee, Senior Design Engineer
- Engineering
- Education
  B.S., Civil Engineering, University of Hawaii - Manoa

Bert Toba, Senior Vice President
- Engineering and Surveying Departments
- Education
  B.S., Engineering, University of Hawaii

Roy Tsutsui, Vice President
- Engineering
- Education
  M.S., Civil Engineering, University of Hawaii
  B.S., Civil Engineering, University of Hawaii

Kenneth Sakai, Chief Engineer
- Engineering
- Education
  M.S., Hydraulics and Ocean Engineering, University of Hawaii
  B.S., Civil Engineering, University of Hawaii

James Yamamoto, Project Manager
- Engineering
- Education
  M.S., Civil Engineering, University of Hawaii
  B.A., Math-Physics, University of Hawaii
  B.S., Engineering & Applied Science, University of Hawaii

SUBCONSULTANTS

B.D. Neal & Associates, Air Quality Analysis
Barry D. Neal

Julian Ng, Inc., Traffic Engineering
Julian Ng

Lea + Elliot, Transit Technology Consultants
Steven Perliss, P.E.

Mason Architects, Historic Architectural Consultants
Glenn Mason
Ann Yoklavich
Barbara Shideler

Norma Wong, Public Policy/Financial Analysis and Act 50 Consultant
Norma Wong

List of Recipients

LIST OF FEIS RECIPIENTS

Federal Agencies

- Department of Agriculture, Natural Resources Conservation Service
- Department of Defense
  - Army Corps of Engineers
  - U.S. Department of the Navy
  - U.S. Naval Base Pearl Harbor
  - U.S. Army Garrison-Hawaii
  - 15th CES - Hickam AFB
- Department of the Interior
- Department of Transportation
  - Federal Highway Administration
  - Federal Transit Administration
  - Federal Aviation Administration
  - Coast Guard
- Environmental Protection Agency
- Federal Emergency Management Agency

State of Hawaii Agencies

- Aloha Tower Development Corporation
- Department of Agriculture
- Department of Accounting and General Services
- Department of Business, Economic Development & Tourism
  - Office of Planning
  - Housing and Community Development Corporation of Hawaii
  - Land Use Commission
  - Energy, Resources & Technology Division
  - Research and Economic Analysis Division
- Department of Defense
- Department of Education
- Department of Hawaiian Home Lands
- Department of Health
- Department of Land and Natural Resources
- Department of Transportation
- Hawaii Community Development Authority
- Office of Environmental Quality Control
- Office of Hawaiian Affairs
- University of Hawaii
  - Environmental Center
  - Water Resources Research Center
  - Facilities Planning and Management Office
  - Hamilton Library

City and County of Honolulu Agencies

- Board of Water Supply
- Department of Design and Construction
- Department of Environmental Services
- Department of Facility Maintenance
- Department of Parks and Recreation
- Department of Planning and Permitting
- Department of Transportation Services, Committee for Accessible Transportation
- Fire Department

- Honolulu Municipal Reference and Records Center
- Mayor's Advisory Committee on Bicycling
- Police Department
- Transportation Commission
- Committee on Accessible Transportation

Elected Officials

- U.S. Congress
  - Honorable Daniel K. Akaka
  - Honorable Daniel K. Inouye
  - Honorable Neil Abercrombie
  - Honorable Ed Case
- State of Hawaii Legislature
  - Honorable Melodie Williams Aduja, State Senator
  - Honorable Rosalyn Baker, State Senator
  - Honorable Robert Bunda, State Senator
  - Honorable Suzanne Chun Oakland, State Senator
  - Honorable Willie C. Espero, State Senator
  - Honorable Carol Fukunaga, State Senator
  - Honorable Colleen Hanabusa, State Senator
  - Honorable Fred Hemmings, State Senator
  - Honorable Bob Hogue, State Senator
  - Honorable David Y. Ige, State Senator
  - Honorable Les Ihara, State Senator
  - Honorable Brian Kanno, State Senator
  - Honorable Calvin K. Kawamoto, State Senator
  - Honorable Donna Mercado Kim, State Senator
  - Honorable Ron Menor, State Senator
  - Honorable Norman Sakamoto, State Senator
  - Honorable Sam Slom, State Senator
  - Honorable Brian Taniguchi, State Senator
  - Honorable Gordon Trimble, State Senator
  - Honorable Paul Whalen, State Senator
  - Honorable Felipe Abinsay Jr., State Representative
  - Honorable Dennis Arakaki, State Representative
  - Honorable Brian Blundell, State Representative
  - Honorable Kirk Caldwell, State Representative
  - Honorable Corinne W. L. Ching, State Representative
  - Honorable Lynn Finnegan, State Representative
  - Honorable Galen Fox, State Representative
  - Honorable Ken Hiraki, State Representative
  - Honorable Ken Ito, State Representative
  - Honorable Michael Puamamo Kahikina, State Representative
  - Honorable Jon Riki Karamatsu, State Representative
  - Honorable Marilyn Lee, State Representative
  - Honorable Bertha F.K. Leong, State Representative
  - Honorable Sylvia Luke, State Representative
  - Honorable Michael Magaoay, State Representative
  - Honorable Barbara Marumoto, State Representative
  - Honorable Colleen Meyer, State Representative
  - Honorable Romy M. Mindo, State Representative
  - Honorable Mark S. Moses, State Representative
  - Honorable Bob Nakasone, State Representative

Appendix A
Coordination and Consultation

APPENDIX A
COORDINATION AND CONSULTATION

This appendix summarizes the public and agency coordination and consultation activities that have been conducted for the Primary Corridor Transportation Project (PCTP) throughout the MIS/DEIS, SDEIS, and FEIS processes. Exhibits A-1 through A-5 include comment letters and responses regarding the EISPN and NOI, SDEISPN and NOI, and agency correspondence.

A.1 PUBLIC WORKSHOPS PRIOR TO THE MIS/DEIS

Public participation activities for the Primary Corridor Transportation Project started with gathering public input to create and refine the Islandwide Mobility Concept Plan (March 1999) (Mobility Plan). From September 1998 through November 1999, rounds of public workshops were held throughout Oahu. These workshops were called Oahu Trans 2K meetings. Each round served a different purpose. The meetings were well advertised, highly participatory, and structured to facilitate public input into the transportation planning process. Total attendance at these four rounds of meetings was over 1,250 individuals (with many attending more than one meeting), and the project mailing list included over 9,000 names.

A project website, <www.oahutrans2k.com>, was established and used to disseminate information. Public input received through the website was tabulated and distributed to agency and project planners. A project hotline was established, which provided information on the public workshops, and solicited public input. Comments received on the hotline were recorded and answered. A brochure was distributed at the public workshops with a tear card for public comments.

A.1.1 Round One Public Workshops

Round One was held in early fall 1998. For this round, Oahu was divided into 11 transportation planning zones (see Figure A.1-1). One workshop was held in each zone according to the schedule in Table A.1-1.

TABLE A.1-1
ROUND ONE SCHEDULE

Transportation Zone	Date	Location
Central Honolulu	September 28, 1998	Ala Moana Hotel
Pearl City-Aiea	September 29, 1998	Aiea High School
East Honolulu	September 30, 1998	Koko Head Elementary
Kapahulu-Kaimuki-Waialae-Kahala	October 1, 1998	Kahala Elementary
Waianae	October 5, 1998	Waianae High School
Kapolei-Ewa Beach-Waipahu	October 6, 1998	Campbell High School
Koolauloa	October 7, 1998	Laie Elementary
Windward	October 8, 1998	Castle High School
North Shore	October 13, 1998	Haleiwa Elementary
Mililani-Wahiawa	October 14, 1998	Mililani High School
Waikiki	November 5, 1998	Jefferson Elementary School

Source: City and County of Honolulu, Department of Transportation Services.

The purpose of Round One was to obtain input from the community on issues of greatest importance to them. Participants actively participate in the transportation planning process. The input from these workshops was used to:

Scale: 0 2 4 mi

Transportation Zones

Figure A.1-1

1. Develop a transportation vision for Oahu;
2. Determine how transportation fits within the Mayor's 21st Century Oahu Vision project;
3. Verify possible transportation improvements and projects for each transportation project zone;
4. Invite participants to share transportation ideas for their community, region and the island; and
5. Provide participants an opportunity to collectively mark down their ideas on a map.

The Round One workshops consisted of an open house, group table design sessions, and group report-back. The open house portion of the program consisted of booths providing information on current SDOT and DTS transportation programs. The SDOT booths included freeway management and ride share programs. The DTS booths included bike plan and traffic calming programs. Other booths showed Federal Transit Administration videos about transit in Portland, Oregon and Curitiba, Brazil, and information about the Primary Corridor Transportation project. The booths remained open throughout the workshop.

The workshop opened with an introductory video specifically produced for the Round One workshops. After that was the interactive portion of the program. Participants joined breakout sessions of about ten people each. A facilitator, whose job was to encourage participation and comments, and help move the process from complaints to proactive suggestions, led each breakout table. The breakout tables were organized by neighborhoods.

Following the interactive session, a spokesperson selected by each breakout group reported back to the larger group.

The comments from the Round One workshops were analyzed, and used to develop a Draft Mobility Plan.

A.1.2 Round Two Public Workshops

The Round Two workshops were conducted over a four-week period from November 16, 1998 to December 8, 1998 (see Table A.1-2). The schedule was designed so that at least a month would have passed between a Round One workshop and a Round Two workshop in a particular zone.

TABLE A.1-2
ROUND TWO SCHEDULE

Transportation Zone	Date	Location
Central Honolulu	November 16, 1998	Ala Moana Hotel
Kapahulu-Kaimuki-Waialae-Kahala	November 18, 1998	Kalmuki Intermedlate School
East Honolulu	November 19, 1998	Kalani High School
Waianae	November 23, 1998	Waianae High School
Kapolei-Ewa Beach-Walpahu	November 24, 1998	Waipahu Intermediate School
Koolauloa	November 30, 1998	Kahuku High School
Windward	December 1, 1998	Castle Hlgh School
North Shore	December 2, 1998	Waialua High School
Mlliilani-Wahiawa	December 3, 1998	Leilehua High School
Pearl City-Alea	December 7, 1998	Pearl City High School
Waikiki	December 8, 1998	Jefferson Elementary School

Source: City and County of Honolulu, Department of Transportation Services.

The Round Two workshops reported the results of the Round One workshops, and how the ideas collected fit together to make a Draft Mobility Plan. The Round Two workshops were also used to obtain feedback on certain elements of the Draft Mobility Plan. To accomplish this, the Round Two workshops were designed to:

AR00016122

1. Describe the Round One workshop process;
2. Describe the data analysis effort and how the mobility concepts were generated;
3. Outline changes to suggested transportation improvements and projects based on Round One input;
4. Explain how ideas generated by each zone fit together into a Draft Mobility Plan;
5. Maintain a climate of interaction and positive dialogue;
6. Solicit additional input on transportation improvements and projects; and
7. Organize feedback for ease of review by the technical team.

To accomplish these goals, a custom-designed workbook was created for each zone. These workbooks contained maps and text outlining islandwide mobility concepts, along with exercises and questions designed to stimulate group interaction during participatory table sessions.

The Round Two program was similar in format to Round One, but included new materials. It began with a shorter open house portion and a new five-minute introductory video. The open house included new display boards outlining the 21st Century Oahu Vision Program, the data analysis process, and the Draft Mobility Plan. A laptop computer was available to introduce participants to the project website, <www.oahutrans2k.com>.

The interactive part of the program consisted of breakout sessions organized by neighborhoods, with participants completing the workbook exercises. Facilitators helped explain the concepts and group exercises. As in Round One, participants were encouraged to write down their ideas and mark up the workbooks.

Fifty-nine marked-up workbooks were produced during the Round Two workshops. The comments on these workbooks were used to refine the Draft Mobility Plan and produce a final plan.

A.1.3 Round Three Public Workshops

The Round Three meetings served primarily as a 'report-back' session, targeting the attendees of the Rounds One and Two Oahu Trans 2K meetings, as well as participants in the 21st Century Oahu Vision Program team members who were by then 6-7 months into the Vision Process. Since the Primary Corridor Transportation Project was part of the 21st Century Vision program, the Round Three meetings were conducted in the 19 vision team districts across Oahu, as opposed to the 11 transportation districts that formed the basis of the Rounds One and Two meetings (see Table A.1-3).

Round Three meetings had multiple objectives, including:

1. Present and distribute the Final Islandwide Mobility Concept Plan (March 1999) (Final Mobility Plan), a document based on the ideas from Rounds One and Two;
2. Explain the components of the Final Mobility Plan and how they coordinate;
3. Explain the transit alternatives being proposed for study in the upcoming MIS/EIS process;
4. Invite active participation in the upcoming formal scoping meeting that would kick off the MIS/EIS process; and
5. Obtain feedback on the components of the Final Mobility Plan.

Since the Round Three meetings were combined with meetings of the vision teams, meeting agendas varied to address issues relevant to each vision team. Presentation boards were displayed showing the proposed transit alternatives, the Final Mobility Plan, and the Sand Island Scenic Parkway/Nimitz Parkway plan. Most participants were supportive of and encouraged by the comprehensive nature of the Final Mobility Plan.

TABLE A.1-3
ROUND THREE SCHEDULE

Vision Team	Date	Location
Aina Haina/ Hawaii Kai	March 25,1999	Hahaione Elementary School
Makiki/McCully-Moiliili/Manoa	March 27, 1999	Ala Wai School
Ewa/Kapolei	March 29, 1999	Ewa Beach Elementary School
Mililani	March 30, 1999	Mililani District Park Multi-Purpose Room
Waipahu	April 1, 1999	Waipahu YMCA
Waialae-Kahala	April 5, 1999	Kapiolani Community College
Waimanalo	April 6, 1999	Waimanalo District Park Multi-Purpose Room
Kaneohe/Kahaluu	April 8, 1996	Kaneohe Senior Center
Kalihi-Palama	April 10, 1999	Mayor's Conference Room
Salt Lake/Moanalua	April 12, 1999	Alvah Scott Elementary School
Ala Moana/Kakaako/ Chinatown/Downtown	April 13, 1999	Blaisdell Center Oahu Room
Waikiki/Kapahulu/ Diamond Head	April 15, 1999	Ala Wai Golf Course Clubhouse
Nuuanu/Alewa	April 17, 1999	Mayor's Conference Room
Kailua	April 19, 1999	Kailua District Park Multi-Purpose Room
Waianae	April 20, 1999	Waianae District Park Multi-Purpose Building
North Shore	April 22, 1999	Haleiwa Alii Surf Center
Aiea/Pearl City	April 23, 1999	Waiau District Park
Wahiawa	April 26, 1999	Wahiawa District Park Recreation Center
Koolau Loa	April 27, 1999	Kahuku High School

Source: City and County of Honolulu, Department of Transportation Services.

A.1.4 Round Four Public Workshops

The Round Four meetings were held in the original 11 transportation zones, except East Honolulu was combined with Kapahulu-Kaimuki-Waialae-Kahala, decreasing the number of meetings to ten. Meetings were held over a three-week period from October 25, 1999 to November 9, 1999 (see Table A.1-4). Invitation letters and advertisements encouraged participants to review the Final Mobility Plan prior to attending the meetings.

TABLE A.1-4
ROUND FOUR SCHEDULE

Transportation Zone	Date	Location
Honolulu	October 25, 1999.	Washington Intermediate School
Waikiki	October 26, 1999	Jefferson Elementary School
Pearl City/Aiea/Salt Lake	October 27, 1999	Aiea Elementary School
Kaimuki/Kapahulu/ Waialae/Kahala & East Honolulu	October 28, 1999	Kaimuki Intermediate School
Waianae	November 1, 1999	Waianae District Park
Kapolei/Ewa/Waipahu	November 2, 1999	James Campbell Building
Windward	November 3, 1999	Castle High School
Mililani/Wahiawa	November 4, 1999	Mililani Middle School
North Shore	November 8, 1999	Waialua Elementary School
Koolau Loa	November 9, 1999	Laie Elementary School

Source: City and County of Honolulu, Department of Transportation Services.

The objectives of Round Four included:

1. Present an update of the project and explain the components of the transit program as reported in the Detailed Progress Report to City Council (November 1999);
2. Explain the Sand Island Scenic Parkway element of the project;
3. Review the financial plan of the project;
4. Review the project schedule; and

5. Provide participants the opportunity to question or comment on aspects of the project.

The Detailed Progress Report was well received by the meeting participants. Most of the questions and comments involved details of the In-town BRT.

A.2 FORMAL SCOPING ACTIVITIES PRIOR TO THE MIS/DEIS

The project's formal scoping process was initiated in March 1999, following completion and distribution of the final Islandwide Mobility Concept Plan (IMCP) (March 1999). Meetings were held with more than 100 governmental agencies, elected officials, businesses, and business, community and civic organizations to present the elements of the final IMCP and gather information and comments. Table A.2-1 lists scoping meetings held prior to the MIS/DEIS.

In accordance with the IMCP and Chapter 343 (the State EIS law) of the Hawaii Revised Statutes, an Environmental Impact Statement Preparation Notice (EISPN) for the Primary Corridor Transportation Project was published in the April 23, 1999 edition of the State Environmental Notice. Because this project anticipated using federal-aid, the Federal Transit Administration published a Notice of Intent to Prepare an EIS (NOI) in the April 27, 1999 edition of the Federal Register. The EISPN stated that an EIS would be prepared, described the alternatives under consideration at that time, and described the environmental studies to be conducted to evaluate the project alternatives in the DEIS. The EISPN was distributed to the federal, State and City and County of Honolulu agencies in Table A.2-2. In addition, the EISPN was sent to utility companies; transportation, business, environmental and neighborhood organizations; and elected officials.

The public review period for the EISPN and NOI closed on May 28, 1999, more than two weeks after the public scoping meeting. However, written comments were accepted by DTS beyond this review period. Table A.2-2 indicates the agencies, organizations and individuals that submitted written comments on the EISPN and NOI. Letters received in response to the EISPN and NOI are reproduced in Exhibit A-1, and Table A.2-3 summarizes these written comments. Responses were mailed to the commenters. Copies of these letters are also in Exhibit A-1.

An agency information meeting was held on March 11, 1999 to brief government agencies on the project, and to solicit relevant project information and agency concerns. The EISPN recipients shown on Table A.2-2 were invited to this meeting. The comments provided by the agencies that attended the meeting are summarized in Table A.2-4. The summaries on Table A.2-4 are meant to be brief, with no intention of obscuring the content of any comment received. The comments are followed by a written response.

A public scoping meeting was held on May 11, 1999 to invite public comment on the purpose of and need for the project, the alternatives under consideration and the environmental studies to be conducted. Following the presentation, oral comments were recorded and written comments were accepted. Table A.2-4 provide summaries of these comments. Additional comments were mailed to DTS after the scoping meeting and are also included in Table A.2-4. To reiterate, the summaries on Table A.2-4 are meant to be brief, with no intention of obscuring the content of any comment received. The comments are followed by a written response.

The EISPN and NOI included a Bus Rapid Transit/Sand Island Scenic Parkway (BRT/SISP) Alternative. Based on input gathered during Rounds 3 and 4 of the Oahu Trans 2K meetings and agency consultation prior to the issuance of the MIS/DEIS, it was decided to move the Sand Island Scenic Parkway element forward apart from the transit alternatives. Agencies, stakeholders, and the public were informed of this change through letters and project Progress Reports (newsletters).

Note: Business, environmental and neighborhood organizations, elected officials, and news media who received copies of the EISPN are not indicated on this table if they did not submit comments.

[1] Comment letter from Federal Highway Administration was in response to a May 5, 1999 letter from the Federal Transit Administration, requesting that the FHWA elect to be a cooperating agency on the Primary Corridor Transportation Project (PCTP).

[2] Comment letter from Decision Analysts Hawaii was in response to the Islandwide Mobility Concept Plan (March 1999).

TABLE A.2-3
SUMMARY OF COMMENTS RECEIVED IN RESPONSE TO THE EISPN AND NOI AS OF JUNE 14, 1999
(RESPONSES TO THE COMMENTS APPEAR IN EXHIBIT A-1)

Name	Organization	Comment
FEDERAL AGENCIES		
Daniel Matsumoto	USDOT, FAA	No comments. Request to be included in scoping process because proposed project is adjacent to airport.
Kenneth Kaneshiro	USDA, Natural Resources Conservation Service	None
William Meyer	USGS, Water Resources Division	None
Robert Smith	USFWS	Endangered bat, waterbird, and plant species within project limits; plant species of concern in Ewa area; recommend avoiding unnecessary destruction of vegetated areas containing species Should address impacts and propose mitigation
C. K. Yokota	Department of the Navy, Pearl Harbor	None
Abraham Wong	FHWA	Preparation of the DEIS/MIS must be coordinated with OMPO Assumptions and data in DEIS must match OMPO's and those in ORTP Cost for alternatives must be determined on a regional basis LPA must be included in ORTP update or amendment Funds must be reasonably available and project must be considered with respect to other transportation priorities Tradeoffs between priority projects must be presented to stakeholders and public Highway options and all other reasonable alternatives should be included in MIS HDOT and OMPO should ensure that the study includes multi-modal alternatives that support their transportation plans for the corridor
STATE AGENCIES		
Esther Ueda	DBEDT, Land Use Commission	Include map of project areas in relation to State land use districts – project areas are designated within State Land Use Urban and Agricultural districts
Edwin Sakoda	DLNR, Commission on Water Resource Management	Stream channel alteration permits (SCAP) needed Avoid adverse Impacts on streams and disclose impacts as much as possible
Thomas Fujikawa	SDOT Harbors Division	Traffic studies associated with Sand Island needed especially at interchanges Several permits required, including those requiring BLNR approval Time required for permitting process may impact Harbors Division tenants Coordinate with HCDA Need more detailed plans for impacts to sewer lines Harbor operations could be disrupted during construction Coordinate with DLNR on Sand Island Access Road maintenance issues Coordinate with Sand Island Business Association – container yard impacts and land impacts may require amendment of several subleases and General Lease from Harbors Division

TABLE A.2-3 (CONTINUED)
SUMMARY OF COMMENTS RECEIVED IN RESPONSE TO THE EISPN AND NOI AS OF JUNE 14, 1999
(RESPONSES TO THE COMMENTS APPEAR IN EXHIBIT A-1)

Name	Organization	Comment
STATE AGENCIES (CONTINUED)		
Thomas Fujikawa (continued)	SDOT Harbors Division	Impacts to Harbor facilities; traffic flow may affect Harbors Division and shipping lanes Coordinate with Harbors Division
Paul LeMahieu	State of Hawaii Department of Education	None
Genevieve Salmonson	OEQC	Format issues -- two-sided, acronym list, color figures Include close-up neighborhood maps Endangered species – need detail and mitigation Summarize Trans2K meetings Discuss secondary impacts Mitigation measures in State final EIS must be implemented also
Don Hibbard	DLNR, Historic Preservation	Historic sites and issues – Section 106 and 4(f) treatments necessary Supply information to SHPD, then SHPD will be able to advise better on sites, significance, adverse-effect determinations, and needed mitigation Acknowledges intent to consult with OHA on Traditional/Cultural Properties Use SHPD's or City and County's GIS for historic sites locations Understands need for further work on area of potential effect (APE)
Kazu Hayashida	SDOT Airports Division	Integration with Honolulu International Airport plans/ traffic on airport access roads Suggested coordinating with Airports Division Impacts possible on Honolulu International Airport and existing utilities
Kazu Hayashida	SDOT Highways Division	Identify "stand-alone" components of Alternatives Need two Enhanced Bus/TSM Alternatives – one using city Buses, other using chartered/subsidized buses and ferries for peak periods Clarify proposed "local street bus priority measures" Address potential conflict with signal pre-emption by emergency vehicles Describe and justify project in existing Highway ROW based on benefits, costs, traffic impacts, operational requirements, and safety How will Sand Island Bypass and narrowing Nimitz affect vehicular access and harbor operations in Kewalo Basin and Honolulu Harbor? Need to preserve bicycle routes and safety What are assumptions about effect of travel time and fares on transit use (peak and off-peak)? Use constant transit fares when evaluating alternatives Compare alternatives based on following: peak/off-peak travel times of transit and private vehicles; loss of vehicular capacity; cumulative effects on traffic congestion; cumulative effects on peak vehicular trips and person-trips; transit costs not covered by fares and FTA grants; transit use by low income and elderly; land use and demographic impacts; impacts on Airport and utilities

TABLE A.2-3 (CONTINUED)
SUMMARY OF COMMENTS RECEIVED IN RESPONSE TO THE EISPN AND NOI AS OF JUNE 14, 1999
(RESPONSES TO THE COMMENTS APPEAR IN EXHIBIT A-1)

Name	Organization	Comment
STATE AGENCIES (CONTINUED)		
Kazu Hayashida (continued)	SDOT Highways Division	Consult Highways Division on improvements in highway ROW Include Highway Alternative Please send 10 copies in future
Dean Uchida	DLNR, Land Division	Improvements in flood zone should be designed with LUO Tenants on State lands should be involved in planning Suggested coordination with other agencies – SHPD, Parks, CWRM
Keith Fujio	DOE, State Library	None
Gary Gill	Department of Health	Address noise and fugitive dust during construction
David Blane	DBEDT, Office of Planning	Need comparison of ridership relative to cost projections, considering population and economic growth Identify costs of self-sustaining or subsidized bus/light rail system Consider multi-modal options, *i.e.* Bike and ferry alternatives Sand Island/Nimitz could include bike/ferry system Note wetlands in vicinity of Sand Island (map included) BMP for non-point source pollution should be discussed Consider TDM policies (reduce parking, use tolls, land use policies) Need for park-and-rides and other support facilities for transit in residential areas Redevelopment potential around transit stops
C. Sebastian Aloot	Office of Hawaiian Affairs	Need detailed archaeological/cultural info near coastal areas and appropriate mitigation Conduct Archaeological survey of area Determine eligibility of sites for NHR register Urge consultation with OHA Study gathering and religious rights in corridor Work with cultural expert rather than just archaeologist/anthropologist
Roy Price	DOD, Civil Defense	Impacts to siren warning system (there are one to five existing sirens on alignment, depending on exact infrastructure placement) Siren relocations must be planned into project
CITY AND COUNTY AGENCIES		
Kenneth Sprague	Department of Environmental Services	None
Attilio Leonardi	Honolulu Fire Department	None
Eugene Uemura	Honolulu Police Department	None
William Balfour	Department of Parks & Recreation	None
Jan Naoe Sullivan	Department of Planning & Permitting	Provide a matrix of alternatives and options being considered
Clifford Jamile	Board of Water Supply	Submit construction plans for review
Gordon Lum	OMPO	Consistency with ORTP – ORTP assumed exclusive ROW and high-capacity transit system. Does LRT have as much capacity as assumed by ORTP for rapid transit? Is it City policy to center growth in Downtown? All Oahu highway projects within ORTP must be prioritized, including those in this project

TABLE A.2-3 (CONTINUED)
SUMMARY OF COMMENTS RECEIVED IN RESPONSE TO THE EISPN AND NOI AS OF JUNE 14, 1999
(RESPONSES TO THE COMMENTS APPEAR IN EXHIBIT A-1)

Name	Organization	Comment
PUBLIC ORGANIZATIONS		
Gordon Lum (continued)	OMPO	Will project use horizon year of 2020 or coordinate with new ORTP (updated to 2025)?
Darrlyn Bunda	Leeward Oahu Transportation Management Association (LOTMA)	Segments of previously-indicated roadways for priority treatments do not appear to be included – Kamehameha Highway from Wahiawa to Radford Costs/benefits of proposed BRT alignments BRT Alternative unclear, confusing. Is there an LRT for Waikiki? Emphasis seems to be on accessing PUC. Need to serve reverse commute market to get to Leeward area also BRT should have a defined route similar to LRT #1, at least west of Pearlridge, and serve several termini Sand Island should not be studied. Too capital intensive Why are bus ramps not included in LRT Alternatives? Is it possible to mix and match portions of alternatives?
PRIVATE ORGANIZATIONS		
Mary Steiner	The Outdoor Circle	Why is Visioning Program used as justification for transportation study? Did not like format of scoping meeting Process/schedule concerns – when will LPA be announced? What if it is not best alternative based on engineering? If PUC is the origin of most trips, why study Kapolei to University? Why is Kahala not included? What impact on street trees (from project in general, from catenaries)? How will efforts to underground wires be affected?
Robin Brandt	Hawaii Bicycling League	Public participation, notification of the public – need additional opportunities for participation Access to report – publish report on Internet; use larger text and map fonts Process/schedule needs clarification What is the involvement of those outside PUC in scoping? In addition to comparing buses against cars, pedestrians, bikes, and the disabled should be considered; use disincentives & education programs on alternative transportation Make pedestrians first priority and cars last priority Discuss measures to make streets more pedestrian, bike, and disabled friendly Discuss car disincentives New transit system, including transit centers and tunnels. should include services/facilities for pedestrians, bikes, and disabled, and be accessible to all Try double-decker buses Promote bikes as circulators New freeway should not impinge on bikes and pedestrians Do not create alternate freeway routes out of local streets Need to coordinate with advocacy groups Should provide funds for studies on transportation alternatives Traffic modeling assumptions are not sufficient; assumed VMT reduction is not proven

TABLE A.2-3 (CONTINUED)
SUMMARY OF COMMENTS RECEIVED IN RESPONSE TO THE EISPN AND NOI AS OF JUNE 14, 1999
(RESPONSES TO THE COMMENTS APPEAR IN EXHIBIT A-1)

Name	Organization	Comment
PRIVATE ORGANIZATIONS (CONTINUED)		
Robin Brandt (continued)	Hawaii Bicycling League	Air quality impacts depends on VMT Social and economic issues – potential concentration of growth in primary corridor leads to environmental justice issues; who will suffer impacts of project? Natural resource issues – water use, impact on indigenous plants; do not reduce green spaces for high-density residential areas Consistency with bike plans – project boundaries are confusing because they do not match
Henry Curtis	Life of the Land	All reasonable alternatives must be considered under NEPA. Therefore, the DEIS must look at full range of alternatives possible. Add Enhanced Bus & Commuter-Based Dedicated Bicycle Lane Alternatives There should be two Enhanced Bus scenarios; one to increase efficiency for both buses and cars; one to encourage buses by developing a more efficient bus system without decreasing the level of congestion Bike Lane Alternative would use different classifications of bike lanes. Bike lanes should connect residential areas with downtown and university, such as Young Street. Reduction of lanes on Nimitz is also an opportunity. Proposes a specific dedicated bike lane route from University using Dole Street, H-1, Isenberg, Young Street, Thomas Square, Hotel Street, Capitol District, Richards, and Nimitz. Documents/sources quoted/referenced: OMPO Policy Committee; OMPO Technical Advisory Committee; OMPO Citizen Advisory Committee; OMPO Overall Work Program; Oahu Regional Transportation Plan; TEA 21; TIP; Mayor's State of the City Address (1/26/99); Oahu Trans 2K City Blueprints; Oahu Trans 2K; 21st Century Oahu; CEQ's Top 40 Questions Asked About NEPA; Major Investment Study guidelines; HRS 343; HAR 11-200 (Implementation of HRS 343); FHWA/FTA Question and Answers on Public Involvement in Transportation Decisionmaking; other documents such as Islandwide Mobility Concept Plan; among others Rather than increase the joy of driving, by having congestion, people will prefer bus. Enhanced Bus System is reasonable, viable, practical, feasible from technical and economic standpoint; it is environmentally preferable Express Bus headway should be every 15-20 min at peak, 30-45 min at non-peak Suggests two separate, linked Express Bus systems: one to Honolulu and one to Kapolei, with circulator buses Enforce 2-person HOV at $250/violation, making them more efficient, decreasing congestion Increase safety for bicycle traffic; make bicycle planning routine; install bicycle parking in activity centers. Traffic modeling considerations

TABLE A.2-3 (CONTINUED)
SUMMARY OF COMMENTS RECEIVED IN RESPONSE TO THE EISPN AND NOI AS OF JUNE 14, 1999
(RESPONSES TO THE COMMENTS APPEAR IN EXHIBIT A-1)

Name	Organization	Comment
PRIVATE ORGANIZATIONS (CONTINUED)		
Henry Curtis (continued)	Life of the Land	VMT and other assumptions may change due to changes in road networks and travel demand, shift in destinations (Kapolei), increased transit service may increase VMT, population growth Choice of traffic models and measures of success should be explained Account for sensitivity of models, and elasticity of demand What unusual impacts may result from project? Address cumulative and secondary impacts Air quality – primary and secondary impacts, including induced growth from all alternatives Water Resources -- primary and secondary impacts, including induced growth from all alternatives What is Public Policy? – preference for mass transit, increased reliance on autos, or expensive all-encompassing system? Need a thorough community impact assessment Include redevelopment incentive for Kakaako as secondary impact of transit Will transit hubs spur nearby development? Will improvements follow same pace as growth in population and tourism? Who pays for new infrastructure – residents, new arrivals? Will project strengthen or divide communities? Will rebuilding Natatorium, cruise ship berths & associated parking encourage vehicle use? Will improvements spur growth along corridor? Secondary impacts to PUC EIS due to Sand Island/Nimitz waterfront development Will increase in tourism encourage more vehicle use? How do Enhanced Bus and Dedicated Bike Alternatives compare to other alternatives in terms of air quality, noise, water resources, aesthetics, etc? Will project increase noise in suburbs/agricultural lands Will water quality change due to secondary growth? Are visual impacts afterthoughts or part of planning process? How? What are gridlock effects from all alternatives, and what policies will reduce gridlock? Can trolley be expanded to elevated rail (1992 plan)? Would privatization of bus system reduce congestion? Would using Dillingham or Nimitz for one-way during peak period reduce congestion? Would Employer Trip Reduction (ETR) plans reduce congestion? Process/procedure – explain timing of project Address how to get people to carpool/use zipper lane Will federal money be available for Sand Island? Why does City's plan include a state highway financed by federal money? Also, City versus State plans raise jurisdictional questions. How can state's Zipper Lane be part of City's Plan? City plans include state programs and enforcement plans.

TABLE A.2-3 (CONTINUED)
SUMMARY OF COMMENTS RECEIVED IN RESPONSE TO THE EISPN AND NOI AS OF JUNE 14, 1999
(RESPONSES TO THE COMMENTS APPEAR IN EXHIBIT A-1)

Name	Organization	Comment
PRIVATE ORGANIZATIONS (CONTINUED)		
Henry Curtis (continued)	Life of the Land	Would Sand Island/Nimitz increase vehicle use? Does PUC plan include express buses outside PUC? Waiawa and Iroquois Point are included in PUC – why not Kahala? Why does MIS study express from suburbs outside PUC? (beyond scope) What are acceptance criteria of FHWA/FTA for NEPA document? Does plan conform with DOT plans? Include ideas from 21st Century Vision, Oahu Trans 2K, and related scoping - how ideas were utilized/screened Explain weighting of different proposals Include baseline plans for rail/trolley Explain effects on residential/business communities of transit Consider economic justice (commercialization of poorer neighborhoods) in siting transmission facilities Is the following a positive statement about rural lifestyles: "Even something relatively simple like having streets without sidewalks can affect community character." Islandwide Mobility Concept Plan. page 4 (What is assumption about sidewalks?) Will there be opportunities for public participation in preparation of MIS? What is source of growth projections? Why move people into Downtown rather than Second City (Kapolei)? Use of overhead lines should be rejected Can electric vehicles be used? Does federal matching funds depend on LPA selected? What is definition of sustainability?
Patricia Tummons		Consider scenic viewplanes Urban sprawl, encroachment into rural areas Emissions from alternatives Traffic modeling necessary
Douglas Meller		Eliminate some bus stops to make routes more efficient Charter private vehicles for peak hour Regulate parking fees Separate Sand Island from project Traffic modeling necessary – travel times, trip generation
Bruce Plasch	Decision Analysts Hawaii, Inc.	Document contains many assumptions about sprawl Define "sprawl" Document indicates contradiction of/one-sided view of sprawl and centralized development. It says Oahu has both widespread sprawl and centralized development. What are benefits and costs of sprawl versus compact development Discussion is moot: many key development decisions have been made by government already Economic decline of commercial areas – which communities? Disputes claim that autos cause economic decline in some areas

TABLE A.2-3 (CONTINUED)
SUMMARY OF COMMENTS RECEIVED IN RESPONSE TO THE EISPN AND NOI AS OF JUNE 14, 1999
(RESPONSES TO THE COMMENTS APPEAR IN EXHIBIT A-1)

Name	Organization	Comment
PRIVATE ORGANIZATIONS (CONTINUED)		
Bruce Plasch (continued)	Decision Analysts Hawaii, Inc.	Development and service costs – sprawl is costly, but higher residential density is not as attractive to buyers; suburban development is not as costly as PUC redevelopment and is easier to locate than PUC in-fill development. Infrastructure planning – document relies on unsubstantiated claim that sprawl is costly and must be subsidized by other neighborhoods. Recommends reading on sprawl and infrastructure financing Contradiction between City policy on urbanizing agricultural lands (in Ewa DP) and protecting prime agricultural lands from sprawl, as stated in document. Economic and environmental costs of agriculture are not any less than that of urban sprawl Factors affecting suburban growth are not limited to transportation policies. Includes development policies and consumer preferences Ewa and Central Oahu would have lower housing prices even without government intervention, due to lack of established communities and services Strategy for the PUC – assumed number of new PUC homes is too high; regardless, PUC should be redeveloped Need to clarify to the public that transportation has land-use development implications, due to mobility issues Implementation of the plan must be realistic Computers and electronic communications may change travel demand and development patterns Extensive network of freeways should include highways Discussion of benefits & costs of automobile travel is biased; does not address benefits of auto travel Is it accurate to use 350 ft/auto as estimated area required for home-based vehicles? Parking area is often shared use. Marginal, sunk, and total costs associated with auto travel should be recognized Use unused equipment and capacity (including carpooling) during peak periods Use road pricing - economic incentives/disincentives to use scarce highway capacity

Source: Parsons Brinckerhoff, Inc., August 2000.

AR00016138

TABLE A.2-4
SUMMARY OF COMMENTS RECEIVED AT THE AGENCY INFORMATION AND SCOPING MEETINGS

Name and Organization	Comment	Response *
Darrlyn Bunda, Leeward Oahu Transportation Management Association	Favored extending the LRT alignment to Waiawa Interchange.	The BRT Alternative, which has since replaced the LRT Alternative, has an In-Town component that goes as far as the Middle Street Interchange. There is an additional Regional BRT component that would service riders as far as Ewa/Kapolei.
	Waiawa Interchange needs to be reconfigured to serve buses/HOVs and to provide better access to the community, such as Leeward Community College.	Under the BRT Alternative, H-1 around the Waiawa Interchange would be widened and improved with a PM zipper lane. Section 2.2.3 discusses this and other improvements to the existing freeway system in detail.
Todd Boulanger, Na Kama Hele	Requested analysis of how the alternatives integrate bicycling and pedestrian trips.	Both SDOT and DTS have developed master plans to enhance the network of bicycle facilities and increase bicycling as a serious transportation mode for some travel markets. Improvement of bicycle facilities is included in all of the alternatives, although the BRT Alternative would do the most to improve bicycle facilities. However, pedestrians and bikes alone cannot satisfy all of the travel markets that must be accommodated. Chapter 1 discusses the project's purposes and needs, which include making the PUC more pedestrian friendly, and Chapter 4 discusses all modes of transportation. Investments in transit systems promote the pedestrian and bicycles modes as viable modes of travel. DTS will also continue to support programs to foster alternative transportation, such as the hub-and-spoke bus system and traffic calming, and Vanpool.
	Requested consideration of biking as a low cost area circulator.	Both SDOT and DTS have developed master plans to enhance the network of bicycle facilities and increase bicycling as a serious transportation mode for some travel markets. Improvement of bicycle facilities is included in all of the alternatives. Pedestrians and bikes are very much a part of the TSM and BRT Alternatives, but they alone cannot satisfy all of the travel markets that must be accommodated.
	Requested analysis of bikes and pedestrian access impacts along certain corridors, such as the tunnel, King Street and Kapiolani Boulevard.	Bicycle and pedestrian access is described in Sections 4.5 and 4.6.
	Requested analysis of impacts to the safety of pedestrians and cyclists from articulated buses as opposed to shorter or double deck buses.	Bicycle and pedestrian access is described in Sections 4.5 and 4.6.
	Questioned predicted reduction of regional vehicle miles traveled (VMT) from the project.	Extensive traffic modeling was done as part of the planning process. See Chapter 4 for details.
	Requested that disincentives to driving (e.g., road pricing, etc.) be included as alternatives, as well as measures to make walking as the preferred mode within the city.	Travel Demand Management (TDM) programs are included in the alternatives, but they are not expected to fully address projected increases in travel demand in the primary transportation corridor. Improved transit service would encourage people to use their cars less. The use of specific travel disincentives is a policy decision to be made by the City Council.

TABLE A.2-4 (CONTINUED)
SUMMARY OF COMMENTS RECEIVED AT THE AGENCY INFORMATION AND SCOPING MEETINGS

Name and Organization	Comment	Response *
Todd Boulanger, Na Kama Hele	Requested analysis of air and water quality impacts.	Impacts to air quality and water quality are discussed in Sections 5.5 and 5.8, respectively.
	Requested analysis of the socio-economic and environmental impacts on poor families having to depend on automobiles for their transportation.	Environmental justice issues are addressed in Section 5.3.
	Requested that the project conducts a more extensive and diverse public outreach program for scoping, and gave suggestions on how this can be accomplished.	Appendix A summarizes the efforts that have been made to provide opportunities for public participation. Comments from the public are welcome at any point. However, to be part of the official record, comments on the Draft EIS need to be made by the close of the comment period on the Draft EIS.
	Requested analysis of how bus fare increases affect future ridership, road congestion, land use, pollution, parking demand and the success the alternatives.	Financial plans are discussed in Chapter 6, and travel demand is discussed in Chapter 4.
Donald Lubitz	Suggested that right-of-way or corridor be reserved now in anticipation that an expanded transit system would be needed in the future.	Because of existing development patterns in the PUC, the rights-of-way of future transportation systems are primarily the existing transportation rights-of-way. This is why the need is to increase people-carrying capacity within the existing transportation rights-of-way.
	Suggested that the City transit system be used to support education programs for visitors and residents (e.g., provide transportation to education sites).	The PCTP would serve several travel markets, including students and visitors.
W-K Luke	Requested that public places of the project (e.g., transit centers) include amenities for socializing, and cultural elements consistent with area (e.g., Chinatown).	Transit centers and other public spaces included in the project would be designed to be pedestrian-friendly and contribute to a sense of community. Transit centers and stops in special districts such as Chinatown would be designed to blend in and enhance the existing cultural setting.
	Requested spot improvements to improve bus service.	Refinements to the existing bus system are made on an ongoing basis as the need arises.
Wendell Lum	Requested cost and funding information and analysis of impacts to the economy.	A financial analysis is provided in Chapter 6. Impacts on the economy are discussed in Section 5.1.
	Suggested that transportation investment be in the Central and Leeward areas where residential growth is occurring.	Transportation investments will be made throughout the primary transportation corridor. These investments are intended to help facilitate growth in Ewa and the PUC.
Christen Mitchell	As part of the No-Build, suggested a mixed-use land use pattern, and a continuous bikeway through the corridor.	The transportation improvements contained in the No-Build Alternative would do less than the other alternatives to help foster a mixed land use pattern. The transportation improvements in the No-Build would encourage continued suburbanization and loss of open space. The bicycle facilities in the existing State and County Bicycle Master Plans are included in the No-Build Alternative.
	Suggested private-public partnerships for mixed-use development at transit stations.	There are several ways to encourage "joint development" at transit centers and transit stops. Public-private partnerships are certainly being considered.

TABLE A.2-4 (CONTINUED)
SUMMARY OF COMMENTS RECEIVED AT THE AGENCY INFORMATION AND SCOPING MEETINGS

Name and Organization	Comment	Response *
Christen Mitchell	Requested analysis of transportation malls' impact on the surrounding community, pedestrian access, safety and crime, and landscaping.	The social impacts of the project on the neighborhoods is discussed Section 5.3. Pedestrian access issues are addressed in Section 4.6. Landscaping issues are addressed in Section 5.7. In general, transit centers and transit stops are intended to help focus growth along the alignment and help develop a pedestrian and transit-oriented setting.
	Criticized advertising for the scoping meeting.	Appendix A summarizes the efforts that have been made to provide opportunities for public participation, including comments from the business community.
	Critical of overhead wires and motorized ferries on the Ala Wai.	Neither overhead lines nor ferries on the Ala Wai are proposed as elements of the PCTP.
Michelle Matson	Requested that potential impacts to businesses be considered in planning the project.	General economic impacts are discussed in Section 5.1. Chapter 4 discusses impacts on parking areas and loading zones.
	Supports Sand Island Bypass and Nimitz Parkway elements of the project for waterfront development.	The Sand Island component of this project is being addressed in the current update to the Regional Transportation Plan. It is not part of this project at the current time.
Lynne Matusow	Requested deleting the LRT and Ala Moana Waterfront Loop elements from the alternatives.	The LRT Alternative has been replaced by the BRT Alternative. The Ala Moana Waterfront Loop is no longer part of the project.
	Suggested a transit system similar to Curitiba, Brazil.	The In-Town BRT system would be a transit system similar to Curitiba, Brazil, adapted to local conditions. The Curitiba situation is in some ways simpler because more space is available to construct new transportation systems.
	Project should consider that certain streets are used for parades and block parties.	The route of the In-Town BRT system would be modified to accommodate special events. This topic is discussed in more detail in Section 4.6.
	Does not favor the use of overhead wires for the LRT.	Overhead lines are not proposed as a part of the PCTP. The LRT Alternative has been replaced by the BRT Alternative.
	Transit improvements should be extended into Waikiki.	The In-Town BRT would extend throughout Waikiki.
Dick Poirier	Supported congestion pricing and other types of user fees, such as charging for accessing the HOV lanes, as a viable alternative.	Travel Demand Management (TDM) programs are included in the alternatives, but they are not expected to fully address projected increases in travel demand in the primary transportation corridor. Improved transit service would encourage people to use their cars less. The use of specific travel disincentives is a policy decision to be made by the City Council.
	Requested the Ewa terminus of LRT Alternative be extended to the Waiawa Interchange area.	The BRT Alternative would accommodate future phased extensions of the system if viable.
	Requested that alternatives for road pricing be studied.	Travel Demand Management (TDM) programs are included in the alternatives, but they are not expected to fully address projected increases in travel demand in the primary transportation corridor. Improved transit service would encourage people to use their cars less. The use of specific travel disincentives is a policy decision to be made by the City Council.

TABLE A.2-4 (CONTINUED)
SUMMARY OF COMMENTS RECEIVED AT THE AGENCY INFORMATION AND SCOPING MEETINGS

Name and Organization	Comment	Response *
Richard Port	Expressed concern about the cost of the alternatives, noting that revenues do not cover operating costs and that the transit system would compete with private operators.	Methods of financing the construction and operation of the alternatives are discussed in Chapter 6.
	Favors expanding the existing bus system, including use of articulated buses.	All of the alternatives would expand the bus system and use articulated vehicles. They vary by the degree and means that they would use to improve transit service.
Richard Quinn	Suggested decentralized transportation systems geared to individual neighborhoods because advances in technology would result in a greater degree of trips within the neighborhood for working and shopping.	While land use changes that would improve the ability of walking to satisfy more trip purposes are desired, walking alone is not expected to address all of the expected increase in travel demand.
Milton Ragsdale	Suggested new alternatives and modifications to certain elements of proposed alternatives - fixed rail along H-1 median from Pearlridge Shopping Center to Kahala Mall, with a subway from Middle Street Transit Center to Ala Moana, and a BRT connecting University/King Transit Center to Manoa Recreation Center or UH quarry area.	These suggestions would be less cost-effective than the alternatives currently under study. Chapter 2 discusses the evolution of the alternatives that receive detailed assessment.
	All BRTs and LRTs should have space or racks for bicycles.	Bicycles will be accommodated on the BRT vehicles.
William Rosa	Requested bus service be more frequent, and that traffic calming be used in downtown areas.	Chapter 2 describes the frequency of bus services for each of the proposed alternatives. The BRT Alternative would provide the greatest frequency of transit service. Traffic calming would continue to be an option wherever an opportunity for implementation is identified.
Linda Starr, Neighborhood Board #2, Kuliouou Kalani Iki	Does not favor special bus ramps- because it would waste resources.	Special bus ramps have been included in the BRT Alternative to decrease travel times for transit patrons.
	Requested studying metering at freeway on ramps.	The Hawaii Department of Transportation has been studying ramp metering.
	Feels that people from Kapolei to Pearlridge would not want to change modes, and that they would want the convenience of riding an express bus into town.	All of the alternatives include selected express routes. Some degree of transfers and modal switches would be necessary for the system to work cost-effectively.
Mary Steiner, The Outdoor Circle	Requested clarification on certain elements of the project, such as details of the transit centers, landscape plans, impact to street trees, and project limits.	Project elements are described in Chapter 2. Landscaping and impacts to trees would be minimized to the extent practicable, and are described in Section 5.7. Further details would be developed in subsequent planning after City Council selects an LPA.
	Criticized lack of public participation.	Appendix A details the extent of efforts made to solicit public participation.

AR00016142

TABLE A.2-4 (CONTINUED)
SUMMARY OF COMMENTS RECEIVED AT THE AGENCY INFORMATION AND SCOPING MEETINGS

Name and Organization	Comment	Response *
Clifton Takamura	Provided suggestions on how to improve existing bus system.	Improvements to the bus system occur on an ongoing basis.
	Suggested using the old OR&L right-of-way as an alignment..	The alignment of the OR&L right-of-way is not appropriate for modern, high-speed transit vehicles. Some of the right-of-way is being proposed for bicycle use.
	Asked whether the proposed transit system will be a moneymaker, and whether it will be used by visitors.	Publicly-funded transit systems are not intended to made a profit. Creation of a profit is not one of the project purposes. Both visitors and residents are expected to use transit under any of the alternatives.
	Favored a system that uses a combination of LRT and buses.	The LRT has been replaced by the BRT Alternative, which would have In-Town and Regional systems that combine traditional buses and more technologically advanced energy-efficient vehicles.
Shannon Wood	Suggested expansion of alternatives to include more freeways, water-based transportation, and expansion of LRT system to Mililani, Hawaii Kai and Waikiki.	Chapter 2 describes the evolution of the alternatives that receive detailed treatment in the MIS/DEIS.
	Requested impacts analysis in the event of a natural disaster, and if the price of fossil fuel rises substantially.	Improved transit would enhance mobility during a natural disaster and if fossil fuel prices rise substantially.
Jim Yamamoto	LRT system should serve Bethel Street.	The LRT has been replaced by the BRT Alternative. There would be a transit stop in the vicinity of Bethel Street.
	Requested analysis of why people drive.	People travel for many reasons, and these factors have been included in the travel demand forecasts prepared for this project.
	Suggested multi-modal efforts to address transportation issues.	The TSM and BRT Alternatives are multi-modal alternatives, as described in Chapter 2.
Brian Yoshida, Moanalua Community Association	Supported the LRT alternative, but would also like to see the project include roadway widening on the H1 Freeway, and extending the Nimitz viaduct to Downtown.	The LRT Alternative has been replaced by the BRT Alternative. The H1 Freeway widening and Nimitz viaduct have been or are being considered under separate projects.
	Requested analysis of disruption of traffic during construction, projected ridership of different alternatives, and projected fares for the LRT.	Construction-phase impacts, including impacts on traffic, are discussed in Section 5.12. Ridership projections are presented in Chapter 4. Fares and project financing plans are presented in Chapter 6.
Pamela Young	Additional right-of-way requirements should be disclosed.	Right-of-way requirements are discussed in Section 5.2.
	Questioned the need for LRT, especially since the Leeward and Central Oahu areas contain a third of Oahu's population.	The LRT Alternative has been replaced by the BRT Alternative. Chapter 1 discusses the need for the project. There is a substantial imbalance now and in the future between travel demand and transportation system capacity for travelers in the Primary Transportation Corridor, which includes Leeward and the southern portion of the Central District.

TABLE A.2-4 (CONTINUED)
SUMMARY OF COMMENTS RECEIVED AT THE AGENCY INFORMATION AND SCOPING MEETINGS

Name and Organization	Comment	Response *
Anonymous	Criticized the lack of opportunity for exchange of comments, questions and answers before the whole audience.	Comment noted.
	Expressed frustration on the lack of progress on needed transportation improvements.	DTS shares the commenters frustration about the lack of progress on this important quality of life issue.
	Supports a "traditional" looking LRT system rather than a "modern" looking LRT system.	The LRT Alternative has been replaced by the BRT Alternative. The final look of the BRT vehicles, if this alternative is selected, has not yet been selected.
Unknown, Agency	Will project be used to assist in urban planning?	Yes. Project is coordinating with current planning efforts to update the PUC DP, sustainability plans of other DP areas and the recently completed Ewa DP. Overall land use objectives are to encourage urban growth in the PUC and Ewa, and discourage suburban sprawl in other areas. Transportation is one tool to help facilitate these land use objectives. Improved transit service will make in-town living more attractive.
	Need land use controls to discourage/prevent gentrification around future transit stations	Will ensure that future development is consistent with community visions and desires.
	Is the third light rail transit LRT Alternative a first phase of the first and second LRT Alternatives?	The LRT Alternative has been replaced by the BRT Alternative.
	Does BRT Alternative include LRT from downtown to Waikiki?	None of the alternatives moving forward include LRT technology.
	Do any of the alternatives include service between the airport and Waikiki?	Ridership estimates will include all travel markets, including demand between the airport and Waikiki. However, addressing the airport/Waikiki travel market is not a major purpose of this project. Airport travelers would need to get to the Middle Street Transit Center to access the system.
	Is modifying the H-1 Zipper Lane to carry P.M. peak traffic possible?	Yes. The BRT Alternative includes a PM zipper lane.
	Is it possible to come up with defensible ridership projections?	Ridership projections are described in Chapter 4.
	Is there a cost per new rider threshold for receiving federal funds as a transit "new start"?	To receive federal funding, a project must be on the federal "new start" list. There are many rating criteria that score projects on the "new start" list, including cost per new rider. The FTA will use many other criteria, such as ridership, to evaluate the project. After determining eligibility, the project would compete with other transit projects across the nation for federal funds.
	Transit center locations in Waipahu should follow the Waipahu Special Area Plan.	There are no site-specific locations for the Waipahu transit centers. However, they will be located strategically to serve BRT treatments on Fort Weaver Road and other roadways.
	Has a site for the LRT maintenance yard for the Waikiki/Downtown line been selected?	The LRT Alternative has been replaced by the BRT Alternative. In-Town BRT vehicles would be maintained at the Middle Street Transit Center.

TABLE A.2-4 (CONTINUED)
SUMMARY OF COMMENTS RECEIVED AT THE AGENCY INFORMATION AND SCOPING MEETINGS

Name and Organization	Comment	Response *
Unknown, Agency	Will lanes be used exclusively for the LRT?	The LRT Alternative has been replaced by the BRT Alternative. The In-Town BRT would use both exclusive and semi-exclusive lanes.
	Disagreed that communities do not want more lanes for automobiles.	Comment noted.
	Will there be any grade-separated sections for the LRT?	The LRT Alternative has been replaced by the BRT Alternative. No grade-separations are proposed.
	People are asking for a more balanced transportation system.	That is what this project is trying to accomplish. Chapter 1 describes the project purposes and needs in more detail.
	Will this project do anything to alleviate the problem of motorists using residential side streets to avoid congestion on the main arterial streets?	By enhancing transit service, more people would be encouraged to use transit instead of private automobiles.
	What are bus ramps?	Ramps that are restricted to buses and certain vehicles, such as vanpools. Their objective is to provide transit priority, thereby rewarding transit patrons with shorter travel times.
	The DPs contain lists of cultural assets and resources, and important viewplanes and visual resources.	The information in the DP's was used in the preparation of the MIS/DEIS.
	What are the costs of the alternatives?	Cost estimates are discussed in Chapter 2.
	What are committed projects?	Projects that are listed in the Oahu Regional Transportation Plan as proposed for completion by the year 2005.
	What is the time horizon for this project?	Planning is based on travel demand forecasts and land use projected for 2025.

Source: Parsons Brinckerhoff, Inc., August 2000.

* Section numbers in responses refer to sections in the MIS/DEIS.

A.3 MIS/DEIS REVIEW PERIOD

The FTA approved the MIS/DEIS for public circulation on August 16, 2000. The Hawaii Office of Environmental Quality Control (OEQC) also approved the document for public distribution. Printed copies of the document were distributed to the public, libraries, community groups, and local, State and federal agencies for review. A separate volume of technical drawings was available for public examination at libraries and the DTS, and was also available upon request. The document, including the technical drawings, was also available on CD-ROM upon request. Those who submitted comments on the Notice of Intent to Prepare an EIS (NOI), published in accordance with the National Environmental Policy Act, or the Environmental Impact Statement Preparation Notice (EISPN), published in accordance with Chapter 343, Hawaii Revised Statutes, were also sent printed copies. Table A.3-1 summarizes the MIS/DEIS review process.

TABLE A.3-1
MIS/DEIS REVIEW PROCESS

Activity	Date	
MIS/DEIS approved for circulation by FTA	August 16, 2000	
Distribution of MIS/DEIS	August 23, 2000	
Notice of MIS/DEIS availability in the Federal Register (public review period officially starts)	September 8, 2000	
Notice of MIS/DEIS availability in the OEQC, The Environmental Notice	September 8, 2000	
Legal notice of MIS/DEIS availability and public hearing in Midweek	September 13, 2000 and September 27, 2000	
Distribution of notice of availability of MIS/DEIS and public hearing to project mailing list	September 11-13, 2000	
Meetings of the City Council's Transportation Committee	September 25, 2000	Kapolei
	October 5, 2000	Waikiki

Resolution selecting LPA adopted by full City Council	November 29, 2000	

Source: Parsons Brinckerhoff Quade & Douglas, Inc., January 2001.

Notices of the availability (NOA) of the MIS/DEIS and information on the public hearing were provided through direct mailings (about 10,000 addresses); a legal notice in Midweek; and display advertisements in Midweek, the Honolulu Advertiser, and the Honolulu Star-Bulletin. The document availability was also given substantial media coverage including coverage by local television stations. The public notice procedures complied with "The Oahu Metropolitan Planning Organization (OMPO) Guide to Public Involvement, Appendix E," adopted on April 2, 1997 by the OMPO Policy Committee; Title 23 Code of Federal Regulations, Section 771 (23CFR771); and Hawaii Revised Statutes Chapter 343.

The Transportation Committee of the Honolulu City Council sponsored four public hearings across the project's study area after the MIS/DEIS was issued. These Committee meetings enhanced the public's ability to provide comments directly to the City Council pertaining to the pending selection of a Locally Preferred Alternative (LPA). The City Council's task in selecting an LPA was to decide between a No-Build Alternative, a

AR00016146

Transportation System Management (TSM) Alternative, and a Bus Rapid Transit Alternative. The full City Council selected the BRT Alternative as the LPA on November 29, 2000, by adopting Resolution No. 00-249 at a special City Council meeting.

A.4 COMMUNITY INVOLVEMENT ACTIVITIES PRIOR TO THE SDEIS

During the LPA discussions, the City Council directed the DTS to continue public dialogue on the project. Community working groups were formed to provide a forum for open dialogue between project sponsors and neighborhood, civic, business and other organizations so that environmental and transportation issues, and refinements to project proposals could be discussed. Section A.4.1 discusses the working group process in detail.

A Round Five Oahu Trans 2K meeting was held on August 14, 2001. The meeting included a community open house and an informational briefing on the working group process and BRT project refinements.

In addition to the working group process, the project team members conducted nearly 200 meetings with numerous individuals, agencies, and organizations between January 2001 and the publication of the SDEIS.

A project website, <www.oahutrans2k.com>, is used to disseminate information. It is updated to provide the public with the current project status.

During the period between the publication of the MIS/DEIS and SDEIS documents, three Oahu Trans 2K Progress Reports (newsletters) were published and distributed. These progress reports were distributed to over 10,000 individuals via the mail and its availability at public hearings and working group meetings.

A.4.1 Working Groups

Working groups were formed in 2001, and provided a forum for open dialogue between project sponsors and neighborhood, civic, business and other organizations. They provided a constructive forum in specific geographic areas along the corridor, where specific opportunities were discussed while simultaneously providing a greater in-depth understanding about BRT and what it means for the community. Environmental and transportation issues and refinements to project proposals were discussed. Five Working Groups were formulated based on geographic area. In addition to the original five working groups, a sixth working group was formed in July 2002 for the Aliamanu/Salt Lake/Foster Village area in response to concerns that arose within that community. The Working Groups and their associated areas are presented below.

1. **Pearl City/Aiea** - Waiawa Interchange to Aloha Stadium/Pearl Harbor
2. **Kalihi** - Middle Street to River Street
3. **Downtown/Kakaako** - River Street to Ala Wai Canal
4. **Mid-Town/University** - Richards Street to UH-Manoa
5. **Waikiki** - Ala Wai Canal to Kapahulu Avenue
6. **Aliamanu/Salt Lake/Foster Village** – Aloha Stadium/Pearl Harbor to Middle Street

Working group members were responsible for attending meetings, reporting back to their representative organizations, and bringing resulting feedback to the working group meetings. The working group process resulted in project changes that were presented in the SDEIS. The following sections briefly describe the participants, process, and issues resolved at each of the six working groups.

A.4.1.1 Pearl City/Aiea Working Group

Participants in this Pearl City/Aiea Working Group included representatives from: Aiea Community Association, Aiea Neighborhood Board #20, Aloha Stadium Authority, Hawaii Transportation Association,

AR00016147

Leeward Oahu Transportation Management Association, Newtown Estates Community Association, Oahu Transit Services, Pearl City Neighborhood Board #21, St. Timothy's Episcopal Church, State Department of Transportation, US Navy, and Councilmembers Duke Bainum and Gary Okino. This working group met five times during March – May 2001.

The discussions of this working group resulted in major changes to the locations for transit centers and BRT ramps. Instead of locating a transit center at the Kamehameha Drive-In site, a new plan for an Aloha Stadium transit center was chosen. The two proposed BRT ramps at Kaonohi Street and Radford Drive were eliminated and the Luapele Drive ramp was added. Another idea from this working group was to create a reversible contra-flow bus lane along Kamehameha Highway to provide service to Aiea and Pearl City, along with two community oriented transit centers. The Kamehameha Highway contra-flow lane and community transit centers are being advanced as projects separate from the PCTP.

A.4.1.2 Kalihi Working Group

Participants in the Kalihi Working Group included representatives from the following businesses, organizations, and agencies: Blood Bank of Hawaii, Bob's Bar-B-Que, Castle & Cooke Properties, City Square Management, Eki Cyclery, FALEA, Hawaii Construction Industry Association, Hawaii Teamsters & Allied Workers, Hawaii Transportation Association, Honolulu Community College, Kalihi-Palama Neighborhood Board #15, Kalihi-Palama Vision Team, Kamehameha Schools, Lanakila Health Center, Marukai Corporation, New Hope All Nations, Oahu Transit Services, Popeye's Chicken, State Department of Transportation, York & Company, and Councilmembers Duke Bainum, Jon Yoshimura, and Romy Cachola. This group met seven times during March – June 2001.

Several significant refinements were adopted in response to the working group's concerns about vehicular access. Traffic lanes on Dillingham Boulevard will be widened to 18 feet between Puuhale Road and Waiakamilo Road, and bus pullouts will be built between Waiakamilo Road and Kaaahi Street. Left turns and U-turns will be permitted at signalized intersections, and parallel streets such as Colburn and Kaumualii Streets will be improved for alternate access. Construction mitigation plans will be developed in coordination with the community and will be implemented to minimize the impact on drivers and businesses.

A.4.1.3 Downtown/Kakaako Working Group

Participants included representatives from the following organizations and agencies: Ala Moana-Kakaako Neighborhood Board #11, Ala Moana Center, Aloha Tower Development Corporation, American Institute of Architects, AM Partners, Chinatown Merchants Association, Downtown Neighborhood Board #13, Hawaii Bicycling League, Hawaii Community Development Authority, Hawaii Children's Discovery Center, Hawaii State Federal Credit Union, Hawaii Teamsters & Allied Workers, Hawaii Transportation Association, Iolani Palace, Kalihi Business Association, Kakaako Improvement Association, Kamehameha Schools, Land Use Research Foundation, Oahu Metropolitan Planning Organization - Citizen Advisory Committee, Oahu Transit Services, Pacific Resource Partnership, Scenic Hawaii, Sierra Club Hawaii Chapter, State Department of Accounting and General Services, State Department of Transportation, Straub Clinic & Hospital, Outdoor Circle, Victoria Ward Centers, and Councilmembers Duke Bainum and Jon Yoshimura. This group met seven times during February – June 2001.

Working group discussions led to several changes in this area of the In-town BRT's alignment. An entirely new branch, the Kakaako Makai branch along Ilalo Street, was created to accommodate the growing demands in this developing waterfront area. Additionally, the BRT route was realigned to use Pensacola Street instead of Ward Avenue.

A.4.1.4 Mid-town/University Working Group

Participants in the Mid-town/University Working Group meetings included representatives from: Ala Moana-Kakaako Neighborhood Board #11, Ala Moana Center, Convention Center Authority/Hawaii Tourism Authority,

Diamond Head/Kapahulu/St. Louis Neighborhood Board #5, Hawaii Bicycle League, Hawaii Community Development Authority, Hawaii Transportation Association, Iolani Palace, Kamehameha Schools, Keeaumoku Super Block - Little Britain Holdings, Makiki-Tantalus Neighborhood Board #11, Manoa Neighborhood Board #7, McCully-Moiliili Neighborhood Board #8, Neal Blaisdell Center, Our Redeemer Lutheran Church, Straub Clinic & Hospital, Outdoor Circle, UH Facilities Planning & Management, UH Lab School, and Councilmembers Duke Bainum, Andy Mirikitani, and Jon Yoshimura. This working group met seven times during March – July 2001.

The discussions of this working group resulted in realignment of a section of the UH Manoa branch from Ward Avenue to Pensacola Street, and affirmation of the location of the terminus at Sinclair Circle. Additional discussions focused on station designs and on-street parking spaces throughout this area's neighborhoods.

A.4.1.5 Waikiki Working Group

Participants in this working group included representatives from: American Institute of Architects, ENOA Tours, Hale Koa Hotel/Fort DeRussy, Hawaii Hotel Association, Hawaii Teamsters & Allied Workers, Hawaii Transportation Association, HERE Local 5 AFL-CIO, Hilton Hawaiian Village Beach Resort & Spa, Honu Group, Hyatt Regency Waikiki Hotel, Kamehameha Schools, Oahu Transit Services, Outrigger Enterprises, Pauahi Management Corporation, Renaissance Ilikai Waikiki Hotel, Sheraton Hotels & Resorts/Kyo-ya Co., State Department of Transportation, State Department of Business, Economic Development and Tourism, SUPERSTAR Hawaii Transit Service, Tiffany & Company, United Laundry Service, Waikiki Beach Marriott Resort Hotel, Waikiki Improvement Association, Waikiki Livable Community Project, Waikiki Neighborhood Board, Waikiki Residents Association, Waikiki Trade Center, and Councilmember Duke Bainum. This group met six times during August 2001 – April 2002.

Several refinements to the project resulted from the discussions of this working group, including changes in lane configurations, ideas for pedestrian enhancements, and consideration of freight and passenger loading. Refinements incorporated into the project include: semi-exclusive curbside lanes throughout Waikiki, most of which will be shared with private buses and shuttles; sidewalk widening, landscaping and loading bays added to Kuhio Avenue; and re-striping and median modifications to provide an additional lane in each direction for the BRT on Ala Moana Boulevard.

A.4.1.6 Aliamanu/Salt Lake/Foster Village Working Group

The sixth working group was formed in response to concerns from the community regarding the proposed Aloha Stadium Transit Center and Luapele Drive BRT ramp. One meeting was held on July 24, 2002 at Makalapa Elementary School. Those represented at the meeting included: Aiea Neighborhood Board #20, Aloha Stadium Authority, East Foster Village Community Association, Foster Village Community Association, Oahu Transit Services, Protect the Planet, State Department of Transportation, US Navy, and Councilmembers Romy Cachola and Gary Okino.

Discussion focused on the design and operation of the Luapele Drive ramp and Aloha Stadium Transit Center, plus the project schedule. No specific refinements to the project were required as a result of this working group meeting. Ongoing coordination with stakeholders and residents will be maintained.

A.4.2 SDEISPN and NOI

The project refinements from the working group process and comments received on the MIS/DEIS resulted in the City initiating an SDEIS process. The DTS proposed to refine the LPA to include new and modified components, which the City Council endorsed on August 1, 2001 via City Council Resolution No. 01-208.

The DTS prepared a SDEISPN that was published in the August 23, 2001 The Environmental Notice, an OEQC publication. The SDEISPN for the SDEIS was also distributed to the same individuals and entities that

received the MIS/DEIS. The SDEIS NOI was published in the September 26, 2001 Federal Register. Table A.4-1 lists the agencies/individuals that have commented on the SDEISPN. Table A.4-2 summarizes the comments received. Exhibit A-2 includes reproductions of the original letters.

In addition to the working group meetings, the project team members have met with numerous individuals, agencies, and organizations. Nearly 200 meetings were conducted from January 2001 to March 2002 (see Table A.4-3).

TABLE A.4-2
SUMMARY OF COMMENTS RECEIVED IN RESPONSE TO THE SDEISPN AND NOI
AS OF OCTOBER 4, 2001 (RESPONSES TO THE COMMENTS APPEAR IN EXHIBIT A-2)

Commenter	Letter Date	No.	Comments
United States			
Daniel K. Akaka, United States Senator	9/7/01	1	I appreciate receiving this information and look forward to reviewing the Final Environmental Impact Statement.
George P. Young, P.E., Chief, Regulatory Branch Department of the Army U.S. Army Engineer District, Honolulu	8/30/01	1	The comments contained in my letter to you dated September 13, 2000 are still appropriate, and we have no additional comments.
	9/13/00	1	It is possible that some of the components of the project may require a Department of the Army (DA) permit; however, since the information provided is not sufficiently detailed to determine specific permit requirements. As the project elements progress to final design stages, we will be better able to advise you concerning permit requirements
Darice B. N. Young, Realty Contracting Officer Federal Aviation Administration	9/14/01	1	The Federal Aviation Administration has no comments regarding your Supplemental DEIS.
State of Hawaii			
Genevieve Salmonson, Director State Office of Environmental Quality Control	8/22/01	1	If you have received any comments during the consultation stage, please include them with their responses in the draft EIS.
		2	Also include synopses of the community working group meetings that dealt with the proposed changes.
		3	Please consider including a list of acronyms and abbreviations in the draft EIS.
		4	In the draft EIS indicate the status of each of the listed permits and approvals for this project.
Teney K. Takahashi, Director of Planning and Development Hawaii Community Development Authority	8/24/01	1	As you know, the Hawaii Community Development Authority development agenda calls for the development of several major public and private projects over the near future. These projects could add over 30,000 automobile trips per day at full build out. The traffic strategy for the Makai Plan called in part for the design of a "walkable community", one in which people could live, work and play without having to depend on an automobile. However, the key to success for such a community would be an efficient and affordable public transit system. BRT service for this area would provide the necessary public transit.
		2	We therefore support your proposed additional alignment through Kakaako Makai.
Linnel T. Nishioka, Deputy Director State Commission on Water Resource Management	8/24/01	1	We are concerned about the potential for ground or surface water degradation/contamination and recommend that approvals for this project be conditioned upon a review by the State Department of Health and the developer's acceptance of any resulting requirements related to water quality.
		2	If the proposed project alters the bed and banks of a stream channel, the project may require a stream channel alteration permit.

AR00016152

TABLE A.4-2 (CONTINUED)
SUMMARY OF COMMENTS RECEIVED IN RESPONSE TO THE SDEISPN AND NOI
AS OF OCTOBER 4, 2001 (RESPONSES TO THE COMMENTS APPEAR IN EXHIBIT A-2)

Commenter	Letter Date	No.	Comments
Denis R. Lau, Chief Clean Water Branch State Department of Health	8/28/01	1	The applicant should contact the Army Corps of Engineers to identify whether a Federal permit (including a Department of Army permit) is required for this project.
		2	A National Pollutant Discharge Elimination System (NPDES) general permit coverage is required for each of the following activities which discharges into State Waters: a. Discharge of storm water runoff associated with construction activities that involve the disturbance of five acres or greater, including clearing, grading, and excavation; b. Discharge of hydrotesting water; and c. Discharge of construction denaturing effluent. If any construction activities will take place after March 10, 2003, discharge of storm water runoff associated with construction activities that involve the disturbance of one acre or greater, including clearing, grading, and excavation shall require coverage under the NPDES general permit.
		3	The applicant may be required to apply for an Individual NPDES Permit if there is any type of process wastewater discharge from the project into State Waters.
Paul G. LeMahieu, Ph.D., Superintendent of Education State of Hawaii, Department of Education	8/31/01	1	The Department of Education has no comment on the subject supplemental draft environmental impact statement preparation notice.
Anthony J. H. Ching, Executive Officer State of Hawaii Department of Business, Economic Development & Tourism, Land Use Commission	9/4/01	1	We have no comments to offer.
Don Hibbard, Administrator, State Historic Preservation Division, State of Hawaii, Department of Land and Natural Resources	9/7/01	1	Since the preferred alternative includes new routes, we would like a windshield level survey done along these new routes to identify historic sites that may be affected.
		2	Of concern to our office, in addition to the underground archaeological resources that may be uncovered, are the historic sites along the route. We would like to ensure that road widening, ramps, transit stations and any other structures necessary to operate the BRT system does not adversely impact these historic sites.
		3	Please note, in the permits and approvals section that while our approval is not necessary to proceed under Section 106 of the National Historic Preservation Act, the responsible federal agency will need to document its consultation with our office.
		4	Also, our written concurrence for projects by the state or its political subdivisions is required under Chapter 6E-8, Hawaii Revised Statutes.

AR00016153

TABLE A.4-2 (CONTINUED)
SUMMARY OF COMMENTS RECEIVED IN RESPONSE TO THE SDEISPN AND NOI
AS OF OCTOBER 4, 2001 (RESPONSES TO THE COMMENTS APPEAR IN EXHIBIT A-2)

Commenter	Letter Date	No.	Comments
Daniel S. Quinn, State Parks Administrator State Department of Land and Natural Resources	9/10/01	1	We appreciate the opportunity to review the Supplemental Draft EIS Preparation Notice for the subject project and would like to request to be a consulted party.
Sharyn L. Miyashiro, Executive Director State Department of Business, Economic Development & Tourism Housing and Community Development Corporation of Hawaii	9/12/01	1	At this point in time, we have no additional comments
Gilbert Coloma-Agaran, State Historic Preservation Officer State Department of Land and Natural Resources Historic Preservation Division	9/19/01	1	In general, we will need to have more specific information on what historic properties are present within the Area of Potential Effect (APE) as well as more details on any ground disturbing activities required to construct portions of the project
Ronald Hirano, Executive Director Aloha Tower Development Corporation	9/21/01	1	We are supportive of these revisions to your project.
		2	What is the timetable for completion of the Kakaako Makai Branch?
		3	Where will the terminus be placed for the Aloha Tower stops?
Gordon Matsuoka, Public Works Administrator, State of Hawaii, Department of Accounting and General Services	9/21/01	1	We are currently working with the Housing and Community Development Corporation of Hawaii (HCDCH) to plan the development of our portion of the area located at and around the old OR&L Building near the intersection of King Street and Iwilei Road. Our intent is to construct a Liliha Civic Center to provide office space for State agencies to service the public. As such, we believe: The proposed plan extending Kaaahi Street (at grade) toward Diamond Head to Iwilei Road would result in maximum disruption to the planned civic center site. It nearly bisects the property with a roadway that we do not intend to utilize. We question if a Bus Rapid Transit (BRT) easement is required to traverse the site at all (as opposed to remaining on Dillingham Boulevard to and from King Street, for example, since the plans for the BRT already take away two of the five lanes on Dillingham one block away). In lieu of an easement for the roadway, we propose an exchange of road Right-of-Way for county-owned school land.
		2	The proposed BRT station and any BRT parking structure on site would also adversely affect the development of the civic center, by increasing traffic around our site and taking up valuable property.
		3	That if the city still plans to go ahead with items 1 and 2 above, then the City should consider purchasing the adjacent Ohtani property to execute a land swap plus purchase of all improvements with the State. This would provide us with adequate property free of the disruption from increased vehicular traffic.
		4	Further, we request additional information about the proposed extension. What is the anticipated volume and type of traffic?
		5	Will private vehicles be permitted to use Kaaahi Street to cross through the site to Iwilei Road?

AR00016154

TABLE A.4-2 (CONTINUED)
SUMMARY OF COMMENTS RECEIVED IN RESPONSE TO THE SDEISPN AND NOI
AS OF OCTOBER 4, 2001 (RESPONSES TO THE COMMENTS APPEAR IN EXHIBIT A-2)

Commenter	Letter Date	No.	Comments
Gordon Matsuoka, Public Works Administrator, State of Hawaii, Department of Accounting and General Services	9/21/01	6	Nearly ten years ago, the previous professionally-planned rapid transit project (unfortunately now defunct), was conceived to be above grade in this area, with a station located Ewa off-site, makai of Kaaahi Street to serve this neighborhood. The transit easement alignment would have been much closer to the makai boundary than, for example, an extension of Kaaahi Street provides, and would therefore have less of an impact on our portion of the site.
Allan Ah San, Associate Vice President University of Hawaii	9/21/01	1	We have reviewed the Supplemental DEIS Preparation Notice and have no comments to offer at this time.
Gary Gill, Deputy Director State Department of Health	10/2/01	1	Wastewater Branch - All wastewater plans must conform to applicable provisions of the Department of Health's Administrative Rules, Chapter 11-62, "Wastewater Systems." We reserve the right to review the detailed wastewater plans for conformance to applicable rules.
		2	Clean Air Branch - The Department of Health, Clean Air Branch, has concerns on construction activities where potential dust problems may arise. There is a significant potential for fugitive dust to be generated during the various phases of the project, including clearing and removal of debris, grubbing, grading, and excavation.
		3	Implementation of adequate dust control measures during all phases of construction is warranted. Construction activities must comply with provisions of Chapter 11-60, Hawaii Administrative Rules, section 11-60.1-33 on Fugitive Dust
		4	The contractor should provide adequate means to control dust from road areas and during various phases of construction activities. These means include, but are not limited to: Control of Fugitive Dust.
		5	Clean Water Branch - The applicant should contact the Army Corps of Engineers to identify whether a federal permit (including a Department of the Army permit) is required for this project.
		6	A National Pollutant Discharge Elimination System (NPDES) general permit is required for the following discharges to waters of the State: (conditions listed). Any person requesting to be covered by a NPDES general permit for any of the above activities should file Notice of Intent with the Department's Clean Water Branch at least 30 days prior to commencement of any discharge to waters of the State.
		7	After construction of the proposed facility is completed, an NPDES individual permit will be required if the operation of the facility involves any wastewater discharge into State waters.

SUMMARY OF COMMENTS RECEIVED IN RESPONSE TO THE SDEISPN AND NOI
AS OF OCTOBER 4, 2001 (RESPONSES TO THE COMMENTS APPEAR IN EXHIBIT A-2)

Commenter	Letter Date	No.	Comments
City and County of Honolulu			
Gary H. Okino, Councilmember District 8	9/19/01	1	A. Inclusion of the Kamehameha Highway Transit Corridor/BRT SPUR and Transit Stations in the SDEIS Analysis. 1. In lieu of the originally proposed Kaonohi Street BRT ramps and Kamehameha Drive-In location of a transit center, the Pearl City-Aiea working group recommended the following transportation elements: 1) Establishment of a transit corridor or "BRT spur" along Kamehameha Highway; 2) Development of two community transit centers along Kamehameha Highway, one at the site of the former Jim Slemmons auto dealership, the other on the site of the old Hale Mohalu Hospital; 3) Development of a major transit center with park-and-ride facilities at the Aloha Stadium overflow parking lot; and Construction of a new BRT on/off ram near Luapele Street to connect the Aloha Stadium Transit Center with the H-1 zipper lanes. It appears from the SDEIS Preparation Notice that the only element of the working group's recommendation to be included in the SDEIS is the construction of the new BRT on/off ramp near Luapele Street. This is a serious omission since the Kamehameha Highway transit corridor and transit stations are intended to service BRT vehicles that will directly enter and run along the Regional BRT H-1 corridor.
		2	Why is this integral part of the system being carved or parceled out of the SDEIS analysis? Does this limited review comply with the intent and legal requirements of the Environmental Impact Statement process? I believe that it is imperative that the SDEIS ascertain the impacts of the system as a whole not just a few selected parts!
		3	Since all elements of the Pearl City-Aiea working group's recommendation will be directly contributing to the BRT system's overall patronage and ridership estimates, revenue projects, and construction and operational expenses, it is only reasonable and logical that all elements likewise be included in the SDEIS analysis of impacts. Moreover, since these new elements will likely alter the results of the existing system-level analysis and findings provided in the MIS/DEIS, these additional elements must be included within the SDEIS to assure reliable, complete, up-to-date, and accurate system-wide projections and estimates.
		4	The amended LPA (reference Resolution 01-208, CD1, FD1) specifically provides that the Kamehameha Highway contra-flow transit corridor and the Pearl City and Aiea transit centers be projects separate from, but complementary to, the amended LPA. Accordingly, this is to request, and strongly urge, that all elements recommended by the Pearl City-Aiea working group identified above, not just the replacement of the Kaonohi Street BRT ramp with one at Luapele Street, be included as part of the SDEIS analysis.

AR00016156

TABLE A.4-2 (CONTINUED)
SUMMARY OF COMMENTS RECEIVED IN RESPONSE TO THE SDEISPN AND NOI
AS OF OCTOBER 4, 2001 (RESPONSES TO THE COMMENTS APPEAR IN EXHIBIT A-2)

Commenter	Letter Date	No.	Comments
Gary H. Okino, Councilmember District 8	9/19/01	5	1. Farrington Highway Transit Corridor and BRT Spur It has recently been brought to my attention that the Department of Transportation Services is also considering developing a portion of Farrington Highway into a transit corridor/BRT spur similar to that proposed for Kamehameha Highway in the Pearl City-Aiea area. For all of the same reason identified above, I strongly urge that this proposed Farrington Highway transit corridor/BRT spur, and its related transit components, be included as part of the SDEIS analysis.
		6	2. Agreement of Participation by State and Federal Agencies A major factor in the success of the overall BRT system is the use of state and federal government infrastructure. For example, the Regional BRT route proposes to utilize the State Department of Transportation's Zipper Lane as a transit corridor, and the Luapele Drive BRT ramp will be connected to and accessible via the Navy-owned portion of Luapele Street. Has the City received assurances from the appropriate agencies that it will be allowed to utilize the aforementioned as well as any other State- and Federally-controlled properties for the BRT system? If not, how will this affect the BRT project where specific locations/elements are identified in the SDEIS? What will be the result of a worst-case scenario where permission is not granted by either or both governments?
		7	3. Mixed Traffic Impediments to Efficient Regional and In-Town BRT Vehicular Movement The key to efficient and effective movement of the BRT vehicles is their use of exclusive right-of-ways or traffic lanes to by-pass the normal congestion of our streets and highways. Unfortunately, there are several segments along the BRT route where the BRT vehicles must operate in mixed- or shared-use lanes with normal traffic. This is potentially a fatal flaw to the entire system.
		8	If the BRT is forced to compete with and operate in existing traffic flow, bottlenecks will surely develop, resulting in greatly diminished speed and possibly even gridlock.
		9	While most of these shared-use segments are within the "In-Town" portion of the project (i.e. Kapiolani Boulevard between Atkinson and Kalakaua, Kapiolani Boulevard between Isenberg and University, along Richards Street, along King Street, etc.), it appears that some shared-use segments may also exist, at least temporarily, along the "Regional" portion as well.

TABLE A.4-2 (CONTINUED)
SUMMARY OF COMMENTS RECEIVED IN RESPONSE TO THE SDEISPN AND NOI
AS OF OCTOBER 4, 2001 (RESPONSES TO THE COMMENTS APPEAR IN EXHIBIT A-2)

Commenter	Letter Date	No.	Comments
Gary H. Okino, Councilmember District 8	9/19/01	10	To assure that we do not construct a system which simply moves commuters quickly to the next bottleneck, where it will stall in existing traffic, I strongly recommend that the SDEIS: 1) Identify all segments of BRT (both Regional and In-Town) where vehicles will be forced to use, share, or transition across mixed-use traffic lanes; 2) Analyze possible alternatives to such mixed-use; and 3) Develop and recommend a set of alternatives that assure BRT vehicles exclusive right-of-way from one end of the system to the other.
		11	E) Impact of New Developments on the BRT System There are locations along or in close proximity to the BRT route where major new developments and land uses have been proposed. While it may be impossible to anticipate all of the potential development or redevelopment sites; the SDEIS should identify and consider the impacts upon the BRT system (both positive and negative) of those developments for which preliminary plans have at least been proposed.
		12	A.5 UPDATE OF FINANCIAL ANALYSIS It is unclear from the language of the Preparation Notice whether or not a full update of the BRT Financial Analysis is proposed as part of the SDEIS. Clearly, given the additional costs associated with the added In-Town and Regional routing, as well as changes to the location and basic designs of the Regional on/off ramps, the overall cost and financial impact of the system will change significantly. Moreover, the additional In-Town routing and the inclusion of the Kamehameha Highway and Farrington Highway transit corridor/BRT spurs will significantly impact estimates of overall system ridership, revenue, and operating costs. Moreover, the State of Hawaii has recently stated (reference attached State DOT letter of September 18, 2001) that, "It is not our intent or expectation to provide funding for the BRT project; and have developed our capital improvement programs accordingly. Accordingly, if the financial analysis of the Primary Corridor Transportation Project is to be complete and accurate, it must be thoroughly updated to reflect all the changes and additions to the system that are currently being proposed, as well as review and revise the entire funding scheme based upon the State's non-participation.
Lee D. Donohue, Chief of Police City and County of Honolulu Police Department	9/12/01	1	The Honolulu Police Department has no comment to offer at this time.
Attilio K. Leonardi, Fire Chief City and County of Honolulu Fire Department	9/13/01	1	The proposed changes will not have an adverse impact on the services provided by the Honolulu Fire Department.

SUMMARY OF COMMENTS RECEIVED IN RESPONSE TO THE SDEISPN AND NOI
AS OF OCTOBER 4, 2001 (RESPONSES TO THE COMMENTS APPEAR IN EXHIBIT A-2)

Commenter	Letter Date	No.	Comments
Clifford S. Jamile, Manager and Chief Engineer City and County of Honolulu Board of Water Supply	9/14/01	1	We have no objections to the proposed modifications to the locally preferred alternative. We reserve further comments until the Supplemental Draft Environmental Impact Statement is submitted for our review.
Randall K. Fujiki, AIA Director of Planning and Permitting City and County of Honolulu Department of Planning and Permitting	9/19/01	1	As indicated in our November 16, 2000 memo on the Draft Environmental Impact Statement, the revisions should be coordinated with proposed revisions to the Primary Urban Center and the Central Oahu Development Plans which are presently undergoing major revisions.
		2	Information on relevant alignment and station descriptions, estimated costs and CIP schedules, and implementation schedules for both the In-Town and Regional BRTs should be included where appropriate to determine if Development Plan Public Facilities Map or Public Infrastructure Map amendments will be required before CIP monies for construction and land acquisition are budgeted.
		3	The proposed In-Town BRT Branch Alignment includes five proposed stations located in the Chinatown, Hawaii Capital, and the Thomas Square/Honolulu Academy of Arts Special Districts. In Section 3.2.1 – Land Use and Relocation, there should be discussions about any consistency and/or impacts the proposed stations and BRT alignment will have on these special districts regarding their respective district objectives, historic architectural character, landscaping, pedestrian linkages, and view corridors.
		4	In Section 3.2.3 – Parks and Recreation Areas, Section 3.2.4 – Archaeological, Historic and Cultural Resources and Section 3.2.5 – Visual and Aesthetic, of the DEIS, there should be discussion regarding any impacts of the proposed stations and alignments on existing parks, streetscape improvements (i.e. curbs, gutters, sidewalks, planting strips, street trees, light standards, and signage), historic structures, and significant sites.
		5	In those areas not included in the special districts, it would be helpful to us to have a discussion on impacts the proposed In-Town Branch Alignment will have on existing street trees.
		6	Additional permits and/or approvals, other than Special Management Area permits, should be disclosed, i.e., the need for special district permits, waivers, and exemptions as a "public use," and Trenching Permits.

TABLE A.4-2 (CONTINUED)
SUMMARY OF COMMENTS RECEIVED IN RESPONSE TO THE SDEISPN AND NOI
AS OF OCTOBER 4, 2001 (RESPONSES TO THE COMMENTS APPEAR IN EXHIBIT A-2)

Commenter	Letter Date	No.	Comments
Organizations			
J.T. Miller, Chairman Resident Committee to Address Honolulu SDEIS Harbor Square Condominium Association	9/21/01	1	The routes directed both mauka and makai upon Richards Street, from King Street to Halekauwila Street/Ala Moana Boulevard are judged ill conceived as to functional operation and adherence within the framework of impact upon the environment..
		2	There are also major unaddressed issues which require total clarification for a comprehensive and acceptable final DEIS.
		3	3.1.1 Air Quality. As stated "Mesoscale impacts resulting from the proposed modifications are not expected to be different from what was disclosed in the MIS/DEIS." How can that be determined, when there has been no determination/selection as to the device of transportation, i.e. bus/train. Testing could not be completed until such vehicles are in place, especially on the heavily frequented segment of Richards Street between Queen Street and Ala Moana Blvd., which is lined with tall buildings, (one of which being residential).
		4	Utilizing the diesel powered articulated tractor type buses now in use with three lines operating one bus every three minutes, (or 60 buses per hour, or 1 per minute) air quality in this downtown canyon would definitely be required data. It is absent.
		5	Section 3.1.2 Noise and Vibration The opening statement of this section states there are no land uses along the proposed In-Town BRT alignment that are sensitive to excess noise such as residences. Located at the corner of Richards and Halekauwila Street, (the bottleneck which the three Kakaako lines intersect), stands a 27 story residential building. All three lines of his reference BRT pass directly beneath the windows of eighty (80) bedrooms, where working people will be trying to sleep at night, so as to be rested for the coming day.
		6	Because this bottleneck in the route structure, requiring right angle turns of the hinged buses, it will necessitate braking, then powering up again to regain speed, a very noise-generating procedure, which will occur, electric powered or diesel driven.
		7	Due to the narrow width of Richards Street (44 ft.), all on street parking will be removed to accommodate the makai/mauka bus lanes and yet include vehicular traffic entering and exiting the parking structures of the following business buildings between King Street and Halekauwila Street. (Buildings listed)....
		8	Located on the Diamond Head side of Richards Street, Below Merchant Street, is the U.S. Postal Service marshaling yard, facilitating over 150 mail trucks per day throughout the work week, commencing with a lineup each morning from 8:00 to 9:00 am of postal vehicles awaiting the deliveries to be dispensed, and at times blocking two lanes.
		9	Because of multiple and varied business utilization on Richards Street, it's narrow width, and the absence of loading docks for both the Melim Building and the Ocean View Center, the open street is often utilized for on street garbage pickup, moving trucks, courier deliveries, tree trimming, and other business requirements.

TABLE A.4-2 (CONTINUED)
SUMMARY OF COMMENTS RECEIVED IN RESPONSE TO THE SDEISPN AND NOI
AS OF OCTOBER 4, 2001 (RESPONSES TO THE COMMENTS APPEAR IN EXHIBIT A-2)

Commenter	Letter Date	No.	Comments
J.T. Miller, Chairman Resident Committee to Address Honolulu SDEIS Harbor Square Condominium Association	9/21/01	10	In the meeting of the DTS Bus Rapid Transit team, moderated by City Council Chairman Yoshimura, with the residents of Harbor Square Condominiums, held at Maritime Museum on 17 September 2001, it was made adamantly clear that the addition of sixty double carred transit buses, (one per minute), to the existing traffic from parking garages on Richards Street would cause insoluble gridlock for area workers and residents.
		11	This radical redesign of the Ala Moana Boulevard/Halekauwila Street/Richards Street juncture is fraught with dysfunction. Beneath the street and islands in this area lies a veritable labyrinth of conduits for: The Honolulu Electric Company (HECO), the Board of Water Supply, and the runoff drainage system for downtown Honolulu.
		12	Within a 100 ft. radius at this intersection, are situated fifteen manholes, accessing these vital (and aging) service tunnels beneath the streets. These manholes are utilized regularly, and nearly always requiring the coning of one or two lanes of Ewa bound traffic on Ala Moana Blvd., choking traffic to a crawl. Yet this will be the triangular apex of the Kakaako routing.
		13	As all Waikiki routing must pass through this bottleneck, either outbound or inbound, it is foreseeable that the Rapid Bus Transit System servicing Waikiki could be brought to a virtual halt.
		14	Unaddressed here is the environmental disfigurement in creating this intersection by the removal of eight 30 ft. palm trees and three plumeria trees, the area to be paved over for double car bus transit.
		15	As presented, the subject Supplemental DEIS will have enormous detrimental environmental impact upon the segment of Richards Street discussed. It will produce traffic congestion, air pollution, noise pollution, and finally, unreliable transit service, due primarily to route selection.
		16	There are at least four alternatives that would better serve this purpose than Richards Street. They are: South Street, Punchbowl Street, Mililani Street, and Bishop Street.
		17	The Downtown Neighborhood Board, a representative body elected by the people, has voted unanimously against the use of Richards Street as a route for the proposed transit plan. And the majority of residents and businessmen of this area are opposed as well.
Beverly W. Harbin, President Kakaako Improvement Association	9/21/01	1	We are in agreement that the three planned routes will effectively service our community. However, if the Kakaako Makai route is at any time deleted from existing plans, we would like to suggest the following changes:
		2	BRT Kakaako-Mauka Branch: KIA proposes to locate the route more in the center of this "critical mass" and provide a more efficient and direct route through Kakaako as follows: to continue makai on South St. to Auahi St. turning left on Auahi and traveling straight on Auahi all the way to the Queen Street stub off Ala Moana. In this closer proximity to the "critical mass" of the Ala Moana Boulevard area and in providing a straighter route through Kakaako (thus utilizing fewer individual streets), this proposed route reduces the environmental impact of the project.

TABLE A.4-2 (CONTINUED)
SUMMARY OF COMMENTS RECEIVED IN RESPONSE TO THE SDEISPN AND NOI
AS OF OCTOBER 4, 2001 (RESPONSES TO THE COMMENTS APPEAR IN EXHIBIT A-2)

Commenter	Letter Date	No.	Comments
Beverly W. Harbin, President Kakaako Improvement Association	9/21/01	3	BRT Kakaako-UH-Manoa Branch: KIA proposes that the route continue on King Street to Pensacola, then turn right and make a left turn onto Kapiolani Boulevard at Pensacola. This would avoid potential traffic congestion at Ward and Kapiolani.
Kirk Tomita, Senior Environmental Scientist, Hawaiian Electric Company, Inc.	10/4/01	1	HECO shall reserve further comments pertaining to the protection of existing power lines bordering the project area until construction plans are finalized.
Community Groups			
Lynne Matusow, Chair Downtown Neighborhood Board, No. 13	08/22/0`	1	The SDEIS Preparation Notice, Section 2.1 – describing the Kakaako Makai Bus Rapid Transit alignment - stated that the alignment currently travels on the Hotel Street Mall until the split at North King Street and Richards Street. Advised that King Street in this area is South King Street.
Lee Manfredi, Secretary Board of Directors Waialae-Kahala Neighborhood Board, No. 3	9/21/01	1	I have reviewed the proposed modifications and impact studies and find the proposals acceptable. I have no recommendations for changes to the proposals at this time.
		2	Where the project involved utilizing arterial streets, those streets have speed limits that are out of date with the current use and design of those streets. There are speed limits set at 25 or 30 MPH on streets and roadways that should be upped to at least 35 to 40 MPH, and 40 that should be upped to 45 MPH. These roadways with the low speed limits appear before or after a freeway entry or exit, i.e. Kalanianaole Highway east bound toward Aina Haina.
		3	The intersection traffic lights are not synchronized at all anywhere. Huge traffic jams are further exasperated when the traffic lights run independently of each other, i.e. Beretania Street westbound toward downtown.
Private Citizens			
Wendell Lum, Member Kaneohe Neighborhood Board No. 30 and the Citizen Advisory Committee of the Oahu Metropolitan Planning Organization	9/7/01	1	After Rounds 1 and 2 of the Oahu Trans 2K meeting, public and agency input was combined with technical analysis to define an initial set of alternatives. Only No-Build, Enhanced Bus/Transportation System Management (TSM), Bus Rapid Transit (BRT), and Light Rail Transit (LRT) were considered. A cost-effective shorter grade-separated light rail alternative most over existing street rights-of-way was not included to be an alternative for the In-Town portion. As the chosen Locally Preferred Alternative (LPA) the last time and within the last ten years it should have been again naturally included, for comparison, once and for all to see and comment on.
		2	The process should ensure that critical community concerns and technical issues are identified early in the study and addressed in the engineering, environmental, economic, and financial analyses...
		3	Was it a done deal to guide the process from the beginning by the City's Department of Transportation and its hired consultants to put the Bus Rapid Transit (BRT) as a preferred final choice somehow by eliminating a superior grade-separated light rail alternative?
		4	According to the U.S. Department of Transportation website: http://www.fta.dot.gov/research/pdf/iibrt.pdf there are problems of arterial bus priority treatments (Bus Rapid Transit).

AR00016162

TABLE A.4-2 (CONTINUED)
SUMMARY OF COMMENTS RECEIVED IN RESPONSE TO THE SDEISPN AND NOI
AS OF OCTOBER 4, 2001 (RESPONSES TO THE COMMENTS APPEAR IN EXHIBIT A-2)

Commenter	Letter Date	No.	Comments
Wendell Lum, Member Kaneohe Neighborhood Board No. 30 and the Citizen Advisory Committee of the Oahu Metropolitan Planning Organization	9/7/01	5	Providing high quality service within the downtown sections of metropolitan areas like Honolulu which is the key to the Bus Rapid Transit concept has not been the subject of a comparable effort in the rest of the U.S.
		6	The most basic obstacle to creating bus lanes in Honolulu is the lack of adequate cross section to separate buses from general purpose traffic.
		7	The need to allow general purpose traffic to use a bus lane for turning interferes with bus operations, increasing travel times and adding to problems of enforcing the restriction of the lane to buses under all other circumstances.
		8	Curbside parking by emergency, delivery, and service vehicles also obstructs bus movements and is particularly disruptive if the bus lane is restricted to a single lane width.
		9	A drawback of median bus lanes is that passengers must walk across general purpose traffic lanes to reach the bus stop.
		10	The constraints imposed by traffic signal progression will limit effective application of signal preemption along the In-Town portion of the corridor.
		11	Because of the use of narrow platforms because of very narrow street rights-of-way the so-called transit stations will not eliminate the need to restrict boarding to the front door of the bus which takes additional time.
		12	System integration becomes an issue when the need to provide transfers between routes and other forms of public transportation where passengers pay fares at these transfer points with on board payment.
		13	The DEIS does not give details on the impact with the loss of one and in most cases two lanes of multi-purpose traffic lanes within the proposed corridor.
		14	Giving priority to the proposed BRT will cause additional delays at cross streets and pedestrian cross-walks creating additional traffic congestion at these locations?
		15	A grade-separated light rail system would do the most to improve the capacity of the transportation system to carry people through Honolulu as the population thrives through 2025.
		16	Because of its exclusive guideway would increase the mode share of transit more than any other alternative travel time savings for transit patrons, providing most reliable service that would be buffered from traffic delays, improving in-town mobility and strengthening the connections throughout the island of Oahu.
		17	The nature of the exclusive right-of-way for the grade-separated light rail would provide significantly faster travel times within Honolulu.
		18	The constant at-grade situations of pedestrians, automobile traffic, traffic lights, emergency vehicles, construction and repairs of underground utilities below the exclusive lanes of the BRT, traffic accidents, long stops because of passenger loading limitations, exceptional narrow bus stops, and more time between vehicles don't help the situation.

TABLE A.4-2 (CONTINUED)
SUMMARY OF COMMENTS RECEIVED IN RESPONSE TO THE SDEISPN AND NOI
AS OF OCTOBER 4, 2001 (RESPONSES TO THE COMMENTS APPEAR IN EXHIBIT A-2)

Commenter	Letter Date	No.	Comments
Wendell Lum, member Kaneohe Neighborhood Board No. 30 and the Citizen Advisory Committee of the Oahu Metropolitan Planning Organization	9/7/01	19	Additionally monitoring of both exclusive and shared lanes with the BRT will be a problem and more adjustments to satisfy problems with the communities nearby, currently going on, will cause additional mediation with a Bus Rapid Transit System to further deteriorate the word "rapid."
		20	Lack of sufficient cross-section of streets of the corridor creates very narrow bus stops, which also prevent faster on-board loading of passengers with a single front entry for verification of fares paid providing further deterioration of transit travel times.
		21	Maintenance and construction projects under our streets within the proposed BRT corridor has potential of nearly shutting down the system sometime in the future if implemented.
		22	Under the Bus Rapid Transit (BRT) alternative because there has been lack of the subject of comparable effort in North America this newer transit alternative application for success is not really known except in Curitiba, Brazil which is very different being under the control of a dictatorship.
		23	Narrow bus stops and limited availability of park and ride facilities are not better able to handle surges in ridership due to possible changes in land use policies in central Oahu, special events and sporting events easily.
		24	More transfers would be needed for both the In-town BRT and a grade-separated light rail system due to the proposed hub-and spoke-bus network
		25	Today's grade-separated light rail vehicles have noise emissions comparable to those of an electric trolley bus.
		26	Today's grade-separated light rail vehicles use far less power than other rapid transit systems and releases no harmful chemicals into our atmosphere.
		27	Fully automated and driveless grade-separated light rail vehicles can run more frequently than any BRT vehicle peak and non-peak hours.
		28	Because of lack of a comparable effort for a Bus Rapid Transit System on the mainland and even in Europe I see a missing alternative that should have been considered fairly for all taxpayers.
		29	A grade-separated light rail can be fast, convenient, reliable, and the right choice among all other alternatives.
		30	Building a grade-separated line for the In-Town portion will create many jobs and is a good investment in our city's future.
		31	Because it runs on its own tracks, separated from roads this transit system eliminates conflicts that are frequent on the road system.
		32	A grade-separated light rail system costs less in the long term and offers greater benefits.
Charles M. Ferrell Harbor Square	9/13/01	1	As proposed, traffic on Richards Street will be greatly increased by the addition of 2 BRT routes mauka and makai as well as the inclusion of a major intersection at Richards, Halekauwila, and Ala Moana Boulevard. In addition to the 2 BRT routes, a new mauka lane will be created which will introduce additional traffic on Richards street flowing from Halekauwila and Ala Moana Boulevard.
		2	Since BRT buses are projected to run at 4 minute intervals (30 buses/hour) at peak travel times, turning vehicles will have to not only compete with buses for access to the appropriate travel lanes but with vehicles already in these lanes.

AR00016164

TABLE A.4-2 (CONTINUED)
SUMMARY OF COMMENTS RECEIVED IN RESPONSE TO THE SDEISPN AND NOI
AS OF OCTOBER 4, 2001 (RESPONSES TO THE COMMENTS APPEAR IN EXHIBIT A-2)

Commenter	Letter Date	No.	Comments
Charles M. Ferrell Harbor Square	9/13/01	3	The creation of a traffic lane along the Ewa curb will eliminate a section of curb adjacent to Harbor Tower currently available for pickup and/or discharge of passengers. This area represents the only handicap accessible entry for residents or visitors to the front entrance. The loss of use of this facility will have a detrimental effect on the social conditions of residents and visitors.
		4	The use of Richard Street for 2 BRT routes as well as two traffic lanes will curtail the beneficial uses of the environment for residents and businesses located along the route as follows: 1. Increased noise, vibration and diminution of air quality from vehicular pollutants resulting forma significant increase in traffic. This will be a major problem for the parking garages from the back-up of vehicles waiting to enter or exit during peak travel times.
		5	2. Significant social effects from the loss of quality of living brought about by stresses engendered from increases in the density of detrimental environmental factors, such as those mentioned above. Additionally, the construction of a major intersection as well as 2 BRT and traffic lanes with its attendant disruption of the peace and tranquility of residents will be inevitable.
		6	3. Significant economic impact due to the reduction in value of properties resulting from the decrease in desirability of Harbor Square as a place to live or do business. Additionally, the city will have a loss of property tax revenues as a result.
		7	4. These factors will cumulatively have an effect upon the health and welfare of residents and business employees as a result of the introduction of significant traffic congestion in their living and working environments. Nor will they benefit from the BRT since there will be no access to busses along Richards Street.
		8	The use of Richards Street for 2 BRT routes as well as the introduction of traffic lanes which do not presently exist will have a major environmental impact upon the residents and businesses located in the area.
Federick C. Gross	9/18/01	1	The routing described in Par. 2.1 is circuitous at best, and the turn from Richards to Halekauwila exists but the entrance to Bishop Street does not exist. At best, all these streets are narrow and hardly suitable for buses even without any street parking. I believe that a better solution to the movement of bus traffic in this area should be found.
		2	Both King Street and Pensacola Street are one-way roads, and now are selected for two-way bus routes. This appears unsatisfactory.
		3	BRT Exclusive Ramp on the H-1 Freeway near Aloha Stadium: I am not familiar with the proposed ramp, but it would be most useful if it could be built with two lanes each on a divided road; thus, it could be used for inbound and outbound traffic at the same time.
Ms. P. Pasha Baker, Resident Harbor Tower	9/21/01	1	We already have buses on three sides of our complex – Nimitz Highway, Alakea Street, and Queen Street. Fortunately these three streets are able to accommodate this load, however we have three sides our building that we cannot stop alongside of, park, or load and unload passengers. If the new system is allowed to take over our tiny Richards Street we will be made an island.

TABLE A.4-2 (CONTINUED)
SUMMARY OF COMMENTS RECEIVED IN RESPONSE TO THE SDEISPN AND NOI
AS OF OCTOBER 4, 2001 (RESPONSES TO THE COMMENTS APPEAR IN EXHIBIT A-2)

Commenter	Letter Date	No.	Comments
Ms. P. Pasha Baker, Resident Harbor Tower	9/21/01	2	It has been with shock and disbelief that we were suddenly notified that these meager remnants on Richard Street are now planning to be eliminated and that this has been in the planning stages for three years without any of us (some 2000 of us in the residential and commercial towers) being advised and/or consulted of the plans to punish us with a complete strangle on us and create hardships beyond measure.
		3	We would like to know - why are we being punished like this?
		4	Why has Mililani Street not been considered for this purpose? Why has Punchbowl Street not been considered for this? Why has South Street not been considered for this?
		5	Who do we turn to for help and answers to this matter?
		6	How can we get some consideration and at least a hearing with your office to address our problems?
Doug Meller	9/21/01	1	I would like to be a formally consulted party and be provided with a paper copy of the Supplemental DEIS, the Final EIS, and future BRT-related environmental documents.
		2	Adding a new BRT route means revising the BRT Alternative to attract more riders. How many daily transit trips would the No Build and the TSM Alternatives generate assuming the same total number of buses as the revised BRT Alternative in 2025? It seems obvious that fewer buses will result in fewer routes, reduced frequency of bus service, longer waits at bus stops, longer boarding times at bus stops, increased crowding of buses, fewer express buses, and fewer bus riders. Assuming the No Build and the TSM Alternative have fewer buses than the BRT Alternative will prevent a fair comparison.
		3	When does the City plan to convert existing traffic lanes east of Middle Street to exclusive use of the BRT route which will serve the UH? At that time, • which intersections will experience significantly reduced levels of service? • how many bus riders will be better off and how much reduction in travel time will they experience? • how many drivers will be worse off and how much more travel delay will they experience?
		4	When does the City plan to convert existing traffic lanes east of Middle Street to exclusive use of the BRT route which will serve Waikiki? At that time, • which intersections will experience significantly reduced levels of service? • how many bus riders will be better off and how much reduction in travel time will they experience? • how many drivers will be worse off and how much more travel delay will they experience?
		5	Am I correct in assuming that the proposed BRT route with stops at Aloha Tower and Kewalo Basin is contingent on the HCDA extending Ilalo Street to Punchbowl Street, and that extension of Ilalo Street may not occur within the next decade?
		6	When will the proposed BRT freeway-access ramp at Luapele Street, associated freeway widening, and the associated park-and-ride lot be constructed and what will each of these improvements costs?

TABLE A.4-2 (CONTINUED)
SUMMARY OF COMMENTS RECEIVED IN RESPONSE TO THE SDEISPN AND NOI
AS OF OCTOBER 4, 2001 (RESPONSES TO THE COMMENTS APPEAR IN EXHIBIT A-2)

Commenter	Letter Date	No.	Comments
Doug Meller	9/21/01	7	Each day, how many buses and bus rider will use the proposed BRT freeway access ramp at Luapele Street: • when it is first constructed? • in 2025?
		8	When the zipper lane is normally not deployed, and during peak traffic when the zipper lane cannot be deployed because of an incident or mechanical problems, the BRT will not be able to use the proposed Luapele ramp. What route will the BRT take when the proposed Luapele ramp cannot be used?
		9	If the proposed Luapelel ramp were not built, what is the projected drop in daily bus ridership?
		10	If the proposed park-and-ride lot were not built near the proposed Luapele ramp, what is the projected drop in daily bus ridership?
		11	In general, how large an expenditure does the City consider justified to attract a single additional daily bus rider? Will proposed expenditures to construct a BRT freeway-access ramp at Luapele Street, associated freeway widening, and the associated park-and-ride lot meet this standard?

A.5 PUBLIC INVOLVEMENT SINCE THE SDEIS

Since the publication of the SDEIS, the public outreach and involvement program has involved a wide variety of forums and tools to increase public awareness about the project and gather community input. The SDEIS public hearing, City Council committee meetings, working group meetings, informational briefings, and other tools have allowed the project to reach out to and hear from thousands of Honolulu's citizens.

A.5.1 SDEIS Review Period and Public Hearing

This section summarizes the SDEIS review period and public hearing. Table A.5-1 summarizes the SDEIS review process.

The FTA approved the SDEIS for public circulation on March 5, 2002. The State of Hawaii, Office of Environmental Quality Control (OEQC) approved the SDEIS for distribution on March 12, 2002. SDEIS printed copies were distributed to the public, libraries, community groups, and local, State, and federal agencies for review and comment. The SDEIS was also available on CD-ROM upon request and posted on the project website (www.oahutrans2k.com). People and agencies who submitted comments on the MIS/DEIS and the Notice of Intent to Prepare a SDEIS, published in accordance with the National Environmental Policy Act (NEPA), and the Environmental Impact Statement Preparation Notice (EISPN), published in accordance with Chapter 343, Hawaii Revised Statutes, were also sent printed copies.

The SDEIS Notice of Availability (NOA) was published in the March 22, 2002 Federal Register and March 23, 2002 The Environmental Notice. The SDEIS NOA and public hearing information were advertised in the Honolulu Star-Bulletin and the project newsletter (Progress Report No. 7). Also, between April 12, 2002 and April 19, 2002 several advertisements were published in The Honolulu Advertiser, and Honolulu Star-Bulletin. The SDEIS availability was given substantial media coverage particularly in local newspapers.

TABLE A.5-1
SDEIS REVIEW PROCESS

Activity	Date
SDEIS approved for circulation by FTA	March 5, 2002
Distribution of SDEIS	March 15, 2002
Notice of SDEIS availability in the Federal Register (public review period officially begins)	March 22, 2002
Notice of SDEIS availability in the OEQC, The Environmental Notice	March 23, 2002
Legal notice of SDEIS availability and public hearing in Honolulu Star-Bulletin	March 23, 2002 and April 1, 2002
Distribution of Progress Report No. 7 announcing availability of SDEIS and public hearing to project mailing list	April 15-17, 2002
Newspaper display ads for public hearing in Honolulu Advertiser and Honolulu Star-Bulletin	April 12-19, 2002
Formal public hearing at Hawaii Convention Center	April 20, 2002
Close of the public review period	May 7, 2002

Source: Parsons Brinckerhoff Quade & Douglas, Inc., November 2002.

The SDEIS public hearing was held on Saturday, April 20, 2002 at the Hawaii Convention Center, from 9 a.m. until approximately 3 p.m. From approximately 9:00 a.m. until 10:00 a.m., there was an "open house" where attendees could review display boards. Project staff was available at that time to discuss the project and answer questions.

There were two registration areas for meeting guests to sign-in and receive comment forms. One hundred sixty-one (161) people registered. In addition, there were 32 project personnel at the public hearing to help register meeting attendees, staff the display board areas where they answered questions plus discussed the project components with meeting attendees, and register people that wanted to testify. In addition, there was a court reporter at the public hearing.

Meeting attendees were provided the following three means to comment on the project while at the public hearing:

- At the registration table, meeting attendees were given comment forms and pencils. Attendees were invited to complete the comment forms at the meeting and deposit them in a box; however; they were also advised they could complete the comment forms and mail them in by the May 7, 2002 comment period close date.
- Attendees wishing to give oral testimony were directed to the testimony sign-up table. Seventy-one (71) people signed-up to testify although not all 71 testified because some had left prior to their names being called.
- Attendees who wanted to give oral testimony but were not comfortable speaking in front of an audience were directed to the court reporter to record their comments. This option was only available between 9:00 a.m. and 10:00 a.m., during the "open house".

At around 10:00 a.m., the public hearing began. A project team member, using PowerPoint slides, briefly presented a project overview which included a discussion of the period from the MIS/DEIS to the SDEIS, purpose and need, alternatives, impacts, funding, etc. After the presentation, registered speakers were invited to speak. Except for elected officials who were allowed to speak first, the speakers spoke in the order that they registered. The court reporter recorded the public hearing proceedings. Chapter 7 presents the written and oral comments and response letters received after the MIS/DEIS and SDEIS were published.

A.5.2 Meetings with City Council and Other Elected Officials

Since the SDEIS was published, project team members have been regularly meeting with the City Council and other elected officials to keep them apprised of the project.

On April 10, 2002, the project team gave a presentation to the City Council Transportation Committee to brief the Councilmembers about the project effects documented in the SDEIS.

City Council Bills 20 and 34 were introduced and passed relating to the funding and permitting for PCTP Phase 1, bus rapid transit service from Iwilei to Waikiki via Kakaako Makai.

Bill 20, the City's CIP budget for FY 2003, ultimately included $31 million in construction funding for the PCTP Phase 1. After numerous committee hearings and three Council readings, Bill 20 was passed by the City Council on May 29, 2002.

In order for public infrastructure facilities to be funded and constructed, they must first be recognized by placing a symbol on the Development Plan Public Facilities Map (DP PFM) for the specific Development Plan area. Bill 34 amended a portion of the DP PFM for the Primary Urban Center by adding a publicly funded transit corridor symbol for the proposed PCTP Phase 1. The project team gave a presentation to the City Council Planning and Transportation Committees explaining Bill 34 on May 14, 2002. Additional committee meetings allowed for questions to the project team and public testimony on the bill. After three joint committee hearings and three Council readings, Bill 34 was passed by the City Council on June 26, 2002.

The project team also held meetings with elected officials and/or staff who requested project updates. These included State Senator Norman Sakamoto, State Senator Suzanne Chun-Oakland, State Representative Jun Abinsay, State Representative Ben Cabreros, State Representative Charles Djou, State Representative Willie Espero, State Representative Nestor Garcia, State Senator Rod Tam, Councilmember Romy Cachola, Councilmember Duke Bainum. Councilmember Gary Okino, and Councilmember Jon Yoshimura.

A.5.3 Outreach Meetings

The continued involvement of individuals from businesses, organizations, and institutions will continue to play an important role as the PCTP moves forward into final design and implementation. Since the SDEIS was published, project representatives have met with numerous individuals and groups in the community. Table A.5-2 summarizes the outreach meetings held since the SDEIS.

The project team carried out meetings and presentations in order to provide project updates to private firms and businesses, universities and colleges, major landowners, professional and business associations, and small businesses along the BRT alignment especially in the areas of the University, Kakaako, and Kalihi. The project team also worked with individuals and groups with specific interests and issues relevant to the transportation system through personal meetings, group briefings, and member communications.

The project team attended numerous neighborhood board and other community meetings throughout Oahu. At these meetings, DTS representatives and consultants were on hand either to give a presentation, to provide information, or to respond to comments and questions.

Comments and questions received at the many outreach meetings primarily focused on the following topics: cost of the project, traffic and transportation issues, community and social concerns, environmental issues, and anticipated ridership.

A.5.4 Other Public Outreach Activities and Tools

In addition to the meetings described above, public outreach efforts since the SDEIS has included various other activities and tools, including public displays, newspaper advertisements, project website, Progress Report newsletters, and informational handouts.

The project team reached out to new audiences through informational displays at special events open to the public and targeted audiences. Since the SDEIS, BRT displays were featured at the "Mayor's Mini City Hall," at large special events, and other public locations.

To increase awareness of the project among the public, a series of paid newspaper advertisements were developed. These advertisements aimed to briefly explain the project and to invite the public to the upcoming public hearing. To publicize the SDEIS public hearing in April 2002, a series of advertisements appeared in the Honolulu Advertiser and Honolulu Star-Bulletin over a four-day period.

The project website, <www.oahutrans2k.com>, continues to provide the public with the current project status. The website has provided BRT news, background information, route maps, PDF files of the SDEIS and other publications, announcements of upcoming events, and links to other relevant websites.

Progress Report No. 7 was published at the time the SDEIS was released. This newsletter included a description of the SDEIS, highlights from the Waikiki Working Group, responses to common questions, and an update on hub-and-spoke bus routes. 12,000 copies of Progress Report No. 7 were printed and distributed to the Oahu Trans 2K mailing list or passed out to participants at outreach meetings.

Numerous informational handouts were published and distributed to the public. These included basic fact sheets about BRT, "frequently asked questions," and material created for specific audiences such as small businesses, senior citizens, and students.

A.5.5 Public Involvement Since the State FEIS

The State FEIS Notice of Availability was published in the December 8, 2002 edition of The Environmental Notice. As a result of comments on the SDEIS, the Refined LPA underwent further refinements, which were presented in the State FEIS. These refinements/clarifications were presented as part of the first briefing on the Primary Corridor Transportation Project to the new City Council Transportation Committee on January 13, 2003. The agenda of the meeting was publicly noticed and members of the public were allowed to ask questions and/or make comments. The meeting was carried live on the public access channel for viewing by those who could not attend the meeting, and the tape was subsequently replayed.

Ms. Cheryl D. Soon, Director
Department of Transportation Services
City and County of Honolulu
711 Kapiolani Boulevard, Suite 1200
Honolulu, Hawaii 96813

Dear Ms. Soon:

We have reviewed the Primary Corridor Transportation Project Environmental Assessment (Environmental Impact Statement Preparation Notice) dated April 1999.

Although we have no comments on the EA/EISPN, we request that our office be included in the scoping process because some of the proposed alternatives are adjacent to Honolulu International Airport. These alternatives, with readily accessible links to airport transportation systems, could improve access for passengers, employees, and other users of the airport. We also suggest coordination with the State Airports Division.

If you have any questions, please call David Welhouse at 541-1243.

Sincerely,

Daniel S. Matsumoto

Re: Notice to Prepare Draft Environmental Impact Statement and Request for a Species List for the Primary Corridor Transportation Project, Oahu, Hawaii (ER 99/397)

Dear Ms. Soon:

The U.S. Fish and Wildlife Service (Service) has reviewed your April 21, 1999, letter notifying us that you intend to prepare a Draft Environmental Impact Statement (DEIS) for the proposed project referenced above. We have also reviewed a letter received from the Federal Transit Administration (FTA), dated May 12, 1999, requesting a list of endangered and threatened species found within the proposed project area. The proposed project is sponsored by the City and County of Honolulu Department of Transportation Services (DTS) and the U. S. Department of Transportation, FTA. This letter has been prepared under the authority of and in accordance with provisions of the National Environmental Policy Act of 1969 [42 U.S.C. 4321 *et seq.*; 83 Stat. 852], as amended, the Fish and Wildlife Coordination Act of 1934 [16 U.S.C. 661 *et seq.*; 48 Stat. 401], as amended, the Endangered Species Act of 1973 [16 U.S.C. 1531 *et seq.*; 87 Stat. 884], as amended, and other authorities mandating Department of the Interior concern for environmental values. Based on these authorities, the Service offers the following comments for your consideration.

The proposed project involves improving Oahu's primary transportation corridor, which extends from Kapolei in the Ewa District, past Pearl Harbor, Honolulu International Airport, downtown Honolulu, and continues eastward to the University of Hawaii at Manoa. The corridor is approximately 27 miles in length and at most 4 miles in width. The alternatives currently being considered include a No-Build Alternative, Enhanced Bus/Transportation System Management Alternative, a Bus Rapid Transit, and a Light Rail Transit alternative.

The Service has reviewed the information that was provided in your letter and pertinent information in our files, including maps and records prepared by the Hawaii Heritage Program of The Nature Conservancy. The Hawaiian hoary bat (*Lasiurus cinereus semotus*), federally listed as endangered, has been sporadically sighted within the metropolitan area of the proposed project. The following waterbird species, federally listed as endangered, have been observed in wetland areas within the project area:

a. Hawaiian coot (*Fulica americana alai*);
b. Hawaiian duck (*Anas wyvilliana*);
c. Hawaiian common moorhen (*Gallinula chloropus sandvicensis*); and
d. Hawaiian stilt (*Himantopus mexicanus knudseni*).

1 The following federally endangered plant species have been observed within the Ewa area of the Primary Transportation Corridor (refer to Figure 1.1 of the DEIS Preparatinn Notice):

a. *Abutilon menziesii* (ko`oloa`ula);
b. *Centaurium sebaeoides* (`awiwi); and
c. *Marsilea villosa* (`ihi`ihi).

In addition, the plant *Tarulinium odoratum* subsp. *auriculatum* (pu `uka `a), a Species of Concern, has been reported within the Ewa area of the Primary Transportation Corridor. However, it has not been observed there since 1916. The term "Species of Concern" describes species that are of concern to the Service, but require further biological research and field study to resolve their conservation status. These species are not currently federally protected.

2 The DEIS should address any potential project-related impacts to these and other native Hawaiian species and propose mitigation measures that avoid unnecessary impacts and minimize unavoidable impacts. For example, we recommend that these measures include avoidance of unnecessary destruction of vegetated areas containing ko`oloa`ula or any other federally listed plant species.

The Service appreciates the opportunity to provide this technical assistance, and we look forward to reviewing a copy of the DEIS when it is available. If you have questions regarding these comments, please contact Fish and Wildlife Biologist Leila Gibson by telephone at (808) 541-3441 or by facsimile transmission at (808) 541-3470.

Sincerely,

Robert P. Smith

San Francisco, CA 94105

Subject: Primary Corridor Transportation Project: Cooperating Agency Decision and Comments

In response to your letter of May 5, 1999, we elect to be a cooperating agency on the Primary Corridor Transportation Project (PCTP) proposed by the City and County of Honolulu. Alternatives presented by the City are primarily transit options. We understand that if future conditions warrant, our role could be changed to joint lead agency, and that change can readily be accommodated. We agree with your understanding stated in the May 5 letter that the EIS will enable FHWA to discharge its jurisdictional responsibilities and that the EIS will satisfy our NEPA requirements including those related to project alternatives, environmental consequences and mitigation. Please keep this office fully informed about any highway related impacts or improvements for the PCTP. We are committed to being involved and responsive to FTA, our State, City, and MPO partners, and the public throughout the study effort.

1 We would like to take this opportunity to remind you that the DEIS/MIS must be fully coordinated with the Oahu Metropolitan Planning Organization (OMPO.) Assumptions on land-use, demographics, traffic, and other data must be consistent between the PCTP and the OMPO planning process, including the Oahu Regional Transportation Plan (ORTP) update. OMPO is responsible for regional transportation planning on Oahu, and the MIS is really a subarea or corridor planning study that is of regional nature, so it should be carried out in the OMPO forum.

2 The cost for the PCTP alternatives must be determined and considered on a regional basis. The PCTP preferred alternative and all of its transit and highway elements must be fully incorporated into the ORTP by including it in the ORTP update or a plan amendment. Funds for the project must be reasonably available, and as part of the ORTP , the project must be considered with respect to all other transportation priorities in the ORTP to determine its priority and validity in the regional perspective. The project as a whole could consume funding for other priority projects included or being considered for inclusion in the ORTP and the tradeoffs must be presented to the stakeholders and the public for their consideration.

3 Alternatives presented by the City thus far are primarily transit options. While this focus is due to the high capacity transit placeholder in the existing ORTP, the MIS requirements call for all reasonable alternatives to be considered within the MIS, therefore highway options should be considered now rather than after the MIS is completed by the City. The HDOT and OMPO should ensure that the study includes multi-modal alternatives that support their transportation plans for the corridor.

Please feel free to contact Jonathan Young at (808) 541-2700, ext. 325, if you have any questions.

Sincerely yours,

Abraham Wong

Dear Mr. Wong:

Subject: Primary Corridor Transportation Project

Thank you for your letter dated June 14, 1999, regarding the Environmental Impact Statement (EIS) Preparation Notice, Primary Corridor Transportation Project.

Your comments are appreciated and will be included in the Major Investment Study/Draft Environmental Impact Statement (MIS/DEIS). Enclosed is a copy of your written comments, which have been numbered. The following responses to your comments are provided.

1. Coordination with the Oahu Metropolitan Planning Organization is ongoing. Section 4.2.5 discusses differences in data used for the MIS/DEIS and the Oahu Regional Transportation Plan analyses. A sensitivity analysis concluded that the difference is not significant enough to alter the analysis and conclusions in the MIS/DEIS.

2. The costs of the alternatives are provided in Section 2.3. A full financial analysis of the project is in Chapter 6.

3. Project alternatives are discussed in Chapter 2. Section 2.1 discusses the evolution of alternatives. The Transportation System Management and Bus Rapid Transit Alternatives are multi-modal alternatives. A highway alternative alone is not sufficient to satisfy project purposes and needs, and is addressed in Section 2.6. A highway alternative is inconsistent with the public's visions for the island's transportation system, as documented through the Oahu Trans 2K process.

Should you have any questions regarding the project, please contact Kenneth Hamayasu at 527-6978.

Sincerely,

CHERYL D. SOON

Dear Ms. Soon:

Subject: Environmental Impact Statement Preparation Notice (EISPN) for the Primary Corridor Transportation Project

We have reviewed the EISPN for the subject project and find that the project areas, as represented on Figures 2.1 through 2.6, are designated within the State Land Use Urban and
1 Agricultural Districts. We suggest that the Draft EIS include a map showing the project areas under the different alternatives in relation to the State land use districts.

We have no further comments to offer at this time. We appreciate the opportunity to comment on the subject EISPN.

Should you have any questions, please feel free to call me or Bert Saruwatari of our office at 587-3822.

Sincerely,

ESTHER UEDA

Dear Ms. Ueda:

Subject: Primary Corridor Transportation Project

Thank you for your letter dated April 29, 1999, regarding the Environmental Impact Statement (EIS) Preparation Notice, Primary Corridor Transportation Project.

Your comments are appreciated and will be included in the Major Investment Study/Draft Environmental Impact Statement. Enclosed is a copy of your written comments, which have been numbered. The following response to your comment is provided.

1. Land use is addressed in Sections 3.1 and 5.1. With the exception of a small area in Ewa, the entire primary transportation corridor is designated as Urban by the State Land Use Commission.

Should you have any questions regarding the project, please contact Kenneth Hamayasu at 527-6978.

Sincerely,

CHERYL D. SOON

Dear Ms. Soon:

EIS Preparation Notice for the Primary Corridor Transportation

Thank you for allowing us to review and comment on the subject document.

1 Page 19 of the document acknowledges the requirement for stream channel alteration permits (SCAP). Stream Channel Alteration permits, pursuant to Hawaii Revised Statutes §174C-71, will be required for projects which modify the bed or banks of streams.

2 As much as possible, plans for future public transportation alternatives should avoid adverse impacts to streams, and the draft environmental impact statement should properly disclose impacts.

We look forward to reviewing future documents relating to the Primary Corridor Transportation project.

If you have any questions regarding this letter, please contact Roy Hardy at 587-0274.

Sincerely,

Edwin T. Sakoda

Dear Ms. Soon:

SUBJECT: Chapter 6E-8 Historic Preservation Comment on an Environmental Impact Statement Preparation Notice (EISPN) for the Primary Corridor Transportation Project
Honolulu and 'Ewa Districts, O'ahu
TMK: Zones 1 - 3, 9

Thank you for the opportunity to comment on the EISPN for the proposed Primary Corridor Transportation Project. According to your materials, the proposed action addresses existing and future transportation demands and capacity needs on the island of O'ahu in conjunction with the following goals: support of socioeconomic growth on the island and in the corridor; improvement of public transit services; facilitate land use development in the central urban core consistent with the vision for Oahu being developed at community meetings; support of current planning activities and policies. Our review is based on historic reports, maps, and aerial photographs maintained at the State Historic Preservation Division; no field inspections were made in conjunction with this review. Sara Collins and Tonia Moy of my staff recently met with Ms. Faith Miyamoto of your office and representatives of Parsons, Brinckerhoff, Quade, and Douglas, the consultant hired to prepare the EISPN, in order to review the proposed improvements.

Section 3.2.4 correctly summarizes the results of our meeting with your project staff and consultant. The parties agreed that the identification, assessment, and any needed treatment of significant historic sites found to be directly or indirectly affected by the undertaking will be carried out pursuant to Section 106 of the National Historic Preservation Act and Section 4(f) of the US Department of Transportation Act. When
1 we receive the pertinent information, we shall be better able to advise you on the following matters: (1) the presence or absence of historic sites within the areas of potential effect and project areas; (2) whether or not any of the identified historic sites

are significant; (3) whether or not the proposed undertaking(s) will have an "adverse effect" on significant historic sites; (4) what actions will be need to mitigate any adverse effects.

With regard to traditional cultural properties and any traditional practices associated with affected properties, your project staff and consultant indicated that they would
2 be consulting with the Office of Hawaiian Affairs and interested parties identified during the scoping process.

Should you have any questions about archaeology, please feel free to call Sara Collins at 692-8026. Should you have any questions about architecture, please feel free to call Tonia Moy at 692-8030.

Aloha,

DON HIBBARD, Administrator
State Historic Preservation Division

Dear Ms. Soon:

SUBJECT: Chapter 6E-8 Historic Preservation Response to a Request for Information on Historic Sites in the Vicinity of the Primary Corridor Transportation Project
'Ewa and Kona, O'ahu

Thank you for your letter of May 7, 1999, in which you request preliminary information on the presence of significant historic sites known to be in the vicinity of the proposed Primary Corridor Transportation Project (PCTP) area. We have attached a map of southern O'ahu, including the PCTP corridor, which shows the general locations of significant historic sites or site districts (e.g., the Pearl Harbor Naval Base National Historic Landmark). At this preliminary stage of investigation, prior to issuing
3 the Draft Environmental Impact Statement, we understand that further work in defining the alternatives and the areas of potential effect (APEs) needs to be done. We further understand that the City and County of Honolulu has resident on its Geographic Information System most if not all of these same site data, including site
4 numbers. As your project progresses, should you or your consultant wish to consult our files for further information on specific sites or site districts, please let us know, and we can arrange a mutually convenient time to meet.

Should you have any questions, please feel free to call Sara Collins at 692-8026.

Aloha,

DON HIBBARD, Administrator
State Historic Preservation Division

Dear Mr. Hibbard:

Subject: Primary Corridor Transportation Project

Thank you for your letters dated May 4, 1999 and June 3, 1999, regarding the Environmental Impact Statement (EIS) Preparation Notice, Primary Corridor Transportation Project.

Your comments are appreciated and will be included in the Major Investment Study/Draft Environmental Impact Statement. Enclosed is a copy of your written comments, which have been numbered. The following responses to your comments are provided:

1. Historic sites issues and Section 106 are discussed in Sections 3.10 and 5.10. Section 106 coordination with SHPD has been initiated and is continuing. Parkland issues and Section 4(f) are discussed in Sections 3.11 and 5.11.
2. Coordination with OHA has occurred, as documented in Section 5.10 and Appendix D.
3. The status of coordination with SHPD is described in Section 5.10 and Appendix D.
4. The approach for studying historic sites is described in Sections 3.10 and 5.10.

Should you have any questions regarding the project, please contact Kenneth Hamayasu at 527-6978.

Sincerely,

Cheryl D. Soon

Ms. Cheryl D. Soon, Director
Department of Transportation Services
City and County of Honolulu
711 Kapiolani Boulevard, 12th Floor
Honolulu, Hawaii 96813

Dear Ms. Soon:

SUBJECT: Comments on The Primary Transportation Corridor as Proposed by the City and County of Honolulu at a Meeting Held on March 25, 1999, on a Corridor Traversing Through Fort Armstrong And Sand Island at Honolulu Harbor, Honolulu, Oahu

We would like to thank you for meeting with us on March 25, 1999 regarding the subject traffic corridor. We are in receipt of the April 16, 1999 memorandum from Mr. Bob Bramen, and we offer the following preliminary comments. This is a project of great magnitude, and as the Draft Environmental Impact Statement (DEIS) has not been published, we are offering comments on the project as discussed at the subject meeting.

1. We request that close scrutiny be given to the traffic studies that are to take place by the applicant, especially where the project intersects with Ala Moana Boulevard near South Street, and where Sand Island Access Road intersects with Nimitz Highway. We are concerned with the large tractor trailer traffic on this corridor as the corridor is proposed to tunnel under the entrance channel to Honolulu Harbor and the tunnel proposed by the Harbors Division under Kalihi Channel. We request that these issues be fully discussed in the DEIS in order to justify this project.

2. There are a multitude of permits required for this project. The acceptance of the Final Impact Statement by the State, together with a Conservation District Use Permit, as approved by the Board of Land and Natural Resources (BLNR), is a portion of the permitting process for the project. The U.S. Army Corps of Engineers and various State entities would have to give their concurrence to the project. As of the meeting date, the City and County of Honolulu (City) had stated they had not, as yet, approached the Department of Land and Natural Resources (DLNR), a key governmental agency in this project. Approval of the project by the Harbors Division is a necessity, but it appears that most of the land dispositions required for the project are public lands and will require approval by the BLNR. The permitting process should be clearly defined in the DEIS.

3. Concurrence by the Department of Business, Economic Development and Tourism, Hawaii Community Development Authority (HCDA) is necessary. The project would have to comply with HCDA's plans for the area since HCDA is planning the Ilalo Street extension in Kaakaukukui

4. The City stated that the Sand Island/Kakaako sewer line would probably have to be relocated, but details were not clear. We are concerned about this rerouting and request that it be implemented in the DEIS.

5. We are concerned with the City's ability to construct the tunnel under the entrance channel of Honolulu Harbor without disrupting harbor operations, and request that this issue be addressed in the DEIS.

6. The permitting process for the environmental issues is susceptible to massive public and governmental input, which may severely hinder the City's lead time for the project and subsequently impact the tenants of the Harbors Division.

7. The City stated that they would be applying for Federal funds for the project. As such, the City would have to acquire the fee title to the lands or perpetual easements to the lands required for the project. We would like to bring up three points here:

   a. We understand that the City has long disclaimed ownership, maintenance and responsibility of Sand Island Access Road, and the DLNR was forced to take responsibility for this access road for many years. Although the roads dispute between the City and the State was purportedly solved by Act 288, Session Laws of Hawaii, 1993, and the City Council Resolution No. 93-287, we are not sure how the DLNR will react to this project.

   b. The lands at Fort Armstrong, Piers 1 and 2, and the Foreign Trade Zone, legally described as the filled lands of Kaakaukukui, have been conveyed to the HCDA by the DLNR. Pursuant to 171-2, HRS, these are privately owned lands and fall under the jurisdiction of the Board of the HCDA, an important entity in this project considering HCDA's proposed Ilalo Street extension and how it may conflict with the proposed corridor.

   c. The City stated at the meeting that Sand Island Access Road would have to be widened, and lands (an undetermined amount, as presented) would have to be taken

AR00016194

from the container yard under the Harbors Division and lands encumbered by General Lease (GL) No. S-5261 issued to Sand Island Business Association (SIBA). We are concerned that the lands required by the City may have an adverse impact on the users of the container yard, together with additional lands required for construction activities. Additionally, the City should meet with Mr. Walter Arakaki, President of the SIBA, as the road widening would affect the amendment of numerous subleases issued by SIBA to its tenants, and also require an amendment to GL No. S-5261 (requiring BLNR approval).

8. It is imperative that our Oahu District Office be included in any discussions regarding traffic flow that may affect our harbor facilities and shipping lanes. They may be contacted at 587-2050. 9

Our Engineering Branch has made comments on the project, and has forwarded them to the Highways Division for inclusion with Highways Division's comments.

Should your staff have any questions regarding this matter, they may contact Mr. John Dooling, Property Manager, at 587-1943.

Very truly yours,

Thomas T. Fujikawa
Harbors Administrator

Dear Mr. Fujikawa:

Subject: Primary Corridor Transportation Project

Thank you for your letter (HAR-PM 5990.99) dated May 6, 1999, regarding the Environmental Impact Statement (EIS) Preparation Notice, Primary Corridor Transportation Project.

Your comments are appreciated and will be included in the Major Investment Study/Draft Environmental Impact Statement. Enclosed is a copy of your written comments, which have been numbered. The following responses to your comments are provided.

1. The Sand Island analysis has been shifted to the Oahu Regional Transportation Plan (ORTP). Traffic impacts are discussed in Section 4.2.
2. Chapter 7 includes a list of potential permits and approvals needed by the project. Further coordination with all affected landowners will occur during subsequent planning.
3. Coordination with HCDA is ongoing.
4. The Sand Island analysis has been shifted to the ORTP. Potential impacts to sewer lines are addressed in Section 5.12.10.
5. The Sand Island analysis has been shifted to the ORTP.
6. The project schedules for the various alternatives are provided in Section 2.5. The Locally Preferred Alternative (LPA) has not been selected. Once the LPA is selected, the project schedule including the permit requirements will be refined.
7. Coordination with DLNR is ongoing, but the Sand Island analysis has been shifted to the ORTP.

8. The Sand Island analysis has been shifted to the ORTP.
9. The Sand Island analysis has been shifted to the ORTP. Coordination with the Harbors Division is ongoing. No impact on harbor facilities and shipping lanes would occur.

Should you have any questions regarding the project, please contact Kenneth Hamayasu at 527-6978.

Sincerely,

CHERYL D. SOON

Dear Ms. Soon:

Subject: Environmental Impact Statement (EIS) Preparation Notice, Primary Corridor Transportation Project

We offer the following comments:

1. Two-sided pages: In order to reduce bulk and conserve paper, we recommend printing on both sides of the pages in the draft EIS.

2. Maps and figures:

   ▸ *Site maps*: Close-up neighborhood maps for each area of each alternative will be required.
   ▸ *Figures*: The use of color to distinguish between the various alignments in the figures would be extremely helpful.

1

3. Acronyms: In the draft EIS please include a list of acronyms found throughout the text.

4. Flora and Fauna: Section 3.1.4, *Ecosystem*, notes that some species in the corridor are classified as threatened or endangered. In the draft EIS please include a thorough discussion of impacts to threatened or endangered species and related mitigation measures.

2

3 5. Community consultation: Include synopses of the Trans 2K meetings held in the latter part of 1998 since they were preparatory to the development of this EIS.

4 6. Secondary impacts: Be sure to include a full discussion of secondary or indirect impacts, such as growth or shifts in population, for each of the alternatives under consideration.

5 7. Mitigation commitments: The last paragraph of Section 1.3, *Planning Process*, states that the federal Record of Decision will document the Locally Preferred Alternative and environmental mitigation commitments. Please bear in mind that the mitigation measures listed in the state final EIS also constitute mitigation commitments which must be implemented.

If you have any questions call Nancy Heinrich at 586-4185.

Sincerely,

Dear Ms. Salmonson:

Subject: Primary Corridor Transportation Project

Thank you for your letter dated May 13, 1999, regarding the Environmental Impact Statement (EIS) Preparation Notice, Primary Corridor Transportation Project.

Your comments are appreciated and will be included in the Major Investment Study/Draft Environmental Impact Stalement (MIS/DEIS). Enclosed is a copy of your written comments, which have been numbered. The following responses to your comments are provided.

1. The MIS/DEIS will be double-sided and will include an acronym list. Copies of the MIS/DEIS with color figures will be available at public libraries and on CD-ROM. Section 3.3 discusses neighborhoods, with maps delineating the neighborhoods in the area.
2. Section 5.7 discusses the impacts on endangered species.
3. The Oahu Trans 2K meetings have been summarized and those summaries are included in Appendix A.
4. Secondary impacts are discussed in Section 5.13.1.
5. Comment noted.

Dear Ms. Soon:

Subject: Primary Corridor Transportation Project

Thank you for the opportunity to review the Primary Corridor Transportation Project Environmental Assessment (Environmental Impact Statement Preparation Notice), (EA/EISPN) dated April 1999.

1 In Figure 2.4, Year 2020 Light Rail Transit (LRT) Alternative 1 of the EA/EISPN, the LRT is in close proximity to Honolulu International Airport (HIA). This may have an impact on the future projects planned in the Honolulu International Airport Master Plan. Also, we are concerned about the LRT's impact on the traffic on the access roads to HIA. We request that the Department of Transportation, Airports Division be involved in your scoping process for this project.

If you have any questions, please call Stephen Takashima, Planner, of the Airports Division at 838-8810.

Very truly yours,

Dear Mr. Hayashida:

Subject: Primary Corridor Transportation Project

Thank you for your letter (AIR-p99.0323) dated May 18, 1999, regarding the Environmental Impact Statement (EIS) Preparation Notice, Primary Corridor Transportation Project.

Your comments are appreciated and will be included in the Major Investment Study/Draft Environmental Impact Statement. Enclosed is a copy of your written comments, which has been numbered. The following response to your comment is provided:

1. The project is being planned to be consistent with other plans, including those of the Airports Division to improve traffic on Honolulu's airport access roads. Coordination with the Airports Division is ongoing. Section 5.1.3 discusses consistency with land use plans. Potential impacts to utilities are addressed in Section 5.12.10.

Should you have any questions regarding the project, please contact Kenneth Hamayasu at 527-6978.

Sincerely,

Cheryl D. Soon

Ms. Cheryl D. Soon, Director
Department of Transportation Services
City and County of Honolulu
711 Kapiolani Boulevard, Suite 1200
Honolulu, Hawaii 96813

Dear Ms. Soon:

Subject: Primary Corridor Transportation Project
Environmental Impact Statement (EIS) Preparation Notice

Thank you for consulting us. We have the following comments on the scope of alternatives and impacts to be considered:

1. The Draft EIS should identify "stand-alone" components of alternatives which could be implemented even if other components are not pursued.

2. There should be two Enhanced Bus/TSM Alternatives. One should only assume expanded use of City buses. The other should assume expanded use of chartered/subsidized private buses and ferries for peak period transit. Findings from our experimental ferry demonstration project may be applicable.

3. The Draft EIS should clarify proposed "local street bus priority measures" and address any potential for conflict with signal preemption by emergency vehicles.

4. The Draft EIS should clearly describe and justify proposed improvements/alterations within the existing State highway right-of-way in terms of benefits, costs, traffic impacts, operational requirements, and safety. The full range of environmental impacts, including cumulative, regional and secondary impacts, must be addressed.

5. The Draft EIS needs to describe how the proposed Sand Island Bypass and narrowing of Nimitz Highway will accommodate vehicular access and space requirements for future Kewalo Basin and Honolulu Harbor operations. So that you understand the importance of harbor operations, our Harbors Division has provided the enclosed Economic Impact Assessment of Hawaii's Harbors.

6. The Draft EIS needs to describe how proposed alternatives will preserve bicycle routes and bicycle safety.

7. The Draft EIS should state its assumptions about how travel time and fares affect peak- and off-peak transit use. As one test of these assumptions, the Draft EIS should report the former travel mode of passengers on the experimental limited-stop "City Express". The Draft EIS also should report effects of future fare changes on multi-stop, limited-stop, and express bus ridership.

8. The Draft EIS should assume the same transit fares when evaluating alternatives. Alternatives should be compared in terms of:

   - Peak and off-peak travel times of transit and private vehicles between screenlines;
   - loss of vehicular capacity on highways and arterial streets;
   - cumulative effects on the location and duration of traffic congestion;
   - cumulative effects on peak vehicular trips and peak person-trips across screenlines;
   - costs that will not be covered by transit fares or Federal Transit Administration grants;
   - transit use by low income and elderly households;
   - impacts on land use and demographics; and
   - impacts on our Honolulu International Airport and existing utilities.

9. Please consult with us when more details are available regarding proposed improvements within our highway right-of-way.

10. As a part of your M.I.S., a highway alternative should be discussed or considered.

11. In the future, it would expedite our review of your Draft EIS/MIS if you could send us at least 10 copies of the document.

Honolulu, Hawaii 96813-5097

Dear Mr. Hayashida:

Subject: Primary Corridor Transportation Project

Thank you for your letter (HWY-PS 2.4081) dated June 9, 1999, regarding the Environmental Impact Statement (EIS) Preparation Notice, Primary Corridor Transportation Project.

Your comments are appreciated and will be included in the Major Investment Study/Draft Environmental Impact Statement. Enclosed is a copy of your written comments, which have been numbered. The following responses to your comments are provided.

1. All alternatives are discussed in detail in Chapter 2. Each alternative is a network of projects with many of the discrete elements serving functions on their own. Benefits are increased as these individual elements are combined. Project components are not assessed individually and are not necessarily interchangeable.
2. All alternatives are discussed in detail in Chapter 2. Transportation Demand Management measures, such as those proposed, are incorporated in all alternatives. For example, all of the alternatives include a vanpool component (use of subsidized vehicles at peak hours).
3. Bus priority measures for the TSM Alternative are described in Section 2.2.2, and in Section 2.2.3 for the BRT Alternative.
4. Project alternatives are discussed in Chapter 2. Chapter 2 discusses how existing transportation right-of-ways (ROWs) are the most feasible for transit system enhancements because of high existing land use densities and limited space in the Primary Urban Center. Costs and adverse impacts are minimized when people-moving capacity can be enhanced within existing transportation ROWs.

5. The Sand Island analysis has been shifted to the Oahu Regional Transportation Plan. Potential vehicular traffic impacts are addressed in Section 4.2.
6. Project impacts on bicycle routes and safety are discussed in Section 4.5. Both SDOT and DTS have developed master plans to enhance the network of bicycle facilities and increase bicycling as a serious transportation mode for some travel markets. Improvement of bicycle facilities is included in only the BRT Alternative. However, bicycles alone cannot accommodate the existing and projected travel demand, and are not appropriate for all travel markets. The use of bicycles would be encouraged by the BRT Alternative, but circulator buses are necessary to reach the large service area and the different types of patrons that use the bus.
7. Financial plans are discussed in Chapter 6.
8. Project alternatives are defined in Chapter 2. Their transportation performance is compared in Chapter 4. Their financial aspects are compared in Chapter 6, including transit fare options. Their impacts on and benefits to low income communities, airports, and utilities are all discussed in Chapter 5.
9. Coordination with the Highways Division is ongoing.
10. All alternatives considered are discussed in Chapter 2. Section 2.1 discusses the evolution of alternatives. A highway alternative alone is not sufficient to satisfy project purposes and needs, and is addressed in Section 2.6. A highway alternative is inconsistent with the public's visions for the island's transportation system, as documented through the Oahu Trans 2K process.
11. Comment noted. The requested number of copies will be provided.

Should you have any questions regarding the project, please contact Kenneth Hamayasu at 527-6978.

Sincerely,

CHERYL D. SOON
Director

Dear Ms. Soon:

Subject: Primary Corridor Transportation Project

We have reviewed the subject report and offer the following comments for your consideration.

Engineering Branch:

1 We recommend that the proposed improvements located in the flood zone be designed in accordance with Section 7.10-4 Development Standards, Article 7 Special District Regulations of the City and County of Honolulu Land Use Ordinance, latest edition.

Oahu District Land Office:

2 If State lands are impacted, tenants should be involved in the planning process. Compensation should be considered, if applicable.

3 Our understanding is that the DLNR State Historic Preservation Division, State Parks Division and the Commission on Water Resource Management were contacted directly regarding the proposed project.

Thank you for the opportunity to review the subject document. If you have any questions or require further assistance, please contact staff planner Ed Henry at 5787-0380.

Very truly yours,

Dean Y. Uchida,

May 24, 1999

Ms. Cheryl D. Soon, Director
Department of Transportation Services
City and County of Honolulu
711 Kapiolani Boulevard, Suite 1200
Honolulu, Hawaii 96813

Dear Ms. Soon:

We have reviewed the April 21, 1999, Primary Corridor Transportation Project Environmental Impact Statement Preparation Notice (EISPN) and have the following comments. The primary transportation corridor extends from Kapolei in the Ewa District to the University of Hawaii at Manoa. The corridor alternatives are a No-Build Alternative, an Enhanced Bus/Transportation System Management (TSM) Alternative, a Bus Rapid Transit (BRT) Alternative and a Light Rail Transit (LRT) Alternative. General alignments and other options within each of the alternatives were briefly addressed in the EISPN.

1 2 The draft EIS should indicate how each alternative would meet ridership demand based on projected population and economic growth for the region relative to the cost of the alternative. The discussion should include ridership projections and identify the costs for a self-sustaining or subsidized bus and/or light rail system.

3 4 Multi-modal options that might be employed separately or in concert with proposed alternatives, such as increased bikeway infrastructure or a ferry system, are additional alternatives that should be discussed. For example, an exclusive bus or rail system could share the right of way with bicycles if the corridor is planned well. Similarly, the proposed Sand Island Bypass Road and the conversion of Nimitz Highway to a parkway could also incorporate a bike and/or ferry system.

5 Potential impacts to the waterfront and Kakaako Waterfront Park due to the proposed Sand Island Bypass Road should be discussed. Page 17 of the EISPN indicates that there are no extensive wetlands in the corridor. Enclosed is a wetland map of the entire corridor. Please note the extensive wetland in the vicinity of the proposed Sand Island Bypass Road.

6 Best management practices to control non-point source pollution should be discussed in the draft EIS. For more information, consult our Coastal Non-Point Pollution Control Program Management Plan.

Other issues which should be further discussed in the draft EIS include:

7 • Transportation system management (TSM) policies such as downtown parking rate strategies, reduction of parking downtown, peak time tolls and land use policies that could reduce traffic.
8 • The need for supportive facilities, such as park and ride facilities in residential areas, and
9 • The redevelopment potential for areas around transit stops.

If you have any questions, please contact Christina Meller at 587-2845.

Sincerely,

David W. Blane
Director

Honolulu, Hawaii 96804

Dear Mr. Blane:

Subject: Primary Corridor Transportation Project

Thank you for your letter dated May 24, 1999, regarding the Environmental Impact Statement (EIS) Preparation Notice, Primary Corridor Transportation Project.

Your comments are appreciated and will be included in the Major Investment Study/Draft Environmental Impact Statement. Enclosed is a copy of your written comments, which have been numbered. The following responses to your comments are provided.

1. The financial plan is described in Chapter 6.
2. The costs of the alternatives are provided in Section 2.3.
3. Project alternatives are discussed in Chapter 2. An increased focus on bicycles as a serious transportation mode for some travel markets is included in all of the alternatives. An intra-island ferry system is currently being demonstrated.
4. The Sand Island analysis has been shifted to the Oahu Regional Transportation Plan (ORTP). Moreover, bicycles in combination with ferries could not accommodate the existing or future travel demand.
5. The Sand Island analysis has been shifted to the ORTP.
6. Water resource issues are addressed in Section 5.8.
7. Transportation Demand Management (TDM) programs are included in the build alternatives, but are not expected to address projected increases in travel demand fully in the primary transportation corridor. The advantages of efficient transit would encourage people to use their cars less. The use of specific disincentive and education programs on alternative transportation is a policy decision to be made by the City Council.

8. The project alternatives, including the use of park-and-rides and other transit support facilities are discussed in Chapter 2.
9. One of the purposes of the BRT Alternative is to establish future nodes of redevelopment within the Primary Urban Center.

Should you have any questions regarding the project, please contact Kenneth Hamayasu at 527-6978.

Sincerely,

CHERYL D. SOON

EIS (99) 298

Re: Primary Corridor Transportation Project

Dear Ms. Soon:

Thank you for the opportunity to comment on the Notice of Intent to prepare and Environmental Impact Statement for the Primary Corridor Transportation Project. We would also like to thank Faith Miyamoto from your office for taking the time to review the project with us on May 21, 1999.

At our meeting, we discussed the possible routes and configurations of the system. Our main concern is for routes that will involve coastal or previously coastal areas. In those areas, the likelihood of finding burials, cultural or archaeological resources is much greater. When routes or configurations affect those areas we urge you to prepare detailed archaeological and cultural information and to address mitigation in a manner which will minimize the concerns of the native Hawaiian community.

1 In order to accomplish this task we suggest that:

- An archaeological survey of the project area must be completed.
- A determination of eligibility for the NHR register must be completed for cultural/archaeological sites found within the project area.
- Meaningful, pre-decision consultation with OHA, as required by the National Historic Preservation Law, must occur.

In addition, gathering and religious rights may exist within the project corridor in those areas which have not been previously used for transportation. It is essential that the existence of these rights be determined early. In order to accomplish this, we suggest that you work with

2 a Hawaiian cultural expert. We suggest that this person(s) should be recognized within the Hawaiian community for his/her cultural expertise. Hawaiian culture exists and is practiced every day in Hawaii. We caution that the concerns of the community will not be addressed if the cultural analysis is provided solely by an archeologist or anthropologist.

Again, thank you for the opportunity for early participation in this project. If you have any questions, please contact Lynn Lee, EIS Planner at 594-1936.

Sincerely,

C. Sebastian Aldet
Land and Natural Resources Division Officer

Ms. Cheryl D. Soon, Director
Department of Transportation Services
City and County of Honolulu
711 Kapiolani Boulevard, Suite 1200
Honolulu, Hawaii 96813

Dear Ms. Soon:

Primary Corridor Transportation Project

We have reviewed the Environmental Assessment (EIS Preparation Notice) for the above-mentioned project and offer the following comments.

1. The 2020 Oahu Regional Transportation Plan (2020 ORTP) identified a rapid transit system which extended from Pearl City to the University of Hawaii at Manoa. Although the plan did not specify or recommend a type of system, it assumed attributes of the Honolulu Rapid Transit Program's Locally Preferred Alternative rail rapid transit system. This system assumed that the rapid transit operated on exclusive right-of-way and was of a high-capacity.

   The Primary Corridor Transportation Project identified three Light Rail Transit (LRT) alternatives along a similar corridor with the 2020 ORTP, but with limited sections of exclusive bus lanes. 1

   How do these LRT alternatives compare against the person-carrying capacity of the rapid transit system identified in the 2020 ORTP? Will other transit and/or highway projects be needed if the person-carrying capacity of the proposed LRT alternatives identified in the Primary Corridor Study is less than what the rapid transit project assumed in the 2020 ORTP?

2. In Section 1.4.4 Land Use Development in the Central Urban Core, it mentioned that one of the major objectives of the 21st Century Oahu Vision was to concentrate new development within the established urban core of Honolulu. 2 Is this an official City land use policy? If not, will the official City land use policy also be tested in the Primary Corridor Transportation Project?

3. The Primary Corridor Transportation Project identified many major roadway projects such as a Sand Island Bypass Road via a tunnel under Fort Armstrong Channel, a Nimitz Parkway, the closing of Nimitz Highway between Queen Street and South Street, redesigned freeway ramps, and improvements to H-1 to allow for the p.m. operation of the Zipper Lane.

   Many of the related highway projects being proposed in the Primary Corridor Transportation Project must be prioritized within the context of the ORTP. Although these projects may be important to the Primary Corridor Transportation Project, there may not be sufficient funds to implement these projects or there may be other higher priority projects on Oahu that deserve the limited funding resources. These priority decisions must be made in the larger context of the ORTP where all regional Oahu transportation projects are considered. 3

4. In Section 1.4.2 Socioeconomic Growth, the report talked about the projected population increase in 2020. Will the Primary Corridor Transportation Project use 2020 as its horizon year?

   OMPO is in the process of updating its 2020 ORTP to 2025 and is expecting to complete this plan in November 2000. DTS and the OMPO Policy Committee should discuss the requirements and analysis needed to ensure the smooth integration of the Primary Corridor Study results into the 2025 ORTP. The horizon year used may be just one of the many issues related to this concern. 4

Thank you for the opportunity to comment on your document. If you have any questions regarding this matter, please call me.

Sincerely,

Gordon G.W. Lum
Executive Director

Dear Mr. Lum:

Subject: Primary Corridor Transportation Project

Thank you for your letter dated May 24, 1999, regarding the Environmental Impact Statement (EIS) Preparation Notice, Primary Corridor Transportation Project.

Your comments are appreciated and will be included in the Major Investment Study/Draft Environmental Impact Statement. Enclosed is a copy of your written comments, which have been numbered. The following responses to your comments are provided.

1. The proposed project is consistent with the Oahu Regional Transportation Plan (ORTP). As presently designed, the Bus Rapid Transit system proposed in this transit project would have less capacity than that designed in the early 90's.
2. It is City policy to focus growth in the Primary Urban Center and in Kapolei, thereby keeping the country country.
3. This project is one of the named high-priority projects in the ORTP.
4. The project's horizon year is 2025.

Should you have any questions regarding the project, please contact Kenneth Hamayasu at 527-6978.

Sincerely,

Cheryl D. Soon

Re: Environmental Impact Statement Preparation Notice (EISPN) for Primary Corridor Transportation Project

Dear Ms. Soon: Cheryl

After reviewing the EISPN, we offer the following comments and questions on the proposed study alternatives for your consideration:

1. **Sec. 2.2 Enhanced Bus/TSM Alternative** - According to Fig.2.2, this alternative proposes to include four (4) new park-and-rides, five (5) new transit centers, and two (2) special freeway ramps, in addition to bus priority treatments on various arterial streets from Kapolei to Waikiki. Surprisingly, major segments of a previously-indicated bus priority arterial (Kamehameha Highway from Wahiawa to Radford Dr.) are not indicated, such as 1) the portion from Wahiawa to its connection with Farrington Highway and on to what appears to be Kamehameha Highway at Waimano Home Road, and 2) from Pearlridge to Radford Dr. Hopefully, this was just an oversight. If not, what is the reason for the change? Since Kamehameha and Farrington Highways are the trunk line routes for buses serving West/ Central Oahu, bus priority treatments on these highways will be vital to improving the delivery of transit services and increasing ridership. (1)

2. **Sec. 2.3 Bus Rapid Transit (BRT) Alternative** - A faster, more efficient bus service linkage between West Oahu and the PUC will be the key to making the use of transit an attractive and convenient alternative to driving and improving the accessibility to jobs in either direction. Therefore, the study of a bus rapid transit system should be as comprehensive and extensive as possible, in order to provide the community with a clear understanding of estimated costs and benefits of proposed BRT alignments. (2)

   Based on Fig. 2.3, however, it is not clear what the BRT alternative is, because it seems to involve a variety of proposals and only identifies one BRT alignment (Middle St. to the University of Hawaii). For the area between Kapolei and Middle Street, it only differs from the Enhanced Bus alternative by the addition of a transit center at the Waiawa Interchange and seven (7) special freeway ramps. Then, in addition to the Middle St.-U.H. arterial BRT, there is a light rail route to Waikiki, a Nimitz Parkway, and a Sand Island Bypass. What is interesting is that while this alternative contains an LRT route for Waikiki, none of the LRT alternatives propose LRT for Waikiki. (3)

94-229 Waipahu Depot Road, #407 • Waipahu, Hawaii 96797
Telephone Number (808) 677-RIDE • Facsimile Number (808) 676-4741

   The emphasis of this alternative seems to concentrate only on bus services during peak commute periods into and out of the PUC, relying on H-1 and H-2 HOV lanes and A.M./P.M. zipper lanes. The only identified "BRT" route on the map is from Middle Street to the U.H.

   We would like to suggest that this alternative study a defined BRT route that replicates the Light Rail Alternative #1, extending the U.H.-Middle Street BRT westward to several termini, such as Pearlridge, Waiawa Interchange, Kunia/Ft. Weaver transit centers, and Kapolei? By doing so, a BRT alignment would be in place for later conversion to LRT, in the event it is not financially feasible to initially extend any LRT beyond Middle Street. Since LOTMA and many Leeward/Central Oahu communities have advocated the extension of an LRT alternative beyond Pearlridge, a defined BRT route would serve as a well-thought out intermediate alternative that will be useful in serving major activity and employment centers west of the PUC, including U.H.-West Oahu, Barbers Point Redevelopment, and the water park and sports complexes in Kapolei. It would also provide an effective means to serve the reverse commute market, which at this time must rely heavily on the automobile to get to Kapolei. (4)

   Because the Nimitz Parkway and Sand Island Bypass involves major capital improvements within the state's jurisdiction, we believe that these options should not be studied at this time. Time and resources could be more effectively spent on thoroughly developing the BRT and LRT alternatives. (5)

3. **Light Rail Transit (LRT) Alternatives** - Since none of the LRT alternatives are proposed past Pearlridge, it is unclear why the special freeway ramps and Waiawa Transit Center (as proposed in the BRT alternative) are not included in this alternative. (6)

4. During the conceptual engineering phase, will it be possible to mix and match portions of the BRT and LRT alternatives? (7)

Thank you for the opportunity to offer these comments. We look forward to the opportunity to review the Draft EIS.

Sincerely,

Darrlyn T. Bunda

Leeward Oahu Transportation Management Association
94-229 Waipahu Depot Road, #407
Waipahu, Hawaii 96797

Dear Ms. Bunda:

Subject: Primary Corridor Transportation Project

Thank you for your letter dated May 24, 1999, regarding the Environmental Impact Statement (EIS) Preparation Notice, Primary Corridor Transportation Project.

Your comments are appreciated and will be included in the Major Investment Study/Draft Environmental Impact Statement. Enclosed is a copy of your written comments, which have been numbered. The following responses to your comments are provided:

1. These measures are included in the No-Build Alternative and, therefore, all of the alternatives.
2. A cost-benefit analysis is provided in Chapter 7.
3. Project alternatives are discussed in Chapter 2. All alternatives under consideration include service to Waikiki.
4. Sections 4.1 and 4.2 address transportation impacts of the project. The proposed alternatives would improve transportation in both directions. All of the alternatives include provisions for enhancing mobility within the Ewa area through increasing roadway connectivity and capacity, and enhanced transit service. The Transportation System Management (TSM) and Bus Rapid Transit (BRT) Alternatives increase transit accessibility within and to Kapolei/Ewa, through the use of a "hub-and-spoke" bus network configuration. These alternatives support the development of Kapolei as both a residential and employment center. The TSM and BRT Alternatives would both improve transit service along the Waianae coast. Travel demand forecasting indicates that there will still be substantial travel between the Primary Urban Center (PUC) and other parts of the island, and within the PUC.

5. The Sand Island analysis has been shifted to the Oahu Regional Transportation Plan.
6. Project alternatives are described in detail in Chapter 2. The BRT Alternative, which has since replaced the Light Rail Transit Alternatives, does include bus ramps.
7. Project alternatives are discussed in detail in Chapter 2. Each alternative is analyzed as a package; project components are not assessed individually and are not necessarily interchangeable.

Should you have any questions regarding the project, please contact Kenneth Hamayasu at 527-6978.

Sincerely,

CHERYL D. SOON
Director

RE: Primary Corridor Transportation Project

Dear Ms. Soon:

Thank you for the opportunity to comment on the above referenced Environmental Impact Statement Preparation Notice (EISPN). We have reviewed the document and offer the following comments at this time:

The proposed action is intended to address existing and future transportation demand and capacity needs; support socioeconomic growth on the island and in the corridor; improve public transit services; facilitate land use development in the central urban core consistent with the vision for Oahu as being articulated at community meetings; and support current planning activities and policies.

1 We do not understand why the City is using the Visioning Program as justification and background for this transportation study. The community based visioning teams met separately from the Oahu Trans 2K meetings. Instead, thorough studies should be provided showing the need for this plan.

2 We hope that when the public hearing is held on the Draft Environmental Impact Statement (DEIS), it will be truly a public forum. The format at the public scoping meeting did not create an opportunity for the community to publicly ask questions and voice their concerns. By blocking communication, an atmosphere of secrecy prevails. It is important for participants and interested community members to hear what others are asking about the project.

3 We are interested in knowing when the Locally Preferred Alternative (LPA) will be announced to the public. What happens if the LPA is not the best alternative based on preliminary engineering? When will the public be notified and what changes will be made to accommodate this?

4 The Primary Urban Center is the origination point for close to 59% of all island wide travel, why does this project study begin in Kapolei and end at the University of Hawaii? Why doesn't this study continue to Kahala?

5 The DEIS must discuss in detail the fate of the street trees along the transit corridor. Also, if a
6 light rail system with overhead lines is proposed, what kinds of impacts would it make on street trees as well as community efforts to place all above ground wires underground?

Thank you for the opportunity to comment. I look forward to receiving a copy of the Draft Environmental Impact Statement and being kept informed as this project progresses.

Sincerely,

Mary Steiner
CEO

Dear Ms. Steiner:

Subject: Primary Corridor Transportation Project

Thank you for your letter dated May 18, 1999, regarding the Environmental Impact Statement (EIS) Preparation Notice, Primary Corridor Transportation Project.

Your comments are appreciated and will be included in the Major Investment Study/Draft Environmental Impact Statement. Enclosed is a copy of your written comments, which have been numbered. The following responses to your comments are provided.

1. The project's purposes and needs are discussed in Chapter 1. The planning for this project has been coordinated with the visioning process because transportation plans address other quality of life issues, included in the visioning process.
2. Appendix A summarizes the efforts that have been made to provide opportunities for public participation. Comments from the public are welcome at any point.
3. It is expected that the City Council will select the Locally Preferred Alternative in late 2000. The City Council will weigh a variety of factors, including engineering, into its decision.
4. The imbalance between travel demand and system capacity is worse in the corridors Ewa of Downtown. While needed, improvements beyond Waikiki and UH-Manoa are lower priority. A circulator service has just begun between Waikiki and Kaimuki, which may help relieve some of the demand.
5. Potential impacts on street trees are addressed in Section 5.7. None of the proposed alternatives will require a catenary system.

6. No overhead lines would be required under any of the alternatives. Efforts to underground wires and other utilities are addressed in Section 5.12.10.

Should you have any questions regarding the project, please contact Kenneth Hamayasu at 527-6978.

Sincerely,

CHERYL D. SOON
Director

RE: Comments on Primary Corridor Transportation Project, Environmental Assessment (Environmental Impact Statement Preparation Notice); Scoping Activity

Dear Mr. Hamayasu,

I am writing to you on behalf of the Hawai'i Bicycling League (HBL). A letter in official stationary will follow in the mail. This letter addresses our concerns with regard to the document entitled, ": Comments on Primary Corridor Transportation Project, Environmental Assessment" (April 1999) connected to the scoping activity held in May 1999.

Access to the report , public input and planning process (for scoping)

1
- Is the report accessible to the public and particularly people with disabilities?
- Was the report available on the Internet in a text file format? People with disabilities were not noticeably participating in the O'ahu Trans 2K events. Lack of transportation alternatives is probably the number one reason why persons with disabilities cannot participate in community affairs. Was there electronic access to

2 document and opportunities to provide feedback by May 24, 1999? There was no fax number available on the report to fax back comments – only an address.

- The report was produced in less than a 12 point font. Production of reports in at least a 12 point font makes it easier and slightly more accessible to an aging population. The maps were also difficult to read due to the very small print.
- There was only one meeting of which HBL was aware for public participation. Will there be any future meetings regarding scoping? The time was relatively limited for

3 feedback – if HBL could request a slight extension of the feedback period (i.e., about two weeks beyond the May 24th deadline), there would be an opportunity to make members aware of this document and encourage our members to provide additional feedback.

- Are there any plans to include other scoping meetings available to other parts of the

4 island not in the primary corridor? Persons living in outlying areas may not have been able to attend the meeting.

- The description of events that will coordinate federal and state requirements for

3 movement on this plan (p. 4) was quite useful. It would be very helpful to have the report provide a estimated timeline for the various activities: the scoping activities, the Draft EIS and public hearing (or hearings??), the LPA (locally preferred alternative) will be determined and engineering will be performed during the final EIS. After this, the Governor may accept the final EIS and at the federal level a ROD (record of decision) will be prepared and signed by the Regional Administrator which details the LPA and any environmental mitigation commitments. The purpose of the scoping activity is still unclear.

Assumptions inherent in the planning

- All the plans still seem to focus on roads and cars in competition with buses on roads as opposed to planning options that would mindfully increase pedestrian and

5 bicycling options. Any plans or mention of pedestrian, bicycling or access for persons with disabilities is glossed over.

- There are assumptions about the increase in population over time (p. 28) and the increase in the number of employees by 37%. There is an assumption or calculation that the speed of buses will be decreased while the number of buses on the road will increase from 525 to 800. There is no discussion about the number of cars increasing (which has been the trend) or that if the buses are slowing down, the cars will

6 probably travel more slowly too.

- There is no discussion of the number of cars on the road, the number of persons per car on the road, or the speeds of cars using the road. Implicitly it appears that the number of car miles will be reduced – but there fails to be evidence of this from the information provided.
- Without better information on the decrease in miles traveled overall, there is some question about the air quality maintenance. Anyone who has bicycled or walked near

7 our streets on a Kona wind or no wind day can tell you that the air is substantially dirtier and less hospital to those not driving around in an air conditioned unit (e.g., cars).

5
- There is no detail regarding pedestrian or bicycling access considerations.
- There is no discussion of an education process for the public about transportation

8 alternatives and options during the planning, engineering, development and implementation process.

- The idea of concentrating growth density along this primary corridor may tend to

9 make parts of the main streets or hubs for transit undiveable for all but the poorest in our communities who cannot afford to live elsewhere.

Attributes in planning that we prefer

- We would prefer, in order to make our communities liveable, to plan with the following priorities as objectives of any plan:

5
  - Pedestrian traffic is first priority
  - Alternative methods of transportation is second priority (buses, bikes, mass transit of other types), and finally,
  - Put the private automobile in third place priority.

AR00016226

This was presented in the vision-like process that was promoted during Mayor Harris's meetings. There was a video which described the traffic planning in Portland, Oregon and this was the premise of the planning there.

- Discuss in detail what facilities would make the streets less "mean" and more friendly to pedestrians, bicyclists and persons with disabilities. Consider:
  - Triggers or sensors on the streets that can be triggered by something as "light" as a bicycle (so we don't need to get off our bikes and push a button or ride up on the sidewalk to push the buttons to get the light to change).
  - Reduce and eliminate the triggers on street lamps for pedestrians to press in order to cross the streets. Many or most of these buttons are broken after a period of time and either are permanently pressed in or don't function when pressed so that the pedestrian can cross the street at all. These triggers effectively convey to pedestrians that they are second class citizens because automobile traffic is always given first priority.
  - Discuss disincentives that will cause people to leave their cars at home or not buy them in the first place. Many countries use disincentives effectively without major complaints from citizens. Many citizens suffer in countries were intelligent use of disincentives are not employed and the car remains king (i.e., Bangkok, Thailand). Disincentives are a legitimate policy alternatives and should go hand-in-hand with public education about broadly defined transportation system costs.
  - Assure that transit centers, park & ride facilities and all transportation projects include services to pedestrians, bicyclists and persons with disabilities.
  - Assure that all new transit equipment is accessible.
    - Bike racks should be available or bikes should be able to be brought aboard a light rail, trolleys, ilmited stop buses and ferries.
    - Do not move to the longer "unfriendly" buses – try double decker buses with the first floor accessible to persons with mobility challenges.
    - Promote bicycles as "circulators."
  - Assure that the Master Bike Plan that was developed previously and other information such as the City and County curb cut plan are available and participants are aware of these documents and their implications. (Help citizens connect the dots between these planning efforts.)
  - Assure that if a tunnel is part of the light rail system mentioned on page 13, that there is access to persons walking or bicycling through the tunnel that is clean of debris and sufficiently wide to move along in safe distance from the traffic.
  - Assure that new or redeveloped freeways and freeway ramps improve and do not impinge on pedestrian and bicycling facilities. These are opportunities to make facilities MORE accessible to pedestrians and bicyclists and should be developed or redeveloped with that in mind.
  - Provide education about transportation alternatives and their costs. Most costs for pedestrian walkways and bicyclists are not necessarily capital intensive. Education for the public certainly is not. These costs should be put in a form that people can see the immediate and longer term maintenance costs for building parking lots and structures compared to facilities that improve mobility and assure safety for pedestrians and bicyclists.

- Do NOT create substitute or alternative freeway routes out of residential, business, commercial or mixed use streets (see 2.3). Current examples of this type of planning are Wai'alae Avenue, Kina'u Street, and Ward Avenue, to mention but a few.
- Water resource use is a concern. There should be a commitment made to use plants that are indigent to the area and reduce the need for further water consumption by choosing plants are salt water or brackish water tolerant and drought resistant (i.e., use of xeroscaping alternatives along the waterfront, along streets, etc. for beautification). Plans to use recycled and "gray" water to provide water for these spots would also be forward thinking.
- We strongly support that there is no reduction of green spaces for high density residential areas. During the vision-like process it was very clear that residents from neighborhoods such as Makiki and Moiliili suffer a decreased quality of life with very few green spaces available to densely populated areas.
- Social and economic impacts on people living in the most densely populated should be examined with respect to the amount of road dust and increases in heat and the need for air conditioning. Who are the people (i.e., demographics of the population, age, ethnicity, the number of people in a family unit and space) who are suffering these environmental impacts?

Other problems with this discussion of transportation

- The boundaries used in various reports are not consistent for planning purposes and in the planning documents. This is confusing for the lay person, even one who attempts to follow along and attend the many meetings related to various plans. This plan discusses the primary urban corridor. How does that relate to the bicycling plans taking place all over the island of O'ahu? How does that relate to the Master Bike Plan for O'ahu? In the longer run (say 20 years'time), wouldn't the primary corridor run from Hawai'i Kai to Kapolei? Making the boundaries consistent in these planning efforts:
  - Reduces confusion for citizens who want to be involved.
  - Decreases inconsistencies in planning efforts and trying to incorporate different planning efforts (i.e., achieving both the results of the Master Bike Plan and the visioning team efforts).
  - Could result in making the process of planning and the technologies used in the process more "transparent" (easily understood, mentally graspable) to the lay person.
- The planning process needs to be transparent. Citizens should be able to understand the need for coordination among neighborhoods, see evidence of coordination among state/county/other local agencies in the time lines, budgeting process, plan development and engineering, and implementation processes.
- In an effort to make planning transparent, there could be one page documents to be faxed on demand or available via a regularly updated accessible website.
- Provide funds for studies to determine what works and what doesn't work to promote cycling and walking locally as substitutes for personal cars.

AR00016227

17 • Focus on the need to make connections with advocacy groups for pedestrians and bicycling. There are few groups and the transportation departments should make an effort to acknowledge the importance of these groups and their activities.

Thank you for this opportunity to provide comments.

Honolulu, Hawaii 96822

Dear Ms. Brandt:

Subject: Primary Corridor Transportation Project

Thank you for your letter dated May 24, 1999, regarding the Environmental Impact Statement (EIS) Preparation Notice, Primary Corridor Transportation Project.

Your comments are appreciated and will be included in the Major Investment Study/Draft Environmental Impact Statement. Enclosed is a copy of your written comments, which have been numbered. The following responses to your comments are provided:

1. Appendix A summarizes the efforts that have been made to provide opportunities for public participation. Comments on the Major Investment Study/Draft Environmental Impact Statement will be welcomed during the public comment period.
2. The method of disseminating the Major Investment Study/Draft Environmental Impact Statement is still under study. Large fonts were not used to comply with the Major Investment Study/Draft Environmental Impact Statement page limits. Please contact the department if you have difficulty reading the document.
3. The project schedule is provided in Section 2.5. The purpose of the scoping activity is to help focus the Major Investment Study/Draft Environmental Impact Statement on the important issues.
4. Appendix A summarizes the efforts that have been made to provide opportunities for public participation. Oahu Trans 2K meetings were held all around the island, not just in the PUC.
5. Chapter 1 discusses the project's purpose and need, one of which is to make the PUC much roore pedestrian friendly. Investment in transit systems promnte the pedestrian mode as a viable mode of travel. However, pedestrian travel alone cannot accommodate regional travel demands. Chapter 4 discusses transportation issues. DTS and SDOT will continue to promote alternative transportation (e.g. SDOT will continue to promote the zipper lane and the Vanpool program, and DTS will continue to promote its limited stop transit services, City Express! and Country Express!). By using existing street capacity as a dedicated transitway, the BRT Alternative would create incentives for the increased use of multiple-occupant vehicles along the alignment of the In-Town BRT. Both SDOT and DTS have developed master plans to enhance the network of bicycle facilities and increase bicycling as a serious transportation mode for some travel markets. Improvement of bicycle facilities is included in the BRT Alternative. All transit facilities would be equipped for disabled access. Pedestrians and bikes are very much a part of the TSM and BRT Alternatives, but they alone cannot satisfy all of the travel markets that must be accommodated. The transit systems contained in all of the alternatives must be compatible with the Americans with Disabilities Act (ADA) requirements. DTS will continue to support programs to foster alternative transportation, such as the hub-and-spoke bus system and traffic calming, and Vanpool. Transportation Demand Management (TDM) programs are included in the alternatives, but are not expected to address projected increases in travel demand fully in the primary transportation corridor. The advantages of efficient transit would encourage people to use their cars less. The use of specific disincentives and education programs on alternative transportation is a policy decision to be made by the City Council.
6. Extensive traffic modeling was done as part of the planning process. See Chapter 4 for details.
7. Section 5.5 discusses potential air quality impacts, based on projected traffic information.
8. See Appendix A.
9. Environmental jnstice issues are addressed in Section 5.3.5.
10. Such plans are available with DTS and/or at major state libraries.
11. The highway alternative was considered and rejected, as discussed in Section 2.6.
12. Natural resource issues are addressed in Sections 5.7 and 5.8.
13. Land use issues are discussed in Sections 3.1 and 5.1. Neighborhood impacts and environmental justice are addressed in Section 5.3.
14. The discussion on bicycle plans is in Section 4.5. The primary transportation corridor is defined where most traffic occurs. Congestion problems Koko Head of Kahala are much less severe.
15. Appendix A describes the coordination and outreach efforts involving agencies and the public. A project schedule is provided in Section 2.5; the financial plan is in Chapter 6.

16. Other programs within DTS are focusing on promoting bicycle and pedestrian improvements. However, bicycle and pedestrian modes cannot satisfy all travel markets, so other solutions need to be explored.
17. See Appendix A.

Should you have any questions regarding the project, please contact Kenneth Hamayasu at 527-6978.

Sincerely,

CHERYL D. SOON
Director

re: Environmental Impact Statement Preparation Notice for the Primary Corridor Transportation Project

Aloha Kenneth Hamayasu and Robert Bramen,

Life of the Land is Hawai`i's own environmental and community action group serving Hawai`i since 1970. Our mission is to preserve and protect the life of the land, to promote sustainable land use and energy policies and open government through research, education, advocacy and litigation.

The following comments constitutes our position on the EIS preparation notice for the proposed project. We have included Enhanced Bus System & Commuter-Based Dedicated Bicycle Lane System Alternatives which are based on minimizing environmental impacts. They are practical, reasonable, and feasible and makes common sense. The alternatives conforms with alternatives that must be evaluated under both the National Environmental Policy Act (NEPA) and the Major Investment Study process.

Table of Contents

Chapter 1: Summary

Environmental Review Process: Status; Approving Agency/Accepting Authority; Consultant; Public Comment Deadline; Permits Required; Description)

Overview of the Transportation Planning Process: Oahu Metropolitan Planning Organization; Overall Work Program; Oahu Regional Transportation Plan; Transportation Equity Act for the 21st Century; Transportation Improvement Program)

Chapter 3 Scoping: The National Environmental Policy Act (NEPA); The Major Investment Study (MIS); Hawai`i Revised Statutes (HRS 343); Hawai`i Administrative Rules (HAR 11-200); Cultural Impact Guidelines; Federal Highway Administration (FHWA)/ Federal Transportation Administration (FTA)

Chapter 4 Experiences of Other Communities

Chapter 5 Alternatives: A Super Enhanced Bus System Management (TSM) Alternative; A Commuter-Based Dedicated Bicycle Lane System Alternative; Light Rail Transit (LRT) Alternative.

Chapter 6 Assumptions & Models Common to all Alternatives: Road Network Assumptions; Travel Demand Management Assumptions; Population Growth Assumptions; Models: Outcome Success vs. Failure; Sensitivity Analysis of the Model

Chapter 7 Environmental Consequences: Unusual Impacts; Cumulative and Secondary Impacts; Air Quality Impacts; Water Resources Impacts; Transportation Impacts; Community Impacts

Chapter 8 Questions: Cumulative and Secondary Impacts; Social and Economic; Air Quality; Noise; Water Resources; Aesthetic; Transportation; Scoping; Transportation Model; Community; Population; Energy; Funding; Sustainability

Chapter 1: Summary

1.1 The Environmental Review Process

Status: Environmental Impact Statement Preparation Notice (EIS PN) First Notice pending public comment. Numerous meetings (50+) created numerous ideas (2000+) which led the consultant to publish a 44 page document called "Islandwide Mobility Concept Plan". The consultant also wrote 7 pages of text for the Environmental Impact Statement Preparation Notice.

Approving Agency/Accepting Authority: Governor, State of Hawaii * c/o OEQC * 235 S Beretania St. #702 * Honolulu, HI 96813 & US DOT * Federal Transportation Administration.

Consultant: Robert Bramen @ Parsons Brinkerhoff Quade & Douglas * 1001 Bishop Street, Suite 3000 * Honolulu, HI 96813

Public Comment Deadline: May 24, 1999

Permits Required: Sec. 404, 10, 142(e) (sole source aquifer), SCAD, State Historic Preservation Division (SHPD) Review, Coastal Zone Management (CZM) Consistency, National Pollution Discharge Elimination System (NPDES), Water Quality Criteria (WQC), Shoreline Management Area (SMA) Permit, Special Design District, Floodplain Variance, Building Permit, Grubbing Permit, Grading Permit

Description: The City and County of Honolulu Department of Transportation Services (DTS), in cooperation with the U.S. Department of Transportation, Federal Transportation Administration (FTA), will be preparing an

AR00016231

Environmental Impact Statement (EIS) for proposed transit improvements in the primary corridor of Oahu. The corridor extends from Kapolei in the Ewa District to the University of Hawaii at Manoa. Because the project may have substantial impacts, DTS is required by both State and Federal law (Chapter 343 of the Hawaii Revised Statutes and the National Environmental Policy Act) to prepare an Environmental Impact. The EIS will satisfy both State and federal requirements. A public scoping meeting will be held to allow for comment on the project, its impacts, and the technical evaluation.

The project is intended to address transportation requirements; improve public transit services; direct future land use development patterns; and implement existing transportation plans.

1 The alternatives must be considered include a No-Build Alternative, an Enhanced Bus / Transportation System Management (TSM) Alternative, a Super Enhanced Bus / Transportation System Management (TSM) Alternative, a Dedicated Bicycle Lane Alternative, a Bus Rapid Transit (BRT) Alternative, and a Light Rail Transit (LRT) Alternative. Variations on the alternatives are also being addressed, including a Sand Island Bypass Road and Nimitz Parkway.

Over ten detailed technical reports will be prepared on such topics as transportation, land use, social and economic impacts, finance and cost-effectiveness, visual and aesthetic impacts, noise and vibration, park and recreation areas, historic resources, air quality, and hazardous materials. The results of the detailed analysis will be summarized in the Draft EIS.

1.2 An Overview of the Transportation Planning Process

Oahu Metropolitan Planning Organization (OMPO)

The Oahu Metropolitan Planning Organization Policy Committee is the "heart" of the Oahu Metropolitan Planning Organization planning process. It determines the direction of the Oahu Metropolitan Planning Organization effort, considers and approves transportation planning issues, and makes the final approval for Oahu Metropolitan Planning Organization matters. The Policy Committee is made up of 13 members. Five members are from the including the chair of the Council's transportation committee. Three members are State senators, including the chair of the Senate's transportation committee. Three members are State representatives, including the chair of the House's transportation committee. One member is the Director of the State Department of Transportation (DOT) and one member is the Director of the City Department of Transportation Services (DTS). Although not a member of the Policy Committee, the Citizen Advisory Committee Chair has been invited to attend and take part in discussions at Policy Committee meetings.

The Oahu Metropolitan Planning Organization Technical Advisory Committee (OMPO TAC) provides the technical input to OMPO's planning process. The Technical Advisory Committee acts as the technical liaison between the Policy Committee and the OMPO Executive Director, provides advice to the Policy Committee and the OMPO Executive Director on technical matters, and insures the technical competence of the planning process. The Technical Advisory Committee has direct responsibility for land use, transportation-related planning, and transit management. The Technical Advisory Committee members include four directors of the City and the State planning and transportation departments. In addition, representatives of the Federal Highway Administration and Federal Aviation Administration attend TAC meetings as non-voting members.

Oahu Metropolitan Planning Organization Citizen Advisory Committee (OMPO CAC):

the Citizen Advisory Committee assists in developing public involvement programs to solicit general public input for the Policy Committee. Comments received from the Citizen Advisory Committee members and non-members are treated equally. The Citizen Advisory Committee meets about once a month. These meetings are open to the public and provide an opportunity for interested parties to hear and discuss transportation issues with the appropriate project administrators or decision-makers. The Citizen Advisory Committee members are organizations and groups interested in transportation planning on Oahu, representative of a broad range of interests. Citizen Advisory Committee members are appointed by the Policy Committee.

The OMPO Overall Work Program (OWP) serves as the key management tool for monitoring State and City transportation activities on Oahu. It describes transportation-related planning studies to be conducted in a given year. The Overall Work Program defines project objectives and tasks and identifies budgetary and staff requirements needed to carry out the projects. In addressing current transportation issues and problems, the Overall Work Program responds to local planning requirements, federal transportation priorities, and Transportation Equity Act for the 21st Century requirements. The Overall Work Program also includes land use studies as they relate to transportation needs. A draft Overall Work Program is prepared each winter and submitted for review in March. After considerable review and revision by citizens and Federal and local agencies, a final Overall Work Program is adopted in late spring for the next fiscal year.

The Oahu Regional Transportation Plan (ORTP) is a blueprint for identifying the development of future transportation improvements on Oahu. It should be noted, however, that the inclusion of a project into this plan does not guarantee its construction. Rather, it allows a project to begin a series of more detailed evaluations and to be eligible for federal funding. During these more detailed evaluations, a project could be postponed or terminated for any number of reasons, such as environmental impact, cost, or lack of public support.

Under the new Transportation Equity Act for the 21st Century (TEA 21), an area's regional transportation plan must have a minimum twenty year horizon, be fiscally-constrained, and be updated at least every five years. In order to conform to this requirement, the Oahu Metropolitan Planning Organization endorsed a year 2020 regional transportation plan in November 1995. This plan was forwarded to the State Department of Transportation and incorporated, intact, into the Statewide Transportation Plan.

The Transportation Improvement Program (TIP) is a programming document that lists transportation projects that will be undertaken by the State and City and funded in part by federal money. Projects identified in the TIP must not be inconsistent with the Oahu Regional Transportation Plan (ORTP).

The Transportation Improvement Program is closely related to the State's and City/County's Capital Improvement Programs and is prepared every other year in the spring. The Transportation Improvement Program identifies funding amounts by source of funding, jurisdictional responsibility, type of project, and year of funding for these projects. Thus, the Transportation Improvement Program is an important reference document of transportation projects.

The Oahu Transportation Improvement Program is the short-term three-year implementation program for federally-assisted surface transportation projects that support the Oahu Regional Transportation Plan. The Transportation Improvement Program describes and prioritizes federally-assisted and major locally-funded transportation programs and projects selected by the Oahu Metropolitan Planning Organization Policy Committee for implementation during the program period. An annual review and a major biennial update of the Transportation Improvement Program are scheduled, with off-schedule amendments considered as needed. The Transportation Improvement Program is adopted by the Oahu Metropolitan Planning Organization Policy Committee and sent to the Governor for approval. Upon his approval, the Transportation Improvement Program is incorporated as the Oahu element of the Statewide Transportation Improvement Program (STIP). The Statewide Transportation Improvement Program is the official document the U.S. Department of Transportation uses to authorize federal

AR00016232

funds for projects in Hawaii. * A Community-Based Transportation Visioning Process Managed by the City and County of Honolulu and the Hawaii Department of Transportation. Contact with questions or problems. Parsons Brinckerhoff 1998

Chapter 2 History

2.1 Jeremy Harris. State of the City Address. January 26, 1999

"Four months ago, as part of my vision we also laid out a conceptual plan for transportation improvements for the 21st century. That plan included improved bus service to Windward, Central, North Shore and Leeward to give better, quicker access to downtown Honolulu. It also included a light rail electric trolley system in the primary urban corridor from Pearl City to the University. It would provide mobility for our growing downtown population and it would be supplemented with parking lots just outside of town, circulator buses within the urban area, and water taxis across the waterfront. That was my vision ...

In the area of transportation a second alternative emerged. That alternative is a bus-rapid transit system that uses dedicated zipper lanes, circulator buses, and express buses in a network that could carry almost as many people as a more costly fixed rail system. Under this proposal, communities around the island from Waianae to Mililani would be served with circulator buses that would move around within their area - taking people to shops, schools and parks. These would connect, at several stops in each community, to bus-rapid transit stations.

Under the plan, the existing Zipper Lane would be reserved solely for bus-rapid transit and would be expanded to include an entry- and exit-way at Pearl City to connect with circulator buses in those surrounding communities.

The Zipper lane would be extended all the way to Nimitz Highway, and it would be made two-directional - carrying people into town in the morning, out of town at night. Using Zipper Lanes as exclusive bus rapid-transit lanes carrying new articulated buses at 90-second intervals, would give us almost the same carrying capacity as a rail system - without the high costs.

Express buses would travel to and from Oahu's communities, pick up their passengers, and travel into Honolulu on a dedicated lane - just as if they were moving on tracks. Our new articulated buses, which can carry more people in comfort, would then move onto Nimitz Highway, where the next segment of our transit plan takes shape.

We're proposing to re-route much of the traffic off Nimitz Highway onto a new Sand Island Parkway and a tunnel under Honolulu Harbor. It's an ambitious plan, but it meets several goals. It frees up the valuable Nimitz waterfront for economic redevelopment, allowing us to make Honolulu a true waterfront city. It also eliminates one of our City's worst traffic bottlenecks. Nimitz Highway can be made into a far more efficient way to get people into town. In our plan, two lanes of Nimitz will become dedicated bus-rapid transit lanes.

These dedicated lanes will carry passengers into town where they will be able to transfer to downtown circulator buses. Riders going to the Diamond Head side of town would go through the new tunnel to South Street or Waikiki. The next segment of this alternative would involve the development of a light rail system in the most heavily used corridor, from Kapolei to downtown. Under this plan a light rail electric trolley would run from the periphery of Waikiki along Ala Moana Boulevard, and connect Waikiki, the Convention Center, Ala Moana Shopping Center, Ward Warehouse, the State's Kakaako Makai redevelopment area, Aloha Tower and downtown with a clean and efficient transportation link. It would provide the impetus for the redevelopment of Kakaako and would increase business for merchants downtown.

This light rail electric trolley would link up with the bus-rapid transit system in the Aloha Tower area as well as with articulated buses that would be operating at short intervals providing convenient access to all areas of town. It's an exciting alternative.

I've given direction to the Department of Transportation Services to move forward with our transportation project to the next phase, the federally mandated environmental impact statement/alternative analysis. In that effort, we will evaluate the following three proposals and choose one for action:

1) A light rail electric trolley from Pearl City to UH with circulator buses in local communities.

2) A bus-rapid transit system from Waipahu to UH using dedicated zipper lanes, with a light rail electric trolley from Waikiki to downtown and local community connection through community circulator buses.

3) Expansion of our existing bus system.

As our Department and its consultants go through this federally mandated analysis, I will assemble a policy team of business, council, and vision team members to work with us throughout the evaluation process. Regardless of which technology we ultimately choose, I believe it's vital in our effort to protect our environment and our quality of life, that we position our City as the world leader in electric based transportation.

One new technology that would have applicability for either of the alternatives is the wireless plate system. With this new technology, light rail vehicles or electric trolley buses could be powered without the need for poles and overhead power lines. Instead, transit vehicles pick up their power from a plate imbedded in the roadway. To protect against electric shock the plate only turns "on" directly under the transit vehicle as it passes by. If such a system was determined to be feasible we might imagine a future time when even Honolulu's private vehicles were electric, picking up their power from the street itself."

2.2 City Blueprints for the Oahu Trans 2K (January - August 1998)

Harris to Unveil City Proposals, Seek Input for '21st Century Oahu' "At the urging of Mayor Jeremy Harris, city officials have spent the past nine months trying to envision and draft a blueprint for the kind of future Oahu could have." David Waite *Honolulu Advertiser*, September 25, 1998.

Mayor Unveils Land-Use Vision - Harris hopes to reduce urban sprawl by limiting growth in population and development to greater Honolulu and Kapolei "Harris first outlined his vision in his State of the City address in January. ... Harris' ideas also include a drive to revitalize the Honolulu waterfront as has been done in Portland, Boston and other major mainland cities." Gordon Y. K. Pang *Honolulu Star Bulletin*, September 24, 1998.

2.3 Oahu Trans 2K

"The Chair introduced Joe Magaldi, Deputy Director of the City's Department of Transportation Services. He gave a presentation on the City's Vision for Oahu. Part of this vision is a study that the City had just begun. They will hold ten community meetings on Oahu to gather input on the type of transportation system people want. These meetings will also include the State's community outreach presentation on their Freeway Management System (FMS). The City Vision for Oahu includes five key elements: ...

As part of this study, the consultant will identify transit lines to increase capacity, look at high speed express service to/from the suburbs; ways to implement a central city trolley; determine initial routes and routes for future expansion; and study opportunities for historic trolley lines. ...

AR00016233

The City's Primary Corridor Transportation Plan (PCTP) will create a future transportation master plan that will support the Vision for Oahu. It involves community-base planning and will be implemented incrementally within our ability to pay. The study will look at areas such as Curitiba, Brazil and Portland Oregon as transit models." OMPO Community Advisory Committee ("OMPO CAC") Minutes September 16, 1998.

850 Meet to 'Vision' Oahu's Future - Concerns about the economy and the environment draw a big crowd: "Mayor Jeremy Harris this week announced the joint city-state effort to incorporate into one 'vision' all aspects of land use, reached through a community consensus. Further meetings will be held." Lori Tighe *Honolulu Star Bulletin*, September 26, 1998

Transportation Takes Input On Transit Plans: "Light-rail transit and other initiatives drew some 300 participants, and Mayor Jeremy Harris said intensive transportation planning will be a joint state and city undertaking between now and January, with many of the ideas coming from the community." Harold Morse *Honolulu Star Bulletin*, September 29, 1998

Editorial: Oahu's Future "The trolley idea is a scaled-down version of the elevated rail transit plan that was narrowly rejected by the City Council in 1992. Harris, as city managing director, was deeply involved in the planning for that project. A trolley might be less effective. The proposals also include diverting traffic from Nimitz Highway to tunnels under Sand Island and Honolulu harbor, building a highway through Waianae mauka of Farrington Highway and creating a bikeway on Ala Wai Boulevard by eliminating the parking lane. All of this would cost money, and it's hard to see where it would come from. Certainly the city doesn't have it. But this would be a plan to be fulfilled over decades. It's never too soon to seek a consensus. Finding the money will have to come later." *Honolulu Star Bulletin*, September 26, 1998

Editorial: New Transit Plans Must Include Public Options: "This time around, city officials say they are determined to go only where the community wants them to go and in a form the community finds acceptable. ... If all this holds, it will mark a refreshing change in transportation planning for Oahu. We have learned one lesson: Any project of this magnitude imposed top-down by government will fail its basic political test." *Honolulu Advertiser*, September 29, 1998

Emotions High as Fight Resumes on Rail Transit: "Residents have a lot to say for and against light rail as the city's second round of meetings, aimed at getting public input, kick off by Gordon Y.K. Pang *Honolulu Star-Bulletin*, November 17, 1998

Opinion Divided on Light Rail -Some residents say planning biased toward popular proposal: "The light-rail proposal prompted the most debate, with some community representatives saying the planning process was weighted toward including light rail. 'They don't even assume that there's a possibility there won't be light rail,' said Richard Port, an Ala Moana area resident who was state Democratic Party chairman from 1994 to 1996. 'It's already a rigged decision.'" Jean Christensen Advertiser Staff Writer *Honolulu Advertiser*, November 17, 1998

Transportation Issues Addressed at Workshop; Light Rail System Urged by Residents: "The first series of workshops ended Oct. 14 ... Among the ideas being proposed is the need for a mass transit system, most likely in the form of a light rail system." Don Robbins *Kanupepa*, October 27, 1998

Parsons Brinckerhoff: "The City and County of Honolulu's Department of Transportation Services (DTS), with the cooperation of the Hawaii Department of Transportation (DOT), is undertaking a major study to examine the future transportation system for Oahu. The study, officially called the Oahu Primary Corridor Transportation Project began in August 1998. It focuses on improving circulation within communities and between them. Moreover, the study

focuses on public transit improvements and more efficient use of existing roads, both to enhance established communities. The study does not focus on building new highways in undeveloped areas.

The project consists of three tracks: community-based planning, project development and delivery-early-start projects and project development-primary corridor. Community outreach will be the first step of a public involvement process that will continue throughout the project; the community-based planning track will identify transportation improvements throughout the island that will improve mobility and enhance the livability of Oahu's communities. Early-start projects will be those that do not require detailed planning or complicated environmental clearances. Primary corridor (from Pearl City to the University of Hawaii Manoa projects will be examined and evaluated through an MIS that will define the characteristics of transit services in the corridor. The transit component will probably be divided into three major subsystems: fixed-route buses that provide local services throughout the communities; high-speed express service from suburbs; and the central city trolley, which will remain at-grade as much as possible to reduce construction costs." A Community-Based Transportation Visioning Process Managed by the City and County of Honolulu and the Hawaii Department of Transportation. Parsons Brinckerhoff 1998

Parsons Brinckerhoff: "The Islandwide Mobility Concept Plan which has emerged from Rounds 1 and 2 of Oahu Trans 2K, including the various public transit alternatives that are under active consideration. The third round of Oahu Trans 2K meetings will be jointly held with another community-based planning project known as 21st Century Oahu. Since last fall, vision teams from the 21st Century Oahu process have been working to develop community goals and prioritize capital improvement projects. The project consists of three tracks: community-based planning, project development and delivery-early-start projects and project development-primary corridor." A Community-Based Transportation Visioning Process Managed by the City and County of Honolulu and the Hawaii Department of Transportation. Parsons Brinckerhoff. 1998

2.4 Phase Three: 21st Century Oahu & Oahu Trans 2K

Mayor Jeremy Harris: "Dear Community Leader: The next phase in our grassroots effort to envision, plan, design and build a sustainable future for Oahu is about to begin with a round of community vision team meetings focusing primarily on transportation. These meetings will complete the integration of two related community-based planning projects known as 21st Century Oahu and Oahu Trans 2K. ... If you previously attended Oahu Trans 2K meetings, you will recognize this as Round 3 of that program. If you have previously participated in the 21st Century Oahu process, you understand how important transportation planning is to implementing your community vision. Please attend any sessions in which you are interested. The meetings will cover: The Islandwide Mobility Concept Plan that has emerged from Rounds 1 and 2 of Oahu Trans 2K, including the various public transit alternatives that are under active consideration; A report back and further refinement of community-specific mobility proposals that emerged from Rounds 1 and 2 of Oahu Trans 2K, which may include traffic calming measures, bikeways, bus stop improvements and neighborhood circulators; Discussion of pending city and state transportation projects; An update on vision team capital improvement requests included in the Mayor's FY 1999-2000 city budget; A look ahead to future planning efforts by the community vision teams. ... Yours truly, Jeremy Harris, Mayor"

Chapter 3 Scoping

3.1 The National Environmental Policy Act (NEPA)

Council on Environmental Quality: Top 40 Questions Asked about NEPA.
http://ceq.eh.doe.gov/nepa/regs/40/40p3.htm

AR00016234

1a. Range of Alternatives. What is meant by "range of alternatives" as referred to in Sec. 1505.1(e)?

The phrase "range of alternatives" refers to the alternatives discussed in environmental documents. It includes all reasonable alternatives, which must be rigorously explored and objectively evaluated, as well as those other alternatives, which are eliminated from detailed study with a brief discussion of the reasons for eliminating them. Section 1502.14. A decisionmaker must not consider alternatives beyond the range of alternatives discussed in the relevant environmental documents. Moreover, a decisionmaker must, in fact, consider all the alternatives discussed in an EIS. Section 1505.1(e).

1b. How many alternatives have to be discussed when there is an infinite number of possible alternatives?

A. For some proposals there may exist a very large or even an infinite number of possible reasonable alternatives. For example, a proposal to designate wilderness areas within a National Forest could be said to involve an infinite number of alternatives from 0 to 100 percent of the forest. When there are potentially a very large number of alternatives, only a reasonable number of examples, covering the full spectrum of alternatives, must be analyzed and compared in the EIS. An appropriate series of alternatives might include dedicating 0, 10, 30, 50, 70, 90, or 100 percent of the Forest to wilderness. What constitutes a reasonable range of alternatives depends on the nature of the proposal and the facts in each case.

2a. Alternatives Outside the Capability of Applicant or Jurisdiction of Agency. If an EIS is prepared in connection with an application for a permit or other federal approval, must the EIS rigorously analyze and discuss alternatives that are outside the capability of the applicant or can it be limited to reasonable alternatives that can be carried out by the applicant?

A. Section 1502.14 requires the EIS to examine all reasonable alternatives to the proposal. In determining the scope of alternatives to be considered, the emphasis is on what is "reasonable" rather than on whether the proponent or applicant likes or is itself capable of carrying out a particular alternative. Reasonable alternatives include those that are practical or feasible from the technical and economic standpoint and using common sense, rather than simply desirable from the standpoint of the applicant.

2b. Must the EIS analyze alternatives outside the jurisdiction or capability of the agency or beyond what Congress has authorized?

A. An alternative that is outside the legal jurisdiction of the lead agency must still be analyzed in the EIS if it is reasonable. A potential conflict with local or federal law does not necessarily render an alternative unreasonable, although such conflicts must be considered. Section 1506.2(d). Alternatives that are outside the scope of what Congress has approved or funded must still be evaluated in the EIS if they are reasonable, because the EIS may serve as the basis for modifying the Congressional approval or funding in light of NEPA's goals and policies. Section 1500.1(a).

3. No-Action Alternative. What does the "no action" alternative include? If an agency is under a court order or legislative command to act, must the EIS address the "no action" alternative?

A. Section 1502.14(d) requires the alternatives analysis in the EIS to "include the alternative of no action." There are two distinct interpretations of "no action" that must be considered, depending on the nature of the proposal being evaluated. The first situation might involve an action such as updating a land management plan where ongoing programs initiated under existing legislation and regulations will continue, even as new plans are developed. In these cases "no action" is "no change" from current management direction or level of management intensity. To construct

an alternative that is based on no management at all would be a useless academic exercise. Therefore, the "no action" alternative may be thought of in terms of continuing with the present course of action until that action is changed. Consequently, projected impacts of alternative management schemes would be compared in the EIS to those impacts projected for the existing plan. In this case, alternatives would include management plans of both greater and lesser intensity, especially greater and lesser levels of resource development.

The second interpretation of "no action" is illustrated in instances involving federal decisions on proposals for projects. "No action" in such cases would mean the proposed activity would not take place, and the resulting environmental effects from taking no action would be compared with the effects of permitting the proposed activity or an alternative activity to go forward.

Where a choice of "no action" by the agency would result in predictable actions by others, this consequence of the "no action" alternative should be included in the analysis. For example, if denial of permission to build a railroad to a facility would lead to construction of a road and increased truck traffic, the EIS should analyze this consequence of the "no action" alternative.

In light of the above, it is difficult to think of a situation where it would not be appropriate to address a "no action" alternative. Accordingly, the regulations require the analysis of the no action alternative even if the agency is under a court order or legislative command to act. This analysis provides a benchmark, enabling decisionmakers to compare the magnitude of environmental effects of the action alternatives. It is also an example of a reasonable alternative outside the jurisdiction of the agency which must be analyzed. Section 1502.14(c). See Question 2 above. Inclusion of such an analysis in the EIS is necessary to inform the Congress, the public, and the President as intended by NEPA. Section 1500.1(a).

4a. Agency's Preferred Alternative. What is the "agency's preferred alternative"?

A. The "agency's preferred alternative" is the alternative which the agency believes would fulfill its statutory mission and responsibilities, giving consideration to economic, environmental, technical and other factors. The concept of the "agency's preferred alternative" is different from the "environmentally preferable alternative," although in some cases one alternative may be both. See Question 6 below. It is identified so that agencies and the public can understand the lead agency's orientation.

4b. Does the "preferred alternative" have to be identified in the Draft EIS and the Final EIS or just in the Final EIS?

A. Section 1502.14(e) requires the section of the EIS on alternatives to "identify the agency's preferred alternative if one or more exists, in the draft statement, and identify such alternative in the final statement . . ." This means that if the agency has a preferred alternative at the Draft EIS stage, that alternative must be labeled or identified as such in the Draft EIS. If the responsible federal official in fact has no preferred alternative at the Draft EIS stage, a preferred alternative need not be identified there. By the time the Final EIS is filed, Section 1502.14(e) presumes the existence of a preferred alternative and requires its identification in the Final EIS "unless another law prohibits the expression of such a preference."

4c. Who recommends or determines the "preferred alternative?"

A. The lead agency's official with line responsibility for preparing the EIS and assuring its adequacy is responsible for identifying the agency's preferred alternative(s). The NEPA regulations do not dictate which official in an agency shall be responsible for preparation of EISs, but agencies can identify this official in their implementing procedures, pursuant to Section 1507.3.

AR00016235

Even though the agency's preferred alternative is identified by the EIS preparer in the EIS, the statement must be objectively prepared and not slanted to support the choice of the agency's preferred alternative over the other reasonable and feasible alternatives.

5a. Proposed Action v. Preferred Alternative. Is the "proposed action" the same thing as the "preferred alternative"?

A. The "proposed action" may be, but is not necessarily, the agency's "preferred alternative." The proposed action may be a proposal in its initial form before undergoing analysis in the EIS process. If the proposed action is [46 FR 18028] internally generated, such as preparing a land management plan, the proposed action might end up as the agency's preferred alternative. On the other hand the proposed action may be granting an application to a non-federal entity for a permit. The agency may or may not have a "preferred alternative" at the Draft EIS stage (see Question 4 above). In that case the agency may decide at the Final EIS stage, on the basis of the Draft EIS and the public and agency comments, that an alternative other than the proposed action is the agency's "preferred alternative."

5b. Is the analysis of the "proposed action" in an EIS to be treated differently from the analysis of alternatives?

A. The degree of analysis devoted to each alternative in the EIS is to be substantially similar to that devoted to the "proposed action." Section 1502.14 is titled "Alternatives including the proposed action" to reflect such comparable treatment. Section 1502.14(b) specifically requires "substantial treatment" in the EIS of each alternative including the proposed action. This regulation does not dictate an amount of information to be provided, but rather, prescribes a level of treatment, which may in turn require varying amounts of information, to enable a reviewer to evaluate and compare alternatives.

6a. Environmentally Preferable Alternative. What is the meaning of the term "environmentally preferable alternative" as used in the regulations with reference to Records of Decision? How is the term "environment" used in the phrase?

A. Section 1505.2(b) requires that, in cases where an EIS has been prepared, the Record of Decision (ROD) must identify all alternatives that were considered, "... specifying the alternative or alternatives which were considered to be environmentally preferable." The environmentally preferable alternative is the alternative that will promote the national environmental policy as expressed in NEPA's Section 101. Ordinarily, this means the alternative that causes the least damage to the biological and physical environment; it also means the alternative which best protects, preserves, and enhances historic, cultural, and natural resources.

The Council recognizes that the identification of the environmentally preferable alternative may involve difficult judgments, particularly when one environmental value must be balanced against another. The public and other agencies reviewing a Draft EIS can assist the lead agency to develop and determine environmentally preferable alternatives by providing their views in comments on the Draft EIS. Through the identification of the environmentally preferable alternative, the decisionmaker is clearly faced with a choice between that alternative and others, and must consider whether the decision accords with the Congressionally declared policies of the Act.

6b. Who recommends or determines what is environmentally preferable?

A. The agency EIS staff is encouraged to make recommendations of the environmentally preferable alternative(s) during EIS preparation. In any event the lead agency official responsible for the EIS is encouraged to identify the environmentally preferable alternative(s) in the EIS. In all cases, commentors from other agencies and the public are

also encouraged to address this question. The agency must identify the environmentally preferable alternative in the ROD.

7. Difference Between Sections of EIS on Alternatives and Environmental Consequences. What is the difference between the sections in the EIS on "alternatives" and "environmental consequences"? How do you avoid duplicating the discussion of alternatives in preparing these two sections?

A. The "alternatives" section is the heart of the EIS. This section rigorously explores and objectively evaluates all reasonable alternatives including the proposed action. Section 1502.14. It should include relevant comparisons on environmental and other grounds. The "environmental consequences" section of the EIS discusses the specific environmental impacts or effects of each of the alternatives including the proposed action. Section 1502.16. In order to avoid duplication between these two sections, most of the "alternatives" section should be devoted to describing and comparing the alternatives. Discussion of the environmental impacts of these alternatives should be limited to a concise descriptive summary of such impacts in a comparative form, including charts or tables, thus sharply defining the issues and providing a clear basis for choice among options. Section 1502.14. The "environmental consequences" section should be devoted largely to a scientific analysis of the direct and indirect environmental effects of the proposed action and of each of the alternatives. It forms the analytic basis for the concise comparison in the "alternatives" section.

8. Early Application of NEPA. Section 1501.2(d) of the NEPA regulations requires agencies to provide for the early application of NEPA to cases where actions are planned by private applicants or non-Federal entities and are, at some stage, subject to federal approval of permits, loans, loan guarantees, insurance or other actions. What must and can agencies do to apply NEPA early in these cases?

A. Section 1501.2(d) requires federal agencies to take steps toward ensuring that private parties and state and local entities initiate environmental studies as soon as federal involvement in their proposals can be foreseen. This section is intended to ensure that environmental factors are considered at an early stage in the planning process and to avoid the situation where the applicant for a federal permit or approval has completed planning and eliminated all alternatives to the proposed action by the time the EIS process commences or before the EIS process has been completed.

Through early consultation, business applicants and approving agencies may gain better appreciation of each other's needs and foster a decisionmaking process which avoids later unexpected confrontations.

Federal agencies are required by Section 1507.3(b) to develop procedures to carry out Section 1501.2(d). The procedures should include an "outreach program", such as a means for prospective applicants to conduct pre-application consultations with the lead and cooperating agencies. Applicants need to find out, in advance of project planning, what environmental studies or other information will be required, and what mitigation requirements are likely, in connection with the later federal NEPA process. Agencies should designate staff to advise potential applicants of the agency's NEPA information requirements and should publicize their pre-application procedures and information requirements in newsletters or other media used by potential applicants.

Complementing Section 1501.2(d), Section 1506.5(a) requires agencies to assist applicants by outlining the types of information required in those cases where the agency requires the applicant to submit environmental data for possible use by the agency in preparing an EIS.

Section 1506.5(b) allows agencies to authorize preparation of environmental assessments by applicants. Thus, the procedures should also include a means for anticipating and utilizing applicants' environmental studies or "early

AR00016236

corporate environmental assessments" to fulfill some of the federal agency's NEPA obligations. However, in such cases the agency must still evaluate independently the environmental issues [46 FR 18029] and take responsibility for the environmental assessment.

These provisions are intended to encourage and enable private and other non-federal entities to build environmental considerations into their own planning processes in a way that facilitates the application of NEPA and avoids delay.

9. Applicant Who Needs Other Permits. To what extent must an agency inquire into whether an applicant for a federal permit, funding or other approval of a proposal will also need approval from another agency for the same proposal or some other related aspect of it?

A. Agencies must integrate the NEPA process into other planning at the earliest possible time to insure that planning and decisions reflect environmental values, to avoid delays later in the process, and to head off potential conflicts. Specifically, the agency must "provide for cases where actions are planned by . . . applicants," so that designated staff are available to advise potential applicants of studies or other information that will forseeable be required for the later federal action; the agency shall consult with the applicant if the agency foresees its own involvement in the proposal; and it shall insure that the NEPA process commences at the earliest possible time. Section 1501.2(d). (See Question 8.)

The regulations emphasize agency cooperation early in the NEPA process. Section 1501.6. Section 1501.7 on "scoping" also provides that all affected Federal agencies are to be invited to participate in scoping the environmental issues and to identify the various environmental review and consultation requirements that may apply to the proposed action. Further, Section 1502.25(b) requires that the draft EIS list all the federal permits, licenses and other entitlements that are needed to implement the proposal.

These provisions create an affirmative obligation on federal agencies to inquire early, and to the maximum degree possible, to ascertain whether an applicant is or will be seeking other federal assistance or approval, or whether the applicant is waiting until a proposal has been substantially developed before requesting federal aid or approval.

Thus, a federal agency receiving a request for approval or assistance should determine whether the applicant has filed separate requests for federal approval or assistance with other federal agencies. Other federal agencies that are likely to become involved should then be contacted, and the NEPA process coordinated, to insure an early and comprehensive analysis of the direct and indirect effects of the proposal and any related actions. The agency should inform the applicant that action on its application may be delayed unless it submits all other federal applications (where feasible to do so), so that all the relevant agencies can work together on the scoping process and preparation of the EIS.

10a. Limitations on Action During 30-Day Review Period for Final EIS. What actions by agencies and/or applicants are allowed during EIS preparation and during the 30-day review period after publication of a final EIS?

A. No federal decision on the proposed action shall be made or recorded until at least 30 days after the publication by EPA of notice that the particular EIS has been filed with EPA. Sections 1505.2 and 1506.10. Section 1505.2 requires this decision to be stated in a public Record of Decision.

Until the agency issues its Record of Decision, no action by an agency or an applicant concerning the proposal shall be taken which would have an adverse environmental impact or limit the choice of reasonable alternatives. Section 1506.1(a). But this does not preclude preliminary planning or design work which is needed to support an application for permits or assistance. Section 1506.1(d).

When the impact statement in question is a program EIS, no major action concerning the program may be taken which may significantly affect the quality of the human environment, unless the particular action is justified independently of the program, is accompanied by its own adequate environmental impact statement and will not prejudice the ultimate decision on the program. Section 1506.1(c).

10b. Do these limitations on action (described in Question 10a) apply to state or local agencies that have statutorily delegated responsibility for preparation of environmental documents required by NEPA, for example, under the HUD Block Grant program?

A. Yes, these limitations do apply, without any variation from their application to federal agencies.

11. Limitations on Actions by an Applicant During EIS Process. What actions must a lead agency take during the NEPA process when it becomes aware that a non-federal applicant is about to take an action within the agency's jurisdiction that would either have an adverse environmental impact or limit the choice of reasonable alternatives (e.g., prematurely commit money or other resources towards the completion of the proposal)?

A. The federal agency must notify the applicant that the agency will take strong affirmative steps to insure that the objectives and procedures of NEPA are fulfilled: Section 1506.1(b). These steps could include seeking injunctive measures under NEPA, or the use of sanctions available under either the agency's permitting authority or statutes setting forth the agency's statutory mission. For example, the agency might advise an applicant that if it takes such action the agency will not process its application.

13. Use of Scoping Before Notice of Intent to Prepare EIS. Can the scoping process be used in connection with preparation of an environmental assessment, i.e., before both the decision to proceed with an EIS and publication of a notice of intent?

A. Yes. Scoping can be a useful tool for discovering alternatives to a proposal, or significant impacts that may have been overlooked. In cases where an environmental assessment is being prepared to help an agency decide whether to prepare an EIS, useful information might result from early participation by other agencies and the public in a scoping process.

The regulations state that the scoping process is to be preceded by a Notice of Intent (NOI) to prepare an EIS. But that is only the minimum requirement. Scoping may be initiated earlier, as long as there is appropriate public notice and enough information available on the proposal so that the public and relevant agencies can participate effectively.

However, scoping that is done before the assessment, and in aid of its preparation, cannot substitute for the normal scoping process after publication of the NOI, unless the earlier public notice stated clearly that this possibility was under consideration, and the NOI expressly provides that written comments on the scope of alternatives and impacts will still be considered.

14a. Rights and Responsibilities of Lead and Cooperating Agencies. What are the respective rights and responsibilities of lead and cooperating agencies? What letters and memoranda must be prepared?

A. After a lead agency has been designated (Sec. 1501.5), that agency has the responsibility to solicit cooperation from other federal agencies that have jurisdiction by law or special expertise on any environmental issue that should be addressed in the EIS being prepared. Where appropriate, the lead agency should seek the cooperation of state or local agencies of similar qualifications. When the proposal may affect an Indian reservation, the agency should consult with the Indian tribe. Section 1508.5. The request for cooperation should come at the earliest possible time in the NEPA process.

AR00016237

After discussions with the candidate cooperating agencies, the lead agency and the cooperating agencies are to determine by letter or by memorandum which agencies will undertake cooperating responsibilities. To the extent possible at this stage, responsibilities for specific issues should be assigned. The allocation of responsibilities will be completed during scoping. Section 1501.7(a)(4).

Cooperating agencies must assume responsibility for the development of information and the preparation of environmental analyses at the request of the lead agency. Section 1501.6(b)(3). Cooperating agencies are now required by Section 1501.6 to devote staff resources that were normally primarily used to critique or comment on the Draft EIS after its preparation, much earlier in the NEPA process -- primarily at the scoping and Draft EIS preparation stages. If a cooperating agency determines that its resource limitations preclude any involvement, or the degree of involvement (amount of work) requested by the lead agency, it must so inform the lead agency in writing and submit a copy of this correspondence to the Council. Section 1501.6(c).

In other words, the potential cooperating agency must decide early if it is able to devote any of its resources to a particular proposal. For this reason the regulation states that an agency may reply to a request for cooperation that "other program commitments preclude any involvement or the degree of involvement requested in the action that is the subject of the environmental impact statement." (Emphasis added). The regulation refers to the "action," rather than to the EIS, to clarify that the agency is taking itself out of all phases of the federal action, not just draft EIS preparation. This means that the agency has determined that it cannot be involved in the later stages of EIS review and comment, as well as decisionmaking on the proposed action. For this reason, cooperating agencies with jurisdiction by law (those which have permitting or other approval authority) cannot opt out entirely of the duty to cooperate on the EIS. See also Question 15, relating specifically to the responsibility of EPA.

14b. How are disputes resolved between lead and cooperating agencies concerning the scope and level of detail of analysis and the quality of data in impact statements?

A. Such disputes are resolved by the agencies themselves. A lead agency, of course, has the ultimate responsibility for the content of an EIS. But it is supposed to use the environmental analysis and recommendations of cooperating agencies with jurisdiction by law or special expertise to the maximum extent possible, consistent with its own responsibilities as lead agency. Section 1501.6(a)(2).

If the lead agency leaves out a significant issue or ignores the advice and expertise of the cooperating agency, the EIS may be found later to be inadequate. Similarly, where cooperating agencies have their own decisions to make and they intend to adopt the environmental impact statement and base their decisions on it, one document should include all of the information necessary for the decisions by the cooperating agencies. Otherwise they may be forced to duplicate the EIS process by issuing a new, more complete EIS or Supplemental EIS, even though the original EIS could have sufficed if it had been properly done at the outset. Thus, both lead and cooperating agencies have a stake in producing a document of good quality. Cooperating agencies also have a duty to participate fully in the scoping process to ensure that the appropriate range of issues is determined early in the EIS process.

Because the EIS is not the Record of Decision, but instead constitutes the information and analysis on which to base a decision, disagreements about conclusions to be drawn from the EIS need not inhibit agencies from issuing a joint document, or adopting another agency's EIS, if the analysis is adequate. Thus, if each agency has its own "preferred alternative," both can be identified in the EIS. Similarly, a cooperating agency with jurisdiction by law may determine in its own ROD that alternative A is the environmentally preferable action, even though the lead agency has decided in its separate ROD that Alternative B is environmentally preferable.

14c. What are the specific responsibilities of federal and state cooperating agencies to review draft EISs?

A. Cooperating agencies (i.e., agencies with jurisdiction by law or special expertise) and agencies that are authorized to develop or enforce environmental standards, must comment on environmental impact statements within their jurisdiction, expertise or authority. Sections 1503.2, 1508.5. If a cooperating agency is satisfied that its views are adequately reflected in the environmental impact statement, it should simply comment accordingly. Conversely, if the cooperating agency determines that a draft EIS is incomplete, inadequate or inaccurate, or it has other comments, it should promptly make such comments, conforming to the requirements of specificity in section 1503.3.

14d. How is the lead agency to treat the comments of another agency with jurisdiction by law or special expertise which has failed or refused to cooperate or participate in scoping or EIS preparation?

A. A lead agency has the responsibility to respond to all substantive comments raising significant issues regarding a draft EIS. Section 1503.4. However, cooperating agencies are generally under an obligation to raise issues or otherwise participate in the EIS process during scoping and EIS preparation if they reasonably can do so. In practical terms, if a cooperating agency fails to cooperate at the outset, such as during scoping, it will find that its comments at a later stage will not be as persuasive to the lead agency.

15. Commenting Responsibilities of EPA. Are EPA's responsibilities to review and comment on the environmental effects of agency proposals under Section 309 of the Clean Air Act independent of its responsibility as a cooperating agency?

A. Yes. EPA has an obligation under Section 309 of the Clean Air Act to review and comment in writing on the environmental impact of any matter relating to the authority of the Administrator contained in proposed legislation, federal construction projects, other federal actions requiring EISs, and new regulations. 42 U.S.C. Sec. 7609. This obligation is independent of its role as a cooperating agency under the NEPA regulations.

16. Third Party Contracts. What is meant by the term "third party contracts" in connection with the preparation of an EIS? See Section 1506.5(c). When can "third party contracts" be used?

A. As used by EPA and other agencies, the term "third party contract" refers to the preparation of EISs by contractors paid by the applicant. In the case of an EIS for a National Pollution Discharge Elimination System (NPDES) permit, the applicant, aware in the early planning stages of the proposed project of the need for an EIS, contracts directly with a consulting firm for its preparation. See 40 C.F.R. 6.604(g). The "third party" is EPA which, under Section 1506.5(c), must select the consulting firm, even though the applicant pays for the cost of preparing the EIS. The consulting firm is responsible to EPA for preparing an EIS that meets the requirements of the NEPA regulations and EPA's NEPA procedures. It is in the applicant's interest that the EIS comply with the law so that EPA can take prompt action on the NPDES permit application. The "third party contract" method under EPA's NEPA procedures is purely voluntary, though most applicants have found it helpful in expediting compliance with NEPA.

If a federal agency uses "third party contracting," the applicant may undertake the necessary paperwork for the solicitation of a field of candidates under the agency's direction, so long as the agency complies with Section 1506.5(c). Federal procurement requirements do not apply to the agency because it incurs no obligations or costs under the contract, nor does the agency procure anything under the contract.

17a. Disclosure Statement to Avoid Conflict of Interest. If an EIS is prepared with the assistance of a consulting firm, the firm must execute a disclosure statement. What criteria must the firm follow in determining whether it has any "financial or other interest in the outcome of the project" which would cause a conflict of interest?

AR00016238

A. Section 1506.5(c), which specifies that a consulting firm preparing an EIS must execute a disclosure statement, does not define "financial or other interest in the outcome of the project." The Council interprets this term broadly to cover any known benefits other than general enhancement of professional reputation. This includes any financial benefit such as a promise of future construction or design work on the project, as well as indirect benefits the consultant is aware of (e.g., if the project would aid proposals sponsored by the firm's other clients). For example, completion of a highway project may encourage construction of a shopping center or industrial park from which the consultant stands to benefit. If a consulting firm is aware that it has such an interest in the decision on the proposal, it should be disqualified from preparing the EIS, to preserve the objectivity and integrity of the NEPA process.

When a consulting firm has been involved in developing initial data and plans for the project, but does not have any financial or other interest in the outcome of the decision, it need not be disqualified from preparing the EIS. However, a disclosure statement in the draft EIS should clearly state the scope and extent of the firm's prior involvement to expose any potential conflicts of interest that may exist.

17b. If the firm in fact has no promise of future work or other interest in the outcome of the proposal, may the firm later bid in competition with others for future work on the project if the proposed action is approved?

A. Yes.

18. Uncertainties About Indirect Effects of A Proposal. How should uncertainties about indirect effects of a proposal be addressed, for example, in cases of disposal of federal lands, when the identity or plans of future landowners is unknown?

A. The EIS must identify all the indirect effects that are known, and make a good faith effort to explain the effects that are not known but are "reasonably foreseeable." Section 1508.8(b). In the example, if there is total uncertainty about the identity of future land owners or the nature of future land uses, then of course, the agency is not required to engage in speculation or contemplation about their future plans. But, in the ordinary course of business, people do make judgments based upon reasonably foreseeable occurrences. It will often be possible to consider the likely purchasers and the development trends in that area or similar areas in recent years; or the likelihood that the land will be used for an energy project, shopping center, subdivision, farm or factory. The agency has the responsibility to make an informed judgment, and to estimate future impacts on that basis, especially if trends are ascertainable or potential purchasers have made themselves known. The agency cannot ignore these uncertain, but probable, effects of its decisions.

19a. Miligation Measures. What is the scope of mitigation measures that must be discussed?

A. The mitigation measures discussed in an EIS must cover the range of impacts of the proposal. The measures must include such things as design alternatives that would decrease pollution emissions, construction impacts, esthetic intrusion, as well as relocation assistance, possible land use controls that could be enacted, and other possible efforts. Mitigation measures must be considered even for impacts that by themselves would not be considered "significant." Once the proposal itself is considered as a whole to have significant effects, all of its specific effects on the environment (whether or not "significant") must be considered, and mitigation measures must be developed where it is feasible to do so. Sections 1502.14(f), 1502.16(h), 1508.14.

19b. How should an EIS treat the subject of available mitigation measures that are (1) outside the jurisdiction of the lead or cooperating agencies, or (2) unlikely to be adopted or enforced by the responsible agency?

A. All relevant, reasonable mitigation measures that could improve the project are to be identified, even if they are outside the jurisdiction of the lead agency or the cooperating agencies, and thus would not be committed as part of the RODs of these agencies. Sections 1502.16(h), 1505.2(e). This will serve to [46 FR 18032] alert agencies or officials who can implement these extra measures, and will encourage them to do so. Because the EIS is the most comprehensive environmental document, it is an ideal vehicle in which to lay out not only the full range of environmental impacts but also the full spectrum of appropriate mitigation.

However, to ensure that environmental effects of a proposed action are fairly assessed, the probability of the mitigation measures being implemented must also be discussed. Thus the EIS and the Record of Decision should indicate the likelihood that such measures will be adopted or enforced by the responsible agencies. Sections 1502.16(h), 1505.2. If there is a history of nonenforcement or opposition to such measures, the EIS and Record of Decision should acknowledge such opposition or nonenforcement. If the necessary mitigation measures will not be ready for a long period of time, this fact, of course, should also be recognized.

21. Combining Environmental and Planning Documents. Where an EIS or an EA is combined with another project planning document (sometimes called "piggybacking"), to what degree may the EIS or EA refer to and rely upon information in the project document to satisfy NEPA's requirements?

A. Section 1502.25 of the regulations requires that draft EISs be prepared concurrently and integrated with environmental analyses and related surveys and studies required by other federal statutes. In addition, Section 1506.4 allows any environmental document prepared in compliance with NEPA to be combined with any other agency document to reduce duplication and paperwork. However, these provisions were not intended to authorize the preparation of a short summary or outline EIS, attached to a detailed project report or land use plan containing the required environmental impact data. In such circumstances, the reader would have to refer constantly to the detailed report to understand the environmental impacts and alternatives which should have been found in the EIS itself.

The EIS must stand on its own as an analytical document which fully informs decisionmakers and the public of the environmental effects of the proposal and those of the reasonable alternatives. Section 1502.1. But, as long as the EIS is clearly identified and is self-supporting, it can be physically included in or attached to the project report or land use plan, and may use attached report material as technical backup.

Forest Service environmental impact statements for forest management plans are handled in this manner. The EIS identifies the agency's preferred alternative, which is developed in detail as the proposed management plan. The detailed proposed plan accompanies the EIS through the review process, and the documents are appropriately cross-referenced. The proposed plan is useful for EIS readers as an example, to show how one choice of management options translates into effects on natural resources. This procedure permits initiation of the 90-day public review of proposed forest plans, which is required by the National Forest Management Act.

All the alternatives are discussed in the EIS, which can be read as an independent document. The details of the management plan are not repeated in the EIS, and vice versa. This is a reasonable functional separation of the documents: the EIS contains information relevant to the choice among alternatives; the plan is a detailed description of proposed management activities suitable for use by the land managers. This procedure provides for concurrent compliance with the public review requirements of both NEPA and the National Forest Management Act.

Under some circumstances, a project report or management plan may be totally merged with the EIS, and the one document labeled as both "EIS" and "management plan" or "project report." This may be reasonable where the documents are short, or where the EIS format and the regulations for clear, analytical EISs also satisfy the requirements for a project report.

AR00016239

22. State and Federal Agencies as Joint Lead Agencies. May state and federal agencies serve as joint lead agencies? If so, how do they resolve law, policy and resource conflicts under NEPA and the relevant state environmental policy act? How do they resolve differences in perspective where, for example, national and local needs may differ?

A. Under Section 1501.5(b), federal, state or local agencies, as long as they include at least one federal agency, may act as joint lead agencies to prepare an EIS. Section 1506.2 also strongly urges state and local agencies and the relevant federal agencies to cooperate fully with each other. This should cover joint research and studies, planning activities, public hearings, environmental assessments and the preparation of joint EISs under NEPA and the relevant "little NEPA" state laws, so that one document will satisfy both laws.

The regulations also recognize that certain inconsistencies may exist between the proposed federal action and any approved state or local plan or law. The joint document should discuss the extent to which the federal agency would reconcile its proposed action with such plan or law. Section 1506.2(d). (See Question 23).

Because there may be differences in perspective as well as conflicts among [46 FR 18033] federal, state and local goals for resources management, the Council has advised participating agencies to adopt a flexible, cooperative approach. The joint EIS should reflect all of their interests and missions, clearly identified as such. The final document would then indicate how state and local interests have been accommodated, or would identify conflicts in goals (e.g., how a hydroelectric project, which might induce second home development, would require new land use controls). The EIS must contain a complete discussion of scope and purpose of the proposal, alternatives, and impacts so that the discussion is adequate to meet the needs of local, state and federal decisionmakers.

23a. Conflicts of Federal Proposal With Land Use Plans, Policies or Controls. How should an agency handle potential conflicts between a proposal and the objectives of Federal, state or local land use plans, policies and controls for the area concerned? See Sec. 1502.16(c).

A. The agency should first inquire of other agencies whether there are any potential conflicts. If there would be immediate conflicts, or if conflicts could arise in the future when the plans are finished (see Question 23(b) below), the EIS must acknowledge and describe the extent of those conflicts. If there are any possibilities of resolving the conflicts, these should be explained as well. The EIS should also evaluate the seriousness of the impact of the proposal on the land use plans and policies, and whether, or how much, the proposal will impair the effectiveness of land use control mechanisms for the area. Comments from officials of the affected area should be solicited early and should be carefully acknowledged and answered in the EIS.

23b. What constitutes a "land use plan or policy" for purposes of this discussion?

A. The term "land use plans," includes all types of formally adopted documents for land use planning, zoning and related regulatory requirements. Local general plans are included, even though they are subject to future change. Proposed plans should also be addressed if they have been formally proposed by the appropriate government body in a written form, and are being actively pursued by officials of the jurisdiction. Staged plans, which must go through phases of development such as the Water Resources Council's Level A, B and C planning process should also be included even though they are incomplete.

The term "policies" includes formally adopted statements of land use policy as embodied in laws or regulations. It also includes proposals for action such as the initiation of a planning process, or a formally adopted policy statement of the local, regional or state executive branch, even if it has not yet been formally adopted by the local, regional or state legislative body.

23c. What options are available for the decisionmaker when conflicts with such plans or policies are identified?

A. After identifying any potential land use conflicts, the decisionmaker must weigh the significance of the conflicts, among all the other environmental and non-environmental factors that must be considered in reaching a rational and balanced decision. Unless precluded by other law from causing or contributing to any inconsistency with the land use plans, policies or controls, the decisionmaker retains the authority to go forward with the proposal, despite the potential conflict. In the Record of Decision, the decisionmaker must explain what the decision was, how it was made, and what mitigation measures are being imposed to lessen adverse environmental impacts of the proposal, among the other requirements of Section 1505.2. This provision would require the decisionmaker to explain any decision to override land use plans, policies or controls for the area.

24a. Environmental Impact Statements on Policies, Plans or Programs. When are EISs required on policies, plans or programs?

A. An EIS must be prepared if an agency proposes to implement a specific policy, to adopt a plan for a group of related actions, or to implement a specific statutory program or executive directive. Section 1508.18. In addition, the adoption of official policy in the form of rules, regulations and interpretations pursuant to the Administrative Procedure Act, treaties, conventions, or other formal documents establishing governmental or agency policy which will substantially alter agency programs, could require an EIS. Section 1508.18. In all cases, the policy, plan, or program must have the potential for significantly affecting the quality of the human environment in order to require an EIS. It should be noted that a proposal "may exist in fact as well as by agency declaration that one exists." Section 1508.23.

24b. When is an area-wide or overview EIS appropriate?

A. The preparation of an area-wide or overview EIS may be particularly useful when similar actions, viewed with other reasonably foreseeable or proposed agency actions, share common timing or geography. For example, when a variety of energy projects may be located in a single watershed, or when a series of new energy technologies may be developed through federal funding, the overview or area-wide EIS would serve as a valuable and necessary analysis of the affected environment and the potential cumulative impacts of the reasonably foreseeable actions under that program or within that geographical area.

24c. What is the function of tiering in such cases?

A. Tiering is a procedure which allows an agency to avoid duplication of paperwork through the incorporation by reference of the general discussions and relevant specific discussions from an environmental impact statement of broader scope into one of lesser scope or vice versa. In the example given in Question 24b, this would mean that an overview EIS would be prepared for all of the energy activities reasonably foreseeable in a particular geographic area or resulting from a particular development program. This impact statement would be followed by site-specific or project-specific EISs. The tiering process would make each EIS of greater use and meaning to the public as the plan or program develops, without duplication of the analysis prepared for the previous impact statement.

25a. Appendices and Incorporation by Reference. When is it appropriate to use appendices instead of including information in the body of an EIS?

A. The body of the EIS should be a succinct statement of all the information on environmental impacts and alternatives that the decisionmaker and the public need, in order to make the decision and to ascertain that every

AR00016240

significant factor has been examined. The EIS must explain or summarize methodologies of research and modeling, and the results of research that may have been conducted to analyze impacts and alternatives.

Lengthy technical discussions of modeling methodology, baseline studies, or other work are best reserved for the appendix. In other words, if only technically trained individuals are likely to understand a particular discussion then it should go in the appendix, and a plain language summary of the analysis and conclusions of that technical discussion should go in the text of the EIS.

The final statement must also contain the agency's responses to comments on the draft EIS. These responses will be primarily in the form of changes in the document itself, but specific answers to each significant comment should also be included. These specific responses may be placed in an appendix. If the comments are especially voluminous, summaries of the comments and responses will suffice. (See Question 29 regarding the level of detail required for responses to comments.)

25b. How does an appendix differ from incorporation by reference?

A. First, if at all possible, the appendix accompanies the EIS, whereas the material which is incorporated by reference does not accompany the EIS. Thus the appendix should contain information that reviewers will be likely to want to examine. The appendix should include material that pertains to preparation of a particular EIS. Research papers directly relevant to the proposal, lists of affected species, discussion of the methodology of models used in the analysis of impacts, extremely detailed responses to comments, or other information, would be placed in the appendix.

The appendix must be complete and available at the time the EIS is filed. Five copies of the appendix must be sent to EPA with five copies of the EIS for filing. If the appendix is too bulky to be circulated, it instead must be placed in conveniently accessible locations or furnished directly to commentors upon request. If it is not circulated with the EIS, the Notice of Availability published by EPA must so state, giving a telephone number to enable potential commentors to locate or request copies of the appendix promptly.

Material that is not directly related to preparation of the EIS should be incorporated by reference. This would include other EISs, research papers in the general literature, technical background papers or other material that someone with technical training could use to evaluate the analysis of the proposal. These must be made available, either by citing the literature, furnishing copies to central locations, or sending copies directly to commentors upon request.

Care must be taken in all cases to ensure that material incorporated by reference, and the occasional appendix that does not accompany the EIS, are in fact available for the full minimum public comment period.

26a. Index and Keyword Index in EISs. How detailed must an EIS index be?

A. The EIS index should have a level of detail sufficient to focus on areas of the EIS of reasonable interest to any reader. It cannot be restricted to the most important topics. On the other hand, it need not identify every conceivable term or phrase in the EIS. If an agency believes that the reader is reasonably likely to be interested in a topic, it should be included.

26b. Is a keyword index required?

A. No. A keyword index is a relatively short list of descriptive terms that identifies the key concepts or subject areas in a document. For example it could consist of 20 terms which describe the most significant aspects of an EIS that a future researcher would need: type of proposal, type of impacts, type of environment, geographical area, sampling or

modeling methodologies used. This technique permits the compilation of EIS data banks, by facilitating quick and inexpensive access to stored materials. While a keyword index is not required by the regulations, it could be a useful addition for several reasons. First, it can be useful as a quick index for reviewers of the EIS, helping to focus on areas of interest. Second, if an agency keeps a listing of the keyword indexes of the EISs it produces, the EIS preparers themselves will have quick access to similar research data and methodologies to aid their future EIS work. Third, a keyword index will be needed to make an EIS available to future researchers using EIS data banks that are being developed. Preparation of such an index now when the document is produced will save a later effort when the data banks become operational.

27a. List of Preparers. If a consultant is used in preparing an EIS, must the list of preparers identify members of the consulting firm as well as the agency NEPA staff who were primarily responsible?

A. Section 1502.17 requires identification of the names and qualifications of persons who were primarily responsible for preparing the EIS or significant background papers, including basic components of the statement. This means that members of a consulting firm preparing material that is to become part of the EIS must be identified. The EIS should identify these individuals even though the consultant's contribution may have been modified by the agency.

27b. Should agency staff involved in reviewing and editing the EIS also be included in the list of preparers?

A. Agency personnel who wrote basic components of the EIS or significant background papers must, of course, be identified. The EIS should also list the technical editors who reviewed or edited the statements.

27c. How much information should be included on each person listed?

A. The list of preparers should normally not exceed two pages. Therefore, agencies must determine which individuals had primary responsibility and need not identify individuals with minor involvement. The list of preparers should include a very brief identification of the individuals involved, their qualifications (expertise, professional disciplines) and the specific portion of the EIS for which they are responsible. This may be done in tabular form to cut down on length. A line or two for each person's qualifications should be sufficient.

28. Advance or Xerox Copies of EIS. May an agency file xerox copies of an EIS with EPA pending the completion of printing the document?

A. Xerox copies of an EIS may be filed with EPA prior to printing only if the xerox copies are simultaneously made available to other agencies and the public. Section 1506.9 of the regulations, which governs EIS filing, specifically requires Federal agencies to file EISs with EPA no earlier than the EIS is distributed to the public. However, this section does not prohibit xeroxing as a form of reproduction and distribution. When an agency chooses xeroxing as the reproduction method, the EIS must be clear and legible to permit ease of reading and ultimate microfiching of the EIS. Where color graphs are important to the EIS, they should be reproduced and circulated with the xeroxed copy.

29a. Responses to Comments. What response must an agency provide to a comment on a draft EIS which states that the EIS's methodology is inadequate or inadequately explained? For example, what level of detail must an agency include in its response to a simple postcard comment making such an allegation?

A. Appropriate responses to comments are described in Section 1503.4. Normally the responses should result in changes in the text of the EIS, not simply a separate answer at the back of the document. But, in addition, the agency

AR00016241

must state what its response was, and if the agency decides that no substantive response to a comment is necessary, it must explain briefly why.

An agency is not under an obligation to issue a lengthy reiteration of its methodology for any portion of an EIS if the only comment addressing the methodology is a simple complaint that the EIS methodology is inadequate. But agencies must respond to comments, however brief, which are specific in their criticism of agency methodology. For example, if a commentor on an EIS said that an agency's air quality dispersion analysis or methodology was inadequate, and the agency had included a discussion of that analysis in the EIS, little if anything need be added in response to such a comment. However, if the commentor said that the dispersion analysis was inadequate because of its use of a certain computational technique, or that a dispersion analysis was inadequately explained because computational techniques were not included or referenced, then the agency would have to respond in a substantive and meaningful way to such a comment.

If a number of comments are identical or very similar, agencies may group the comments and prepare a single answer for each group. Comments may be summarized if they are especially voluminous. The comments or summaries must be attached to the EIS regardless of whether the agency believes they merit individual discussion in the body of the final EIS.

29b. How must an agency respond to a comment on a draft EIS that raises a new alternative not previously considered in the draft EIS?

A. This question might arise in several possible situations. First, a commentor on a draft EIS may indicate that there is a possible alternative which, in the agency's view, is not a reasonable alternative. Section 1502.14(a). If that is the case, the agency must explain why the comment does not warrant further agency response, citing authorities or reasons that support the agency's position and, if appropriate, indicate those circumstances which would trigger agency reappraisal or further response. Section 1503.4(a). For example, a commentor on a draft EIS on a coal fired power plant may suggest the alternative of using synthetic fuel. The agency may reject the alternative with a brief discussion (with authorities) of the unavailability of synthetic fuel within the time frame necessary to meet the need and purpose of the proposed facility.

A second possibility is that an agency may receive a comment indicating that a particular alternative, while reasonable, should be modified somewhat, for example, to achieve certain mitigation benefits, or for other reasons. If the modification is reasonable, the agency should include a discussion of it in the final EIS. For example, a commentor on a draft EIS on a proposal for a pumped storage power facility might suggest that the applicant's proposed alternative should be enhanced by the addition of certain reasonable mitigation measures, including the purchase and setaside of a wildlife preserve to substitute for the tract to be destroyed by the project. The modified alternative including the additional mitigation measures should be discussed by the agency in the final EIS.

A third slightly different possibility is that a comment on a draft EIS will raise an alternative which is a minor variation of one of the alternatives discussed in the draft EIS, but this variation was not given any consideration by the agency. In such a case, the agency should develop and evaluate the new alternative, if it is reasonable, in the final EIS. If it is qualitatively within the spectrum of alternatives that were discussed in the draft, a supplemental draft will not be needed. For example, a commentor on a draft EIS to designate a wilderness area within a National Forest might reasonably identify a specific tract of the forest, and urge that it be considered for designation. If the draft EIS considered designation of a range of alternative tracts which encompassed forest area of similar quality and quantity, no supplemental EIS would have to be prepared. The agency could fulfill its obligation by addressing that specific alternative in the final EIS.

As another example, an EIS on an urban housing project may analyze the alternatives of constructing 2,000, 4,000, or 6,000 units. A commentor on the draft EIS might urge the consideration of constructing 5,000 units utilizing a different configuration of buildings. This alternative is within the spectrum of alternatives already considered, and, therefore, could be addressed in the final EIS.

A fourth possibility is that a commentor points out an alternative which is not a variation of the proposal or of any alternative discussed in the draft impact statement, and is a reasonable alternative that warrants serious agency response. In such a case, the agency must issue a supplement to the draft EIS that discusses this new alternative. For example, a commentor on a draft EIS on a nuclear power plant might suggest that a reasonable alternative for meeting the projected need for power would be through peak load management and energy conservation programs. If the permitting agency has failed to consider that approach in the Draft EIS, and the approach cannot be dismissed by the agency as unreasonable, a supplement to the Draft EIS, which discusses that alternative, must be prepared. (If necessary, the same supplement should also discuss substantial changes in the proposed action or significant new circumstances or information, as required by Section 1502.9(c)(1) of the Council's regulations.)

If the new alternative was not raised by the commentor during scoping, but could have been, commentors may find that they are unpersuasive in their efforts to have their suggested alternative analyzed in detail by the agency. However, if the new alternative is discovered or developed later, and it could not reasonably have been raised during the scoping process, then the agency must address it in a supplemental draft EIS. The agency is, in any case, ultimately responsible for preparing an adequate EIS that considers all alternatives.

30. Adoption of EISs. When a cooperating agency with jurisdiction by law intends to adopt a lead agency's EIS and it is not satisfied with the adequacy of the document, may the cooperating agency adopt only the part of the EIS with which it is satisfied? If so, would a cooperating agency with jurisdiction by law have to prepare a separate EIS or EIS supplement covering the areas of disagreement with the lead agency?

A. Generally, a cooperating agency may adopt a lead agency's EIS without recirculating it if it concludes that its NEPA requirements and its comments and suggestions have been satisfied. Section 1506.3(a), (c). If necessary, a cooperating agency may adopt only a portion of the lead agency's EIS and may reject that part of the EIS with which it disagrees, stating publicly why it did so. Section 1506.3(a).

A cooperating agency with jurisdiction by law (e.g., an agency with independent legal responsibilities with respect to the proposal) has an independent legal obligation to comply with NEPA. Therefore, if the cooperating agency determines that the EIS is wrong or inadequate, it must prepare a supplement to the EIS, replacing or adding any needed information, and must circulate the supplement as a draft for public and agency review and comment. A final supplemental EIS would be required before the agency could take action. The adopted portions of the lead agency EIS should be circulated with the supplement. Section 1506.3(b). A cooperating agency with jurisdiction by law will have to prepare its own Record of Decision for its action, in which it must explain how it reached its conclusions. Each agency should explain how and why its conclusions differ, if that is the case, from those of other agencies which issued their Records of Decision earlier.

An agency that did not cooperate in preparation of an EIS may also adopt an EIS or portion thereof. But this would arise only in rare instances, because an agency adopting an EIS for use in its own decision normally would have been a cooperating agency. If the proposed action for which the EIS was prepared is substantially the same as the proposed action of the adopting agency, the EIS may be adopted as long as it is recirculated as a final EIS and the agency announces what it is doing. This would be followed by the 30-day review period and issuance of a Record of Decision by the adopting agency. If the proposed action by the adopting agency is not substantially the same as that in [46 FR 18036] the EIS (i.e., if an EIS on one action is being adapted for use in a decision on another action), the

AR00016242

EIS would be treated as a draft and circulated for the normal public comment period and other procedures. Section 1506.3(b).

31a. Application of Regulations to Independent Regulatory Agencies. Do the Council's NEPA regulations apply to independent regulatory agencies like the Federal Energy Regulatory Commission (FERC) and the Nuclear Regulatory Commission?

A. The statutory requirements of NEPA's Section 102 apply to "all agencies of the federal government." The NEPA regulations implement the procedural provisions of NEPA as set forth in NEPA's Section 102(2) for all agencies of the federal government. The NEPA regulations apply to independent regulatory agencies, however, they do not direct independent regulatory agencies or other agencies to make decisions in any particular way or in a way inconsistent with an agency's statutory charter. Sections 1500.3, 1500.6, 1507.1, and 1507.3.

31b. Can an Executive Branch agency like the Department of the Interior adopt an EIS prepared by an independent regulatory agency such as FERC?

A. If an independent regulatory agency such as FERC has prepared an EIS in connection with its approval of a proposed project, an Executive Branch agency (e.g., the Bureau of Land Management in the Department of the Interior) may, in accordance with Section 1506.3, adopt the EIS or a portion thereof for its use in considering the same proposal. In such a case the EIS must, to the satisfaction of the adopting agency, meet the standards for an adequate statement under the NEPA regulations (including scope and quality of analysis of alternatives) and must satisfy the adopting agency's comments and suggestions. If the independent regulatory agency fails to comply with the NEPA regulations, the cooperating or adopting agency may find that it is unable to adopt the EIS, thus forcing the preparation of a new EIS or EIS Supplement for the same action. The NEPA regulations were made applicable to all federal agencies in order to avoid this result, and to achieve uniform application and efficiency of the NEPA process.

32. Supplements to Old EISs. Under what circumstances do old EISs have to be supplemented before taking action on a proposal?

A. As a rule of thumb, if the proposal has not yet been implemented, or if the EIS concerns an ongoing program, EISs that are more than 5 years old should be carefully reexamined to determine if the criteria in Section 1502.9 compel preparation of an EIS supplement.

If an agency has made a substantial change in a proposed action that is relevant to environmental concerns, or if there are significant new circumstances or information relevant to environmental concerns and bearing on the proposed action or its impacts, a supplemental EIS must be prepared for an old EIS so that the agency has the best possible information to make any necessary substantive changes in its decisions regarding the proposal. Section 1502.9(c).

33a. Referrals. When must a referral of an interagency disagreement be made to the Council?

A. The Council's referral procedure is a pre-decision referral process for interagency disagreements. Hence, Section 1504.3 requires that a referring agency must deliver its referral to the Council not later than 25 days after publication by EPA of notice that the final EIS is available (unless the lead agency grants an extension of time under Section 1504.3(b)).

33b. May a referral be made after this issuance of a Record of Decision?

A. No, except for cases where agencies provide an internal appeal procedure which permits simultaneous filing of the final EIS and the record of decision (ROD). Section 1506.10(b)(2). Otherwise, as stated above, the process is a pre-decision referral process. Referrals must be made within 25 days after the notice of availability of the final EIS, whereas the final decision (ROD) may not be made or filed until after 30 days from the notice of availability of the EIS. Sections 1504.3(b), 1506.10(b). If a lead agency has granted an extension of time for another agency to take action on a referral, the ROD may not be issued until the extension has expired.

34a. Records of Decision. Must Records of Decision (RODs) be made public? How should they be made available?

A. Under the regulations, agencies must prepare a "concise public record of decision," which contains the elements specified in Section 1505.2. This public record may be integrated into any other decision record prepared by the agency, or it may be separate if decision documents are not normally made public. The Record of Decision is intended by the Council to be an environmental document (even though it is not explicitly mentioned in the definition of "environmental document" in Section 1508.10). Therefore, it must be made available to the public through appropriate public notice as required by Section 1506.6(b). However, there is no specific requirement for publication of the ROD itself, either in the Federal Register or elsewhere.

34b. May the summary section in the final Environmental Impact Statement substitute for or constitute an agency's Record of Decision?

A. No. An environmental impact statement is supposed to inform the decisionmaker before the decision is made. Sections 1502.1, 1505.2. The Council's regulations provide for a 30-day period after notice is published that the final EIS has been filed with EPA before the agency may take final action. During that period, in addition to the agency's own internal final review, the public and other agencies can comment on the final EIS prior to the agency's final action on the proposal. In addition, the Council's regulations make clear that the requirements for the summary in an EIS are not the same as the requirements for a ROD. Sections 1502.12 and 1505.2.

34c. What provisions should Records of Decision contain pertaining to mitigation and monitoring?

A. Lead agencies "shall include appropriate conditions [including mitigation measures and monitoring and enforcement programs] in grants, permits or other approvals" and shall "condition funding of actions on mitigation." Section 1505.3. Any such measures that are adopted must be explained and committed in the ROD.

The reasonable alternative mitigation measures and monitoring programs should have been addressed in the draft and final EIS. The discussion of mitigation and monitoring in a Record of Decision must be more detailed than a general statement that mitigation is being required, but not so detailed as to duplicate discussion of mitigation in the EIS. The Record of Decision should contain a concise summary identification of the mitigation measures which the agency has committed itself to adopt.

The Record of Decision must also state whether all practicable mitigation measures have been adopted, and if not, why not. Section 1505.2(c). The Record of Decision must identify the mitigation measures and monitoring and enforcement programs that have been selected and plainly indicate that they are adopted as part of the agency's decision. If the proposed action is the issuance of a permit or other approval, the specific details of the mitigation measures shall then be included as appropriate conditions in whatever grants, permits, funding or other approvals are being made by the federal agency. Section 1505.3 (a), (b). If the proposal is to be carried out by the [46 FR 18037] federal agency itself, the Record of Decision should delineate the mitigation and monitoring measures in sufficient detail to constitute an enforceable commitment, or incorporate by reference the portions of the EIS that do so.

AR00016243

34d. What is the enforceability of a Record of Decision?

A. Pursuant to generally recognized principles of federal administrative law, agencies will be held accountable for preparing Records of Decision that conform to the decisions actually made and for carrying out the actions set forth in the Records of Decision. This is based on the principle that an agency must comply with its own decisions and regulations once they are adopted. Thus, the terms of a Record of Decision are enforceable by agencies and private parties. A Record of Decision can be used to compel compliance with or execution of the mitigation measures identified therein.

35. Time Required for the NEPA Process. How long should the NEPA process take to complete?

A. When an EIS is required, the process obviously will take longer than when an EA is the only document prepared. But the Council's NEPA regulations encourage streamlined review, adoption of deadlines, elimination of duplicative work, eliciting suggested alternatives and other comments early through scoping, cooperation among agencies, and consultation with applicants during project planning. The Council has advised agencies that under the new NEPA regulations even large complex energy projects would require only about 12 months for the completion of the entire EIS process. For most major actions, this period is well within the planning time that is needed in any event, apart from NEPA.

The time required for the preparation of program EISs may be greater. The Council also recognizes that some projects will entail difficult long-term planning and/or the acquisition of certain data which of necessity will require more time for the preparation of the EIS. Indeed, some proposals should be given more time for the thoughtful preparation of an EIS and development of a decision which fulfills NEPA's substantive goals.

For cases in which only an environmental assessment will be prepared, the NEPA process should take no more than 3 months, and in many cases substantially less, as part of the normal analysis and approval process for the action.

36a. Environmental Assessments (EA). How long and detailed must an environmental assessment (EA) be?

A. The environmental assessment is a concise public document which has three defined functions. (1) It briefly provides sufficient evidence and analysis for determining whether to prepare an EIS; (2) it aids an agency's compliance with NEPA when no EIS is necessary, i.e., it helps to identify better alternatives and mitigation measures; and (3) it facilitates preparation of an EIS when one is necessary. Section 1508.9(a).

Since the EA is a concise document, it should not contain long descriptions or detailed data which the agency may have gathered. Rather, it should contain a brief discussion of the need for the proposal, alternatives to the proposal, the environmental impacts of the proposed action and alternatives, and a list of agencies and persons consulted. Section 1508.9(b).

While the regulations do not contain page limits for EA's, the Council has generally advised agencies to keep the length of EAs to not more than approximately 10-15 pages. Some agencies expressly provide page guidelines (e.g., 10-15 pages in the case of the Army Corps). To avoid undue length, the EA may incorporate by reference background data to support its concise discussion of the proposal and relevant issues.

36b. Under what circumstances is a lengthy EA appropriate?

A. Agencies should avoid preparing lengthy EAs except in unusual cases, where a proposal is so complex that a concise document cannot meet the goals of Section 1508.9 and where it is extremely difficult to determine whether

the proposal could have significant environmental effects. In most cases, however, a lengthy EA indicates that an EIS is needed.

37a. Findings of No Significant Impact (FONSI). What is the level of detail of information that must be included in a finding of no significant impact (FONSI)?

A. The FONSI is a document in which the agency briefly explains the reasons why an action will not have a significant effect on the human environment and, therefore, why an EIS will not be prepared. Section 1508.13. The finding itself need not be detailed, but must succinctly state the reasons for deciding that the action will have no significant environmental effects, and, if relevant, must show which factors were weighted most heavily in the determination. In addition to this statement, the FONSI must include, summarize, or attach and incorporate by reference, the environmental assessment.

37b. What are the criteria for deciding whether a FONSI should be made available for public review for 30 days before the agency's final determination whether to prepare an EIS?

A. Public review is necessary, for example, (a) if the proposal is a borderline case, i.e., when there is a reasonable argument for preparation of an EIS; (b) if it is an unusual case, a new kind of action, or a precedent setting case such as a first intrusion of even a minor development into a pristine area; (c) when there is either scientific or public controversy over the proposal; or (d) when it involves a proposal which is or is closely similar to one which normally requires preparation of an EIS. Sections 1501.4(e)(2), 1508.27. Agencies also must allow a period of public review of the FONSI if the proposed action would be located in a floodplain or wetland. E.O. 11988, Sec. 2(a)(4); E.O. 11990, Sec. 2(b).

38. Public Availability of EAs v. FONSIs. Must (EAs) and FONSIs be made public? If so, how should this be done?

A. Yes, they must be available to the public. Section 1506.6 requires agencies to involve the public in implementing their NEPA procedures, and this includes public involvement in the preparation of EAs and FONSIs. These are public "environmental documents" under Section 1506.6(b), and, therefore, agencies must give public notice of their availability. A combination of methods may be used to give notice, and the methods should be tailored to the needs of particular cases. Thus, a Federal Register notice of availability of the documents, coupled with notices in national publications and mailed to interested national groups might be appropriate for proposals that are national in scope. Local newspaper notices may be more appropriate for regional or site-specific proposals.

The objective, however, is to notify all interested or affected parties. If this is not being achieved, then the methods should be reevaluated and changed. Repeated failure to reach the interested or affected public would be interpreted as a violation of the regulations.

39. Mitigation Measures Imposed in EAs and FONSIs. Can an EA and FONSI be used to impose enforceable mitigation measures, monitoring programs, or other requirements, even though there is no requirement in the regulations in such cases for a formal Record of Decision?

A. Yes. In cases where an environmental assessment is the appropriate environmental document, there still may be mitigation measures or alternatives that would be desirable to consider and adopt even though the impacts of the proposal will not be "significant." In such cases, the EA should include a discussion of these measures or alternatives to "assist [46 FR 18038] agency planning and decisionmaking" and to "aid an agency's compliance with [NEPA] when no environmental impact statement is necessary." Section 1501.3(b), 1508.9(a)(2). The appropriate mitigation

AR00016244

measures can be imposed as enforceable permit conditions, or adopted as part of the agency final decision in the same manner mitigation measures are adopted in the formal Record of Decision that is required in EIS cases.

40. Propriety of Issuing EA When Mitigation Reduces Impacts. If an environmental assessment indicates that the environmental effects of a proposal are significant but that, with mitigation, those effects may be reduced to less than significant levels, may the agency make a finding of no significant impact rather than prepare an EIS? Is that a legitimate function of an EA and scoping?

[N.B.: Courts have disagreed with CEQ's position in Question 40. The 1987-88 CEQ Annual Report stated that CEQ intended to issue additional guidance on this topic. Ed. note.]

A. Mitigation measures may be relied upon to make a finding of no significant impact only if they are imposed by statute or regulation, or submitted by an applicant or agency as part of the original proposal. As a general rule, the regulations contemplate that agencies should use a broad approach in defining significance and should not rely on the possibility of mitigation as an excuse to avoid the EIS requirement. Sections 1508.8, 1508.27.

If a proposal appears to have adverse effects which would be significant, and certain mitigation measures are then developed during the scoping or EA stages, the existence of such possible mitigation does not obviate the need for an EIS. Therefore, if scoping or the EA identifies certain mitigation possibilities without altering the nature of the overall proposal itself, the agency should continue the EIS process and submit the proposal, and the potential mitigation, for public and agency review and comment. This is essential to ensure that the final decision is based on all the relevant factors and that the full NEPA process will result in enforceable mitigation measures through the Record of Decision.

In some instances, where the proposal itself so integrates mitigation from the beginning that it is impossible to define the proposal without including the mitigation, the agency may then rely on the mitigation measures in determining that the overall effects would not be significant (e.g., where an application for a permit for a small hydro dam is based on a binding commitment to build fish ladders, to permit adequate down stream flow, and to replace any lost wetlands, wildlife habitat and recreational potential). In those instances, agencies should make the FONSI and EA available for 30 days of public comment before taking action. Section 1501.4(e)(2).

Similarly, scoping may result in a redefinition of the entire project, as a result of mitigation proposals. In that case, the agency may alter its previous decision to do an EIS, as long as the agency or applicant resubmits the entire proposal and the EA and FONSI are available for 30 days of review and comment. One example of this would be where the size and location of a proposed industrial park are changed to avoid affecting a nearby wetland area.

3.2 The Major Investment Study (MIS)

The following is paraphrased from the Washington State Department of Transportation (WSDOT) Major Investment Study (MIS) Guidelines. September 1996 found at www.wsdot.wa.gov/ppsc/planning/mis.htm

The Federal Highway Administration and Federal Transit Administration developed guidance based on ISTEA which included the requirements for Major Investment Studies (MIS) for Metropolitan Planning guidance. Major Investment Studies are tools to aid the decision making process by providing more complete information on the options for addressing transportation problems. Major Investment Studies can help to level the playing field among modal alternatives by providing a single integrated analysis process that looks at all modes equally.

The Major Investment Study is a sub-element of the Metropolitan Transportation Planning (MTP) process. It focuses on corridor or subarea transportation demand and other problems that may lead to transit or highway investments that have a substantial capital investment and impact on the metropolitan transportation system.

Flexibility is the key to the Major Investment Study process. The goal is to produce the information necessary to make the best investment decision, while minimizing the funding resources needed to produce that information. The guidelines are deliberately generalized to avoid specific recommendations that would not be applicable to all types of studies.

The Major Investment Study process is tied to the development of environmental documentation, so a determination of when to begin Major Investment Study development should be made to coincide with the environmental process. The environmental process will use Major Investment Study analysis as an input if the Major Investment Study is started during the planning process. The Major Investment Study should be concluded before including a project in the TIP. Major investment studies are aimed at deficiencies that have the following characteristics: major demand problem; on a corridor or subarea level; require a substantial capital investment; and have significant impact on the metropolitan transportation system.

Major Investment Study are designed to develop alternatives which represent the full range of modal solutions; to evaluate alternatives; to determine what information is required; and to identify what technical methods should be used. The statement should be based on underlying causes and should not be mode specific. The problem statement should describe the problem itself, not symptoms of the problem. The steering committee determines goals and objectives after the problem statement is completed.

A Major Investment Study should consider all reasonable alternatives, including demand and system management options when appropriate. No alternative should be analyzed after it has been determined to be unfeasible. A Major Investment Study alternative should be a design concept for a transportation mode, operations element, or demand management strategy. The location, general alignment and termini should be identified. Each alternative should be distinguished from other alternatives based on its performance, benefits, cost, and/or impacts. All alternatives should be sufficiently distinctive that they are not confused with other alternatives.

There are different methods for analyzing modal alternatives. While there is no one correct methodology, certain methods work better in certain areas, and the precision needed may differ by problem and by region. The goal is to perform the minimum amount of analysis needed to identify the preferred alternative. When the method of analysis is unclear, it should be determined by a consensus of the Scoping Committee.

After completion of MIS analysis, the findings should be documented. The documentation usually occurs either in the project's environmental document or in a separate report document. There is no formal approval of a Major Investment Study findings. After the lead agency prepares the documentation, it should be distributed to all stakeholders. After an agreed upon and brief period for comment and acceptance of the preferred alternative by the Major Investment Study steering committee, the Major Investment Study will be considered final.

Two options exist within Major Investment Study development for environmental documentation such as environmental impact statements. Table 1 shows the two options. In Option One, the Major Investment Study is completed before the environmental documentation. In Option Two, the Major Investment Study and environmental document are developed concurrently. The determination of which "option" to use is entirely dependent on what point in the project's life the Major Investment Study is started.

Requirements for analyzing alternatives to capacity expansion projects in the Congestion Management System (CMS) are similar to Major Investment Study requirements, however they are less rigorous. While a Congestion Management System requires some consideration of modal alternatives, a Major Investment Study will analyze

AR00016245

alternatives on a specific project/corridor/suburen level, while the Congestion Management System will analyze on more of a system wide level. Some deficiencies that do not require an Major Investment Study will require alternatives analysis under the Congestion Management System. Any deficiency that undergoes a Major Investment Study will meet analysis requirements of the Congestion Management System.

How do Major Investment Studies relate to Least Cost Planning? Least Cost Planning requires that Regional Transportation Plans undergo alternatives analysis. Least cost planning, as defined in Washington State law, will analyze the entire regional plan. Like the Congestion Management System, least cost planning will apply to more of a system level, and will be less rigorous than an Major Investment Study.

3.3 Hawai'i Revised Statutes (HRS 343)

§343-1 Findings and purpose. The legislature finds that the quality of humanity's environment is critical to humanity's well being, that humanity's activities have broad and profound effects upon the interrelations of all components of the environment, and that an environmental review process will integrate the review of environmental concerns with existing planning processes of the State and counties and alert decision makers to significant environmental effects which may result from the implementation of certain actions. The legislature further finds that the process of reviewing environmental effects is desirable because environmental consciousness is enhanced, cooperation and coordination are encouraged, and public participation during the review process benefits all parties involved and society as a whole.

3.4 Hawai'i Administrative Rules (HAR 11-200)

§11-200-1 Purpose. Chapter 343, HRS, establishes a system of environmental review at the state and county levels which shall ensure that environmental concerns are given appropriate consideration in decision making along with economic and technical considerations. The purpose of this chapter is to provide agencies and persons with procedures, specifications of contents of environmental assessments and environmental impact statements, and criteria and definitions of statewide application.

"Cumulative impact" means the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time.

"Primary impact" or "primary effect" or "direct impact" or "direct effect" means effects which are caused by the action and occur at the same time and place.

"Secondary impact" or "secondary effect" or "indirect impact" or "indirect effect" means effects which are caused by the action and are later in time or farther removed in distance, but are still reasonably foreseeable. Indirect effects may include growth inducing effects and other effects related to induced changes in the pattern of land use, population density or growth rate, and related effects on air and water and other natural systems, including ecosystems.

§11-200-7 Multiple or phased applicant or agency actions. A group of actions proposed by an agency or an applicant shall be treated as a single action when:

(1) The component actions are phases or increments of a larger total undertaking;

(2) An individual project is a necessary precedent for a larger project;

(3) An individual project represents a commitment to a larger project; or

(4) The actions in question are essentially identical and a single statement will adequately address the impacts of each individual action and those of the group of actions as a whole.

§11-200-14 General provisions. Chapter 343, HRS, directs that in both agency and applicant actions where statements are required, the preparing party shall prepare the EIS, submit it for review and comments, and revise it, taking into account all critiques and responses. Consequently, the EIS process involves more than the preparation of a document; it involves the entire process of research, discussion, preparation of a statement, and review. The EIS process shall involve at a minimum: identifying environmental concerns, obtaining various relevant data, conducting necessary studies, receiving public and agency input, evaluating alternatives, and proposing measures for avoiding, minimizing, rectifying or reducing adverse impacts. An EIS is meaningless without the conscientious application of the EIS process as a whole, and shall not be merely a self-serving recitation of benefits and a rationalization of the proposed action. Agencies shall ensure that statements are prepared at the earliest opportunity in the planning and decision-making process. This shall assure an early open forum for discussion of adverse effects and available alternatives, and that the decision-makers will be enlightened to any environmental consequences of the proposed action. [Eff 12/6/85; am and comp AUG 31 1996] (Auth: HRS §343-5, 343-6) (Imp: HRS §343-6)

§11-200-16 Content requirements. The environmental impact statement shall contain an explanation of the environmental consequences of the proposed action. The contents shall fully declare the environmental implications of the proposed action and shall discuss all relevant and feasible consequences of the action. In order that the public can be fully informed and that the agency can make a sound decision based upon the full range of responsible opinion on environmental effects, a statement shall include responsible opposing views, if any, on significant environmental issues raised by the proposal. [Eff 12/6/85; am and comp AUG 31 1996] (Auth: HRS §343-5, 343-6) (Imp: HRS §343-2, 343-5, 343-6)

§11-200-17 Content requirements; draft environmental impact statement. ... (f) The draft EIS shall describe in a separate and distinct section alternatives which could attain the objectives of the action, regardless of cost, in sufficient detail to explain why they were rejected. The section shall include a rigorous exploration and objective evaluation of the environmental impacts of all such alternative actions. Particular attention shall be given to alternatives that might enhance environmental quality or avoid, reduce, or minimize some or all of the adverse environmental effects, costs, and risks. Examples of alternatives include:

(1) The alternative of no action;

(2) Alternatives requiring actions of a significantly different nature which would provide similar benefits with different environmental impacts;

(3) Alternatives related to different designs or details of the proposed actions which would present different environmental impacts;

AR00016246

(4) The alternative of postponing action pending further study; and,

(5) Alternative locations for the proposed project.

In each case, the analysis shall be sufficiently detailed to allow the comparative evaluation of the environmental benefits, costs, and risks of the proposed action and each reasonable alternative. For any agency actions, the discussion of alternatives shall include, where relevant, those alternatives not within the existing authority of the agency. ...

(i) The draft EIS shall include a statement of the probable impact of the proposed action on the environment, and impacts of the natural or human environment on the project, which shall include consideration of all phases of the action and consideration of all consequences on the environment; direct and indirect effects shall be included. The interrelationships and cumulative environmental impacts of the proposed action and other related projects shall be discussed in the draft EIS. It should be realized that several actions, in particular those that involve the construction of public facilities or structures (e.g., highways, airports, sewer systems, water resource projects, etc.) may well stimulate or induce secondary effects. These secondary effects may be equally important as, or more important than, primary effects, and shall be thoroughly discussed to fully describe the probable impact of the proposed action on the environment. The population and growth impacts of an action shall be estimated if expected to be significant, and an evaluation made of the effects of any possible change in population patterns or growth upon the resource base, including but not limited to land use, water, and public services, of the area in question. Also, if the proposed action constitutes a direct or indirect source of pollution as determined by any governmental agency, necessary data shall be incorporated into the EIS.

§11-200-19 Environmental impact statement style. In developing the EIS, preparers shall make every effort to convey the required information succinctly in a form easily understood, both by members of the public and by public decision-makers, giving attention to the substance of the information conveyed rather than to the particular form, or length, or detail of the statement. The scope of the statement may vary with the scope of the proposed action and its impact. Data and analyses in a statement shall be commensurate with the importance of the impact, and less important material may be summarized, consolidated, or simply referenced. Statements shall indicate at appropriate points in the text any underlying studies, reports, and other information obtained and considered in preparing the statement, including cost benefit analyses and reports required under other legal authorities. Care shall be taken to concentrate on important issues and to ensure that the statement remains an essentially self-contained document, capable of being understood by the reader without the need for undue cross-reference.

3.5 Federal Highway Administration (FHWA)/ Federal Transportation Administration (FTA)

Public involvement in transportation investment decisionmaking is central. Transportation investment decisions have far-reaching effects. Public input is essential in adequately considering them. An effective public involvement process provides for an open exchange of information and ideas between the public and transportation decisionmakers. The overall objective of an area's public involvement process is that it be proactive, provide complete information, timely public notice, full public access to key decisions, and opportunities for early and continuing involvement. It also provides mechanisms for the agency or agencies to solicit public comments and ideas, identify circumstances and impacts which may not have been known or anticipated by public agencies, and, by doing so, to build support among the public who are stakeholders in transportation investments which impact their communities.
A good indicator of an effective public involvement process is a well informed public which feels it has opportunities to contribute input into transportation decisionmaking processes through a broad array of involvement opportunities at all stages of decisionmaking. In contrast, an ineffective process is one that relies on one or two

public meetings or hearings to obtain input immediately prior to decisionmaking on developed draft plans and programs.

"Six useful key elements in planning for effective public involvement are:

(1) Clearly-defined purpose and objectives for initiating a public dialogue on transportation plans, programs, and projects,

(2) Identification of specifically who the affected public and other stakeholder groups are with respect to the plan(s), program(s), and project(s) under development,

(3) Identification of techniques for engaging the public in the process,

(4) Notification procedures which effectively target affected groups,

(5) Education and assistance techniques which result in an accurate and full public understanding of the transportation problem, potential solutions, and obstacles and opportunities within various solutions to the problem, and,

(6) Follow through by public agencies demonstrating that decisionmakers seriously considered public input." [2] What are some of the key considerations in planning for effective public involvement? *FHWA/FTA Questions and Answers on Public Involvement in Transportation Decisionmaking*

Technical Access "Under the ISTEA and related regulations, the public must have reasonable access to technical assumptions and specifications used in planning and emissions models. This includes access to input assumptions such as population projections, land use projections, fares, tolls, levels of service, the structure and specifications of travel demand and other evaluation tools. To the maximum extent possible, all technical information should be made available in formats which are easily accessible and understandable by the general public. *FHWA/FTA Questions and Answers on Public Involvement in Transportation Decisionmaking*

Chapter 4 Experiences of Other Communities

OMPO: "In Santa Clara, the light rail system really helped reduce traffic congestion by moving masses of people from residential areas to the work centers. In Portland, its fully integrated transportation system reduced traffic congestion, increased mobility, and lowered infrastructure costs. This integrated system even enabled them to convert a freeway into a park. Also, new land use laws helped them determine commuter packages. In both Santa Clara and Portland, transportation developments spurred retail and residential growth along transit lines and around transit malls. In Vancouver, ferries were incorporated as a transportation mode to move people from the residential areas to the downtown business areas. Retail malls developed around the ferry terminals." City and County of Honolulu Transportation Commissioner Paul Leong. OMPO Policy Committee ("OMPO-PC") Minutes. Tuesday, December 1, 1998, 10:30 a.m.

OMPO: "Councilmember Mansho noted that, for the financing of rail design and construction, Portland used local property taxes and a 0.6% payroll tax (like a sales tax on the operating expenses). The biggest difference discovered between Hawaii's initial attempt at acquiring rail and Portland's approach was that Portland's goals included planning livable communities and congestion management. All the statistics and data the Council has been receiving over the past years show that rail doesn't necessarily reduce all the congestion; it manages the congestion. Benefits of rail also include economic stimulus, land use planning, and urban growth boundary lines. These factors played a Life of the Land

AR00016247

bigger role in our current discussions on rail and the future." OMPO-PC Minutes. Tuesday, December 1, 1998, 10:30 a.m.

SmartGrowth: "As anyone who reads the fiction in The New Yorker knows, American mostly live in banal places with the souls of shopping malls, affording nowhere to mingle except traffic jams, nowhere to walk except in the health club. But economic unsustainability may carry more weight. A conference on 'Alternatives to Sprawl' at the Brookings Institution this year was electrified by a report from the Bank of America endorsing the formerly elitist view that sprawl in California has created 'enormous social, environmental and economic costs, which until now have been hidden, ignored, or quietly borne by society ... Businesses suffer from higher costs, a loss in worker productivity, and underutilized investments in older communities.' 'You can't keep spreading out,' says Mike Burton, executive director of Portland, Ore.'s metropolitan government, Metro. 'The cost to make roads and sewers gets to the point where it doesn't work.'" Paved Paradise By Jerry Adler *www.smartgrowth.org/*

Chapter 5 Alternatives

5.1 A Super Enhanced Bus System Management (TSM) Alternative

Parsons Brinkerhoff Quade & Douglas proposed two versions of the TSM Alternative for the Orange County, California Major Investment Study. One increased existing buses by approximately 49% the other by approximately 116%.

Honolulu should evaluate two different expanded bus-only scenarios. The first would encourage a "balanced" approach relying on increased efficiency for both buses and cars. The second would "encourage" people to take buses. The second approach, the "Enhanced Bus System (EBS) would not decrease the current level of congestion. It would instead focus on developing a highly efficient bus system. People would then face two options: car congestion and bus efficiency. This would cause people to shift from cars to buses which would indirectly reduce congestion while sharply reducing air pollution, non-point-source-pollution (oil, metals) and make the city more "sustainable."

"Any successful transportation plan will make it easier and more pleasant to drive, not more difficult" Islandwide Mobility Concept Plan, page 2. This point rather succinctly summarizes all the proposed plans by the consultant. They are designed to increase the joy of driving. A super enhanced bus system is based on the opposite. By having congestion, people find the bus to be more desirable. At the same time, the super-availability of the bus and the variety of routes offered, would lead to widespread enjoyment of the bus.

2 An Enhanced Bus System is a reasonable and viable alternative (CEQ Q1a,b). The alternative is "practical' and "feasible from the technical and economic standpoint and using common sense" (CEQ Q2a). It is an environmental preferable alternative (CEQ 6a) since it would result in less vehicular air pollution and oil/heavy metal non-point-source runoff than other alternatives listed in the Environmental Impact Statement Preparation Notice. It is "the alternative that causes less damage to the biological and physical environment" and it is "the alternative which greatly protects, preserves, and enhances historic, cultural, and natural resources." Furthermore the Enhanced Bus System is a viable option under the Major Investment Study process.

The Enhanced Bus System would further expand on the Express Bus & Circulator Bus System. The system would provide high capacity; frequent service; ziplane and busways; express routes from outer communities; bus priority measures on arterial routes; local bus routes; neighborhood circulators; transit centers to transfer between routes and modes.

Express Buses should run every 15-20 minutes during the full rush hour and every 30-45 minutes during the rest of the day. There should be two seperate but linked Express Bus systems: one offering service to Honolulu and one

offering service to Kapolei (which is our "second city"). Circulator buses should offer more complete service to the military bases (including Helemano). Regional bus service should link neighboring communities (such as Wahiawa, Mililani, Waipio and Waikele).

2

The number of buses acquired by this alternative would be at least twice that of the regular bus expansion alternative.

At $250 a ticket, enforcement of the two-person HOV lane could initially finance a large part of this alternative. It has been alleged that there is no place to pull over vehicles who's occupant appears to be driving solo. It has also been alleged that it is inefficient to mail tickets to apparent violators because many people state that they had a hidden passenger. However, at $250 a ticket, it is profitable for the police to follow a car for up to 20 miles and pull the car over somewhere else. If tickets led to drivers obeying the HOV lanes, then the lanes would suddenly lose 30% of the vehicles currently occupying them. The HOV lanes would move faster, appear to be more appealing than the regular lanes, and lead to greater carpooling.

3

As drivers shifted to HOV lanes and buses, congestion would decrease. The expansion of the zipper lane to Middle Street would make transit more efficient.

5.2 A Commuter-Based Dedicated Bicycle Lane System Alternative

"A successful Transportation Demand Management (TDM) must evaluate all forms of alternative modes of transportation designed to reduce the use of single occupant vehicles. This includes buses, carpools, vans and bicycles. The bicycle component of TDM must include bicycle use for recreation and business commutes as well as bicycle parking." San Francisco Bicycle Plan

A Commuter-Based Dedicated Bicycle Lane System Alternative is a reasonable and viable alternative (CEQ Q1a,b). The alternative is "practical' and "feasible from the technical and economic standpoint and using common sense" (CEQ Q2a). It is the most environmental preferable alternative (CEQ 6a) since it would result the least vehicular air pollution and oil/heavy metal non-point-source runoff than other alternatives listed in the Environmental Impact Statement Preparation Notice. It is "the alternative that causes the least damage to the biological and physical environment" and it is "the alternative which greatly protects, preserves, and enhances historic, cultural, and natural resources." Furthermore the Commuter-Based Dedicated Bicycle Lane System Alternative is a viable option under the Major Investment Study process.

4 "Honolulu is already a great city for bicycles - and it has a potential to be one of the best! It has physical beauty, mild year-around climate, relatively flat coastal plain and a compact form making it ideal for bicycle transportation." The Honolulu Bikeway System Master Plan (www.co.honolulu.hi.us/dts/)

"The potential is great for bicycles to become a significant transportation mode in urban Honolulu. Already, more than three times as many commuters use bicycles to get to work as the national average, despite a scarcity of well located bikeways and sufficient end-of-transit facilities" The Honolulu Bikeway System Master

"Bicycling is a very popular form of recreation for Honolulu residents." The Honolulu Bikeway System Master

"Bicycling is a pollution-free, economical and healthy alternative transportation mode for many work, shopping and recreational trips in Honolulu. The limited supply and high cost of parking as well as traffic congestion and the City's compactness make bicycling an attractive option for many."

AR00016248

"The key to a successful implementation strategy, as evidenced by the experience of other cities, has been the routinization of bicycle planning considerations in the on-going planning and design phases of a capital construction project. In particular, the inclusion of bicycle design standards must be at a phase sufficiently early in the project's development that there are no adverse cost implications that might curtail their inclusion." San Francisco Bicycle Plan

Bicycle Lanes can be classified by the amount of multi-use activity: dedicated bike path; dedicated lane; dedicated half-lane; car/bike lane designated as a multiuse lane; and non-bike-designated car lane.

"Many parents prohibit their children from riding bicycles to school due to fears about safety on the streets." The Honolulu Bikeway System Master Plan

Currently, during the rush hour, residents of Palolo can travel to Hotel Street equally quickly by car or bike. Many chose cars because of the inherent danger associated with riding bicycles in a congested vehicle area.

Some of the members of Life of the Land have been injured while on their bicycles in the downtown area. Many of our members would chose to use bicycles some or all of the time if dedicated bicycle lanes provided a safe, convenient commute.

"The City should install on-street bicycle parking in retail districts, activity centers or developments in areas where businesses or landlords are not individually responsible for off-street parking. This program must include bicycle parking in both the public right-of-way and in the private off-street parking lots of existing businesses, including supermarkets, super drugstores, retail stores, shopping malls, and employment sites." San Francisco Bicycle Plan

4

California found the four most common forms of accidents caused by automobile drivers to bike riders were: Opening car door when unsafe; failure to yield when turning left; unsafe turn and/or without signaling; and unsafe speed.

"It should be noted at the outset that a wide spectrum of traditional funding sources is available for bicycle programs and projects. Following the passage of the Intermodal Surface Transportation Efficiency Act (ISTEA) in 1991, several new funding opportunities became available for bicycle projects and programs. The opportunities to develop regional funding requests that included a greater emphasis on air quality, congestion mitigation, and balanced transportation systems allowed bicycle programs to be evaluated routinely along with highway and transit requests. These Surface Transportation Program (STP) and Congestion Mitigation and Air Quality (CMAQ) funds were further expanded via the federal government's annual consideration of worthy demonstration projects." San Francisco Bicycle Plan

Commuter biking will increase with the creation of dedicated bike lanes that connect residential areas with the downtown and with the university. The route most suggested by environmentalists has been Young Street. The proposal by the consultant in this study - to reduce the car lanes on the Nimitz - provides another opportunity. One possible dedicated bicycle route would be from the University area along (a) Dole Street; (b) a dedicated bike lane over the H-1; (c) a dedicated lane along Isenburg; (d) conversion of Young Street to five lanes (parking on each side; one-lane-one-way car traffic; and two-way bicycle traffic); (e) a dedicated bike path through or around the edge of Thomas Square; (f) Hotel Street; (g) a dedicated path paralleling the current pedestrian path by the City and State Governmental buildings; (h) dedicated lane on Richards; (i) dedicated lanes on Nimitz.

5.3 A Light Rail Transit (LRT) Alternative.

"DTS would like to lay out an entire system that doesn't require the whole system to be in place in order to be of value. DTS would develop a program that could be implemented incrementally, in phases, according to ability to pay. The policy makers will need to decide what the ability to pay is for each particular phase." Policy Committee Meeting OMPO Policy Committee. August 4, 1998, 10:30 a.m.

Chapter 6 Assumptions & Models Common to all Alternatives

6.1 Road Network Assumptions

There may be an increase in vehicle-miles due to the building of alternate routes (Sand Island Parkway; Nimitz Highway); providing radio coverage/electronic signs on traffic jams; and/or the ending of the Hawaii and/or Asian recessions;

6.2 Travel Demand Management Assumptions

There may be an decrease in vehicle-miles due to people shifting from one-person per vehicle to carpools, rail and/or buses, perhaps due to the availability of all-day express buses.

There may be a shift in destinations due to the development of the Second City; building the Natatorium; expanding the Aloha Tower Marketplace; development of cruise ship berths; and/or building the Waipio/Kalaeloa Sports Complexes.

5

There may be an increase in bus use with no decrease in vehicle-miles due to the availability of all-day express buses that will encourage people (elderly and youth) who would stay home without the service. This phenomena was written about regarding the Mililani Trolley in the latest issue of Ka Nupepa.

OMPO: "Gordon Lum explained that ... OMPO is also in the process of finalizing the development of new travel forecasting models. ... These models will also be more sensitive to some of our travel needs, including transit forecasts. In order to ensure that these models are used by OMPO staff as well as the agencies, OMPO requires this in-house capability. Otherwise, OMPO would have to continue to rely upon consultants to use these models." OMPO-PC Minutes Tuesday, September 1, 1998, 10:30 a.m

6.3 Population Growth Assumptions

There may be an increase in vehicle-miles and bus/train use due to population growth, tourism growth and/or the rejuvenation of Waikiki, since under the existing limits of the Waikiki Special District (WSD) the floor area of Waikiki has already been zoned to expand from the current 7M square feet to 14M square feet, in effect, doubling in size.

5

6.4 Models: Outcome Success vs. Failure

AR00016249

The model may measure success or failure through the use of indices such as the "Time Of Travel" (TOT) and/or the "Level Of Service" (LOS) or through some other means. The model should clearly identify why a particular measure of success was chosen.

5 Determining whether a project will be successful or not frequently boils down to the model chosen, the assumptions (often unstated) assumed and the data used. It sort of seems to make sense that if there are more buses and or trains, the number of vehicles on the role will decrease. But this does not necessarily follow.

6.5 Sensitivity Analysis of the Model

5 How dependent is the models solution on the model, assumptions and data used? When the data is chosen, the assumptions are assumed and the model is used, a result will follow. But how will the result change under minimal alterations of the given?

Chapter 7 Environmental Consequences

7.1 Unusual Impacts?

"Cities like Honolulu have grown up next to deep harbors and at the intersections of railroads and rivers." Islandwide Mobility Concept Plan, page 10

6 "Freeway ramps have attracted development of shopping malls and 'big box' stores. Neighborhood shopping districts have thrived where pedestrians walk. Islandwide Mobility Concept Plan, page 10. Perhaps that is why Office Depot is arriving, they will be next to a not-yet-publicly-announced freeway ramp. We thought it was because of the million dollar financial package.

7.2 Cumulative and Secondary Impacts

"Cumulative impact" means the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time. (HAR §11-200-1)

"Primary impact" or "primary effect" or "direct impact" or "direct effect" means effects which are caused by the action and occur at the same time and place. (HAR §11-200-1)

7

"Secondary impact" or "secondary effect" or "indirect impact" or "indirect effect" means effects which are caused by the action and are later in time or farther removed in distance, but are still reasonably foreseeable. Indirect effects may include growth inducing effects and other effects related to induced changes in the pattern of land use, population density or growth rate, and related effects on air and water and other natural systems, including ecosystems. (HAR §11-200-1)

A group of actions proposed by an agency or an applicant shall be treated as a single action when: (1) The component actions are phases or increments of a larger total undertaking; (2) An individual project is a necessary precedent for a larger project; (3) An individual project represents a commitment to a larger project; or (4) The actions in question are essentially identical and a single statement will adequately address the impacts of each individual action and those of the group of actions as a whole. (HAR §11-200-7)

"Promoting economic development is also critical to maintaining the health of our island communities." Islandwide Mobility Concept Plan, page vi. "Honolulu must find a way to preserve, maintain, and protect the quality of life of its
7 people and the health of its environment, while providing for the growth necessary for prosperity." Islandwide Mobility Concept Plan, page 2. (Are they stating that: "stability requires growth")

7.3 Air Quality Impacts

How will air quality change as a result of secondary growth resulting from the new bus and/or bus/rail system? It should be realized that several actions, in particular those that involve the construction of public facilities ... may
8 well stimulate or induce secondary effects. These secondary effects may be equally important as, or more important than, primary effects, and shall be thoroughly discussed ... and an evaluation made of the effects of any possible change in population patterns or growth upon the resource base" (HAR §11-200-17(i))

7.4 Water Resources Impacts

It should be realized that several actions, in particular those that involve the construction of public facilities ... may
9 well stimulate or induce secondary effects. These secondary effects may be equally important as, or more important than, primary effects, and shall be thoroughly discussed ... and an evaluation made of the effects of any possible change in population patterns or growth upon the resource base, including ... water" (HAR §11-200-17(i))

7.5 Transportation Model Impacts

Should we be moving toward greater use of mass transit OR greater use of cars OR be designing a system that has something for everything and has a huge price tag for our recession-based economy? "Road building and automobile use have a synergistic relationship that is ultimately unsustainable, since it leads to ever more road building, cars, congestion, and reduction in the quality of the environment. Islandwide Mobility Concept Plan, page 10. Dedicated Ramps provide direct access to and from zipper lanes, busways, and HOV lanes. ...Oahu has an extensive network of
10 freeways ... some physical modifications will help to maintain the effectiveness of the overall system. Also, the expansion of the Zipper Lane ... Interchange improvements and selective widenings will also help to alleviate bottlenecks and improve freeway safety. ... The feasibility of using a zipper lane for the afternoon rush hour out of town is being studied. ... Kamehameha Highway to be widened from two to four lanes from Ka Uka Boulevard to Mililani ... Kunia Road ... plans to extend this widening to Anonui Road in the near future. ... widen Puuloa Road" Islandwide Mobility Concept Plan, page 30, 34, 35

7.6 Community Impacts

The Draft EIS needs a thorough Community Impact Assessment which includes supporting sustainable livable
11 communities; promoting community values and thriving neighborhoods; contributing to general well-being; embracing the concerns of neighborhoods and communities.

Chapter 8 Questions

8.1 Cumulative and Secondary Impacts

Q1. The redevelopment of Kakaako would be much easier if a trolley were built. Therefore it must be included as a
12 secondary impact. "a light rail electric trolley ... would provide the impetus for the redevelopment of Kakaako" Mayor Jeremy Harris State of the City 1998.

AR00016250

8.2 Social and Economic Impacts

Q1. Will the development of transportation hubs (buses, light and/or heavy rail) lead to greater development near the hubs? Q2. Will the transportation improvements occur faster, keep pace with, or trail the expected growth in population and tourism? Q3. If the improvements exactly matches the growth in population, will the new arrivals pay for the needed infrastructural changes or will the existing residents pay for system improvements that will benefit the new arrivals? Q4. Will the project strengthen communities/ohana or will it divide poor communities for the benefit of richer communities? Q5. Will the building of the Natatorium encourage greater vehicle use? Q6. Will the building of cruise ship berths at or near the Aloha Tower Marketplace encourage more vehicle use? Q7. Will the building parking structures near the proposed cruise ship berths at or near the Aloha Tower Marketplace encourage more vehicle use? Q8. Will "transportation developments spurred retail and residential growth along transit lines and around transit malls"? Q9. Some of the proposed transportation plans are designed to free up valuable waterfront for development. Such development would constitute a secondary or indirect impact to the PUC EIS and to the PUC NEPA right? Q10. Will the desired increase in tourism encourage greater vehicular use?

8.3 Air Quality Impacts

Q1. How will air quality change as a result of secondary growth resulting from the new bus and/or bus/rail system? Q2. How do the Enhanced Bus Alternative and the Commuter-Based Dedicated Bicycle Lane System Alternative compare to the other alternatives?

8.4 Noise Impacts

Q1. Bus stop announcements can be heard at a 1000 feet. Is the City planning to introduce noise pollution to the quiet suburbs and agricultural lands? "increase access to information through audible 'next stop' announcers" Islandwide Mobility Concept Plan, page v. Q2. How do the Enhanced Bus Alternative and the Commuter-Based Dedicated Bicycle Lane System Alternative compare to the other alternatives?

8.5 Water Resources Impacts

Q1. How will water quality change as a result of secondary growth resulting from the new bus and/or bus/rail system? Q2. How do the Enhanced Bus Alternative and the Commuter-Based Dedicated Bicycle Lane System Alternative compare to the other alternatives?

8.6 Aesthetic Impacts

Q1. Are visual impacts afterthoughts or are they part of the planning process? If so, how? Q2. How do the Enhanced Bus Alternative and the Commuter-Based Dedicated Bicycle Lane System Alternative compare to the other alternatives?

8.7 Transportation Impacts

Q1. Will each alternative (the Enhanced Bus Alternative and the Commuter-Based Dedicated Bicycle Lane System) proposed increase/decrease mass transit system gridlock? Q2. How can we adopt transportation policies that will decrease gridlock? Q3. Can the proposed trolley (1998-99) be expanded into the elevated rail transit plan (1992)? Q4. Will privatization of the bus service into one or more separate competing companies (as in done in Queens, New York) help or hinder services on Oahu? Q5. How significant would the use of one-way rush-hour traffic on Dillingham be on congestion? Q6. How significant would the use of one-way rush-hour traffic on Nimitz be on congestion? see Tim Tucker's column in Island Voices (Honolulu Advertiser, May 18, 1999, page A-6). Q7. How significant would Employer Trip Reduction (ETR) Plans be in reducing congestion? Q8. The Draft Environmental Impact Statement may need to include an explanation of the timing for the proposal. Q9. What will the secondary impact be? Q10. If the Zipper Lane has not convinced enough people to carpool, how will each proposal solve that? Q11. The Coast Guard held a meeting regarding the Sand Island Parkway and the Truman-Hobbs Act. The census was that federal money would not be available. Has anything changed? Q12. Is a state highway financed by federal $ part of the City plan? Q13. Is there a reasonable chance that the building of the Sand Island Parkway increase vehicle use? Q14. Is there a reasonable chance that the alteration of the Nimitz Highway increase vehicle use.

8.8 Scoping Impacts

Q1 How can alterations to the Zipper Lane be part of the City Plan when it is totally under State control? Q2. Does the PUC plan include Express Buses which operate partially outside of the PUC? Q3. The map of the PUC includes Waiawa and Iroquois Point but not Kahala Mall. Is that correct? Q4. How can the MIS analyze "high-speed express service from suburbs" if that is beyond the scope of the PUC? Q5. How can the contractor for the City state that the City plan includes three state programs, one of which is enforcement? "Specific elements include ... AHI ... ITS ... enforcement activities in State DOT's Safe Communities program." Islandwide Mobility Concept Plan, page v. Q6. What are the acceptance criteria of the FHWA/FTA for the NEPA document? Does this plan conform to State DOT plans? Q7. Inclusion of the ideas generated from the 21st Century Vision, Oahu Trans 2K, and related scoping meetings. Q8. Explanation of how ideas were filtered from the meetings to determination inclusion/exclusion from the proposal. Q9. Explanation of how the weight of different proposals was determined. Q10. The baseline plans for rail/trolley must be included, at least in the appendix.

8.9 Transportation Model Impacts

Q1. Which Travel Forecast models are used? Why? Q2. How sensitive are the models to changes in input? Which variables have the highest elasticity (smallest change in output, largest change in output, greatest chance the "desired plan" is the wrong plan)?

8.10 Community Impacts

Q1 How will the residential and business communities be affected by the building and operation of buses/rails traveling through their communities? Q2. Will the need for new transmission facilities result in commercialization of poorer neighborhoods (Economic Justice)? Q3. This following statement is a positive statement about rural lifestyles, right?? "Even something relatively simple like having streets without sidewalks can affect community character." Islandwide Mobility Concept Plan, page v. Q4. Can the public participate in the Draft/Final MIS?

AR00016251

8.11 Population Impacts

43 | Q1. What are the source of the growth projections? Q2. If the purpose of the Second City was to move people out of
44 | downtown, why are we trying to move more people into downtown?

8.12 Energy Impacts

45 | Q1. Shouldn't any project which would require new overhead lines automatically be rejected? Q2. Can electric buses be used?

8.13 Funding Impacts

46 | Q1 Does the amount of federal matching funds vary depending on the option chosen? Please elaborate.

8.14 Sustainability Impacts

47 | Q1. How do you define "sustainability"? "This Mobility Concept plan ... is not only sustainable over the long run, but absolutely necessary to shape an economically robust future for Oahu." Islandwide Mobility Concept Plan, page iv.

Mahalo for this opportunity to comment on this EISPN.

August 16, 2000

Mr. Henry Curtis, Executive Director
Life of the Land
1111 Bishop Street, Suite 503
Honolulu, Hawaii 96813

Dear Mr. Curtis:

Subject: Primary Corridor Transportation Project

Thank you for your letter dated May 22, 1999, regarding the Environmental Impact Statement (EIS) Preparation Notice, Primary Corridor Transportation Project.

Your comments are appreciated and will be included in the Major Investment Study/Draft Environmental Impact Statement. Enclosed is a copy of your written comments, which have been numbered. The following responses to your comments are provided:

1. Chapter 2 discusses the full range of alternatives that have been considered. The build alternatives incorporate the use of bus priority lanes. They also include implementation of the State and County bicycle master plans. A bicycle lane alternative would not satisfy all of the travel markets and growth in travel demand that is expected through the year 2025.
2. Chapter 2 discusses the full range of alternatives that have been considered. The TSM and BRT Alternatives enhance bus and automobile efficiency to varying degrees. The features you suggest are included in the TSM and BRT Alternatives. Headways are described for each alternative in Chapter 2.
3. HOV enforcement is increasing.
4. Both SDOT and DTS have developed master plans to enhance the network of bicycle facilities and increase bicycling as a serious transportation mode for some travel markets. Improvement of bicycle facilities is included in all of the alternatives. However, bicycles alone cannot accommodate the existing and projected travel demand, and are not appropriate for all travel markets. The TSM and BRT Alternatives are multimodal alternatives that increase pedestrian, bicycle and disabled access to transit and other alternative modes.

5. The project planning was based on assumptions about future growth, as detailed in Chapter 4, which discusses the traffic modeling.
6. Impacts are discussed in Chapter 4 and 5, and are summarized in the Executive Summary.
7. Cumulative impacts are addressed in Section 5.13.1.
8. Air quality impacts are discussed in Section 5.5. Cumulative impacts are discussed in Section 5.13.1.
9. Water resource issues are addressed in Section 5.8. Cumulative issues are addressed in Section 5.13.1.
10. This document describes three reasonable transportation alternatives. The City Council will consider various factors in selecting the Locally Preferred Alternative (LPA).
11. Sections 3.3 and 5.3 discuss the communities in the Primary Urban Center (PUC) and how they may be affected by the project.
12. Section 5.1 discusses redevelopment potential for Kakaako and other areas.
13. One of the purposes of transit is to focus growth by encouraging increased density. Total growth would be constant across all alternatives. The project schedule is provided in Section 2.5.
14. The financing plans for the alternatives are described in Chapter 6. Financing comes from a variety of sources, including federal and State grants, user fees, and proceeds from municipal bonds.
15. Potential impacts on communities are addressed in Sections 3.3 and 5.3, and also in Section 5.13.
16. Future levels of travel activity have been predicted based on accepted government projections that included the development projects you named.
17. Redevelopment of waterfront areas is not included in the alternatives discussed.
18. Yes. Predictions of future travel activity levels included assumptions about increases in tourism and other economic activities.
19. The following sections describe various types of impacts: Section 5.5 discusses air quality impacts, Section 5.6 discusses noise impacts, Section 5.8 discusses water quality, and Section 5.4 discusses visual impacts. The Enhanced Bus Alternative is similar to the TSM Alternative.
20. Potential noise impacts are addressed in Section 5.6.
21. The visual environment and potential impacts are addressed in Sections 3.4 and 5.4.
22. Chapter 4 discusses the potential traffic impacts of each of the proposed alternatives, including vehicle hours of delay (VHD). The project itself is intended to help alleviate the traffic problems of the island, especially in the PUC. Increasing the people-carrying capacity of existing roadway lanes is a policy that would reduce gridlock.
23. A fully grade-separated transit system was considered but rejected, as discussed in Section 2.6.

24. Privatization speaks to how bus service is provided, not the level of bus service, per se. Privatization alone would not be expected to affect levels of roadway congestion. However, the TSM and BRT Alternatives provide for the privatization of selected bus services.
25. The commercial uses along Nimitz Highway and Dillingham Boulevard require two-directional vehicular access. If these roads were converted to one-way access, the circuitous routes that would be required would increase regional levels of congestion.
26. These and other Transportation Demand Management (TDM) measures are included in all of the alternatives.
27. Section 2.5 discusses the project timeline.
28. By rewarding people with travel time savings, parking discounts, and subsidized vehicles, programs such as Vanpool are expected to induce ridesharing. The intent of the zipper lane is also to reward people who rideshare with travel time savings. We hope that the travel time savings will induce people to use the zipper lane.
29. The Sand Island analysis has been shifted to the Oahu Regional Transportation Plan (ORTP).
30. Once the City Council selects the LPA, the State and the City will work together to implement the different elements of the preferred alternative.
31. The Sand Island analysis has been shifted to the ORTP.
32. Yes.
33. The analysis of future travel demand and existing infrastructure capacity indicates that the major shortfall in transportation capacity extends from the PUC to the Ewa area.
34. The PUC is so important in terms of islandwide trip generation and trip attraction that transportation planning for the PUC cannot be limited to only the PUC. Connections between the PUC and other parts of the island must also be considered.
35. The acceptance criteria are described in various rules, regulations, and guidances. Plan conformance is addressed in Section 5.1.3.
36. The Oahu Trans 2K meetings have been summarized and those summaries are included in Appendix A. Chapter 2 discusses how these ideas were screened and utilized.
37. The evaluation of the alternatives is provided in Chapter 7.
38. Rail is not an alternative considered under this Major Investment Study/Draft Environmental Impact Statement. The alternatives are described in Chapter 2. Conceptual plans are provided in Appendix B.
39. Potential impacts on communities are addressed in Sections 3.3 and 5.3, and also in Section 5.13.
40. Environmental justice issues are addressed in Section 5.3.5.
41. The statement is neither positive nor negative.
42. Appendix A summarizes the efforts that have been made to provide opportunities for public participation.

43. As described in Chapter 1, Section 3.1, and Section 4.2.5, the Department of Business, Economic Development, and Tourism (DBEDT) is the source of the growth projections.
44. The project does both. The project will improve transportation connections between Downtown and Kapolei. It is both State and City policy to direct growth to both cities.
45. No overhead lines would be required under any of the alternatives. The BRT Alternative includes the use of electric vehicles.
46. Yes, different federal funding lines have different restrictions, as described in Chapter 6.
47. There are many definitions, but applying that to a transportation project means saving energy and encouraging compact land use development patterns.

Should you have any questions regarding the project, please contact Kenneth Hamayasu at 527-6978.

Sincerely,

CHERYL D. SOON
Director

Attn: Kenneth Hamayasu

Dear Mr. Hamayasu:

Subject: EISPN for Honolulu Primary Transportation Corridor Improvements

In response to the notice of preparation of an EIS that appeared in the April 23, 1999, Environmental Notice, I have the following comments.

In developing plans for transportation improvements, I believe the following should be taken into account:

1 | 1) Scenic viewplanes;
2 | 2) Whether the improvements will encourage or discourage urban sprawl and encroachments into rural areas;
3 | 3) Emissions produced by the various options;
4 | 4) Whether the improvements will encourage more vehicular traffic (as, say, road improvements tend to do) or will discourage use of automobiles for commuting.

Thank you for your attention to my concerns.

Sincerely,

Patricia Tummons

Subject: Primary Corridor Transportation Project
Environmental Impact Statement (EIS) Preparation
Notice

Dear Mrs. Soon:

These are personal comments. They have not been encouraged, reviewed, or approved by my employer.

I request that the Draft EIS consider the following alternatives:

1. Eliminating bus stops to improve bus operating speeds. (It is inefficient to have bus stops a few hundred feet apart.)

2. Chartering and/or subsidizing private buses and ferries for peak period transit. (The City's current private bus charters and the State DOT's proposed ferry demonstration project will provide useful data.)

3. Regulating public and private parking charges to encourage car-pooling and use of public transit. (Other cities regulate parking charges to reduce traffic.)

4. Providing light rail and/or bus rapid transit without a Sand Island Bypass. (Because of cost and impacts, decisions about a Sand Island Bypass should be "uncoupled" from decisions on transit alternatives.)

I also request that the Draft EIS compare the various alternatives in terms of the following impacts:

5

1. peak and off-peak transit/bus travel time between several screenlines.
2. peak and off-peak private vehicle travel time between several screenlines.
3. peak and daily vehicle trips across several screenlines.
4. peak and daily person-trips across several screenlines.
5. per cent of Oahu voters who will ride public transit.

Sincerely,

Doug Meller

Dear Mr. Meller:

Subject: Primary Corridor Transportation Project

Thank you for your letter dated May 24, 1999, regarding the Environmental Impact Statement (EIS) Preparation Notice, Primary Corridor Transportation Project.

Your comments are appreciated and will be included in the Major Investment Study/Draft Environmental Impact Statement (MIS/DEIS). Enclosed is a copy of your written comments, which have been numbered. The following responses to your comments are provided:

1. All alternatives and the proposed stops are described in Chapter 2. Both the City Express! and the Country Express! Services are limited-stop bus services, and more limited stop services will be provided under the Transportation System Management (TSM) and Bus Rapid Transit (BRT) Alternatives.
2. All alternatives are discussed in detail in Chapter 2. The TSM and BRT Alternatives include incentives for HOV vehicles (carpooling), and other measures to enhance the operational efficiency of the existing transportation network including private sector transit services (using unused equipment and capacity).
3. Project alternatives are defined in Chapter 2. At this point, regulation of parking fees are not included in the alternatives that received detailed analysis in the MIS/DEIS.
4. The Sand Island analysis has been shifted to the Oahu Regional Transportation Plan.

5. Chapter 4 discusses traffic modeling.

Should you have any questions regarding the project, please contact Kenneth Hamayasu at 527-6978.

Sincerely,

CHERYL D. SOON

Re: "O'ahu Transit 2K, Islandwide Mobility Concept Plan"

Dear Cheryl:

I am sending the following suggestions and comments on "O'ahu Transit 2K, Islandwide Mobility Concept Plan" in response to a recent presentation by the Parsons Brinckerhoff/Carter & Burgess Team to the Land Use and Transportation Committee of the Chamber of Commerce.

For the most part, this is an excellent and informative document. However, some of the assertions which are made to support arguments are inaccurate or overstate the situation, thereby undermining the credibility of the report and the overall planning effort. My comments focus on the shortcomings within the document, rather than on the "good" parts. As such, these critical comments and suggested additions do not reflect my overall impression of the document, which is favorable.

Many of my comments address assertions made in the Concept Plan about the economic, social, and environmental costs of sprawl and our reliance on automobiles. While I am not advocating an increased reliance on automobiles or increased sprawl, it is important, for the sake of good planning, to prevent half-truths and fiction from becoming accepted as fact.

- Definition of "Sprawl"

  In view of the extensive use of the term "sprawl" in the report, a clear definition of it is in order. For example, is Mililani an example of suburban sprawl which should be discouraged, or is it the type of compact development which should be encouraged? 1

1655 Kamole Street • Honolulu, HI 96821 • Office: (808) 373-9364 • Fax: (808) 373-9590 • E-mail: bplasch@hawaii.rr.com

- Sprawl vs. Centralized Development

  On page 2, the observation that "widespread urban and suburban sprawl" seems to be contradicted by the more accurate statement on page 9, "O'ahu's development pattern is highly centralized." This compactness is the result of deliberate land-use policies originated in the 1960s and 1970s—policies which were designed to protect the lands farmed by O'ahu Sugar Co., Ltd., limit growth in rural communities, and protect environmentally sensitive areas. 2

- Benefits and Costs of Sprawl vs. Compact Development

  The discussions in various sections on the benefits and costs of sprawl versus compact development present only one side of an ongoing and as-yet-unresolved debate. A cogent summary of the issues is provided by Dowell Myers and Alicia Kitsue, "The Debate Over Future Density of Development: An Interpretive Review," 1999. This paper can be downloaded from the Lincoln Institute (www.lincolninst.edu). 3

  Also, much of this discussion seems academic in that many key development decisions have already been made by the City and the State.

- Economic Decline of Commercial Areas

  On page 2, the following statement is made: "The economic patterns generated by automobile dependence contributes [sic] to the decline of neighborhood retail and office districts and the small businesses that formerly thrived in them." Which communities have suffered a decline because of dependence on the automobile? If, from page 10, Kaimuki is the example, I disagree; local businesses adjusted to the development of the H-1, and the area exhibits considerable economic health. 4

- Development and Service Costs

  The statement on page 2 that "sprawl has resulted in extremely high costs to provide streets, utilities, schools, parks, police and fire protection, and other services to a far-flung population." While this is true, two comments are in order. First, *suburban* development of densities significantly higher than the housing densities which are selling in 'Ewa and Central O'ahu risk rejection by potential homebuyers.

  Second, as a general rule, the overall cost of suburban development falls between the costs of urban in-fill and urban redevelopment. 5

  In-fill development is generally the least expensive form of development, provided that: large vacant parcels are available in sufficient size to allow economies of scale, the terrain is relatively level, soils can accommodate foundations, access is adequate, existing infrastructure is relatively new and has excess capacity, restrictive building practices will not be imposed (e.g., restricted hours to protect neighbors from noise), etc. Based on my work, the supply of such land within the Primary Urban Center (PUC) is quite limited.

AR00016259

On the other hand, redevelopment within the PUC can be quite expensive, particularly when: a premium must be paid to assemble small parcels, usable structures must be purchased then torn down and removed, infrastructure must be replaced due to age and/or inadequate capacity, and construction practices must minimize adverse impacts to neighbors.

5

- **Infrastructure Financing**

On page 8, it is stated that older established neighborhoods must subsidize the high cost of infrastructure development in outlying (i.e., suburban) areas because "...sprawl does not support itself through the additional [tax] revenue it generates..."

To the best of my knowledge, no in-depth study exists to support this claim. The studies which do exist are for mainland communities, the findings of which cannot be safely generalized to Hawai'i because of different financing approaches and tax structures.

Furthermore, the argument is open to challenge based on the fact that developers in 'Ewa and Central O'ahu, and in turn new home buyers, are financing most of the required infrastructure development—either directly or through various charges. In addition, the State receives the equivalent of a large up-front exaction in the form of excise taxes on the sales of homes and on construction expenditures. Also, much of the City's CIP funding has been for projects in *established* neighborhoods and for projects which serve residents islandwide. Although my findings on this subject are limited somewhat by data shortcomings, they are summarized in "Cost to Government of Supporting New Development in 'Ewa and Central O'ahu," May 1995, which is on file with the City.

6

- **City Policy on Urbanizing Agricultural Lands**

The statements on pages 8 and 13 regarding the need to protect prime agricultural land from residential sprawl appears hypocritical in view of recent City actions. Past government policy has been to direct development to the marginal agricultural lands in 'Ewa while protecting 'Ewa's "Golden Triangle," which encompasses some of the best farm land in the State. Rather than continuing the policy of protecting this prime agricultural land, the City's most recent Development Plan for 'Ewa supports urbanizing this land.

7

- **Economic and Environmental Costs of Urbanizing Agricultural Lands**

On page 8, the following statement is made: "If left unchallenged, this trend towards 'residential sprawl' [onto agricultural lands] could create serious economic and environmental problems."

While prime agricultural land should be protected, the reality is that urbanization of agricultural land results in a relatively small economic loss for two reasons. First, ample land is available for agriculture due to the enormous contraction of plantation agriculture—even with extensive urbanization, the supply of agricultural land would

8

still exceed the demand. Second, per acre returns and employment from agriculture are small compared to most urban uses of land.

Furthermore, farming is not free of adverse environmental impacts. Typically, suburban development of farm land results in less pollution, not more.

- **Factors Affecting Suburban Growth**

The fifth paragraph on page 9 attributes growth in Central, Windward, and East O'ahu "...at least partially to transportation policies that favored the automobile over other forms of transportation." To be fair, growth in these areas also reflected deliberate State and City development policies from the 1960s to the present, as well as strong consumer preferences for single-family homes.

9

- **Credit for Affordable Housing**

On page 10, the following statement is made: "Due to prior government policies, most new affordable for-sale housing is found in 'Ewa and Central O'ahu." The second part of this sentence would have been true even without government intervention. Lower housing prices are required to attract a large number of new home buyers in outlying areas which typically lack the full complement of jobs, stores, services, recreational opportunities, etc. However, government intervention did change the *mix* of housing in 'Ewa and Central O'ahu, but this change in mix occurred at the cost of slowing development of these projects and increasing the price of market housing islandwide.

- **Strategy for the PUC**

On page 10, a statement is made to the effect that approximately 44,000 new homes will have to be developed in the PUC over the next 20 years (about 2,200 new homes per year). This number of new homes within the PUC, plus homes to replace those which will be lost to redevelopment, appears somewhat high for the following reasons:

- — O'ahu has yet to break out of its anemic economic growth
- — The PUC appears to lack sufficient vacant land that is suitable for substantial new development.
- — Redevelopment will be slow and costly, and is likely to be opposed by many residents in the affected communities.

10

Regardless of the number of homes planned for development in the PUC, many neighborhoods are in very poor condition and should be redeveloped. The challenge will be to redevelop to higher densities with attractive projects that preserve ocean and mountain views; this has not been the case with a great many past projects.

- **Land-Use Implications**

The document correctly argues that transportation has had a profound impact on the form and type of development on O'ahu. Presumably, the analysis of transporta-

11

AR00016260

tion alternatives will address the likely impacts on future development patterns, including impacts on both residential development and job creation in the PUC and outlying areas. Depending upon the transportation alternative selected, increased mobility could accelerate residential development in outlying areas while concentrating job creation in the PUC, thereby thwarting the balanced development planned for 'Ewa. 12

Along these same lines, it should be made very clear to residents that they are choosing far more than a transportation system: they are also choosing a related land-use development scheme. Such clarification is particularly important for those communities which will experience extensive changes, possibly because they are to be redeveloped to higher densities.

- **Implementation of the Plan**

As the consulting team is surely aware, it is important to go beyond the desires of the community to dispassionately and realistically assess what can actually be implemented successfully. For example, major components of land-use and transportation plans from the 1960s, 1970s, and 1980s were eventually abandoned or reversed as a result of changing values, unacceptable costs, market rejection, and/or community opposition—thereby contributing to some of today's problems. Examples of government plans which were ultimately rejected or reversed include:

- — land use plans to direct residential, resort and commercial development to East Honolulu, Windward O'ahu, the North Shore and Wai'anae in order to preserve low-rise development in the PUC and to protect agricultural lands in 'Ewa and Central O'ahu; 12
- — redevelopment of the PUC with low-rise garden apartments so as to protect rural communities and prime agricultural lands;
- — development of the marginal agricultural lands in 'Ewa while protecting the prime agricultural lands;
- — a second cross-town freeway;
- — a highway around Kaena Point; and
- — a mass transit system.

- **Implications of Computers and Electronic Communications**

Continuing rapid advances in computers and electronic communications are likely to have significant and possibly profound implications on travel and development patterns. Regardless of location, current technology allows near instantaneous exchanges of documents, inexpensive video conferencing, access to research materials, etc. As a result, many workers are being freed from spending long hours in town, and so may choose to live in suburban and rural communities. 13

The implications of how this technology will affect travel and development patterns should be addressed.

- **Extensive Network of Freeways**

For accuracy, the statement on page 34 regarding the existence of an extensive network of freeways should be written to include highways. Most people would not regard three freeways as an "extensive network." 14

- **Benefits and Costs of Automobile Travel**

On pages 2 and 3, the material on the benefits and costs of automobiles comes across as biased, since it recognizes the high costs associated with automobiles but does not acknowledge the many personal benefits which may justify the high costs, such as: faster door-to-door travel, travel to destinations not served by transit systems, fast and convenient travel to multiple destinations, the ability to transport large items safely (e.g., groceries and recreational equipment on weekends), etc. Personal time saved and increased mobility can translate into a more productive workforce. 15

A balanced transportation plan must take into account the benefits and the costs of various alternatives, not just the cost of one and the benefits of another.

- **Area Required for Home-Based Vehicles**

On page 11, it is stated that 350 square feet are required to accommodate each home-based vehicle, for a total of 2,800 acres of space needed for all the home-based vehicles in the PUC.

The requirement of 350 square feet per automobile corresponds to a two-car garage for each vehicle. Is this correct? Is this based on one parking space at home and a second one at a destination? 16

Even if this figure is correct, it should be made clear that the 2,800 acres of space does not correspond to 2,800 acres of land used only for parking. Because of shared use, the effective land area is much smaller. For example, many homes have rooms or decks over garages, and many parking structures feature multiple stories.

- **Marginal vs. Sunk Costs Associated with Automobile Travel**

Because of their many benefits, most families will choose to own one or more automobiles. Once ownership occurs, many of the costs associated with car ownership are "sunk" costs which will have no bearing on the decision to commute to work by car or by some other mode of transportation because they must be paid regardless. Sunk costs include the cost of the car itself, automobile insurance, the cost of the home garage, the cost of roads, etc. These last two costs occur even without automobile ownership. 17

The automobile costs which affect one's choice of transportation mode are the much lower marginal costs, including the dollar cost of fuel and parking, and the time cost of door-to-door travel.

The analysis should address both the total costs and the marginal costs of the various transportation alternatives.

AR00016261

- Unused Equipment and Capacity

  Greater effort should be expended on using Honolulu's unused transportation equipment and capacity to help resolve transportation problems. This might include some of the tourist buses and vans which go unused during peak commuter periods, particularly in the early morning. 18

  Also, most cars travel during rush hour with three empty seats. Theoretically, capacity exists for over a three-fold increase in the number of commuters with no increase in the number of automobiles on the road.

- Road Pricing

  Highway capacity is a scarce resource which, in congested areas, is allocated to those commuters willing to suffer travel delays while other commuters adjust their schedules to travel before or after rush hour in order to avoid the delays.

  Like other scarce resources, most economists would argue that sensible road pricing during rush hour would be a better approach to allocating scarce highway capacity. The objective would be to maintain a good flow of traffic at all times by providing an *economic* incentive designed to induce commuters to (1) double up, thereby reducing the cost to these commuters while also reducing the number of cars on the road; (2) travel by express bus; (3) avoid the trip by using electronic communications; (4) travel at a different time; etc. Such an economic solution, in combination with other transportation alternatives, may be more effective and far less expensive than a purely engineering solution. 19

  This alternative should be presented, along with an honest assessment of its merits. The challenge will be to design an approach that is *politically* acceptable because it works better than other alternatives, and is regarded as fair.

I hope that these comments are helpful.

Yours truly,

Bruce

Mr. Bruce S. Plasch, President
Decisions Analysis Hawaii, Inc.
1655 Kamole Street
Honolulu, Hawaii 96821

Dear Mr. Plasch:

Subject: Primary Corridor Transportation Project

Thank you for your letter dated June 8, 1999, regarding the Environmental Impact Statement (EIS) Preparation Notice, Primary Corridor Transportation Project.

Your comments are appreciated and will be included in the Major Investment Study/Draft Environmental Impact Statement. Enclosed is a copy of your written comments, which have been numbered. The following responses to your comments are provided.

1. Sprawl typically means land-intensive, low-density, single-family, unattached, residential developments that are located far from employment centers.
2. The current land use patterns on Oahu contain elements of both sprawl and centralized development. There is no contradiction.
3. If present patterns of sprawl continue, Oahu's open green spaces would all be converted to low-density residential developments. Therefore, in order to keep the country country, more compact forms of land development are necessary.
4. Socio-economic data is provided in Section 3.3. Comment noted.
5. Higher density developments can be affordable and attractive, as has been demonstrated many times on the mainland and throughout the world. Oahu is not large enough to accommodate unconstrained growth, while still preserving the natural values treasured by residents and visitors.
6. The outreach conducted for this project demonstrated widespread public support for the preservation of Oahu's natural values, which can occur only if sprawl is contained.
7. It is the desire to preserve prime agricultural lands that motivates the City to try to focus growth in designated areas such as Kapolei. If growth can be focused at Oahu's first and second cities, substantial prime agricultural land will remain on Oahu.
8. Continued agriculture on Oahu is part of the vision for the island articulated by the public in the Oahu Trans 2K outreach process.
9. The City is working with the State to develop consistent policies and investments that encourage concentrating growth in Oahu's first and second cities.

10. The vision for the PUC is being developed through the PUC DP update process now underway.
11. Sections 3.1 and 5.1 discuss the land use implications of the proposed project.
12. Section 2.5 provides the implementation schedule, and Chapter 6 provides the financing methods for all alternatives.
13. Experience to date has not shown a substantial impact of telecommunications on travel demand on Oahu.
14. Section 3.2 describes the existing transportation network in the study area.
15. The elements of benefits and costs, that are included in the cost-benefit analysis, are defined in Chapter 7. There are benefits and costs of automobile and transit travel that are not included in the cost-benefit analysis. There are multiple criteria upon which to evaluate the alternatives, and combining them all into a quantitative cost-benefit analysis is not appropriate.
16. Parking spaces per automobile typically range from 300 to 400 square feet, according to the Urban Land Institute and the National Parking Association's The Dimensions of Parking.
17. It is agreed that these costs should be recognized. However, continuing policies that facilitate automobile travel benefit only one segment of the population and have impacts on society at large and the environment that need to be considered.
18. Project alternatives are discussed in detail in Chapter 2. The TSM and BRT Alternatives include incentives for HOV vehicles (carpooling), and other measures to enhance the operational efficiency of the existing transportation network including private sector transit services (using unused equipment and capacity).
19. Transportation Demand Management (TDM) programs are included in the alternatives, but are not expected to address projected increases in travel demand fully in the primary transportation corridor. The advantages of efficient transit would encourage people to use their cars less. The use of specific disincentives and education programs on alternative transportation is a policy decision to be made by the City Council.

Should you have any questions regarding the project, please contact Kenneth Hamayasu at 527-6978.

Sincerely,

CHERYL D. SOON
Director

Dear Participant:

Subject: Primary Corridor Transportation Project

On May 11, 1999, you participated in a public scoping meeting on the Primary Corridor Transportation Project at Washington Middle School. The function of the scoping meeting was to invite public comment on the purpose of and need for the project, the alternatives under consideration and the environmental studies to be conducted.

The oral and written comments we received that evening or shortly thereafter are summarized in the attached table along with responses to the issues raised. Many of the responses reference further information that is provided in the Major Investment Study/Draft Environmental Impact Statement (MIS/DEIS) for the project, which will be released shortly. Your comments were important input to the development of the MIS/DEIS.

The MIS/DEIS document will be available for your review at various libaries and at the Department of Transportation Services after August 23, 2000. Should you have comments on the MIS/DEIS, please submit them by November 6, 2000.

Thank you for working with us to develop transportation solutions for our island. Should you have any questions regarding the Primary Corridor Transportation Project, please contact Faith Miyamoto at (808) 527-6976.

Sincerely,

CHERYL D. SOON
Director

AR00016264

SUMMARY OF COMMENTS RECEIVED AT THE AGENCY INFORMATION AND SCOPING MEETINGS

Name and Organization	Comment	Response
Darrlyn Bunda, Leeward Oahu Transportation Management Association	Favored extending the LRT alignment to Waiawa Interchange.	The BRT Alternative, which has since replaced the LRT Alternative, has an In-Town component that goes as far as the Middle Street Interchange. There is an additional Regional BRT component that would service riders as far as Ewa/Kapolei.
	Waiawa Interchange needs to be reconfigured to serve buses/HOVs and to provide better access to the community, such as Leeward Community College.	Under the BRT Alternative, H-1 around the Waiawa Interchange would be widened and improved with a PM zipper lane. Section 2.2.3 discusses this and other improvements to the existing freeway system in detail.
Todd Boulanger, Na Kama Hele	Requested analysis of how the alternatives integrate bicycling and pedestrian trips.	Both SDOT and DTS have developed master plans to enhance the network of bicycle facilities and increase bicycling as a serious transportation mode for some travel markets. Improvement of bicycle facilities is included in all of the alternatives, although the BRT Alternative would do the most to improve bicycle facilities. However, pedestrians and bikes alone cannot satisfy all of the travel markets that must be accommodated. Chapter 1 discusses the project's purposes and needs, which include making the PUC more pedestrian friendly, and Chapter 4 discusses all modes of transportation. Investments in transit systems promote the pedestrian and bicycles modes as viable modes of travel. DTS will also continue to support programs to foster alternative transportation, such as the hub-and-spoke bus system and traffic calming, and Vanpool.
	Requested consideration of biking as a low cost area circulator.	Both SDOT and DTS have developed master plans to enhance the network of bicycle facilities and increase bicycling as a serious transportation mode for some travel markets. Improvement of bicycle facilities is included in all of the alternatives. Pedestrians and bikes are very much a part of the TSM and BRT Alternatives, but they alone cannot satisfy all of the travel markets that must be accommodated.
	Requested analysis of bikes and pedestrian access impacts along certain corridors, such as the tunnel, King Street and Kapiolani Boulevard.	Bicycle and pedestrian access is described in Sections 4.5 and 4.6.
	Requested analysis of impacts to the safety of pedestrians and cyclists from articulated buses as opposed to shorter or double deck buses.	Bicycle and pedestrian access is described in Sections 4.5 and 4.6.
	Questioned predicted reduction of regional vehicle miles traveled (VMT) from the project.	Extensive traffic modeling was done as part of the planning process. See Chapter 4 for details.
	Requested that disincentives to driving (e.g., road pricing, etc.) be included as alternatives, as well as measures to make walking as the preferred mode within the city.	Travel Demand Management (TDM) programs are included in the alternatives, but they are not expected to fully address projected increases in travel demand in the primary transportation corridor. Improved transit service would encourage people to use their cars less. The use of specific travel disincentives is a policy decision to be made by the City Council.

SUMMARY OF COMMENTS RECEIVED AT THE AGENCY INFORMATION AND SCOPING MEETINGS (CONTINUED)

Name and Organization	Comment	Response
Todd Boulanger, Na Kama Hele	Requested analysis of air and water quality impacts.	Impacts to air quality and water quality are discussed in Sections 5.5 and 5.8, respectively.
	Requested analysis of the socio-economic and environmental impacts on poor families having to depend on automobiles for their transportation.	Environmental justice issues are addressed in Section 5.3.
	Requested that the project conducts a more extensive and diverse public outreach program for scoping, and gave suggestions on how this can be accomplished.	Appendix A summarizes the efforts that have been made to provide opportunities for public participation. Comments from the public are welcome at any point. However, to be part of the official record, comments on the Draft EIS need to be made by the close of the comment period on the Draft EIS.
	Requested analysis of how bus fare increases affect future ridership, road congestion, land use, pollution, parking demand and the success the alternatives.	Financial plans are discussed in Chapter 6, and travel demand is discussed in Chapter 4.
Donald Lubitz	Suggested that right-of-way or corridor be reserved now in anticipation that an expanded transit system would be needed in the future.	Because of existing development patterns in the PUC, the rights-of-way of future transportation systems are primarily the existing transportation rights-of-way. This is why the need is to increase people-carrying capacity within the existing transportation rights-of-way.
	Suggested that the City transit system be used to support education programs for visitors and residents (e.g., provide transportation to education sites).	The PCTP would serve several travel markets, including students and visitors.
W-K Luke	Requested that public places of the project (e.g., transit centers) include amenities for socializing, and cultural elements consistent with area (e.g., Chinatown).	Transit centers and other public spaces included in the project would be designed to be pedestrian-friendly and contribute to a sense of community. Transit centers and stops in special districts such as Chinatown would be designed to blend in and enhance the existing cultural setting.
	Requested spot improvements to improve bus service.	Refinements to the existing bus system are made on an ongoing basis as the need arises.
Wendell Lum	Requested cost and funding information and analysis of impacts to the economy.	A financial analysis is provided in Chapter 6. Impacts on the economy are discussed in Section 5.1.
	Suggested that transportation investment be in the Central and Leeward areas where residential growth is occurring.	Transportation investments will be made throughout the primary transportation corridor. These investments are intended to help facilitate growth in Ewa and the PUC.
Christen Mitchell	As part of the No-Build, suggested a mixed-use land use pattern, and a continuous bikeway through the corridor.	The transportation improvements contained in the No-Build Alternative would do less than the other alternatives to help foster a mixed land use pattern. The transportation improvements in the No-Build would encourage continued suburbanization and loss of open space. The bicycle facilities in the existing State and County Bicycle Master Plans are included in the No-Build Alternative.
	Suggested private-public partnerships for mixed-use development at transit stations.	There are several ways to encourage "joint development" at transit centers and transit stops. Public-private partnerships are certainly being considered.

AR00016265

SUMMARY OF COMMENTS RECEIVED AT THE AGENCY INFORMATION AND SCOPING MEETINGS (CONTINUED)

Name and Organization	Comment	Response
Christen Mitchell	Requested analysis of transportation malls' impact on the surrounding community, pedestrian access, safety and crime, and landscaping.	The social impacts of the project on the neighborhoods is discussed Section 5.3. Pedestrian access issues are addressed in Section 4.6. Landscaping issues are addressed in Section 5.7. In general, transit centers and transit stops are intended to help focus growth along the alignment and help develop a pedestrian and transit-oriented setting.
	Criticized advertising for the scoping meeting.	Appendix A summarizes the efforts that have been made to provide opportunities for public participation, including comments from the business community.
	Critical of overhead wires and motorized ferries on the Ala Wai.	Neither overhead lines nor ferries on the Ala Wai are proposed as elements of the PCTP.
Michelle Matson	Requested that potential impacts to businesses be considered in planning the project.	General economic impacts are discussed in Section 5.1. Chapter 4 discusses impacts on parking areas and loading zones.
	Supports Sand Island Bypass and Nimitz Parkway elements of the project for waterfront development.	The Sand Island component of this project is being addressed in the current update to the Regional Transportation Plan. It is not part of this project at the current time.
Lynne Matusow	Requested deleting the LRT and Ala Moana Waterfront Loop elements from the alternatives.	The LRT Alternative has been replaced by the BRT Alternative. The Ala Moana Waterfront Loop is no longer part of the project.
	Suggested a transit system similar to Curitiba, Brazil.	The In-Town BRT system would be a transit system similar to Curitiba, Brazil, adapted to local conditions. The Curitiba situation is in some ways simpler because more space is available to construct new transportation systems.
	Project should consider that certain streets are used for parades and block parties.	The route of the In-Town BRT system would be modified to accommodate special events. This topic is discussed in more detail in Section 4.6.
	Does not favor the use of overhead wires for the LRT.	Overhead lines are not proposed as a part of the PCTP. The LRT Alternative has been replaced by the BRT Alternative.
	Transit improvements should be extended into Waikiki.	The In-Town BRT would extend throughout Waikiki.
Dick Poirier	Supported congestion pricing and other types of user fees, such as charging for accessing the HOV lanes, as a viable alternative.	Travel Demand Management (TDM) programs are included in the alternatives, but they are not expected to fully address projected increases in travel demand in the primary transportation corridor. Improved transit service would encourage people to use their cars less. The use of specific travel disincentives is a policy decision to be made by the City Council.
	Requested the Ewa terminus of LRT Alternative be extended to the Waiawa Interchange area.	The BRT Alternative would accommodate future phased extensions of the system if viable.
	Requested that alternatives for road pricing be studied.	Travel Demand Management (TDM) programs are included in the alternatives, but they are not expected to fully address projected increases in travel demand in the primary transportation corridor. Improved transit service would encourage people to use their cars less. The use of specific travel disincentives is a policy decision to be made by the City Council.

SUMMARY OF COMMENTS RECEIVED AT THE AGENCY INFORMATION AND SCOPING MEETINGS (CONTINUED)

Comment	Response	Comment
Richard Pon	Expressed concern about the cost of the alternatives, noting that revenues do not cover operating costs and that the transit system would compete with private operators.	Methods of financing the construction and operation of the alternatives are discussed in Chapter 6.
	Favors expanding the existing bus system, including use of articulated buses.	All of the alternatives would expand the bus system and use articulated vehicles. They vary by the degree and means that they would use to improve transit service.
Richard Quinn	Suggested decentralized transportation systems geared to individual neighborhoods because advances in technology would result in a greater degree of trips within the neighborhood for working and shopping.	While land use changes that would improve the ability of walking to satisfy more trip purposes are desired, walking alone is not expected to address all of the expected increase in travel demand.
Milton Ragsdale	Suggested new alternatives and modifications to certain elements of proposed alternatives - fixed rail along H-1 median from Pearlridge Shopping Center to Kahala Mall, with a subway from Middle Street Transit Center to Ala Moana, and a BRT connecting University/King Transit Center to Manoa Recreation Center or UH quarry area.	These suggestions would be less cost-effective than the alternatives currently under study. Chapter 2 discusses the evolution of the alternatives that receive detailed assessment.
	All BRTs and LRTs should have space or racks for bicycles.	Bicycles will be accommodated on the BRT vehicles.
William Rosa	Requested bus service be more frequent, and that traffic calming be used in downtown areas.	Chapter 2 describes the frequency of bus services for each of the proposed alternatives. The BRT Alternative would provide the greatest frequency of transit service. Traffic calming would continue to be an option wherever an opportunity for implementation is identified.
Linda Starr, Neighborhood Board #2, Kuliouou Kalani Iki	Does not favor special bus ramps because it would waste resources.	Special bus ramps have been included in the BRT Alternative to decrease travel times for transit patrons.
	Requested studying metering at freeway on ramps.	The Hawaii Department of Transportation has been studying ramp metering.
	Feels that people from Kapolei to Pearlridge would not want to change modes, and that they would want the convenience of riding an express bus into town.	All of the alternatives include selected express routes. Some degree of transfers and model switches would be necessary for the system to work cost-effectively.
Mary Steiner, The Outdoor Circle	Requested clarification on certain elements of the project, such as details of the transit centers, landscape plans, impact to street trees, and project limits.	Project elements are described in Chapter 2. Landscaping and impacts to trees would be minimized to the extent practicable, and are described in Section 5.7. Further details would be developed in subsequent planning after City Council selects an LPA.
	Criticized lack of public participation.	Appendix A details the extent of efforts made to solicit public participation.

AR00016266

SUMMARY OF COMMENTS RECEIVED AT THE AGENCY INFORMATION AND SCOPING MEETINGS (CONTINUED)

Comment	Response	Comment
Clifton Takamura	Provided suggestions on how to improve existing bus system.	Improvements to the bus system occur on an ongoing basis.
	Suggested using the old OR&L right-of-way as an alignment..	The alignment of the OR&L right-of-way is not appropriate for modern, high-speed transit vehicles. Some of the right-of-way is being proposed for bicycle use.
	Asked whether the proposed transit system will be a moneymaker, and whether it will be used by visitors.	Publicly-funded transit systems are not intended to made a profit. Creation of a profit is not one of the project purposes. Both visitors and residents are expected to use transit under any of the alternatives.
	Favored a system that uses a combination of LRT and buses.	The LRT has been replaced by the BRT Alternative, which would have In-Town and Regional systems that combine traditional buses and more technologically advanced energy-efficient vehicles.
Shannon Wood	Suggested expansion of alternatives to include more freeways, water-based transportation, and expansion of LRT system to Mililani, Hawaii Kai and Waikiki.	Chapter 2 describes the evolution of the alternatives that receive detailed treatment in the MIS/DEIS.
	Requested impacts analysis in the event of a natural disaster, and if the price of fossil fuel rises substantially.	Improved transit would enhance mobility during a natural disaster and if fossil fuel prices rise substantially.
Jim Yamamoto	LRT system should serve Bethel Street.	The LRT has been replaced by the BRT Alternative. There would be a transit stop in the vicinity of Bethel Street.
	Requested analysis of why people drive.	People travel for many reasons, and these factors have been included in the travel demand forecasts prepared for this project.
	Suggested multi-modal efforts to address transportation issues.	The TSM and BRT Alternatives are multi-modal alternatives, as described in Chapter 2.
Brian Yoshida, Moanalua Community Association	Supported the LRT alternative, but would also like to see the project include roadway widening on the H1 Freeway, and extending the Nimitz viaduct to Downtown.	The LRT Alternative has been replaced by the BRT Alternative. The H1 Freeway widening and Nimitz viaduct have been or are being considered under separate projects.
	Requested analysis of disruption of traffic during construction, projected ridership of different alternatives, and projected fares for the LRT.	Construction-phase impacts, including impacts on traffic, are discussed in Section 5.12. Ridership projections are presented in Chapter 4. Fares and project financing plans are presented in Chapter 6.
Pamela Young	Additional right-of-way requirements should be disclosed.	Right-of-way requirements are discussed in Section 5.2.
	Questioned the need for LRT, especially since the Leeward and Central Oahu areas contain a third of Oahu's population.	The LRT Alternative has been replaced by the BRT Alternative. Chapter 1 discusses the need for the project. There is a substantial imbalance now and in the future between travel demand and transportation system capacity for travelers in the Primary Transportation Corridor, which includes Leeward and the southern portion of the Central District.

SUMMARY OF COMMENTS RECEIVED AT THE AGENCY INFORMATION AND SCOPING MEETINGS (CONTINUED)

Comment	Response	Comment
Anonymous	Criticized the lack of opportunity for exchange of comments, questions and answers before the whole audience.	Comment noted.
	Expressed frustration on the lack of progress on needed transportation improvements.	DTS shares the commentors frustration about the lack of progress on this important quality of life issue.
	Supports a "traditional" looking LRT system rather than a "modern" looking LRT system.	The LRT Alternative has been replaced by the BRT Alternative. The final look of the BRT vehicles, if this alternative is selected, has not yet been selected.
Unknown, Agency	Will project be used to assist in urban planning?	Yes. Project is coordinating with current planning efforts to update the PUC DP, sustainability plans of other DP areas and the recently completed Ewa DP. Overall land use objectives are to encourage urban growth in the PUC and Ewa, and discourage suburban sprawl in other areas. Transportation is one tool to help facilitate these land use objectives. Improved transit service will make in-town living more attractive.
	Need land use controls to discourage/prevent gentrification around future transit stations	Will ensure that future development is consistent with community visions and desires.
	Is the third light rail transit LRT Alternative a first phase of the first and second LRT Alternatives?	The LRT Alternative has been replaced by the BRT Alternative.
	Does BRT Alternative include LRT from downtown to Waikiki?	None of the alternatives moving forward include LRT technology.
	Do any of the alternatives include service between the airport and Waikiki?	Ridership estimates will include all travel markets, including demand between the airport and Waikiki. However, addressing the airport/Waikiki travel market is not a major purpose of this project. Airport travelers would need to get to the Middle Street Transit Center to access the system.
	Is modifying the H-1 Zipper Lane to carry P.M. peak traffic possible?	Yes. The BRT Alternative includes a PM zipper lane.
	Is it possible to come up with defensible ridership projections?	Ridership projections are described in Chapter 4.
	Is there a cost per new rider threshold for receiving federal funds as a transit "new start"?	To receive federal funding, a project must be on the federal "new start" list. There are many rating criteria that score projects on the "new start" list, including cost per new rider. The FTA will use many other criteria, such as ridership, to evaluate the project. After determining eligibility, the project would compete with other transit projects across the nation for federal funds.
	Transit center locations in Waipahu should follow the Waipahu Special Area Plan.	There are no site-specific locations for the Waipahu transit centers. However, they will be located strategically to serve BRT treatments on Fort Weaver Road and other roadways.
	Has a site for the LRT maintenance yard for the Waikiki/Downtown line been selected?	The LRT Alternative has been replaced by the BRT Alternative. In-Town BRT vehicles would be maintained at the Middle Street Transit Center.

AR00016267

SUMMARY OF COMMENTS RECEIVED AT THE AGENCY INFORMATION AND SCOPING MEETINGS (CONTINUED)

Comment	Response	Comment
Unknown, Agency	Will lanes be used exclusively for the LRT?	The LRT Alternative has been replaced by the BRT Alternative. The In-Town BRT would use both exclusive and semi-exclusive lanes.
	Disagreed that communities do not want more lanes for automobiles.	Comment noted.
	Will there be any grade-separated sections for the LRT?	The LRT Alternative has been replaced by the BRT Alternative. No grade-separations are proposed.
	People are asking for a more balanced transportation system.	That is what this project is trying to accomplish. Chapter 1 describes the project purposes and needs in more detail.
	Will this project do anything to alleviate the problem of motorists using residential side streets to avoid congestion on the main arterial streets?	By enhancing transit service, more people would be encouraged to use transit instead of private automobiles.
	What are bus ramps?	Ramps that are restricted to buses and certain vehicles, such as vanpools. Their objective is to provide transit priority, thereby rewarding transit patrons with shorter travel times.
	The DPs contain lists of cultural assets and resources, and important viewplanes and visual resources.	The information in the DP's was used in the preparation of the MIS/DEIS.
	What are the costs of the alternatives?	Cost estimates are discussed in Chapter 2.
	What are committed projects?	Projects that are listed in the Oahu Regional Transportation Plan as proposed for completion by the year 2005.
	What is the time horizon for this project?	Planning is based on travel demand forecasts and land use projected for 2025.

Dear Ms. Soon:

Thank you for providing me a copy of the City and County of Honolulu Department of Transportation Services' notification that it will be preparing a Supplemental Draft Environmental Impact Statement (DEIS) for the Primary Corridor Transportation Project.

I appreciate receiving this information and look forward to reviewing the final Environmental Impact Statement for this project.

Once again, mahalo for taking the time to share the Supplemental DEIS with me.

Aloha pumehana,

Department of the Army
U. S. Army Engineer District, Honolulu
Fort Shafter, Hawaii 96858-5440

Dear Mr. Young:

Subject: Primary Corridor Transportation Project
Supplemental Draft Environmental Impact Statement

Thank you for your August 30, 2001 letter responding to the Supplemental Draft Environmental Impact Statement (SDEIS) Preparation Notice. Your letter referred us to your September 13, 2000 letter, which had the following comment:

> "It is possible that some of the components of the project may require a Department of the Army (DA) permit; however, since the information provided is not sufficiently detailed to determine specific permit requirements. As the project elements progress to final design stages, we will be better able to advise you concerning permit requirements."

Coordination with the Army is continuing and at this time we do not believe the project will require a DA permit. The SDEIS does identify the required permits.

You will be receiving a copy of the SDEIS under separate cover. We appreciate your interest in this important transportation project and look forward to receiving your comments on the SDEIS.

Sincerely,

CHERYL D. SOON

Dear Ms. Soon:

Subject: Supplemental Environmental Impact Statement (EIS) Preparation Notice
Primary Corridor Transportation Project

We have the following comments to offer:

1. Pre-consultation comments: If you have received any comments during the pre-consultation stage, please include them with their responses in the draft EIS. Also include *synopses* of the community working group meetings that dealt with the proposed changes.

2. Acronyms: Please consider including a list of acronyms and abbreviations in the draft EIS. Such a list would be useful for the reviewer.

3. Permits and approvals: In the draft EIS indicate the status of each of the listed permits and approvals for this project. If a permit has not been applied for, give the expected date of application.

If you have any questions call Nancy Heinrich at 586-4185.

Sincerely,

GENEVIEVE SALMONSON
Director

711 Kapiolani Boulevard, Suite 1200
Honolulu, Hawaii 96813

Dear Ms. Soon:

Thank you for transmitting the Supplemental Draft Environment Impact Statement of the Primary Corridor Transportation Project for our review and comment.

As you know, the Hawaii Community Development Authority development agenda calls for the development of several major public and private projects over the near future. These projects could add over 30,000 automobile trips per day at full build out. The traffic strategy for the Makai Plan called in part for the design of a "walkable community", one in which people could live, work and play without having to depend on an automobile. However, the key to success for such a community would be an efficient and affordable public transit system. BRT service for this area would provide that necessary public transit.

We therefore support your proposed additional alignment through Kakaako Makai.

Please feel free to call me if you have any questions.

Sincerely,

Teney K. Takahashi
Director of Planning and Development

Ms. Cheryl D. Soon, Director
Department of Transportation Services
City & County of Honolulu
711 Kapiolani Boulevard, Suite 1200
Honolulu, HI 96813

Dear Ms. Soon:

Supplemental Draft EIS for Primary Corridor Transportation Project

Thank you for the opportunity to review the subject document. Our comments related to water resources are marked below.

In general, the CWRM strongly promotes the efficient use of our water resources through conservation measures and use of alternative non-potable water resources whenever available, feasible, and there are no harmful effects to the ecosystem. Also, the CWRM encourages the protection of water recharge areas, which are important for the maintenance of streams and the replenishment of aquifers.

[ ] We recommend coordination with the county government to incorporate this project into the county's Water Use and Development Plan.

[ ] We recommend coordination with the Land Division of the State Department of Land and Natural Resources to incorporate this project into the State Water Projects Plan.

[X] We are concerned about the potential for ground or surface water degradation/contamination and recommend that approvals for this project be conditioned upon a review by the State Department of Health and the developer's acceptance of any resulting requirements related to water quality.

[ ] A Well Construction Permit and/or a Pump Installation Permit from the Commission would be required before ground water is developed as a source of supply for the project.

[ ] The proposed water supply source for the project is located in a designated water management area, and a Water Use Permit from the Commission would be required prior to use of this source.

[ ] Groundwater withdrawals from this project may affect streamflows, which may require an instream flow standard amendment.

[ ] We are concerned about the potential for degradation of instream uses from development on highly erodible slopes adjacent to streams within or near the project. We recommend that approvals for this project be conditioned upon a review by the corresponding county's Building Department and the developer's acceptance of any resulting requirements related to erosion control.

[ ] If the proposed project includes construction of a stream diversion, the project may require a stream diversion works permit and amend the instream flow standard for the affected stream(s).

[X] If the proposed project alters the bed and banks of a stream channel, the project may require a stream channel alteration permit.

[ ] OTHER:

If there are any questions, please contact Roy Hardy at 587-0274.

Sincerely,

LINNEL T. NISHIOKA
Deputy Director

Dear Ms. Nishioka:

Subject: Primary Corridor Transportation Project
Supplemental Draft Environmental Impact Statement

Thank you for your August 24, 2001 letter responding to the Supplemental Draft Environmental Impact Statement (SDEIS) Preparation Notice. Your letter provided us with the following comments for which we have prepared responses.

Comment	Response
We are concerned about the potential for ground or surface water degradation/contamination and recommend that approvals for this project be conditioned upon a review by the State Department of Health and the developer's acceptance of any resulting requirements related to water quality.	The proposed project will comply with all appropriate local, state, and federal regulations and will obtain all necessary permits.
If the proposed project alters the bed and banks of a stream channel, the project may require a stream channel alteration permit.	The proposed project would not alter the bed or banks of any stream channels; therefore, a stream channel alteration permit would not be necessary.

You will be receiving a copy of the SDEIS under separate cover. We appreciate your interest in this important transportation project and look forward to receiving your comments on the SDEIS.

Sincerely,

CHERYL D. SOON

711 Kapiolani Boulevard, Suite 1200
Honolulu, Hawaii 96813

Dear Ms. Soon:

Subject: **Comments on Supplemental Draft Environmental Impact Statement (DEIS) Preparation Notice for Primary Corridor Transportation Project Honolulu, Oahu, Hawaii**

The Department of Health, Clean Water Branch (CWB) acknowledges receipt of your Supplemental DEIS Preparation Notice and has the following comments:

1. The applicant should contact the Army Corps of Engineers to identify whether a Federal permit (including a Department of Army permit) is required for this project. A Section 401 Water Quality Certification is required for "Any applicant for Federal license or permit to conduct any activity including, but not limited to, the construction or operation of facilities, which may result in any discharge into the navigable waters...," pursuant to Section 401(a)(1) of the Federal Water Pollution Act (commonly known as the "Clean Water Act").

2. A National Pollutant Discharge Elimination System (NPDES) general permit coverage is required for each of the following activities which discharges into State Waters:

   a. Discharge of storm water runoff associated with construction activities that involve the disturbance of five acres or greater, including clearing, grading, and excavation;
   b. Discharge of hydrotesting water; and
   c. Discharge of construction dewatering effluent.

   If any construction activities will take place after March 10, 2003, discharge of storm water runoff associated with construction activities that involve the disturbance of one acre or greater, including clearing, grading, and excavation shall require coverage under the NPDES general permit.

3. The applicant may be required to apply for an Individual NPDES Permit if there is any type of process wastewater discharge from the project into State Waters.

Should you have any further questions regarding this matter, please contact Mr. Shane Sumida of the Engineering Section , CWB, at 586-4309.

Sincerely,

DENIS R. LAU, P.E., CHIEF
Clean Water Branch

Honolulu, Hawaii 96813

Dear Ms. Soon:

Subject: Primary Corridor Transportation Project

Thank you for allowing us to review and comment on the subject project. We have the following comments to offer at this time:

Wastewater Branch

All wastewater plans must conform to applicable provisions of the Department of Health's Administrative Rules, Chapter 11-62, "Wastewater Systems." We reserve the right to review the detailed wastewater plans for conformance to applicable rules.

Should you have any questions, please contact the Planning/Design section of the Wastewater Branch at 586-4294.

Clean Air Branch

Control of Fugitive Dust:

A Supplemental Draft Environmental Impact Statement was submitted to the Department of Health for the proposed changes to the Primary Corridor Transportation Project. The applicant, Department of Transportation Services, City & County of Honolulu, proposes to add an In-Town Bus Rapid Transit (BRT) branch to serve Aloha Tower Marketplace and Kakaako Makai; realign a section of the U.H. In-Town BRT alignment from Ward Avenue to Pensacola Street; and replace the Kaonohi Street BRT ramp with one at Luapele Drive. The Department of Health, Clean Air Branch, has concerns on construction activities where potential dust problems may arise. There is a significant potential for fugitive dust to be generated during the various phases of the project, including clearing and removal of debris, grubbing, grading, and excavation.

Implementation of adequate dust control measures during all phases of construction is warranted. Construction activities must comply with provisions of Chapter 11-60.1, Hawaii Administrative Rules, section 11-60.1-33 on Fugitive Dust.

The contractor should provide adequate means to control dust from road areas and during the various phases of construction activities. These means include, but are not limited to: Control of Fugitive Dust:

A Supplemental Draft Environmental Impact Statement was submitted to the Department of Health for the proposed changes to the Primary Corridor Transportation Project. The applicant, Department of Transportation Services, City & County of Honolulu, proposes to add an In-Town Bus Rapid Transit (BRT) branch to serve Aloha Tower Marketplace and Kakaako Makai; realign a section of the U.H. In-Town BRT alignment from Ward Avenue to Pensacola Street; and replace the Kaonohi Street BRT ramp with one at Luapele Drive. The Department of Health, Clean Air Branch, has concerns on construction activities where potential dust problems may arise. There is a significant potential for fugitive dust to be generated during the various phases of the project, including clearing and removal of debris, grubbing, grading, and excavation. Implementation of adequate dust control measures during all phases of construction is warranted. Construction activities must comply with provisions of Chapter 11-60.1, Hawaii Administrative Rules, section 11-60.1-33 on Fugitive Dust.

The contractor should provide adequate means to control dust from road areas and during the various phases of construction activities. These means include, but are not limited to:

a. Planning the different phases of construction, focusing on minimizing the amount of dust-generating materials and activities, centralizing on-site vehicular traffic routes, and locating potentially dusty equipment in areas of the least impact;

b. Providing an adequate water source at site prior to start-up of construction activities;

c. Landscaping and rapid covering of bare areas, including slopes, starting from the initial grading phase;

d. Controlling of dust from shoulders, and access roads;

e. Providing adequate dust control measures during weekends, after hours, and prior to daily start-up of construction activities; and

f. Controlling of dust from debris being hauled away from project site.

If you have any questions on fugitive dust issues, please contact Ms. Crystal Peltier at 586-4200.

Clean Water Branch

1. The applicant should contact the Army Corps of Engineers to identify whether a federal permit (including a Department of Army permit) is required for this project. If a federal permit is required, then a Section 401 Water Quality Certification is require from the State Department of Health, Clean Water Branch.

2. A National Pollutant Discharge Elimination System (NPDES) general permit is required for the following discharges to waters of the State:

   a. Storm water discharges relating to construction activities, such as clearing, grading, and excavation for projects equal to or greater than five acres;

   b. Storm water discharges from industrial activities;

   c. Construction dewatering activities;

   d. Noncontact cooling water discharges less than one million gallons per day;

   e. Treated groundwater from underground storage tank remedial activities;

   f. Hydro testing water;

   g. Treated effluent from petroleum bulk stations and terminals; and

   h. Treated effluent from well drilling activities.

   Any person requesting to be covered by a NPDES general permit for any of the above activities should file a Notice of Intent with the Department's Clean Water Branch at least 30 days prior to commencement of any discharge to waters of the State.

3. After construction of the proposed facility is completed, an NPDES individual permit will be required if the operation of the facility involves any wastewater discharge into State waters.

Any questions regarding these comments can de directed to the Clean Water Branch at 586-4309.

Sincerely,

GARY GILL

P. O. Box 3378
Honolulu, Hawaii 96801-3378

Dear Mr. Gill:

Subject: Primary Corridor Transportation Project
Supplemental Draft Environmental Impact Statement

Thank you for your October 2, 2001 letter responding to the Supplemental Draft Environmental Impact Statement (SDEIS) Preparation Notice. Your letter provided us with the following comments for which we have prepared responses.

Comment	Response
Wastewater Branch - All wastewater plans must conform to applicable provisions of the Department of Health's Administrative Rules, Chapter 11-62, "Wastewater Systems." We reserve the right to review the delailed wastewater plans for conformance to applicable rules.	If wastewater plans are required, they will conform to the Department of Health's (DOH) Administrative Rules, Chapter 11-62, "Wastewater Systems" and be submitted to DOH for review.
Clean Air Branch - The Department of Health, Clean Air Branch, has concerns on construction activities where potential dust problems may arise. There is a significant potential for fugitive dust to be generated during the various phases of the project, including clearing and removal of debris, grubbing, grading, and excavation.	Appropriate dust control measures would be implemented during construction.

Implementation of adequate dust control measures during all phases of construction is warranted. Construction activities must comply with provisions of Chapter 11-60, Hawaii Administrative Rules, section 11-60.1-33 on Fugitive Dust	All construction activities for the project will comply with appropriate Hawaii Administrative Rules.
The contractor should provide adequate means to control dust from road areas and during various phases of construction activities. These means include, but are not limited to: Control of Fugitive Dust.	Appropriate dust control measures would be implemented during construction.
Clean Water Branch - The applicant should contact the Army Corps of Engineers to identify whether a federal permit (including a Department of the Army permit) is required for this project.	All necessary agencies will be contacted and required permits obtained.
A National Pollutant Discharge Elimination System (NPDES) general permit is required for the following discharges to waters of the State: (conditions listed). Any person requesting to be covered by a NPDES general permit for any of the above activities should file Notice of Intent with the Department's Clean Water Branch at least 30 days prior to commencement of any discharge to waters of the State.	Thank you for this information, all necessary agencies will be contacted and required permits obtained.
After construction of the proposed facility is completed, an NPDES individual permit will be required if the operation of the facility involves any wastewater discharge into State waters.	Thank you for this information, all necessary agencies will be contacted and required permits obtained.

You will be receiving a copy of the SDEIS under separate cover. We appreciate your interest in this important transportation project and look forward to receiving your comments on the SDEIS.

Dear Ms. Soon:

SUBJECT: Primary Corridor Transportation Project
Supplemental Draft Environmental Impact Statement

Thank you for transmitting the Supplemental Draft Environmental Impact Statement for the Primary Corridor Transportation Project. Since the preferred alternative includes new routes, we would like a windshield level survey done along these new routes to identify historic sites that may be affected. Of concern to our office, in addition to the underground archaeological resources that may be uncovered, are the historic sites along the route. We would like to ensure that road widening, ramps, transit stations and any other structures necessary to operate the BRT system does not adversely impact these historic sites.

Please note, in the permits and approvals section, that while our approval is not necessary to proceed under Section 106 of the National Historic Preservation Act, the responsible federal agency will need to document its consultation with our office. Also, our written concurrence for projects by the state or its political subdivisions is required under Chapter 6E-8, Hawaii Revised Statutes.

Thank you for the opportunity to comment. Should you have further questions regarding the historic sites survey, please call Tonia Moy at (808)692-8030.

Aloha,

DON HIBBARD, Administrator
State Historic Preservation Division

Dear Mr. Hibbard:

Subject: Primary Corridor Transportation Project
Supplemental Draft Environmental Impact Statement

Thank you for your September 7, 2001 letter responding to the Supplemental Draft Environmental Impact Statement (SDEIS) Preparation Notice. Your letter provided us with the following comments for which we have prepared responses.

Comment	Response
Since the preferred alternative includes new routes, we would like a windshield level survey done along these new routes to identify historic sites that may be affected.	The SDEIS will include a windshield survey of the potential historic sites along the alignments.
Of concern to our office, in addition to the underground archaeological resources that may be uncovered, are the historic sites along the route. We would like to ensure that road widening, ramps, transit stations and any other structures necessary to operate the BRT system does not adversely impact these historic sites.	The SDEIS will address any impacts to historic sites.

Please note, in the permits and approvals section, that while our approval is not necessary to proceed under Section 106 of the National Historic Preservation Act, the responsible federal agency will need to document its consultation with our office.	Consultation with the SHPD is an integral part of the coordination process and will continue throughout the project development process.
Also, our written concurrence for projects by the state or its political subdivisions is required under Chapter 6E-8, Hawaii Revised Statutes.	Chapter 6-E, Hawaii Revised Statues will be followed and SHPD written concurrence will be obtained.

You will be receiving a copy of the SDEIS under separate cover. We appreciate your interest in this important transportation project and look forward to receiving your comments on the SDEIS.

Dear Ms. Soon:

SUBJECT: National Historic Preservation Act, Section 106 Compliance – Comment on Preparation Notice (PN) for a Supplemental Draft Environmental Impact Statement (SDEIS) for the Proposed Primary Corridor Transportation Project Island of O`ahu

Thank you for the opportunity to comment on the SDEISPN issued for the proposed Primary Corridor Transportation Project. The City and County of Honolulu Department of Transportation Services (DTS) is carrying out the subject project with the assistance of the US Department of Transportation, Federal Transit Administration, and the Federal Highway Administration. We received notice of the subject undertaking on or about August 22, 2001. In addition, Sara Collins, Elaine Jourdane, and Tonia Moy of our office met with Faith Miyamoto of DTS and Ann Koby of PB Consult on September 13, 2001, in order to review aspects of the SDEISPN. We provide the following comments.

In general, we will need to have more specific information on what historic properties are present within the Area of Potential Effect (APE) as well as more details on any ground disturbing activities required to construct portions of the project. Once we have the data on historic sites, we shall be better able to determine what, if any, effects the proposed undertaking will have on significant historic sites. We thus look forward to receiving more detailed information from your agency as it becomes available.

Should you have any questions about archaeology, please feel free to contact Sara Collins at 692-8026. Should you have any questions about architecture, please feel free to contact Tonia Moy at 692-8030. Should you have any questions about burial matters, please feel free to contact Kai Markell at 587-0008.

Aloha,

Gilbert Coloma-Agaran

Dear Ms. Soon:

Subject: Supplemental Draft Environmental Impact Statement for the Primary Corridor Transportation Project /Bus Rapid Transit System

A stop at the Aloha Tower Marketplace has been planned for the Kakaako Makai branch of this route. This new BRT line will serve the Marketplace, the many shops restaurants and attractions in the area, as well as new projects proposed for the area known as Kakoako Makai. It will also provide a convenient transportation alternative for the hundreds of employees that work at the Marketplace and surrounding businesses.

The Aloha Tower Marketplace currently serves over 2 million patrons annually, both residents and visitors. A large number of these visitors are currently served by dedicated trolleys that take them from Waikiki to the Marketplace. While the Marketplace is also served by The Bus, this added route would greatly enhance the appeal of the Marketplace to local patrons as the BRT should be more convenient and accessible to the general public. ATDC is committed to its mission of creating opportunities for local residents to visit and enjoy the downtown waterfront, and to support any endeavors that accomplishes that goal. The Kakaako Makai branch of the BRT as designed, will take ATDC another step closer to fulfilling that goal.

While we are supportive of these revisions to your project, we do have the following questions: What is the timetable for completion of the Kakaako Makai Branch? Where will the terminus be placed for the Aloha Tower stops?

Thank you for allowing ATDC to provide comments to the SDEIS for the Primary Corridor Transportation Project.

Sincerely,

Ronald Hirano
Executive Director

Subject: Primary Corridor Transportation Project
Supplemental Draft Environmental Impact Statement

Thank you for your September 21, 2001 letter responding to the Supplemental Draft Environmental Impact Statement (SDEIS) Preparation Notice. Your letter provided us with the following comments for which we have prepared responses.

Comment	Response
We are supportive of these revisions to your project.	Support for the proposed modifications to the BRT Alternative noted.
What is the timetable for completion of the Kakaako Makai Branch?	The Kakaako Makai Branch will be implemented in 2006.
Where will the terminus be placed for the Aloha Tower stops?	The proposed Aloha Tower Transit Stop will be located along Aloha Tower Drive just Koko Head of Bishop Street. The stop for the Ewa direction will be located along the mauka curb between two existing driveways servicing the HECO facility. The stop for vehicles traveling in the Koko Head direction would also be located on Aloha Tower Drive but on the makai curb just to the Koko Head side of Pier 7.

You will be receiving a copy of the SDEIS under separate cover. We appreciate your interest in this important transportation project and look forward to receiving your comments on the SDEIS.

City and County of Honolulu
711 Kapiolani Boulevard, Suite 1200
Honolulu, Hawaii 96813

Dear Ms. Soon:

Subject: Primary Corridor Transportation Project
Supplemental Draft Environmental Impact Statement

Thank you for the opportunity to review the Supplemental Draft Environmental Impact Statement for the subject project. We do have concerns about the negative impacts on a portion of the subject project, and we offer the following comments.

We are currently working with the Housing and Community Development Corporation of Hawaii (HCDCH) to plan the development of our portion of the area located at and around the old OR&L Building near the intersection of King Street and Iwilei Road. Our intent is to construct a Liliha Civic Center to provide office space for State agencies to service the public. As such, we believe:

1. The proposed plan extending Kaaahi Street (at grade) toward Diamond Head to Iwilei Road would result in maximum disruption to the planned civic center site. It nearly bisects the property with a roadway that we do not intend to utilize. We question if a Bus Rapid Transit (BRT) easement is required to traverse the site at all (as opposed to remaining on Dillingham Boulevard to and from King Street, for example, since the plans for the BRT already take away two of the five lanes on Dillingham one block away). In lieu of an easement for the roadway, we propose an exchange of road Right-of-Way for county-owned school land.

2. The proposed BRT station and any BRT parking structure on site would also adversely affect the development of the civic center, by increasing traffic around our site and taking up valuable property.

3. That if the city still plans to go ahead with Items 1 and 2 above, then the City should consider purchasing the adjacent Ohtani property to execute a land swap plus purchase of all improvements with the State. This would provide us with adequate property free of the disruption from increased vehicular traffic.

Further, we request additional information about the proposed extension. What is the anticipated volume and type of traffic? Will private vehicles be permitted to use Kaaahi Street to cross through the site to Iwilei Road?

Nearly ten years ago, the previous professionally-planned rapid transit project (unfortunately now defunct), was conceived to be above grade in this area, with a station located Ewa off-site, makai of Kaaahi Street to serve this neighborhood. The transit easement alignment would have been much closer to the makai boundary than, for example, an extension of Kaaahi Street provides, and would therefore have less of an impact on our portion of the site.

Should there be any questions, please have your staff call Mr. Bruce Bennett of the Planning Branch at 586-0491.

Sincerely,

GORDON MATSUOKA
Public Works Administrator

Dear Mr. Matsuoka:

Subject: Primary Corridor Transportation Project
Supplemental Draft Environmental Impact Statement

Thank you for your September 21, 2001 letter responding to the Supplemental Draft Environmental Impact Statement (SDEIS) Preparation Notice. Your letter provided us with the following comments for which we have prepared responses.

Comment	Response
We are currently working with the Housing and Community Development Corporation of Hawaii (HCDCH) to plan the development of our portion of the area located at and around the old OR&L Building near the intersection of King Street and Iwilei Road. Our intent is to construct a Liliha Civic Center to provide office space for State agencies to service the public. As such, we believe:	The DTS is committed to coordinating with DAGS to ensure that the two projects proceed in a timely manner.
The proposed plan extending Kaaahi Street (at grade) toward Diamond Head to Iwilei Road would result in maximum disruption to the planned civic center site. It nearly bisects the property with a roadway that we do not intend to utilize. We question if a Bus Rapid Transit (BRT) easement is required to traverse the site at all (as opposed to remaining on Dillingham Boulevard to and from King Street, for example, since the plans for the BRT already take away two of the five lanes on Dillingham one block away). In lieu of an easement for the roadway, we propose an exchange of road Right-of-Way for county-owned school land.	The DTS is committed to coordinating with DAGS to ensure that the two projects proceed in a timely manner.

The proposed BRT station and any BRT parking structure on site would also adversely affect the development of the civic center, by increasing traffic around our site and taking up valuable property.	Chapter 4 of the DEIS presents the traffic impacts associated with the BRT project.
That if the city still plans to go ahead with items 1 and 2 above, then the City should consider purchasing the adjacent Ohtani property to execute a land swap plus purchase of all improvements with the State. This would provide us with adequate property free of the disruption from increased vehicular traffic.	The DTS is committed to coordinating with DAGS to ensure that the two projects proceed in a timely manner.
Further, we request additional information about the proposed extension. What is the anticipated volume and type of traffic?	The FEIS will refine the traffic conditions associated with implementing the BRT in this location.
Will private vehicles be permitted to use Kaaahi Street to cross through the site to Iwilei Road?	At this point in project development, private vehicles will not be permitted to use Kaaahi Street to access Iwilei Road.
Nearly ten years ago, the previous professionally-planned rapid transit project (unfortunately now defunct), was conceived to be above grade in this area, with a station located Ewa off-site, makai of Kaaahi Street to serve this neighborhood. The transit easement alignment would have been much closer to the makai boundary than, for example, an extension of Kaaahi Street provides, and would therefore have less of an impact on our portion of the site.	The FEIS will refine the benefits and impacts associated with implementing the BRT as discussed in the DEIS.

You will be receiving a copy of the SDEIS under separate cover. We appreciate your interest in this important transportation project and look forward to receiving your comments on the SDEIS.

Dear Ms. Soon:

Re: Comments and Concerns
Primary Corridor Transportation Project
Supplemental Draft Environmental Impact Statement Preparation Notice

In response to the Primary Corridor Transportation Project Supplemental Draft Environmental Impact Statement (SDEIS) Preparation Notice dated August 2001, I wish to raise the following questions and concerns, and request that they be fully addressed in the SDEIS.

A. Inclusion of the Kamehameha Highway Transit Corridor/BRT Spur and Transit Stations in the SDEIS Analysis.

In lieu of the originally proposed Kaonohi Street BRT ramps and Kamehameha Drive-in location of a transit center, the Pearl City-Aiea working group recommended the following transportation elements:

1) Establishment of a transit corridor or "BRT spur" along Kamehameha Highway;
2) Development of two community transit centers along Kamehameha Highway, one at the site of the former Jim Slemmons auto dealership, the other on the site of the old Hale Mohalu Hospital;
3) Development of a major transit center with park-and-ride facilities at the Aloha Stadium overflow parking lot; and
4) Construction of a new BRT on/off ramp near Luapele Street to connect the Aloha Stadium Transit Center with the H-1 zipper lanes.

It appears from the SDEIS Preparation Notice that the only element of the working group's recommendation to be included in the SDEIS is the construction of the new BRT on/off ramp near Luapele Street. This is a serious omission since the Kamehameha Highway transit corridor and transit stations are intended to service BRT vehicles that will directly enter and run along the Regional BRT H-1 corridor.

Why is this integral part of the system being carved or parceled out of the SDEIS analysis? Does this limited review comply with the intent and legal requirements of the Environmental Impact Statement process? I believe that it is imperative that the SDEIS ascertain the impacts of the system as a whole not just a few selected parts!

Since all elements of the Pearl City-Aiea working group's recommendation will be directly contributing to the BRT system's overall patronage and ridership estimates, revenue projections, and construction and operational expenses, it is only reasonable and logical that all elements likewise be included in the SDEIS analysis of impacts. Moreover, since these new elements will likely alter the results of the existing system-level analysis and findings provided in the MIS/DEIS, these additional elements must be included within the SDEIS to assure reliable, complete, up-to-date, and accurate system-wide projections and estimates.

The amended LPA (reference Resolution 01-208, CD1, FD1) specifically provides that the Kamehameha Highway contra-flow transit corridor and the Pearl City and Aiea transit centers be projects separate from, but complementary to, the amended LPA. Accordingly, this is to request, and strongly urge, that all elements recommended by the Pearl City-Aiea working group identified above, not just the replacement of the Kaonohi Street BRT ramp with one at Luapele Drive, be included as part of the SDEIS analysis.

B. Farrington Highway Transit Corridor and BRT Spur

It has recently been brought to my attention that the Department of Transportation Services is also considering developing a portion of Farrington Highway into a transit corridor/BRT spur similar to that proposed for Kamehameha Highway in the Pearl City-Aiea area. For all of the same reason identified above, I strongly urge that this proposed Farrington Highway transit corridor/BRT spur, and its related transit components, be included as part of the SDEIS analysis.

C. Agreement of Participation by State and Federal Agencies

A major factor in the success of the overall BRT system is the use of state and federal government infrastructure. For example, the Regional BRT route proposes to utilize the State Department of Transportation's Zipper Lane as a transit corridor, and the Luapele Drive BRT ramp will be connected to and accessible via the Navy-owned portion of Luapele Street.

Has the City received assurances from the appropriate agencies that it will be allowed to utilize the aforementioned as well as any other State- and Federally-controlled properties for the BRT system? If not, how will this affect the BRT project where specific locations/elements are identified in the SDEIS? What will be the result of a worst-case scenario where permission is not granted by either or both governments?

D. **Mixed Traffic Impediments to Efficient Regional and In-Town BRT Vehicular Movement.**

The key to efficient and effective movement of the BRT vehicles is their use of exclusive right-of-ways or traffic lanes to by-pass the normal congestion of our streets and highways. Unfortunately, there are several segments along the BRT route where the BRT vehicles must operate in mixed- or shared-use lanes with normal traffic. This is potentially a fatal flaw to the entire system.

If the BRT is forced to compete with and operate in existing traffic flow, bottlenecks will surely develop, resulting in greatly diminished speed and possibly even gridlock. While most of these shared-use segments are within the "In-Town" portion of the project (i.e. Kapiolani Boulevard between Atkinson and Kalakaua, Kapiolani Boulevard between Isenberg and University, along Richards Street, along King Street, etc), it appears that some shared-use segments may also exist, at least temporarily, along the "Regional" portion as well.

To assure that we do not construct a system which simply moves commuters quickly to the next bottleneck, where it will stall in existing traffic, I strongly recommend that the SDEIS:

1) Identify all segments of the BRT (both Regional and In-Town) where the BRT vehicles will be forced to use, share or transition across mixed-use traffic lanes;

2) Analyze possible alternatives to such mixed-use; and

3) Develop and recommend a set of alternatives that assure BRT vehicles an exclusive right-of-way from one end of the system to the other.

E. **Impact of New Developments on the BRT System**

There are locations along or in close proximity to the BRT route where major new developments and land uses have been proposed. While it may be impossible to anticipate all of the potential development or redevelopment sites, the SDEIS should identify and consider the impacts upon the BRT system (both positive and negative) of those developments for which preliminary plans have at least been proposed. Examples of such major projects include the redevelopment of Ford Island and the proposed Outrigger Beachwalk redevelopment.

F. **Update of Financial Analysis**

It is unclear from the language of the Preparation Notice whether or not a full update of the BRT Financial Analysis is proposed as part of the SDEIS. Clearly, given the additional costs associated with the added In-Town and Regional routing, as well as changes to the location and basic designs of the Regional on/off ramps, the overall cost and financial impact of the system will change significantly. Moreover, the additional In-Town routing and the inclusion of the Kamehameha Highway and Farrington Highway transit corridor/BRT spurs will significantly impact estimates of overall system ridership, revenue, and operating costs.

Moreover, the State of Hawaii has recently stated (reference attached State DOT letter of September 18, 2001) that, "*It is not our intent or expectation to provide funding for the BRT project; and have developed our capital improvement programs accordingly.*"

Accordingly, if the Financial Analysis of the Primary Corridor Transportation Project is to be complete and accurate, it must be thoroughly updated to reflect all of the changes and additions to the system that are currently being proposed, as well as review and revise the entire funding scheme based upon the State's non-participation.

I thank you for the opportunity to submit these comments and concerns, and trust that they will be included and appropriately analyzed in the forthcoming SDEIS.

Sincerely,

Gary H. Okino
Councilmember, District VIII

Dear Ms. Soon:

Subject: Funding for the Bus Rapid Transit Project (BRT)

This is a follow-up to the Policy Committee meeting of September 14, 2001, where we were requested to submit, in writing, our understanding of the funding for the Bus Rapid Transit Project.

We have from the onset expressed our reservations on being able to fund this project, as the statewide needs far exceed our limited resources. More recently, in meetings on the project, we were advised that alternative funding strategies were in place, where Federal Highways (FHWA) and State funds would not be required.

As such, it is not our intent or expectation to provide funding for the BRT project; and have developed our capital improvement programs accordingly.

Very truly yours,

BRIAN K. MINAAI
Director of Transportation

The Honorable Gary H. Okino
Member, City Council
City and County of Honolulu
Honolulu, Hawaii 96813-3065

Dear Councilmember Okino:

Subject: Primary Corridor Transportation Project

Thank you for your letter of September 19, 2001, regarding the Supplemental Draft Environmental Impact Statement (SDEIS) Preparation Notice for the subject project.

The following responses to your comments are provided by section.

A. Inclusion of the Kamehameha Highway Transit Corridor/BRT Spur and Transit Stations in the SDEIS Analysis

We agree with the working group that establishing preferred transit treatment on Kamehameha Highway is an excellent idea, with or without BRT. Therefore, we are proposing it as a project for concept planning, and future design and construction. We recommend this be done jointly with the transit centers tentatively proposed by the working group. Because these projects have independent utility from the BRT system and can proceed using City CIP funds, it is advantageous for them to proceed into formal planning now.

The Luapele ramp is a recommendation integrally tied to the BRT and, therefore, we have included it in the SDEIS. This approach not only fully complies with the EIS process but is advantageous to accelerating the implementation of the various recommendations.

Having said this, all components of the BRT system are being treated as a whole in the environmental documentation that is being prepared. The FEIS ridership forecasts will reflect the complementary projects recommended by the Pearl City-Aiea working group. Likewise the cumulative impacts of these complementary improvements will be discussed in the FEIS.

B. Farrington Highway Transit Corridor and BRT Spur

A number of possible transit improvements have been offered for Waipahu. One of these would give priority to buses on Farrington Highway. Once a decision is reached on the type of improvement needed, a separate environmental analysis will be done.

C. Agreement of Participation by State and Federal Agencies

Coordination has been continuous and ongoing with the State Department of Transportation and the Navy regarding the zipper lanes, BRT ramps, and related improvements. The worst case scenario would be that we could not build sections where there is no agreement. This would be regrettable, and the public would suffer.

D. Mixed Traffic Impediments to Efficient Regional and In-Town BRT Vehicular Movement

Exclusive right-of-way for BRT vehicles would be ideal from the transit operational perspective. However, through our early outreach program that resulted in the evolution of the BRT project, the community participants provided very clear direction to us about not wanting the cost or the disruptions of the elevated structures that would provide the separate and exclusive right-of-way for transit. Therefore, we are not including an alternative that requires an exclusive/elevated right-of-way for the entire length of the alignment.

Exclusive lanes would be ideal, but are not imperative or even necessary at all times of the day, from initial implementation of the BRT project. This project will be in use for many years into the future. When and where exclusive rights-of-way can be created, including grade separations, travel times would further benefit. We look forward to working with you on any ideas you have for areas where exclusive right-of-way can be developed.

The BRT system strives to strike a balance between transit speed and impacts to general purpose traffic and the community. In segments where it was judged that roadway capacity was needed for general purpose traffic and the impacts to BRT operation would be tolerable, exclusive lanes were replaced by either semi-exclusive or mixed-flow operation. In areas of high BRT ridership volumes, exclusive transit lanes were retained such as through Kalihi and along Hotel Street in Downtown. We have also retained exclusive lanes where right-of-way is available, such as along Kalia Road.

Chapter 2 of the FEIS will identify where the In-Town BRT travels in exclusive, semi-exclusive and mixed-use lanes. Alternatives to mixed-use lanes have been analyzed. Based on consultation with the public and affected stakeholders, the currently proposed BRT configuration achieves the balance between transit speed and traffic impacts. Delays due to the BRT operating in mixed traffic have been reflected in the BRT operations plan, ridership forecasts, and cost estimates.

The only significant section of the Regional BRT where there will be temporary mixed traffic operations is between Kapolei and Managers Drive. In this section, ridership justifies express lanes. This could be changed at some future time if traffic conditions warrant installation of exclusive lanes.

E. Impact of New Developments on the BRT System

The discussion of land use impacts will be updated in Section 5.1, Land Use and Economic Activity, of both the SDEIS and FEIS. The proposed developments and redevelopments will be included in that discussion. It is true that new developments are constantly proposed, but we have been especially careful to identify all those known at the time of document preparation.

F. Update of Financial Analysis

Chapter 6 of the SDEIS will provide a discussion of the financial analysis for the Primary Corridor Transportation Project. The SDEIS will include costs at the same base year (1998) as the MIS/DEIS, so that the two can be adequately compared. The FEIS will update costs to a new base year (2001).

Councilmember Okino, I want you to know how much we appreciate your insight and support of BRT to ensure that it is of most value to our residents. After you have reviewed our response, we would be pleased to sit down together to discuss overall progress on implementation. I will call you to arrange a meeting.

SUBJECT: PREPARATION NOTICE FOR A SUPPLEMENTAL DRAFT ENVIRONMENTAL IMPACT STATEMENT FOR THE PRIMARY CORRIDOR TRANSPORTATION PROJECT

Thank for providing the DPP the opportunity to comment on revisions to the proposed project. As indicated in our November 16, 2000 memo on the Draft Environmental Impact Statement, the revisions should be coordinated with proposed revisions to the Primary Urban Center and the Central Oahu Development Plans which are presently undergoing major revisions. We offer the following comments for your consideration:

1. Information on relevant alignment and station descriptions, estimated costs and CIP schedules, and implementation schedules for both the In-Town and Regional BRTs should be included where appropriate to determine if Development Plan Public Facilities Map or Public Infrastructure Map amendments will be required before CIP monies for construction and land acquisition are budgeted.

2. The proposed In-Town BRT Branch Alignment includes five proposed stations located in the Chinatown, Hawaii Capital, and the Thomas Square/Honolulu Academy of Arts Special Districts. In Section 3.2.1 - Land Use and Relocation, there should be discussions about any consistency and/or impacts the proposed stations and BRT alignment will have on these special districts regarding their respective district objectives, historic architectural character, landscaping, pedestrian linkages, and view corridors.

3. In Section 3.2.3 - Parks and Recreation Areas, Section 3.2.4 - Archaeological, Historic and Cultural Resources and Section 3.2.5 - Visual and Aesthetic, of the DEIS, there should be discussions regarding any impacts of the proposed stations and alignments on existing parks, streetscape improvements (i.e., curbs, gutters, sidewalks, planting strips, street trees, light standards, and signage), historic structures, and significant sites.

4. In those areas not included in the special districts, it would be helpful to us to have a discussion on impacts the proposed In-Town Branch Alignment will have on existing street trees.

5. Additional permits and/or approvals, other than Special Management Area permits, should be disclosed, i.e., the need for special district permits, waivers, and exemptions as a "public use," and Trenching Permits.

Should you have any questions regarding our comments, please contact Raymond Young of our staff at 527-5839.

Sincerely yours,

RANDALL K. FUJIKI, AIA
Director of Planning and Permitting

MEMORANDUM

TO: RANDALL K. FUJIKI, AIA, DIRECTOR
DEPARTMENT OF PLANNING AND PEMITTING

FROM: CHERYL D. SOON, DIRECTOR

SUBJECT: PRIMARY CORRIDOR TRANSPORTATION PROJECT
SUPPLEMENTAL DRAFT ENVIRONMENTAL IMPACT STATEMENT

Thank you for your September 19, 2001 letter responding to the Supplemental Draft Environmental Impact Statement (SDEIS) Preparation Notice. Your letter provided us with the following comments for which we have prepared responses.

Comment	Response
As indicated in our November 16, 2000 memo on the Draft Environmental Impact Statement, the revisions should be coordinated with proposed revisions to the Primary Urban Center and the Central Oahu Development Plans which are prepsently undergoing major revisions.	The project refinements will be coordinated with the Primary Urban Center and the Central Oahu Development Plan updates.
Information on relevant alignment and station descriptions, estimated costs and CIP schedules, and implementation schedules for both the In-Town and Regional BRTs should be included where appropriate to determine if Development Plan Public Facilities Map or Public Infrastructure Map amendments will be required before CIP monies for construction and land acquisition are budgeted.	Chapter 2 of the SDEIS provides alignment and station location descriptions. The Refined BRT Alignment plans are provided in Appendix B. The SDEIS Section 2.3 – Capital Costs and Section 2.4 - Operating and Maintenance Costs provide the cost estimates associated with the proposed project refinements. The SDEIS Section 2.5 Implementation Schedule includes Figure 2.5-1, which presents the proposed schedule for implementing the Refined BRT Alternative components.

The proposed In-Town BRT Branch Alignment includes five proposed stations located in the Chinatown, Hawaii Capital, and the Thomas Square/Honolulu Academy of Arts Special Districts. In Section 3.2.1 – Land Use and Relocation, there should be discussions about any consistency and/or impacts the proposed stations and BRT alignment will have on these special districts regarding their respective district objectives, historic architectural character, landscaping, pedestrian linkages, and view corridors.	Chapter 3 of the SDEIS presents the affected environment associated with the Refined BRT Alternative. The pedestrian discussion in presented in Section 4.6 of the SDEIS. Chapter 5 of the SDEIS discusses the environmental consequences associated with implementing the Refined BRT Alternative. Section 5.4 discusses the visual and aesthetic resources, Section 5.10 discusses the historic and archaeological resources, and Section 5.11 discusses parklands.
In Section 3.2.3 – Parks and Recreation Areas, Section 3.2.4 – Archaeological, Historic and Cultural Resources and Section 3.2.5 – Visual and Aesthetic, of the DEIS, there should be discussion regarding any impacts of the proposed stations and alignments on existing parks, streetscape improvements (i.e. curbs, gutters, sidewalks, planting strips, street trees, light standards, and signage), historic structures, and significant sites.	Chapter 5 of the SDEIS discusses the environmental consequences associated with implementing the Refined BRT Alternative. Section 5.4 discusses the visual and aesthetic resources, Section 5.10 discusses the historic and archaeological resources, and Section 5.11 discusses parklands.
In those areas not included in the special districts, it would be helpful to us to have a discussion on impacts the proposed In-Town Branch Alignment will have on existing street trees.	The SDEIS, Section 3.7.1 – Terrestrial Vegetation summarizes the results of the tree survey conducted since the MIS/DEIS was published. Section 5.7.1 – Impacts and Section 5.7.2 – Mitigation for Trees summarize the potential tree impacts and proposed mitigations for the Refined BRT Alternative.
Additional permits and/or approvals, other than Special Management Area permits, should be disclosed, i.e., the need for special district permits, waivers, and exemptions as a "public use," and Trenching Permits.	The SDEIS, Section 7.5 – Required Permits and Approvals presents the anticipated permits required for implementing the project.

You will be receiving a copy of the SDEIS under separate cover. We appreciate your interest in this important transportation project and look forward to receiving your comments on the SDEIS.

Comments Regarding
Primary Corridor Transportation Project
Supplemental Draft Environmental Impact Statement

September 21, 2001

To: Ms. Cheryl D. Soon, Director
Department of Transportation Services
City and County of Honolulu
711 Kapiolani Boulevard, Suite 1200
Honolulu, Hawaii 96813

From: J. T. Miller
700 Richards Street, #1909
Honolulu, Hawaii 96813

Subj: Primary Corridor Transportation Project,
Supplemental Draft Environmental Impact Statement

Dear Ms. Soon:

In response to your letter of August 16, 2001, (TPD01-00500), forwarding the subject Supplemental DEIS, the following comments are submitted.

These observations target one segment only of the Primary Corridor Transportation Project; that of:

The In-Town BRT branches serving the Kakaako Branches, both Mauka and Makai. In particular, the routes directed both Mauka and Makai upon Richards Street, from King Street to Halekauwila Street/Ala Moana Boulevard are judged ill conceived as to functional operation and adherence within the framework of impact upon the environment. There are also major unaddressed issues, which require total clarification for a comprehensive, acceptable final DEIS.

The following information is submitted for the review process of this project.

Sincerely,

J. T. Miller
Chairman, Resident Committee to Address Honolulu SDEIS
Harbor Square Condominium Association

Enclosures

Rebuttal to: Section 3. Proposed Impact Studies

3.1 Physical Environment

3.1.1 **Air Quality** As stated, "Mesoscale impacts resulting from the proposed modifications are not expected to be different from what was disclosed in the MIS/DEIS." How can that be determined, when there has been no determination/selection as to the device of transportation, i.e., bus/train. Testing could not be completed until such vehicles are in place, especially on the heavily frequented segment of Richards Street between Queen Street and Ala Moana Blvd, which is lined with tall buildings, (one of which being residential). Further, as stated in Oahu Trans 2K Progress Report #5:

> **Has the technology for the BRT system been selected?**
> Power technologies for the BRT system have not been chosen and will need to be service-proven before they are used in Honolulu. The existing articulated express buses will be able to use the In-Town BRT route until electric vehicles are acquired.

Therefore, utilizing the diesel powered, articulated tractor type buses now in use, with **three lines operating one bus every three minutes, (or 60 buses per hour, or 1 per minute)**, air quality in this downtown canyon would definitely be required data. It is absent.

3.1.2 **Noise and Vibration** The opening statement of this section states that there are no land uses along the proposed In-town BRT alignment that are sensitive to excess noise, "such as residences."

Located at the corner of Richards Street and Halekauwila Street, (the bottleneck in which the three Kakaako lines intersect), stands a 27 story residential building. **(Picture 1)**. All three lines of this referenced BRT pass directly beneath the windows of **EIGHTY (80) bedrooms,** where working people will be trying to sleep at night, so as to be rested for the coming day. **(Picture 2)**

As there has not yet been a selection of the supposedly 'quiet' electric bus, the diesel/tractor buses will be utilized, which are NOTquiet. Because this bottleneck in the route structure, requiring right angle turns of the hinged buses, it will necessitate braking, then powering up again to regain speed, a very noise-generating procedure, which will occur, electric powered or diesel driven.

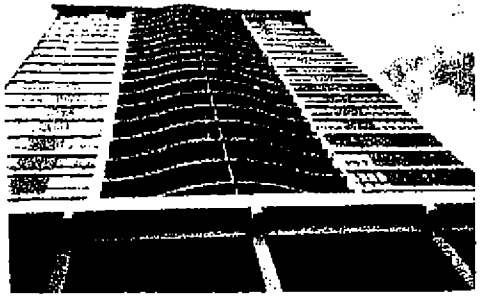
AR00016305

Picture 1

Photo was taken at the corner of Richards Street and Halekauwila Street, at the point where three instersecting BRT lines will come together, proceeding mauka and makai on Richards Street.

Picture 2 was taken from the centerline of Richards Street.

Eighty (80) bedrooms are forty five feet from this centerline.



Picture 2

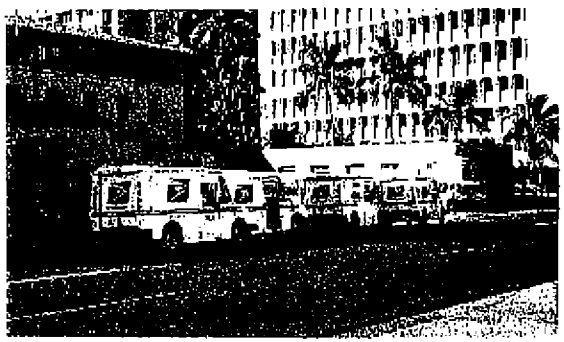
3.2.1 Land use and Relocation "Partial or full displacements of businesses, public facilities, or local organizations would be described, if necessary."

Due to the narrow width of Richards Street, (44 ft.), all onstreet parking will be removed to to accommodate the makai/mauka bus lanes and yet include vehicular traffic entering and exiting the parking structures of the following business buildings between King Street and Halekauwila Street:

The City Bank Building	Six (6) stories of parking
The Melim Building	Five (5) stories of parking
Harbor Square Condominiums	Fourteen (14) levels of parking
Ocean View Center	Six (6) levels of parking
The Haseko Building	Five (5) floors of parking

Located on the Diamond Head side of Richards Street, below Merchant Street, is the U.S., Postal Service marshalling yard, facilitating over 150 mail trucks per day throughout the work week, commencing with a lineup each morning from 8:00 to 9:00 AM of postal vehicles awaiting the deliveries to be dispensed, and at times blocking two lanes, as seen in **Pictures 3 and 4.**

Picture 3



Picture 4

AR00016306

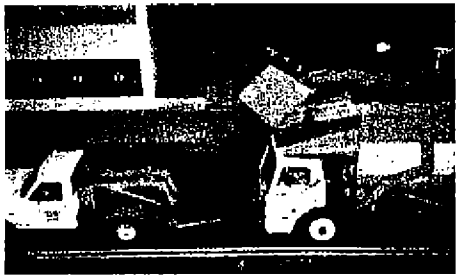
Because of the multiple and varied business utilization on Richards Street, it's narrow width, and the absence of loading docks for both The Melim Building and The OceanView Center, the open street is often utilized for onstreet garbage pickup, moving trucks, courier deliveries, tree trimming and other business requirements. **Pictures 5 thru 8** are examples of daily activity.

Picture 5

Early morning garbage truck pickup

Picture 6

Garbage pickup can close lanes for up to one half hour.

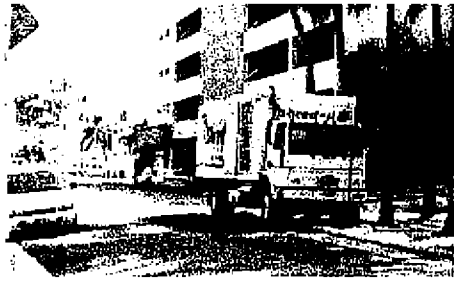


Picture 7

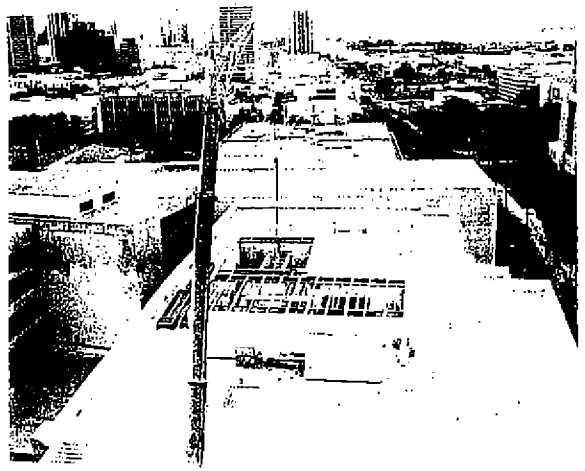
Moving vans can park for up to 6 hours.

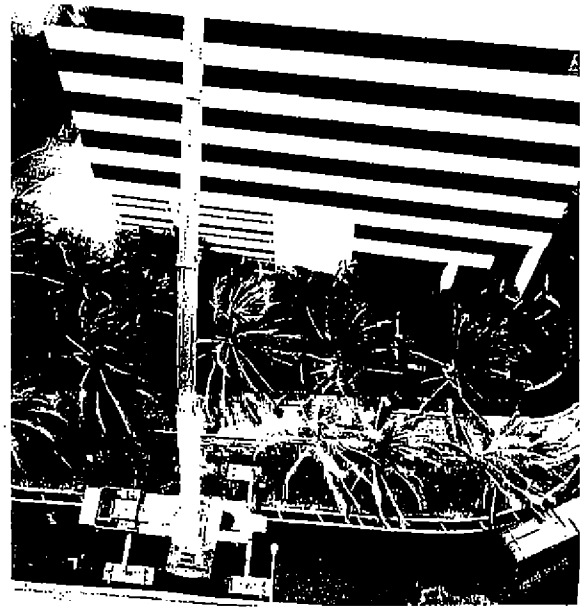
Picture 8

A new necessity for busy offices: The shredder truck will usually park for one half hour.



Picture 9





Rooftop maintenance is periodically required on business buildings on this strip.

Richards Street is the only avenue in which large lifting cranes can be situated to facilitate this need.

On August 11th and 18, 2001, Richards Street was closed from Queen Street to Halekauwila St, from 7:00 AM to 4:00 PM, in order to change the air conditioning units atop the Ocean View Center.

Dear Mr. Miller:

Subject: Primary Corridor Transportation Project
Supplemental Draft Environmental Impact Statement

Thank you for your September 21, 2001 letter responding to the Supplemental Draft Environmental Impact Statement (SDEIS) Preparation Notice. Your comments and our responses are shown on the attached table.

You will be receiving a copy of the SDEIS under separate cover. We appreciate your interest in this important transportation project and look forward to receiving your comments on the SDEIS.

Sincerely,

CHERYL D. SOON
Director

Attachment

Comment	Response
The routes directed both mauka and makai upon Richards Street, from King Street to Halekauwila Street/Ala Moana Boulevard are judged ill conceived as to functional operation and adherence within the framework of impact upon the environment.	The SDEIS will present the social, economic, and environmental impacts associated with the proposed project refinements. It should be noted that the Kakaako Makai alignment has been refined and will now use the Bishop/Alakea couplet instead of Bishop/Richards from S. King Street to Nimitz Highway.
There are also major unaddressed issues which require total clarification for a comprehensive and acceptable final DEIS.	The SDEIS will present the social, economic, and environmental impacts associated with the proposed project refinements.
3.1.1 Air Quality. As stated "Mesoscale impacts resulting from the proposed modifications are not expected to be different from what was disclosed in the MIS/DEIS." How can that be determined, when there has been no determination/selection as to the device of transportation, i.e. bus/train? Testing could not be completed until such vehicles are in place, especially on the heavily frequentad segment of Richards Street between Queen Street and Ala Moana Blvd., which is lined with tall buildings, (one of which being residential).	The BRT alignment has been revised to travel on Alakea Street and will not travel on Richards Street between S. King Street and Nimitz Highway. An air quality, microscale analysis will be done at various intersections, to model the anticipated emissions of the candidate technologies. The analysis will be included in the SDEIS.
Utilizing the diesel powered articulated tractor type buses now in use with three lines operating one bus every three minutes, (or 60 buses per hour, or 1 per minute) air quality in this downtown canyon would definitely be required data. It is absent.	Standard diesel buses are not considered a candidate technology for the In-Town BRT system. Technologies proposed for the BRT Alternative include the Embedded Plate technology which consists of electric vehicles powered by a wayside traction power delivery system or Hybrid Propulsion system where energy for the traction power is carried on-board the vehicle. The Embedded Plate technology vehicles would emit zero pollutants. The hybrid electric vehicles would be low-emission vehicles because their diesel engines would always be operating at

4. Significance Evaluation

No. 6. "The proposed modifications are not expected to cause secondary impacts, such as triggering other actions that would cause environmental or social impacts."

In the meeting of the DTS Bus Rapid Transit team, moderated by City Council Chairman, Yoshimura, with the residents of Harbor Square Condominiums, held at Maritime Museum on 17 September 2001, it was made adamantly clear that the addition of SIXTY double carred transit buses, (ONE per minute!), to the exiting traffic from parking garages on Richards Street would cause insoluble gridlock for area workers and residents.

Further, the DTS BRT team also presented the massive, new intersection devised to handle the out going ridership to Waikiki, and the returning Kakaako Makai Alignment line from Aloha Tower, directed mauka up Richards Street. This radical redesign of the Ala Moana Boulevard/Halekauwila Street/Richards Street juncture is fraught with dysfunction. Beneath the street and islands in this area lies a veritable labyrinth of conduits for:

The Honolulu Electric Company (HECO)
The Board of Water Supply
The runoff drainage system for downtown Honolulu

Within a 100 ft. radius at this intersection, are situated **FIFTEEN** manholes, accessing these vital (and aging)service tunnels beneath the streets. (See below for only 3 of the 15.)

Picture 10

These manholes are utilized regularly, and nearly always requiring the coning of one or two lanes of Ewa bound traffic on Ala Moana Blvd., choking traffic to a crawl. Yet this will be the triangular apex of the Kakaako routing. As ALL Waikiki routing must pass through this bottleneck, either outbound or inbound, it is foreseeable that the Rapid Bus Transit System servicing Waikiki could be brought to a virtual halt.

Unaddressed here is the Environmental Disfigurement in creating this intersection by the removal of eight (8) 30 ft. palm trees and three plumeria trees, the area to be paved over for double car bus transit. The Outdoor Circle and The Sierra Club may find this of interest.

SUMMARY

As presented, the subject Supplemental DEIS will have enormous detrimental environmental impact upon the segment of Richards Street discussed. It will produce traffic congestion, air pollution, noise pollution and finally, unreliable transit service, due primarily to route selection.

The Bus Rapid Transit plan requires a 'slip,' (or connection) from it's main hub, (Hotel/King Streets) to the Waikiki routes. There are at least four alternatives that would better serve this purpose than Richards Street. They are:

- South Street, (an enormously wide avenue, with moderate traffic)
- Punchbowl Street (a wide street which could also service the Judicial District.)
- Mililani Street (literally unused except for skateboarders and hot dog stands)
- Bishop Street (remove onstreet parking/install dedicated RT lanes)

The Downtown Neighborhood Board, a representative body elected by the people, has voted unanimously against the use of Richards Street as a route for the proposed transit plan. And the majority of residents and businessmen of this area are opposed to it as well. It is our earnest hope that these objections to the degradation of our environment will be studied and incorporated into a more optimal routing of the Bus Rapid Transit plan.

. . .

AR00016309

Comment	Response
	efficient levels. Since the BRT Alternative would use either zero or low-emission vehicles, it would substantially reduce the level of particulate emissions (black smoke and soot) at certain intersections and street level locations in comparison to the No-Build and TSM Alternatives, which would continue to use diesel buses. An air quality, microscale analysis will be included in the SDEIS at particular intersections.
Section 3.1.2 Noise and Vibration The opening statement of this section states there are no land uses along the proposed In-Town BRT alignment that are sensitive to excess noise such as residences. Located at the corner of Richards and Halekauwila Street, (the bottleneck which the three Kakaako lines intersect), stands a 27 story residential building. All three lines of his reference BRT pass directly beneath the windows of eighty (80) bedrooms, where working people will be trying to sleep at night, so as to be rested for the coming day.	The BRT alignment has been revised to travel on Alakea Street and will not travel on Richards Street between S. King Street and Nimitz Highway. Existing noise measurements will be included in the SDEIS and Harbor Square because it includes residences has been included as a site for the noise measurements.
Because this bottleneck in the route structure, requiring right angle turns of the hinged buses, it will necessitate braking, then powering up again to regain speed, a very noise-generating procedure, which will occur, electric powered or diesel driven.	In general, the future noise levels would be lower with the BRT Alternative than with the TSM and No-Build Alternatives. This is due to the use of the quieter electric or hybrid diesel/electric vehicles in the In-Town portion of the BRT Alternative, versus diesel buses operating in the TSM and No-Build alternatives. No vibration impacts are expected. The Embedded Plate Technology would generate minimal noise because its source of energy would be the power strip embedded in the street. The Hybrid Propulsion system

Comment	Response
	vehicles would also be relatively quiet due to its efficient use of fuel. For example, the spurt of higher electric power needed for acceleration is taken mainly from the batteries.
Due to the narrow width of Richards Street (44ft), all on street parking will be removed to accommodate the makai/mauka bus lanes and yet include vehicular traffic entering and exiting the parking structures of the following business buildings between King Street and Halekauwila Street. (Buildings listed).	The BRT alignment has been revised to travel on Alakea Street and will not travel on Richards Street between S. King Street and Nimitz Highway.
Located on the Diamond Head side of Richards Street, Below Merchant Street, is the U.S. Postal Service marshaling yard, facilitating over 150 mail trucks per day throughout the work week, commencing with a lineup each morning from 8:00 to 9:00 am of postal vehicles awaiting the deliveries to be dispensed, and at times blocking two lanes.	The BRT alignment has been revised to travel on Alakea Street and will not travel on Richards Street between S. King Street and Nimitz Highway.
Because of multiple and varied business utilization on Richards Street, it's narrow width, and the absence of loading docks for both he Melim Building and the Ocean View Center, the open street is often utilized for on street garbage pickup, moving trucks, courier deliveries, tree trimming, and other business requirements. Honolulu, Hawaii 96813

Re: Primary Corridor Transportation Project – Supplemental EIS Commentary

Dear Mrs. Soon:

The Kakaako Improvement Association submits the following comments for the supplemental EIS process for the Primary Corridor Transportation Project specifically concerning the BRT routes through Kakaako:

Referencing the presentation you made to KIA on June 13, 2001, we are in agreement that the 3 planned routes will effectively service our community. However, if the Kakaako Makai route is at any time deleted from existing plans, we would like to suggest the following changes:

a. BRT Kakaako – Manoa Branch: The originally proposed route travels east on Halekauwila, turns right on South St., turns left on Pohukaina, turns right on Kamani then turns left on Auahi and travels to the Queen St. stub off Ala Moana Boulevard. This turn-interrupted route would serve the proposed goals better if it used fewer streets and provided a more direct route through Kakaako. In addition, the route is on the perimeter of the "critical mass" that any transit line would service. KIA proposes to locate the route more in the center of this "critical mass" and provide a more efficient and direct route through Kakaako as follows: To continue makai on South St. to Auahi St. turning left on Auahi and traveling straight on Auahi all the way to the Queen St. stub off Ala Moana. In this closer proximity to the "critical mass" of the Ala Moana Boulevard area and in providing a straighter route through Kakaako (thus utilizing fewer individual streets), this proposed route reduces the environmental impact of the project.

b. BRT Kakaako-UH-Manoa Branch: To avoid possible congestion from putting the BRT on Ward Ave. (at King St.) and making a 90 degree turn at the busy intersection of Ward and Kapiolani, KIA proposes that the route continue on King St. to Pensacola, then turn right and make the left turn onto Kapiolani Boulevard at Pensacola. This would not only enhance the operation of the BRT, but would avoid potential traffic congestion at Ward and Kapiolani.

A sketch-map of the proposed new routing is enclosed.

Very truly yours,

Beverly W. Harbin
President

Dear Ms. Harbin:

Subject: Primary Corridor Transportation Project
Supplemental Draft Environmental Impact Statement

Thank you for your September 21, 2001 letter responding to the Supplemental Draft Environmental Impact Statement (SDEIS) Preparation Notice. Your letter provided us with the following comments for which we have prepared responses.

Comment	Response
We are in agreement that the three planned routes will effectively service our community. However, if the Kakaako Makai route is at any time deleted from existing plans, we would like to suggest the following changes:	Thank you for your comment.
BRT Kakaako-Mauka Branch: KIA proposes to locate the route more in the center of this "critical mass" and provide a more efficient and direct route through Kakaako as follows: to continue makai on South St. to Auahi St. turning left on Auahi and traveling straight on Auahi all the way to the Queen Street stub off Ala Moana. In this closer proximity to the "critical mass" of the Ala Moana Boulevard area and in providing a straighter route through Kakaako (thus utilizing fewer individual streets), this proposed route reduces the environmental impact of the project.	The proposed Kakaako Makai Branch would provide convenient access to the "critical mass" area of Ala Moana Boulevard. The branch would operate along Halo Street, one block in the makai of Ala Moana Boulevard. Transit stops would be located at Coral Street and Ahui Street providing easy access to the businesses along Ala Moana Boulevard.

Comment	Response
BRT Kakaako-UH-Manoa Branch: KIA proposes that the route continue on King Street to Pensacola, then turn right and make a left turn onto Kapiolani Boulevard at Pensacola. This would avoid potential traffic congestion at Ward and Kapiolani.	One of the proposed modifications to the BRT Alternative is to realign a portion of the Kakaako-UH Manoa branch as suggested. The branch would continue along South King Street to Pensacola Street to Kapiolani.

You will be receiving a copy of the SDEIS under separate cover. We appreciate your interest in this important transportation project and look forward to receiving your comments on the SDEIS.

Subject: SDEIS Preparation Notice

Hi Ann and Susan -

Received our first comment on the SDEIS Preparation Notice from Lynne Matusow. In Section 2.1, in the description of the Kakaako Makai alignment, we say that currently the alignment goes on the Hotel Street Mall until the split at North King Street and Richards Street. King Street in that area is South King Street. Please note this error. Thanks.

Refer: Primary Corridor Transportation Project
Supplemental Draft Environmental Impact Statement

Dear Ms. Soon, September 21, 2001

On behalf of the Waialae-Kahala Neighborhood Board, I have reviewed the Supplemental DEIS Preparation Notice that was sent to the Waialae-Kahala Neighborhood Board, dated August 16, 2001. I have reviewed the proposed modifications and impact studies and find the proposals acceptable. I have no recommendations for changes to the proposals at this time.

There was a comment repeated by several residents: the projects seemed hopeful but there were some basic problems still unanswered; where the project involved utilizing arterial streets, those streets have speed limits that are out of date with the current use and design of those streets. There are speed limits set at 25 or 30 MPH on streets and roadways that should be upped to at least 35 to 40 MPH, and 40 that should be upped to 45 MPH. These roadways with the low speed limits appear before or after a freeway entry or exit, i.e., Kalanianaole Highway east bound toward Aina Haina.

Also, the intersection traffic lights are not synchronized at all anywhere. Huge traffic jams are further exasperated when the traffic lights run independently of each other, i.e., Beretania Street westbound toward downtown. In other cities like San Francisco and Chicago where mass transit is widely accepted and utilized, traffic lights are synchronized for efficient and expedient vehicular movement. Hawaii's traffic light management is a joke that some residents say, there isn't any, really. Why has there not been an attempt to address these two problems? These were comments that I thought I'd pass on to you.

Sincerely yours,

Lee Manfredi

Dear Ms. Manfredi:

Subject: Primary Corridor Transportation Project
Supplemental Draft Environmental Impact Statement

Thank you for your September 21, 2001 letter responding to the Supplemental Draft Environmental Impact Statement (SDEIS) Preparation Notice. Your letter provided us with the following comments for which we have prepared responses.

Comment	Response
I have reviewed the proposed modifications and impact studies and find the proposals acceptable. I have no recommendations for changes to the proposals at this time.	Thank you for taking the time to review the SDEISPN.
Where the project involved utilizing arterial streets, those streets have speed limits that are out of date with the current use and design of those streets. There are speed limits set at 25 or 30 MPH on streets and roadways that should be upped to at least 35 to 40 MPH, and 40 that should be upped to 45 MPH. These roadways with the low speed limits appear before or after a freeway entry or exit, i.e. Kalanianaole Highway east bound toward Aina Haina.	It is not within the scope of the Primary Corridor Transportation Project to reset speed limits on arterial streets.

The intersection traffic lights are not synchronized at all anywhere. Huge traffic jams are further exasperated when the traffic lights run independently of each other, i.e. Beretania Street westbound toward downtown.	Signal coordination along the BRT alignments will be reviewed and optimized.

You will be receiving a copy of the SDEIS under separate cover. We appreciate your interest in this important transportation project and look forward to receiving your comments on the SDEIS.

Sincerely,

CHERYL D. SOON

Ms. Donna Turchie
Senior Transportation Representative
Region IX
Federal Transit Administration
U.S. Department of Transportation
201 Mission Street, Suite 2210
San Francisco, California 94105-1839

Dear Ms. Turchie:

Subject: Primary Corridor Transportation Project
Major Investment Study/Draft Environmental Impact Statement

S.1 NEED FOR ACTION

Every resident including participants of the Oahu Trans 2K workshops agree that Oahu's traffic is a problem. Most feel strongly that proposed improvements must be reasonably affordable and willingly to pay for an alternative that will work and help with the ever increasing traffic congestion. But significantly will say "no" if they really know that an In-Town alternative will increase traffic congestion. The purpose of the Primary Corridor Transportation Project Major Investment Study/Draft Environmental Impact Statement (MIS/DEIS) is to examine a range of alternative investments and identify the one that would most efficiently and effectively improve both the transportation system in the primary transportation corridor and the connections between the corridor and the rest of the island.

1. Increase the people-carrying capacity of the transportation system in the primary transportation corridor by providing attractive alternatives to the private automobile

With the number of people living and working in Honolulu's urban core, a significant and key strategy is to get people out of their cars while they move around the city. It requires alternative modes such as walking, bicycling and using public transit that is "rapid" and to avoid "at-grade" traffic situations that are frequent on the road system. Reducing congestion will decrease the time transport trucks find themselves caught in traffic, which will in turn lower the cost of consumer goods they deliver. And keeping our vehicles moving instead of "traffic-jammed" means we'll spend less time fouling the air and wasting expensive fuel.

For many, the biggest bonus will be having no need to waste time looking for a parking spot. A "rapid" alternative transit system should never be stopped by traffic jams, accidents, pedestrians, emergencies or construction of infrastructure repairs below or at-grade of our street rights-of-way.
The transit system must be made convenient for the user, offering rapid and dependable travel times to effectively take more automobiles off our streets. If public transit is not "rapid" and convenient less cars will be taken off our streets and highways. It will not be an attractive alternative to automobile travel and the public will eventually roar with disapproval and complain to responsible City Council members and State officials to the chosen transit alternative.

S.2 ALTERNATIVES CONSIDERED and NOT CONSIDERED

S.2.1 Summary of Alternatives

The 21st Century Oahu Visioning process began in September 1998 and consisted of a series of neighborhood-based community meetings designed to enhance public input in planning the vision for Oahu communities.

After Rounds 1 and 2 of the Oahu Trans 2K meeting, public and agency input was combined with technical analysis to define an initial set of alternatives. Only No-Build, Enhanced Bus/Transportation System Management (TSM), Bus Rapid Transit (BRT), and Light Rail Transit (LRT) were considered. *A cost-effective shorter grade-separated light rail alternative most over existing street rights-of-way was not included* to be an alternative for the In-Town portion. A suggested grade-separated light rail alternative shorter than the proposed In-Town BRT with a length of approximately 7.70 miles from the proposed Middle Street Transit Station could have been included for the In-Town portion and terminating in the University of Hawaii Quarry. Light Rail Transit is defined as a transit mode characterized by its ability to operate in both at-grade and/or grade-separated environment, and usually operating in smaller trains consisting of 2, 4, or 6 vehicles. As the chosen Locally Preferred Alternative (LPA) the last time and within the last ten years it should have been again naturally included, for comparison, once and for all to see and comment on.

There was no actual vote taken for a choice of a public transit alternative among the participants at these Oahu Trans 2K meetings except for individuals who wanted to express, in their own words, at these meetings or chose to put their thoughts in written form, which were few, as public records will show if any were kept. Individuals representing several environmental and community organizations were at these meeting who spoke up quite a bit.

However, the amended locally preferred alternative (LPA) back in 1992 was for a grade-separated aerial structure with an alignment of 15.9 miles long with 22 transit stations. The State Legislature enabled the City Council to levy a 0.5% surcharge on the local General Excise and Use Tax. However, the City Council by a single vote did not enact this General Excise Tax surcharge to ensure the local share of funding for the project although City Council previous actions were favorable to implementation of the project. It would be built today and running if the vote was different.

Active public involvement is critical to the success of any project with significant impact on the community. The process should ensure that critical community concerns and technical issues are identified early in the study and addressed in the engineering, environmental, economic, and financial analyses, so alternatives and ultimately the locally preferred alternative effectively responded to community needs and preferences and satisfy local, State, and federal environmental clearance requirements. Was it a done deal to guide the process from the beginning by the city's Department of Transportation and its hired consultants to put the Bus Rapid Transit (BRT) as a preferred final choice somehow by eliminating a superior grade-separated light rail alternative?

So the grade-separated amended locally preferred alternative (LPA) which included a corridor for the Honolulu Rapid Transit Program began from the vicinity of Waiawa and follows Kamehameha Highway until passing Honolulu International Airport and follows Dillingham Boulevard into the Central Business District (CBD). The guideway then goes along Nimitz Highway, follows Halekauwila Street, Ward

AR00016318

Avenue, Waimanu Street, and Kona Street to the Ala Moana Center. The alignment continues along Kona Street, Atkinson Drive, and Kapiolani Boulevard to University Avenue, terminating at the University of Hawaii Quarry.

The Final Environmental Impact Statement (FEIS) will show local citizens significantly supported the rapid transit proposal as the locally preferred alternative (LPA). Chapter 7, Comments and Responses, within the document list the record of substantive comments received on the Alternative Analysis/Draft Environmental Impact Statement (AA/DEIS) and the Supplemental Draft Environmental Impact Statement (SDEIS) during the public comment period and responses to those concerns. Both written and oral comments provided at the public hearings are included.

S.3 IMPACTS AND MITIGATION

The transportation analyses indicated that major regional roadways would still have traffic bottlenecks in 2025 under any of the alternatives. According to a U.S. Department of Transportation, Federal Transit Administration website: http://www.fta.dot.gov/research/pdf/iibrt.pdf there are problems of arterial bus priority treatments (Bus Rapid Transit).

Extensive development of High Occupancy Vehicles (HOV) lanes in the case of busways to improve bus service on the highways connecting suburban and downtown areas represent a significant effort which is similarly proposed in our Primary Corridor Transportation Project. However, providing high quality service within the downtown sections of metropolitan areas like Honolulu which is the key to the Bus Rapid Transit concept has not been the subject of a comparable effort in the rest of the U.S. Mobility within congested urban centers like Honolulu is essential to support economic and social functions of the city and to sustain high levels of transit ridership.

In most cities including Honolulu, a number of factors can impede the upgrading of rights-of-way to provide for exclusive bus lanes on our local city streets. The most basic obstacle to creating a bus lane in Honolulu is the lack of an adequate cross section to separate buses from general-purpose traffic. At a minimum, bus lanes require an 11-foot cross section per direction. On most major two-way streets in Honolulu, the creation of even a single bus lane will limit at least one direction of general-purpose traffic to a single lane, likely producing serious adverse consequences for general-purpose traffic. Wide one-way streets, which we don't have, can provide opportunity to dedicate a lane for exclusive bus use although this too will produce adverse effects on general-purpose traffic flows and scarcity of on-street parking spaces.

Locating a bus lane along a curb or in the median of a two-way street conflicts are created with right- or left-turning vehicles. The need to allow general-purpose traffic to use a bus lane for turning interferes with bus operations, increasing travel time and adding to problems of enforcing the restriction of the lane to buses under all other circumstances. Curbside parking by emergency, delivery and service vehicles also obstructs bus movement and is particularly disruptive if the bus lane is restricted to a single lane width. Dual bus lanes are superior to single-width lanes but obviously require a wider cross-section (right-of-way) which Honolulu does not have in most cases. A drawback of median bus lanes is that passengers must walk across general-purpose traffic lanes to reach the bus stop.

Because of the existing cross-section of most streets (rights-of-way) are very narrow the geometry does not allow queue bypass lane segments. These "queue jumps" allow buses to circumvent traffic at an

intersection approach and thereby allow for faster average traveling times. A major limitation on bus signal preference is the adverse effect associated with reduction of green signal time for general-purpose traffic on the cross streets. Honolulu cross streets are much closer on the average in comparison with larger mainland cities. The constraints imposed by traffic signal progression will limit effective application of signal preemption along the In-Town portion of the corridor.

There is a trade-off between the improvement in travel times that can be achieved by reducing the number of bus stops in a BRT versus a conventional bus service with convenient access made possible by frequent stops. Because of the use of narrow platforms because of very narrow street rights-of-way the so-called transit stations will not eliminate the need to restrict boarding to the front door of the bus which takes additional time.

A potential option for doing away with a variety of physical constraints on boarding would be greater use of enclosed bus waiting transit facilities where passenger would be required to enter waiting areas in advance to allow boarding through all doors of the bus. All passengers could pay fares within the boarding areas before boarding the bus, thus reducing bus dwell times. However, because of the cross-section (rights-of-way) width of all our streets makes it rare and impractical. Enclosed boarding areas take up significant sidewalk space and capital, operating and maintenance cost. Thus conventional boarding procedures would continue at most stations which will increase bus travel times along the corridor.

System integration becomes an issue when the need to provide transfers between routes and other forms of public transportation where passengers pay fares at these transfer points with on board payment. Another concern is when specialized vehicle boarding features designed to be compatible with platforms in enclosed areas may impose constraints on the deployment of a transit system's vehicle fleet.

S.3.1 Transportation Impacts

The Draft Environmental Impact Statement (DEIS) does not give details on the impact with the loss of one and in most cases two lanes of multi-purpose traffic lanes within the proposed corridor. Giving priority to the proposed BRT will cause additional delays at cross streets and pedestrian cross-walks creating additional traffic congestion at these locations. With our cross streets at these intersections much closer than most other U.S. cities this problem is not addressed satisfactorily. If the existing rights-of-way could accommodate an additional BRT lane both ways to allow a minimum of two lanes of multi-purpose automobile traffic each way I would see much more success for the In-Town Bus Rapid Transit portion for the Primary Corridor Transportation Project for the City and County of Honolulu than currently.

Transit Supply

Further more a grade-separated light rail system would do the most to improve the capacity of the transportation system to carry people through Honolulu as the population thrives through 2025. Many of the factors that motivate consumer buying decisions also influence transportation choices. Improved access to a transit system (car or bus) combined with the knowledge that a grade-separated light rail system is always available and "rapid" with the capability of being available as much as one and a half minute apart during peak hours and also available as "rapid" during off-peak hours as fast as four to five minutes apart because of its own guideway and lowest operating cost of any transit alternative.

AR00016319

no moving parts and rarely need maintenance, and needing far less energy than other rapid transit systems making it one of the most reliable in the world. It can be far quieter than the system proposed as the locally preferred alternative (LPA) in the FEIS for the Honolulu Rapid Transit Program of July 1992. The frequency of the automated and driverless transit vehicles can run as frequently as one-and-a-half minutes apart. Special events within the CBD, Waikiki, University of Hawaii and other sites will be provided with a "rapid" transportation alternative unlike a BRT which is slow with an average of 8 minutes or more between vehicles during peak times with the necessity of drivers for each vehicle and thereby added labor cost.

Instead of waiting on platforms, this "rapid" transit alternative gets moving quickly, especially at night, when we don't want to wait a long time to get on the train. It can run about every five minutes at night, and do so without significant added costs or faster if needed.

A grade-separated light rail system cost less in the long term and offers great benefits. It will require a larger initial investment, but benefits are well worth it: speed, reliability, capacity and comfort. It can move more people than competing technologies due to these benefits the operating costs are lower than other rapid transit systems and that mean lower costs well into the future. Because of a shorter grade-separated light rail transit system than previously suggested in 1992 will make this In-Town portion much more an affordable one and the best choice to make more people use this "rapid" alternative than a much slower bus rapid transit system alternative.

By not being part of the problems on the streets is most assured than the proposed In-Town BRT which hasn't really addressed the additional traffic congestion it will create due to the loss of one and most cases two multi-purpose traffic lanes and proposed shorter green light times for the cross streets along the proposed corridor. The lack of a sufficient cross-section width of most of our existing street rights-of-way will contribute significantly, when implemented, to our traffic congestion almost immediately rather than help it.

Using Traffic Summary Information made available by the State of Hawaii, Department of Transportation, Highways Division, which was prepared by the Planning Branch in cooperation with the U.S. Department of Transportation, Federal Highway Administration will show immediate and additional traffic congestion where the In-Town BRT will have exclusive or near-exclusive use of lanes formerly used by multi-purpose traffic.

Screen lines properly selected along natural barriers to traffic within a city provide a means of checking the number and types of vehicles moving from one part of the city to the other across the screen lines.

To function properly, a screen line must extend entirely across the city. It should be reasonably straight or at least so located with respect to existing thoroughfares as to minimize the possibility of trips crossing the line twice. It should also intercept large volumes of traffic, but should not pass directly through the central business district.

There are four such screen lines in the city of Honolulu: *Selected

1. *Kalihi Stream Screen Line
2. *Kapalama Drainage Canal Screen Line
3. Nuuanu-Wuolani Streams Screen Line

4. *Manoa-Palolo Drainage Canal Screen Line

Their vehicular records are shown in the following page(s) on a CD-Rom disc which is powered by an included software program called PaperVision ER, Version 9.0. For simplicity only some the facilities are used and listed which will show that existing multi-purpose traffic in the proposed BRT corridor, as well as around and near the same, will be changed significantly because of the loss of one or more multi-purpose traffic lanes and the action will be cumulative.

Using Dillingham Boulevard, as an example, in the years of 1998 and 1999, you can see the 24-Hour Traffic Volumes, as shown below, from Traffic Summaries. What will the loss of 50% of the multi-purpose traffic lanes on Dillingham Boulevard create as a result? Obviously major streets nearby have to make up the loss like School Street, King Street, and Nimitz Highway. We will see increase in multi-purpose traffic volume in both easterly and westerly directions as well as nearby northerly and southerly directions and additional traffic congestion. Existing cross streets within and around the Central Business District (CBD) will also be significantly affected by shorter green light times and more traffic and pedestrian congestion.

Also from the same source of information, available only on a CD-ROM disc, beginning this year for years 1998 and 1999 Traffic Summaries, Island of Oahu, are Traffic Counts for the Manoa-Palolo Drainage Canal - Ala Wai Canal Screen Line Counts - 24-Hour Traffic Volumes. What will happen with the loss of multi-purpose traffic lanes in each direction on this portion of Ala Moana Boulevard at the Ala Wai Bridge to accommodate the BRT?

Obviously multi-purpose traffic lanes within the corridor here for the BRT as well as those nearby and adjacent will experience additional traffic congestion. With the loss of multi-purpose traffic lanes traffic volumes on nearby and adjacent major streets will increase to adjust to the current number of cars that use Ala Moana Boulevard. Constant monitoring of exclusive BRT lanes for compliance of non-use by multi-purpose traffic will be a continuing problem as well as respect by pedestrians to traffic signals when crossing multi-purpose traffic lanes to get to bus stops.

1998 and 1999 24-HOUR TRAFFIC COUNT- STATION SUMMARY

no moving parts and rarely need maintenance, and needing far less energy than other rapid transit systems making it one of the most reliable in the world. It can be far quieter than the system proposed as the locally preferred alternative (LPA) in the FEIS for the Honolulu Rapid Transit Program of July 1992. The frequency of the automated and driverless transit vehicles can run as frequently as one-and-a-half minutes apart. Special events within the CBD, Waikiki, University of Hawaii and other sites will be provided with a "rapid" transportation alternative unlike a BRT which is slow with an average of 8 minutes or more between vehicles during peak times with the necessity of drivers for each vehicle and thereby added labor cost.

Instead of waiting on platforms, this "rapid" transit alternative gets moving quickly, especially at night, when we don't want to wait a long time to get on the train. It can run about every five minutes at night, and do so without significant added costs or faster if needed.

A grade-separated light rail system cost less in the long term and offers great benefits. It will require a larger initial investment, but benefits are well worth it: speed, reliability, capacity and comfort. It can move more people than competing technologies due to these benefits the operating costs are lower than other rapid transit systems and that mean lower costs well into the future. Because of a shorter grade-separated light rail transit system than previously suggested in 1992 will make this In-Town portion much more an affordable one and the best choice to make more people use this "rapid" alternative than a much slower bus rapid transit system alternative.

By not being part of the problems on the streets is most assured than the proposed In-Town BRT which hasn't really addressed the additional traffic congestion it will create due to the loss of one and most cases two multi-purpose traffic lanes and proposed shorter green light times for the cross streets along the proposed corridor. The lack of a sufficient cross-section width of most of our existing street rights-of-way will contribute significantly, when implemented, to our traffic congestion almost immediately rather than help it.

Using Traffic Summary Information made available by the State of Hawaii, Department of Transportation, Highways Division, which was prepared by the Planning Branch in cooperation with the U.S. Department of Transportation, Federal Highway Administration will show immediate and additional traffic congestion where the In-Town BRT will have exclusive or near-exclusive use of lanes formerly used by multi-purpose traffic.

Screen lines properly selected along natural barriers to traffic within a city provide a means of checking the number and types of vehicles moving from one part of the city to the other across the screen lines.

To function properly, a screen line must extend entirely across the city. It should be reasonably straight or at least so located with respect to existing thoroughfares as to minimize the possibility of trips crossing the line twice. It should also intercept large volumes of traffic, but should not pass directly through the central business district.

There are four such screen lines in the city of Honolulu: *Selected

1. *Kalihi Stream Screen Line
2. *Kapalama Drainage Canal Screen Line
3. Nuuanu-Waulani Streams Screen Line

4. *Manoa-Palolo Drainage Canal Screen Line

Their vehicular records are shown in the following page(s) on a CD-Rom disc which is powered by an included software program called PaperVision ER, Version 9.0. For simplicity only some the facilities are used and listed which will show that existing multi-purpose traffic in the proposed BRT corridor, as well as around and near the same, will be changed significantly because of the loss of one or more multi-purpose traffic lanes and the action will be cumulative.

Using Dillingham Boulevard, as an example, in the years of 1998 and 1999, you can see the 24-Hour Traffic Volumes, as shown below, from Traffic Summaries. What will the loss of 50% of the multi-purpose traffic lanes on Dillingham Boulevard create as a result? Obviously major streets nearby have to make up the loss like School Street, King Street, and Nimitz Highway. We will see increase in multi-purpose traffic volume in both easterly and westerly directions as well as nearby northerly and southerly directions and additional traffic congestion. Existing cross streets within and around the Central Business District (CBD) will also be significantly affected by shorter green light times and more traffic and pedestrian congestion.

Also from the same source of information, available only on a CD-ROM disc, beginning this year for years 1998 and 1999 Traffic Summaries, Island of Oahu, are Traffic Counts for the Manoa-Palolo Drainage Canal - Ala Wai Canal Screen Line Counts - 24-Hour Traffic Volumes. What will happen with the loss of multi-purpose traffic lanes in each direction on this portion of Ala Moana Boulevard at the Ala Wai Bridge to accommodate the BRT?

Obviously multi-purpose traffic lanes within the corridor here for the BRT as well as those nearby and adjacent will experience additional traffic congestion. With the loss of multi-purpose traffic lanes traffic volumes on nearby and adjacent major streets will increase to adjust to the current number of cars that use Ala Moana Boulevard. Constant monitoring of exclusive BRT lanes for compliance of non-use by multi-purpose traffic will be a continuing problem as well as respect by pedestrians to traffic signals when crossing multi-purpose traffic lanes to get to bus stops.

Dear Mr. Lum:

Subject: Primary Corridor Transportation Project
Supplemental Draft Environmental Impact Statement

Thank you for your September 7, 2001 letter responding to the Supplemental Draft Environmental Impact Statement (SDEIS) Preparation Notice. Your comments and our responses are shown on the attached table.

You will be receiving a copy of the SDEIS under separate cover. We appreciate your interest in this important transportation project and look forward to receiving your comments on the SDEIS.

Sincerely,

CHERYL D. SOON
Director

Comments	Response
After Rounds 1 and 2 of the Oahu Trans 2K meeting, public and agency input was combined with technical analysis to define an initial set of alternatives. Only No-Build, Enhanced Bus/Transportation System Management (TSM), Bus Rapid Transit (BRT), and Light Rail Transit (LRT) were considered. A cost-effective shorter grade-separated light rail alternative most over existing street rights-of-way was not included to be an alternative for the In-Town portion. As the chosen Locally Preferred Alternative (LPA) the last time and within the last ten years it should have been again naturally included, for comparison, once and for all to see and comment on.	A fully grade-separated transit system was considered and rejected since it was determined that the public was not in favor of an elevated transit system because of its high cost and its physical and visual impacts. This is discussed in Chapter 2.6.1 of the MIS/DEIS.
The process should ensure that critical community concerns and technical issues are identified early in the study and addressed in the engineering, environmental, economic, and financial analyses…	The Primary Corridor Transportation Project is following the requirements of the National Environmental Policy Act (NEPA) and Chapter 343 of the Hawaii Revised Statutes (HRS), as amended. The purpose of the NEPA and HRS processes is to ensure that accurate environmental studies are performed, that they are done with public involvement, and that public officials make decisions based on an understanding of environmental consequences. For the past two years the City and County of Honolulu (City) has conducted the 21st Century Oahu visioning process including its transportation component, Oahu Trans 2K. It has been the most extensive community-based transportation planning effort in the City's history and it is the principal public outreach medium for the Primary Corridor Transportation Project. During the DEIS process, in addition to the required scoping meetings, meetings with over 100 governmental agencies, elected officials, businesses, and business, community, and civic organizations to present the elements of the Final Mobility Plan and gather information and comments.

AR00016323

Comments	Response
	Over 70 presentations were made at community-sponsored meetings that were held prior to issuance of the MIS/DEIS. The formal public hearing was held on October 12, 2000. The City Council Transportation Committee has been continuously briefed on the project status since inception. In anticipation of the LPA decision, the City Council Transportation Committee conducted a series of public hearings out in the districts throughout the primary transportation corridor after the MIS/DEIS was distributed. After the LPA was selected, the City Council asked the DTS to continue public dialogue on the project. Community working groups were formed to provide a forum for open dialogue between project sponsors and neighborhood, civic, business and other organizations so that environmental and transportation issues and refinements to project proposals could be discussed. Five working groups were formed and several meetings held with each group regarding the project. As a result of the working groups, this SDEIS has resulted to address the project refinements resulting from the working groups' efforts. In addition to the working groups, the project team members have been meeting with numerous individuals, agencies, and organizations. Over 100 meetings have been conducted since January 2001.
Was it a done deal to guide the process from the beginning by the City's Department of Transportation and its hired consultants to put the Bus Rapid Transit (BRT) as a preferred final choice somehow by eliminating a superior grade-separated light rail alternative?	It is a federal requirement that all alternatives be treated in a balanced manner and the DEIS has been reviewed to ensure that this "balanced treatment" requirement is met. Even at this point in the process, there is no foregone conclusion that the BRT Alternative would be implemented. Until there is a completed Record of Decision (ROD), the preferred alternative is not for certain. After the ROD is issued, construction funding will be procured to implement the

Comments	Response
	project. A fully grade-separated transit system was considered and rejected since it was determined at the outset that the public was not in favor of an elevated transit system because of its high cost and its physical and visual impacts. This is discussed in Chapter 2.6.1 of the MIS/DEIS.
According to the U.S. Department of Transportation website: http://www.fta.dot.gov/research/pdf/iibrt.pdf there are problems of arterial bus priority treatments (Bus Rapid Transit).	Although there are obstacles to successful implementation of a BRT system, it can provide a flexible and cost-effective method of public transportation. When properly developed in conjunction with land use policies and development plans, the BRT system can provide fast, reliable, and convenient transit service to cities and suburbs. It can also lead to compact, pedestrian-oriented, and environmentally sensitive development that preserves neighborhoods and open space.
Providing high quality service within the downtown sections of metropolitan areas like Honolulu which is the key to the Bus Rapid Transit concept has not been the subject of a comparable effort in the rest of the U.S.	The BRT is based on the most ubiquitous technology around the world - the bus. It has been continually improved and updated with BRT being the most recent application of this proven technology. The key BRT features being proposed in Honolulu have been tested and proven in cities throughout the world including Curitiba and Sao Paolo, Brazil; Brisbane and Adelaide, Australia; Auckland, New Zealand: Vancouver and Ottawa, Canada; Dublin Ireland; Nagoya, Japan; New York City, Los Angeles, Pittsburgh, and Orlando in the U.S.
The most basic obstacle to creating bus lanes in Honolulu is the lack of adequate cross section to separate buses from general purpose traffic.	The BRT Alternative is comprised of a mix of exclusive BRT, semi-exclusive BRT and mixed-use lanes. The BRT system strives to strike a balance between transit speed and impacts to general traffic. In segments where it was judged that roadway capacity was needed for general traffic and the BRT operation would not be significantly affected, exclusive lanes were replaced by either semi-exclusive or mixed-flow operation. In areas of high BRT ridership volumes, exclusive transit lanes were retained such as on Dillingham and through Downtown.

AR00016324

Comments	Responses
The need to allow general purpose traffic to use a bus lane for turning interferes with bus operations, increasing travel times and adding to problems of enforcing the restriction of the lane to buses under all other circumstances.	The BRT system strives to strike a balance between transit speed and impacts to general traffic. In segments where it was judged that roadway capacity was needed for general traffic and the BRT operation would not be significantly impacted exclusive lanes were replaced by either semi-exclusive or mixed-flow operation. In areas of high BRT ridership volumes, exclusive transit lanes were retained such as on Kapiolani and through Downtown. The BRT lanes will be clearly delineated and signed. Since large, specially marked BRT vehicles will be utilizing these lanes it will be obvious which vehicles are violators and therefore it will not take much law enforcement manpower to monitor and enforce the lane designation. There will be an enforcement mechanism developed to discourage private vehicles from entering BRT-exclusive lanes. These enforcement mechanisms may be in the form of a fine for entering a BRT-exclusive lane, similar to the fines imposed on the existing HOV lanes.
Curbside parking by emergency, delivery, and service vehicles also obstructs bus movements and is particularly disruptive if the bus lane is restricted to a single lane width.	The two technologies under consideration, the Embedded Plate System and the Hybrid Propulsion System both provide the flexibility to operate outside of the designated BRT lanes. Therefore, the BRT vehicles would bypass the vehicle that is parked along the curve by maneuvering around the vehicle.
A drawback of median bus lanes is that passengers must walk across general purpose traffic lanes to reach the bus stop.	The conceptual design of transit stops located in the median includes features such as railings to discourage transit patrons from exiting the platform except at designated locations. Traffic signals and crosswalks will be provided at BRT stations to allow pedestrians to safely cross the street.
The constraints imposed by traffic signal progression will limit effective application of signal preemption along the In-Town	Traffic signals will utilize prioritization for BRT vehicles not pre-emption. At certain intersections, BRT vehicles approaching a green

Comments	Responses
portion of the corridor.	signal will activate an extension of the green indication for that cycle only. BRT vehicles stopped at a red signal will move concurrently with the through traffic in the same direction, unless the BRT vehicle must turn or change lanes, in which case it will be given a green signal in advance of the general purpose traffic lanes. All traffic signal extensions and advance indications will be timed in the field during actual operation to minimize effects on general traffic flow.
Because of the use of narrow platforms because of very narrow street rights-of-way the so-called transit stations will not eliminate the need to restrict boarding to the front door of the bus which takes additional time.	The transit stops will be designed to efficiently handle the expected volume of passengers.
System integration becomes an issue when the need to provide transfers between routes and other forms of public transportation where passengers pay fares at these transfer points with on board payment.	The BRT system will be seamlessly integrated into the hub-and-spoke bus network by implementing well-planned stops, efficient dwell times and a stream-lined fare collection and transfer system to provide convenient and cost-effective service for potential users.
The DEIS does not give details on the impact with the loss of one and in most cases two lanes of multi-purpose traffic lanes within the proposed corridor.	See Chapter 4 of the MIS/DEIS for the discussion of traffic related impacts.
Giving priority to the proposed BRT will cause additional delays at cross streets and pedestrian cross-walks creating additional traffic congestion at these locations.	Traffic signals will not be pre-empted by the BRT. At certain intersections, BRT vehicles approaching a green signal will activate an extension of the green indication for that cycle only. BRT vehicles stopped at a red signal will move concurrently with the through traffic in the same direction, unless the BRT vehicle must turn or change lanes, in which case it will be given a green signal in advance of the general purpose traffic lanes. All traffic signal extensions and advance indications will be timed in the field during actual operation to minimize effects on general traffic flow.
A grade-separated light rail system would do the most to improve the capacity of the transportation system to carry people through Honolulu as the population thrives through 2025.	A fully grade-separated transit system was considered and rejected since it was determined at the outset that the public was not in favor of an elevated transit system due to its high cost and its physical and visual impacts. This is

AR00016325

Comments	Responses
	discussed in Chapter 2.6.1 of the MIS/DEIS.
Because of its exclusive guideway would increase the mode share of transit more than any other alternative travel time savings for transit patrons, providing most reliable service that would be buffered from traffic delays, improving in-town mobility and strengthening the connections throughout the island of Oahu.	A fully grade-separated transit system was considered and rejected since it was determined at the outset that the public was not in favor of an elevated transit system due to its high cost and its physical and visual impacts. This is discussed in Chapter 2.6.1 of the MIS/DEIS.
The nature of the exclusive right-of-way for the grade-separated light rail would provide significantly faster travel times within Honolulu.	A fully grade-separated transit system was considered and rejected since it was determined at the outset that the public was not in favor of an elevated transit system due to its high cost and its physical and visual impacts. This is discussed in Chapter 2.6.1 of the MIS/DEIS.
The constant at-grade situations of pedestrians, automobile traffic, traffic lights, emergency vehicles, construction and repairs of underground utilities below the exclusive lanes of the BRT, traffic accidents, long stops because of passenger loading limitations, exceptional narrow bus stops, and more time between vehicles don't help the situation.	The BRT system is an at-grade system and as such does interface with other features at that level. However, the two candidate technologies, the Embedded Plate System and the Hybrid Propulsion System, both provide the flexibility to operate outside of the designated BRT lanes and therefore can easily maneuver around construction areas, emergency vehicles, and traffic.
Additionally monitoring of both exclusive and shared lanes with the BRT will be a problem and more adjustments to satisfy problems with the communities nearby, currently going on, will cause additional mediation with a Bus Rapid Transit System to further deteriorate the word "rapid."	The BRT lanes will be clearly delineated and signed. Since large, specially marked BRT vehicles will be utilizing these lanes it will be obvious which vehicles are violators and therefore it will not take much law enforcement manpower to monitor and enforce the lane designation. There will be some enforcement mechanism developed to discourage private vehicles from entering BRT-exclusive lanes. These enforcement mechanisms may be in the form of a fine for entering a BRT-exclusive lane, similar to the fines imposed on the existing HOV lanes.
Lack of sufficient cross-section of streets of the corridor creates very narrow bus stops which also prevent faster on-board loading of passengers with a single front entry for verification of fares paid providing further	The transit stops will be designed to efficiently handle the expected volume of passengers.

Comments	Responses
deterioration of transit travel times.	
Maintenance and construction projects under our streets within the proposed BRT corridor has potential of nearly shutting down the system sometime in the future if implemented.	The provisions to accommodate maintenance and construction projects within the BRT corridor will be similar to how construction projects within a lane are handled currently – the traffic will be detoured around the construction/maintenance area. The two technologies under consideration the Embedded Plate System, and the Hybrid Propulsion System both provide the flexibility to operate outside of the designated BRT lanes.
Under the Bus Rapid Transit (BRT) alternative because there has been lack of the subject of comparable effort in North America this newer transit alternative application for success is not really known except in Curitiba, Brazil which is very different being under the control of a dictatorship.	The BRT is based on the most ubiquitous technology around the world, -the bus. It has been continually improved and updated with BRT being the most recent application of this proven technology. The key BRT features being proposed in Honolulu have been tested and proven in cities throughout the world including Curitiba and Sao Paolo, Brazil; Brisbane and Adelaide, Australia; Auckland, New Zealand: Vancouver and Ottawa, Canada; Dublin Ireland; Nagoya, Japan; New York City, Los Angeles, Pittsburgh, and Orlando in the U.S.
Narrow bus stops and limited availability of park and ride facilities are not better able to handle surges in ridership due to possible changes in land use policies in central Oahu, special events and sporting events easily.	The design of the BRT system and transit stops will be able to accommodate peaks in ridership due to special events. For example, to accommodate transit patrons attending a UH football game at Aloha Stadium, the City would coordinate with the Stadium Authority prior to the event to identify alternative parking sites where fans could park and utilize the BRT to attend the game. The current land use plans for Central Oahu and resulting increase in transit ridership was taken into account in the planning of the BRT project.
More transfers would be needed for both the In-town BRT and a grade-separated light rail system due to the proposed hub-and spoke-bus network	The BRT system will be seamlessly integrated into the hub-and-spoke bus network by implementing well-planned stops, efficient dwell times and a stream-lined fare collection and transfer system to provide convenient and cost-effective service for potential users.
Today's grade-separated light rail vehicles have noise emissions comparable to those of an electric trolley bus.	There are still many noise factors to be considered associated when designing a rail system. Steel wheels on steel rails require

AR00016326

Comments	Responses
	mitigation for brake squeals, vehicle vibration, and electronic propulsion tones. The noise severity will be dependent on the speed of the vehicles, the weight of the vehicles, the type of suspension used in the vehicles, and the track foundation. The costs associated with mitigation can be substantial. The two candidate technologies, the Embedded Plate and Hybrid Propulsion Systems are quieter than the diesel buses currently used.
Today's grade-separated light rail vehicles use far less power than other rapid transit systems and releases no harmful chemicals into our atmosphere.	Technologies proposed for the BRT Alternative include the embedded plate technology which consists of electric vehicles powered by a wayside traction power delivery system or hybrid propulsion system where energy for the traction power is carried on-board the vehicle. The Embedded Plate technology vehicles would emit zero pollutants. The hybrid electric vehicles would be low-emission vehicles because their diesel engines would always be operating at efficient levels. Since the BRT Alternative would utilize either zero or low-emission vehicles, it would substantially reduce the level of particulate emissions (black smoke and soot) at certain intersections and street level locations in comparison to the No-Build and TSM Alternatives, which would continue to use diesel buses.
Fully automated and driverless grade-separated light rail vehicles can run more frequently than any BRT vehicle peak and non-peak hours.	A fully grade-separated transit system was considered and rejected since it was determined at the outset that the public was not in favor of an elevated transit system due to its high cost and its physical and visual impacts. This is discussed in Chapter 2.6.1 of the MIS/DEIS.
Because of lack of a comparable effort for a Bus Rapid Transit System on the mainland and even in Europe I see a missing alternative that should have been considered fairly for all taxpayers.	The key BRT features being proposed in Honolulu have been tested and proven in cities throughout the world including Curitiba and Sao Paolo, Brazil; Brisbane and Adelaide, Australia; Auckland, New Zealand: Vancouver and Ottawa, Canada; Dublin Ireland; Nagoya, Japan;

Comments	Responses
	New York City, Los Angeles, Pittsburgh, and Orlando in the U.S. If you are referring to the "missing alternative" being the consideration of the a grade-separated light rail system, fully grade-separated transit system was considered and rejected since it was determined at the outset that the public was not in favor of an elevated transit system due to its high cost and its physical and visual impacts. This is discussed in Chapter 2.6.1 of the MIS/DEIS.
A grade-separated light rail can be fast, convenient, reliable, and the right choice among all other alternatives.	A fully grade-separated transit system was considered and rejected since it was determined at the outset that the public was not in favor of an elevated transit system due to its high cost and its physical and visual impacts. This is discussed in Chapter 2.6.1 of the MIS/DEIS.
Building a grade-separated line for the In-Town portion will create many jobs and is a good investment in our city's future.	A fully grade-separated transit system was considered and rejected since it was determined at the outset that the public was not in favor of an elevated transit system due to its high cost and its physical and visual impacts. This is discussed in Chapter 2.6.1 of the MIS/DEIS. The BRT Alternative will generate jobs related to the operations of the BRT system such as transit drivers and operations and maintenance personnel. Along with transit needs, one of the other goals of the PCTP is to help shape growth in the corridor. The large, underdeveloped parcels along the alignment present opportunities for transit oriented development at these sites, which will result in the creation of jobs.
Because it runs on its own tracks, separated from roads this transit system eliminates conflicts that are frequent on the road system.	A fully grade-separated transit system was considered and rejected since it was determined at the outset that the public was not in favor of an elevated transit system due to its high cost and its physical and visual impacts. This is discussed in Chapter 2.6.1 of the MIS/DEIS.

AR00016327

Comments	Responses
A grade-separated light rail system costs less in the long term and offers greater benefits.	A fully grade-separated transit system was considered and rejected since it was determined at the outset that the public was not in favor of an elevated transit system due to its high cost and its physical and visual impacts. This is discussed in Chapter 2.6.1 of the MIS/DEIS.

AR00016328

700 Richards Street, #2103
Honolulu, HI 96813-4621
13 September 2001

Ms. Cheryl D. Soon, Director
Department of Transportation Services
City and County of Honolulu
711 Kapi`olani Blvd., Suite 1200
Honolulu, HI 96813

RE: Primary Corridor Transportation Project
Supplemental Draft Environmental Impact Statement

Dear Ms. Soon:

After an analysis of the proposed traffic patterns on Richards Street as presented in the August 2000 DEIS and the subsequent addition of an In-Town BRT branch to serve Aloha Tower Marketplace and Kaka`ako Makai, I wish to express my concerns about the impact of these BRT routes on the residents of Harbor Square, 700 Richards Street.

As proposed, traffic on Richards Street will be greatly increased by the addition of 2 BRT routes mauka and makai as well as the inclusion of a major intersection at Richards, Halekauwila and Ala Moana Boulevard. In addition to the 2 BRT routes, a new mauka lane will be created which will introduce additional traffic on Richards street flowing from Halekauwila and Ala Moana Boulevard.

As a result of these new traffic patterns, between S. King street and Ala Moana Boulevard, Richards street will have 4 lanes of traffic with 2 BRT lanes in the middle between a traffic lane mauka on the Diamond Head side and a traffic lane makai on the Ewa side.

Consequently, vehicles entering or exiting parking garages or the post office loading dock located on this section of Richards Street will have to cross 3 lanes of traffic to make a left turn to reach appropriate traffic lanes. Since BRT busses are projected to run at 4 minute intervals (30 busses/hour) at peak travel times, turning vehicles will have to not only compete with busses for access to the appropriate travel lanes but with vehicles already in these lanes.

Harbor Square consists of 360 residential apartments, 10 commercial apartments, a 14-story commercial parking garage with 507 parking stalls and a 6-story residential parking garage with 201 parking stalls. Anyone using these parking garages can attest to the current difficulty of getting in or out at peak travel times.

The creation of a traffic lane along the Ewa curb will eliminate a section of curb adjacent to Harbor Tower currently available for pickup and/or discharge of passengers. This area represents the only handicap accessible entry for residents or visitors to the front entrance. The loss of use of this facility will have a detrimental effect on the social conditions of residents and visitors.

As proposed, the use of Richards Street for 2 BRT routes as well as two traffic lanes will curtail the beneficial uses of the environment for residents and businesses located along the route as follows:

1. Increased noise, vibration and diminution of air quality from vehicular pollutants resulting from a significant increase in traffic. This will be a major problem for the parking garages from the back-up of vehicles waiting to enter or exit during peak travel times.

2. Significant social effects from the loss of quality of living brought about by stresses engendered from increases in the density of detrimental environmental factors, such as those mentioned above. Additionally, the construction of a major intersection as well as 2 BRT and traffic lanes with its attendant disruption of the peace and tranquility of residents will be inevitable.

3. Significant economic impact due to the reduction in value of properties resulting from the decrease in the desirability of Harbor Square as a place to live or do business. Additionally, the city will have a loss of property tax revenues as a result.

4. These factors will cumulatively have an effect upon the health and welfare of residents and business employees as a result of the introduction of significant traffic congestion in their living and working environments. Nor will they benefit from the BRT since there will be no access to busses along Richards street.

Consequently, the use of Richards Street for 2 BRT routes as well as the introduction of traffic lanes which do not presently exist will have a major environmental impact upon the residents and businesses located in the area.

Sincerely yours,

Charles M. Ferrell

Mr. Charles Ferrell
700 Richards Street, #2103
Honolulu, Hawaii 96813-4621

Dear Mr. Ferrell:

Subject: Primary Corridor Transportation Project
Supplemental Draft Environmental Impact Statement

Thank you for your September 13, 2001 letter responding to the Supplemental Draft Environmental Impact Statement (SDEIS) Preparation Notice. Your letter provided us with the following comments for which we have prepared responses.

Comment	Response
As proposed, traffic on Richards Street will be greatly increased by the addition of 2 BRT routes mauka and makai as well as the inclusion of a major intersection at Richards, Halekauwila, and Ala Moana Boulevard. In addition to the 2 BRT routes, a new mauka lane will be created which will introduce additional traffic on Richards street flowing from Halekauwila and Ala Moana Boulevard.	The BRT alignment has been revised to travel on Alakea Street and will not travel on Richards Street between South King Street and Nimitz Highway.
Since BRT buses are projected to run at 4 minute intervals (30 buses/hour) at peak travel times, turning vehicles will have to not only compete with buses for access to the appropriate travel lanes but with vehicles already in these lanes.	The BRT alignment has been revised to travel on Alakea Street and will not travel on Richards Street between South King Street and Nimitz Highway

The creation of a traffic lane along the Ewa curb will eliminate a section of curb adjacent to Harbor Tower currently available for pickup and/or discharge of passengers. This area represents the only handicap accessible entry for residents or visitors to the front entrance. The loss of use of this facility will have a detrimental effect on the social conditions of residents and visitors.	The BRT alignment has been revised to travel on Alakea Street and will not travel on Richards Street between South King Street and Nimitz Highway.
The use of Richard Street for 2 BRT routes as well as two traffic lanes will curtail the beneficial uses of the environment for residents and businesses located along the route as follows: 1. Increased noise, vibration and diminution of air quality from vehicular pollutants resulting form a significant increase in traffic. This will be a major problem for the parking garages from the back-up of vehicles waiting to enter or exit during peak travel times.	The BRT alignment has been revised to travel on Alakea Street and will not travel on Richards Street between South King Street and Nimitz Highway.
2. Significant social effects from the loss of quality of living brought about by stresses engendered from increases in the density of detrimental environmental factors, such as those mentioned above. Additionally, the construction of a major intersection as well as 2 BRT and traffic lanes with its attendant disruption of the peace and tranquility of residents will be inevitable.	The BRT alignment has been revised to travel on Alakea Street and will not travel on Richards Street between South King Street and Nimitz Highway.
3. Significant economic impact due to the reduction in value of properties resulting from the decrease in desirability of Harbor Square as a place to live or do business. Additionally, the city will have a loss of property tax revenues as a result.	The BRT alignment has been revised to travel on Alakea Street and will not travel on Richards Street between South King Street and Nimitz Highway.

4. These factors will cumulatively have an effect upon the health and welfare of residents and business employees as a result of the introduction of significant traffic congestion in their living and working environments. Nor will they benefit from the BRT since there will be no access to busses along Richards Street.	The BRT alignment has been revised to travel on Alakea Street and will not travel on Richards Street between South King Street and Nimitz Highway.

You will be receiving a copy of the SDEIS under separate cover. We appreciate your interest in this important transportation project and look forward to receiving your comments on the SDEIS.

Sincerely,

CHERYL D. SOON

Dear Ms. Soon:

Subject: Primary Corridor Transportation Project
Supplemental Draft Environmental Impact Statement

In response to your letter on this subject dated August 16, 2001, the following is submitted:

Section 1: Introduction. No comments.

Section 2: Proposed Modifications to the locally preferred alternative.

2.1 Kakaako Makai Alignment.

The routing described in Par. 2.1 is circuitous at best, and the turn from Richards to Halekauwila exists but the entrance to Bishop Street does not exist. At best, all these streets are narrow and hardly suitable for buses even without any street parking. I believe that a better solution to the movement of bus traffic in this area should be found.

2.2 Modification of the U.H. In-town Branch.

Both King Street and Pensacola Street are one-way roads, and now are selected for two-way bus routes. This appears unsatisfactory.

2.3 BRT Exclusive Ramp on the H-1 Freeway near Aloha Stadium.

I am not familiar with the proposed ramp, but it would be most useful if it could be built with two lanes each on a divided road; thus, it could be used for inbound and outbound traffic at the same time.

Section 3: Proposed Impact Studies. No comments.

These remarks are made in my sincerest interest in improving the traffic problems.

Sincerely,

Frederick C. Gross

Dear Mr. Gross:

Subject: Primary Corridor Transportation Project
Supplemental Draft Environmental Impact Statement

Thank you for your September 18, 2001 letter responding to the Supplemental Draft Environmental Impact Statement (SDEIS) Preparation Notice. Your letter provided us with the following comments for which we have prepared responses.

Comment	Response
The routing described in Par. 2.1 is circuitous at best, and the turn from Richards to Halekauwila exists but the entrance to Bishop Street does not exist. At best, all these streets are narrow and hardly suitable for buses even without any street parking. I believe that a better solution to the movement of bus traffic in this area should be found.	The Kakaako Makai alignment was determined using current and projected land uses and employment information to ensure that the BRT will serve transit patrons' origins and destinations. Buses currently operate on these city streets.
Both King Street and Pensacola Street are one-way roads, and now are selected for two-way bus routes. This appears unsatisfactory.	Thank you for your comment. The two directional BRT operating on one-way streets has proven very effective because the BRT design incorporates features to ensure that automobile, truck, etc. drivers are aware of the BRT.
BRT Exclusive Ramp on the H-1 Freeway near Aloha Stadium: I am not familiar with the proposed ramp, but it would be most useful if it could be built with two lanes each on a divided road; thus, it could be used for inbound and outbound traffic at the same time.	The Luapele Drive ramp will be a one-way, reversible ramp. This will allow buses to use the ramp in the peak direction – Koko Head in the morning and Ewa in the afternoon.

You will be receiving a copy of the SDEIS under separate cover. We appreciate your interest in this important transportation project and look forward to receiving your comments on the SDEIS.

Sincerely,

RE: Primary Corridor Transportation Project
Supplemental Draft Enviornmental Impact Statement

Dear Ms. Soon,

It is my understanding that the subject EIS is now in preparation for final submittal for approval, & that comments so concerning are to be filed with you office by 9-21-01. It is in that regard that the following comments, made by me are forwarded herewith.

I am a civic & community minded individual, involved in numerous organizations both in Hawaii & the mainland which include:
The Navy League of the United States, Employer Support of the Guard & Reserve, Salvation Army Auxiliary, Paul Harris Fellow, Honolulu Rotary Club, Armed Service Comm. Chamber of Commerce of Hawaii(to name only a few).
Along with my volunteer involvement, I am a Honolulu business woman dealing in fimcial services.

It's been almost 13 years since I moved into Harbor Square(#2209 Harbor Tower - no mail is rec'd there - only at adress as above).
When we first moved there we were able to entertain a great deal as there was ample street parking - if not on Richards, then on Hakaweila, & lots of parking across Nimitz at the public parking lot or on the streets around HECO power plant.
Then Aloha Market place was allowed to buy not onlythe public parking lot - but also the street parking all around the power plant. Then after the Oklahoma bombing of the federal building - all the parking on the streets around our neighboring Federal building was taken away - And - Mililani Street by the downtown post office is pretty much limited to mostly tour buses -
THUS - There is basically only a few spots let on the street for our complex, & thus an end to our entertaining at home - no place to park!!!

A Bus Rapid Transit System is, in my view, a worthy idea, PROVIDED that is does not impact the community adversely. We ALREADY have buses on THREE sides of our complex - Nimitz Hgy, Alakea Street, & Queen Street.

Fortunately - these 3 streets are able to accomadate this load - HOWEVER - We have 3 sides of our building that we cannot stop alongside of, park or load & unload passengers.
IF - THE NEW SYSTEM IS ALLOWED TO TAKE OVER OUR TINY RICHARDS STREET - WE WILL BE MADE AN ISLAND !!!!!!!

WHY ARE WE BEING PUNISHED LIKE THIS !?!?!?!?!?

It is now difficult for folks waiting to be picked up or dropped off at Harbor Square as is so often the case - one has to double park to be able to do so as sooooo many of us who live there are also being dropped off or picked up.

Ithas been with Shock & Disbelief that we were suddenly notified that these meager remants on Richard Street are now planning to be eliminated! AND THAT THIS HAS BEEN IN THE PLANNING stages for THREE YEARS without any of us (some 2000 of us in the residentail & commercial towers)being advised & or consulted of the plans to punish us with a complete strangle on us & create hardships beyond measure.

We would like to know - WHY are we being PUNISHED like this!?!?!?!?!
Why has Mililani Street not been Considered for this purpose!?!?!?!
Why Has Punchbowl Street NOT been considered for this !?!?!?!?!
Why has South Street Not Been Considered for this !?!?!?!?!?!

WHO DO WE TURN TO FOR HELP & ANSWERS TO THIS MATTER?!?!?
How Can We Get some Consideration & at least a hearing with your office to address our problems!?!?!?!?!

Your time and consideration would be greatly appreciated as soon as possible.

Sincerely,

P.Pasha Baker

Honolulu, Hawaii 96812-3919

Dear Ms. Baker:

Subject: Primary Corridor Transportation Project
Supplemental Draft Environmental Impact Statement

Thank you for your September 21, 2001 letter responding to the Supplemental Draft Environmental Impact Statement (SDEIS) Preparation Notice. Your letter provided us with the following comments for which we have prepared responses.

Comment	Response
We already have buses on three sides of our complex – Nimitz Highway, Alakea Street, and Queen Street. Fortunately these three streets are able to accommodate this load, however we have three sides our building that we cannot stop alongside of, park, or load and unload passengers. If the new system is allowed to take over our tiny Richards Street we will be made an island.	The BRT alignment has been revised to travel on Alakea Street instead of Richards Street between S. King Street and Nimitz Highway.
It has been with shock and disbelief that we were suddenly notified that these meager remnants on Richard Street are now planning to be eliminated and that this has been in the planning stages for three years without any of us (some 2000 of us in the residential and commercial towers) being advised and/or consulted of the plans to punish us with a complete strangle on us and create hardships beyond measure.	For the past two years the City and County of Honolulu (City) has conducted the 21st Century Oahu visioning process including its transportation component, Oahu Trans 2K. It has been the most extensive community-based transportation planning effort in the City's history and it is the principal public outreach medium for the Primary Corridor Transportation Project. More than 44 public workshops were held to allow the public an opportunity to work on solutions to the mobility problems facing Oahu. There also was newspaper coverage and neighborhood presentations, all with open debate.

Comment	Response
	An outcome of the process was the Primary Corridor Transportation Project, Major Investment Study/Draft Environmental Impact Statement [DEIS] (August 2000) which was distributed the to agencies and the public in August 2000 for a 45 day review period. During the DEIS process, in addition to the required scoping meetings, meetings were held with over 100 governmental agencies, elected officials, businesses, and business, community, and civic organizations to present the elements of the Final Mobility Plan and gather information and comments. Over 70 presentations were made at community-sponsored meetings that were held prior to issuance of the MIS/DEIS. The formal public hearing was held on October 12, 2000. The Honolulu City Council selected the BRT Alternative as the Locally Preferred Alternative. Based on comments received on the DEIS, the Department of Transportation Services proposed to amend this alternative to include new and modified components which were approved by the City Council on August 1, 2001.
Why has Mililani Street not been considered for this purpose? Why has Punchbowl Street not been considered for this? Why has South Street not been considered for this?	The BRT alignment traverses Bishop Street makai-bound. Punchbowl Street and Mililani Street were previously considered and eliminated. South Street was not considered because it is too far from downtown.
Who do we turn to for help and answers to this matter?	Council Chair Yoshimura sponsored special meetings that resulted in the change requested by residents of Harbor

Comment	Response
	Square on September 17, 2001 and October 16, 2001.
How can we get some consideration and at least a hearing with your office to address our problems?	At a meeting arranged by Council Chair Yoshimura, the City's Department of Transportation Services (DTS) met with the residents of Harbor Square on September 17, 2001 to gather input on the proposed alignment and to provide a project status. Council Chair Yoshimura met again with the Harbor Square residents on October 16, 2001 to advise the Harbor Square residents of the proposed changes in the alignment through Downtown.

You will be receiving a copy of the SDEIS under separate cover. We appreciate your interest in this important transportation project and look forward to receiving your comments on the SDEIS.

Sincerely,

CHERYL D. SOON

Honolulu, HI 96813

Dear Ms. Soon:

Subject: Supplemental DEIS for the Primary Corridor Transportation Project

I would like to be a formally consulted party and be provided with a paper copy of the Supplemental DEIS, the Final EIS, and future BRT-related environmental documents. I do not have access at home or at work to a computer with the right software to read the CD prepared for the previous DEIS.

I would appreciate a response to the following questions and concerns.

1. Adding a new BRT route means revising the BRT Alternative to attract more riders. How many daily transit trips would the No Build and the TSM Alternatives generate assuming the same total number of buses as the revised BRT Alternative in 2025? It seems obvious that fewer buses will result in fewer routes, reduced frequency of bus service, longer waits at bus stops, longer boarding times at bus stops, increased crowding of buses, fewer express buses, and fewer bus riders. Assuming the No Build and the TSM Alternative have fewer buses than the BRT Alternative will prevent a fair comparison.

2. When does the City plan to convert existing traffic lanes east of Middle Street to exclusive use of the BRT route which will serve the UH? At that time,

- which intersections will experience significantly reduced levels of service?
- how many bus riders will be better off and how much reduction in travel time will they experience?
- how many drivers will be worse off and how much more travel delay will they experience?

3. When does the City plan to convert existing traffic lanes east of Middle Street to exclusive use of the BRT route which will serve Waikiki? At that time,

- which intersections will experience significantly reduced levels of service?
- how many bus riders will be better off and how much reduction in travel time will they experience?
- how many drivers will be worse off and how much more travel delay will they experience?

4. Am I correct in assuming that the proposed BRT route with stops at Aloha Tower and Kewalo Basin is contingent on the HCDA extending Ilalo Street to Punchbowl Street, and that extension of Ilalo Street may not occur within the next decade?

5. When will the proposed BRT freeway-access ramp at Luapele Street, associated freeway widening, and the associated park-and-ride lot be constructed and what will each of these improvements cost?

6. Each day, how many buses and bus rider will use the proposed BRT freeway access ramp at Luapele Street:

- when it is first constructed?
- in 2025?

7. When the zipper lane is normally not deployed, and during peak traffic when the zipper lane cannot be deployed because of an incident or mechanical problems, the BRT will not be able to use the proposed Luapele ramp. What route will the BRT take when the proposed Luapele ramp cannot be used?

8. If the proposed Luapele ramp were not built, what is the projected drop in daily bus ridership?

9. If the proposed park-and-ride lot were not built near the proposed Luapele ramp, what is the projected drop in daily bus ridership?

10. In general, how large an expenditure does the City consider justified to attract a single additional daily bus rider? Will proposed expenditures to construct a BRT freeway-access ramp at Luapele Street, associated freeway widening, and the associated park-and-ride lot meet this standard?

It is my hope that your answers to these questions will improve future decisions about Oahu transit improvements.

Sincerely,

D. Meller

Mr. Doug Meller
2748 Rooke Avenue
Honolulu, Hawaii 96817

Dear Mr. Meller:

Subject: Primary Corridor Transportation Project
Supplemental Draft Environmental Impact Statement

Thank you for your September 21, 2001 letter responding to the Supplemental Draft Environmental Impact Statement (SDEIS) Preparation Notice. Your letter provided us with the following comments for which we have prepared responses.

Comment	Response
I would like to be a formally consulted party and be provided with a paper copy of the Supplemental DEIS, the Final EIS, and future BRT-related environmental documents.	You are included as a SDEIS recipient.
Adding a new BRT route means revising the BRT Alternative to attract more riders. How many daily transit trips would the No Build and the TSM Alternatives generate assuming the same total number of buses as the revised BRT Alternative in 2025? It seems obvious that fewer buses will result in fewer routes, reduced frequency of bus service, longer waits at bus stops, longer boarding times at bus stops, increased crowding of buses, fewer express buses, and fewer bus riders. Assuming the No Build and the TSM Alternative have fewer buses than the BRT Alternative will prevent a fair comparison.	The No-Build, TSM, and Refined BRT Alternatives reflect three possible levels of transit investment. Having three levels of service provided consistent with the level of investment does indeed allow for a fair comparison.

When does the City plan to convert existing traffic lanes east of Middle Street to exclusive use of the BRT route which will serve the UH? At that time, • which intersections will experience significantly reduced levels of service? • how many bus riders will be better off and how much reduction in travel time will they experience? • how many drivers will be worse off and how much more travel delay will they experience?	Converting existing traffic lanes from general-purpose traffic use to exclusive BRT use is projected to occur by 2006 for the UH BRT Branch. Analyzed intersections projected to operate with greater delay in the BRT Alternative than in the No Build Alternative are: South King Street/ Pensacola Street, Kapiolani Boulevard/ Pensacola Street, Kapiolani Boulevard/Piikoi Street, and University Avenue/South King Street. Overall, 2025 peak period vehicle hours of delay are projected to decrease from 251,970 for the No Build Alternative to 243,261 for the BRT Alternative. Although peak period vehicle hours of delay was not calculated for 2006, systemwide vehicle hours of delay is also expected to decrease. Transit passenger benefits would accrue mainly from increased service reliability.
When does the City plan to convert existing traffic lanes east of Middle Street to exclusive use of the BRT route which will serve Waikiki? At that time, • which intersections will experience significantly reduced levels of service? • how many bus riders will be better off and how much reduction in travel time will they experience? • how many drivers will be worse off and how much more travel delay will they experience?	Converting existing traffic lanes form general-purpose traffic use to exclusive BRT use is projected to occur by 2005 for the Kakaako Mauka BRT Branch. Analyzed intersections projected to operate with greater delay in the BRT Alternative than in the No Build Alternative are: Ala Moana Boulevard/Piikoi Street, Ala Moana Boulevard/ Atkinson Drive, and Ala Moana Boulevard/Kalia Road. Overall, 2025 peak period vehicle hours of delay are projected to decrease from 251,970 for the No Build Alternative to 243,261 for the BRT Alternative. Although peak period vehicle hours of delay was not calculated for 2006, systemwide vehicle hours of delay is also expected to decrease. Transit passenger benefits would accrue mainly from increased service reliability.
Am I correct in assuming that the proposed BRT route with stops at Aloha Tower and Kewalo Basin is contingent on the HCDA extending Halo Street to Punchbowl Street, and that extension of Halo Street may not occur within the next decade?	The BRT Kakaako Mauka Branch is proposed to use Channel Street to get to Halo Street, not Punchbowl Street.

When will the proposed BRT freeway-access ramp at Luapele Street, associated freeway widening, and the associated park-and-ride lot be constructed and what will each of these improvements costs?	The Luapele BRT Ramp will be open in 2010 and cost $32.8 M in 1998 dollars. The Aloha Stadium Park-and-Ride will open in 2007 and cost $1.7 M in 1998 dollars.
Each day, how many buses and bus rider will use the proposed BRT freeway access ramp at Luapele Street: • when it is first constructed? • in 2025?	The Luapele Ramp is forecasted to carry 23 transit vehicles per hour in 2004 and 35 transit vehicles per hour in 2025 during a peak hour. The projected number of transit riders for the same two planning years is 2,300 transit riders per hour and 3,500 transit riders per hour, respectively.
When the zipper lane is normally not deployed, and during peak traffic when the zipper lane cannot be deployed because of an incident or mechanical problems, the BRT will not be able to use the proposed Luapele ramp. What route will the BRT take when the proposed Luapele ramp cannot be used?	When the Zipper Lane is not deployed, the BRT would use one of two routes: 1) Kamehameha Highway to Aiea Interchange with eastbound Moanalua Freeway, eastbound Moanalua Freeway to eastbound H-1 Freeway, eastbound H-1 Freeway to eastbound shoulder lane on H-1 Airport Viaduct; 2) Kamehameha Highway to Pearl Harbor Interchange, eastbound H-1 Freeway to eastbound shoulder lane on H-1 Airport Viaduct.
If the proposed Luapelel ramp were not built, what is the projected drop in daily bus ridership?	There would be a daily drop in projected year 2025 transit riders of approximately 3,000 transit riders per day.
If the proposed park-and-ride lot were not built near the proposed Luapele ramp, what is the projected drop in daily bus ridership?	A park and ride facility would normally be constructed so as to have a strong relationship with major transit lines. If a park and ride facility is not constructed near Luapele Ramp, it would still be constructed in a manner to foster this relationship. Therefore, the drop in daily transit riders would be negligible.

In general, how large an expenditure does the City consider justified to attract a single additional daily bus rider? Will proposed expenditures to construct a BRT freeway-access ramp at Luapele Street, associated freeway widening, and the associated park-and-ride lot meet this standard?	The SDEIS, Chapter 7 – Comparison of Alternatives includes a cost-effectiveness analysis, which relates the ability of an alternative to attract new riders to its costs. The FTA also uses the cost-effectiveness index (CEI) as input into its rating system, which compares projects across the country, and identifies those most worthy of federal funding. The CEI analysis indicates that the TSM Alternative would have a CEI (or incremental cost per new rider) of $9.74. The Refined BRT Alternative would have a $7.42 CEI compared to the No-Build Alternative and a $6.82 CEI compared to the TSM Alternative. The costs and ridership used in the analysis are for the whole project and not each project component separately or several project components together.

You will be receiving a copy of the SDEIS under separate cover. We appreciate your interest in this important transportation project and look forward to receiving your comments on the SDEIS.

Sincerely,

CHERYL D. SOON
Director

Appendix A
Exhibit A-3

EXHIBIT A-3. AGENCY COORDINATION UP TO MIS/DEIS

Exhibits A-3 through A-5 contains a record of all the agency correspondence regarding the following regulations:

- Cooperating agencies as required in the Regulations for Implementing the Procedural Provisions of the National Environmental Policy Act
- Section 106 of the National Historic Preservation Act
- Section 7 of the Endangered Species Act
- Section 404 of the Clean Water Act
- Section 4(f) of the U.S. Department of Transportation Act
- Section 6(f) of the Land and Water Conservation Fund
- Use of Conservation District under Chapter 205 of the Hawaii Revised Statutes
- Farmland Protection Policy Act
- Safe Drinking Water Act

A summary of the correspondence and consultation activities is provided below. Copies of these documents are provided in this exhibit.

COOPERATING AGENCY LETTERS

May 5, 1999 letter from the Federal Highway Administration (FTA) to the Federal Highway Administration (FHWA) inviting them to be a cooperating agency

June 14, 1999 letter from the FHWA to the FTA accepting invitation to be a cooperating agency

May 5, 1999 letter from the FTA to the U.S. Army Corps of Engineers (USACE) inviting them to be a cooperating agency

June 16, 1999 letter from USACE to FTA accepting invitation to be a cooperating agency

July 27, 2000 letter from the State of Hawaii Department of Transportation (SDOT) to City and County of Honolulu, Department of Transportation Services (DTS) requesting to be a cooperating agency

SECTION 106 OF THE NATIONAL HISTORIC PRESERVATION ACT

Minutes of April 8, 1999 meeting with State Historic Preservation Division (SHPD) to discuss definition of the project's Area of Potential Effect (APE) and the methods to identify potential historic properties within the APE

May 7, 1999 letter from the DTS to the SHPD confirming the agreements made during the April 8, 1999 meeting

Minutes of May 21, 1999 meeting with the Office of Hawaiian Affairs to discuss potential archaeological and cultural issues of the project

Minutes of June 17, 1999 meeting with the SHPD to discuss the results of the project's first phase to identify potential historic properties

Minutes of September 28, 1999 meeting with the SHPD to discuss the list of potential historic properties in the APE

Minutes of November 12, 1999 meeting with the SHPD to discuss changes that were made to the project, and how these changes would affect the identification of potential historic properties

February 8, 2000 letter from the DTS to the SHPD submitting the results of the inventory survey

February 25, 2000 letter from the DTS to the SHPD requesting concurrence that the APE be reduced because of changes made to the project

March 8, 2000 letter from the State Historic Preservation Officer (SHPO) concurring with the reduction of the APE

SECTION 7 OF THE ENDANGERED SPECIES ACT

May 12, 1999 letter from the FTA to the U.S. Fish and Wildlife Service (USFWS) requesting a list of potential Federal Trust species that may be in the project area

May 24, 1999 letter from the USFWS to the DTS providing a list of Federal Trust species that may potentially be in the project area

SECTION 404 OF THE CLEAN WATER ACT

May 4, 2000 letter from DTS to FHWA requesting concurrence with project purpose and need and alternatives per the Memorandum of Understanding (MOU) that integrates the National Environmental Policy Act (NEPA) and Clean Water Act Section 404 processes for surface transportation projects in the State of Hawaii

June 26, 2000 letter from FHWA to DTS informing DTS that they intend to contact FTA directly if they have any recommendations or concerns

August 17, 2000 letter from DTS to FHWA informing FHWA that the Bus Rapid Transit (BRT)/Sand Island Scenic Parkway (SISP) Alternative is no longer being considered in the MIS/DEIS, and the Section 404/NEPA MOU no longer applies to the project

May 4, 2000 letter from DTS to the U.S. Army Corps of Engineers (ACOE) requesting concurrence with project purpose and need and alternatives per the Section 404/NEPA MOU

June 8, 2000 letter from ACOE to DTS stating concurrence with project purpose and need and alternatives per the Section 404/NEPA MOU

July 19, 2000 letter from DTS to ACOE informing ACOE that the BRT/SISP Alternative is no longer being considered in the MIS/DEIS, and the Section 404/NEPA MOU no longer applies to the project

May 4, 2000 letter from DTS to the National Marine Fisheries Service (NMFS) requesting concurrence with project purpose and need and alternatives per the Section 404/NEPA MOU

June 9, 2000 letter from NMFS to DTS stating concurrence with project purpose and need and alternatives per the Section 404/NEPA MOU

MAY 5 1999

Mr. Abraham Wong, Division Administrator
Federal Highway Administration, Hawaii Division
U. S. Department of Transportation
P. O. Box 50206
Honolulu, Hawaii 96850

Dear Mr. Wong:

Re: Primary Corridor Transportation Project

The Federal Transit Administration (FTA), in cooperation with the City and County of Honolulu Department of Transportation Services (DTS) is initiating an environmental impact statement (EIS) for proposed transportation improvements in the Primary Transportation Corridor of the City and County of Honolulu. Since some of the proposed improvements may require Federal Highway Administration (FHWA) approval, we are requesting FHWA to be a joint lead agency.

The Primary Corridor Transportation Project proposes transportation improvements in the primary transportation corridor of Oahu. The corridor extends from Kapolei in the Ewa District to the University of Hawaii at Manoa. The proposed action is intended to address existing and future transportation demand and capacity needs; support socioeconomic growth on the island and in the corridor; improve public transit services; facilitate land use development in the central urban core consistent with the vision for Oahu; and support current planning activities and policies. The alternatives under consideration include a No-Build and several build alternatives that would include an Enhanced Bus/Transportation System Management (TSM) Alternative, a Bus Rapid Transit Alternative, and a Light Rail Transit Alternative. The build alternatives include highway improvements, such as modified freeway ramps and other roadway improvements to provide priority treatment for buses, and transit centers. A Sand Island Bypass Road, including a tunnel from Sand Island to Kakaako, and a conversion of a portion of the existing Nimitz Highway to a parkway, could be part of the build alternatives. Detailed technical reports will be prepared on topics such as transportation, land use, social and economic impacts, finance and cost-effectiveness, visual and aesthetic impacts, noise and vibration, parks and recreation areas, historic resources, air quality and hazardous materials.

Your agency's involvement should entail those areas under its jurisdiction and no direct writing or analysis will be necessary for the document's preparation. The following are activities we will take to maximize interagency cooperation:

1. Invite you to coordination meetings;
2. Consult with you on any relevant technical studies that will be required for the project;
3. Organize joint field reviews with you;
4. Provide you with project information, including study results;
5. Encourage your agency to use the above documents to express your views on subjects within your jurisdiction or expertise; and
6. Include information in the project environmental documents that joint lead and cooperating agencies need to discharge their National Environmental Policy Act (NEPA) responsibilities and any other requirements regarding jurisdictional approvals, permits, licenses, and/or clearances.

You have the right to expect that the EIS will enable you to discharge your jurisdictional responsibilities. Likewise you have the obligation to tell us if, at any point in the process, your needs are not being met. We expect that at the end of the process the EIS will satisfy your NEPA requirements including those related to project alternatives, environmental consequences and mitigation. Further, we intend to utilize the EIS and our subsequent record of decision as our decision -making documents and as the basis for permit applications.

We look forward to your response to this request and your role as a joint lead agency on this project. If you have any questions or would like to discuss in more detail the project or our agencies' respective roles and responsibilities during the preparation of this EIS, please contact Mr. Robert Hom, Director, Office of Planning and Program Development, at (415) 744-3116.

Sincerely,

Leslie T. Rogers
Regional Administrator

Subject: Primary Corridor Transportation Project: Cooperating Agency Decision and Comments

In response to your letter of May 5, 1999, we elect to be a cooperating agency on the Primary Corridor Transportation Project (PCTP) proposed by the City and County of Honolulu. Alternatives presented by the City are primarily transit options. We understand that if future conditions warrant, our role could be changed to joint lead agency, and that change can readily be accommodated. We agree with your understanding stated in the May 5 letter that the EIS will enable FHWA to discharge its jurisdictional responsibilities and that the EIS will satisfy our NEPA requirements including those related to project alternatives, environmental consequences and mitigation. Please keep this office fully informed about any highway related impacts or improvements for the PCTP. We are committed to being involved and responsive to FTA, our State, City, and MPO partners, and the public throughout the study effort.

We would like to take this opportunity to remind you that the DEIS/MIS must be fully coordinated with the Oahu Metropolitan Planning Organization (OMPO.) Assumptions on land-use, demographics, traffic, and other data must be consistent between the PCTP and the OMPO planning process, including the Oahu Regional Transportation Plan (ORTP) update. OMPO is responsible for regional transportation planning on Oahu, and the MIS is really a subarea or corridor planning study that is of regional nature, so it should be carried out in the OMPO forum.

The cost for the PCTP alternatives must be determined and considered on a regional basis. The PCTP preferred alternative and all of its transit and highway elements must be fully incorporated into the ORTP by including it in the ORTP update or a plan amendment. Funds for the project must be reasonably available, and as part of the ORTP , the project must be considered with respect to all other transportation priorities in the ORTP to determine its priority and validity in the regional perspective. The project as a whole could consume funding for other priority projects included or being considered for inclusion in the ORTP and the tradeoffs must be presented to the stakeholders and the public for their consideration.

Alternatives presented by the City thus far are primarily transit options. While this focus is due to the high capacity transit placeholder in the existing ORTP, the MIS requirements call for all reasonable alternatives to be considered within the MIS, therefore highway options should be considered now rather than after the MIS is completed by the City. The HDOT and OMPO should ensure that the study includes multi-modal alternatives that support their transportation plans for the corridor.

Please feel free to contact Jonathan Young at (808) 541-2700, ext. 325, if you have any questions.

Sincerely yours,

Abraham Wong
Division Administrator

Lieutenant Colonel Wally Z. Walters
District Engineer
Honolulu Engineer District
U.S. Army Corps of Engineers
Building 230
Fort Shafter, Hawaii 96858-5440

Dear Lieutenant Colonel Walters:

Re: Primary Corridor Transportation Project

The Federal Transit Administration (FTA), in cooperation with the City and County of Honolulu Department of Transportation Services (DTS) is initiating an environmental impact statement (EIS) for proposed transportation improvements in the Primary Transportation Corridor of the City and County of Honolulu. Since the project will almost certainly require a Section 404 permit and because of your agency's legal jurisdiction over such permits, we are requesting the Corp of Engineers to be a cooperating agency.

The Primary Corridor Transportation Project proposes transportation improvements in the primary transportation corridor of Oahu. The corridor extends from Kapolei in the Ewa District to the University of Hawaii at Manoa. The proposed action is intended to address existing and future transportation demand and capacity needs; support socioeconomic growth on the island and in the corridor; improve public transit services; facilitate land use development in the central urban core consistent with the vision for Oahu; and support current planning activities and policies. The alternatives under consideration include a No-Build and several build alternatives that would include an Enhanced Bus/Transportation System Management (TSM) Alternative, a Bus Rapid Transit Alternative, and a Light Rail Transit Alternative. The build alternatives include highway improvements, such as modified freeway ramps and other roadway improvements to provide priority treatment for buses, and transit centers. A Sand Island Bypass Road, including a tunnel from Sand Island to Kakaako, and a conversion of a portion of the existing Nimitz Highway to a parkway, could be part of the build alternatives. Detailed technical reports will be prepared on topics such as transportation, land use, social and economic impacts, finance and cost-effectiveness, visual and aesthetic impacts, noise and vibration, parks and recreation areas, historic resources, air quality and hazardous materials.

Your agency's involvement should entail those areas under its jurisdiction and no direct writing or analysis will be necessary for the document's preparation. The following are activities we will take to maximize interagency cooperation:

1. Invite you to coordination meetings;
2. Consult with you on any relevant technical studies that will be required for the project;
3. Organize joint field reviews with you;
4. Provide you with project information, including study results;
5. Encourage your agency to use the above documents to express your views on subjects within your jurisdiction or expertise; and
6. Include information in the project environmental documents that cooperating agencies need to discharge their National Environmental Policy Act (NEPA) responsibilities and any other requirements regarding jurisdictional approvals, permits, licenses, and/or clearances.

You have the right to expect that the EIS will enable you to discharge your jurisdictional responsibilities. Likewise you have the obligation to tell us if, at any point in the process, your needs are not being met. We expect that at the end of the process the EIS will satisfy your NEPA requirements including those related to project alternatives, environmental consequences and mitigation. Further, we intend to utilize the EIS and our subsequent record of decision as our decision-making documents and as the basis for permit applications.

We look forward to your response to this request and your role as a cooperating agency on this project. If you have any questions or would like to discuss in more detail the project or our agencies' respective roles and responsibilities during the preparation of this EIS, please contact Mr. Robert Hom, Director, Office of Planning and Program Development, at (415) 744-3116.

Dear Mr. Rogers:

This is in response to your request that the U.S. Army Corps of Engineers participate as a cooperating agency in preparation of the environmental documents for the proposed Primary Corridor Transportation project. Our understanding is that the Federal Transit Administration will act as the lead federal agency.

Under Section 404 of the Clean Water Act and Section 10 of the Rivers and Harbors Act, the Corps has jurisdiction over waters of the U.S. that may be impacted by the proposed project. Therefore, the Corps will participate as a cooperating agency as provided by 40 CFR 1501.6.

If you have any further questions, please contact Mr. Alan Everson of my staff at (808) 438-9258 ext. 11.

Sincerely,

Wally A. Walters
Lieutenant Colonel, U.S. Army
District Engineer

Dear Ms. Soon:

Subject: Primary Corridor Transportation Study (PCTS), Cooperating Agency

In accordance with the recommendations from the meeting held on July 17, 2000, with our staffs and the Federal Highway Administration, we are requesting that the Hawaii Department of Transportation (HDOT) be designated as a cooperating agency for the PCTS.

Very truly yours,

Kazu Hayashida

Memorandum

DRAFT

To: File

From: Jason Yazawa

Date: April 30, 1999

Subject: Primary Corridor Transportation Project
Meeting with State Historic Preservation Division (SHPD)
Held on April 8, 1999

In Attendance: Sara Collins, SHPD
Tonia Moy, SHPD
Faith Miyamoto, DTS
David Atkin, PB
Jason Yazawa, PB

Meeting Summary

DTS and PB provided a briefing on the proposed project (status, purpose and need, alternatives, etc.)

DTS and PB proposed that the method of identifying historic buildings, in accordance with Section 106 of the National Historic Preservation Act, be the following:

- secondary data search (previous transit report, Registers, etc.);
- windshield survey to develop a "long list" of possible eligible sites;
- consultation with SHPD to screen the long list and develop a "short list";
- inventory survey the screened short list to evaluate significance (eligibility for the National Register); and
- SHPD agreement on significance evaluations.

DTS and PB proposed that the Area of Potential Effect (APE) for historic buildings be one lot deep from the transit (LRT or BRT) corridor because improvements will be at-grade.

SHPD agreed with the approach above to identify historic buildings. SHPD also generally agreed with the dimensions of the APE along the transit corridor. However, the APE around new ramps, park-and-ride lots or transit centers where such facilities might rise above the grade would be determined on a case-by-case basis.

With regards to archaeological sites, DTS and PB will request SHPD to provide a list of known archaeological sites in the corridor. DTS and PB believe this should suffice with regards to Section 106 requirements because the corridor is generally a built-up, urban

environment and most improvements would be done on existing streets and highways. SHPD agreed, and commented that a more detailed study could be done at a later time if needed. SHPD has GIS records of archaeological sites, which they would share with DTS and PB.

With regards to traditional cultural practices, SHPD recommended that DTS and PB consult with the Office of Hawaiian Affairs (OHA).

Once all historic properties are identified, the Federal Transit Administration will make an effect determination, which would be submitted to the State Historic Preservation Officer for concurrence.

SHPD stated that project compliance with Section 106 would cover State requirements as specified in Chapter 6E of the Hawaii Revised Statutes.

Action Items:

1. PB team to conduct windshield survey to develop "long list" of buildings that could potentially be eligible for the National Register.
2. PB team to coordinate with SHPD to screen "long list" to develop a "short list" of potential sites.
3. PB team to conduct additional studies of "short list" with scope to be determined in consultation with SHPD.
4. PB team to request from SHPD a list of known archaeological sites in the project area that are on or eligible for the National Register.
5. PB team and DTS to meet with OHA to discuss traditional cultural properties in the project area.

Kapolei, Hawaii 96707

Attention: Ms. Sara Collins

Dear Dr. Hibbard:

Subject: Primary Corridor Transportation Project

This letter is to follow up on the April 8, 1999 meeting with your staff regarding compliance with Section 106 of the National Historic Preservation Act and Chapter 6E of the Hawaii Revised Statutes.

At that meeting, the approach to identify historic properties (i.e., sites on or eligible for the National Register) that could potentially be affected by the subject project was proposed. Your staff agreed with the approach presented to identify historic buildings, and recommended consultation with the Office of Hawaiian Affairs to identify traditional cultural properties in the project area. I have enclosed for your review and comment draft minutes of the meeting.

With regard to archaeological sites, your staff agreed to provide a list of known archaeological sites in the project area (see enclosed project area map) that are on or eligible for the National Register as well as other pertinent information, such as GIS mapping and files. This information is now formally requested. We would appreciate receiving this information as soon as possible so we can determine whether the proposed project would affect these sites.

If you have any questions, please feel free to contact Faith Miyamoto of the Transportation Planning Division, at 527-6976.

Sincerely,

Cheryl D. Soon

Memorandum

DRAFT

To: File

From: Jason Yazawa

Date: June 11, 1999

Subject: Primary Corridor Transportation Project
Scoping Meeting with the Office of Hawaiian Affairs (OHA)
Held on May 21, 1999

In Attendance: Faith Miyamoto, DTS
C. Sebastian Alcot, OHA
Lynn Lee, OHA
Susan Killen, PB
Jason Yazawa, PB

Meeting Summary

Ms. Miyamoto provided a short briefing on the status of the project, noting that an Environmental Impact Statement (EIS) Preparation Notice and a Notice of Intent were recently issued, and that a public scoping meeting was held. Ms. Miyamoto indicated that the comment period ends on May 24th, but we would work with OHA to get their comments incorporated into the Draft EIS. As background for the discussion, Ms. Killen provided a briefing on the alternatives currently being considered.

Ms. Lee questioned why transportation improvements between Kapolei and Honolulu were being proposed when the vision for Kapolei is to develop a city where people live and work. Ms. Lee thought that the proposed improvements were inconsistent with this vision. Ms. Killen stated that there would still be a need for people to travel between Kapolei and Honolulu. However, the proposed transportation improvements for Kapolei are transit-related, and are meant to provide people with transportation options to driving their cars. Ms. Lee was in agreement with providing transit priority improvements. It was suggested that a glossary would be useful as a guide to the project maps provided.

The Sand Island Bypass / Nimitz Parkway improvements, which are included as part of the BRT and LRT Alternatives, were discussed. Ms. Lee stated that OHA would have concerns about impacts to burials, archaeology and water quality. Mr. Aloot stated that the Sand Island property is categorized as 5A lands, meaning that it was obtained by the State from the federal government before Statehood, and is, therefore, not part of the public land trust (5F lands) for which OHA is entitled to 20

percent revenues. The status of the Sand Island property is in dispute. Therefore, Mr. Aloot stated that this issue would likely be raised (maybe by OHA) during the planning of this project.

Ms. Lee asked what kind of land uses would be expected on Sand Island after the bypass is completed. Ms. Killen answered that Matson and SeaLand would probably remain. However, more commercial uses and greenways along the waterfront would be expected.

Ms. Lee recommended that a cultural impact assessment be conducted for the Sand Island project. The assessment should include fishing practices, burials and archaeological resources. Ms. Lee noted that the manner in which Sand Island was filled might be important in determining the extent of any burials, and that many families still heve strong connections to Sand Island. Ms. Lee stated that Mokauea Island contains about a half-dozen houses on leases from the Department of Land and Natural Resources.

Ms. Lee noted that the Burial Council will not be handling all the burial issues associated with Sand Island. Ms. Lee recommended that consultants from the Hawaiian community be used to help the project resolve issues of handling burials and other artifacts. Mr. Aloot stated that OHA has a Cultural Rights Specialist who could help link the project with the proper community groups.

In response to a question from Ms. Lee regarding the inclusion of the Bypass in the BRT and LRT Alternatives, Ms. Killen stated that for the EIS, the alternatives will include a scenario without the Sand Island Bypass / Nimitz Parkway improvements.

Ms. Lee did not know of any cultural/traditional practices in other parts of the project. Generally, the mauka areas (say areas mauka of Queen Street) are less likely to contain burials. Ms. Lee suggested that there be a check for sinkholes in the Fort Weaver Road area.

For compliance with Section 106 of the National Historic Preservation Act, Ms. Lee recommended consultation with Hui Malama o Kapuna and the Pearl Harbor Hawaiian Civic Club. Ms. Lee agreed to provide contact names and telephone numbers.

The meeting concluded with an agreement to continue to coordinate throughout the duration the project.

David Atkin, PB

AR00016351

Memorandum

To: File

From: Jason Yazawa

Date: June 17, 1999

Subject: Primary Corridor Transportation Project
Meeting regarding historic resources held on June 17, 1999

In Attendance: Faith Miyamoto, DTS
Don Hibbard, State Historic Preservation Division (SHPD)
Tonia Moy, SHPD
Glenn Mason, Mason Architects Inc.
Ann Yaklovich, Mason Architects Inc.
Susan Killen, PBQD
Jason Yazawa, PBQD

Meeting Summary

The purpose of this meeting was to discuss the screening of the windshield survey list. In a meeting with SHPD staff on April 8, 1999, it was agreed that a windshield survey be conducted to identify potential historic resources, apart from known resources that were identified from previous reports and listing in the National and Hawaii Registers of Historic Places.

Ms. Killen and Mr. Yazawa provided a short briefing on the status of the project and the alternatives currently being considered. Included in this discussion was an explanation on the possible appearance of the catenaries (poles and overhead wires) under the LRT Alternative.

Ms. Yaklovich provided a briefing on the screening of the initial windshield survey list. The initial survey, conducted on all the affected roadways (LRT, BRT, etc.) of the alternatives, identified 242 sites. In consultation with SHPD, the area of potential effect (APE) of any BRT improvement (e.g., semi-exclusive and exclusive bus lanes; but excluding ramps) would be limited to the roadway. By only including sites along the LRT alignments, 187 sites remained on the list. The second screening involved eliminating sites that are younger than 50 years. In consultation with SHPD, 1952 was set as the cut-off year. After the date research, 112 sites remained. These sites were evaluated on whether they have integrity (a criterion for eligibility to the National Register). Although some of the sites had integrity, Mason Architects judged them not likely to be eligible for the National Register for other reasons. Mason Architects

produced assessment sheets of the sites, which included photography. Copies of the sheets were submitted to SHPD. After evaluating the integrity and potential eligibility the 112 sites, 32 sites remained, which represent sites recommended for an inventory survey.

SHPD staff agreed to review the screening of the windshield survey, which produced the list of sites recommended for further study. Mr. Hibbard stated that they can respond in writing in a couple of weeks.

Mr. Hibbard had the following concerns or provided the following information regarding historic resources:

- changes in curb heights at transit stations should be minimized or be consistent with surrounding curb heights if they are at or adjacent to an historic property;
- all lava rock curbs and sidewalks should be retained;
- check whether there are any 50+ year old traffic signals along the project, since they may be considered historic;
- Bachman Hall and Sinclair Library at the University of Hawaii may be eligible properties;
- the trees along Kapiolani Boulevard are considered an historic landscape; and
- catenaries in the Capitol District may not be a concern because there are already street lamps in the district (response to a PBQD question).

A list of known sites within the project's APE was submitted to SHPD. SHPD staff agreed to review the list, and to alert DTS if there are known sites missing other than those above.

Over a Century of Engineering Excellence

Memorandum

DRAFT

To: File

From: Jason Yazawa

Date: October 13, 1999

Subject: Primary Corridor Transportation Project
Meeting with State Historic Preservation Division (SHPD)
Held on September 28, 1999

In Attendance: Don Hibbard, SHPD
Sara Collins, SHPD
Tonia Moy, SHPD
Faith Miyamoto, DTS
Ann Yoklavich, Mason
David Atkin, PB
Jason Yazawa, PB

Meeting Summary

Mr. Jason Yazawa, of Parsons Brinckerhoff (PB), provided a briefing on the changes made to the proposed project since the last meeting with staff from the State Historic Preservation Division (SHPD) held on June 17, 1999.

Mr. Yazawa also briefed SHPD staff on the upcoming historic building survey work for the CityTram Waikiki Branch and Sand Island Bypass/Nimitz Parkway elements of the project. Mason Architects will conduct a windshield survey and screening, the same methods used in the previous survey work. SHPD staff agreed with this work.

The archaeological and cultural survey work on the Sand Island Bypass portion of the project was discussed. Mr. Yazawa informed SHPD staff that during a consultation meeting with the Office of Hawaiian Affairs held on May 21, 1999, project staff were informed about native Hawaiians who reside on Mokauea Island under lease from the State Department of Land and Natural Resources. Ms. Sara Collins, an archaeologist with SHPD, was not aware of any other archaeological or cultural resources on or near Sand Island mainly because most, if not all, the island was created by fill material from Honolulu Harbor and Keehi Lagoon. Mr. Don Hibbard, the administrator of SHPD, recalled a report about Sand Island. Ms. Collins said she would try to find it.

Ms. Collins stated that the natural shoreline in the vicinity of Sand Island Bypass/Nimitz Parkway is along Nimitz Highway. The area makai of Nimitz Highway is fill material. Ms. Collins stated that construction at Pier 39-40 (Young Brothers terminal) uncovered

a burial, but this discovery is unusual because the current Pier 39-40 is beyond the natural shoreline. A known archaeological resource in the project area is a buried fishpond in the vicinity of Nimitz Highway near Keehi Interchange. Mr. Yazawa stated that the unstable soil conditions in this area might require deep foundations for the alternative alignment of the Bypass near Nimitz Highway. Ms. Collins stated that during construction monitoring would be needed in this area if this alignment is selected.

With regards to the Waikiki Branch of the CityTram, Ms. Collins stated that there could be potential burials along Richards and Kamakee Streets. Mr. David Atkin noted, however, that construction on city streets for CityTram would only involve repavement, and that deep excavation would not be necessary. Ms. Collins is also aware of burials in the Fort DeRussy area, along Kalia Road. These burials are only 4 to 6 feet below the surface. The recent Hale Koa Hotel construction uncovered many burials. However, Ms. Collins said that no burials have been uncovered so far at the Hilton Hawaiian Village construction site (old dome).

Ms. Collins is mindful that archaeological surveys would not be possible because any resource in the project area would be buried. The use of existing data, such as the City's Geographic Information System, would be acceptable to identify archaeological sites. However, Ms. Collins raised the possibility of an "adverse effect" on unknown burials because monitoring (arguably a form of data recovery) would be required along certain sections and stations of the CityTram. The new Section 106 regulations require an "adverse effect" determination if data recovery is required, even though the resource does not have to be preserved (under the old regulations, this would be a "no adverse effect" determination). Ms. Collins raised the possibility of conducting a phased Section 106 process to address the problem of unknown archaeological sites. Ms. Collins was not sure if a phased Section 106 process is applicable to the project. Mr. Hibbard questioned how such a process could be used since Section 106 is used in the National Environmental Policy Act process to select the preferred alternative. Mr. Yazawa said he would research into the new regulations to see if a phased Section 106 process makes sense for the project.

The group discussed reconciling the "Mason list" of 32 potential historic building sites within the Area of Potential Effect (APE) and the "SHPD list" of approximately 80 potential sites. The goal of this discussion is to come up with one list of potential historic sites (excluding the CityTram Waikiki Branch and Sand Island Bypass, which will be discussed at a later date), which will be the subject of further research (i.e., inventory survey). The following was agreed to by the group to reconcile the lists:

- Despite changes made to the proposed project (see above), alternative corridors for the CityTram have not been eliminated (e.g., North and South King Streets), and these corridors may be used as alternatives in the upcoming draft environmental impact statement (EIS). Therefore, no historic resource within these corridors' APE can be eliminated at this time.

- The 50-year cut-off used to produce the Mason list was set at 1952. The SHPD list contains many buildings constructed in the late 1950s and early 1960s. It was agreed that the cut-off year be moved to 1959, except in cases where a building

AR00016353

DRAFT

may be exceptionally important, such as the old Kamehameha Drive-In Theater (the last of its kind). Some of the buildings identified by SHPD staff require date research.

- Some of the sites on the SHPD list were included in the 1989 inventory survey report prepared for the Honolulu Rapid Transit Project. SHPD staff agreed that the information provided in the 1989 report is acceptable for the current project.

- Ms. Ann Yoklavich, of Mason Architects, questioned the integrity of some of the buildings on the SHPD list because she felt that they were altered too much. SHPD staff requested that most of these buildings remain on the list.

Ms. Yoklavich will prepare a new list combining the Mason and SHPD lists, and taking into account the discussion above. SHPD suggested that the project use a "Kauai-Inventory-type form" in conducting the inventory survey.

Mr. Yazawa informed SHPD staff that the project plans to secure the State Historic Preservation Officer's (SHPO) concurrence on the National Register eligible properties in the APE prior to public release of the Draft EIS. Since the current schedule has the Draft EIS completed in early 2000. The concurrence request letter to the SHPO would be submitted in November or December.

Action Items:

1. Ms. Collins to find a report about archeeological resources on Sand Island.
2. Mr. Yazawa to research the possibility of using a phased Section 106 process.
3. Mason Architects to conduct windshield survey and screening of the CityTram Waikiki Branch and Sand Island Bypass elements of the project.
4. PB, DTS, SHPD and Mason Architects to discuss results of Mason Architect's windshield survey and screening.
5. Ms. Yaklovich to prepare a new list of potential historic buildings requiring an inventory survey.
6. Mason Architects to conduct inventory survey.

AR00016354

Memorandum

To: Attendees

From: Colette Sakoda

Date: November 12, 1999

Subject: Primary Corridor Transportation Project
Meeting with State Historic Preservation Division
Held on November 8, 1999

In Attendance: Don Hibbard, SHPD
Tonia Moy, SHPD
Faith Miyamoto, DTS
Barbara Shideler, Mason Architects
Glenn Mason, Mason Architects
Susan Killen, PB
Colette Sakoda, PB

Meeting Summary

Susan Killen provided a briefing on the changes made to the proposed project that consists of the Sand Island Parkway and Waikiki extension alternatives appended to the CityTram route. Also discussed was the technology update in that there will be no overhead catenary; instead the vehicle will be electrically powered through a power strip embedded at surface level in the street pavement.

Barbara Shideler reviewed the supplemental list of properties located within the expanded project alignments with the group. Criteria utilized in the selection of the sites were:

1. Properties and buildings with dates before 1960
2. Area of Potential Effects (APE) for historic buildings would be one lot deep from an affected roadway
3. Records research of the National Register and Hawaii Register, review of Historic Sites Inventory Report for the Honolulu Rapid Transit Development Project (1989), and windshield survey

The supplemental list geographically consisted of potential sites along the Sand Island Parkway, Waikiki, and Kakaako extensions of the CityTram route. This list will be combined with the original list contained in the Historical/Cultural Resources Impacts Technical Report, May 1999.

Potential impacts on trees on Kapiolani Boulevard are still an issue for further evaluation. It may in part depend on whether the CityTram is curb side running or requiring taking the median within the Kapiolani Boulevard right-of-way, both of which are possible locations of some significant trees. Another issue that is being investigated by PB is the potential impact

on existing curbs. Depending again on the location, some curbs may require section 106 review due to historic significance.

Don Hibbard reviewed and approved the inventory survey form proposed for use by Mason Architects. The format is the same that was utilized for a Kauai project previously reviewed and approved by the State Historic Preservation Division.

Susan Killen recommended that for the next phase of the evaluation, priority be placed on properties most vulnerable due to proposed transit station locations, park and ride facilities, and stops. Properties that would not be affected should be looked at to possibly shorten the list.

Our target is to submit the Draft EIS to the Federal Transit Administration (FTA) in January, 2000. The APE list with a preliminary determination of potential effects will be included in the document.

Action Items:

1. Mason Architects will proceed with inventory survey with priority on properties that would be most vulnerable due to proximity to proposed transit stations, park and ride facilities, and stops.
2. PB will continue research on proposed locations of trees on Kapiolani Boulevard relative to the CityTram use of right-of-way; research will also continue on potential effects on existing curbs by the alignment.

Dear Dr. Hibbard:

Subject: Primary Corridor Transportation Project

As part of the ongoing Section 106 consultation process for the subject project, under separate cover, the following was transmitted for your information:

1. One (1) set of completed inventory survey cards for sites built prior to 1960 in the area of potential effect (APE)

2. List of Potential and Known Historic Resources

3. Preliminary Effect Assessment of Historic Period Resources

Should you have any questions regarding this matter, please contact Faith Miyamoto of the Transportation Planning Division at 527-6976.

Sincerely,

Cheryl D. Soon

Attention: Ms. Tonia Moy

Dear Dr. Hibbard:

Subject: Primary Corridor Transportation Project

The purpose of this letter is to request the reduction of the Area of Potential Effect (APE) agreed upon during discussions held in April, 1999.

At the November 18, 1999 coordination meeting, the following major changes to the proposed in-town transit alignment and technology were discussed:

1. Figure 1 illustrates the revised transit alignment. Figures 2 and 3 are artist's renderings of what a transit stop at a median and at curbside would look like. North King, South Beretania, and South King Streets are no longer being considered as parts of the transit alignment. A Waikiki branch has now been added to the alignment.

2. The system alternatives currently under consideration do not include overhead catenary, as the previous alternatives did. Potential vehicle technologies include Tram-on-Tires, hybrid powered, fuel cell or embedded power collection system, Articulated Electric Hybrid (diesel, propane, or fuel cell), and Articulated Electric Bus powered by touchable embedded power collection system.

We believe that the above provides justification for the reduction of the APE from one parcel deep along the current in-town transit alignment to only the road right-of-way. Please advise us of your decision in this matter.

Should you have any questions or wish to discuss this matter further, please contact Faith Miyamoto of the Transportation Planning Division at 527-6976.

Sincerely,

Cheryl D. Soon

CHERYL D. SOON
Director

Dear Ms. Soon:

SUBJECT: Section 106 Consultation
Primary Corridor Transportation
TMK: Various, Oahu

Thank you for your letter regarding the reduction of the Area of Potential Effect (APE) for the Primary Corridor Transportation Project (PCTP). Since the new proposed system no longer utilizes overhead catenary, we concur that the APE may be reduced to road right-of-way along the in-town transit alignment for most of the project. However, wherever there will be a transit station or special ramp or park-and-ride facility, we believe the APE should include the neighboring parcels.

Thank you for the opportunity to comment. Should you have further questions, please call Tonia Moy at 692-8030.

Aloha,

TIMOTHY E. JOHNS
State Historic Preservation Officer

Dear Mr. Smith:

Subject: Primary Corridor Transportation Project
Section 7 Consultation

The Federal Transit Administration and the City & County of Honolulu are currently preparing a National Environmental Policy Act environmental impact statement (EIS) for the subject project. As shown on Figure 1.1 of the enclosed EIS Preparation Notice, the study area is from Kapolei to Kahala. The alternatives currently being considered for analysis in the Draft EIS include an Enhanced Bus/Transportation System Management (TSM) Alternative, Bus Rapid Transit (BRT) Alternative and Light Rail Transit (LRT) Alternative.

To be in compliance with Section 7 of the Endangered Species Act, we request that the U.S. Fish & Wildlife Service identify the listed and proposed to be listed endangered and threatened species in the project area.

If you have any questions or need additional information, please call Kenneth Hamayasu of the City and County of Honolulu Department of Transportation Services at 527-6978.

Sincerely,

Leslie T. Rogers
Regional Administrator

Re: Notice to Prepare Draft Environmental Impact Statement and Request for a Species List for the Primary Corridor Transportation Project, Oahu, Hawaii (ER 99/397)

Dear Ms. Soon:

The U.S. Fish and Wildlife Service (Service) has reviewed your April 21, 1999, letter notifying us that you intend to prepare a Draft Environmental Impact Statement (DEIS) for the proposed project referenced above. We have also reviewed a letter received from the Federal Transit Administration (FTA), dated May 12, 1999, requesting a list of endangered and threatened species found within the proposed project area. The proposed project is sponsored by the City and County of Honolulu Department of Transportation Services (DTS) and the U. S. Department of Transportation, FTA. This letter has been prepared under the authority of and in accordance with provisions of the National Environmental Policy Act of 1969 [42 U.S.C. 4321 *et seq.*; 83 Stat. 852], as amended, the Fish and Wildlife Coordination Act of 1934 [16 U.S.C. 661 *et seq.*; 48 Stat. 401], as amended, the Endangered Species Act of 1973 [16 U.S.C. 1531 *et seq.*; 87 Stat. 884], as amended, and other authorities mandating Department of the Interior concern for environmental values. Based on these authorities, the Service offers the following comments for your consideration.

The proposed project involves improving Oahu's primary transportation corridor, which extends from Kapolei in the Ewa District, past Pearl Harbor, Honolulu International Airport, downtown Honolulu, and continues eastward to the University of Hawaii at Manoa. The corridor is approximately 27 miles in length and at most 4 miles in width. The alternatives currently being considered include a No-Build Alternative, Enhanced Bus/Transportation System Management Alternative, a Bus Rapid Transit, and a Light Rail Transit alternative.

The Service has reviewed the information that was provided in your letter and pertinent information in our files, including maps and records prepared by the Hawaii Heritage Program of The Nature Conservancy. The Hawaiian hoary bat (*Lasiurus cinereus semotus*), federally listed as endangered, has been sporadically sighted within the metropolitan area of the proposed project. The following waterbird species, federally listed as endangered, have been observed in wetland areas within the project area:

a. Hawaiian coot (*Fulica americana alai*);
b. Hawaiian duck (*Anas wyvilliana*);
c. Hawaiian common moorhen (*Gallinula chloropus sandvicensis*); and
d. Hawaiian stilt (*Himantopus mexicanus knudseni*).

The following federally endangered plant species have been observed within the Ewa area of the Primary Transportation Corridor (refer to Figure 1.1 of the DEIS Preparation Notice):

a. *Abutilon menziesii* (ko`oloa`ula);
b. *Centaurium sebaeoides* (`awiwi); and
c. *Marsilea villosa* (`ihi`ihi).

In addition, the plant *Torulinium odoratum* subsp. *auriculatum* (pu`uka`a), a Species of Concern, has been reported within the Ewa area of the Primary Transportation Corridor. However, it has not been observed there since 1916. The term "Species of Concern" describes species that are of concern to the Service, but require further biological research and field study to resolve their conservation status. These species are not currently federally protected.

The DEIS should address any potential project-related impacts to these and other native Hawaiian species and propose mitigation measures that avoid unnecessary impacts and minimize unavoidable impacts. For example, we recommend that these measures include avoidance of unnecessary destruction of vegetated areas containing ko`oloa`ula or any other federally listed plant species.

The Service appreciates the opportunity to provide this technical assistance, and we look forward to reviewing a copy of the DEIS when it is available. If you have questions regarding these comments, please contact Fish and Wildlife Biologist Leila Gibson by telephone at (808) 541-3441 or by facsimile transmission at (808) 541-3470.

Sincerely,

Robert P. Smith
Pacific Islands Manager

JOSEPH M. MAGALDI, JR.
DEPUTY DIRECTOR

TPD00-00243

May 4, 2000

Mr. Abraham Wong, Division Administrator
Hawaii Division
Federal Highway Administration
U.S. Department of Transportation
Box 50206
Honolulu, Hawaii 96850

Dear Mr. Wong:

Subject: Primary Corridor Transportation Project

We are writing to request your assistance and formal participation in an important transportation project in the City and County of Honolulu known as the Primary Corridor Transportation Project. We understand that the "Memorandum of Understanding (MOU), National Environmental Policy Act (NEPA) and Clean Water Act Section 404, Integration Process for Surface Transportation Projects in the State of Hawaii" (copy enclosed), looks towards consultation in the project development process.

The Federal Transit Administration and the City and County of Honolulu are currently preparing a NEPA environmental impact statement (EIS) for the subject project. Transportation improvements are being proposed for the primary transportation corridor, which stretches from Kapolei to Kahala. One of the alternatives being considered (Bus Rapid Transit/Sand Island Scenic Parkway (BRT/SISP)) includes an approximately one kilometer (0.6 mile) tunnel under the Fort Armstrong Channel of Honolulu Harbor and improvements to the Kalihi Channel crossing. These actions would require an individual permit from the U.S. Army Corps of Engineers. The NEPA EIS that is being prepared for the subject project proposes increasing bridge capacity across Kalihi Channel. However, the preferred option is a tunnel to replace the Kalihi Channel Bridge, as recommended in the State of Hawaii's long-range harbor master plan. Initial studies of this tunnel are currently being conducted and its impacts will be documented in a separate environmental document by the State of Hawaii Department of Transportation.

As set forth in the MOU, the involvement of the signatory agencies would be limited to issues pertaining to waters of the United States, including wetlands, and associated sensitive species,

including threatened and endangered species, regarding the BRT/SISP Alternative. Although the SISP component would not have any long-term impacts, construction related impacts are anticipated. The impacts to water quality from the dredging of the Fort Armstrong Channel would be similar in many respects to the water quality impacts of normal maintenance dredging in Honolulu Harbor. Widening of the existing Kalihi Channel Bridge and construction of a new bridge would require pile driving and demolition, which may result in increased turbidity. The impacts of the proposed construction in the Fort Armstrong and Kalihi Channels would be mostly indirect and limited to those associated with increased suspended solids and turbidity loads. The project should not impact any sensitive species.

Enclosed are copies of the following components of the Draft EIS that is being prepared:

Chapter 1 Purpose and Need
Chapter 2 Alternatives Considered
Appendix B Conceptual Design Drawings, Bus Rapid Transit
Appendix C Conceptual Design Drawings, Sand Island Scenic Parkway and Marina Road
Appendix D Screening of Alternatives

Your expeditious review of these documents and concurrence on the NEPA purpose and need, Section 404 basic and overall project purpose, criteria for alternative selection and project alternatives to be evaluated in the Draft EIS will be greatly appreciated.

The MOU states that concurrence or non-concurrence must be a written determination that either the information to date is adequate for this stage and the project may proceed to the next stage without modification, that the information to date is not adequate for this stage, or that the potential adverse impacts of the project are severe.

We ask for your attention to this matter to expedite the concurrence process. In order to facilitate your review, Ms. Faith Miyamoto of the Transportation Planning Division will be contacting you to schedule a meeting where we can discuss your input and review.

Should you have any questions regarding this matter, please contact Kenneth Hamayasu at (808) 527-6978.

Sincerely,

Cheryl D. Soon

U.S. Department of Transportation
Box 50206
Honolulu, Hawaii 96850

Dear Mr. Wong:

Subject: Primary Corridor Transportation Project

Thank you for your June 26, 2000 letter regarding participation during the project development process under the "Memorandum of Understanding (MOU), National Environmental Policy Act (NEPA) and Clean Water Act Section 404, Integration Process for Surface Transportation Projects in the State of Hawaii." The Bus Rapid Transit/Sand Island Scenic Parkway (BRT/SISP) Alternative, which included a tunnel under the Fort Armstrong Channel of Honolulu Harbor and improvements to the Kalihi Channel crossing, was the trigger for the MOU coordination. As the agency review of and consultation on the project progressed, it was agreed that the Sand Island Scenic Parkway would best be reviewed in the context of the Oahu Regional Transportation Plan. Therefore, this letter is to inform you that the discussion of Sand Island Scenic Parkway will continue in that arena and that it will be separated from the Primary Corridor Transportation Project Major Investment Study/Draft Environmental Impact Statement (MIS/DEIS).

The time and effort expended to review the project documents are greatly appreciated. The comments and recommendations included in your June 26, 2000 letter to Leslie Rogers, Regional Administrator, Federal Transit Administration have been reviewed. Close coordination will continue to ensure that the comments and concerns that were not addressed by the elimination of the BRT/SISP Alternative are resolved.

Should you have any questions regarding this matter, please contact Kenneth Hamayasu at 527-6978.

Sincerely,

CHERYL D. SOON
Director

Attention: Mr. William Lennan
File No. 990000338

Dear Mr. Young:

Subject: Primary Corridor Transportation Project

In May of this year, your assistance and formal participation was requested in the project development process for the Primary Corridor Transportation Project. This was done pursuant to the "Memorandum of Understanding (MOU), National Environmental Policy Act and Clean Water Act Section 404, Integration Process for Surface Transportation Projects in the State of Hawaii." The Bus Rapid Transit/Sand Island Scenic Parkway (BRT/SISP) Alternative, which included a tunnel under the Fort Armstrong Channel of Honolulu Harbor and improvements to the Kalihi Channel crossing, was the trigger for the MOU coordination. As the agency review of the project progressed, concerns were expressed regarding SISP's role. Therefore, this letter is to inform you that the SISP portion of the subject project will not be pursued at this time. The BRT/SISP Alternative will be deleted from consideration in the Major Investment Study/Draft Environmental Impact Statement that is being prepared.

We thank you for the time and effort expended to review the project documents in a timely manner. Although the decision to defer SISP will annul the MOU process, we will continue to keep you informed about the subject project.

Should you have any questions concerning this matter, please contact Kenneth Hamayasu at 527-6978.

Sincerely,

CHERYL D. SOON
Director

National Marine Fisheries Service
1601 Kapiolani Boulevard, Suite 1110
Honolulu, Hawaii 96814-4700

Dear Mr. Naughton:

Subject: Primary Corridor Transportation Project

We are writing to request your assistance and formal participation in an important transportation project in the City and County of Honolulu known as the Primary Corridor Transportation Project. We understand that the "Memorandum of Understanding (MOU), National Environmental Policy Act (NEPA) and Clean Water Act Section 404, Integration Process for Surface Transportation Projects in the State of Hawaii" (copy enclosed), looks towards consultation in the project development process. Initial discussions regarding this project occurred at an agency coordination meeting held in August 1999.

The Federal Transit Administration and the City and County of Hooolulu are currently preparing a NEPA environmental impact statement (EIS) for the subject project. Transportation improvements are being proposed for the primary transportation corridor, which stretches from Kapolei to Kahala. One of the alternatives being considered (Bus Rapid Transit/Sand Island Scenic Parkway (BRT/SISP)) includes an approximately one kilometer (0.6 mile) tunnel under the Fort Armstrong Channel of Honolulu Harbor and improvements to the Kalihi Channel crossing. These actions would require an individual permit from the U.S. Army Corps of Engineers. The NEPA EIS that is being prepared for the subject project proposes increasing bridge capacity across Kalihi Channel. However, the preferred option is a tunnel to replace the Kalihi Channel Bridge, as recommended in the State of Hawaii's long-range harbor master plan. Initial studies of this tunnel are currently being conducted and its impacts will be documented in a separate environmental document by the State of Hawaii Department of Transportation.

As set forth in the MOU, the involvement of the signatory agencies would be limited to issues pertaining to waters of the United States, including wetlands, and associated sensitive species, including threatened and endangered species, regarding the BRT/SISP Alternative. Although the

SISP component would not have any long-term impacts, construction related impacts are anticipated. The impacts to water quality from the dredging of the Fort Armstrong Channel would be similar in many respects to the water quality impacts of normal maintenance dredging in Honolulu Harbor. Widening of the existing Kalihi Channel Bridge and construction of a new bridge would require pile driving and demolition, which may result in increased turbidity. The impacts of the proposed construction in the Fort Armstrong and Kalihi Channels would be mostly indirect and limited to those associated with increased suspended solids and turbidity loads. The project should not impact any sensitive species.

Enclosed are copies of the following components of the Draft EIS that is being prepared:

Chapter 1 Purpose and Need
Chapter 2 Alternatives Considered
Appendix B Conceptual Design Drawings, Bus Rapid Transit
Appendix C Conceptual Design Drawings, Sand Island Scenic Parkway and Marina Road
Appendix D Screening of Alternatives

Your expeditious review of these documents and concurrence on the NEPA purpose and need, Section 404 basic and overall project purpose, criteria for alternative selection and project alternatives to be evaluated in the Draft EIS will be greatly appreciated.

The MOU states that concurrence or non-concurrence must be a written determination that either the information to date is adequate for this stage and the project may proceed to the next stage without modification, that the information to date is not adequate for this stage, or that the potential adverse impacts of the project are severe.

We ask for your attention to this matter to expedite the concurrence process. In order to facilitate your review, Ms. Faith Miyamoto of the Transportation Planning Division will be contacting you to schedule a meeting where we can discuss your input and review.

Should you have any questions regarding this matter, please contact Kenneth Hamayasu at (808) 527-6978.

Sincerely,

Cheryl D. Soon

Honolulu, Hawaii 96813

Dear Ms. Soon:

The National Marine Fisheries Service (NMFS) has received the information sent by you on the Primary Corridor Transportation Project, City and County of Honolulu, dated May 4, 2000. We have reviewed the components of the Draft EIS for the project under the multi-agency Memorandum of Understanding (MOU), Integration Process for Surface Transportation in the State of Hawaii. We offer the following comments for your consideration concerning the adequacy of the information provided to date.

NMFS believes that the majority of the proposed Primary Corridor Project will have minimal impacts on those resources and habitats for which we have a responsibility. The exception will be the alternative which includes the proposed tunnel under the Fort Armstrong Channel of Honolulu Harbor and the proposed improvements to the Kalihi Channel crossing. However, we have reviewed the information submitted and concur that it is adequate for this early stage of the project. We have no objection with the project proceeding to the next stage, as presented in the compoocnts of the Draft EIS.

We appreciate the opportunity to review the project at this early stage under the MOU. Should you have any questions please contact John Naughton (973-2935x211) of my staff at our Pacific Islands Area Office in Honolulu.

Sincerely,

C. Kamella

Re: Primary Corridor Transportation Project

Dear Ms. Soon:

The U.S. Fish and Wildlife Service (Service) has reviewed the portions of the Draft Environmental Impact Statement (DEIS) sent to us for early participation in the environmental review process of the Primary Corridor Transportation Project. The project sponsors are the Federal Transit Administration and the City and County of Honolulu. A variety of transportation improvements are proposed that would result in a one kilometer long tunnel under the Fort Armstrong Channel of Honolulu Harbor and replacement of the existing Kalihi Channel Bridge with either an enlarged new bridge or a tunnel under the Kalihi Channel.

The Service is a signatory agency to the 1995 Memorandum of Understanding (MOU) that integrates the environmental review process of the National Environmental Policy Act (NEPA) and the Clean Water Act (CWA) section 404 for transportation projects in the State of Hawaii. This MOU provides structured coordination for resources agencies, including the Service, to participate in the project development and review process when aquatic resource impacts may be substantial. The MOU also requires that the Service provide written concurrence or non-concurrence on: NEPA-defined purpose and need, CWA section 404 basic and overall project purpose, criteria for alternative selection, project alternatives to be considered in the draft EIS, and the preferred alternative.

The Bus Rapid Transit/Sand Island Scenic Parkway (BRT/SISP) alternative, which includes a tunnel under the entrance to Honolulu Harbor, will substantially impact aquatic resources; especially during the construction phase of the project. These impacts will require careful review by the Service as specific construction plans are developed, and in coordination with other federal environmental review agencies, such as the National Marine Fisheries Service, U.S.

Environmental Protection Agency, and the U.S. Army Corps of Engineers. Based upon the documents we have reviewed, the Service concurs that the information presented to us is adequate in describing NEPA project purpose and need, CWA section 404 basic and overall purpose, criteria for alternative selection, criteria to be considered in the DEIS, and the preferred alternative.

As described in the MOU, participation by the Service in the coordinated environmental review of this transportation project does not imply endorsement of all aspects of the plan. The Service will work with all federal and state agencies involved to place a high priority on the avoidance of adverse impacts to waters of the US, coral reef ecosystems, associated sensitive species, and threatened and endangered species.

The Service appreciates the opportunity to provide comments on the proposed project. If you have questions regarding these comments, please contact Fish and Wildlife Biologist Gordon Smith at 808/541-3441.

Sincerely,

for Paul Henson

Dear Mr. Farrel:

Subject: Primary Corridor Transportation Project

We are writing to request your assistance and formal participation in an important transportation project in the City and County of Honolulu known as the Primary Corridor Transportation Project. We understand that the "Memorandum of Understanding (MOU), National Environmental Policy Act (NEPA) and Clean Water Act Section 404, Integration Process for Surface Transportation Projects in the State of Hawaii" (copy enclosed), looks towards consultation in the project development process. Initial discussions regarding this project have taken place with Dr. Wendy Wiltse of your Honolulu office.

The Federal Transit Administration and the City and County of Honolulu are currently preparing a NEPA environmental impact statement (EIS) for the subject project. Transportation improvements are being proposed for the primary transportation corridor, which stretches from Kapolei to Kahala. One of the alternatives being considered (Bus Rapid Transit/Sand Island Scenic Parkway (BRT/SISP)) includes an approximately one kilometer (0.6 mile) tunnel under the Fort Armstrong Channel of Honolulu Harbor and improvements to the Kalihi Channel crossing. These actions would require an individual permit from the U.S. Army Corps of Engineers. The NEPA EIS that is being prepared for the subject project proposes increasing bridge capacity across Kalihi Channel. However, the preferred option is a tunnel to replace the Kalihi Channel Bridge, as recommended in the State of Hawaii's long-range harbor master plan. Initial studies of this tunnel are currently being conducted and its impacts will be documented in a separate environmental document by the State of Hawaii Department of Transportation.

As set forth in the MOU, the involvement of the signatory agencies would be limited to issues pertaining to waters of the United States, including wetlands, and associated sensitive species, including threatened and endangered species, regarding the BRT/SISP Alternative. Although the SISP component would not have any long-term impacts, construction related impacts are

anticipated. The impacts to water quality from the dredging of the Fort Armstrong Channel would be similar in many respects to the water quality impacts of normal maintenance dredging in Honolulu Harbor. Widening of the existing Kalihi Channel Bridge and construction of a new bridge would require pile driving and demolition, which may result in increased turbidity. The impacts of the proposed construction in the Fort Armstrong and Kalihi Channels would be mostly indirect and limited to those associated with increased suspended solids and turbidity loads. The project should not impact any sensitive species.

Enclosed are copies of the following components of the Draft EIS that is being prepared:

Chapter 1 Purpose and Need
Chapter 2 Alternatives Considered
Appendix B Conceptual Design Drawings, Bus Rapid Transit
Appendix C Conceptual Design Drawings, Sand Island Scenic Parkway and Marina Road
Appendix D Screening of Alternatives

Your expeditious review of these documents and concurrence on the NEPA purpose and need, Section 404 basic and overall project purpose, criteria for alternative selection and project alternatives to be evaluated in the Draft EIS will be greatly appreciated.

The MOU states that concurrence or non-concurrence must be a written determination that either the information to date is adequate for this stage and the project may proceed to the next stage without modification, that the information to date is not adequate for this stage, or that the potential adverse impacts of the project are severe.

We ask for your attention to this matter to expedite the concurrence process. In order to facilitate your review, Ms. Faith Miyamoto of the Transportation Planning Division will be contacting you to schedule a meeting where we can discuss your input and review.

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
REGION IX
75 Hawthorne Street
San Francisco, CA 94105-3901

June 14, 2000

Cheryl Soon, Director
Department of Transportation Services
City and County of Honolulu
Pacific Park Plaza
711 Kapiolani Boulevard, Suite 1200
Honolulu, HI 96813

Dear Ms. Soon:

The Environmental Protection Agency (EPA) has reviewed the City and County of Honolulu's Purpose & Need statement, Range of Alternatives, and associated materials for the **Primary Corridor Transportation Project**. Our review is pursuant to the Memorandum of Understanding (MOU), National Environmental Policy Act (NEPA) and Clean Water Act Section 404, Integration Process for Surface Transportation Projects in the State of Hawaii. Wendy Wiltse of our Honolulu office has also participated in this review.

Chapter 1: Purpose & Need and *Chapter 2: Alternatives Considered* do an excellent job of explaining the extensive public participation process that has contributed to this project. In addition, we are particularly pleased with the goals of the *Islandwide Mobility Concept Plan*, which focuses on improved transit, strengthened connections between communities, and fostering livable communities. It appears that this project will provide significant long-term benefits to both the residents of and visitors to Oahu.

While we support the purpose and need of this project in concept, we have significant concerns about the details of both the Purpose & Need statement and the Range of Alternatives. For this reason, the intent of this letter is to state our **non-concurrence** on both the Purpose & Need statement and the Range of Alternatives. We would be pleased to work with you to resolve these issues. Our concerns and recommendations are stated below:

Purpose & Need Statement #5: "Improve access to Sand Island and to the Koko Head end of the PUC, including Waikiki." This statement is very broad and includes five "sub-objectives": 1) improve access to Sand Island to increase the efficiency of the movement of goods, 2) open up the use of Sand Island's recreational resources, 3) rejuvenate the urban waterfront of Sand Island, 4) improve the entryway and access to and from Waikiki along a scenic coastal route, and 5) provide a Downtown bypass for those travelers who travel between Keehi Interchange and Kakaako/Waikiki.

We have two main concerns. First, this Purpose & Need statement is far too broad, and second, only the Bus Rapid Transit/Sand Island Scenic Parkway (BRT/SISP) Alternative fully meets the five "sub-objectives" laid out in the Purpose & Need statement #5. Neither of the other alternatives fully meet the purposes of Purpose & Need statement #5. The Transportation System Management (TSM) Alternative does not address any of the issues laid out in Purpose & Need statement #5, and the Bus Rapid Transit (BRT) Alternative only partially fulfills the "sub-objectives" laid out in Purpose & Need statement #5.

Recommendation: Re-draft a more concise Purpose & Need statement #5 that focuses on supportable community needs, which are clearly laid out in the "Need" section of the Purpose & Need statement.

Range of Alternatives: The BRT/SISP Alternative is the only alternative that currently meets all of the Purpose & Need statements. Our concern is that the range of alternatives is much too narrow. In addition, the BRT/SISP Alternative includes a major highway component, which could have significant environmental impacts as a result of creek crossings, proximity to fragile, coastal ecosystems, road runoff, beach erosion, etc.

Recommendation: Once the Purpose & Need statement is re-drafted, re-visit each alternative to ensure that they all meet Purpose & Need. In addition, any significant highway component under consideration should analyze the potential environmental impacts, and an appropriate number of alternatives should be developed accordingly.

Bus Priority/Express Improvements: The TSM Alternative, BRT Alternative, and BRT/SISP Alternative all call for bus priority/express improvements. Our concern is that these improvements may impact curbside parking.

Recommendation: Address the impacts to parking, including a demonstration of how the park and ride stations will accommodate both lost curbside parking spaces, as well as increased park and ride demand.

Transit Technology for the In-Town BRT System: Embedded plate technology is being considered for the In-Town BRT system. Our concern is for the environmental consequences of the additional electricity demanded by this system.

Recommendation: Describe the source of electricity for the embedded plate technology system, and discuss any environmental impacts that may be associated with the generation of the additional electricity needed to operate the embedded plate system.

BRT/SISP Induced Demand: The BRT/SISP Alternative will increase road capacity relative to the BRT Alternative, reducing the level of BRT service needed. Our concern is that the BRT/SISP Alternative will result in more cars entering Kakaako at Ala Moana and South Street, as well as Waikiki.

Recommendation: Analyze the ability of Ala Moana Blvd. to handle increased traffic between South Street and Waikiki, especially with the BRT in operation.

BRT/SISP Lane Numbers & Traffic Flow: The BRT/SISP Alternative calls for a four lane tunnel under the Fort Armstrong Channel and an eight lane bridge over the Kalihi Channel. Hawaii Department of Transportation (HDOT) and the Corps of Engineers (COE) are currently working on initial studies of the development of a tunnel under Kalihi Channel. Our concern is that the BRT/SISP Alternative does not specify the number of lanes contemplated by HDOT and COE for the Kalihi tunnel.

Recommendation: Clarify the number of lanes planned by HDOT and COE for the Kalihi tunnel to demonstrate the compatibility of the BRT/SISP Alternative and the HDOT/COE Kalihi tunnel project.

Thank you for this opportunity to comment. Again, we are happy to work with you to modify the Purpose & Need statement and Range of Alternatives so that EPA can concur on this stage of the project. Please have your staff contact Nova Blazej, our principal reviewer on this project, should you have any questions concerning our comments or recommendations. Nova can be reached at 415-744-2089 or *blazej.nova@epa.gov*.

Dear Mr. Farrel:

Subject: Primary Corridor Transportation Project

Thank you for your June 14, 2000 letter that provided comments on the Purpose and Need statement, Range of Alternatives, and associated materials for the subject project. This was done pursuant to the "Memorandum of Understanding (MOU), National Environmental Policy Act (NEPA) and Clean Water Act Section 404, Integration Process for Surface Transportation Projects in the State of Hawaii." The Bus Rapid Transit/Sand Island Scenic Parkway (BRT/SISP) Alternative, which included a tunnel under the Fort Armstrong Channel of Honolulu Harbor and improvements to the Kalihi Channel crossing, was the trigger for the MOU coordination. As the agency review of and consultation on the project progressed, it was agreed that the Sand Island Scenic Parkway would best be reviewed in the context of the Oahu Regional Transportation Plan. Therefore, this letter is to inform you that the discussion of Sand Island Scenic Parkway will continue in that arena and that it will be separated from the Primary Corridor Transportation Project Major Investment Study/Draft Environmental Impact Statement (MIS/DEIS).

The time and effort expended to review the project documents in a timely manner are greatly appreciated. In order to bring closure to the MOU process, the following responses to your comments are provided:

Purpose and Need Statement #5 - As a result of the decision to separate Sand Island Scenic Parkway from the MIS/DEIS for the subject project, this statement has been eliminated.

Range of Alternatives - The BRT/SISP Alternative is no longer being considered in the MIS/DEIS. Chapter 2 of the MIS/DEIS includes a description of the alternatives evaluated and a discussion of the alternatives that were considered and eliminated.

Bus Priority/Express Improvements - The parking impacts are discussed in Section 4.3 of the MIS/DEIS.

Transit Technology for the In-Town BRT System - The additional electricity demanded by the embedded plate technology is discussed in Section 5.9 of the MIS/DEIS.

BRT/SISP Induced Demand - The BRT/SISP Alternative is no longer being considered in the MIS/DEIS.

BRT/SISP Lane Numbers and Traffic Flow - The BRT/SISP Alternative is no longer being considered in the MIS/DEIS.

A copy of the MIS/DEIS will be transmitted for your review.

Should you have any questions regarding this matter, please contact Kenneth Hamayasu at (808) 527-6978.

Honolulu, Hawaii 96813

Dear Mr. Hayashida:

Subject: Primary Corridor Transportation Project

We are writing to request your assistance and formal participation in an important transportation project in the City and County of Honolulu known as the Primary Corridor Transportation Project. We understand that the "Memorandum of Understanding (MOU), National Environmental Policy Act (NEPA) and Clean Water Act Section 404, Integration Process for Surface Transportation Projects in the State of Hawaii" (copy enclosed), looks towards consultation in the project development process.

The Federal Transit Administration and the City and County of Honolulu are currently preparing a NEPA environmental impact statement (EIS) for the subject project. Transportation improvements are being proposed for the primary transportation corridor, which stretches from Kapolei to Kahala. One of the alternatives being considered (Bus Rapid Transit/Sand Island Scenic Parkway (BRT/SISP)) includes an approximately one kilometer (0.6 mile) tunnel under the Fort Armstrong Channel of Honolulu Harbor and improvements to the Kalihi Channel crossing. These actions would require an individual permit from the U.S. Army Corps of Engineers. The NEPA EIS that is being prepared for the subject project proposes increasing bridge capacity across Kalihi Channel. However, the preferred option is a tunnel to replace the Kalihi Channel Bridge, as recommended in the State of Hawaii's long-range harbor master plan. Initial studies of this tunnel are currently being conducted and its impacts will be documented in a separate environmental document by the State of Hawaii Department of Transportation.

As set forth in the MOU, the involvement of the signatory agencies would be limited to issues pertaining to waters of the United States, including wetlands, and associated sensitive species, including threatened and endangered species, regarding the BRT/SISP Alternative. Although the

SISP component would not have any long-term impacts, construction related impacts are anticipated. The impacts to water quality from the dredging of the Fort Armstrong Channel would be similar in many respects to the water quality impacts of normal maintenance dredging in Honolulu Harbor. Widening of the existing Kalihi Channel Bridge and construction of a new bridge would require pile driving and demolition, which may result in increased turbidity. The impacts of the proposed construction in the Fort Armstrong and Kalihi Channels would be mostly indirect and limited to those associated with increased suspended solids and turbidity loads. The project should not impact any sensitive species.

Enclosed are copies of the following components of the Draft EIS that is being prepared:

Chapter 1 Purpose and Need
Chapter 2 Alternatives Considered
Appendix B Conceptual Design Drawings, Bus Rapid Transit
Appendix C Conceptual Design Drawings, Sand Island Scenic Parkway and Marina Road
Appendix D Screening of Alternatives

Your expeditious review of these documents and concurrence on the NEPA purpose and need, Section 404 basic and overall project purpose, criteria for alternative selection and project alternatives to be evaluated in the Draft EIS will be greatly appreciated.

The MOU states that concurrence or non-concurrence must be a written determination that either the information to date is adequate for this stage and the project may proceed to the next stage without modification, that the information to date is not adequate for this stage, or that the potential adverse impacts of the project are severe.

We ask for your attention to this matter to expedite the concurrence process. In order to facilitate your review, Ms. Faith Miyamoto of the Transportation Planning Division will be contacting you to schedule a meeting where we can discuss your input and review.

Should you have any questions regarding this matter, please contact Kenneth Hamayasu at (808) 527-6978.

Sincerely,

Cheryl D. Soon

Ms. Cheryl Soon
Director
Department of Transportation Services
City and County of Honolulu
Pacific Park Plaza, Suite 1200
711 Kapiolani Boulevard
Honolulu, Hawaii 96813

Dear Ms. Soon:

Subject: Primary Corridor Transportation Project

Thank you for your letter of May 4, 2000, requesting our participation as a consulting agency under the "Memorandum of Understanding (MOU). National Environmental Policy Act (NEPA) and Clean Water Act Section 404 Integration Process for Surface Transportation Projects in the State of Hawaii."

We are pleased with the City's initiative in developing an islandwide mobility concept. However, we cannot concur at this stage because we believe that there are other transportation alternatives and needs which should be considered.

Some of our specific concerns include:

1. Purpose No. 5, regarding improved access to Sand Island is inconsistent with the other purposes as it relates to the performance of the proposed alternatives. Only one alternative, the BRT/SISP, seems to fully satisfy this purpose; and thus, the project presentations are biased toward that alternative.

2. We have serious concerns with the BRT/SISP alternative. These would include the right-of-way requirements and its impact on the planned surface facilities for our harbor operations; potential conflicts of the landside access to Fort Armstrong with our passenger and cargo movements in the Pier 1 and 2 areas; and the loss of lands and the loss of best use revenues which could be generated through the development of these lands (e.g., KIPA, Kapalama storage areas, Keehi Industrial Lots project).

3. The goals and objectives of our 2020 Commercial Harbor Plan, which addresses the efficient movement of goods and freight in the area, should be recognized. Aside from accommodating the stakeholders' needs, the harbor plans address safety concerns, and call for the separation of cargo and cruise ship movements. We do not want to compromise our harbor requirements.

4. There would be a significant impact of the Project's funding requirements on the rest of the transportation program. Also, it would appear that the requirements are understated in that it assumes certain improvements to be part of the state's program. HDOT has not committed to implement or fund any proposal or component at this time.

5. The impact of the reduction of lanes on Nimitz Highway/Ala Moana Boulevard, and the reduced capacity on other highway facilities have not been adequately addressed.

6. The purpose is too narrow, pre-empting the consideration of even those roadway improvements which have been identified in the Oahu Regional Transportation Plan (e.g., Nimitz Viaduct project).

We strongly recommend that joint meetings with all affected agencies be held to facilitate coordination. We are aware that there have been briefings held on the various components of the project, but an overview of all the impacts and concerns related to the entire project would be most helpful. We look forward to working with you to resolve these issues so that we can concur on this stage of the project.

Very truly yours,

Kazu Hayashida

Dear Mr. Hayashida:

Subject: Primary Corridor Transportation Project

Thank you for your June 22, 2000 letter regarding participation during the project development process under the "Memorandum of Understanding (MOU), National Environmental Policy Act (NEPA) and Clean Water Act Section 404, Integration Process for Surface Transportation Projects in the State of Hawaii." The Bus Rapid Transit/Sand Island Scenic Parkway (BRT/SISP) Alternative, which included a tunnel under the Fort Armstrong Channel of Honolulu Harbor and improvements to the Kalihi Channel crossing, was the trigger for the MOU coordination. As the agency review of and consultation on the project progressed, it was agreed that the Sand Island Scenic Parkway would best be reviewed in the context of the Oahu Regional Transportation Plan. Therefore, this letter is to inform you that the discussion of Sand Island Scenic Parkway will continue in that arena and that it will be separated from the Primary Corridor Transportation Project Major Investment Study/Draft Environmental Impact Statement (MIS/DEIS).

The time and effort expended to review the project documents are greatly appreciated. Close coordination will continue to ensure that the comments and concerns that were not addressed by the elimination of the BRT/SISP Alternative are resolved.

Should you have any questions regarding this matter, please contact Kenneth Hamayasu at 527-6978.

Sincerely,

CHERYL D. SOON

Mr. Gary Munsterman
Western Region
National Park Service
U. S. Department of Interior
600 Harrison Street, Suite 600
San Francisco, California 94107-1372

Dear Mr. Munsterman:

Subject: Primary Corridor Transportation Project

In its May 25, 2000 letter, the Federal Transit Administration (FTA) initiated coordination with the National Park Service regarding the subject project. The focus of the letter was the possible project impact on Sand Island State Recreation Area, a Section 6(f) property. Sand Island State Recreation Area would be impacted only if the Bus Rapid Transit/Sand Island Scenic Parkway Alternative is implemented. Subsequent to lhe May 25, 2000 FTA letter, continued agency review of and consultation on the project progressed, resulting in agreement that Sand Island Scenic Parkway would best be reviewed in the context of the Oahu Regional Transportation Plan. Therefore, this letter is to inform you that the discussion of Sand Island Scenic Parkway will continue in that arena and that it will be separated from the Primary Corridor Transportation Project Major Investment Study/Draft Environmental Impact Statement (MIS/DEIS). This action will eliminate the need to discuss the project impact on Sand Island State Recreation Area.

The only other Section 6(f) property that would be affected by the subject project is Aloha Stadium. Both of the build alternatives evaluated in the MIS/DEIS include a park-and-ride lot at the site of the overflow parking lot. Presently, the existing overflow parking lot has space for about 1,000 cars. It is estimated that up to 500 spaces would be needed to service existing and potential transit patrons in the Pearl City to Foster Village region. The improved transit service that would be provided by both build alternatives would, in turn, improve transit access to the Stadium.

In terms of the possible impact of the proposed park-and-ride facility, the Aloha Stadium overflow parking lot would function both as a park-and-ride lot for the proposed transit system and as an overflow lot for Stadium activities. Because the times of use would be different for transit commuters and stadium patrons, both of these uses could be accommodated with little overlap. Continued coordination will be necessary to ensure that parking in the lot is available to Stadium patrons on those occasions when the Stadium activities overlap with the park-and-ride hours.

The Aloha Stadium property, which is a portion of the former Halawa/Aiea Veterans Housing Area, G.S.A. No. N-Haw-495A, was originally owned by the Department of the Interior and was transferred to the City and County of Honolulu with a reversionary clause that in the event of any breach of certain use conditions or covenants stated in the Quitclaim Deed dated June 30, 1967, the property would revert to the United States. Subsequently and with the approval of the Department of the Interior, the property was transferred on October 27, 1970 to the State of Hawaii with similar use provisions.

We are, therefore, requesting your concurrence that the use being proposed is consistent with the provision under which this property was acquired from the Federal government. Previously, by letter dated July 15, 1992, the National Park Service found that a similar proposed use (transit station, aerial guideway structure and park-and-ride facility) at the same location would be compatible with the terms of the transfer. We are hoping for a favorable response to the current request. Your immediate attention to this matter would be greatly appreciated.

Should you have any questions regarding this matter, please contact Kenneth Hamayasu at (808) 527-6978.

Sincerely,

Cheryl D. Soon

Mr. Dean Y. Uchida, Administrator
Land Division
Department of Land and Natural Resources
State of Hawaii
P.O. Box 621
Honolulu, Hawaii 96809

Dear Mr. Uchida:

Subject: Primary Corridor Transportation Project

As part of the subject project, the City and County of Honolulu Department of Transportation Services is studying the possibility of constructing a downtown bypass road on Sand Island, which would include a tunnel beneath the Fort Armstrong Entrance Channel to Honolulu Harbor. Members of your staff have attended meetings at which preliminary plans were presented. At one meeting, it was suggested that a boundary interpretation be requested to determine the potential involvement of conservation lands.

Enclosed is a map showing the proposed bypass road and tunnel. Although the precise roadway alignment has not yet been selected, all of the options include a tunnel beneath the Fort Armstrong Channel. Most of the options also involve an easement or other conveyance along the portion of the alignment that would extend through Sand Island State Recreation Area, with restoration of the park after completion of tunnel construction.

We therefore formally request a determination of the possible involvement of the project with conservation lands, and the need for a Conservation District Use Application.

Please call Faith Miyamoto of the Transportation Planning Division at 527-6976 with any questions. We look forward to working together on this project.

Sincerely,

Cheryl D. Soon

The Honorable Cheryl D. Soon, Director
Department of Transportation Services
City and County of Honolulu
Pacific Park Plaza
711 Kapiolani Blvd., Suite 1200
Honolulu, Hawaii 96813

Dear Ms. Soon:

Subject: Primary Corridor Transportation Project

Thank you for your September 28, 1999 letter regarding the need for a Conservation District Use Application. It is our understanding that the proposed bypass road would extend under the Fort Armstrong Channel. Construction methods would involve excavation of the seabed and placement of reinforced concrete tunnel segments followed by backfilling. Since this project would cause substantial disturbance of the seabed, it meets the definition of land use under Title 13-5, Hawaii Administrative Rules. Therefore, a Conservation District Use Application would be required.

Please feel free to call Sam Lemmo of the Planning Branch at 587-0381, should you have any questions on this matter.

Aloha,

Dean Y. Uchida, Administrator
Land Division

EXHIBIT A-4. AGENCY COORDINATION UP TO SDEIS

This exhibit contains a record of agency correspondence and consultation regarding the Refined BRT Alternative. A summary of the correspondence and consultation activities is provided below. Copies of these documents are also provided in this exhibit.

SECTION 106 OF THE NATIONAL HISTORIC PRESERVATION ACT

Minutes of the September 13, 2001 meeting with the State Historic Preservation Division regarding the SDEIS, archaeology, and historic properties

Minutes of January 22, 2002 meeting with the State Historic Preservation Division regarding the archaeological survey

SAFE DRINKING WATER ACT

February 25, 2002 letter from DTS to U.S. Environmental Protection Agency requesting Section 1424(e) review of the Ground Water Impact Assessment for the Southern Oahu Basal Aquifer (SOBA) Sole Source Aquifer.

OTHER CORRESPONDENCE

Minutes of April 26, 2001 meeting with State of Hawaii Office of Hawaiian Affairs and Office of Environmental Quality Control regarding compliance with Act 50

August 2, 2001 meeting with State of Hawaii Office of Environmental Quality Control regarding the SDEISPN preparation. No minutes were prepared for this meeting.

Minutes of August 22, 2001 meeting with the Hawaii Department of Transportation regarding the Middle Street Transit Center ramp

Minutes of October 1, 2001 meeting with the U.S. Navy regarding the Luapele Drive ramp

Minutes of October 10, 2001 meeting with the Hawaii Department of Transportation regarding Middle Street ramp

Minutes of October 12, 2001 meeting with the U.S. Navy regarding the project, with emphasis on the Luapele Drive ramp access and impact of the Kamehameha Highway contra-flow lane on the Ford Island access

October 24, 2001 Hawaii Department of Transportation letter responding to the SDEISPN

November 6, 2001 U.S. Fish and Wildlife Service letter responding to the SDEIS NOI

Minutes of February 11, 2002 meeting with State of Hawaii Office of Environmental Quality Control regarding the SDEIS/FEIS process issues related to appendices and responses to comments

March 16, 2001 Hawaii Department of Transportation memo to the OMPO Policy Committee regarding the Oahu Regional Transportation Plan

PRIMARY CORRIDOR TRANSPORTATION PROJECT
STATE HISTORIC PRESERVATION DIVISION (SHPD) MEETING
THURSDAY, SEPTEMBER 13, 2001
9:00 A.M.
SHPD CONFERENCE ROOM

Attendees: Elaine "Muffet" Jourdane, SHPD Archaeologist
Sara L. Collins, SHPD Archaeologist
Tonia Moy, SHPD
Faith Miyamoto, Department of Transportation Services
Ann Koby, Parsons Brinckerhoff

Purpose: Discuss the potential bus rapid transit (BRT) archaeological component.

Summary: Faith Miyamoto gave a brief overview of the BRT project and the project refinements since the Major Investment Study/Draft Environmental Impact Statement (MIS/DEIS) was published and the SHPD reviewed the MIS/DEIS and submitted comments. The project refinements are:

- Kamehameha Drive-In is no longer being considered as a transit center site. The Aloha Stadium/Luapele Ramp has replaced the ramp from the Kamehameha Drive-In site (Kaonohi ramp).
- The BRT alignment will now use Pensacola Street instead of Ward Avenue between S. King Street and Kapiolani Blvd.
- A new BRT alignment is being included. It is the Kakaako makai alignment operating from the Iwilei Transit Center on Iwilei Road, continuing on S. King Street, Hotel Street Transit Mall, Bishop Street, Richards Street, Aloha Tower Drive, Ala Moana Boulevard, Channel Street, Illalo Street, and Ward Avenue before connecting with the Waikiki alignment.

Ms. Miyamoto passed out the Regional and In-Town BRT alignment maps, including the Kakaako makai alignment map.

The SHPD personnel advised the following:

1. The potential underground sites should be "scoped out." The "old shoreline" should be used as a guideline as to where potential archaeological sites may occur. Typically, archaeological sites are more prevalent in the vicinity of fishponds and the late 19th Century Oahu coastline.
2. The area makai of Ala Moana Blvd. is typically a "high sensitivity area" where archaeological sites are encountered.
3. If fishponds are involved, core samples will need to be taken.

4. Recommend a two-step archaeological process: (a) collect data using secondary sources and field review (b) once this data is compiled, then the SHPD should be contacted regarding the next appropriate action.
5. A burial treatment plan will be required.
6. If the project is in a "high" sensitivity area in Waikiki, then the family group with ancestors buried in the area will need to be contacted. Michelle Bradley or –Van Diamond, SHPD, can set-up the meeting.
7. If the lava rock curbs are disturbed, then will need to be replaced.
8. If the project is taking land from Fort DeRussy, it is a "double" Section 106 because NAGPRA is invoked.
9. Recommend not widening on the makai side of Kalia Road in the Hale Koa vicinity because 40 graves were exhumed in this area and they had to be reinterred.
10. It is believed that the Ala Moana Regional Park wall was constructed in the 1930's.

The SHPD staff loaned Parsons Brinckerhoff a map of Oahu's sensitive archaeological areas to have reproduced and returned. They also gave Faith Miyamoto and Ann Koby a list of potential archaeological survey contractors.

The SHPD staff agreed to review the archaeological scope of work prior to it being sent to potential archaeological survey contractors.

AR00016388

PRIMARY CORRIDOR TRANSPORTATION PROJECT
State Historic Preservation Division (SHPD) Meeting
Tuesday, January 22, 2002

Attendees: Elaine "Muffet" Jourdane, SHPD Archaeologist
Sara L. Collins, SHPD Archaeologist
Faith Miyamoto, Department of Transportation Services (DTS)
Ann Koby, Parsons Brinckerhoff
Bob Spear, SCS
Bert Davis, SCS
Leann McGerty, SCS

Purpose: Discuss the PRIMCOR archaeological survey progress, report format, and SHPD guidance on interviews.

Summary: Bert Davis gave a brief review of what SCS has accomplished to date regarding the archaeological survey. The SHPD personnel were advised of the following:

- The Kapolei project components will not result in any archaeological effects.
- There appears to be nothing significant at the Aloha Stadium, but need to review the fire maps. The area was naval housing closer to the stadium, but there is a fishpond plus Halawa Stream in the vicinity.
- The Middle Street area contained over two dozen fishponds and a leprosarium. There are several named historic house sites in the area.
- Iwilei area appears to be fill over the Kuwili fishpond.
- The Waikiki area is of primary concern because project involves widening along Kalia Road, where archaeological resources are known to exist.

SHPD personnel responded positively to the above discussion and the report format, which Bert shared with them.

Leann McGerty requested guidance regarding who the SHPD personnel would like interviewed in conjunction with the archaeological survey. It was noted that extensive interviews were conducted as part of the Act 50 analysis. The SHPD felt that those interviews would probably be sufficient, but felt that the project team should coordinate with the Burial Council and possibly the Waikiki families.

The SHPD personnel also advised that they were not the entity responsible for Act 50 compliance. The OEQC was responsible.

The SHPD would review and comment on the Act 50 report, but only if requested to do so in writing. Also, it would not be a priority to complete such a request, since Act 50 compliance is not in their purview.

The SHPD reminded the project team that consultation should occur with the Office of Hawaiian Affairs and Hui Malama I Na Kupuna O Hawaii Nei. It was also suggested that the Historic Hawaii Foundation be consulted.

AR00016389

April 27, 2001

To: Pua Aiu, Office of Hawaiian Affairs
Wayne Kawamura, Office of Hawaiian Affairs
Nancy Heinrich, Office of Environmental Quality Control

Re: Act 50 and the Primary Corridor Transportation Project (PRIMCOR)

Mahalo for taking the time yesterday to consult with Faith Miyamoto (City Department of Transportation Services), Ann Koby (PB Consulting) and me on the proposed process to implement a cultural practices assessment for PRIMCOR.

As discussed, we plan to proceed in a three-step process. First, a panel of experts/scholars will be convened to develop a working definition of "cultural practice", and develop criteria that will establish the affected "study area". Second, individuals knowledgeable about cultural practices within geographic areas, ethnicities, and/or cultural categories will be brought together to talk story and describe cultural practices in the study area. Third, practices potentially "adversely affected" would be identified and measures developed to lessen any adverse impacts.

On OHA's part, you emphasized areas that may be built out, such as substations, access ramps, and street widening. OHA is particularly concerned about potentially sensitive areas that may contain burials, mentioning Waikiki, Pearl Harbor, and the Kakaako area near Queen Street and Pohukaina Street.

In our discussion of what might constitute a cultural practice, Nancy suggested that the emphasis be placed on traditional cultural practices that arise from traditional cultures; i.e., the anthropological view rather than the sociological view. While we understand that the legal definition in Act 50 is not conclusive, we appreciate this guidance in proceeding with this assessment.

Nancy requested that an effort be made to include small cultural groups that may not be as outspoken about the protection of their practices; Laotians and Vietnamese, for example. OHA emphasized the need to be as broad-based as possible in our consultation.

Are there are any other issues that you would like us to be aware of as we begin this process? In particular, please let us know as soon as possible if there are any people and/or groups that we should consider in comprising the panel of experts, as well as people that would be good resources on the cultural practices along the urban corridor.

We will, of course, keep you advised as we proceed. Mahalo again for your time and consideration.

PRIMARY CORRIDOR TRANSPORTATION PROJECT
HAWAII DEPARTMENT OF TRANSPORTATION (HDOT) MEETING
WEDNESDAY, AUGUST 22, 2001
1:30 P.M.
HDOT 5TH FLOOR CONFERENCE ROOM

Attendees: Brian Minaai, HDOT
Toru Hamayasu, Department of Transportation Services (DTS)
Norman Kawachika, DTS
Bob Bramen, PB Consult
Clyde Shimizu, PBQD
Greg Hiyakumoto, RM Towill
Warren Sato, SSFM

Purpose: Discuss ramp to the Middle Street Transit Center

Summary: HDOT expressed the following concerns:

- Ramp exiting on left-hand side
- Did not like freeway ramp going directly into a facility
- Poor soil conditions in area of proposed ramp
- Potential queuing back onto ramp if robotic parking facility cannot process arriving autos quickly enough
- Middle Street driveways for buses and autos too close to one another

PRIMARY CORRIDOR TRANSPORTATION PROJECT
US NAVY MEETING
MONDAY, OCTOBER 1, 2001
9:30 A.M.
NAVY PUBLIC WORKS CENTER CONFERENCE ROOM

Attendees: Art Antolin, PACDIV PLN 215
Connie Chang, PACDIV PLN 23
Lansing Sugita, PWF 400 – Engineering
Melvin Kaku, PACDIV PLN 23
Faith Miyamoto, Department of Transportation Services (DTS)
Ann Koby, Parsons Brinckerhoff
Lydia Yee, RM Towill
Greg Hiyakumoto, RM Towill

Purpose: Discuss the bus rapid transit (BRT) project, including the Luapele ramp and Aloha Stadium overflow parking facility.

Summary: Faith Miyamoto gave a brief overview of the BRT project as presented in the Major Investment Study/Draft Environmental Impact Statement (MIS/DEIS). She explained that the Regional BRT component includes express bus service, extending the AM zipper lane, a PM zipper lane, transit centers and access ramps. Ms. Miyamoto briefly presented the In-Town BRT alignments to Waikiki and the University of Hawaii – Manoa. Ms. Miyamoto then explained that since the MIS/DEIS was released for review and comment, the DTS formulated working groups in several of the areas along the alignments. She explained that the Navy – Lansing Sugita – participated in the Pearl City/Aiea Working Group. The working groups resulted in several project refinements, as follows:

- Kamehameha Drive-In is no longer being considered as a transit center site. The Aloha Stadium/Luapele Ramp has replaced the ramp from the Kamehameha Drive-In site (Kaonohi Ramp).
- The BRT alignment will now use Pensacola Street instead of Ward Avenue between S. King Street and Kapiolani Blvd.
- A new BRT alignment is being included. It is the Kakaako makai alignment operating from the Iwilei Transit Center on Iwilei Road, continuing on S. King Street, Hotel Street Transit Mall, Bishop Street, Richards Street, Aloha Tower Drive, Ala Moana Boulevard, Channel Street, Ilalo Street, and Ward Avenue before connecting with the Waikiki alignment.

Ms. Miyamoto passed out the Regional and In-Town BRT alignment maps, including the Kakaako makai alignment map. She explained that a Supplemental Draft Environmental Impact

Statement (SDEIS) was being prepared and gave the Navy personnel copies of the SDEIS Environmental Impact Statement Preparation Notice (EISPN), published in the August 23, 2001 The Environmental Notice and a copy of the Notice of Intent (NOI) published in the September 26, 2001 Federal Register. One of the Navy personnel asked if the DTS had received any response on the EISPN from the neighborhood. Ms. Miyamoto replied that they had not.

Greg Hiyakumoto then presented the proposed Luapele ramp design. He explained that the ramp would be a single lane, reversible ramp that would feed the buses into the H-1 median.

The Navy personnel had following comments:

1. The Navy intends to deed Luapele Road to either the State or City.
2. The queue at the gates is relatively short and since there are lots of people trying to access the base during peak hours this results in long traffic queues.
3. The queue at St. Elizabeth School is ten cars and that is not long enough and this results in traffic problems.
4. The traffic queues at the gates are worse since the September 11, 2001 terrorist attacks because security has been heightened. The Navy personnel believe that the heightened security will be in place for an indefinite time period and should be considered in the traffic analysis.
5. The Luapele gate is open from 5-8 a.m. and 3-6 p.m. and traffic queues onto Salt Lake Blvd.
6. Navy personnel wanted to know how the buses are going to integrate/affect Navy traffic.
7. Are any other alternatives being considered for the Luapele ramp? Faith Miyamoto explained that during the Pearl City/Aiea Working Group meetings several options were analyzed and Luapele was the preferred site.
8. The DTS should contact the area residents regarding the proposed Luapele ramp/BRT project.
9. There is Navy housing in the area where numerous admirals and other high-ranking Navy personnel live and they can be very vocal.
10. How recent are the traffic counts? If the traffic analysis uses traffic counts taken before September 11, 2001, the information will not be valid as the traffic patterns have changed.
11. City Councilmember Gary Okino has sent the Navy a letter regarding his concerns that the proposed Ford Island Development would have an adverse effect on the BRT

AR00016391

project and the bus priority lanes proposed on Kamehameha Highway. Councilmember Okino recently presented his objections at a neighborhood board meeting. The Navy personnel indicated that a BRT alignment on Kamehameha Highway was news to them. They also indicated that the Hawaii Department of Transportation indicated their concern regarding through traffic on Kamehameha Highway with BRT.

12. The Navy personnel advised that they have met with Wayne Yoshioka and Cheryl Yoshida, Parsons Brinckerhoff, regarding traffic movements at intersections near Pearl Harbor.
13. There is a proposed Veteran's Center on Kamehameha Highway.
14. The Navy's tunnel is active. Ideally the Luapele ramp should be designed to go over the tunnel. The tunnel is very old and carries fuel from Red Hill to the Navy yards. The tunnel goes under the Navy's main buildings.
15. Connie Chang will be reviewing the BRT environmental documents for NEPA compliance.
16. The Navy needs to determine whether or not they want to be a co-lead on the EIS.
17. Stanford Yuen at the Navy is the intergovernmental liaison.
18. Commander Summer is responsible for environmental issues.

Since traffic is one of the Navy's concerns, it was agreed that once the traffic analysis for the Luapele ramp area was completed an additional meeting would be scheduled to review the analysis.

PRIMARY CORRIDOR TRANSPORTATION PROJECT
HAWAII DEPARTMENT OF TRANSPORTATION (HDOT) MEETING
WEDNESDAY, OCTOBER 10, 2001
9:00 P.M.
HDOT 5TH FLOOR CONFERENCE ROOM

Attendees: Brian Minaai, HDOT
Glenn Yasui, HDOT
Toru Hamayasu, Department of Transportation Services (DTS)
Norman Kawachika, DTS

Purpose: Discuss alternative to proposed Middle Street ramp

Summary: BRT project team presented an alternative to the proposed Middle Street ramp. This alternative was proposed by HDOT during a previous meeting to mitigate some of HDOT's concerns, such as the left-hand exit and the need for a major flyover structure. Some design concerns associated with the ramp, such as requiring buses to weave across three highly congested lanes to exit and sight distance restrictions, were discussed and G. Yasui stated that he would review the design in detail.

B. Minaai expressed his support for the proposed transit improvements, but cautioned that the project should not impact capacity on State facilities.

The revised Kakaako alignment was also discussed in detail. HDOT expressed concern about BRT vehicles blocking Nimitz Highway after leaving Aloha Tower Marketplace to go mauka on Alakea Street. G. Yasui was also concerned about the reduction of intersection capacity, if signal preference was given to transit. B. Minaai mentioned the future State plans, but did not elaborate. The Kakaako Makai alignment needs to be further coordinated with the HDOT-Harbors Division regarding the Channel Street land acquisition.

AR00016392

PRIMARY CORRIDOR TRANSPORTATION PROJECT
U.S. NAVY MEETING
FRIDAY, OCTOBER 12, 2001
2:30 P.M.
NAVY PUBLIC WORKS CENTER CONFERENCE ROOM

Attendees: Captain Jennifer Mustain, Commanding Officer, Navy PWC and Facilities Engineer for Commander Navy Region Hawaii
Becky Hommon, Navy Region Hawaii Counsel
Melvin Kaku, PACDIV PLN 23
Connie Chang, PACDIV PLN 23
Lansing Sugita, PWF 400 – Engineering
Toru Hamayasu, Department of Transportation Services (DTS)
Norman Kawachika, DTS

Purpose: Discuss project with Navy Public Works staff

Summary: An overview of the project was presented.

The Luapele ramp access was specifically discussed. Luapele Road is used as the primary access to the facility from the north. New security measures and transit use of the road as the ramp access must be coordinated with the Navy.

The Navy expressed concern regarding the impact of the proposed Kamehameha Highway contra-flow lane on the Ford Island access. The proposed BRT project does not impact the causeway traffic operation at Salt Lake Boulevard. A follow-up meeting will be scheduled when the Navy completes the Ford Island EIS.

OCT 2 4 2001

Ms. Cheryl D. Soon
Director
Department of Transportation Services
City and County of Honolulu
711 Kapiolani Boulevard, Suite 702
Honolulu, Hawaii 96813

Dear Ms. Soon:

Subject: Primary Corridor Transportation Project, Supplemental Draft Environmental Statement (DEIS) Preparation Notice

Thank you for the opportunity to review the Preparation Notice for the Supplemental DEIS.

We request that you respond to our previous comments (DIR 1.110300, dated 11/3/00) on the Draft EIS and (DIR 1.015, dated 3/16/01), which includes further comments regarding the Primary Corridor Transportation project. Further comments are listed below:

1. Because our statewide needs far exceed our limited resources, we cannot commit State highway funds for the Bus Rapid Transit (BRT)project.

2. The Supplemental DEIS needs to update previous information about where and when the City proposes to convert existing traffic lanes to contra-flow and/or to BRT use.

3. At the time traffic lanes are initially converted to exclusive use of the proposed In-Town BRT:
   - Which intersections and roadways will have reduced levels of service?
   - What will be the cumulative impacts on the duration and severity of traffic congestion at screenlines?
   - How many drivers will be worse off and how much more travel delay will they experience?
   - How many bus riders will be better off and how much less travel delay will they experience?

4. The Supplemental DEIS needs to address the impacts of the proposed makai Kakaako BRT route on cargo and cruise ship operations at Pier 2.

5. At the westbound approach to the Waiawa Interchange, deployment of the eastbound zipperlane reduces Interstate H-1 to a single westbound lane. The Supplemental DEIS should determine necessary improvements so that deployment of the eastbound zipperlane does not cause a bottleneck for morning westbound traffic in 2025. Proposed improvements also must not preclude construction of an additional lane to off-ramp 8-B to Waipahu.

6. Please describe the timing and nature of improvements needed on Nimitz Highway to accommodate the proposed extension of the eastbound zipperlane into Keehi Interchange.

7. Please evaluate the noise impacts resulting from increased peak afternoon traffic volumes when the proposed westbound zipperlane is deployed on Interstate H-1.

8. Within the existing Waiawa and Waiau Interchanges, where there is no shoulder lane, deployment of the proposed westbound zipperlane would narrow Interstate H-1 to three eastbound lanes. Please verify that there will be acceptable levels of service for eastbound traffic through these interchanges when the proposed westbound zipperlane is initially deployed. We also request that you evaluate when and how these Interchanges will need to be widened so that deployment of the proposed westbound zipperlane will not cause a bottleneck for increasing eastbound traffic volumes.

9. Full compliance with Interstate Standards is normally a reasonable alternative to Design Exceptions. Hence, you need to compare the benefits, costs, and drawbacks of full compliance with Interstate Standards with the benefits, costs, and drawbacks for each proposed Design Exception. Unless compelling justification is provided, we may not support and FHWA may not grant even a temporary Design Exception for substandard at-grade highway shoulders.

10. According to the Preparation Notice, new ramps and freeway widening are proposed for exclusive BRT access to Interstate Route H-1 from a proposed Kapolei Interchange, a proposed transit center near the Kunia Interchange, Luapele Drive near the Stadium, and the Radford Drive overpass. According to the Preparation Notice, a new ramp is also proposed for unrestricted vehicular access from Interstate Route H-1 to a proposed City transit center near Middle Street.

For each of these locations, we request that the Supplemental DEIS separately:

- provide updated plans showing proximity to other ramps.
- provide updated cost estimates.
- describe temporary construction-related impacts to freeway traffic and what mitigation measures are proposed.
- describe long-term environmental impacts and mitigation measures.
- describe what traffic movements would be allowed on the proposed ramp.
- explain how the BRT would be rerouted if no zipperlane were deployed and/or the proposed ramp were temporarily unusable.
- estimate daily bus riders using the proposed ramp, both when initially constructed and in 2025.
- estimate the drop in projected daily bus ridership if the proposed ramp were not constructed.
- estimate peak traffic volume on the proposed ramp and the lane into which the ramp would merge in 2025.
- assess design features and traffic controls necessary for articulated buses to safely enter and exit the proposed ramp.

Much of this information will also be needed for a formal Justification Report which must be submitted for our concurrence and FHWA approval before new access is allowed to our Interstate system.

If you have any questions, please contact Ronald Tsuzuki, Head Planning Engineer, Highways Division, at 587-1830.

Very truly yours;

BRIAN K. MINAAI
Director of Transportation

Re: Notice of Intent to Prepare a Supplemental Draft Environmental Impact Statement on Transportation Improvements in the Primary Transportation Corridor of the City and County of Honolulu, Hawaii

Dear Dr. Kong:

The U.S. Fish and Wildlife Service (Service) has reviewed the September 26, 2001, Federal Register notice that a Supplemental Draft Environmental Impact Statement (SDEIS) will be prepared for the proposed project referenced above. The proposed project is sponsored by the Federal Transit Administration, Federal Highway Administration, and the Hawaii Department of Transportation. This letter has been prepared under the authority of and in accordance with provisions of the National Environmental Policy Act of 1969 [42 U.S.C. 4321 *et seq.*; 83 Stat. 852], as amended, the Fish and Wildlife Coordination Act of 1934 [16 U.S.C. 661 *et seq.*; 48 Stat. 401], as amended, the Endangered Species Act of 1973 [16 USC 1531 *et seq.*; 87 Stat. 884], as amended, and other authorities mandating Department of the Interior concern for environmental values. Based on these authorities, the Service offers the following comments for your consideration.

The proposed project has been modified since the Draft EIS. The SDEIS will address the following proposed changes to the Bus Rapid Transit (BRT) Alternative selected as the Locally Preferred Alternative by the City and County of Honolulu on November 29, 2000: (1) addition of an In-Town BRT branch to serve Aloha Tower Marketplace and Kakaako Makai, (2) realignment of a section of the In-Town BRT alignment from Ward Avenue to Pensacola Street, and (3) relocate the H-1 BRT freeway ramp from the Kaonohi Street overpass to a section of the freeway near Aloha Stadium.

The Service has reviewed the information that was provided in the Federal Register Notice and pertinent information in our files. Federally listed species are not known to occur at the sites of the proposed modifications.

Nevertheless, the Service recommends that the SDEIS address potential project-related impacts to native Hawaiian marine species known to exist adjacent to the Kakaako Makai area and native aquatic life known to occur in streams near the Aloha Stadium. Measures to avoid unnecessary impacts and Best Management Practices to minimize unavoidable impacts to native organisms and habitat should be incorporated into the project. For example, we recommend that these measures include the use of effective sediment containment devices and the revegetation of cleared ground as quickly as possible to minimize project-related sedimentation of stream and coastal waters.

The Service appreciates the opportunity to comment on the Notice of Intent. If you have questions regarding these comments, please contact my Environmental Review Coordinator, Michael Molina, by telephone at (808) 541-3441 or by facsimile transmission at (808) 541-3470.

Sincerely,

Paul Henson
Field Supervisor

AR00016395

PRIMARY CORRIDOR TRANSPORTATION PROJECT
OFFICE OF ENVIRONMENTAL QUALITY CONTROL (OEQC) MEETING
MONDAY, FEBRUARY 11, 2002
9:30 A.M.
PARSONS BRINCKERHOFF CONFERENCE ROOM

Attendees: Nancy Heinrich, Office of Environmental Quality Control (OEQC)
Faith Miyamoto, Department of Transportation Services (DTS)
Ann Koby, Parsons Brinckerhoff

Purpose: Discuss SDEIS/FEIS process issues related to appendices, responses to comments, etc.

Summary: Nancy Heinrich gave a brief overview of OEQC's standards for voluminous environmental impact statements (EISs). She used the Hawaiian Electric Company's (HECO's) Kamoku-Pukele Transmission Line Project as an example. For that EIS, the consultant sent letters to the EIS recipients asking them if they wanted all ten volumes, did not want to receive the EIS, or options to receive certain EIS volumes.

A discussion ensued regarding the numerous reports associated with the PRIMCOR project. The data in the technical reports has been superseded in many cases since the Draft EIS (DEIS) was published and the technical reports have not been redone to reflect the project changes. The public is apt to compare the technical report data to the Supplemental DEIS (SDEIS), and/or Final EIS (FEIS) and the information will not match.

At a minimum, OEQC requires that the reports are made available to the public. Faith Miyamoto explained that in the past, the DTS has placed the EIS and relevant technical reports in the libraries along the project corridor. DTS has made available the technical reports so that people can call and get copies.

Another option discussed was posting the EIS and supporting technical reports on the project website. Ms. Heinrich suggested a CD. Ms. Miyamoto stated that the Major Investment Study (MIS)/DEIS was reproduced onto CDs, but that people had problems being able to access the plans and profiles because they did not have the appropriate software available.

It was agreed that a list of PRIMCOR technical reports would be compiled for Nancy Heinrich's review.

Ms. Heinrich also stated that everyone who sent a substantive comment on the DEIS and/or SDEIS needed to receive a letter restating their comment(s), the responses as they appear in the FEIS, and the exact FEIS text changes that relate to the comment and response. When asked if a matrix with the comments and responses would suffice, Ms. Heinrich indicated it would not.

Ms. Heinrich also reminded attendees that the OEQC must approve the SDEIS and FEIS distribution lists and not to forget the signature sheet.

Action Items: The meeting resulted in the following action items.

1. Prepare a list of the PRIMCOR technical reports that will be made available to the public for OEQC review.
2. Discuss options for the comments/responses/FEIS text changes with OEQC and agree upon the format.

MEMORANDUM

TO: OMPO Policy Committee

Councilmember Duke Bainum, Chair	Senator Cal Kawamoto, Vice-Chair
Councilmember John DeSoto	Senator Fred Hemmings
Councilmember John Henry Felix	Senator Brian Kanno
Councilmember Steve Holmes	Representative Willie Espero
Councilmember Rene Mansho	Representative Mark Moses
Cheryl Soon, DTS Director	Representative Joseph Souki

FROM: Brian K. Minaai, Director of Transportation

SUBJECT: Oahu Regional Transportation Plan

As the OMPO Policy Committee begins to finalize the Oahu Regional Transportation Plan, (ORTP), it is important that Department of Transportation (DOT) identify its priority projects that must be included in the ORTP. These priorities include the following project categories: System preservation projects, safety projects, and highway system congestion relief projects.

First, funding of system preservation projects is vital in preserving and maintaining DOT's entire highway system. Projects in this category are not specifically identified in the draft ORTP, but adequate levels of funding for our aging highway system must be budgeted for.

Secondly, the following major safety projects must be included:

1. Farrington Highway Safety Improvements, Nanakuli to Makaha, Project No. W-8 is an important safety project for an area that has experienced many vehicular and pedestrian incidents.

2. Kalanianaole Highway, Rockfall Protection at Makapuu, Project No. U-1 is an extremely important safety project to prevent a closure of the highway similar to what occurred at Waimea Bay last year.

3. Kamehameha Highway Widening, Ke Uka to Lanikuhene, Project No. C-7 is urgently needed not only for congestion relief, but more importantly for safety purposes, as this area is the location of many major traffic incidents.

4. Kamehameha Highway Safety Improvements, Kahaluu to Waimea Bay, Modified Project No. K-9, is another much needed project to address the many vehicular and pedestrian incidents that have occurred along this coastal highway

5. Sand Island Bridge (replace with a tunnel), Project No. P-35 is vital in providing the State's primary harbor a needed second harbor entrance in case of a major accident blocking the present harbor channel. This project will remove the existing bridge and replace it with a tunnel to allow larger ships to utilize Honolulu Harbor, translating into lower cargo costs to our residents.

And finally, the Department of Transportation's congestion relief priority on Oahu is the H-1 corridor system from Urban Honolulu to the Leeward Oahu and up H-2 to Central Oahu.

1. H-1, Waiawa Interchange to Halawa Interchange:

   a. Project No. P-6, H-1 Widening, Waimalu Viaduct to Pearl City Viaduct.
   b. Project No. P-7, H-1 Widening (EB), Waiawe to Helawa. (white funding category)
   c. Project No. P42, H-1 Widen Waipahu Off-Ramp.
   d. Project No. U-2, H-1 Widening (WB) through Waiawa Interchange.
   e. Project No. U-3, H-1 Widening (WB), Waiau to Waiawa Interchange.
   f. Project No. U-4, Waiawa Interchange, Missing Ramp Movements.

All of these projects are part of a total system improvement. These projects are complementary and should be treated as a single project to improve an existing system. Deletion of any one of these projects would cause a system dysfunction.

2. H-1, Middle Street to Kapiolani Interchange and Nimtz Highway:

   a. Project No. P-8, H-1 WB Widening, Vineyard to Middle. (white funding category)
   b. Project No. P-9, H-1 WB Weave Modification, Lunalilo to Vineyard. (white funding category)
   c. Project No. P-10, H-1 EB Widening, Ward to Punahou, Close Piikoi On-Ramp.(white funding category)
   d. Project No. P-11, H-1 University Interchange Modifications. (white funding category)
   e. Project No. P-23, Nimitz Highway Improvements, Keehi to Pacific Street.

All of these projects are complementary and are elements of a systemwide improvement to make our oldest section of the H-1 Freeway operate more efficiently and safely. Deletion of any of these projects would hamper our efforts to improve traffic flow and safety. These projects should be treated as a single project to improve an existing system. Deletion of any one of these projects would cause a system dysfunction.

3. Kahekili Highway Widening, Project No. K-2 is badly needed to address the congestion that occurs daily. This project was originally in the dark blue funding category for deletion, but OMPO Policy Committee in the last meeting agreed at DOT's request to place the project in thewhite/yellow category. Further, this project should be redescribed to end at Ahuimanu (rather than Kamehameha Highway).

4. Intelligent Transportation Systems, Project No. I-3 is important because it allows DOT to operate our existing highway system more efficiently to provide critical congestion relief (white funding category).

At the next OMPO Policy Committee meeting on Monday, March 19, 2001, the Oahu Regional Transportation Plan (ORTP) will be financially constrained. Towards that end, the following are DOT's recommendations.

1. Include in the ORTP, and shift from the white funding category to the yellow funding category those previously identified DOT high priority projects which include modified K-9, P-7, P-8, P-9, P-10, P-11, K-12, I-3, and K-2, totaling approximately $730 million.

2. Delete Project No. W-1, Waianae Second Access across the Waianae Range - $515 million for the following reasons:

   a. High cost (which is underestimated - this project is comparable to another H-3 project, which cost more than a billion dollars), due to its steep and rough topography.
   b. Adverse environmental impacts on endangered species, streams, Kamaili Punenaula Heiaus, residences, farm lots and Hawaiian Homelands.
   c. Increased congestion on Kunia Road and Kunia Interchange may require improvements to those two facilities and add to the total project cost.

3. Delete Project No. P-30, Sand Island Scenic Parkway plus Marina Road plus Fort Armstrong Tunnel -$615 million for the following reasons:

   a. The proposed project severely conflicts with DOT Harbors development plans, which are designed for the efficient, economical and optimal use of the area.
   b. The widening of the Kalihi Channel Bridge will directly conflict with DOT's proposal to replace the existing bridge with a new, much needed DOT Harbors' tunnel (Project No. P-35).
   c. The Fort Armstrong Tunnel portal directly conflicts with the DOT Harbors Division's planned use in the vicinity of Piers 1 and 2.
   d. The Fort Armstrong Tunnel portal also conflicts with the Hawaii Community Development Authority's (HCDA) proposed Punchbowl Street Extension project and its Makai District development plans. HCDA has expressed strong opposition to the Sand Island Scenic Parkway project.
   e. DOT's project to replace the existing Sand Island Bridge with a new tunnel (Project No. P-35) will probably compete with the Sand Island Scenic Parkway for the same discretionary federal funds, which are limited. Funding of both projects is highly unlikely.

   DOT strongly opposes this project.

4. Delete Project No. P-33, Nimitz Highway Lane Reduction - $36.4 million for the following reasons:

a. This project is intended to be developed in conjunction with the Sand Island Scenic Parkway, which DOT opposes.

b. This project directly conflicts with our proposed congestion relief improvements to Nimitz Highway (Project No. P-23).

c. The proposed reduction in lanes on Nimitz Highway will have a tremendous adverse impact on our cargo and maritime operations along the Honolulu Harbor waterfront. The resulting increased congestion on Nimitz Highway will adversely impact all of the maritime users of Pier 10/11 through Piers 40, as well as the local circulation in the area.

DOT strongly opposes this project.

5. The following are comments regarding the Bus Rapid Transit (BRT) project – Regional Highway Portion, Project No. P2a:

a. DOT cannot commit funding for this project because our limited resources far exceed the statewide needs.

b. Wherever the BRT project causes a reduction in Interstate standards, the project cost must include work to restore these standards. Therefore, the BRT project cost is grossly underestimated.

6. As for the Bus Rapid Transit project – In-town BRT, Project No. P-2b, DOT is very concerned about the congestion impact that will be caused by the reduction of roadway lanes and the resulting reduction in roadway capacity. The City's Draft Environmental Impact Study does not adequately disclose this impact nor does it identify any mitigation measures to address this impact. DOT will scrutinize any proposed reduction of roadway lanes, especially on State highways, such as on Ala Moana Boulevard. Satisfactory mitigation measures must be implemented before the proposed project can be constructed.

The tremendous number of transportation projects that have been identified which far exceed our limited financial resources many times over; DOT must balance the transportation priorities statewide, including needs for the neighboring counties of Maui, Kauai, and the Big Island.

I hope this serves to clarify the State Department of Transportation's priorities regarding the formulation of OMPO's Oahu Regional Transportation Plan.

c: The Honorable Benjamin J. Cayetano, Governor
Mr. Gordon Lum, OMPO Executive Director

EXHIBIT A-5. AGENCY COORDINATION SINCE THE SDEIS

This exhibit contains a record of agency correspondence and consultation since the issuance of the SDEIS. A list of the correspondence and consultation activities is provided below. Copies of these documents are provided in this exhibit.

SECTION 106 OF THE NATIONAL HISTORIC PRESERVATION ACT

Minutes of May 3, 2002 meeting with Historic Hawaii Foundation

Minutes of June 24, 2002 meeting with the State Historic Preservation Division (SHPD)

July 17, 2002 letter from DTS to the State Historic Preservation Officer (SHPO) requesting concurrence on Effect Determinations for the BRT Alternative Historic Districts, Buildings, Structures, and Landscapes. Letter contains concurrence signature by the SHPO.

August 27, 2002 letter from DTS to the Office of Hawaiian Affairs submitting the archaeological assessment report for review and comment.

August 27, 2002 letter from DTS to the SHPD submitting the archaeological assessment report for review and comment.

November 6, 2002 letter from the SHPO to DTS providing concurrence with the results of the archaeological assessment report.

February 14, 2003 letter from DTS to Hui Malama I Na Kapuna O Hawaii Nei requesting a meeting to discuss project impacts to historic properties

March 19, 2003 letter from the SHPD regarding completion of initial consultation with the Oahu Island Burial Council.

Section 106 Memorandum of Agreement between the FTA and Hawaii SHPO, with DTS concurrence.

FARMLAND PROTECTION POLICY ACT

July 17, 2002 letter from DTS to U.S. Department of Agriculture regarding Farmland Protection Policy Act Form AD-1006

SAFE DRINKING WATER ACT

March 27, 2002 letter from U.S. Environmental Protection Agency to DTS for the Section 1424(e) review of Southern Oahu Basal Aquifer (SOBA) Sole Source Aquifer, requesting additional information on the proposed project.

March 5, 2003 letter from DTS to U.S. Environmental Protection Agency responding to March 27, 2002 letter.

April 28, 2003 letter from U.S. Environmental Protection Agency to DTS completing Section 1424(e) review.

COASTAL ZONE MANAGEMENT ACT

May 24, 2003 letter from DTS to State Department of Business, Economic Development and Tourism, Office of Planning (OP) submitting a Hawaii Coastal Zone Management (CZM) Program Assessment Form for the proposed project.

June 30, 2003 letter from OP to DTS providing concurrence with DTS's assessment that the grant agreement for the proposed project would be consistent with the Hawaii CZM Program.

OTHER CORRESPONDENCE

October 24, 2001 letter from Hawaii Department of Transportation to DTS regarding SDEISPN

April 15, 2002 letter from Hawaii Department of Transportation regarding Development Plan Public Facilities Map Amendment

April 29, 2002 letter from the State of Hawaii Department of Land and Natural Resources to DTS regarding Historic Preservation Review – Cultural Practices Assessment

May 7, 2002 memorandum from Department of Environmental Services to DTS regarding the SDEIS

May 24, 2002 letter from U.S. Army to DTS regarding the SDEIS

PRIMARY CORRIDOR TRANSPORTATION PROJECT (POP8)
HISTORIC HAWAII FOUNDATION (HHF) MEETING
Friday, May 03, 2002 9:00 A.M. at HHF Offices

Attendees: David Scott, HHF Executive Director
Faith Miyamoto, Department of Transportation Services
Ann Koby, Parsons Brinckerhoff

Purpose: Discuss the potential bus rapid transit (BRT) historic/cultural resources components.

Summary: Faith Miyamoto gave a brief overview of the BRT project and the project refinements since the Major Investment Study/Draft Environmental Impact Statement (MIS/DEIS) was published. She advised Mr. Scott that the HHF received the MIS/DEIS, but did not receive a copy of the Supplemental DEIS (SDEIS).

Ms. Miyamoto passed out the Regional and In-Town BRT alignment maps, including the Kakaako Ma Kai Alignment Map.

Ms. Miyamoto discussed the historic effects associated with the proposed project. These effects are limited to the BRT stops in the Capitol, Chinatown and University Historic Districts. She explained that the Area of Potential Effect (APE) includes the streets where the BRT is operating and one building around the stops and stations. She told Mr. Scott that the goal is to have no adverse effects and that this is to be accomplished using sensitive design features in those areas.

Ms. Miyamoto also explained that a Draft - Act 50 Report was completed and gave Mr. Scott a copy. Mr. Scott also received copies of the MIS/DEIS and SDEIS Executive Summaries, Sections 3.10-Historic and Archaeological Resources, and Sections 5.10-Historic and Archaeological Resources Effects.

Mr. Scott advised the following:

1. The HHF is a nonregulatory entity that is funded from private donations. He gave Ms. Miyamoto and Ms. Koby brochures about the HHF.
2. The HHF's focus is primarily historic structures, but has broadened to traditional cultural practices and view planes.
3. His areas of concern are maintaining the coral curbs and that the BRT stop designs do not affect historic properties and are compatible with their surrounding environment.
4. He prefers electric BRT vehicles.
5. He feels a mass transit system for Honolulu is long overdue and that taking a traffic lane will entice folks to use mass transit instead of cars.
6. If the HHF does not have a problem with a project, they will not write a letter.

Faith Miyamoto and Ann Koby committed to send Mr. Scott copies of the BRT stop concepts that Urban Works developed. (These concepts were mailed to Mr. Scott on May 3, 2002.)

AR00016402

PRIMARY CORRIDOR TRANSPORTATION PROJECT [POP11]
MEETING WITH THE STATE HISTORIC PRESERVATION DIVISION (SHPD)
MONDAY, JUNE 24, 2002 @ 9:45AM

Attendees: Don Hibbard, SHPD
Tonia Moy, SHPD
Faith Miyamoto, DTS
Ann Koby, PB
Jason Yazawa, PB

Purpose: Brief the staff of the State Historic Preservation Division on the project status and continue consultation pursuant to Section 106 of the Natural Historic Preservation Act.

Summary: Highlights for this meeting follow, but this consultation did not include discussion of archaeological sites and resources, which will be held on a later date.

Ms. Miyamoto described the following changes to the project definition that were made following public release of the Supplement Draft Environmental Impact Statement (SDEIS):

- Eliminating the Kapolei, Kunia, and Middle Street bus ramps and the H-1 Express Lanes.
- Relocating the Ewa Park-and-Ride Facility from Kunia to a site near the future North-South Road, and
- Shifting the Kaka`ako Ma Kai Branch from Channel Street to Forrest Avenue.

Mr. Yazawa reminded the SHPD Staff that the project's Area of Potential Effect (APE) is limited to the streets that BRT would use. At transit centers or stop locations, the APE would extend to lots immediately adjacent to the facility because of potential visual impacts. The SHPD was previously consulted regarding this APE definition and concurred.

Enclosed with these minutes are historic and potentially historic properties within the APE preliminary effect determinations summary, excluding archaeological sites, which were presented to the SHPD Staff. The SHPD Staff agreed with the summary contents, including historic eligibility; except the following:

- The transit stops fronting the U.S. Post Office, Custom House and Court House Building, and the Hawaii State Library would cause adverse effects if structures (e.g. shelters) are used. SHPD asked for an explanation of why the segment near the S. King Street and Punchbowl Street intersection (existing bus stop) is not suitable for the Koko Head bound stop.
- The transit stop at Thomas Square would cause an adverse effect if structures are used; even though no park property would be affected. SHPD asked for an explanation of why the stop could not be placed at a different location.
- The transit stop at Sinclair Circle would not cause an adverse effect on the University of Hawaii Historic District.
- SHPD will field check the City & County of Honolulu Corporation Yard in Kaka`ako to determine its potential historic status.
- The Kapahulu transit stop may cause an adverse effect on Kapiolani Park due to its visual impact. SHPD asked that the Kapiolani Park Preservation Society be consulted with and for an explanation of why the stop could not be located in front of the Honolulu Zoo Parking Lot, which would not result in an adverse effect.

For the letter requesting State Historic Preservation Officer (SHPO) concurrence on effect determinations, Mr. Hibbard suggested that the letter list only those properties with adverse effect determinations. However, the letter could also provide the total number of historic properties along the BRT alignment(s) without having to name them all. Ms. Koby suggested that the SHPO concurrence request be a set of duplicate letters where the SHPO would counter-sign one of them to be returned to DTS. Mr. Hibbard stated that this process would be acceptable, but does not preclude the need for a Memorandum Of Agreement (MOA).

Action Items:

1. DTS to advise the SHPD on why there are no feasible alternatives to transit stops fronting the Downtown U. S. Post Office, Custom House and Court House Building (and not at the existing bus stop near Punchbowl Street), Thomas Square and Kapiolani Park (and not the Honolulu Zoo Parking Lot).
2. SHPD to determine historic eligibility of the City & County of Honolulu Corporation Yard in Kaka`ako.
3. DTS to submit request for SHPD concurrence on adverse effect determinations.

U.S. Department of Agriculture
P.O. Box 50004
Honolulu, Hawaii 96850

Dear Mr. Nakamura:

Subject: Revised Site for City and County of Honolulu, Primary Corridor Transportation Project, Farmland Protection Policy Act, Form AD-1006

The City and County of Honolulu, Department of Transportation Services, in cooperation with the U.S. Department of Transportation, Federal Transit Administration, is proposing to construct a park-and-ride facility on the proposed North-South Road, between Farrington Highway and Interstate Route H-1. The proposed park-and-ride is part of the Primary Corridor Transportation Project. The facility would require the use of approximately four acres of agriculturally-zoned land.

In compliance with the Farmland Protection Policy Act, we need to determine the Farmland Conversion Impact Ratings for the project alternatives. Please find enclosed a revised Farmland Conversion Impact Rating form (AD-1006), with Parts I and III completed, per instructions. The attached maps indicate the location of the proposed park-and-ride facility.

The Primary Corridor Transportation Project proposes two build alternatives, both of which require the park-and-ride facility: the Bus Rapid Transit (BRT) and the Transportation System Management (TSM) Alternatives. The City and County of Honolulu zoning designation for this area is Restricted Agricultural (AG1). The No-Build Alternative would not require the use of farmland.

Please note that in September 2000, our consultant, Parsons Brinckerhoff, submitted an AD-1006 form for a transit center planned in the Waipahu area (on Kunia Road) as part of this project. That previously proposed site is no longer a part of the project and has since been replaced by the North-South Road park-and-ride now proposed.

We would appreciate your completing the appropriate parts of Form AD-1006 and returning it to us at your earliest convenience. If you should have any questions, please call Faith Miyamoto of the Transportation Planning Division at 527-6976.

Sincerely,

CHERYL D. SOON
Director

OCT 2 4 2001

DIR 1442
HWY-PS
2.4594

Ms. Cheryl D. Soon
Director
Department of Transportation Services
City and County of Honolulu
711 Kapiolani Boulevard, Suite 702
Honolulu, Hawaii 96813

Dear Ms. Soon:

Subject: Primary Corridor Transportation Project, Supplemental Draft Environmental Statement (DEIS) Preparation Notice

Thank you for the opportunity to review the Preparation Notice for the Supplemental DEIS.

We request that you respond to our previous comments (DIR 1.110300, dated 11/3/00) on the Draft EIS and (DIR 1.015, dated 3/16/01), which includes further comments regarding the Primary Corridor Transportation project. Further comments are listed below:

1. Because our statewide needs far exceed our limited resources, we cannot commit State highway funds for the Bus Rapid Transit (BRT)project.

2. The Supplemental DEIS needs to update previous information about where and when the City proposes to convert existing traffic lanes to contra-flow and/or to BRT use.

3. At the time traffic lanes are initially converted to exclusive use of the proposed In-Town BRT:
   - Which intersections and roadways will have reduced levels of service?
   - What will be the cumulative impacts on the duration and severity of traffic congestion at screenlines?
   - How many drivers will be worse off and how much more travel delay will they experience?
   - How many bus riders will be better off and how much less travel delay will they experience?

4. The Supplemental DEIS needs to address the impacts of the proposed makai Kakaako BRT route on cargo and cruise ship operations at Pier 2.

5. At the westbound approach to the Waiawa Interchange, deployment of the eastbound zipperlane reduces Interstate H-1 to a single westbound lane. The Supplemental DEIS should determine necessary improvements so that deployment of the eastbound zipperlane does not cause a bottleneck for morning westbound traffic in 2025. Proposed improvements also must not preclude construction of an additional lane to off-ramp 8-B to Waipahu.

6. Please describe the timing and nature of improvements needed on Nimitz Highway to accommodate the proposed extension of the eastbound zipperlane into Keehi Interchange.

7. Please evaluate the noise impacts resulting from increased peak afternoon traffic volumes when the proposed westbound zipperlane is deployed on Interstate H-1.

8. Within the existing Waiawa and Waiau Interchanges, where there is no shoulder lane, deployment of the proposed westbound zipperlane would narrow Interstate H-1 to three eastbound lanes. Please verify that there will be acceptable levels of service for eastbound traffic through these interchanges when the proposed westbound zipperlane is initially deployed. We also request that you evaluate when and how these Interchanges will need to be widened so that deployment of the proposed westbound zipperlane will not cause a bottleneck for increasing eastbound traffic volumes.

9. Full compliance with Interstate Standards is normally a reasonable alternative to Design Exceptions. Hence, you need to compare the benefits, costs, and drawbacks of full compliance with Interstate Standards with the benefits, costs, and drawbacks for each proposed Design Exception. Unless compelling justification is provided, we may not support and FHWA may not grant even a temporary Design Exception for substandard at-grade highway shoulders.

10. According to the Preparation Notice, new ramps and freeway widening are proposed for exclusive BRT access to Interstate Route H-1 from a proposed Kapolei Interchange, a proposed transit center near the Kunia Interchange, Luapele Drive near the Stadium, and the Radford Drive overpass. According to the Preparation Notice, a new ramp is also proposed for unrestricted vehicular access from Interstate Route H-1 to a proposed City transit center near Middle Street.

For each of these locations, we request that the Supplemental DEIS separately:

- provide updated plans showing proximity to other ramps.
- provide updated cost estimates.
- describe temporary construction-related impacts to freeway traffic and what mitigation measures are proposed.
- describe long-term environmental impacts and mitigation measures.
- describe what traffic movements would be allowed on the proposed ramp.
- explain how the BRT would be rerouted if no zipperlane were deployed and/or the proposed ramp were temporarily unusable.
- estimate daily bus riders using the proposed ramp, both when initially constructed and in 2025.
- estimate the drop in projected daily bus ridership if the proposed ramp were not constructed.
- estimate peak traffic volume on the proposed ramp and the lane into which the ramp would merge in 2025.
- assess design features and traffic controls necessary for articulated buses to safely enter and exit the proposed ramp.

Much of this information will also be needed for a formal Justification Report which must be submitted for our concurrence and FHWA approval before new access is allowed to our Interstate system.

If you have any questions, please contact Ronald Tsuzuki, Head Planning Engineer, Highways Division, at 587-1830.

Very truly yours;

BRIAN K. MINAAI
Director of Transportation

Honolulu City Council
City and County of Honolulu
530 South King Street
Honolulu, Hawaii 96813

Dear Chairman DeSoto and Members:

Subject: Development Plan Public Facilities Map Amendment (2002/DPPFM-5) for the Primary Urban Center Bus Rapid Transit (BRT) Iwilei to Waikiki Alignment, Honolulu, Oahu

Thank you for consulting us concerning the proposed Development Plan Facilities Map Amendment.

We support expanded provision of limited-stop bus service and conversion of overlapping bus routes to a hub-and-spoke system. However, before the City decides to take away traffic lanes from existing motorists, the City needs to fully disclose, and the public needs to be adequately informed of, traffic impacts which will occur at the time traffic lanes are initially converted to exclusive use by the proposed BRT. To date, this information has not been provided in the City's EIS documents.

All plans for work within the State highway right-of-way must be coordinated and submitted to our Highways Division for our review and approval. The proposed BRT alignment uses portions of Nimitz Highway and Ala Moana Boulevard—which are both State highways.

We consulted the Hawaii Community Development Authority (HCDA) and our Harbors Division concerning proposed BRT use of their property makai of Ala Moana Boulevard. The HCDA will not consent to the City proposal to extend Ilalo Street to Channel Street because the alignment would not be consistent with their adopted plan. However, they probably would welcome City assistance to implement their plan to extend Ilalo Street to Punchbowl Street. Our Harbors Division wishes to minimize constraints on container yard and cruise ship operations. Although the proposed Pier 2 Cruise Ship Terminal has been postponed, the City needs to consult the U.S. Coast Guard concerning design requirements, access limitations, and parking restrictions necessary to maintain security between the proposed Terminal and Ilalo Street.

If you have any questions, please contact Ronald Tsuzuki, Head Planning Engineer, Highways Division, at 587-1830.

Very truly yours,

BRIAN K. MINAAI
Director of Transportation

DOC NO: 0204hm05

Attention: Ms. Faith Miyamoto

Dear Ms. Soon:

Subject: Historic Preservation Review (Chapter 6E, HRS) - Cultural Practices Assessment for the Primary Corridor Transportation Project (City and County of Honolulu)
Ewa to Waikiki, Oahu Island
TMK: Zones 1, 2, 3 and 9

Thank you for submitting for our review the draft report entitled *Act 50 - Cultural Practices Assessment Project Report* (PB Consult Inc. with N. Wong, December 2001). This study was undertaken to assess the potential impacts of the Primary Corridor Transportation Project on cultural practices as required under Chapter 343. We apologize for the delay in our review.

As you are probably aware, we limit our reviews of cultural practices assessments to those components which potentially fall within the jurisdiction of the historic preservation process as defined in Chapter 6E (HRS). Generally this means that we comment on three major components that have a bearing on the adequate identification, evaluation, and treatment of historic properties which are associated with traditions or practices. These include the methods used to identify individuals who are potentially knowledgeable of the project area's past; the description and assessment of any historic properties identified (i.e., those generally called traditional cultural properties); and the proposed treatment of identified properties. We do not, for example, comment on the adequacy with which studies assess a project's impacts on broadly based customary practices or native rights that are not associated with specific sites, places, or landscape features.

In this case, we appreciate the conceptual and methodological efforts made during the study to identify cultural practices within such a large and highly urbanized area and one in which multiple ethnic groups live or participate in activities. The approaches chosen to identify the study area, the kinds of practices to be considered, and the individuals or groups to be consulted is very clearly described and well reasoned. The information compiled and presented in the report is, however, still too general for us to determine if the identified practices contribute to the significance of particular historic properties or if the corridor project will specifically affect any these properties. We are hoping that the authors will be able to apply this study's results or methods to the more detailed historic property reports being prepared for the archaeological or architectural assessments.

If you have any questions, please call Nathan Napoka (587-0040) or Holly McEldowney (692-8028) of our History and Culture Branch.

Aloha,

DON HIBBARD, Administrator
State Historic Preservation Division

MEMORANDUM

TO: CHERYL D. SOON, DIRECTOR
DEPARTMENT OF TRANSPORTATION SERVICES

FROM: TIMOTHY E. STEINBERGER, DIRECTOR
DEPARTMENT OF ENVIRONMENTAL SERVICES

SUBJECT: PRIMARY CORRIDOR TRANSPORTATION PROJECT
SUPPLEMENTAL DRAFT ENVIRONMENTAL IMPACT STATEMENT (SDEIS)

We have reviewed the subject SDEIS, and have the following comments:

The project may potentially have an impact on the City's sewer lines that are located in the same alignment as the bus lanes, both during the construction phase and during future sewer maintenance activities. We are concerned about the potential impacts of nearby excavations, vibrations, and dewatering on the structural integrity of the sewer lines, especially the older ones. The design and construction of the subject project should be closely coordinated with the Department of Environmental Services, wherever the City's sewer lines may be impacted.

Should you have any questions, please call me at 692-5159, or Jack Pobuk, Program Coordinator, at 692-5727.

Ms. Cheryl D. Soon
Director, Department of Transportation Services
City and County of Honolulu
650 South King Street, Third Floor
Honolulu, Hawaii 96813

Dear Ms. Soon:

The Primary Corridor Transportation Project, sponsored by the City and County of Honolulu Department of Transportation Services, released its Supplemental Draft Environmental Impact Statement (SDEIS) on March 13, 2002. The Army, as represented by the U.S. Army Garrison, Hawaii (USAG-HI) and the Hale Koa Hotel (a major Army tenant at Fort DeRussy), appreciates the opportunity to review and provide comments on the SDEIS.

After reviewing this document, I would like to have further consultations concerning the portion of the proposed Revised Bus Rapid Transit (BRT) Alternative relating to Fort DeRussy and Kalia Road, as I believe the SDEIS must provide more information to the Army for adequately assess the impacts, if any, the project would have on the operations involving the Hale Koa Hotel. I am also concerned about the increase of vehicular and pedestrian traffic this project could cause as well as incorporating the unique military force protection requirements we now must consider and the potential negative impact they may have on our efforts to preserve open, green space at the entrance to Waikiki.

The Army is very interested in partnering with the City and County of Honolulu and the Department of Transportation Services to resolve our traffic problems in the most cost and effective manner while, at the same time, minimizing any potential adverse impacts. As a result. To this end, Colonel William E. Ryan III, my Director of Public Works, and his staff is ready to work with you in developing viable and mutually agreeable solutions to Honolulu's problems.

Please feel free to contact Colonel Ryan at 656-1289. Together, we can make a difference.

Sincerely,

William R. Putman
Colonel, U.S. Army
Commanding

B I-11C RIVER STREET SCALE: 1"=10'

CONSTRUCTION NOTES

1. PROVIDE 12" THICK PCC PAVEMENT AT EXCLUSIVE AND SEMI EXCLUSIVE BRT LANES, 8" ROUND PAVEMENT DELINEATORS FOR EXCLUSIVE BRT LANES AND MOUNTABLE AC CURB BETWEEN ADJACENT BRT LANES.
2. RECONSTRUCT, REPAIR, OR REPAVE EXISTING PAVEMENT AS REQUIRED PER C&C/STATE DOT STANDARDS. SLURRY SEAL REMAINING PAVEMENT TO MATCH.
3. PROVIDE NEW AC PAVEMENT, STRIPE AS SHOWN
4. PROVIDE NEW RAISED MEDIAN
5. MODIFY/REMOVE EXISTING RAISED MEDIAN AS SHOWN. PROVIDE AC AND/OR CONCRETE PAVEMENT AS SHOWN
6. PROVIDE NEW SIDEWALK AS SHOWN
7. RELOCATE OR PROVIDE NEW CURB, GUTTER AND SIDEWALK AS SHOWN. REPLACE AC PAVEMENT IN KIND AND RELOCATE UTILITIES AS NEEDED.
8. MODIFY EXISTING BRT INTERSECTION TRAFFIC SIGNAL CONTROLS FOR BRT COMPLETE. CONSTRUCT NEW BRT TRAFFIC SIGNAL CONTROLS WHEN NOTED AS NEW.
9. PROVIDE NEW 13" HIGH BRT PLATFORM AS SHOWN WITH 12" THICK PCC BUS PAD. PLATFORM TO INCLUDE ALL APPLICABLE APPURTENANCES
10. PROVIDE BRT STATION VEHICLE BARRIER/PLANTER (SEE DET. 1/DT-3)
11. PROVIDE BUS BAY COMPLETE WITH 12" THICK PCC BUS PAD, BUS SHELTER, APPURTENANCES, AND SIDEWALK
12. REMOVE EXISTING BUS STOP COMPLETE
13. RECONSTRUCT EXISTING DRIVEWAY
14. RELOCATE EXISTING TREE
15. REMOVE/REPLACE EXISTING TREE
16. PROVIDE NEW DRAINAGE CATCH BASIN AND LATERAL CONNECTION
17. PROVIDE 2KV ELECTRICAL SUBSTATION COMPLETE IN AREA SHOWN
18. RELOCATE EXISTING BUS STOP

CONSTRUCTION NOTES

1. PROVIDE 12" THICK PCC PAVEMENT AT EXCLUSIVE AND SEMI EXCLUSIVE BRT LANES, 8" ROUND PAVEMENT DELINEATORS FOR EXCLUSIVE BRT LANES AND MOUNTABLE AC CURB BETWEEN ADJACENT BRT LANES.
2. RECONSTRUCT, REPAIR, OR REPAVE EXISTING PAVEMENT AS REQUIRED PER C&C/STATE DOT STANDARDS. SLURRY SEAL REMAINING PAVEMENT TO MATCH.
3. PROVIDE NEW AC PAVEMENT, STRIPE AS SHOWN
4. PROVIDE NEW RAISED MEDIAN
5. MODIFY/REMOVE EXISTING RAISED MEDIAN AS SHOWN. PROVIDE AC AND/OR CONCRETE PAVEMENT AS SHOWN
6. PROVIDE NEW SIDEWALK AS SHOWN
7. RELOCATE OR PROVIDE NEW CURB, GUTTER AND SIDEWALK AS SHOWN. REPLACE AC PAVEMENT IN KIND AND RELOCATE UTILITIES AS NEEDED.
8. MODIFY EXISTING BRT INTERSECTION TRAFFIC SIGNAL CONTROLS FOR BRT COMPLETE. CONSTRUCT NEW BRT TRAFFIC SIGNAL CONTROLS WHEN NOTED AS NEW.
9. PROVIDE NEW 15" HIGH BRT PLATFORM AS SHOWN WITH 12" THICK PCC BUS PAD. PLATFORM TO INCLUDE ALL APPLICABLE APPURTENANCES
10. PROVIDE BRT STATION VEHICLE BARRIER/PLANTER (SEE DET. 1/DT-3)
11. PROVIDE BUS BAY COMPLETE WITH 12" THICK PCC BUS PAD, BUS SHELTER, APPURTENANCES, AND SIDEWALK
12. REMOVE EXISTING BUS STOP COMPLETE
13. RECONSTRUCT EXISTING DRIVEWAY
14. RELOCATE EXISTING TREE
15. REMOVE/REPLACE EXISTING TREE
16. PROVIDE NEW DRAINAGE CATCH BASIN AND LATERAL CONNECTION
17. PROVIDE 2KV ELECTRICAL SUBSTATION COMPLETE IN AREA SHOWN
18. RELOCATE EXISTING BUS STOP

WAIKIKI SEGMENT PLAN

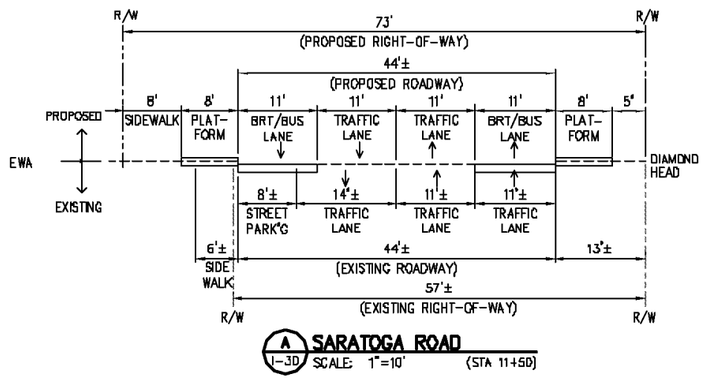
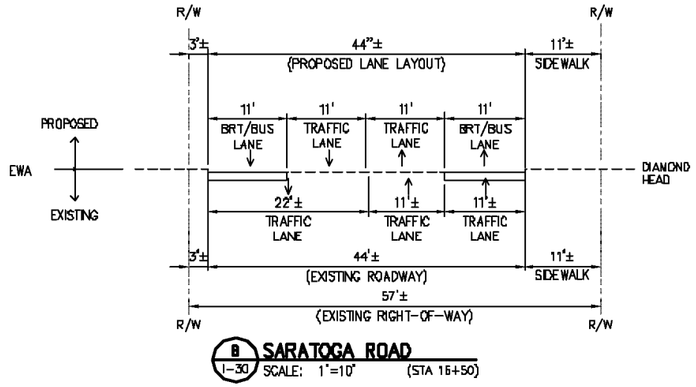
SCALE: 1" = 40'-0" (KALIA STA 34+00 TO SARATOGA STA 20+00)



A I-30 **SARATOGA ROAD**
SCALE: 1"=10' (STA 11+50)



B I-30 **SARATOGA ROAD**
SCALE: 1"=10' (STA 15+50)

CONSTRUCTION NOTES

1. PROVIDE 12" THICK PCC PAVEMENT AT EXCLUSIVE AND SEMI EXCLUSIVE BRT LANES, 8" ROUND PAVEMENT DELINEATORS FOR EXCLUSIVE BRT LANES AND MOUNTABLE AC CURB BETWEEN ADJACENT BRT LANES.
2. RECONSTRUCT, REPAIR, OR REPAVE EXISTING PAVEMENT AS REQUIRED PER C&C/STATE DOT STANDARDS. SLURRY SEAL REMAINING PAVEMENT TO MATCH.
3. PROVIDE NEW AC PAVEMENT. STRIPE AS SHOWN
4. PROVIDE NEW RAISED MEDIAN
5. MODIFY/REMOVE EXISTING RAISED MEDIAN AS SHOWN. PROVIDE AC AND/OR CONCRETE PAVEMENT AS SHOWN
6. PROVIDE NEW SIDEWALK AS SHOWN
7. RELOCATE OR PROVIDE NEW CURB, GUTTER AND SIDEWALK AS SHOWN. REPLACE AC PAVEMENT IN KIND AND RELOCATE UTILITIES AS NEEDED.
8. MODIFY EXISTING BRT INTERSECTION TRAFFIC SIGNAL CONTROLS FOR BRT COMPLETE. CONSTRUCT NEW BRT TRAFFIC SIGNAL CONTROLS WHEN NOTED AS NEW.
9. PROVIDE NEW 15" HIGH BRT PLATFORM AS SHOWN WITH 12" THICK PCC BUS PAD. PLATFORM TO INCLUDE ALL APPLICABLE APPURTANCES
10. PROVIDE BRT STATION VEHICLE BARRIER/PLANTER (SEE DET. 1/DT-3)
11. PROVIDE BUS BAY COMPLETE WITH 12" THICK PCC BUS PAD, BUS SHELTER, APPURTENANCES, AND SIDEWALK
12. REMOVE EXISTING BUS STOP COMPLETE
13. RECONSTRUCT EXISTING DRIVEWAY
14. RELOCATE EXISTING TREE
15. REMOVE/REPLACE EXISTING TREE
16. PROVIDE NEW DRAINAGE CATCH BASIN AND LATERAL CONNECTION
17. PROVIDE 2KV ELECTRICAL SUBSTATION COMPLETE IN AREA SHOWN
18. RELOCATE EXISTING BUS STOP

GENERAL NOTES

1. THE INDICATED LOCATION OF ALL PROPOSED FACILITIES IS CONCEPTUAL. THE INDICATED ALIGNMENTS AND STOP LOCATIONS HAVE BEEN DEVELOPED FOR BUDGETARY PURPOSES AND ARE NOT BE CONSTRUED AS A COMMITMENT BY THE DEPARTMENT OF TRANSPORTATION SERVICES TO ANY SPECIFIC ROUTE ALIGNMENT OR STOP LOCATION.
2. LOCATION OF TRACTION POWER SUPPLY STATIONS IS PRELIMINARY AND SUBJECT TO CHANGE.
3. LIMITS OF WORK FOR EACH SHEET SHALL BE FROM MATCHLINE TO MATCHLINE.
4. TRANSIT CENTERS SHOWN HEREIN ARE OF FOOTPRINTS AND DO NOT INCLUDE ANY PARKING STRUCTURE AS PART OF THESE PLANS.
5. ALL BUS STOPS, PLATFORMS AND PULL OUTS CONFORM TO THE STANDARDS SET FORTH IN THE DRAFT ENVIRONMENTAL IMPACT STATEMENT (DEIS) AND LOCAL DESIGN CRITERIA.
6. ALL HISTORIC CURB SEGMENTS (BASALT) SHALL BE REMOVED AND REUSED PER THE PLANS, EXCEPT AT CURB-SIDE BRT PLATFORMS, WHICH SHALL BE REMOVED, SALVAGED AND STORED AT A LOCATION DESIGNATED BY THE CITY AND COUNTY OF HONOLULU.
7. FOR EXACT PAVEMENT RECONSTRUCTION LIMITS, REFER TO PAVEMENT MANAGEMENT REPORT.
8. FOR LANDSCAPING AND SIDEWALK PATTERNING REFER TO COST ESTIMATE FOR THE IN-TOWN SEGMENT OF THIS PROJECT.
9. CENTERLINE STATIONING SHOWN HEREIN IS FOR PROJECT BRT ROUTE AND NOT INTENDED TO BE A ROADWAY CENTERLINE.
10. FOR ADA COMPLIANCE IMPROVEMENTS, REFER TO THE ADA DETAIL IMPROVEMENT PLAN.
11. BRT SEMI-EXCLUSIVE LANES WILL ALLOW BRT, BUSES AND RIGHT-TURNING VEHICLES.

CONSTRUCTION NOTES

1. PROVIDE 12" THICK PCC PAVEMENT AT EXCLUSIVE AND SEMI EXCLUSIVE BRT LANES, 6" ROUND PAVEMENT DELINEATORS FOR EXCLUSIVE BRT LANES AND MOUNTABLE AC CURB BETWEEN ADJACENT BRT LANES.
2. RECONSTRUCT, REPAIR, OR REPAVE EXISTING PAVEMENT AS REQUIRED PER C&C/STATE DOT STANDARDS. SLURRY SEAL REMAINING PAVEMENT TO MATCH.
3. PRDVIDE NEW AC PAVEMENT. STRIPE AS SHOWN
4. PROVIDE NEW RAISED MEDIAN
5. MODIFY/REMOVE EXISTING RAISED MEDIAN AS SHOWN. PROVIDE AC AND/OR CONCRETE PAVEMENT AS SHOWN
6. PROVIDE NEW SIDEWALK AS SHOWN
7. RELOCATE OR PROVIDE NEW CURB, GUTTER AND SIDEWALK AS SHOWN. REPLACE AC PAVEMENT IN KIND AND RELOCATE UTILITIES AS NEEDED.
8. MODIFY EXISTING BRT INTERSECTION TRAFFIC SIGNAL CONTROLS FOR BRT COMPLETE. CONSTRUCT NEW BRT TRAFFIC SIGNAL CONTROLS WHEN NOTED AS NEW.
9. PROVIDE NEW 13" HIGH BRT PLATFORM AS SHDWN WITH 12" THICK PCC BUS PAD. PLATFORM TO INCLUDE ALL APPLICABLE APPURTENANCES
10. PROVIDE BRT STATION VEHICLE BARRIER/PLANTER (SEE DET. 1/DT-3)
11. PROVIDE BUS BAY COMPLETE WITH 12" THICK PCC BUS PAD, BUS SHELTER, APPURTENANCES, AND SIDEWALK
12. REMOVE EXISTING BUS STOP COMPLETE
13. RECONSTRUCT EXISTING DRIVEWAY
14. RELOCATE EXISTING TREE
15. REMOVE/REPLACE EXISTING TREE
16. PROVIDE NEW DRAINAGE CATCH BASIN AND LATERAL CONNECTION
17. PROVIDE 2KV ELECTRICAL SUBSTATION COMPLETE IN AREA SHOWN
18. RELOCATE EXISTING BUS STOP

I-35 SCALE: 1"=10' (STA 18+00)

CONSTRUCTION NOTES

1. PROVIDE 12" THICK PCC PAVEMENT AT EXCLUSIVE AND SEMI EXCLUSIVE BRT LANES, 6" ROUND PAVEMENT DELINEATORS FOR EXCLUSIVE BRT LANES AND MOUNTABLE AC CURB BETWEEN ADJACENT BRT LANES.
2. RECONSTRUCT, REPAIR, OR REPAVE EXISTING PAVEMENT AS REQUIRED PER C&C/STATE DOT STANDARDS. SLURRY SEAL REMAINING PAVEMENT TO MATCH.
3. PROVIDE NEW AC PAVEMENT. STRIPE AS SHOWN
4. PROVIDE NEW RAISED MEDIAN
5. MODIFY/REMOVE EXISTING RAISED MEDIAN AS SHOWN. PROVIDE AC AND/OR CONCRETE PAVEMENT AS SHOWN
6. PROVIDE NEW SIDEWALK AS SHOWN
7. RELOCATE OR PROVIDE NEW CURB, GUTTER AND SIDEWALK AS SHOWN. REPLACE AC PAVEMENT IN KIND AND RELOCATE UTILITIES AS NEEDED.
8. MODIFY EXISTING BRT INTERSECTION TRAFFIC SIGNAL CONTROLS FOR BRT COMPLETE. CONSTRUCT NEW BRT TRAFFIC SIGNAL CONTROLS WHEN NOTED AS NEW.
9. PROVIDE NEW 13" HIGH BRT PLATFORM AS SHOWN WITH 12" THICK PCC BUS PAD. PLATFORM TO INCLUDE ALL APPLICABLE APPURTANCES
10. PROVIDE BRT STATION VEHICLE BARRIER/PLANTER (SEE DET. 1/DT-3)
11. PROVIDE BUS BAY COMPLETE WITH 12" THICK PCC BUS PAD, BUS SHELTER, APPURTENANCES, AND SIDEWALK
12. REMOVE EXISTING BUS STOP COMPLETE
13. RECONSTRUCT EXISTING DRIVEWAY
14. RELOCATE EXISTING TREE
15. REMOVE/REPLACE EXISTING TREE
16. PROVIDE NEW DRAINAGE CATCH BASIN AND LATERAL CONNECTION
17. PROVIDE 2KV ELECTRICAL SUBSTATION COMPLETE IN AREA SHOWN
18. RELOCATE EXISTING BUS STOP

I–42 SCALE: 1"=10' (STA. 22+50)

CONSTRUCTION NOTES

1. PROVIDE 12" THICK PCC PAVEMENT AT EXCLUSIVE AND SEMI EXCLUSIVE BRT LANES, 6" ROUND PAVEMENT DELINEATORS FOR EXCLUSIVE BRT LANES AND MOUNTABLE AC CURB BETWEEN ADJACENT BRT LANES.
2. RECONSTRUCT, REPAIR, OR REPAVE EXISTING PAVEMENT AS REQUIRED PER C&C/STATE DOT STANDARDS. SLURRY SEAL REMAINING PAVEMENT TO MATCH.
3. PROVIDE NEW AC PAVEMENT. STRIPE AS SHOWN
4. PROVIDE NEW RAISED MEDIAN
5. MODIFY/REMOVE EXISTING RAISED MEDIAN AS SHOWN. PROVIDE AC AND/OR CONCRETE PAVEMENT AS SHOWN
6. PROVIDE NEW SIDEWALK AS SHOWN
7. RELOCATE OR PROVIDE NEW CURB, GUTTER AND SIDEWALK AS SHOWN. REPLACE AC PAVEMENT IN KIND AND RELOCATE UTILITIES AS NEEDED.
8. MODIFY EXISTING BRT INTERSECTION TRAFFIC SIGNAL CONTROLS FOR BRT COMPLETE. CONSTRUCT NEW BRT TRAFFIC SIGNAL CONTROLS WHEN NOTED AS NEW.
9. PROVIDE NEW 13" HIGH BRT PLATFORM AS SHOWN WITH 12" THICK PCC BUS PAD. PLATFORM TO INCLUDE ALL APPLICABLE APPURTANCES
10. PROVIDE BRT STATION VEHICLE BARRIER/PLANTER (SEE DET. 1/DT-3)
11. PROVIDE BUS BAY COMPLETE WITH 12" THICK PCC BUS PAD, BUS SHELTER, APPURTENANCES, AND SIDEWALK
12. REMOVE EXISTING BUS STOP COMPLETE
13. RECONSTRUCT EXISTING DRIVEWAY
14. RELOCATE EXISTING TREE
15. REMOVE/REPLACE EXISTING TREE
16. PROVIDE NEW DRAINAGE CATCH BASIN AND LATERAL CONNECTION
17. PROVIDE 2KV ELECTRICAL SUBSTATION COMPLETE IN AREA SHOWN
18. RELOCATE EXISTING BUS STOP

CONSTRUCTION NOTES

1. PROVIDE 12" THICK PCC PAVEMENT AT EXCLUSIVE AND SEMI EXCLUSIVE BRT LANES, 6" ROUND PAVEMENT DELINEATORS FOR EXCLUSIVE BRT LANES AND MOUNTABLE AC CURB BETWEEN ADJACENT BRT LANES.
2. RECONSTRUCT, REPAIR, OR REPAVE EXISTING PAVEMENT AS REQUIRED PER C&C/STATE DOT STANDARDS. SLURRY SEAL REMAINING PAVEMENT TO MATCH.
3. PROVIDE NEW AC PAVEMENT. STRIPE AS SHOWN
4. PROVIDE NEW RAISED MEDIAN
5. MODIFY/REMOVE EXISTING RAISED MEDIAN AS SHOWN. PROVIDE AC AND/OR CONCRETE PAVEMENT AS SHOWN
6. PROVIDE NEW SIDEWALK AS SHOWN
7. RELOCATE OR PROVIDE NEW CURB, GUTTER AND SIDEWALK AS SHOWN. REPLACE AC PAVEMENT IN KIND AND RELOCATE UTILITIES AS NEEDED.
8. MODIFY EXISTING BRT INTERSECTION TRAFFIC SIGNAL CONTROLS FOR BRT COMPLETE. CONSTRUCT NEW BRT TRAFFIC SIGNAL CONTROLS WHEN NOTED AS NEW.
9. PROVIDE NEW 13" HIGH BRT PLATFORM AS SHOWN WITH 12" THICK PCC BUS PAD. PLATFORM TO INCLUDE ALL APPLICABLE APPURTANCES
10. PROVIDE BRT STATION VEHICLE BARRIER/PLANTER (SEE DET. 1/DT-3)
11. PROVIDE BUS BAY COMPLETE WITH 12" THICK PCC BUS PAD, BUS SHELTER, APPURTENANCES, AND SIDEWALK
12. REMOVE EXISTING BUS STOP COMPLETE
13. RECONSTRUCT EXISTING DRIVEWAY
14. RELOCATE EXISTING TREE
15. REMOVE/REPLACE EXISTING TREE
16. PROVIDE NEW DRAINAGE CATCH BASIN AND LATERAL CONNECTION
17. PROVIDE 2KV ELECTRICAL SUBSTATION COMPLETE IN AREA SHOWN
18. RELOCATE EXISTING BUS STOP
